configure service ies interface ipsec ipsec-tunnel security-policy
configure service vprn interface ipsec ipsec-tunnel security-policy
configure service vprn interface sap ipsec-tunnel security-policy

Description This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD_SA for the matched security policy, then the setup fails, and NO_PROPOSAL_CHOSEN.

If there is a match, and there is not CHILD_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD_SA is created.

Default no security-policy

Parameters *security-policy-id* — Specifies the IPsec security policy entry that the tunnel will use.

Values 1 to 32768

strict-match — Enables strict match of security-policy entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel security-policy

VSR

- configure service vprn interface ipsec ipsec-tunnel security-policy

Full Context configure application-assurance group transit-ip-policy radius seen-ip-radius-acct-policy

Description This command refers to a RADIUS accounting-policy to enable seen-IP notification.

The no form of this command removes the policy.

Default no seen-ip-radius-acct-policy

Parameters *rad-acct-plcy-name* — Specifies the RADIUS accounting policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.107 segment

segment

Syntax **segment** [1..11] [**create**]
no segment

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy>segment-list segment)

Full Context configure router segment-routing sr-policies static-policy segment-list segment

Description This command creates the context to configure a segment inside a segment-list of a statically-defined segment routing policy.

Each segment list can have up to 11 segments.

The **no** form of this command deletes the segment context.

Default no segment

Parameters **create** — Keyword used to create the list.

Platforms All

23.108 segment-list

segment-list

Syntax **segment-list** *segment-list*
no segment-list

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

Context **[Tree]** (config>service>epipe>bgp-evpn segment-routing-v6)

Full Context configure service epipe bgp-evpn segment-routing-v6

Description Commands in this context configure the SRv6 instance that is used in the service.

The **no** form of this command removes the configured SRv6 instance.

Parameters *bgp-instance* — Specifies the SRv6 instance that is configured in the service and associated to an EVPN control plane.

Values 1, 2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

srv6-instance — Specifies the SRv6 instance ID that exists in the service and is associated to a BGP EVPN control plane.

Values 1

name — Specifies the locator that exists in the service SRv6 instance and is used as the default locator for the service, up to 64 characters.

create — Keyword used to create the SRv6 instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.112 sel-mcast-advertisement

sel-mcast-advertisement

Syntax [**no**] **sel-mcast-advertisement**

Context **[Tree]** (config>service>vpls>bgp-evpn sel-mcast-advertisement)

Full Context configure service vpls bgp-evpn sel-mcast-advertisement

Description This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes.

The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

Default no sel-mcast-advertisement

Platforms All

23.113 selection-criteria

selection-criteria

Syntax **selection-criteria** [**best-port** | **highest-count** | **highest-weight**] [**slave-to-partner**] [**subgroup-hold-time** *hold-time*]
no selection-criteria

Context **[Tree]** (config>lag selection-criteria)

Full Context configure lag selection-criteria

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

Default selection-criteria highest-count

Parameters **highest-count** — Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to “power-off” mode of operations).

highest-weight — Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to “power-off” mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

best-port — Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

slave-to-partner — The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

hold-time — Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

Values

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

23.115 selective-label-ip-prioritization

selective-label-ip-prioritization

Syntax [**no**] **selective-label-ip-prioritization**

Context [Tree] (config>router>bgp selective-label-ip-prioritization)

Full Context configure router bgp selective-label-ip-prioritization

Description This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables selective-label IP prioritization for BGP.

Default no selective-label-ip-prioritization

Platforms All

23.116 selective-label-ipv4-install

selective-label-ipv4-install

Syntax [**no**] **selective-label-ipv4-install**

Context **[Tree]** (config>router>bgp selective-label-ipv4-install)
[Tree] (config>router>bgp>group selective-label-ipv4-install)
[Tree] (config>router>bgp>group>neighbor selective-label-ipv4-install)

Full Context configure router bgp group neighbor selective-label-ipv4-install
configure router bgp group selective-label-ipv4-install
configure router bgp selective-label-ipv4-install

Description This command enables selective download for BGP label-ipv4 routes.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

Default no selective-label-ipv4-install

23.117 selective-learned-fdb

selective-learned-fdb

Syntax [**no**] **selective-learned-fdb**

Context **[Tree]** (config>service>vpls selective-learned-fdb)

Full Context configure service vpls selective-learned-fdb

Description This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type “L” or “Evpn” in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type “L” or “Evpn” but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

Default no selective-learned-fdb

Full Context configure service vprn rip group neighbor send
configure service vprn rip group send
configure service vprn rip send
configure service vprn ripng group neighbor send
configure service vprn ripng group send
configure service vprn ripng send

Description This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

The **no** form of this command resets the type of messages sent back to the default value.

Default no send

Parameters *broadcast* — Send RIPv2 formatted messages to the broadcast address.

multicast — Send RIPv2 formatted messages to the multicast address.

none — Do not send any RIP messages (i.e. silent listener).

version-1 — Send RIPv1 formatted messages to the broadcast address.

both — Send both RIP v1 & RIP v2 updates to the broadcast address.

Platforms All

send

23.120 send-acct-stop-on-fail

send-acct-stop-on-fail

Syntax **send-acct-stop-on-fail** {[**on-request-failure**] [**on-reject**] [**on-accept-failure**]}
no send-acct-stop-on-fail

Context **[Tree]** (config>subscr-mgmt>auth-policy send-acct-stop-on-fail)

Full Context configure subscriber-mgmt authentication-policy send-acct-stop-on-fail

Description This command activates the reporting of RADIUS authentication failures of a PPPoE session to a RADIUS accounting server with an Accounting Stop message.

Three failure categories can be enabled separately:

- **on-request-failure**: All failure conditions between the sending of an Access-Request and the reception of an Access-Accept or Access-Reject.
- **on-reject**:
- **on-accept-failure**: All failure conditions that appear after receiving an Access-Accept and before successful instantiation of the host or session.

The RADIUS accounting policy to be used for sending the Accounting Stop messages must be obtained prior to RADIUS authentication via local user database pre-authentication.

The **no** form of this command reverts to the default.

Parameters **on-request-failure** — Specifies that an accounting stop message is sent when a RADIUS Access-Request message could not be sent (for example, there is no server configured, or timeout).

on-reject — Specifies that an accounting stop message is sent when an Access-Reject is received.

on-accept-failure — Specifies that an accounting stop message is sent a failure occurred after the reception of a RADIUS Access-Accept message (such as a duplicate IP address).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.121 send-bvpls-evpn-flush

send-bvpls-evpn-flush

Syntax [**no**] **send-bvpls-evpn-flush**

Context **[Tree]** (config>service>vpls>pbb send-bvpls-evpn-flush)

Full Context configure service vpls pbb send-bvpls-evpn-flush

Description This command triggers ISID-based C-MAC flush signaling in the PBB-EVPN. When the command is enabled in an I-VPLS service, a B-MAC/ISID route is sent for the I-VPLS ISID.

Default no send-bvpls-evpn-flush

Platforms All

23.122 send-bvpls-flush

send-bvpls-flush

Syntax **send-bvpls-flush** {[**all-but-mine**] [**all-from-me**]}
no send-bvpls-flush

Context **[Tree]** (config>service>vpls>pbb send-bvpls-flush)

Full Context configure service vpls pbb send-bvpls-flush

Description This command enables generation of LDP MAC withdrawal “flush-all-from-me” in the B-VPLS domain when the following triggers occur in the related IVPLS:

- MC-LAG failure
- Failure of a local SAP
- Failure of a local pseudowire/SDP binding

A failure means transition of link SAP/pseudowire to either down or standby status.

This command does not require send-flush-on-failure in B-VPLS to be enabled on an IVPLS trigger to send an MAC flush into the BVPLS.

Default no send-bvpls-flush

Parameters **all-but-mine** — Specifies to send an LDP flush all-but-mine and also sent into the B-VPLS. Both parameters can be set together.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

all-from-me — Specifies to send an LDP flush-all-from and when STP initiates a flush, it is sent into the B-VPLS using LDP MAC flush all-from-me. Both parameters can be set together.

Platforms All

23.123 send-chain

send-chain

Syntax [**no**] **send-chain**

Context **[Tree]** (config>ipsec>cert-profile>entry send-chain)

Full Context configure ipsec cert-profile entry send-chain

Description Commands in this context configure the send-chain in the **cert-profile entry**.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

send-chain

Syntax [**no**] **send-chain**

Context **[Tree]** (config>system>security>tls>cert-profile>entry send-chain)

Full Context configure system security tls cert-profile entry send-chain

Description This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config**>**system**>**security**>**pki**>**ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

Default no send-chain

Platforms All

23.124 send-count

send-count

Syntax **send-count** *send-count*
no send-count

Context **[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy send-count)

Full Context configure saa test type-multi-line lsp-ping sr-policy send-count

Description This command configures the number of messages to send. The *send-count* value is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message *interval* value must be expired before the next message request is sent.

The **no** form of this command reverts to the default value.

Default send-count 1

Parameters *send-count* — Specifies the send count in number of packets.

Values 1 to 100

Default 1

Platforms All

Use subject to Terms available at: www.nokia.com

23.125 send-default

send-default

Syntax **send-default** [**ipv4**] [**ipv6**] [**export-policy** *export-policy*]
no send-default

Context **[Tree]** (config>router>bgp send-default)
[Tree] (config>router>bgp>group send-default)
[Tree] (config>router>bgp>group>neighbor send-default)

Full Context configure router bgp group neighbor send-default
configure router bgp group send-default
configure router bgp send-default

Description This command enables the advertisement of a default route. When this command is configured so that it applies to an IBGP or EBGP session, the default route for IPv4 and/or IPv6 is automatically added to the Adj_RIB-OUT of that peer. The advertised defaults are unrelated to any default routes that may be installed in the FIB of the local router.

When the command includes the **ipv4** parameter, an IPv4 default route (0/0) is generated.

When the command includes the **ipv6** parameter, an IPv6 default route (::/0) is generated.

If there is an active default route in the FIB of the local router and a BGP export policy allows that default route to be advertised so it conflicts with the **send-default** command, the artificially generated default overrides the advertisement of the installed default.

The artificially generated default route is not matched by BGP export policies. In order to modify its attributes, a route policy must be created for this purpose and it must be referenced by the **export-policy** parameter. Only the route modifications in the default-action of this policy are parsed and applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels the default behavior is to inherit the configuration from a higher level. At the instance level the default behavior is to not generate nor inject a default route.

Default no send-default

Parameters **ipv4** — Includes the **ipv4** parameter.

ipv6 — Includes the **ipv6** parameter.

export-policy — Specifies the name of a route policy, up to 64 characters. Only the route modifications in the **default-action** context of this route policy are parsed. Those modifications change the attributes of the advertised default route.

23.126 send-fib-population-packets

send-fib-population-packets

Syntax **send-fib-population-packets** *mode*
no send-fib-population-packets

Context [Tree] (config>service>ies>sub-if>grp-if>srrp send-fib-population-packets)
[Tree] (config>service>vprn>sub-if>grp-if>srrp send-fib-population-packets)

Full Context configure service ies subscriber-interface group-interface srrp send-fib-population-packets
configure service vprn subscriber-interface group-interface srrp send-fib-population-packets

Description This command configures the mode used to send Fib population packets. When SRRP becomes master it generates gratuitous ARPs (GARPs) used by the Layer 2 access network to populate the correct SRRP gateway.

The **no** form of this command disables sending FDB population packets.

Default send-fib-population-packets all

Parameters *mode* — Specifies on which VLANs the gratuitous ARPs are sent.

Values **all**: Generates, on SSRP master assignment, the GARPs on all VLANs

out-tag-only: Generates, on SRRP master assignment, the GARPs only on SAPs with unique outer VLAN and lowest VLAN tags

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.127 send-flush-on-bvpls-failure

send-flush-on-bvpls-failure

Syntax [**no**] **send-flush-on-bvpls-failure**

Context [Tree] (config>service>vpls>pbb send-flush-on-bvpls-failure)

Full Context configure service vpls pbb send-flush-on-bvpls-failure

Description This command enables the generation in the local I-VPLS of an LDP MAC flush-all-from-me following a failure of SAP/the whole endpoint/spoke-SDP in the related B-VPLS. The failure of mesh-SDP in B-VPLS does not generate the I-VPLS MAC flush.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the generation of LDP MAC flush in I-VPLS on failure of SAP/endpoint/spoke-SDP in the related B-VPLS.

Default no send-flush-on-bvpls-failure

Platforms All

23.128 send-flush-on-failure

send-flush-on-failure

Syntax [**no**] **send-flush-on-failure**

Context **[Tree]** (config>service>vpls send-flush-on-failure)

Full Context configure service vpls send-flush-on-failure

Description This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or “operationally down” events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

Default no send-flush-on-failure

Platforms All

23.129 send-idr-after-eap-success

send-idr-after-eap-success

Syntax [**no**] **send-idr-after-eap-success**

Full Context configure ipsec ike-policy send-idr-after-eap-success

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the system to add the Identification Responder (IDr) payload in the last IKE authentication response after an Extensible Authentication Protocol (EAP) Success packet is received. When disabled, the system will not include IDr payload.

The **no** form of this command disables sending the IDr payload in the last IKE.

Default send-idr-after-eap-success

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.130 send-imet-ir-on-ndf

send-imet-ir-on-ndf

Syntax **send-imet-ir-on-ndf**
no send-imet-ir-on-ndf

Context **[Tree]** (config>service>vpls>bgp-evpn>vxlan send-imet-ir-on-ndf)

Full Context configure service vpls bgp-evpn vxlan send-imet-ir-on-ndf

Description This command controls the advertisement of Inclusive Multicast Ethernet Tag (IMET) routes for ingress replication in the case where the PE is Non-DF for a specified network interconnect VXLAN virtual ES. When enabled, the router will advertise IMET-IR routes even if the PE is NDF. This attracts BUM traffic but also speeds up convergence in case of DF failure.

The **no** form of this command withdraws the advertisement of the IMET-IR route on the network interconnect VXLAN NDF router.

Default send-imet-ir-on-ndf

Platforms All

23.131 send-orf

send-orf

Syntax **send-orf** [*comm-id*]
no send-orf [*comm-id*]

Context **[Tree]** (config>router>bgp>outbound-route-filtering>extended-community send-orf)
[Tree] (config>router>bgp>group>outbound-route-filtering>extended-community send-orf)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>router>bgp>group>neighbor>outbound-route-filtering>extended-community send-orf)

Full Context configure router bgp group neighbor outbound-route-filtering extended-community send-orf
configure router bgp group outbound-route-filtering extended-community send-orf
configure router bgp outbound-route-filtering extended-community send-orf

Description This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

Default no send-orf

Parameters *comm-id* — Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

Values [**target:** {*ip-address*:*comm-val* | *2byte-asnumber*:*ext-comm-val* | *4byte-asnumber*:*comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

configure service vpls sap mld-snooping send-queries
configure service vpls spoke-sdp igmp-snooping send-queries
configure service vpls spoke-sdp mld-snooping send-queries

Description This command specifies whether to send IGMP general query messages on the SAP or SDP.

When send-queries is configured, all type of queries generate ourselves are of the configured version. If a report of a version higher than the configured version is received, the report will get dropped and a new wrong version counter will get incremented. If send-queries is not configured, the version command has no effect. The version used will be the version of the querier. This implies that, for example, when we have a v2 querier, we will never send out a v3 group or group-source specific query when a host wants to leave a certain group.

If **mrouter-port** is enabled on this SAP or spoke SDP, the **send-queries** command parameter cannot be set.

The **no** form of this command disables the IGMP general query messages.

Default no send-queries

Full Context configure service vprn bgp group link-bandwidth send-to-ebgp
configure service vprn bgp group neighbor link-bandwidth send-to-ebgp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGP peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGP peer.

Default no send-to-ebgp

Parameters *family* — Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

sender-id

Syntax **sender-id local** *local-name*
sender-id system
no sender-id

Context **[Tree]** (config>eth-cfm>system sender-id)

Full Context configure eth-cfm system sender-id

Description This command allows the operator to include the configured “system name” (chassis3) or a locally configured value in ETH-CFM PDUs sent from MEPs and MIPs. The operator may only choose one of these options to use for ETH-CFM. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

Note: LBR functions reflect all TLVs received in the LBM unchanged, including the SenderID TLV.

Parameters *local-name* — Specifies a local alphanumeric string different from the “system name” chassis(3) value that can be used for other means, up to 45 characters.

system — Allows ETH-CFM to use the configured “system name” value as the chassis(3).

[**coa-only**] [**pending-requests-limit** *limit*]
no server *index*

Context **[Tree]** (config>subscr-mgmt>auth-plcy>radius-auth-server server)

Full Context configure subscriber-mgmt authentication-policy radius-authentication-server server

Description This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to sixteen RADIUS servers can be configured at any one time in a RADIUS authentication policy. Only five can be used for authentication, all other servers should be configured as coa-only servers. RADIUS servers are accessed in order from lowest to highest index for authentication or accounting requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server index from the configuration.

Parameters *server-index* — Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 16 (a maximum of 5 authentication servers)

ip-address — Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

key — Specifies the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

Values secret-key: Up to 20 characters.
hash-key: Up to 33 characters.
hash2-ke: Up to 55 characters.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

port-num — Specifies the UDP port number on which to contact the RADIUS server for authentication.

Values 1 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

coa-only — Specifies Change-of-Authorization Messages only. Servers that are marked with the coa-only flag will not be used for authentication, but they is able to accept RADIUS CoA messages, independent of the accept-authorization-change setting in the authentication policy.

For authentication purposes, the maximum number of servers is 5. All other servers may only be used as coa-only servers.

limit — Specifies the maximum number of outstanding RADIUS authentication requests for this authentication server.

Values 1 to 4096

Default The default value when not configured is 4096

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ip-address*
no server

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host server)

Full Context configure subscriber-mgmt local-user-db ipoe host server

Description This command configures the IP address of the DHCP server to relay to.

The configured DHCP server IP address must reference one of the addresses configured under the DHCP CLI context of an IES/VPRN subscriber or group interface.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IP address of the DHCP server.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ip-address*
no server

Context **[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay server)

Full Context configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay server

Description This command configures the IPv6 address of the DHCP6 server to relay to.

The configured DHCP6 server IPv6 address must reference one of the addresses configured under the DHCP6 CLI context of an IES/VPRN subscriber or group interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies up to eight IPv6 addresses of the DHCP6 server.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** [**service** *service-id*] **name** *server-name*
no server

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>match-radprox-cache server)

Full Context configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache server

Description This command specifies the name of radius-proxy-server and optionally id of the service that the radius-proxy-server resides in.

The **no** form of this command removes the parameters from the configuration.

Parameters **service** *service-id* — Specifies the ID or name of the service.

Values 1 to 214748365
svc-name up to 64 char maximum

name *server-name* — Specifies the name of radius-proxy-server up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ipv6z-address* [*ipv6z-address*]
no server [*ipv6z-address*]

Context **[Tree]** (config>service>ies>if>ipv6>dhcp6 server)

Full Context configure service ies interface ipv6 dhcp6 server

Description This command specifies a list of servers where DHCP6 requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP6 relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

The **no** form of this command reverts to the default.

Parameters *ipv6z-address* — Specifies up to eight non-global IPv4 addresses including a zone index as defined by the InetAddressIPv4z textual convention.

Values
ipv6z-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2022 Nokia.

configure service vprn subscriber-interface group-interface local-address-assignment server
configure service vprn subscriber-interface local-address-assignment server

Description This command designates a local DHCPv4 server for local pools management where IPv4 addresses for PPPoXv4 clients are allocated without the need for the internal DHCP relay-agent. Those addresses are tied to PPPoX sessions and they are de-allocated when the PPPoX session is terminated.

Parameters *server-name* — Specifies the name of the local DHCP server.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*] [**create**]
no server *server-index*

Context **[Tree]** (config>aaa>l2tp-acct-plcy>radius-acct-server server)

Full Context configure aaa l2tp-accounting-policy radius-accounting-server server

Description This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

Parameters *server-index* — The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 16 (a maximum of 5 accounting servers)

address ip-address — The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

secret *key* — The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

Values secret-key — A string up to 20 characters.
hash-key — A string up to 33 characters.
hash2-key — A string up to 55 characters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash — Specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

custom — Specifies the custom encryption to management interface.

port — Specifies the UDP port number on which to contact the RADIUS server for authentication.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>radius-server server)

Full Context configure router radius-server server
configure service vprn radius-server server

Description This command either specifies an external RADIUS server in the corresponding routing instance or enters configuration context of an existing server. The configured server could be referenced in the radius-server-policy.

The **no** form of this command removes the parameters from the server configuration.

Parameters *server-name* — Specifies the name of the external RADIUS server.

ip-address — Specifies the IPv4 or IPv6 IP address of the external RADIUS server.

key — Specifies the shared secret key of the external RADIUS server, up to 64 characters.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

server

Syntax **server** *server-name* [**create**] [**purpose** {[**accounting** | **authentication**]}] [**wlan-gw-group** *group-id*]
no server *server-name*

Context **[Tree]** (config>router>radius-proxy server)
[Tree] (config>service>vprn>radius-proxy server)

Full Context configure router radius-proxy server
configure service vprn radius-proxy server

Description This command creates a RADIUS-proxy server in the corresponding routing instance. The proxy server can be configured for the purpose of proxying authentication or accounting or both.

If a WLAN-GW ISA group is specified, then the RADIUS proxy server is instantiated on the set of ISAs in the specified wlan-gw group. The RADIUS messages from the AP are load-balanced to these ISAs. The ISA that processes the RADIUS message then hashes this message to the ISA that anchors the UE. The hash is based on UE MAC address (required to be present in the calling-station-id attribute) in the RADIUS message.

If the **create** parameter is not specified, then this command enters configuration context of the specified RADIUS-proxy server.

The **no** form of this command removes the server-name and parameters from the radius-proxy configuration.

Parameters *server-name* — Specifies the name of the RADIUS-proxy server.

create — Specifies that the system will create the specified RADIUS-proxy server.

purpose — Specifies the purpose the RADIUS-proxy server.

Values accounting — proxy accounting packets
authentication — proxy authentication packets

group-id — Specifies the WLAN-GW ISA group.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ipv6-address* [*ipv6-address*]

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client server

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This specifies the DHCPv6 servers that are used for requesting addresses.

The **no** form of this command removes the server. This cannot be executed while any DHCPv6 client application is not shut down.

Parameters *ipv6-address* — Specifies up to 8 unicast IPv6 addresses of a DHCP6 server.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *xmpp-server-name* [**domain-name** *fqdn*] [**username** *user-name*] [**password** *password*] [**create**] [**service-name** *service-name*]
server *xmpp-server-name* [**domain-name** *fqdn*] [**username** *user-name*] [**password** *password*] [**create**] [**router** *router-instance*]
no server *xmpp-server-name*

Context **[Tree]** (config>system>xmpp server)

Full Context configure system xmpp server

Description This command configures the XMPP server as well as the Jabber ID that the 7750 SR, 7450 ESS, or 7950 XRS will use for the XMPP communication with the server. The system uses DNS to resolve the configured domain-name.

no server *name* will remove all the dynamic configurations in all the services.

Parameters *xmpp-server-name* — Specifies the name of the server in lower-case letters.

fqdn — Specifies the Fully Qualified Domain Name of the server.

user-name — Specifies the user-name part of the Jabber ID.

password — Specifies the password part of the Jabber ID's user.

create — Keyword used to create the server instance.

router-instance — Specifies the router name or service ID used to identify the router instance.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	"Base", "management"
vprn-svc-id	1 to 2147483647

Default Base

service-name — Specifies the service name, up to 64 characters.

Platforms All

Syntax **server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**tls-client-profile** *profile*]
no server *index*

Context **[Tree]** (config>service>vprn>aaa>remote-servers>radius server)

Full Context configure service vprn aaa remote-servers radius server

Description This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default no server

Parameters *index* — Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address — Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key — Specifies the secret key, up to 64 characters, that must match the password on the RADIUS server.

Values Up to 64 characters in length.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

profile — Specifies the TLS profile name, up to 32 characters, for the RADIUS server.

Platforms All

server

Syntax **server** *index* **address** *ip-address* **secret** *key* [{**hash** | **hash2** | **custom**}] [**port** *port*]
no server *index*

Context **[Tree]** (config>service>vprn>aaa>remote-servers>tacplus server)

Full Context configure service vprn aaa remote-servers tacplus server

Description This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

Default No TACACS+ servers are configured.

Parameters *index* — Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

Values 1 to 5

ip-address — Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

key — Specifies the secret key, up to 128 characters, for access to the TACACS+ server. This secret key must match the password on the TACACS+ server.

Values Up to 128 characters in length.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

Full Context configure application-assurance group url-filter icap server

Description This command configures the IP address and server port of the ICAP server.

Parameters *ip-address[:port]* — Specifies the ICAP server IP address and port.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ip-address* [*ip-address*] **router** *router-instance*
server *ip-address* [*ip-address*] **service-name** *service-name*
no server

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw>dhcp server)
[Tree] (config>service>vprn>if>sap>ipsec-gw>dhcp server)

Full Context configure service ies interface sap ipsec-gw dhcp server
configure service vprn interface sap ipsec-gw dhcp server

Description This command specifies up to eight DHCPv4 server addresses for DHCPv4-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

Default no server

Parameters *ip-address* — Specifies up to eight unicast IPv4 addresses.

Values

ipv4-address	a.b.c.d

router-instance — Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server** *ip-address* **service-name** *service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

vprn-svc-id:	1 to 2147483647
router-name:	*router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

Default Base

service-name — Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *ipv6-address* [*ipv6-address*] **router** *router-instance*
server *ipv6-address* [*ipv6-address*] **service-name** *service-name*
no server

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw>dhcp6 server)
[Tree] (config>service>vprn>if>sap>ipsec-gw>dhcp6 server)

Full Context configure service ies interface sap ipsec-gw dhcp6 server
configure service vprn interface sap ipsec-gw dhcp6 server

Description This command specifies up to eight DHCPv6 server addresses for DHCPv6-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

Default no server

Parameters *ipv6-address* — Specifies up to eight unicast global unicast IPv6 addresses.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

router-instance — Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server** *ip-address* **service-name** *service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

vprn-svc-id:	1 to 2147483647
router-name:	*router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

Default Base

service-name — Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** *server-index* [**create**]
no server *server-index*

Context **[Tree]** (config>aaa>isa-radius-plcy>servers server)

Full Context configure aaa isa-radius-policy servers server

Description This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of the command removes the server from the configuration.

Default none

Parameters *server-index* — The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 10 (a maximum of 5 accounting servers)

create — Keyword used to create the server index.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server**

Context **[Tree]** (config>test-oam>twamp server)

Full Context configure test-oam twamp server

Description This command configures the node for TWAMP server functionality.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

server

Syntax **server** *server* [*server*]

Context **[Tree]** (config>router>if>dhcp server)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router interface dhcp server

Description This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

Default no server

Parameters *server* — Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

Platforms All

server

Syntax **server** *ipv6-address* [*ipv6-address*]
no server

Context **[Tree]** (config>router>router-advert>dns-options server)
[Tree] (config>router>router-advert>if>dns-options server)

Full Context configure router router-advertisement dns-options server
configure router router-advertisement interface dns-options server

Description This command specifies the IPv6 DNS servers to include in the RDNSS option in Router Advertisements. When specified at the router advertisement level this applies to all interfaces that have **include-dns** enabled, unless the interfaces have more specific **dns-options** configured.

Parameters *ipv6-address* — Specifies the IPv6 address of the DNS servers as eight 16-bit hexadecimal pieces. A maximum of four ipv6 addresses can be specified in a single statement.

Platforms All

server

Syntax **server** *pcp-server-name* [**create**]
no server *pcp-server-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>pcp-server server)

Full Context configure router pcp-server server

Description Commands in this context configure a PCP server.

The **no** form of this command deletes the specified PCP server.

Parameters *pcp-server-name* — Specifies the PCP server name, up to 32 characters.

create — Creates a PCP server before entering the context to configure it.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

Syntax **server** [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id*] [**version** *version*] [**prefer**]
no server [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

Context [Tree] (config>system>time>ntp server)

Full Context configure system time ntp server

Description This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is to be used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, then the prefer parameter must also be specified. After PTP has established a UTC traceable time from an external grandmaster then it will always be the source for time into NTP, even if PTP goes into time holdover. PTP applies only to the 7450 ESS and 7750 SR.

Use of the internal PTP time source for NTP will promote the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

Parameters *router-instance* — Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management
service-id — 1 to 2147483647

Default Base

service name — Specifies the service name for the VPRN. The name can be up to 64 characters. CPM routing instances are not supported.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address — Configures the IPv4 address of an external NTP server.

Values a.b.c.d

Default None

ipv6-address — Configures the IPv6 address of an external NTP server.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Default None

key-id — Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet will be rejected and an event/trap generated. This is an optional parameter.

Values 1 to 255

version — Configures the NTP version number that is expected by this node. This is an optional parameter.

Values 2 to 4

Default 4

ptp — Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

prefer — Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, then the new entry overrides the old entry.

Platforms All

server

Syntax **server**

Context **[Tree]** (config>system>security>ssh>key-re-exchange server)

Full Context configure system security ssh key-re-exchange server

Description This command enables the key re-exchange context for the SSH server.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

server

Syntax **server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**tls-client-profile** *profile*]
no server *index*

Context **[Tree]** (config>system>security>radius server)

Full Context configure system security radius server

Description This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default no server

Parameters *index* — Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address — Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key — Specifies the secret key to access the RADIUS server, up to 64 characters. This secret key must match the password on the RADIUS server.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

tls-client-profile — Specifies the TLS profile for the RADIUS server.

profile — Specifies the TLS profile name, up to 32 characters.

Platforms All

server

Syntax **server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*]
no server *index*

Context **[Tree]** (config>system>security>tacplus server)

Full Context configure system security tacplus server

Description This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

Parameters *index* — Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

Values 1 to 5

ip-address — Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key — Specifies the secret key, up to 128 characters, to access the TACACS+ server. This secret key must match the password on the TACACS+ server.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

port — Specifies the port ID.

Values 0 to 65535

Platforms All

server

Syntax **server** *server-index* [**create**]
no server *server-index*

Context **[Tree]** (config>system>security>ldap server)

Full Context configure system security ldap server

Description This command configures an LDAP server. Up to five servers can be configured, which can then work in a redundant manner.

The **no** version of this command removes the server connection.

Parameters *server-index* — Specifies a unique LDAP server connection.

Values 1 to 5

Platforms All

server

Syntax **server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**auth-port** *auth-port*] [**acct-port** *acct-port*] [**type** *server-type*]

Context **[Tree]** (config>system>security>dot1x>radius-plcy server)

Full Context configure system security dot1x radius-plcy server

Description This command adds a Dot1x server and configures the Dot1x server IP address, index, and key values.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Up to five Dot1x servers can be configured at any one time. Dot1x servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other Dot1x servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default no server

Parameters *server-index* — Specifies the index for the Dot1x server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address — Specifies the IP address of the Dot1x server. Two Dot1x servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

key — Specifies the secret key, up to 128 characters, to access the Dot1x server. This secret key must match the password on the Dot1x server.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

acct-port — Specifies the UDP port number on which to contact the RADIUS server for accounting requests.

auth-port — Specifies a UDP port number to be used as a match criteria.

Values 1 to 65535

server-type — Specifies the server type.

Values authorization, accounting, combined

Platforms All

no server-address *server-address*

Context **[Tree]** (config>app-assure>group>dns-ip-cache>dns-match server-address)

Full Context configure application-assurance group dns-ip-cache dns-match server-address

Description This command configures a DNS server address. DNS responses from this DNS server are used to populate the dns-ip-cache. Up to 64 server addresses can be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *server-address* — Specifies the IPv4 or IPv6 address of the DNS.

Values

ipv4-address	a.b.c.d[/mask]	
		mask - [1 to 32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length	
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D
	prefix-length	[1 to 128]

server-name — Specifies an optional server name for a given server address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-address

Syntax **server-address {eq | neq}** *ip-address*
server-address {**eq** | **neq**} **ip-address** *masked-ip-address* **netmask** *netmask*
server-address {**eq** | **neq**} **dns-ip-cache** *dns-ip-cache-name*
server-address {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*
no server-address

Context **[Tree]** (config>app-assure>group>policy>app-filter>entry server-address)

Full Context configure application-assurance group policy app-filter entry server-address

Description This command configures the server address to use in application definition. The server IP address may be the source or destination, network or subscriber IP address and may include the use of netmasks.

The **no** form of this command restores the default (removes the server address from application criteria defined by this entry).

Default no server-address

Parameters **eq** — Specifies a comparison operator that the value configured and the value in the flow are equal.

neq — Specifies a comparison operator that the value configured differs from the value in the flow.

ip-address — Specifies a valid unicast address.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D
prefix-length [1..128]

netmask — Specifies an IPv4 or IPv6 address mask.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

masked-ip-address — Specifies a valid unicast IPv4 or IPv6 address.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

dns-ip-cache-name — Specifies a DNS IP cache name, up to 32 characters.

ip-prefix-list-name — Specifies the name of an IP prefix list, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-address

Syntax **server-address** *ip-address* [**version** *version-number*] [**normal** | **preferred**] [**interval** *seconds*]
no server-address *ip-address*

Context **[Tree]** (config>system>time>sntp server-address)

Full Context configure system time sntp server-address

Description This command creates an SNTP server for unicast client mode.

Parameters *ip-address* — Specifies the IP address of the SNTP server.

Values a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

version-number — Specifies the SNTP version supported by this server.

Values 1 to 3

Default 3

normal | preferred — Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

Default normal

seconds — Specifies the frequency at which this server is queried.

Values 64 to 1024

Default 64

Platforms All

23.145 server-cipher-list

server-cipher-list

Syntax **server-cipher-list protocol-version** *version*

Context **[Tree]** (config>system>security>ssh server-cipher-list)

Full Context configure system security ssh server-cipher-list

Description This command enables the configuration of the list of allowed ciphers by the SSH server.

Parameters *version* — Specifies the SSH version.

Values 1 — Specifies that the SSH server only accepts connections from clients that support SSH protocol version 1 2 — Specifies that the SSH server accepts connections from clients supporting either SSH protocol version 2

Platforms All

server-cipher-list

Syntax **server-cipher-list** *name* [**create**]
no server-cipher-list *name*

Context **[Tree]** (config>system>security>tls server-cipher-list)

Full Context configure system security tls server-cipher-list

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates the cipher list that is compared against cipher lists sent by the client to the server in the client hello message. The list contains all ciphers that are supported and desired by SR OS for use in the TLS session. The first common cipher found in both the server and client cipher lists will be chosen. As such, the most desired ciphers should be added at the top of the list.

The **no** form of the command removes the cipher list.

Parameters *name* — Specifies the name of the server cipher list, up to 32 characters in length.

create — Keyword used to create the server cipher list.

Platforms All

[Tree] (config>service>vprn>dhcp6>server server-id)

Full Context configure router dhcp6 local-dhcp-server server-id
configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id
configure service vprn dhcp6 local-dhcp-server server-id
configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

Description This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

Default server-id duid-ll

Parameters *hex-string* — Specifies a DUID system ID in a hex format.

Values 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

ascii-string — Specifies a DUID system ID in an ASCII format, up to 58 characters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

duid-ll — Specifies that the DUID system ID is derived from the system link layer address.

duid-en — Specifies the enterprise number.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.147 server-ip

server-ip

Syntax **server-ip** {**eq** | **neq**} *ip-address*
no server-ip

Context **[Tree]** (debug>app-assure>group>traffic-capture>match server-ip)

Full Context debug application-assurance group traffic-capture match server-ip

Description This command configures debugging on a servicer IP address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.148 server-kex-list

server-kex-list

Syntax **server-kex-list**

Context **[Tree]** (config>system>security>ssh server-kex-list)

Full Context configure system security ssh server-kex-list

Description This command allows the user to configure SSH KEX algorithms for SR OS as an SSH server.

An empty list is the default list that the SSH KEX advertises. The default list contains the following:

diffie-hellman-group16-sha512

diffie-hellman-group14-sha256

diffie-hellman-group14-sha1

© 2022 Nokia.

diffie-hellman-group1-sha1

Platforms All

23.149 server-mac-list

server-mac-list

Syntax **server-mac-list**

Context **[Tree]** (config>system>security>ssh server-mac-list)

Full Context configure system security ssh server-mac-list

Description This command allows the user to configure SSH MAC algorithms for SR OS as an SSH server.

Platforms All

23.150 server-policy

server-policy

Syntax **server-policy** *policy-name*
no server-policy

Context **[Tree]** (config>service>dynsvc>acct-1 server-policy)
[Tree] (config>service>dynsvc>acct-2 server-policy)

Full Context configure service dynamic-services dynamic-services-policy accounting-1 server-policy
configure service dynamic-services dynamic-services-policy accounting-2 server-policy

Description This command configures the radius server policy to be used for dynamic data services RADIUS accounting.

The **no** form of this command removes the radius server policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

Parameters *policy-name* — Specifies the name of the radius server policy.

Values Up to 32 characters maximum

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server-policy

Syntax **server-policy** *policy-name*
no server-policy

Context **[Tree]** (config>service>dynsvc>plcy>auth server-policy)

Full Context configure service dynamic-services dynamic-services-policy authentication server-policy

Description This command configures the RADIUS server policy to be used for RADIUS authentication of data-triggered dynamic services.

Local authentication and RADIUS authentication are mutually exclusive.

The **no** form of this command removes the server policy from the configuration and disables RADIUS authentication.

Parameters *policy-name* — Specifies a RADIUS server policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.151 server-port

server-port

Syntax **server-port** {**eq** | **neq** | **gt** | **lt**} *port-num*
server-port {**eq** | **neq**} **range** *start-port-num end-port-num*
server-port {**eq**} {*port-num* | **range** *start-port-num end-port-num*} {**first-packet-trusted** | **first-packet-validate**}
server-port {**eq** | **neq**} **port-list** *port-list-name*
server-port {**eq**} **port-list** *port-list-name* {**first-packet-trusted** | **first-packet-validate**}
no server-port

Context **[Tree]** (config>app-assure>group>policy>app-filter>entry server-port)

Full Context configure application-assurance group policy app-filter entry server-port

Description This command specifies the server TCP or UDP port number to use in the application definition.

The **no** form of this command restores the default (removes server port number from application criteria defined by this app-filter entry).

Default no server-port (the server port is not used in the application definition)

Parameters **eq** — Specifies that the value configured and the value in the flow are equal.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

neq — Specifies that the value configured differs from the value in the flow.

gt — Specifies all port numbers greater than server-port-number match.

lt — Specifies all port numbers less than server-port-number match.

port-list-name — Specifies a named port list containing a set or range of ports.

port-num — Specifies a valid server port number.

Values 0 to 65535

start-port-num, end-port-num — Specifies the starting or ending port number.

Values 0 to 65535

Server Port Options: — The following options are available:

- **No option specified:** TCP/UDP port applications with full signature verification:
  - AA ensures that other applications that can be identified do not run over a well-known port.
  - Application-aware policy applied once signature-based identification completes (likely requiring several packets).
- **first-packet-validate:** TCP/UDP trusted port applications with signature verification:
  - Application identified using well known TCP/UDP port based filters and re-identified once signature identification completes.
  - AA policy applied from the first packet of a flow while continuing signature-based application identification. Policy re-evaluated once the signature identification completes, allowing to detect improper/unexpected applications on a well-known port.
- **first-packet-trusted:** TCP/UDP trusted port applications - no signature verification:
  - Application identified using well known TCP/UDP port based filters only.
  - Application Aware policy applied from the first packet of a flow.
  - No signature processing assumes operator/customer trusts that no other applications can run on the well-known TCP/UDP port (statistics collected against trusted_tcp or trusted_udp protocol).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server-port

Syntax **server-port** {**eq** | **neq**} *port-num*
no server-port

Context **[Tree]** (debug>app-assure>group>traffic-capture>match server-port)

Full Context debug application-assurance group traffic-capture match server-port

Description This command configures debugging on a server port.

23.152 server-shutdown

server-shutdown

Syntax [**no**] **server-shutdown**

Context **[Tree]** (config>system>security>ssh server-shutdown)

Full Context configure system security ssh server-shutdown

Description This command enables the SSH servers running on the system.

Default no server-shutdown

Platforms All

23.153 server-timeout

server-timeout

Syntax **server-timeout** *seconds*
no server-timeout

Context **[Tree]** (config>port>ethernet>dot1x server-timeout)

Full Context configure port ethernet dot1x server-timeout

Description This command configures the period during which the router waits for the RADIUS server to respond to its access request message. When this timer expires, the router will re-send the access request message, up to the specified number times.

The **no** form of this command returns the value to the default.

Default server-timeout 30

Parameters *seconds* — Specifies the server timeout period, in seconds.

Values 1 to 300

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.154 server-tls-profile

server-tls-profile

Syntax **server-tls-profile** *name* [**create**]
no server-tls-profile *name*

Context **[Tree]** (config>system>security>tls server-tls-profile)

Full Context configure system security tls server-tls-profile

Description This command creates a TLS server profile. This profile can be used by applications that support TLS for encryption. The applications should not send any PDUs until the TLS handshake has been successful.

The **no** form of the command removes the TLS server profile.

Parameters *name* — Specifies the name of the TLS server profile, up to 32 characters in length.

create — Keyword used to create the TLS server profile.

Platforms All

23.155 server6

server6

Syntax **server6** *ipv6-address*
no server6

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host server6)

Full Context configure subscriber-mgmt local-user-db ipoe host server6

Description This command allows DHCP6 server selection based on the host entry in LUDB.

The configured DHCP6 server IP address must reference one of the v6 addressees configured under the **config>service>vprn>sub-if>grp-if>ipv6>dhcpv6>relay** or **config>service>ies>sub-if>grp-if>ipv6>dhcpv6>relay** context.

The **no** form of this command reverts to the default.

Parameters *ipv6-address* — Specifies the retailer service ID.

Values

ipv6-address:	x:x:x:x:x:x:x:x	(eight 16-bit pieces)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

service

Syntax **service** *service-id*
no service

Context **[Tree]** (config>service>vprn>sub-if>grp-if>bonding-parameters>connection service)
[Tree] (config>service>ies>sub-if>grp-if>bonding-parameters>connection service)

Full Context configure service ies subscriber-interface group-interface bonding-parameters connection service
configure service vprn subscriber-interface group-interface bonding-parameters connection service

Description This command binds a specified service to this connection. ESM subscribers created under this service are eligible for bonding in this group interface and are identified by the provisioned connection ID. All connections in one bonding context must use subscriber interfaces in separate router instances.

The **no** form of this command removes the service from this bonding context, which can only be done when bonding is administratively disabled.

Parameters *service-id* — Specifies the service ID of the service containing this subscriber interface.

service

Syntax **service**

Context **[Tree]** (config>cflowd>collector>exp-filter>if-list service)

Full Context configure cflowd collector export-filter interface-list service

Description Commands in this context configure which service interfaces' flow data is being sent to this collector

service

Syntax **service** *service-id* **preference** *preference*
no service *service-id*

Context **[Tree]** (config>router>dns>redirect-vprn service)

Full Context configure router dns redirect-vprn service

Description This command configures the VPRN DNS redirection for the specified service.

The **no** form of this command removes the service from the VPRN DNS resolution configuration.

Parameters *service-id* — Specifies the unique service identification number or string identifying the service in the service domain.

Values *service-id*: 1 to 2147483647
svc-name: 64 characters maximum

preference — Specifies the service preference.

Values 0 to 255

Platforms All

service

Syntax [**no**] **service** *service-id*

Context **[Tree]** (config>log>services-all-events service)

Full Context configure log services-all-events service

Description This command enables access to the entire system-wide set of log events (VPRN and non-VPRN) in the logs configured within the management VPRN specified by the service ID.

The **no** form of the command enables the display of VPRN events only.

Parameters *service-id* — Identifies the VPRN.

Values {*id* | *svc-name*}

id: 1 to 2147483647
svc-name: up to 64 characters

Platforms All

© 2022 Nokia.

service

Syntax **service** *service-id*
service name *service-name*
no service

Context **[Tree]** (config>system>security>pki>ca-profile>ocsp service)

Full Context configure system security pki ca-profile ocsp service

Description This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

Parameters *service-id* — Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

name *service-name* — Identifies the service, up to 64 characters.

Platforms All

23.158 service-carving

service-carving

Syntax **service-carving**

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg service-carving)

Full Context configure service system bgp-evpn ethernet-segment service-carving

Description Commands in this context configure service-carving in the Ethernet-Segment. The service-carving algorithm determines which PE is the Designated Forwarder (DF) in a specified Ethernet Segment and for a specific service.

Platforms All

Use subject to Terms available at: www.nokia.com

23.159 service-category

service-category

Syntax **service-category** *service-category*

Context **[Tree]** (config>qos>atm-td-profile service-category)

Full Context configure qos atm-td-profile service-category

Description This command is used to configure an ATM service category attribute of an ATM traffic descriptor profile per ATM Forum Traffic Management Specification Version 4.1.

The router supports the ATM service categories on ATM-capable MDAs listed in Table 124.

Table 124 **ATM Service Categories**

Service Category	Description
CBR	Constant Bit Rate
rt-VBR	Real time Variable Bit Rate
nrt-VBR	Non-real time Variable Bit Rate
UBR	Unspecified Bit Rate without Minimum Desired Cell Rate (defined by specifying service category to be UBR, and MIR of 0)
UBR (with MIR)	Unspecified Bit Rate with non-zero Minimum Desired Cell Rate (defined by specifying service category to be UBR, and MIR > 0)

Changing the service category of a profile will reset all traffic attributes to their defaults (see the **config>qos>atm-td-profile traffic** command) and will cause reprogramming of the data path (with a small impact on user traffic) and a reset of VC statistics for all VCs using this traffic descriptor profile.

Default service-category ubr

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

23.160 service-context-id

service-context-id

Syntax **service-context-id** *name*
no service-context-id

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gy>include-avp service-context-id)

Full Context configure subscriber-mgmt diameter-application-policy gy include-avp service-context-id

Description This command configures the value of the service context ID AVP.

The **no** form of this command returns the command to the default setting.

Parameters *name* — Specifies the service context ID AVP value, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.161 service-id

service-id

Syntax **service-id** *service-id*
no service-id

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident service-id)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification service-id

Description This command specifies the service ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

The **no** form of this command removes the service ID from the configuration.

Parameters *service-id* — Specifies an existing service ID or service name.

Values *service-id* — 1 to 2147483647
service-name — up to 64 characters

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no service-id

Context **[Tree]** (config>redundancy>mc>peer>mcr>ring>ibc service-id)
[Tree] (config>redundancy>mc>peer>mcr>l3-ring>ibc service-id)

Full Context configure redundancy multi-chassis peer mc-ring l3-ring in-band-control-path service-id
configure redundancy multi-chassis peer mc-ring ring in-band-control-path service-id

Description This command specifies the service ID if the interface used for the inband control connection belongs to a VPRN service. If not specified, the service-id is zero and the interface must belong to the Base router. This command supersedes the configuration of a service name.

The no form of this command removes the service ID from the IBC configuration.

Parameters *service-id* — Specifies a service ID or an existing service name.

Values 1 to 214748364 - Only supported in 'classic' configuration-mode (**configure>system>management-interface>configuration-mode classic**)

Platforms All

service-id

Syntax **service-id** *service-id*
no service-id

Context **[Tree]** (config>redundancy>mc>peer>mcr>node>cv service-id)
[Tree] (config>redundancy>mc>peer>mcr>l3-ring>node>cv service-id)

Full Context configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-id
configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify service-id

Description This command specifies the service ID of the SAP used for the ring-node connectivity verification of this ring node. This command supersedes the configuration of a service name.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command removes the service ID from the CV configuration.

Default no service-id

Parameters *service-id* — Specifies the service ID or an existing service name.

Values 1 to 2147483647- Only supported in “classic” configuration mode (**configure system management-interface configuration-mode classic**)

Platforms All

service-id

Syntax **service-id**

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg service-id)

Full Context configure service system bgp-evpn ethernet-segment service-id

Description This command enables the **service-id** context within the virtual **ethernet-segment** configuration.

Platforms All

23.162 service-id-lag-hashing

service-id-lag-hashing

Syntax [**no**] **service-id-lag-hashing**

Context **[Tree]** (config>system>load-balancing service-id-lag-hashing)

Full Context configure system load-balancing service-id-lag-hashing

Description This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

Default no service-id-lag-hashing

Platforms All

23.163 service-id-range

service-id-range

Syntax **service-id-range start** *service-id* **end** *service-id*
no service-id-range

Context **[Tree]** (config>service>md-auto-id service-id-range)

Full Context configure service md-auto-id service-id-range

Description This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default no service-id-range

Parameters **start** *service-id* — Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

end *service-id* — Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 2147483647

23.164 service-mtu

service-mtu

Syntax **service-mtu** *octets*
no service-mtu

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vpls service-mtu)
[Tree] (config>service>template>vpls-template service-mtu)

Full Context configure service template vpls-template service-mtu
configure service vpls service-mtu

Description This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

Default service-mtu 1514

Parameters *octets* — The following table displays MTU values for specific VC types

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

The size of the MTU in octets, expressed as a decimal integer

Values 1 to 9194

Platforms All

service-mtu

Syntax **service-mtu** *octets*
no service-mtu

Context **[Tree]** (config>service>apipe service-mtu)
[Tree] (config>service>cpipe service-mtu)
[Tree] (config>service>epipe service-mtu)
[Tree] (config>service>fpipe service-mtu)
[Tree] (config>service>ipipe service-mtu)

Full Context configure service apipe service-mtu
configure service cpipe service-mtu
configure service epipe service-mtu
configure service fpipe service-mtu
configure service ipipe service-mtu

Description This command configures the service payload in bytes, for the service. The configured Maximum Transmission Unit (MTU) value overrides the service-type default MTU. The **service-mtu** command defines the payload capabilities of the service. It is used by the system to validate the operational state of the SAP and SDP binding within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

Note: In the **configure**>**service**>**epipe** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE. For more information, see **adv-service-mtu** command.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

By default, if **no service-mtu** is configured, the MTU value is (1514 - 14) = 1500.

Default no service-mtu 1508 (for Apipe, Fpipe)

no service-mtu 1500 (for Ipipe)

no service-mtu 1524 (for Epipe)

Table 125 lists the MTU values for specific VC types.

Table 125 **MTU Values**

SAP VC-Type	Example: Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

Parameters *octets* — Specifies the MTU size in octets, expressed as a decimal integer.

Values 1 to 9782
1 to 9800 (for Epipe only)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.165 service-name

service-name

Syntax **service-name** *service-name*
no service-name

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>host-ident service-name)

Full Context configure subscriber-mgmt local-user-db ppp host host-identification service-name

Description This command specifies the service name tag in PADI and/or PADR packets to match for PPPoE hosts.

Note: This command is only used when **service-name** is configured as one of the **match-list** parameters.

The **no** form of this command removes the service-name from the configuration.

Parameters *service-name* — Specifies a PPPoE service name, up to 255 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

service-name

Syntax **service-name** *service-name*
no service-name

Context **[Tree]** (config>redundancy>mc>peer>mcr>ring>ibc service-name)
[Tree] (config>redundancy>mc>peer>mc>l3-ring>ibc service-name)

Full Context configure redundancy multi-chassis peer multi-chassis l3-ring ibc service-name
configure redundancy multi-chassis peer mc-ring ring in-band-control-path service-name

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the service name if the interface used for the inband control connection belongs to a VPRN service. If not specified the interface must belong to the Base router. This command supersedes the configuration of a service ID.

The **no** form of this command removes the service name from the IBC configuration.

Default no service-name

Parameters *service-name* — Specifies the service name, up to 64 characters.

Platforms All

service-name

Syntax **service-name** *service-name*
no service-name

Context **[Tree]** (config>redundancy>mc>peer>mcr>node>cv service-name)
[Tree] (config>redundancy>mc>peer>mcr>l3-ring>cv service-name)

Full Context configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-name
configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify service-name

Description This command specifies the service name of the SAP used for ring-node connectivity verification of this ring node. This command supersedes the configuration of a service ID.

The **no** form of this command removes the service name from the CV configuration.

Default no service-name

Parameters *service-name* — Specifies a service name, up to 64 characters.

Platforms All

23.166 service-range

service-range

Syntax **service-range** *service-id service-id*
no service-range

Context **[Tree]** (config>service>dynsvc service-range)

Full Context configure service dynamic-services service-range

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the service ID range that is reserved for dynamic data service creation. The range cannot overlap with existing static configured services. Once configured with active dynamic services in the range, the service range can only be extended at the end.

The **no** form of this command removes the service-range from the configuration. This is only allowed when there are no active dynamic data services.

When **no service-range** is specified, the setup of dynamic data services fails.

Parameters *service-id* — Specifies the start and end service IDs to define the service range for dynamic services.

Values 1 to 2147483647

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

service-range

Syntax **service-range** *svc-id* **to** *svc-id*
no service-range

Context **[Tree]** (config>service>vsd service-range)

Full Context configure service vsd service-range

Description This command configures the range of service identifiers that the system allows for dynamic services configured by python, when the Nuage VSD sends the service configuration parameters for the VSD fully-dynamic integration model.

Parameters *svc-id* — Specifies the start and end service identifier values.

Values 1 to 2147483647

Platforms All

service-range

Syntax **service-range** *svc-id* [**to** *svc-id*]
no service-range *svc-id*

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg>service-id service-range)

Full Context configure service system bgp-evpn ethernet-segment service-id service-range

Description This command associates a specified service range to a virtual ES, along with the **network-interconnect-vxlan** command. Up to eight service ranges per VXLAN instance can be configured, where the ranges may overlap. The service range may be configured before the service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the association of the service range to the virtual ES for the configured VXLAN instance.

Parameters *svc-id* — Specifies which service range will be associated with the virtual Ethernet Segment.

Values 1 to 2147483647

Platforms All

service-range

Syntax **service-range** *startid-endid* [**start-vlan-id** *startvid*]
no service-range

Context **[Tree]** (config>service>vpls>vpls-group service-range)

Full Context configure service vpls vpls-group service-range

Description This command configures the service ID and implicitly the VLAN ID ranges to be used as input variables for related VPLS and SAP templates to pre-provision “data” VPLS instances and related SAPs using the service ID specified in the command. If the **start-vlan-id** is not specified then the service-range values are used for vlan-ids. The data SAPs will be instantiated on all the ports used to specify SAP instances under the related control VPLS.

Modifications of the service id and vlan ranges are allowed with the following restrictions.

- service-range increase can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - By creating a new vpls-group
- service-range decrease can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state; when **shutdown** command is executed the associated service instances are deleted.
  - Allowed when vpls-group is in no shutdown state and has completed successfully instantiating services.
  - In both cases, only the services that do not have user configured SAPs will be deleted. Otherwise the above commands are rejected. Existing declarations or registrations do not prevent service deletion.
- start-vlan-id change can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - At the time of range decrease by increasing the start-vlan-id which can be done when vpls-group is in no shutdown state and has completed successfully instantiating services

The **no** form of this command removes the specified ranges and deletes the pre-provisioned VPLS instances and related SAPs. The command will fail if any of the VPLS instances in the affected ranges have a provisioned SAP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no service-range

Parameters *startid-endid* — Specifies the range of service IDs

Values 1 to 2147483647

startvid — Specifies the starting VLAN ID; it provides a way to set aside a service ID range that is not the same as the VLAN range and allows for multiple MVRP control-VPLSs to control same VLAN range on different ports.

Values 1 to 4094

Platforms All

23.167 services-all-events

services-all-events

Syntax **services-all-events**

Context **[Tree]** (config>log services-all-events)

Full Context configure log services-all-events

Description Commands in this context control which log events are present in VPRN logs.

By default, the event streams for VPRN logs contain only events that are associated with the particular VPRN.

Access to the entire system-wide set of events (VPRN and non-VPRN) can be enabled using the **services-all-events** command.

Platforms All

23.168 serving-network

serving-network

Syntax **serving-network mcc** *mcc-value* **mnc** *mnc-value*
no serving-network

Context **[Tree]** (config>subscr-mgmt>gtp serving-network)

Full Context configure subscriber-mgmt gtp serving-network

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the Operator Identifier part (MCC and MNC) of the APN.

The **no** form of this command removes the values from the profile.

Default no serving-network

Parameters *mcc-value* — Specifies the Mobile Country Code (MCC) portion of the Serving Network.

Values 3 digits

mnc-value — Specifies the Mobile Network Code (MNC) portion of the Serving Network.

Values 2 or 3 digits

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.169 session

session

Syntax **session**

Context **[Tree]** (config>isa>video-group>watermark session)

Full Context configure isa video-group watermark session

Description Commands in this context configure watermark parameters based on the session.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

session

Syntax **session** *session-name* [**test-family** [**ethernet** | **ip** | **mpls**] [**session-type** {**proactive** | **on-demand**}] **create**]
no session *session-name*

Context **[Tree]** (config>oam-pm session)

Full Context configure oam-pm session

Description This command creates the individual session containers that houses the test specific configuration parameters. Since this session context provides only a container abstract to house the individual test functions, it cannot be shut down. Individual tests sessions within the container may be shut down. No values, parameters, or configuration within this context may be changed if any individual test is active. Changes may only be made when all tests within the context are shut down. The only exception to this is the description value.

The **no** form of this command deletes the session.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *session-name* — Specifies the session name, up to 32 characters.

test-family — Indicates the type family and sets the context for the individual parameters.

Values **ethernet** — Specifies that the test is based on the Ethernet layer.

ip — Specifies that the test is based on the IP layer.

mpls — Specifies that the test is based on the MPLS layer.

session-type — Specifies how to set the Type bit in the Flags byte, and influences how different test criteria may be applied to the individual test. Not all test families carry this information in the PDU.

Values **proactive** — Sets the type to always on, with an immediate start and no stop.

on-demand — Sets the type to on-demand, with an immediate start and no stop, or a stop based on the offset.

Default proactive

create — Creates the PM session.

Platforms All

23.170 session-accounting

session-accounting

Syntax **session-accounting** [**interim-update**] [**host-update**]
no session-accounting

Context **[Tree]** (config>subscr-mgmt>acct-plcy session-accounting)

Full Context configure subscriber-mgmt radius-accounting-policy session-accounting

Description This command enables per session accounting mode. In per session accounting mode, the acct-session-id is generated per session. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

This accounting mode of operation can be used only in PPPoE environment with dual-stack host in which case both hosts (IPv4 and IPv6) are considered part of the same session. In addition to regular interim-updates, *triggered* interim-updates are sent by a host joining or leaving the session.

When an IPv4/v6 address is allocated, or released from a dual-stack host, a triggered interim-update message is immediately sent. This triggered interim-update message reflects the change in the IP address. The triggered interim-update has no effect on the interval at which the regular interim updates are scheduled.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance.

CoA and LI is supported based on the acct-session-id of the session.

The **no** form of this command reverts to the default.

Parameters **interim-update** — Specifies to enable interim updates. Without this keyword only START and STOP accounting messages are generated when the session is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

host-update — Indicates that host updates messages are sent. INTERIM-UPDATE messages can be generated (volume based accounting) by selecting this keyword.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.171 session-assign-method

session-assign-method

Syntax **session-assign-method** {**weighted** | **weighted-random**}
no session-assign-method

Context **[Tree]** (config>router>l2tp session-assign-method)
[Tree] (config>service>vprn>l2tp session-assign-method)

Full Context configure router l2tp session-assign-method
configure service vprn l2tp session-assign-method

Description This command configures the session assignment method.

The **no** form of this command reverts to the default value.

Default no session-assign-method

Parameters **weighted** — Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random — Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

session-assign-method

Syntax **session-assign-method** {**existing-first** | **weighted** | **weighted-random**}
no session-assign-method

Context **[Tree]** (config>router>l2tp>group session-assign-method)
[Tree] (config>service>vprn>l2tp>group session-assign-method)

Full Context configure router l2tp group session-assign-method
configure service vprn l2tp group session-assign-method

Description This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.

The **no** form of this command reverts to the default value.

Default session-assign-method existing-first

Parameters **existing-first** — Specifies that all new sessions are placed by preference in the existing tunnels.

weighted — Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

weighted-random — Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.172 session-filter

session-filter

Syntax **session-filter** *session-filter-name*
no session-filter

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action session-filter)

Full Context configure application-assurance group policy app-qos-policy entry action session-filter

Description This command specifies the Application-Assurance session filter that will be evaluated. If no session filters are specified then no session filters will be evaluated.

Default no session-filter

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *session-filter-name* — Specifies the session filter to be applied.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-filter

Syntax **session-filter** *session-filter-name* [**create**]
no session-filter *session-filter-name*

Context **[Tree]** (config>app-assure>group session-filter)

Full Context configure application-assurance group session-filter

Description This command creates a session filter.

Parameters *session-filter-name* — Creates a session filter name up to 32 characters.

create — Keyword used to create the session filter.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-filter

Syntax **session-filter** *session-filter-name*

Context **[Tree]** (config>app-assure>group>statistics>tca session-filter)

Full Context configure application-assurance group statistics threshold-crossing-alert session-filter

Description This command configures TCA generation for a session filter.

Parameters *session-filter-name* — Specifies the name of the session filter, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.173 session-filter-stats

session-filter-stats

Syntax [**no**] **session-filter-stats**

Context **[Tree]** (config>app-assure>group>statistics>aa-admit-deny session-filter-stats)

Full Context configure application-assurance group statistics aa-admit-deny session-filter-stats

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures whether to include or exclude session filter admit-deny statistics in accounting records.

Default no session-filter-stats

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.174 session-hold-time

session-hold-time

Syntax **session-hold-time remaining-lease-time**
session-hold-time *seconds*
no session-hold-time

Context **[Tree]** (config>subscr-mgmt>gtp>peer-profile session-hold-time)

Full Context configure subscriber-mgmt gtp peer-profile session-hold-time

Description This command configures, in seconds, the time that a GTP session context is held after the corresponding UE is disconnected. If the same UE re-connects to this system before this time has elapsed, its GTP session context is re-used. When the timer expires, the GTP session context is cleared.

The **no** form of this command reverts to the default.

Default session-hold-time 30

Parameters **remaining-lease-time** — Specifies that the timer is equal to the UE's DHCP remaining lease time.

seconds — Specifies the time, in seconds, to hold a GTP session after its UE is disconnected.

Values 0 to 3600

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.175 session-id

session-id

Syntax **session-id** *session-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no session-id

Context [Tree] (config>li>li-source>nat>classic-lsn-sub session-id)
[Tree] (config>li>li-source>nat>dslite-lsn-sub session-id)
[Tree] (config>li>li-source>nat>ethernet-header session-id)
[Tree] (config>li>li-source>nat>l2-aware-sub session-id)
[Tree] (config>li>li-source>nat>nat64-lsn-sub session-id)

Full Context configure li li-source nat classic-lsn-sub session-id
configure li li-source nat dslite-lsn-sub session-id
configure li li-source nat ethernet-header session-id
configure li li-source nat l2-aware-sub session-id
configure li li-source nat nat64-lsn-sub session-id

Description This command configures the session ID that is inserted into the packet header for all mirrored packets of the associated LI source entry. This session ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

The session ID is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-gre-shim**).

For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a session-id field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encapsulation, no *session-id* is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the *session-id* from the configuration which results in the default value being used.

Default no session-id (an id of 0, or no id)

Parameters *session-id* — Specifies the value to insert into the header of the mirrored packets.

Values 1 to 4,294,967,295 (32b)

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-id

Syntax **session-id** [*session-id*]
no session-id

Context [Tree] (config>li>li-source>wlan-gw session-id)

Full Context configure li li-source wlan-gw session-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the session ID inserted in the packet header for all mirrored packets of the associated li-source. When the mirror-service is configured with the **ip-udp-shim** routable encapsulation, session-id field (as part of the routable encapsulation) is always present in the mirrored packets. The session-id can be used by the LIG to identify a particular LI session to which the packet belongs.

Parameters *session-id* — Specifies the session ID inserted in the LI header.

Values 1 to 4294967295

session-id

Syntax **session-id** *session-id*
no session-id

Context **[Tree]** (config>test-oam>build-packet>header>l2tp session-id)
[Tree] (debug>oam>build-packet>packet>field-override>header>l2tp session-id)

Full Context configure test-oam build-packet header l2tp session-id
debug oam build-packet packet field-override header l2tp session-id

Description This command defines the session ID to be used in the L2TP header.

The **no** form of this command removes the session ID value.

Default session-id 0

Parameters *session-id* — Specifies the L2TP session ID to be used in the L2TP header.

Values 0 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.176 session-id-format

session-id-format

Syntax **session-id-format** {**description** | **number**}
no session-id-format

Context **[Tree]** (config>subscr-mgmt>acct-plcy session-id-format)

Full Context configure subscriber-mgmt radius-accounting-policy session-id-format

Description This command specifies the format for the acct-session-id attribute used in RADIUS accounting requests.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Default session-id-format description

Parameters **description** — Specifies to use a string containing following information: <subscriber>@<sap-id>@<SLA-profile>_<creation-time>

number — Specifies to use a unique number generated by the OS to identify a given session.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.177 session-key

session-key

Syntax **session-key sap mac** [**cid**] [**rid**]
no session-key

Context **[Tree]** (config>subscr-mgmt>ipoe-plcy session-key)

Full Context configure subscriber-mgmt ipoe-session-policy session-key

Description This command configures the key to logically group subscriber hosts that belong to the same dual stack end device in an IPoE session.

The SAP and MAC address are always part of the IPoE session key. Optionally the Circuit-Id/ Interface-Id or Remote-Id can be added to the session key.

The **no** form of this command reverts to the default.

Default session-key sap mac

Parameters **sap** — Includes the SAP as part of the IPoE session key. The **sap** parameter is mandatory and cannot be removed from the key.

mac — Includes the MAC address as part of the IPoE session key. The **mac** parameter is mandatory and cannot be removed from the key.

cid — Optionally adds the DHCPv4 Relay Agent Circuit-Id (Option 82, sub Option 1) and DHCPv6 Interface-Id (Option 18) field to the IPoE session key.

rid — Optionally adds the DHCPv4 Relay Agent Remote-Id (Option 82, sub Option 2) and DHCPv6 Remote-Id (Option 37) field to the IPoE session key. For DHCPv6, the enterprise number is excluded from the key.

sap and **mac** are mandatory parameters while **cid** and **rid** are optional and mutually exclusive. Valid IPoE session key parameters are: **sap mac**, **sap mac cid** and **sap mac rid**.

23.178 session-limit

session-limit

Syntax **session-limit** *session-limit*
session-limit unlimited
no session-limit

Context **[Tree]** (config>router>l2tp session-limit)
[Tree] (config>router>l2tp>group session-limit)
[Tree] (config>router>l2tp>group>tunnel session-limit)
[Tree] (config>service>vprn>l2tp session-limit)
[Tree] (config>service>vprn>l2tp>group session-limit)
[Tree] (config>service>vprn>l2tp>group>tunnel session-limit)

Full Context configure router l2tp group session-limit
configure router l2tp group tunnel session-limit
configure router l2tp session-limit
configure service vprn l2tp group session-limit
configure service vprn l2tp group tunnel session-limit
configure service vprn l2tp session-limit

Description This command configures the session limit.

This command configures the L2TP session limit for the router. The value controls how many L2TP sessions will be allowed within a given context (system, group, tunnel).

L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one-to-one relationship between established L2TP sessions and their associated calls.

The **no** form of this command removes the value from the configuration.

Default no session-limit

Parameters *session-limit* — Specifies the allowed number of sessions within the given context.

Values 1 to 131071

unlimited — Specifies to use the maximum number of sessions available.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit

Syntax **session-limit** *session-limit*
no session-limit

Context [Tree] (config>service>ies>sub-if>grp-if>pppoe session-limit)
[Tree] (config>service>vprn>sub-if>grp-if>pppoe session-limit)
[Tree] (config>service>ies>sub-if>pppoe session-limit)
[Tree] (config>service>vprn>sub-if>pppoe session-limit)
[Tree] (config>service>ies>sub-if>grp-if>ppp session-limit)
[Tree] (config>service>vprn>sub-if>grp-if>ppp session-limit)

Full Context configure service ies subscriber-interface group-interface ppp session-limit
configure service ies subscriber-interface group-interface pppoe session-limit
configure service ies subscriber-interface pppoe session-limit
configure service vprn subscriber-interface group-interface ppp session-limit
configure service vprn subscriber-interface group-interface pppoe session-limit
configure service vprn subscriber-interface pppoe session-limit

Description This command specifies the number of PPPoE hosts allowed for this group interface.

The **no** form of this command reverts to the default.

Default session-limit 1

Parameters *session-limit* — Specifies the number of PPPoE hosts allowed.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 1 to 131071
1 to 262143 (retail subscriber interface)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit

Syntax **session-limit** *session-limit*
no session-limit

configure service vprn subscriber-interface group-interface ipoe-session session-limit
configure service vprn subscriber-interface ipoe-session session-limit

Description This command specifies the number of IPoE sessions allowed for this group interface or retail subscriber interface.

The **no** form of this command reverts to the default.

Default session-limit 1

Parameters *session-limit* — Specifies the number of allowed IPoE sessions.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 1 to 131071
1 to 500000 (retail subscriber interface)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit

Syntax **session-limit** *limit*

Context **[Tree]** (config>li>x-interfaces>x3 session-limit)

Full Context configure li x-interfaces x3 session-limit

Description This command configures the number of X3 sessions that the system should initiate to the LIC.

The **no** form of this command reverts to the default.

Default session-limit 32

Parameters *limit* — Specifies the session limit.

Values 1 to 32

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.179 session-limits

session-limits

Syntax **session-limits**

Context **[Tree]** (config>isa>wlan-gw-group>nat session-limits)

Full Context configure isa wlan-gw-group nat session-limits

Description Commands in this context configure session limits for the ISA WLAN gateway NAT group.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-limits

Syntax **session-limits**

Context **[Tree]** (config>isa>nat-group session-limits)

Full Context configure isa nat-group session-limits

Description Commands in this context configure session limits for the ISA NAT group.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-limits

Syntax **session-limits**

Context **[Tree]** (config>service>nat>firewall-policy session-limits)
[Tree] (config>service>nat>nat-policy session-limits)
[Tree] (config>service>nat>up-nat-policy session-limits)

Full Context configure service nat firewall-policy session-limits
configure service nat nat-policy session-limits
configure service nat up-nat-policy session-limits

Description Commands in this context configure session limits for the NAT policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy session-limits
- configure service nat up-nat-policy session-limits

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service nat firewall-policy session-limits

session-limits

Syntax [**no**] **session-limits**

Context **[Tree]** (config>subscr-mgmt>sla-profile session-limits)
[Tree] (config>subscr-mgmt>sub-profile session-limits)

Full Context configure subscriber-mgmt sla-profile session-limits
configure subscriber-mgmt sub-profile session-limits

Description Commands in this context configure session limits per SLA profile instance or per subscriber.

The **no** form of this command removes the configuration.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.180 session-messages

session-messages

Syntax [**no**] **session-messages**

Context **[Tree]** (debug>diam>application>policy session-messages)

Full Context debug diameter application policy session-messages

Description This command debugs session messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.181 session-optimized-stop

session-optimized-stop

Syntax [**no**] **session-optimized-stop**

Context **[Tree]** (config>subscr-mgmt>sub-prof>rad-acct session-optimized-stop)

Full Context configure subscriber-mgmt sub-profile radius-accounting session-optimized-stop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command optimizes a RADIUS Accounting Stop message for a PPPoE session termination (specifically for session accounting mode when the host update is enabled). By default when a PPPoE session terminates, the system removes a dual stack host in sequence, one host at a time. Therefore, the system will generate a RADIUS accounting interim for each host termination until only the final host is left. The final host will generate a final accounting stop message. Enabling this command will trigger a single Stop RADIUS accounting message and include information of all hosts without the host updates.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.182 session-parameters

session-parameters

Syntax **session-parameters**

Context **[Tree]** (config>router>ldp session-parameters)

Full Context configure router ldp session-parameters

Description Commands in this context configure peer specific parameters.

Platforms All

23.183 session-qer

session-qer

Syntax **session-qer**

Context **[Tree]** (config>subscr-mgmt>sla-prof>pfcp session-qer)

Full Context configure subscriber-mgmt sla-profile pfcp-mappings session-qer

Description Commands in this context configure the mapping of the GBR/MBR IEs present in a per-session QER without a QER correlation ID. A QER that contains a QER correlation ID does not use the QER mapping because it is assumed not to be a per-session construct.If a signaled PFCP QER rate applies to all data-plane rules, it is interpreted as the session QER rate and is mapped to the QoS overrides in the configuration. Examples of such QER rates are APN-AMBR for 4G FWA sessions and session-AMBR for 5G FWA sessions.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.184 session-time

session-time

Syntax [**no**] **session-time**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes session-time)

Full Context configure aaa isa-radius-policy acct-include-attributes session-time

Description This command enables the inclusion of the session-time attributes.

The **no** form of the command excludes session-time attributes.

Default no session-time

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.185 session-timeout

session-timeout

Syntax **session-timeout** *timeout*
no session-timeout

Context **[Tree]** (config>subscr-mgmt>ppp-policy session-timeout)

Full Context configure subscriber-mgmt ppp-policy session-timeout

Description This command defines the time before the PPP session is terminated.

A RADIUS specified session-timeout (attribute [27] Session-Timeout) overrides the CLI configured value.

The **no** form of this command reverts to the default.

Parameters *timeout* — Specifies the session timeout in seconds.

Values 1 to 31104000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

session-timeout

Syntax **session-timeout** *timeout*
no session-timeout

Context **[Tree]** (config>subscr-mgmt>ipoe-plcy session-timeout)

Full Context configure subscriber-mgmt ipoe-session-policy session-timeout

Description This command defines the time in seconds between 1 second and 360 days before the IPoE session is disconnected. The default value is unlimited session timeout.

The **no** form of this command reverts to the default.

Parameters *timeout* — Specifies the session timeout in seconds.

Values 1 to 31104000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.186 set-time

set-time

Syntax **set-time** *date time*

Context **[Tree]** (admin set-time)

Full Context admin set-time

Description This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

If SNTP or NTP is enabled (no shutdown) then this command cannot be used.

Parameters *date* — Specifies the local date and time accurate to the minute in the YYYY/MM/DD format.

Values *YYYY* is the four-digit year
MM is the two-digit month
DD is the two-digit date

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

time — Specifies the time (accurate to the second) in the *hh*:*mm[:ss]* format. If no seconds value is entered, the seconds are reset to :00.

Values *hh* is the two-digit hour in 24 hour format (00=midnight, 12=noon)*mm* is the two-digit minute

Default 0

Platforms All

23.187 set-tos

set-tos

Syntax **set-tos** [**0**..**255**]
no set-tos

Context **[Tree]** (config>service>vprn>nat>inside>nat64 set-tos)
[Tree] (config>router>nat>inside>nat64 set-tos)

Full Context configure router nat inside nat64 set-tos
configure service vprn nat inside nat64 set-tos

Description This command specifies the value of the IPv4 ToS field. When enabled, the NAT64 node ignores IPv6 traffic-class and sets IPv4 ToS to the supplied ToS value in the translated IPv4 packet.

The **no** form of the command reverts to the default.

Default set-tos 0

Parameters [**0**..**255**] — Sets the IPv4 ToS to a fixed value the IPv6 Traffic Class and set the IPv4 ToS to a fixed value and ignores the IPv6 traffic class.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.188 setup-role

setup-role

Syntax **setup-role** {**active** | **passive**}

Context **[Tree]** (config>router>lmp>peer>control-channel setup-role)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router lmp peer control-channel setup-role

Description This command specifies whether this node takes the active or the passive role in establishing the LMP session to the peer over a GMPLS UNI.

Default setup-role active

Parameters **active** — The router takes the active role.

passive — The router takes the passive role.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.189 setup-timeout

setup-timeout

Syntax **setup-timeout access-accept** *timeout*
no setup-timeout

Context **[Tree]** (config>service>dynsvc>timers setup-timeout)

Full Context configure service dynamic-services timers setup-timeout

Description This command specifies the time that dynamic data services setup requests from a RADIUS Access-Accept are hold in an internal work queue waiting to be processed. If after the timeout, the dynamic data service setup request is still in the queue (meaning it is not setup), then the dynamic service setup request is removed from the queue and the setup fails.

The **no** form of this command reverts to the default value of 30 seconds.

Default no setup-timeout

Parameters *timeout* — Specifies the setup-timeout, in seconds, for setup requests of dynamic services received via Access-Accept.

Values 2 to 3600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

23.190 severity

severity

Syntax **severity** {**eq** | **neq** | **lt** | **lte** | **gt** | **gte**} *severity-level*
no severity

Context **[Tree]** (config>service>vprn>log>filter>entry>match severity)

Full Context configure service vprn log filter entry match severity

Description This command adds an event severity level as a match criterion. Only one severity command can be entered per event filter entry. The latest severity command overwrites the previous command.

The **no** form of this command removes the severity match criterion.

Default no severity

Parameters **eq | neq | lt | lte | gt | gte** — Specifies the type of match. Valid operators are listed below.

Values

Operator	Notes
eq	equal to
neq	not equal to
lt	less than
lte	less than or equal to
gt	greater than
gte	greater than or equal to

severity-name — The ITU severity level name. Table 126 lists severity names and corresponding numbers per ITU standards M.3100 X.733 & X.21 severity levels.

23.191 severity-level

severity-level

Syntax **severity-level** *syslog-level*

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy severity-level)

Full Context configure service nat syslog syslog-export-policy severity-level

Description This command configures the severity level.

For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*. The **config>log>syslog>level** hierarchy also applies to this context.

Default severity-level info

Parameters *syslog-level* — Specifies the severity level.

Values emergency, alert, critical, error, warning, notice, info, debug

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.192 sf-offset

sf-offset

Syntax **sf-offset** *offset-value*
no sf-offset

Context **[Tree]** (config>service>vprn>isis>if>level sf-offset)

Full Context configure service vprn isis interface level sf-offset

Description If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default no sf-offset

Parameters *offset-value* — Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

Values 0 to 16777215

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

sf-offset

Syntax **sf-offset** *offset-value*
no sf-offset

Context **[Tree]** (config>router>isis>if>level sf-offset)

Full Context configure router isis interface level sf-offset

Description If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default no sf-offset

Parameters *offset-value* — Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

Values 0 to 16777215

Platforms All

23.193 sf-sd-method

sf-sd-method

Syntax **sf-sd-method** {**bip8** | **fec**}

Context **[Tree]** (config>port>otu sf-sd-method)

Full Context configure port otu sf-sd-method

Description This command specifies the method used to determine the signal failure (SF) and signal degrade (SD) alarms. When the **bip8** method is selected, the SM-BIP8 errors are used. When the **fec** method is selected, the FEC corrected bits are used.

The following rules must be followed:

- The port's OTU must be enabled to set or change the **sf-sd-method**.
- The FEC mode must be **enhanced** or **g709** before setting **sf-sd-method** to **fec**.
- The SF threshold must be 5 or higher before setting **sf-sd-method** to **bip8**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default sf-sd-method fec

Parameters **bip8** — Specifies that SM-BIP8 errors are used to declare the presence of the SF and SD conditions.

fec — Specifies that FEC corrected bit errors are used to declare the presence of the SF and SD conditions.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.194 sf-threshold

sf-threshold

Syntax **sf-threshold** *threshold* [**coefficient** *coefficient*]

Context **[Tree]** (config>port>otu sf-threshold)

Full Context configure port otu sf-threshold

Description This command defines the error rate at which to declare the signal failure (SF) condition.

The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold 5 coefficient 20** defines an error rate of (20/10) * 10E-5, or 2 * 10E-5, or 0.000 02.

The SF threshold must be the following:

- less than the SD threshold
- 5 or higher before setting **sf-sd-method** to **bip8**

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

Parameters *threshold* — Specifies the exponent for the SF threshold value.

Values 3 to 6 when **sf-sd-method** is **bip8**
3 to 8 when **sf-sd-method** is **fec**

Default 5

coefficient — Specifies the coefficient for the SF threshold value.

Values 10 to 99

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sf-threshold

Syntax **sf-threshold** *errored-frames*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame sf-threshold)

Full Context configure port ethernet efm-oam link-monitoring errored-frame sf-threshold

Description The option defines the number of frame errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the **local-sf-action** configuration. This event can only be cleared through manual intervention that affects the state of the port.

Parameters *errored-frames* — The number of errored frames within the configured window which indicates the port has become unusable.

Values 1 to 1000000

Default 1

Platforms All

sf-threshold

Syntax **sf-threshold** *errored-frames*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame-period sf-threshold)

Full Context configure port ethernet efm-oam link-monitoring errored-frame-period sf-threshold

Description This command defines the number of frame errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the local-sf-action configuration. This event can only be cleared through manual intervention that affects the state of the port.

Default sf-threshold 1

Parameters *errored-frames* — Specifies the number of errored frames within the configured window which indicates the port has become unusable.

Values 1 to 1000000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sf-threshold

Syntax **sf-threshold** *errored-seconds*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds sf-threshold)

Full Context configure port ethernet efm-oam link-monitoring errored-frame-seconds sf-threshold

Description This command defines the number of errors seconds within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the **local-sf-action** configuration. This event can only be cleared through manual intervention that affects the state of the port.

Parameters *errored-seconds* — Specifies the number of errored seconds within the configured window which indicates the port has become unusable.

Values 1 to 900

Platforms All

sf-threshold

Syntax **sf-threshold** *errored-symbols*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-symbols sf-threshold)

Full Context configure port ethernet efm-oam link-monitoring errored-symbols sf-threshold

Description This command defines the number of symbol errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the local-sf-action configuration.

Parameters *errored-symbols* — Specifies the number of errored-symbols which indicates the port has become unusable.

Values 1 to 1000000

Platforms All

sf-threshold

Syntax **sf-threshold** *threshold* [**multiplier** *multiplier*]
no sf-threshold

Context **[Tree]** (config>port>ethernet>sym-mon sf-threshold)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port ethernet symbol-monitor sf-threshold

Description This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N symbol errors over total symbols received over W seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sf-threshold is specified, the multiplier will return to the default value of 1.

Default no sf-threshold

Parameters *threshold* — Specifies the rate of symbol errors.

Values 1 to 9

multiplier — Specifies the multiplier used to scale the symbol error ratio.

Values 1 to 9

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sf-threshold

Syntax **sf-threshold** *threshold* [**multiplier** *multiplier*]
no sf-threshold

Context **[Tree]** (config>port>ethernet>crc-monitor sf-threshold)

Full Context configure port ethernet crc-monitor sf-threshold

Description This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sf-threshold** is specified the multiplier will return to the default value of 1.

Default no sf-threshold

Parameters *threshold* — Specifies the threshold value.

Values 1 to 9

multiplier — Specifies the multiplier value.

Values 1 to 9

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.195 sf-threshold-clear

sf-threshold-clear

Syntax **sf-threshold-clear** *threshold* [**coefficient** *coefficient*]

Context **[Tree]** (config>port>otu sf-threshold-clear)

Full Context configure port otu sf-threshold-clear

Description This command defines the signal failure (SF) threshold clear value.

When the bit error rate falls below this value, the SF condition is cleared. The parameters define an error rate of (*coefficient*/10) * 10E-*threshold*. For example, **sf-threshold-clear 7 coefficient 10** defines an error rate of (10/10) * 10E-7, or 10E-7, or 0.000 000 1.

This SF threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

Parameters *threshold* — Specifies the exponent for the SF threshold clear value.

Values 3 to 9

Default 6

coefficient — Specifies the coefficient for the SF threshold clear value.

Values 10 to 99

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.196 sflow

sflow

Syntax [**no**] **sflow**

Context **[Tree]** (config>port>ethernet sflow)

Full Context configure port ethernet sflow

Description This command enables sFlow data collection for a port and its SAPs that support sFlow data collection.

The **no** form of this of this command disables sFlow.

Default no sflow

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7750 SR, 7750 SR-s, 7950 XRS

sflow

Syntax **sflow**

Context **[Tree]** (config sflow)

Full Context configure sflow

Description Commands in this context configure sflow agent parameters.

Platforms 7750 SR, 7750 SR-s, 7950 XRS

23.197 sfm

sfm

Syntax **sfm** *sfm-name*
no sfm *sfm-name*

Context **[Tree]** (config sfm)

Full Context configure sfm

Description Commands in this context configure the specified SFM.

The **no** form of this command removes the SFM configuration for the specified SFM.

Parameters *sfm-name* —

Values 1 to 4

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-2s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

23.198 sfm-loss-threshold

sfm-loss-threshold

Syntax **sfm-loss-threshold** *num-sfm*
no sfm-loss-threshold

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>switch-fabric sfm-loss-threshold)

Full Context configure system switch-fabric sfm-loss-threshold

Description This command sets the number of SFMs that are permitted to fail before the system goes into SFM overload state. This command is only applicable on the 7750 SR-7s and the 7750 SR-14s. Users can select the SFM limit based on the number possible for the system minus one. For the 7750 SR-7s this is a value of 3 and for the 7750 SR-14s this is a value of 7.

For networks that can accommodate more SFM failures than the default value, this command allows the selection of the number of SFMs to fail prior to the system going into SFM overload state.

The **no** form of this command reverts the threshold to the default value.

Default 7750 SR-7s: sfm-loss-threshold 1

7750 SR-14s: sfm-loss-threshold 2

Parameters *num-sfm* — Specifies the number of SFMs permitted to fail before SFM overload state.

Values 1 to 7

Platforms 7750 SR-7s, 7750 SR-14s

23.199 sfm-type

sfm-type

Syntax **sfm-type** *sfm-type*
no sfm *sfm-type*

Context [Tree] (config>sfm sfm-type)

Full Context configure sfm sfm-type

Description This command provisions the SFM.

The **no** form of this command deprovisions the SFM.

Default no sfm *sfm-type*

Parameters *sfm-type* — Specifies the SFM card type.

Values Depending on the SR hardware platform.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-2s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.200 sg

sg

Syntax **sg** [**group** *grp-addr* [**source** *src-addr*]]
no sg

Context **[Tree]** (debug>service>id>video-interface sg)

Full Context debug service id video-interface sg

Description This command enables channel debugging.

Parameters **group** *grp-addr* — Specifies the multicast channel address.

source *src-addr* — Specifies the source address.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

23.201 sgsn-mcc-mnc

sgsn-mcc-mnc

Syntax [**no**] **sgsn-mcc-mnc**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp sgsn-mcc-mnc)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp sgsn-mcc-mnc

Description This command enables the inclusion of the 3GPP-SGSN-MCC-MNC AVP, which contains the MCC and MNC as configured under **configure subscriber-mgmt gtp serving-network**.

The **no** form of this command disables the inclusion of the AVP.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.202 sgt-qos

sgt-qos

Syntax **sgt-qos**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router sgt-qos)
[Tree] (config>service>vprn sgt-qos)

Full Context configure router sgt-qos
configure service vprn sgt-qos

Description Commands in this context configure DSCP/dot1p remarking for self-generated traffic.

Platforms All

23.203 shallow-inspection

shallow-inspection

Syntax [**no**] **shallow-inspection**

Context [Tree] (config>app-assure>group shallow-inspection)

Full Context configure application-assurance group shallow-inspection

Description This command disables all Layer 7 signature-based flow inspection.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.204 sham-link

sham-link

Syntax **sham-link** *ip-int-name ip-address*

Context [Tree] (config>service>vprn>ospf>area sham-link)

Full Context configure service vprn ospf area sham-link

Description This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VPRN link and the backdoor.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-int-name* — The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for **config>router>if**, **config>service>ies>if** and **config>service>vprn>if** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

ip-address — The IP address of the sham-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the sham-link. This is a mandatory parameter and must be a valid IP address.

Platforms All

23.205 sham-neighbor

sham-neighbor

Syntax **sham-neighbor** [*ip-address*]
no sham-neighbor

Context **[Tree]** (debug>router>ospf sham-neighbor)

Full Context debug router ospf sham-neighbor

Description This command enables debugging of the OSPFv2 sham-link neighbor.

Parameters *ip-address* — Debugs the sham-link neighbor identified by this IP address.

Platforms All

23.206 shape-multi-client-only

shape-multi-client-only

Syntax [**no**] **shape-multi-client-only**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>egress shape-multi-client-only)

Full Context configure service ies subscriber-interface group-interface wlan-gw egress shape-multi-client-only

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the egress shaping is only enabled for a wlan-gw tunnel while there are multiple UE (User Equipment) using it.

The **no** form of this command disables the egress shaping.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.207 shaper

shaper

Syntax [**no**] **shaper**

Context **[Tree]** (config>service>sdp>binding>pw-port>egress shaper)

Full Context configure service sdp binding pw-port egress shaper

Description This command enables the egress shaping option for use by a pseudowire port.

The **no** form of the command disables the egress shaping option.

Default no shaper

Platforms All

shaper

Syntax [**no**] **shaper**

Context **[Tree]** (config>service>epipe>pw-port>egress shaper)

Full Context configure service epipe pw-port egress shaper

Description Commands in this context configure PW-port shaper parameters.

Platforms All

23.208 shaping

shaping

Syntax **shaping** {**per-retailer** | **per-tunnel**}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no shaping

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>egress shaping)

Full Context configure service ies subscriber-interface group-interface wlan-gw egress shaping

Description This command configures the granularity of the egress shaping for wlan-gw on this group interface.

The **no** form of this command removes the parameter from the configuration.

Parameters **per-tunnel** — Specifies that a separate shaper is applied to each wlan-gw tunnel.

per-retailer — Specifies that a separate shaper is applied to each retailer Mobile Network Operator's fraction of the wlan-gw tunnel payload.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shaping

Syntax [**no**] **shaping**

Context **[Tree]** (config>qos>atm-td-profile shaping)

Full Context configure qos atm-td-profile shaping

Description This command enables cell level shaping when the ATM traffic descriptor profile is applied to an ATM SAP queue. Shaping is only applied in the egress queue of the ATM SAP. Shaping cannot be enabled on an ATM SAP with the UBR service category.

The **no** form of this command disables shaping.

Default The default is determined by the service category. Table 129 lists which defaults apply for shaping depending on the service and UBR/UBR+MIR category.

Table 129 **Default Shaping Values**

Applicable Service Category	Default Shaping Value	Comments
UBR	disabled	Shaping cannot be enabled
CBR	enabled	Shaping cannot be disabled when the profile is applied to ATM SAP on ATM MDA
rt-VBR	enabled	Shaping cannot be disabled when applied to ATM SAP on ATM MDA

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 129 **Default Shaping Values**

Applicable Service Category	Default Shaping Value	Comments
nrt-VBR	enabled	—

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

23.209 shared-circuit-id

shared-circuit-id

Syntax [**no**] **shared-circuit-id**

Context **[Tree]** (config>service>ies>sub-if>grp-if shared-circuit-id)
[Tree] (config>service>vprn>sub-if>grp-if shared-circuit-id)

Full Context configure service ies subscriber-interface group-interface shared-circuit-id
configure service vprn subscriber-interface group-interface shared-circuit-id

Description If configured, circuit-id in DHCPv4 Option82 is used to authenticate DHCPv6. If DHCPv6 is received before DHCPv4, it is dropped. Also, a SLAAC host is created based on DHCPv4 authentication if RADIUS returns IPv6 framed-prefix. The IPv6oE host is deleted if the linked IPv4oE host is deleted due to DHCP release or lease time-out. The linkage between IPv4 and IPv6 is based on SAP and MAC address. The sharing of circuit-id from DHCPv4 for authentication of DHCPv6 (or SLAAC) allows 7750 SR to work around lack of support for LDRA on access nodes.

The **no** form of this command reverts to the default.

23.210 shared-queue

shared-queue

Syntax **shared-queue** *policy-name* [**create**]
no shared-queue *policy-name*

Context **[Tree]** (config>qos shared-queue)

Full Context configure qos shared-queue

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context modify the QoS default shared-queue policy.

Parameters *policy-name* — The name of the default shared-queue policy.

Values default

Platforms All

shared-queue

Syntax **shared-queue** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy shared-queue)

Full Context configure qos copy shared-queue

Description This command copies an existing **shared-queue** to another **shared-queue**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters *src-name* — Specifies the existing source **shared-queue**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name — Specifies the destination **shared-queue**, up to 32 characters, to which the copy command attempts to copy.

overwrite — Use this parameter when the **shared-queue** *dst-name* already exists. If it does, everything in the existing destination **shared-queue** *dst-name* is completely overwritten with the contents of the **shared-queue** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "sqtest10" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

Platforms All

23.211 shared-radius-filter-wmark

shared-radius-filter-wmark

Syntax **shared-radius-filter-wmark low** *low-watermark* **high** *high-watermark*
no shared-radius-filter-wmark

Context **[Tree]** (config>filter>ip-filter shared-radius-filter-wmark)
[Tree] (config>filter>ipv6-filter shared-radius-filter-wmark)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure filter ip-filter shared-radius-filter-wmark
configure filter ipv6-filter shared-radius-filter-wmark

Description This command configures the low and high watermark for the number of RADIUS shared filters reporting

Default no shared-radius-filter-wmark

Parameters *low-watermark* — Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be raised by the agent.

Values 0 to 8000

high-watermark — Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be cleared by the agent.

Values 1 to 8000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.212 shared-resources

shared-resources

Syntax **shared-resources**

Context **[Tree]** (config>isa>aa-grp shared-resources)

Full Context configure isa application-assurance-group shared-resources

Description Commands in this context configure the shared resources pool.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.213 shcv-policy

shcv-policy

Syntax **shcv-policy** *name* [**create**]
no shcv-policy *name*

Context **[Tree]** (config>subscr-mgmt shcv-policy)

Full Context configure subscriber-mgmt shcv-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a Subscriber Host Connectivity Verification (SHCV) policy. An SHCV policy can be applied to both the subscriber management group interface and VPLS instances. All SHCV-related features inside a group interface and a VPLS service follows the configuration specified in the SHCV policy. The SHCV policy and the SHCV configuration on a group interface are mutually exclusive. Only one can be applied to the group interface.

The **no** form of this command removes the policy name from the configuration.

Parameters *name* — Specifies the name of the SHCV policy, up to 32 characters.

create — Keyword required to create the configuration context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shcv-policy

Syntax **shcv-policy** *name*
no shcv-policy

Context **[Tree]** (config>service>vprn>sub-if>grp-if shcv-policy)
[Tree] (config>service>ies>sub-if>grp-if shcv-policy)

Full Context configure service ies subscriber-interface group-interface shcv-policy
configure service vprn subscriber-interface group-interface shcv-policy

Description This command references the SHCV policy to be used for both IPv4 and IPv6 subscriber hosts. The policy name must already exist in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the service configuration.

Parameters *name* — Specifies an existing SHCV policy name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.214 shcv-policy-ipv4

shcv-policy-ipv4

Syntax **shcv-policy-ipv4** *name*
no shcv-policy-ipv4

Context **[Tree]** (config>service>vpls shcv-policy-ipv4)

Use subject to Terms available at: www.nokia.com

23.218 short-sequence

short-sequence

Syntax [**no**] **short-sequence**

Context **[Tree]** (config>port>multilink-bundle short-sequence)

Full Context configure port multilink-bundle short-sequence

Description This command specifies that the Multi-link Point to Point Protocol (MLPPP) bundle should use short (12 bit) sequence numbers instead of the default 24-bit sequence number. This command is only valid for MLPPP bundles.

The **no** form of this command disables the short-sequence feature.

Default no short-sequence

Platforms 7450 ESS, 7750 SR-7/12/12e

23.219 short-sequence-numbers

short-sequence-numbers

Syntax [**no**] **short-sequence-numbers**

Context **[Tree]** (config>subscr-mgmt>ppp-policy>mlppp short-sequence-numbers)
[Tree] (config>router>l2tp>group>mlppp short-sequence-numbers)
[Tree] (config>router>l2tp>group>tunnel>mlppp short-sequence-numbers)
[Tree] (config>service>vprn>l2tp>group>mlppp short-sequence-numbers)
[Tree] (config>service>vprn>l2tp>group>tunnel>mlppp short-sequence-numbers)

Full Context configure router l2tp group mlppp short-sequence-numbers
configure router l2tp group tunnel mlppp short-sequence-numbers
configure service vprn l2tp group mlppp short-sequence-numbers
configure service vprn l2tp group tunnel mlppp short-sequence-numbers
configure subscriber-mgmt ppp-policy mlppp short-sequence-numbers

Description This command enables a peer request to send short sequence numbers. This command is applicable to LAC and LNS. By default, MLPPPoX negotiates 24bit long sequence numbers. This command allows this to be changed to shorter, 12-bit sequence numbers.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

23.220 shortcut-local-ttl-propagate

shortcut-local-ttl-propagate

Syntax [**no**] **shortcut-local-ttl-propagate**

Context **[Tree]** (config>router>ldp shortcut-local-ttl-propagate)
[Tree] (config>router>mpls shortcut-local-ttl-propagate)

Full Context configure router ldp shortcut-local-ttl-propagate
configure router mpls shortcut-local-ttl-propagate

Description This command configures the TTL handling of locally generated packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

Local IP packets include ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. Transit IP packets are all IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut

By default, the feature propagates the TTL from the header of locally generated IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of this command is enabled, TTL propagation is disabled on all locally generated IP packets, including ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

Default shortcut-local-ttl-propagate

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router ldp shortcut-transit-ttl-propagate
configure router mpls shortcut-transit-ttl-propagate

Description This command configures the TTL handling of transit packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

By default, the feature propagates the TTL from the header of transit IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of the command is enabled, TTL propagation is disabled on all transit IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

Default shortcut-transit-ttl-propagate

Platforms All

23.222 shortcut-tunnel

shortcut-tunnel

Syntax **shortcut-tunnel**

Context **[Tree]** (config>router>bgp>next-hop-resolution shortcut-tunnel)

Full Context configure router bgp next-hop-resolution shortcut-tunnel

Description This command creates the context to configure the tunnel types that can be used to resolve unlabeled IPv4 and IPv6 BGP routes.

The following tunnel types are supported for resolving IPv4 routes and IPv6 routes with IPv4-mapped IPv6 next-hop addresses: bgp, ldp, rsvp, sr-isis, sr-ospf, sr-policy and sr-te. In this context:

- **bgp** — refers to IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes.
- **ldp** — refers to /32 and shorter length LDP FEC prefixes imported into the tunnel table. For IPv4 NLRI, BGP selects the LDP FEC that is the longest-prefix-match (LPM) of the BGP next-hop address. For IPv6 NLRI, BGP selects the /32 FEC that is an exact match of the BGP next-hop address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- **rsvp** — refers to RSVP tunnels in the tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next-hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel id.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-ospf** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the OSPF protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPF instance or (in case of a tie) the lowest numbered OSPF instance.
- **sr-policy** — refers to segment routing policies with an IPv4 endpoint that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an unlabeled IPv4 or IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the segment routing policy.
- **sr-te** — refers to traffic engineered (TE) segment routing tunnels. This option allows BGP to use the best metric SR-TE tunnel to the address of the BGP next-hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel id.
- **udp** — refers to MPLSoUDPoIPv4 tunnels set up by action of the BGP import policies.

The following tunnel types are supported for resolving IPv6 routes with IPv6 next-hops that are not IPv4-mapped IPv6 addresses: ldp, sr-isis, and sr-policy. In this context:

- **ldp** — refers to /128 LDP FEC prefixes in the tunnel table. BGP selects the /128 FEC that is an exact match of the BGP next-hop address.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv6 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-policy** — refers to segment routing policies with a null IPv4 endpoint (0.0.0.0) that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv6 route must match the color of the segment routing policy and its color bits must be set to '01' or '10'.

23.223 show-ipsec-keys

show-ipsec-keys

Syntax [**no**] **show-ipsec-keys**

Context **[Tree]** (config>ipsec show-ipsec-keys)

Full Context configure ipsec show-ipsec-keys

Description This command enables user to optionally include IKE-SA or CHILD-SA keys in the output of **debug ipsec** or **admin ipsec display-key**.

The **no** form of this command disallows the user from including keys in the output.

Default no show-ipsec-keys

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.224 show-request

show-request

Syntax **show-request** [**ca** *ca-profile-name*]

Context **[Tree]** (admin>certificate>cmpv2 show-request)

Full Context admin certificate cmpv2 show-request

Description This command displays current the CMPv2 pending request toward the specified CA. If there is no pending request, the last pending request is displayed including the status (success/fail/rejected) and the receive time of last CMPv2 message from server.

The following information is included in the output:

- Request type, original input parameter (password is not displayed), checkAfter and reason in of last PollRepContent, time of original command input.

Parameters *ca-profile-name* — Specifies a ca-profile name, up to 32 characters. If not specified, the system will display pending requests of all ca-profiles.

configure test-oam mpls-dm shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure li x-interfaces shutdown
- configure system ptp ptsf monitor-ptsf-unusable shutdown
- configure system sync-if-timing synce shutdown
- configure system satellite port-template shutdown
- configure system sync-if-timing bits output shutdown
- configure system sync-if-timing bits input shutdown
- configure oam-pm streaming delay-template shutdown
- configure system sync-if-timing ref1 shutdown
- configure eth-tunnel shutdown
- configure system satellite local-forward sap shutdown
- configure eth-tunnel path shutdown
- configure system sync-if-timing ptp shutdown
- configure test-oam mpls-dm shutdown
- configure system sync-if-timing ref2 shutdown

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt diameter-application-policy gy extended-failure-handling shutdown

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service epipe nat-outside shutdown

7450 ESS, 7750 SR-7, 7950 XRS

- configure system switch-fabric failure-recovery shutdown

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router gmpls lsp shutdown

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command places the entity into an administratively enabled state.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls mpls-tp transit-path shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>shcv-policy>trigger shutdown)

Full Context configure subscriber-mgmt shcv-policy trigger shutdown

Description This command administratively disables the SHCV triggers.

The **no** form of this command administratively enables the the SHCV triggers.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>shcv-policy>periodic shutdown)

Full Context configure subscriber-mgmt shcv-policy periodic shutdown

Description This command administratively disables the periodic connectivity verification.

The **no** form of this command administratively enables the periodic connectivity verification.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>sap>ipoe-session shutdown)
[Tree] (config>service>ies>sub-if>grp-if>ipoe-session shutdown)
[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session shutdown)

Full Context configure service ies subscriber-interface group-interface ipoe-session shutdown
configure service vpls sap ipoe-session shutdown
configure service vprn subscriber-interface group-interface ipoe-session shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description The **shutdown** command enables or disables IPoE session management on a group interface or capture SAP.

A **shutdown** of the IPoE session CLI hierarchy on a group-interface clears all active IPoE sessions on that interface, resulting in a deletion of all corresponding subscriber hosts.

On wlan-gw group interfaces it is not possible to disable an IPoE session.

The **no** form of this command reverts to the default.

Default shutdown no shutdown on wlan-gw group interfaces

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface pppoe shutdown
- configure service ies subscriber-interface group-interface sap sub-sla-mgmt shutdown
- configure service ies subscriber-interface group-interface sap static-host shutdown
- configure service ies subscriber-interface group-interface ipv6 router-advertisements shutdown

- configure service ies interface dhcp shutdown
- configure service ies interface spoke-sdp shutdown
- configure service ies interface dhcp proxy-server shutdown
- configure service ies shutdown
- configure service ies interface shutdown
- configure service ies interface spoke-sdp control-channel-status shutdown

Special Cases

IES — The default administrative status of an IES service is down. While the service is down, all its associated virtual router interfaces will be operationally down. The administrative state of the service is not reflected in the administrative state of the virtual router interface.

For example if:

1) An IES service is operational and an associated interface is shut down. 2) The IES service is administratively shutdown and brought back up. 3) The interface shutdown will remain in administrative shutdown state.

A service is regarded as operational provided that one IP Interface is operational.

Shutting down a subscriber interface will operationally shut down all child group interfaces and SAPs. Shutting down a group interface will operationally shut down all SAPs that are part of that group-interface.

IES IP Interfaces — When the IP interface is shutdown, it enters the administratively and operationally down states. For a SAP bound to the IP interface, no packets are transmitted out the SAP and all packets received on the SAP will be dropped while incrementing the packet discard counter.

Description The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they can be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

Shutting down a subscriber interface on a 7750 SR will operationally shut down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR will operationally shut down all SAPs that are part of that group-interface.

The **no** form of this command puts an entity into the administratively enabled state.

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command places the entity into an administratively enabled state.

If the AS number was previously changed, the BGP AS number inherits the new value.

Special Cases

Service Admin State — Bindings to an SDP within the service will be put into the out-of-service state when the service is shutdown. While the service is shutdown, all customer packets are dropped and counted as discards for billing and debugging purposes.

A service is regarded as operational providing that one IP Interface SAP and one SDP is operational.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

VPRN BGP and RIP — This command disables the BGP or RIP instance on the given IP interface. Routes learned from a neighbor that is shutdown are immediately removed from the BGP or RIP database and RTM. If BGP or RIP is globally shutdown, then all RIP group and neighbor interfaces are shutdown operationally. If a BGP or RIP group is shutdown, all member neighbor interfaces are shutdown operationally. If a BGP or RIP neighbor is shutdown, just that neighbor interface is operationally shutdown.

Special Cases

Service Admin State — Bindings to an SDP within the service are put into the out-of-service state when the service is **shutdown**. While the service is shut down, all customer packets are dropped and counted as discards for billing and debugging purposes.

Service Operational State — A service is regarded as operational providing that two SAPs or if one SDP are operational.

SDP (global) — When an SDP is shut down at the global service level, all bindings to that SDP are put into the out-of-service state and the SDP itself is put into the administratively and operationally down states. Packets that would normally be transmitted using this SDP binding are discarded and counted as dropped packets.

SDP (service level) — Shutting down an SDP within a service only affects traffic on that service from entering or being received from the SDP. The SDP itself may still be operationally up for other services.

SDP Keepalives — Enables SDP connectivity monitoring keepalive messages for the SDP ID. Default state is disabled (**shutdown**) in which case the operational state of the SDP-ID is not affected by the keepalive message state.

VPLS SAPs and SDPs — SAPs are created in a VPLS and SDPs are bound to a VPLS in the administratively up default state. The created SAP attempts to enter the operationally up state. An SDP attempts to go into the in-service state once bound to the VPLS.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vpls mesh-sdp eth-cfm mep shutdown
- configure service vpls sap eth-cfm mep shutdown
- configure service vpls spoke-sdp eth-cfm mep shutdown
- configure service vpls eth-cfm mep shutdown

All

- configure service vpls sap mld-snooping mcac mc-constraints shutdown
- configure service vpls mrp mvrp shutdown
- configure service vpls allow-ip-int-bind evpn-mcast-gateway shutdown
- configure service vpls igmp-snooping mvr shutdown
- configure service vpls mac-notification shutdown
- configure service vpls mld-snooping mvr shutdown
- configure service vpls interface shutdown
- configure service vpls spoke-sdp spb shutdown
- configure service vpls sap dhcp proxy-server shutdown
- configure service vpls sap igmp-snooping mcac mc-constraints shutdown
- configure service vpls sap spb shutdown
- configure service vpls igmp-snooping shutdown
- configure service vpls spoke-sdp shutdown
- configure service vpls sap stp shutdown
- configure service vpls stp shutdown
- configure service vpls mrp shutdown
- configure service vpls bgp-ad shutdown
- configure service vpls mld-snooping shutdown
- configure service vpls mac-move shutdown
- configure service vpls spoke-sdp stp shutdown
- configure service vpls sap l2tpv3-session shutdown

Special Cases **Service Admin State —** Bindings to an SDP within the service will be put into the out-of-service state when the service is shut down. While the service is shut down, all customer packets are dropped and counted as discards for billing and debugging purposes.

Service Operational State — A service is regarded as operational providing that two SAPs or one SDP is operational.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

SDP (global) — When an SDP is shut down at the global service level, all bindings to that SDP are put into the out-of-service state and the SDP itself is put into the administratively and operationally down states. Packets that would normally be transmitted using this SDP binding will be discarded and counted as dropped packets.

SDP (service level) — Shutting down an SDP within a service only affects traffic on that service from entering or being received from the SDP. The SDP itself may still be operationally up for other services.

SDP Keepalives — Enables SDP connectivity monitoring keepalive messages for the SDP ID. Default state is disabled (shutdown), in which case the operational state of the SDP ID is not affected by the keepalive message state.

VPLS SAPs and SDPs — SAPs are created in a VPLS and SDPs are bound to a VPLS in the administratively up default state. The created SAP will attempt to enter the operationally up state. An SDP will attempt to go into the in-service state when bound to the VPLS.

Routed VPLS with forward-ipv4-multicast-to-ip-int and IGMP Snooping — To enable IGMP snooping (configured using **igmp-snooping no shutdown**) in a routed VPLS supporting the forwarding of multicast traffic from the VPLS to the IP interface (configured using **forward-ipv4-multicast-to-ip-int**), it is necessary to enable IGMP on the routed VPLS IP interface.

Routed VPLS with forward-ipv6-multicast-to-ip-int and MLD Snooping — To enable MLD snooping (configured using **mld-snooping no shutdown**) in a routed VPLS supporting the forwarding of multicast traffic from the VPLS to the IP interface (configured using forward-ipv6-multicast-to-ip-int) it is necessary to enable MLD on the routed VPLS IP interface.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>spb shutdown)
[Tree] (config>service>vpls>spoke-sdp>spb shutdown)
[Tree] (config>service>vpls>mrp>mmrp shutdown)

Full Context configure service vpls mrp mmrp shutdown
configure service vpls spb shutdown
configure service vpls spoke-sdp spb shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within.

The **no** form of this command administratively enables an entity.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The operational state of the entity is disabled as well as the operational state of any entities contained within.

This command is supported on TDM satellite.

The **no** form of this command administratively enables an entity.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port ethernet symbol-monitor shutdown
- configure port sonet-sdh path shutdown
- configure lag eth-cfm mep shutdown
- configure port ethernet eth-cfm mep shutdown

7450 ESS, 7750 SR-7/12/12e

- configure port multilink-bundle ima test-pattern-procedure shutdown

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm ds3 shutdown
- configure port tdm ds1 shutdown
- configure port tdm e1 channel-group shutdown
- configure port tdm e1 shutdown
- configure port tdm ds1 channel-group shutdown
- configure port tdm e3 shutdown

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

- configure port sonet-sdh path atm ilmi shutdown

7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

- configure card fp ingress mcast-path-management shutdown

7750 SR-s

- configure card xiom shutdown
- configure card xiom mda shutdown

All

- configure card mda shutdown
- configure interface-group-handler shutdown
- configure redundancy multi-chassis peer mc-endpoint shutdown
- configure port shutdown
- configure port-xc pxc shutdown
- configure port ethernet ssm shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify shutdown
- configure port ethernet efm-oam shutdown
- configure lag shutdown
- configure port ethernet dampening shutdown
- configure port ethernet down-when-looped shutdown
- configure redundancy multi-chassis peer mc-ring ring shutdown
- configure card shutdown

Special Cases **card —** Specifies the default state for a card is **no shutdown**.

interface group handler (IGH) — Specifies the default state for an IGH is **shutdown**.

mda — Specifies the default state for a mda is **no shutdown**.

lag — Specifies the default state for a Link Aggregation Group (LAG) is **shutdown**.

port — Specifies the default state for a port is **shutdown**.

path — Specifies the default state for a SONET/SDH path is **shutdown**.

xiom — Specifies the default state for an XIOM is **no shutdown**.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>aaa>l2tp-acct-plcy shutdown)

Full Context configure aaa l2tp-accounting-policy shutdown

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>mcast-mgmt>mcast-rprt-dest shutdown)

Full Context configure mcast-management mcast-reporting-dest shutdown

Use subject to Terms available at: www.nokia.com

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>python>py-policy>cache shutdown)
[Tree] (config>python>python-script shutdown)

Full Context configure python python-policy cache shutdown
configure python python-script shutdown

Description Shutting down a Python script triggers the system to load and compile the script from the configured location(s). Since the system supports three locations, the primary, secondary and tertiary, the system will try to load the Python script in that order.

Shutting down a Python script will disable the Python script and cause the corresponding packet to pass through without any modification.

The **no** form of this command enables the cache or policy script.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>sap>dyn-svc shutdown)

Full Context configure service vpls sap dynamic-services shutdown

Description This command disables or enables data-triggered dynamic services on this **capture-sap**.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>dynsvc>ladb shutdown)

Full Context configure service dynamic-services local-auth-db shutdown

Description This command disables or enables the local authentication database. When disabled, the database cannot be used for authentication.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>dynsvc>ladb>user shutdown)

Full Context configure service dynamic-services local-auth-db user-name shutdown

Description This command disables or enables a user name entry in the local authentication database. When disabled, the entry is not matched.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>svlan-statistics shutdown)

Full Context configure subscriber-mgmt svlan-statistics shutdown

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command places the entity into an administratively enabled state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>isa-svc-chain>evpn shutdown)
[Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter shutdown)

Full Context configure subscriber-mgmt isa-service-chaining evpn shutdown
configure subscriber-mgmt isa-service-chaining vas-filter shutdown

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the no shutdown command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command puts an entity into the administratively enabled state.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>ccrt-replay shutdown)
[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>ccrt-replay shutdown)

Full Context configure subscriber-mgmt diameter-application-policy gx ccrt-replay shutdown
configure subscriber-mgmt diameter-application-policy gy ccrt-replay shutdown

Description This command, enables or disables the CCR-T replay function for all Gx or Gy sessions that belong to the diameter application policy. Sessions in CCR-T replay are dropped when **ccrt-replay** is shut down.

The **no** form of this command enables the CCR-T replay function.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vprn>sub-if>grp-if>bonding-parameters shutdown)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>ies>sub-if>grp-if>bonding-parameters shutdown)

Full Context configure service ies subscriber-interface group-interface bonding-parameters shutdown
configure service vprn subscriber-interface group-interface bonding-parameters shutdown

Description The **shutdown** command administratively disables the entity. When a bonding context is shut down, all bonding subscribers are removed and no new bonding subscribers can be created in this context. The bonding configuration can be altered.

When a bonding context is placed in **no shutdown**, bonding subscribers can be created with connections in the specified subscriber interfaces. The specified FPE and connections can no longer be changed in this mode.

Default shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-sol shutdown)
[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol shutdown)

Full Context configure service ies subscriber-interface group-interface ipv6 router-solicit shutdown

Description This command enables SLAAC triggered host creation.

The **no** form of this command disables SLAAC triggered host creation.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (debug>diam>diam-peer-plcy>avp-match shutdown)

Full Context debug diameter diameter-peer-policy avp-match shutdown

Description This command enables or disables the **avp-match** *id* criteria for filtering debug output based on AVP value matching.

A shutdown of the **avp-match** *id* clears the learned diameter session ID.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>aaa>radius-srv-plcy>servers>health-check>test-account shutdown)

Full Context configure aaa radius-server-policy servers health-check test-account shutdown

Description This command disables the test account that probes the RADIUS server.

The **no** form of this command enables the capability.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax **shutdown** *sap-id* [**create**]
no shutdown *sap-id*

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap shutdown)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap shutdown)

Full Context configure service ies subscriber-interface group-interface wlan-gw l2-access-points l2-ap shutdown
configure service vprn subscriber-interface group-interface wlan-gw l2-access-points l2-ap shutdown

Description This command administratively enables this SAP to begin accepting Layer 2 packets for WIFI offloading.

The **no** form of this command disables this SAP.

Default shutdown

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>pfcp-association shutdown)

Full Context configure subscriber-mgmt pfcp-association shutdown

Description This command administratively enables or disables the PFCP association.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When administratively enabled, the system will try to maintain an active PFCP association with the configured peer. While no association is established, it will continue to retry setting up the association using the **association-setup-retry** configuration.

Shutting down a subscriber interface on a 7750 SR operationally shuts down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR operationally shuts down all SAPs that are part of that group interface.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>pwr-mgmt>peq shutdown)

Full Context configure system power-management peq shutdown

Description This command administratively enables/disables the APEQ. This command is supported in the 7750 SR-S OS and 7950 XRS only.

Platforms 7750 SR-12e, 7950 XRS

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>card>fp>egress>wred-queue-control shutdown)

Full Context configure card fp egress wred-queue-control shutdown

Description This command enables or disables egress WRED queue support on the forwarding plane. By default, WRED queue support is disabled (shutdown). While disabled, the various wred-queue-control commands may be executed on the forwarding plane and SAP egress QoS policies and egress queue group templates with wred-queue enabled may be applied to egress SAPs and port, respectively. The forwarding plane will allocate WRED pools to the WRED queues and the appropriate WRED mega-pool size and CBS reserve size will be calculated, but the WRED mega-pool will be empty and all buffers will be allocated to the default mega-pool. Each WRED queue will be mapped to its appropriate default pool.

Once the **no shutdown** command is executed, the calculated WRED mega-pool buffers will be moved from the default mega-pool to the WRED mega-pool. The WRED mega-pool CBS reserve size will be applied and each egress WRED queue will be moved from its default mega-pool buffer pool to its WRED pool within the WRED mega-pool hierarchy.

The **no** form of this command enables WRED queuing on an egress forwarding plane.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>macsec>connectivity-association shutdown)

Full Context configure macsec connectivity-association shutdown

Description This command shuts down the CA profile. All ports that are using this profile will not transmit PDUs as this command shuts down the MACsec for this profile.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>port>ethernet>efm-oam>link-monitoring shutdown)

Full Context configure port ethernet efm-oam link-monitoring shutdown

Description This command enables the link monitoring function. Issuing a no shutdown will start the process. Issuing a shutdown will clear any previously established negative conditions that were a result of the link monitoring process on this port and all collected data. This also controls the advertising capabilities.

The **no** form of this command activates the link monitoring function.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame shutdown)
[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-period shutdown)
[Tree] (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds shutdown)
[Tree] (config>port>ethernet>efm-oam>link-mon>errored-symbols shutdown)

Full Context configure port ethernet efm-oam link-monitoring errored-frame shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure port ethernet efm-oam link-monitoring errored-frame-period shutdown
configure port ethernet efm-oam link-monitoring errored-frame-seconds shutdown
configure port ethernet efm-oam link-monitoring errored-symbols shutdown

Description This command enables or disables the local counting, thresholding and actions associated with this type of local monitor. Peer received errors are not controlled by this command. Reaction to peer messaging is defined in the peer-rdi-rx hierarchy.

The **no** form of this command activates the local monitoring function and actions for the event.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>port>ethernet>dot1x>macsec>sub-port shutdown)

Full Context configure port ethernet dot1x macsec sub-port shutdown

Description This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in clear text until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

Default shutdown

Platforms All

shutdown

Syntax **shutdown**
no shutdown

Context **[Tree]** (config>lag>bfd>family shutdown)

Full Context configure lag bfd family shutdown

Description This command disables micro BFD sessions for this address family.

The **no** form of this command re-enables micro BFD sessions for this address family.

[Tree] (config>service>sdp>binding>pw-port shutdown)
[Tree] (config>eth-ring>path shutdown)
[Tree] (config>eth-tunnel>path>eth-cfm>mep shutdown)

Full Context configure eth-ring path shutdown
configure eth-tunnel path eth-cfm mep shutdown
configure service pw-routing hop shutdown
configure service pw-template stp shutdown
configure service sdp binding pw-port shutdown
configure service sdp class-forwarding shutdown
configure service sdp keep-alive shutdown
configure service sdp shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure eth-tunnel path eth-cfm mep shutdown
- configure eth-ring path shutdown

All

- configure service sdp keep-alive shutdown
- configure service sdp class-forwarding shutdown
- configure service sdp binding pw-port shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service sdp shutdown
- configure service pw-template stp shutdown

Special Cases

Service Admin State — Bindings to an SDP within the service will be put into the out-of-service state when the service is shutdown. While the service is shutdown, all customer packets are dropped and counted as discards for billing and debugging purposes.

SDP (global) — When an SDP is shutdown at the global service level, all bindings to that SDP are put into the out-of-service state and the SDP itself is put into the administratively and operationally down states. Packets that would normally be transmitted using this SDP binding will be discarded and counted as dropped packets.

SDP (service level) — Shutting down an SDP within a service only affects traffic on that service from entering or being received from the SDP. The SDP itself may still be operationally up for other services.

SDP Keepalives — Enables SDP connectivity monitoring keepalive messages for the SDP ID. Default state is disabled (shutdown) in which case the operational state of the SDP-ID is not affected by the keepalive message state.

shutdown

Syntax **shutdown**
[**no**] **shutdown**

Context **[Tree]** (config>service>epipe>bgp-evpn>mpls shutdown)
[Tree] (config>service>epipe>bgp-evpn>vxlan shutdown)
[Tree] (config>service>vpls>bgp-evpn>mpls shutdown)
[Tree] (config>service>vpls>bgp-evpn>srv6 shutdown)
[Tree] (config>service>vpls>bgp-evpn>vxlan shutdown)

Full Context
configure service epipe bgp-evpn mpls shutdown
configure service epipe bgp-evpn vxlan shutdown
configure service vpls bgp-evpn mpls shutdown
configure service epipe bgp-evpn segment-routing-v6 shutdown
configure service vpls bgp-evpn vxlan shutdown

Description This command controls the administrative state of EVPN-MPLS or EVPN-VXLAN in the service.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service epipe bgp-evpn segment-routing-v6 shutdown

All

- configure service vpls bgp-evpn mpls shutdown
- configure service vpls bgp-evpn vxlan shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service epipe bgp-evpn mpls shutdown
- configure service epipe bgp-evpn vxlan shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>provider-tunnel>inclusive shutdown)

Full Context configure service vpls provider-tunnel inclusive shutdown

Description This command administratively enables and disables the service.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>proxy-arp shutdown)
[Tree] (config>service>vpls>proxy-nd shutdown)

Full Context configure service vpls proxy-arp shutdown
configure service vpls proxy-nd shutdown

Description This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vsd>domain shutdown)

Full Context configure service vsd domain shutdown

Description This command enables or disables a domain. A description must be provided before no shutdown is executed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg shutdown)

Full Context configure service system bgp-evpn ethernet-segment shutdown

Description This command changes the administrative status of the Ethernet-Segment.

The user can do **no shutdown** only when esi, multi-homing and lag/port/sdp are configured. If the Ethernet-Segment or the corresponding lag/port/sdp shutdown, the Ethernet-Segment route and the AD per-ES routes will be withdrawn. No changes are allowed when the Ethernet-Segment is **no shutdown**.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>xmpp>server shutdown)

Full Context configure system xmpp server shutdown

Description This command enables or disables the communication with a specified XMPP server. When the xmpp server is properly configured, **no shutdown** instructs the system to establish a TCP session with the XMPP server through the management interface first. If it fails to establish communication, the 7750 SR, 7450 ESS, or 7950 XRS uses an in-band communication and its system IP as source IP address. Shutdown does not remove the dynamic configurations.

Platforms All

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described as follows in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

All

- configure service epipe sap shutdown
- configure service ipipe shutdown
- configure service ipipe sap shutdown
- configure service epipe spoke-sdp shutdown
- configure service ipipe spoke-sdp shutdown
- configure service epipe shutdown
- configure service epipe site shutdown
- configure service epipe sap l2tpv3-session shutdown
- configure service epipe pw-port shutdown

Special Cases

Service Admin State — Bindings to an SDP within the service will be put into the out-of-service state when the service is shutdown. While the service is shutdown, all customer packets are dropped and counted as discards for billing and debugging purposes.

Service Operational State — A service is regarded as operational providing that at least one SAP and one SDP are operational or if two SAPs are operational.

SDP (global) — When an SDP is shutdown at the global service level, all bindings to that SDP are put into the out-of-service state and the SDP itself is put into the administratively and operationally down states. Packets that would normally be transmitted using this SDP binding will be discarded and counted as dropped packets.

SDP (service level) — Shutting down an SDP within a service only affects traffic on that service from entering or being received from the SDP. The SDP itself may still be operationally up for other services.

Use subject to Terms available at: www.nokia.com

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>epipe>bgp-vpws shutdown)

Full Context configure service epipe bgp-vpws shutdown

Description This command administratively enables/disables the local BGP VPWS instance. On de-activation an MP-UNREACH-NLRI is sent for the local NLRI.

The **no** form of this command enables the BGP VPWS addressing and the related BGP advertisement. The associated BGP VPWS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>ipipe>eth-legacy-fault-notification shutdown)

Full Context configure service ipipe eth-legacy-fault-notification shutdown

Description This command enables or disables the propagation of fault from the Ethernet segment to the legacy connection using PPP, MLPPP and HDLC for an Ipipe service. Issuing a “no shutdown” will activate the feature. Issuing a “shutdown” will deactivate the feature and stop fault notification from the Ethernet to PPP, MLPPP and HDLC protocols.

The **no** form of this command activates the ethernet legacy fault propagation.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vpls>bgp-vpls shutdown)

Full Context configure service vpls bgp-vpls shutdown

Description This command administratively enables/disables the local BGP VPLS instance. On de-activation an MP-UNREACH-NLRI must be sent for the local NLRI.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command enables the BGP VPLS addressing and the related BGP advertisement. The associated BGP VPLS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane. RT, RD usage: same as in the BGP AD solution, if the values are not configured here, the value of the VPLS-id from under the bgp-ad node is used. If VPLS-id value is not configured either the MH site cannot be activated – i.e. no shutdown returns an error. Same applies if a pseudowire template is not specified under the BGP node.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>ies>if>ipv6>secure-nd shutdown)

Full Context configure service ies interface ipv6 secure-nd shutdown

Description This command enables or disables Secure Neighbor Discovery (SeND) on the interface.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>vprn>aaa>remote-servers>tacplus shutdown)

Full Context configure service vprn aaa remote-servers tacplus shutdown

Description This command administratively disables the TACACS+ protocol operation. Shutting down the protocol does not remove or change the configuration other than the administrative state.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables the protocol which is the default state.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

configure service vprn static-route-entry grt shutdown
configure service vprn static-route-entry indirect shutdown
configure service vprn static-route-entry ipsec-tunnel shutdown
configure service vprn static-route-entry next-hop shutdown

Description This command causes the static route to be placed in an administratively down state and removed from the active route-table

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context [Tree] (config>service>vprn>if>secure-nd shutdown)

Full Context configure service vprn interface secure-nd shutdown

Description This command enables or disables Secure Neighbor Discovery (SeND) on the interface.

shutdown

Syntax [**no**] **shutdown**

Context [Tree] (config>router>gmpls>path shutdown)

Full Context configure router gmpls path shutdown

Description This command disables GMPLS LSPs using the path. All services using these GMPLS LSPs are affected. Paths are created in the **shutdown** state.

The **no** form of this command administratively enables the path. All LSPs, where this path is defined as primary or defined as standby secondary, are (re)established.

Default no shutdown

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>router>ldp>egr-stats>fec-prefix shutdown)
[Tree] (config>router>ldp>aggregate-prefix-match shutdown)

Full Context configure router ldp aggregate-prefix-match shutdown
configure router ldp egress-statistics fec-prefix shutdown
configure router ldp interface-parameters interface ipv4 shutdown
configure router ldp interface-parameters interface ipv6 shutdown
configure router ldp interface-parameters interface shutdown
configure router ldp shutdown
configure router ldp targeted-session peer shutdown
configure router ldp targeted-session peer-template shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>ldp>targeted-session>auto-tx>ipv4 shutdown)
[Tree] (config>router>ldp>targeted-session>auto-rx>ipv4 shutdown)

Full Context configure router ldp targeted-session auto-rx ipv4 shutdown
configure router ldp targeted-session auto-tx ipv4 shutdown

Description This command administratively disables the capabilities associated with automatically sending targeted Hello messages through the **auto-tx** command or processing targeted Hello messages through the **auto-rx** command.

The **no** form of this command administratively enables the capabilities associated with the **auto-tx** and **auto-rx** commands.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Full Context configure router mpls ingress-statistics p2mp-template-lsp shutdown
configure router mpls ingress-statistics p2p-template-lsp shutdown
configure router mpls interface shutdown
configure router mpls lsp egress-statistics shutdown
configure router mpls lsp primary shutdown
configure router mpls lsp primary-p2mp-instance shutdown
configure router mpls lsp secondary shutdown
configure router mpls lsp-template egress-statistics shutdown
configure router mpls shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The **config**>**router**>**mpls**>**ingr-stats**>**p2mp-template-lsp**>**shutdown** command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **config**>**router**>**mpls**>**lsp**>**primary-p2mp-instance**>**shutdown** is not supported on the 7450 ESS.

MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>pce-initiated-lsp>sr-te shutdown)

Full Context configure router mpls pce-initiated-lsp sr-te shutdown

Description This command administratively enables or disables the **sr-te** context for PCE initiated LSPs. A shutdown of the **sr-te** context under **pce-initiated-lsp** causes an error to be generated for new PCInitate messages, and existing PCE-initiated LSPs are taken to the **oper-down** state.

The **no** form of this command administratively enables the **sr-te** context for PCE initiated LSP.

Platforms All

Use subject to Terms available at: www.nokia.com

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>if>label-map shutdown)

Full Context configure router mpls interface label-map shutdown

Description This command disables the label map definition. This drops all packets that match the specified *in-label* specified in the **label-map** *in-label* command.

The **no** form of this command administratively enables the defined label map action.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>lsp shutdown)
[Tree] (config>router>mpls>lsp-template shutdown)

Full Context configure router mpls lsp shutdown
configure router mpls lsp-template shutdown

Description This command disables the existing LSP including the primary and any standby secondary paths.

To shutdown only the primary enter the **config router mpls lsp** *lsp-name* **primary** *path-name* **shutdown** command.

To shutdown a specific standby secondary enter the **config router mpls lsp** *lsp-name* **secondary** *path-name* **shutdown** command. The existing configuration of the LSP is preserved.

Use the **no** form of this command to restart the LSP. LSPs are created in a shutdown state. Use this command to administratively bring up the LSP.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>rib-api>mpls shutdown)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router rib-api mpls shutdown

Description This command disables the programming of tunnel and label FIB entries by the RIB-API gRPC service. It causes all existing tunnel and label FIB entries to be de-programmed from the data path, but they remain in the control plane database.

The **no** form of this command enables the programming of tunnel and label FIB entries by the RIB-API gRPC service.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>path shutdown)

Full Context configure router mpls path shutdown

Description This command disables the existing LSPs using this path. All services using these LSPs are affected. Binding information, however, is retained in those LSPs. Paths are created in the **shutdown** state.

The **no** form of this command administratively enables the path. All LSPs, where this path is defined as primary or defined as standby secondary, are (re)established.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>pcep>pcc shutdown)
[Tree] (config>router>pcep>pce shutdown)

Full Context configure router pcep pcc shutdown
configure router pcep pce shutdown

Description This command administratively disables the PCC or PCE process.

The following PCE parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **unknown-message-rate** PCE parameter can be modified without shutting down the PCEP session.

The following PCC parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**
- **peer**

The following PCC parameters can be modified without shutting down the PCEP session:

- **report-path-constraints**
- **unknown-message-rate**

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>rsvp shutdown)
[Tree] (config>router>rsvp>interface shutdown)

Full Context configure router rsvp interface shutdown
configure router rsvp shutdown

Description This command disables the RSVP protocol instance or the RSVP-related functions for the interface. The RSVP configuration information associated with this interface is retained. When RSVP is administratively disabled, all the RSVP sessions are torn down. The existing configuration is retained.

The **no** form of this command administratively enables RSVP on the interface.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy>nh-grp shutdown)

Full Context configure router mpls forwarding-policies forwarding-policy next-hop-group shutdown

Description This command shuts down an NHG entry in a forwarding policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When an NHG is shut down, it is removed from the data path entry of the forwarding policy.

The **no** form of this command brings up an NHG entry in a forwarding policy.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy shutdown)

Full Context configure router mpls forwarding-policies forwarding-policy shutdown

Description This command shuts down the forwarding policy.

The **no** form of this command enables the forwarding policy.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>mpls>fwd-policies shutdown)

Full Context configure router mpls forwarding-policies shutdown

Description This command shuts down the **forwarding-policies** context; causing all forwarding policies to be removed from the data path, however they remain in the MPLS forwarding database.

The **no** form of this command enables the **forwarding-policies** context.

Platforms All

configure isa application-assurance-group shutdown
configure service ies aa-interface sap shutdown
configure service ies aa-interface shutdown
configure service vprn aa-interface sap shutdown
configure service vprn aa-interface shutdown

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>app-assure>group>transit-ip>diameter shutdown)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure application-assurance group transit-ip-policy diameter shutdown

Description This command removes all transit AA subscribers created via Diameter on this transit AA subscriber IP policy and clears all corresponding Diameter sessions.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>isa>aa-grp>overload-sub-quarantine shutdown)

Full Context configure isa application-assurance-group overload-sub-quarantine shutdown

Description This command disables the overload subscriber detection algorithm in the ISA group for the purpose of quarantining an overloaded subscriber. It is possible to manually quarantine an AA subscriber even when this command is disabled (**shutdown**).

The **no** form of this command enables the overload subscriber detection algorithm in the ISA group. When enabled, each ISA monitors the traffic on a continuous basis to identify AA subscribers that occupy more than their fair share of ISA resources and need to be quarantined.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (debug>app-assure>group>traffic-capture shutdown)

Full Context debug application-assurance group traffic-capture shutdown

Description This command administratively disables traffic capture.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (debug>app-assure>group>http-host-recorder shutdown)
[Tree] (debug>app-assure>group>port-recorder shutdown)

Full Context debug application-assurance group http-host-recorder shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

debug application-assurance group port-recorder shutdown

Description This commands allows to stop or start the http-host-recorder. To reset the recorded values execute shutdown followed by **no** shutdown.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>esa shutdown)

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>nat>map-domain>mapping-rule shutdown)

Full Context configure service nat map-domain mapping-rule shutdown

Description This command enables or disables a rule within a MAP domain. A MAP rule can be enabled (**no shutdown**) only when all parameters within the rule are defined. Disabling a rule within an instantiated MAP domain will withdraw the rule IPv4 routes and disable forwarding for the rule.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of an instantiated MAP rule disables the rule (the rule routes will be withdrawn and forwarding will be disabled).

Default shutdown

Platforms VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>service>nat>map-domain shutdown)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service nat map-domain shutdown

Description This command enables or disables a MAP domain. A MAP domain can be enabled (**no shutdown**) only when the DMR prefix is configured. Disabling an instantiated domain will withdraw all routes associated with it.

Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of a MAP domain template disables the instantiated MAP domain (the routes will be withdrawn and forwarding will be disabled).

Description

The **shutdown** command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of this command puts an entity into the administratively enabled state.

Default

See Special Cases below.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface ping-template shutdown
- configure service ies interface ping-template shutdown

All

- configure li li-source shutdown
- configure service vprn ip-mirror-interface spoke-sdp shutdown
- configure mirror mirror-dest shutdown
- configure service vprn ip-mirror-interface shutdown
- configure mirror mirror-source shutdown
- configure li log log-id shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Special Cases

Mirror Destination — When a mirror destination service ID is shutdown, mirrored packets associated with the service ID are not accepted from the mirror source or remote source router. The associated mirror source is put into an operationally down mode. Mirrored packets are not transmitted out of the SAP or SDP. Each mirrored packet is silently discarded. If the mirror destination is a SAP, the SAP's discard counters are incremented.

The **shutdown** command places the mirror destination service or mirror source into an administratively down state. The **mirror-dest** service ID must be shut down in order to delete the service ID, SAP or SDP association from the system.

The default state for a mirror destination service ID is **shutdown**. A **no shutdown** command is required to enable the service.

Mirror Source — Mirror sources do not need to be shutdown in order to remove them from the system.

When a mirror source is **shutdown**, mirroring is terminated for all sources defined locally for the mirror destination service ID. If the **remote-source** command has been executed on the mirror destination associated with the shut down mirror source, mirroring continues for remote sources.

The default state for a mirror source for a given mirror-dest service ID is **no shutdown**. A **shutdown** command is required to disable mirroring from that mirror-source.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (debug>mirror-source shutdown)

Full Context debug mirror-source shutdown

Description This command enables mirror source debugging.

The **no** form of this command clears mirror source information.

Platforms All

shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>open-flow>of-switch shutdown)

Full Context configure open-flow of-switch shutdown

Description This command administratively enables or disables the OpenFlow switch instance. Disabling the switch purges all flowtable entries.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>if>vrrp shutdown)
[Tree] (config>router>if>ipv6>vrrp shutdown)
[Tree] (config>vrrp>policy shutdown)

Full Context configure router interface ipv6 vrrp shutdown
configure router interface vrrp shutdown
configure vrrp policy shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Default no shutdown

Platforms All

Special Cases **Non-Owner Virtual Router —** Non-owner virtual router instances can be administratively shutdown. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Shutting down the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup/master state changes.

If the **shutdown** command is executed, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.

By default, virtual router instances are created in the **no shutdown** state.

Whenever the administrative state of a virtual router instance transitions, a log message is generated.

Whenever the operational state of a virtual router instance transitions, a log message is generated.

Owner Virtual Router — An owner virtual router context does not have a **shutdown** command. To administratively disable an owner virtual router instance, use the **shutdown** command within the parent IP interface node which administratively downs the IP interface.

shutdown

Syntax [**no**] **shutdown** [**active**] [**standby**]
[**no**] **shutdown** [*cflash-id*]

Context **[Tree]** (file shutdown)

Full Context file shutdown

Description This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note: The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

LED Status Indicators

Table 130 lists the possible states for the compact flash and their LED status indicators.

Table 130 **LED Status Indicators**

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default no shutdown

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *cflash-id* — Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

active — Specifies that all drives on the active CPM are shutdown or enabled.

standby — Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>satellite>eth-sat shutdown)
[Tree] (config>system>satellite>tdm-sat shutdown)

Full Context configure system satellite eth-sat shutdown
configure system satellite tdm-sat shutdown

Description This command disables the associated satellite.

If the associated satellite is active, the satellite will not be reset but all satellite client ports will be shut down.

If the satellite is not active but attempts to associate with the host, the satellite chassis will be brought up according to the satellite configuration but all client ports will be shut down.

The **no** form of this command removes the shutdown state and all client ports on active satellites will be brought back up.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat shutdown

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>alarm-contact-input shutdown)

Full Context configure system alarm-contact-input shutdown

Description This command disables tracking of state changes associated with the alarm contact input. The system does not generate or clear the alarms for the alarm contact input while tracking is disabled. The system clears existing alarms when the **shutdown** command is executed.

The **no** form of this command enables tracking of state changes associated with the alarm contact input.

Default shutdown

Platforms 7750 SR-a

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>ptp>peer shutdown)

Full Context configure system ptp peer shutdown

Description This command disables or enables a specific PTP peer. Shutting down a peer sends cancel unicast negotiation messages on any established unicast sessions. When shutdown, all received packets from the peer are ignored.

If the clock-type is ordinary slave or boundary, and PTP is no shutdown, the last enabled peer cannot be shutdown. This prevents the user from having PTP enabled without any peer configured and enabled.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>ptp>port shutdown)

Full Context configure system ptp port shutdown

Description This command disables or enables a specific PTP port. When shutdown, all PTP Ethernet messages are dropped on the IOM They will not be counted in the PTP message statistics. No PTP packets are transmitted by the node toward this port.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the clock-type is ordinary slave or boundary, and PTP is no shutdown, the last enabled port or peer cannot be shutdown. This prevents the user from having PTP enabled without any means to synchronize the local clock to a parent clock.

Default no shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>management-interface>remote-management shutdown)
[Tree] (config>system>management-interface>remote-management>manager shutdown)

Full Context configure system management-interface remote-management manager shutdown
configure system management-interface remote-management shutdown

Description This command administratively disables remote management.

The **no** form of this command administratively enables remote management.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>alarms shutdown)

Full Context configure system alarms shutdown

Description This command enables or disables the Facility Alarm functionality. When enabled, the Facility Alarm sub-system tracks active and cleared facility alarms and controls the Alarm LEDs on the CPMs. When Facility Alarm functionality is enabled, the alarms are viewed using the show system alarms command(s).

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

[Tree] (config>log>event-handling>handler>action-list>entry shutdown)
[Tree] (config>log>event-trigger>event shutdown)
[Tree] (config>log>event-trigger>event>trigger-entry shutdown)

Full Context configure log accounting-policy shutdown
configure log event-handling handler action-list entry shutdown
configure log event-handling handler shutdown
configure log event-trigger event shutdown
configure log event-trigger event trigger-entry shutdown
configure log log-id shutdown

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Default no shutdown

Platforms All

Special Cases **log-id —** When a log ID is shut down, no events are collected for the entity. This leads to the loss of event data.

accounting-policy — When an accounting policy is shut down, no accounting data is written to the destination log ID. Counters in the billing data reflect totals, not increments, so when the policy is re-enabled (**no shutdown**) the counters include the data collected during the period the policy was shut down.

shutdown

Syntax [**no**] **shutdown**

Context [Tree] (config>system>netconf shutdown)

Full Context configure system netconf shutdown

Description This command disables the NETCONF server. The **shutdown** command is blocked if there are any active NETCONF sessions. Use the **admin disconnect** command to disconnect all NETCONF sessions before shutting down the NETCONF service.

Platforms All

shutdown

Syntax [**no**] **shutdown**

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>pki>ca-profile shutdown)

Full Context configure system security pki ca-profile shutdown

Description Use this command to enable or disable the ca-profile. The system verifies the configured cert-file and crl-file. If the verification fails, then the **no shutdown** command fails.

The ca-profile in a **shutdown** state cannot be used in certificate authentication.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>ssh>key-re-exchange>client shutdown)
[Tree] (config>system>security>ssh>key-re-exchange>server shutdown)

Full Context configure system security ssh key-re-exchange client shutdown
configure system security ssh key-re-exchange server shutdown

Description This command stops the key exchange. It sets the minutes and bytes to infinity so there will not be any key exchange during the PDU transmission.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>tacplus shutdown)

Full Context configure system security tacplus shutdown

Description This command administratively disables the TACACS+ protocol operation. Shutting down the protocol does not remove or change the configuration other than the administrative state.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables the protocol which is the default state.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>ldap shutdown)
[Tree] (config>system>security>ldap>server shutdown)

Full Context configure system security ldap server shutdown
configure system security ldap shutdown

Description In the **ldap** context, this command enables or disabled LDAP protocol operations.

In the **server** context, this command enables or disables the LDAP server. To perform **no shutdown**, an LDAP server address is required. To change the address, the user first needs to shut down the server.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>grpc>gnmi shutdown)

Full Context configure system grpc gnmi shutdown

Description This command stops the gNMI service.

The **no** form of this command starts the gNMI service.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>grpc>rib-api shutdown)

Full Context configure system grpc rib-api shutdown

Description This command stops the RibApi gRPC service, deletes all programmed RIB entries (stale and non-stale), but does not close the TCP connections.

The **no** form of this command restarts the RibApi gRPC service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>grpc shutdown)

Full Context configure system grpc shutdown

Description This command stops the gRPC server. This closes all of the associated TCP connections and immediately purges all RIB entries that were programmed using the RibApi Service.

The **shutdown** command is not blocked if there are active gRPC sessions. Shutting down gRPC will terminate all active gRPC sessions.

The **no** form of this command starts the gRPC server.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>grpc>tcp-keepalive shutdown)

Full Context configure system grpc tcp-keepalive shutdown

Description This command stops the TCP keepalives from being sent to all gRPC clients.

The **no** form of this command restarts the sending of TCP keepalives to all gRPC clients.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>snmp>streaming shutdown)

Full Context configure system snmp streaming shutdown

Description This command administratively disables proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes.

The **no** form of the command administratively re-enables SNMP request/response bundling and TCP-based transport mechanism.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>snmp shutdown)

Full Context configure system snmp shutdown

Description This command administratively disables SNMP agent operations. System management can then only be performed using the command line interface (CLI). Shutting down SNMP does not remove or change configuration parameters other than the administrative state. This command does not prevent the agent from sending SNMP notifications to any configured SNMP trap destinations. SNMP trap destinations are configured under the **config>log>snmp-trap-group** context.

This command is automatically invoked in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof persist on** command is enabled.

The **no** form of the command administratively enables SNMP which is the default state.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>tls>cert-profile shutdown)

Full Context configure system security tls cert-profile shutdown

Description This command disables the certificate profile. When the certificate profile is disabled, it will not be sent to the TLS server.

The **no** form of the command enables the certificate profile and allows it to be sent to the TLS server.

Default shutdown

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>system>security>tls>client-tls-profile shutdown)
[Tree] (config>system>security>tls>server-tls-profile shutdown)

Full Context configure system security tls client-tls-profile shutdown
configure system security tls server-tls-profile shutdown

Description This command administratively enables or disables the TLS profile. If the TLS profile is shut down, the TLS operational status will be down. Therefore, if the TLS profile is shut down, any application using TLS should not attempt to send any PDUs.

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default administrative states for services and service entities are described in Special Cases.

The **no** form of this command places an entity in an administratively enabled state.

Platforms All

Special Cases **BGP Global —** The BGP protocol is created in the **no shutdown** state.

BGP Group — BGP groups are created in the **no shutdown** state.

BGP Neighbor — BGP neighbors/peers are created in the **no shutdown** state.

Default shutdown

Platforms All

Special Cases

IS-IS IGP-Shortcut — In the **config>router>isis>igp-shortcut** context, the command enables or disables IGP shortcuts in the IGP instance.

IS-IS Interface — In the **config>router>isis>interface** context, the command disables the IS-IS interface. By default, the IS-IS interface is enabled, **no shutdown**.

IS-IS Interface and Level — In the **config>router>isis>interface** *ip-int-name*>**level** context, the command disables the IS-IS interface for the level. By default, the IS-IS interface at the level is enabled, **no shutdown**.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>isis>flex-algos shutdown)

Full Context configure router isis flexible-algorithms shutdown

Description This command enables IS-IS flexible algorithms. If it is enabled with the **no shutdown** command the router starts supporting the flexible algorithms IGP LSDB extensions. Flexible algorithm IGP LSDB extensions are by default not enabled.

The **no** form of this command enables the router to support flexible algorithms.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>ospf>flex-algos shutdown)

Full Context configure router ospf flexible-algorithms shutdown

Description This command enables OSPFv2 flexible algorithms. If **no shutdown** is configured, the router enables support for the flexible algorithms IGP LSDB extensions. Flexible algorithm IGP LSDB extensions are disabled by default.

The **no** form of this command enables the router to support flexible algorithms.

Default shutdown

configure router rip group neighbor shutdown
configure router rip group shutdown
configure router rip shutdown
configure router ripng group neighbor shutdown
configure router ripng group shutdown
configure router ripng shutdown

Description

This command administratively disables an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down and the operational state of any entities contained within the administratively down entity.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Platforms

All

Special Cases

RIP Global — In the **config>router>rip** context, the **shutdown** command administratively enables/disables the RIP protocol instance. If RIP is globally shutdown, then all RIP group and neighbor interfaces transition to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed from the RIP database and route table manager (RTM). A RIP protocol instance is administratively enabled by default.

RIP Group — In the **config>router>rip>group** *group-name* context, the **shutdown** command administratively enables/disables the RIP group. If a RIP group is shutdown, all member neighbor interfaces transition to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed from the RIP database and route table manager (RTM). A RIP group is administratively enabled by default.

RIP Neighbor — In the **config>router>rip>group** *group-name*>**neighbor** *ip-int-name* context, the **shutdown** command administratively enables/disables the RIP neighbor interface. If a RIP neighbor is shutdown, the neighbor interface transitions to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed from the RIP database and route table manager (RTM). A RIP neighbor interface is administratively enabled by default.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>segment-routing>maintenance-policy shutdown)

Full Context configure router segment-routing maintenance-policy shutdown

Description This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>segment-routing>sr-policies>egress-statistics shutdown)
[Tree] (config>router>segment-routing>sr-policies>ingress-statistics shutdown)

Full Context configure router segment-routing sr-policies egress-statistics shutdown
configure router segment-routing sr-policies ingress-statistics shutdown

Description This command administratively disables the collection of egress or ingress statistics for all segment routing policies.

The **no** form of this command administratively enables the collection of egress or ingress statistics for all segment routing policies.

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>segment-routing>sr-policies shutdown)

Full Context configure router segment-routing sr-policies shutdown

Description This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

It is necessary to execute this shutdown if you want to make a change to the reserved-label-block reference.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy>segment-list shutdown)

Full Context configure router segment-routing sr-policies static-policy segment-list shutdown

Description This command deactivates a segment-list. If this is done on an active policy with more than one segment list, then traffic forwarded by the policy will be diverted to the remaining segment-lists.

The **no** form of this command enables the segment list so that it can be validated and installed as necessary.

Default shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy shutdown)

Full Context configure router segment-routing sr-policies static-policy shutdown

Description This command deactivates the associated static policy and causes another policy for the same (color, endpoint) combination to be promoted as the active path, assuming there is another valid policy.

It is necessary to execute this shutdown if you want to make critical configuration changes to the static policy.

The **no** form of this command enables the static policy so that it can be validated and installed as necessary.

Platforms All

shutdown

Description This command administratively disables the SRv6 context in a ISIS instance or a SRv6 locator.

The **no** form of this command enables the SRv6 context in a ISIS instance or a SRv6 locator.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>bgp>egress-peer-engineering shutdown)

Full Context configure router bgp egress-peer-engineering shutdown

Description This command administratively enables or disables BGP-EPE. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.

The **no** form of this command places the entity into an administratively enabled state and prevents peer node SIDs and peer adjacency SIDs from being advertised in BGP-LS.

Default no shutdown

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>bgp>group>egress-engineering shutdown)

Full Context configure router bgp group egress-engineering shutdown

Description This command administratively enables or disable egress engineering on a BGP neighbor or group of neighbors.

If this command is enabled along with the **egress-peer-engineering** command in BGP, SIDs in the form of MPLS labels are allocated for the segments toward the neighbor and to all links (adjacencies). These adjacencies are then advertised in BGP LS.

The **no** form of this command places the entity into an administratively enabled state.

Default no shutdown

Platforms All

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>sis shutdown)

Full Context configure subscriber-mgmt subscriber-interface-statistics shutdown

Description This command disables the collection of aggregate subscriber interface statistics.

The **no** form of this command enables subscriber interface statistics collection.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>subscr-mgmt>gis shutdown)

Full Context configure subscriber-mgmt group-interface-statistics shutdown

Description This command disables the collection of aggregate group interface statistics.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command enables group interface statistics collection.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>test-oam>link-meas>template shutdown)

Full Context configure test-oam link-measurement measurement-template shutdown

Description This command administratively enables and disables the measurement template. The **measurement-template** can be referenced even if it is disabled. The template must be administratively enabled to transmit probes on any associated IP interface. The template configuration can be modified even if it is administratively enabled. The template can be administratively disabled even if interfaces are actively registered with the template. When the template configuration is modified, all registered IP interfaces start from the initial state and enter a first reporting scenario. This is true even if the template is administratively disabled and enabled, and no configuration changes are made.

The **no** form of this command disables the measurement template.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shutdown

Syntax [**no**] **shutdown**

Context **[Tree]** (config>router>if>if-attr>delay>dyn>twamp>ipv4 shutdown)
[Tree] (config>router>if>if-attr>delay>dyn>twamp>ipv6 shutdown)

Full Context configure router interface if-attribute delay dynamic twamp-light ipv4 shutdown
configure router interface if-attribute delay dynamic twamp-light ipv6 shutdown

Description This command enables and disables the TWAMP Light IPv4 or IPv6 protocol. Only one protocol, IPv4 or IPv6, can be enabled at any time. Attempting to enable both protocols is rejected.

The **no** form of this command administratively disables the IPv4 or IPv6 protocol.

Default shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.226 sid

sid

Syntax **sid label** *value*

Context **[Tree]** (config>router>isis>segm-rtng>adjacency-set sid)
[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

Full Context configure router isis segment-routing adjacency-set sid
configure router ospf segment-routing adjacency-set sid

Description This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters **label** *value* — Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms All

23.227 sid-action

sid-action

Syntax **sid-action** *action*
no sid-action

Context **[Tree]** (config>router>p2mp-sr-tree>replication-segment sid-action)

Full Context configure router p2mp-sr-tree replication-segment sid-action

Description This command configures the SID action to take for the replication segment of the P2MP SR tree.

The **no** form of this command removes the SID action.

Default no sid-action

Parameters *action* — Specifies the name of the SID action.

Values **push** — Specifies that an outgoing SID list is pushed and forwarded on to the corresponding programmed outgoing interfaces.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pop — Specifies that on the leaf node the incoming SID is popped on the underlay packet forwarded to the host.

swap — Specifies, if an incoming SID is configured, that the SID is swapped with an outgoing SID or SID list and forwarded to the corresponding OIF.

Platforms All

23.228 sid-allocation

sid-allocation

Syntax **sid-allocation** {**sequential** | **random**}
no sid-allocation

Context **[Tree]** (config>subscr-mgmt>ppp-policy sid-allocation)

Full Context configure subscriber-mgmt ppp-policy sid-allocation

Description This command configures the method for allocating the PPPoE session ID.

For both **sequential** and **random** options, the session ID range is 1 to 8191.

The **no** form of this command reverts to the default.

Default sid-allocation sequential

Parameters **sequential** — Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate the session ID in sequential order starting with ID = 1.

random — Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate a unique session ID in random order.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.229 sid-map

sid-map

Syntax **sid-map node-sid** {**index** *value* [**range** *value*]} **prefix** {{*ip-addressImask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** {**1** | **2** | **1/2**}] [**clear-n-flag**]
no sid-map node-sid index *value*

Context [Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

Full Context configure router isis segment-routing mapping-server sid-map

Description This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters *index* — Specifies the node SID index for the IS-IS prefix which will be advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

Default none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

value — Specifies the node SID range for the IS-IS prefix which will be advertised in a SID/Label Binding TLV.

Values 0 to 65535

Default none

ip-address/mask — Specifies the IP address and mask.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)
mask: **0 to 32**

ip-address netmask — Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags — Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**
The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2} — Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag — Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms All

sid-map

Syntax **sid-map node-sid index** *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]
sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}
no sid-map node-sid index *index-value*

Context **[Tree]** (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context configure router ospf segment-routing mapping-server sid-map

Description This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note: SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default no prefix-sid-range

Parameters **index** *index-value* — Specifies the index.

Values 0 to 4294967295

range *range-value* — Specifies the range.

Values 1 to 65535

prefix *ip-address/mask* — Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask — Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

area *area-id* — Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms All

23.230 sid-protection

sid-protection

Syntax [**no**] **sid-protection**

Context **[Tree]** (config>router>isis>interface sid-protection)

Full Context configure router isis interface sid-protection

Description This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default sid-protection

Platforms All

sid-protection

Syntax [**no**] **sid-protection**

Context **[Tree]** (config>router>ospf>area>interface sid-protection)

Full Context configure router ospf area interface sid-protection

Description This command enables or disables adjacency SID protection by LFA and remote LFA.

LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternate** option in IS-IS or OSPF at the LER and LSR. However, may be applications where the user never wants traffic to divert from the strict hop computed by CSPF for an SR-TE LSP. In this case, the user can disable protection for all adjacency SIDs formed over a particular network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

23.231 signal-label

signal-label

Syntax **signal-label** *value*
no signal-label

Context **[Tree]** (config>port>sonet-sdh>path signal-label)

Full Context configure port sonet-sdh path signal-label

Description This command sets the C2 byte value. The purpose of this byte is to communicate the payload type being encapsulated by SONET framing.

This command is supported on TDM satellite.

Default signal-label 0xcf

Parameters *value* — Specifies the C2 byte value, expressed as a decimal integer or a value in hex format.

Values 1 to 254 or 0x01 to 0xfe

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.232 signal-mode

signal-mode

Syntax **signal-mode** {**cas**}
no signal-mode

Context **[Tree]** (config>port>tdm>ds1 signal-mode)
[Tree] (config>port>tdm>e1 signal-mode)

Full Context configure port tdm ds1 signal-mode
configure port tdm e1 signal-mode

Description This command activates the signal mode on the channel. When enabled, it uses routing information to direct the payload of voice or data to its destination.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no signal-mode

Parameters **cas** — Specifies channel associated signaling.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

23.233 signaled-vc-type-override

signaled-vc-type-override

Syntax **signaled-vc-type-override** *atm-vcc*
no signaled-vc-type-override

Context **[Tree]** (config>service>apipe signaled-vc-type-override)

Full Context configure service apipe signaled-vc-type-override

Description This command overrides the pseudowire type signaled to type 0x0009 N:1 VCC cell within an Apipe VLL service of vc-type atm-cell. Normally, this service vc-type signals a pseudowire of type 0x0003 ATM Transparent Cell.

This command is not allowed in an Apipe VLL of vc-type value atm-cell if a configured ATM SAP is not using a connection profile. Conversely, if the signaling override command is enabled, only an ATM SAP with a connection profile assigned will be allowed.

The **override** command is not allowed on Apipe VLL service of vc-type value other than atm-cell. It is also not allowed on a VLL service with the vc-switching option enabled since signaling of the PW FEC in a Multi-Segment PW (MS-PW) is controlled by the T-PE nodes. Therefore, for this feature to be used on a MS-PW, it is required to configure an Apipe service of vc-type atm-cell at the T-PE nodes with the signaled-vc-type-override enabled, and to configure a Apipe VLL service of vc-type atm-vcc at the S-PE node with the vc-switching option enabled.

The **no** form of this command returns the Apipe VLL service to signal its default pseudowire type.

Parameters *atm-vcc* — Specifies the pseudowire type to be signaled in the pseudowire establishment.

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.234 signaling

signaling

Syntax **signaling** *signaling*

Context **[Tree]** (config>service>epipe>spoke-sdp-fec signaling)

Full Context configure service epipe spoke-sdp-fec signaling

Description This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default signaling auto

Parameters *signaling* — Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms All

signaling

Syntax **signaling** {**off** | **tldp** | **bgp**}

Context **[Tree]** (config>service>sdp signaling)

Full Context configure service sdp signaling

Description This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

Default signaling tldp

Parameters **off** — Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp — Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp — Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

Platforms All

23.235 significant-change

significant-change

Syntax **significant-change** *delta*
no significant-change

Context **[Tree]** (config>subscr-mgmt>acct-plcy>cr significant-change)

Full Context configure subscriber-mgmt radius-accounting-policy custom-record significant-change

Description This command configures the significant change required to generate the record.

Parameters *delta* — Specifies the delta change (significant change) that is required for the custom record to be generated.

Values 0 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Syntax **significant-change** *delta*
no significant-change

Context **[Tree]** (config>app-assure>rad-acct-plcy significant-change)

Full Context configure application-assurance radius-accounting-policy significant-change

Description This command configures the significant change required to generate the record.

The **no** form of this command reverts to the default.

Default no significant-change

Parameters *delta* — Specifies the delta change (significant change) that is required for the charging-group counts to be included in the RADIUS Accounting VSAs.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

significant-change

Syntax **significant-change** *delta*
no significant-change

Context **[Tree]** (config>log>acct-policy>cr significant-change)

Full Context configure log accounting-policy custom-record significant-change

Description This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default significant-change 0

Parameters *delta* — Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

single-fiber

Syntax [**no**] **single-fiber**

Context **[Tree]** (config>port>ethernet single-fiber)
[Tree] (config>port>sonet-sdh single-fiber)

Full Context configure port ethernet single-fiber
configure port sonet-sdh single-fiber

Description This command enables packet gathering and redirection of IP packets from a single fiber (RX) port of the Ethernet or SONET/SDH interface and redistributes packets to other interfaces through either static routes or policy-based forwarding.

This parameter can be applied in conjunction with the strip-label command. If they are applied together, the port must have the single-fiber option configured before it can be associated with an interface that is configured with the strip-label option.

Once a port is configured with single-fiber, traffic will no longer be transmitted out of that port. This command can be used in conjunction with strip-label.

Default no single-fiber

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.237 single-mac

single-mac

Syntax [**no**] **single-mac**

Context **[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options single-mac)
[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options single-mac)

Full Context configure service ies subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac
configure service vprn subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command controls how the SAP learns the IPv6 static host MAC address. Enabling this command indicates that this particular SAP only has one subscriber and only has one MAC address for all hosts. With this parameter enabled, the subscriber's NS and RS source MAC address is used to automatically populate the subscriber MAC address. To allow this auto-populate behavior, the subscriber's NS and RS source IP must be of type link local address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.238 single-sfm-overload

single-sfm-overload

Syntax **single-sfm-overload** [**holdoff-time** *holdoff-time*]
no single-sfm-overload

Context **[Tree]** (config>service>vprn single-sfm-overload)

Full Context configure service vprn single-sfm-overload

Description This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7950 XRS-20, 7750 SR-12/SR-7, and 7450 ESS-12/ESS-7 platforms: if an SF/CPMs fails, the protocol will set the overload
- 7950-40 XRS and 7750 SR-12e platforms: if two SFMs fail (a connected pair on the XRS-40) the protocol will set the overload

The **no** form of this command configures the router to not set overload if an SFM fails.

Default no single-sfm-overload

Parameters *holdoff-time* — Specifies the delay between detecting SFM failures and setting overload.

Values 1 to 600 seconds

Default 0 seconds

Platforms 7450 ESS, 7750 SR, 7750 SR-14s, 7750 SR-2s, 7750 SR-7s, 7750 SR-a, 7750 SR-e, 7950 XRS, VSR

Full Context configure service ies interface sap sub-sla-mgmt single-sub-parameters
configure service ies subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters
configure service vpls sap sub-sla-mgmt single-sub-parameters
configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters

Description Commands in this context configure single subscriber SAP parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.240 sip

sip

Syntax [**no**] **sip**

Context **[Tree]** (config>service>nat>nat-policy>alg sip)
[Tree] (config>service>nat>firewall-policy>alg sip)
[Tree] (config>service>nat>up-nat-policy>alg sip)

Full Context configure service nat firewall-policy alg sip
configure service nat nat-policy alg sip
configure service nat up-nat-policy alg sip

Description This command enables SIP ALG.

The **no** form of the command disables SIP ALG.

Default no sip

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy alg sip
- configure service nat nat-policy alg sip

7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service nat firewall-policy alg sip

sip

Syntax **sip** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no sip

Context **[Tree]** (config>service>nat>nat-policy>timeouts sip)
[Tree] (config>service>nat>firewall-policy>timeouts sip)
[Tree] (config>service>nat>up-nat-policy>timeouts sip)

Full Context configure service nat firewall-policy timeouts sip
configure service nat nat-policy timeouts sip
configure service nat up-nat-policy timeouts sip

Description This command configures the SIP inactive media timeout.

Default sip min 2

Parameters *hours* — Specifies the SIP inactive media timeout, in hours.

Values 1 to 2

minutes — Specifies the SIP inactive media timeout, in minutes.

Values 1 to 59

seconds — Specifies the SIP inactive media timeout, in seconds.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts sip
- configure service nat nat-policy timeouts sip

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts sip

23.241 site

site

Syntax **site** *name* [**create**]
no site *name*

Context **[Tree]** (config>service>vpls site)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls site

Description This command configures a VPLS site.

The no form of this command removes the name from the configuration.

Parameters *name* — Specifies a site name up to 32 characters in length.

create — This keyword is mandatory while creating a VPLS site.

Platforms All

site

Syntax **site** *name* [**create**]
no site name

Context **[Tree]** (config>service>epipe site)

Full Context configure service epipe site

Description This command configures a Epipe site.

The **no** form of this command removes the name from the configuration.

Parameters *name* — Specifies a site name up to 32 characters in length.

create — This keyword is mandatory while creating a Epipe service.

Platforms All

23.242 site-activation-timer

site-activation-timer

Syntax **site-activation-timer** *seconds*
no site-activation-timer

Context **[Tree]** (config>redundancy>bgp-mh site-activation-timer)

Full Context configure redundancy bgp-mh site-activation-timer

Description This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following event occurs only if the site is operationally up:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Manual site activation using “no shutdown” at site-id level or at member object(s) level (for example, SAP(s) or PW(s)
- Site activation after a failure

The **no** form of this command sets the value to 2.

Default no site-activation-timer

Parameters *seconds* — Specifies the timer, in seconds.

Values 1 to 100

site-activation-timer

Syntax **site-activation-timer** *seconds*
no site-activation-timer

Context **[Tree]** (config>service>vpls>site site-activation-timer)

Full Context configure service vpls site site-activation-timer

Description This command configures the time-period the system keeps the local sites in standby status, waiting for BGP updates from remote PEs before running the DF (designated-forwarder) election algorithm to decide whether the site should be unblocked. This timer if terminated if an update is received for which the remote PE has transitioned from DF to non-DF.

The no form of this command removes the value from the configuration.

Default site-activation-timer 2

Parameters *seconds* — Specifies the site activation timer in seconds.

Values 0 to 100

Platforms All

site-activation-timer

Syntax **site-activation-timer** *seconds*
no site-activation-timer

Context **[Tree]** (config>service>epipe>site site-activation-timer)

Full Context configure service epipe site site-activation-timer

Description This command configures the time-period the system keeps the local sites in standby status, waiting for BGP updates from remote PEs before running the DF (designated-forwarder) election algorithm to decide whether the site should be unblocked. This timer is terminated if an update is received for which the remote PE has transitioned from DF to non-DF.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the value from the configuration.

Default site-activation-timer 2

Parameters *seconds* — Specifies the site activation timer in seconds.

Values 0 to 100

Platforms All

site-activation-timer

Syntax **site-activation-timer** *seconds*
no site-activation-timer

Context **[Tree]** (config>redundancy>bgp-multi-homing site-activation-timer)

Full Context configure redundancy bgp-multi-homing site-activation-timer

Description This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following events occurs if the site is operationally up:

- Manual site activation using the **no shutdown** command at site-id level or at member object(s) level (SAP(s) or PW(s))
- Site activation after a failure

Default no site-activation-timer

Parameters *seconds* — Specifies the standby status in seconds.

Values 0 to 100

Default 2

Platforms All

23.243 site-id

site-id

Syntax **site-id** *value*
no site-id

Context **[Tree]** (config>service>vpls>site site-id)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls site site-id

Description This command configures the identifier for the site in this service.

Parameters *value* — Specifies the site identifier.

Values 1 to 65535

Platforms All

site-id

Syntax **site-id** *value*
no site-id

Context **[Tree]** (config>service>epipe>site site-id)

Full Context configure service epipe site site-id

Description This command configures the identifier for the site in this service. It must match between services but it is local to the service.

Parameters *value* — Specifies the site identifier.

Values 1 to 65535

Platforms All

23.244 site-min-down-timer

site-min-down-timer

Syntax **site-min-down-timer** *seconds*
no site-min-down-timer

Context **[Tree]** (config>redundancy>bgp-multi-homing site-min-down-timer)

Full Context configure redundancy bgp-multi-homing site-min-down-timer

Description This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default no site-min-down-timer

Parameters *seconds* — Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms All

site-min-down-timer

Syntax **site-min-down-timer** *min-down-time*
no site-min-down-timer

Context **[Tree]** (config>service>vpls>site site-min-down-timer)

Full Context configure service vpls site site-min-down-timer

Description This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters *min-down-time* — Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms All

site-min-down-timer

Syntax **site-min-down-timer** *min-down-time*
no site-min-down-timer

Context **[Tree]** (config>service>epipe>site site-min-down-timer)

Full Context configure service epipe site site-min-down-timer

Description This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The preceding operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the s**ite-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to default value.

Default Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters *min-down-time* — Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.245 site-preference

site-preference

Syntax **site-preference** *preference-value*
no site-preference

Context **[Tree]** (config>service>epipe>site site-preference)

Full Context configure service epipe site site-preference

Description This command defines the value to advertise in the VPLS preference field of the BGP VPWS and BGP Multi-homing NLRI extended community. This value can be changed without having to shutdown the site itself. The site-preference is only applicable to VPWS services.

When not configured, the default is zero, indicating that the VPLS preference is not in use.

Default no site-preference, value=0

Parameters *preference-value* — Specifies the preference value to advertise in the NLRI L2 extended community for this site.

Values 1 to 65535

primary — Sets the site-preference to 65535.

backup — Sets the site-preference to 1.

Platforms All

23.246 size

size

Syntax **size** *cache-size*

Context **[Tree]** (config>app-assure>group>dns-ip-cache>ip-cache size)

Full Context configure application-assurance group dns-ip-cache ip-cache size

Description This command configures the maximum number of entries in the cache.

Default size 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *cache-size* — Specifies the maximum number of IP addresses that can be stored in the cache.

Values 10 to 32000

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

size

Syntax **size** *url-list-size*

Context **[Tree]** (config>app-assure>group>url-list size)

Full Context configure application-assurance group url-list size

Description This command specifies the size of the URL list that can be filtered. The size can be set to either standard or extended. Configuring the specified url-list as extended provides support for filtering on a larger number of URLs.

Default size standard

Parameters *url-list-size* — Specifies the size of the AA url-list for URL filtering.

Values standard, extended

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

size

Syntax **size** *octets*
no size

Context **[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy size)
[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy size)

Full Context configure saa test type-multi-line lsp-ping sr-policy size
configure saa test type-multi-line lsp-trace sr-policy size

Description This command configures the MPLS echo request packet size.

The **no** form of this command reverts to the default value.

Default size 1

Parameters *octets* — Specifies the size in octets. The request payload is padded with zeros to the specified size.

Values 1 to 9786

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

size

Syntax **size** *octets*
no size

Context **[Tree]** (config>test-oam>icmp>ping-template size)

Full Context configure test-oam icmp ping-template size

Description This command configures the size of the Data field (in other words, padding) of the outgoing ICMP echo packet. Minimum packet sizes should be used to test connectivity. Larger packet size should only be used if there is a requirement to spot-check large packet size issues on a very limited number of tests and should not be used for normal connectivity testing. Packet sizes should never be configured to require fragmentation anywhere along the path. Exceeding these recommendations will negatively affect the scale and performance of icmp ping check testing.

The **no** form of this command reverts to the default value.

Default size 56

Parameters *octets* — Specifies the size of the ICMP echo ping padding field, in octets.

Values 12 to 9786

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.247 size-limit

size-limit

Syntax **size-limit** *limit-value*
no size-limit

Context **[Tree]** (config>call-trace>location size-limit)

Full Context configure call-trace location size-limit

Description This command limits the total size of call-trace files on the specified compact flash card.

The **no** form of this command removes the size restriction.

Default size-limit 1000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *limit-value* — Specifies the total size of call-trace files on the specified compact flash card, in Mbytes.

Values 1 to 65536

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

size-limit

Syntax **size-limit** *limit-value*

Context **[Tree]** (config>call-trace>trace-profile size-limit)

Full Context configure call-trace trace-profile size-limit

Description This command specifies a maximum of how big a trace may grow before it is stopped.

Default size-limit 10

Parameters *limit-value* — Specifies the maximum data volume generated by a single call trace job to the output in megabytes. After reaching the limit the call trace job for a given host is automatically terminated.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.248 skip-gtp-ipv4-alloc

skip-gtp-ipv4-alloc

Syntax [**no**] **skip-gtp-ipv4-alloc**

Context **[Tree]** (config>subscr-mgmt>gtp>apn-policy>apn skip-gtp-ipv4-alloc)

Full Context configure subscriber-mgmt gtp apn-policy apn skip-gtp-ipv4-alloc

Description This command enables the ability to skip IPv4 address assignment using a GTP session setup response when PCO "allocation via NAS" is not present in a GTP session creation request. Without this configuration, IPv4 address allocation is done using GTP session setup response, even in absence of the PCO "allocation via NAS" in a GTP session setup request.

The **no** form of this command reverts to IPv4 address allocation using GTP.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.249 skip-ttl-decrement

skip-ttl-decrement

Syntax [**no**] **skip-ttl-decrement**

Context **[Tree]** (config>filter>gre-tun-tmp>ipv4 skip-ttl-decrement)

Full Context configure filter gre-tunnel-template ipv4 skip-ttl-decrement

Description This command enables an option to not decrement the TTL of the IP packet matching the IPv4/IPv6 filter, when it is encapsulated into the GRE tunnel header.

The **no** form of this command disables this option (default). This results in the matching of IP packet's TTL field to be decremented before it is encapsulated in the GRE tunnel header.

Platforms All

23.250 sla-profile

sla-profile

Syntax [**no**] **sla-profile**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute sla-profile)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute sla-profile

Description This command specifies that SLA profile attributes should be included into RADIUS accounting messages.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile

Syntax **sla-profile** *sla-profile-name*
no sla-profile

Context **[Tree]** (config>service>ies>if>sap>static-host sla-profile)
[Tree] (config>service>vpls>sap>static-host sla-profile)
[Tree] (config>service>ies>sub-if>grp-if>sap>static-host sla-profile)
[Tree] (config>service>vprn>if>sap>static-host sla-profile)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host sla-profile)

Full Context configure service ies interface sap static-host sla-profile
configure service ies subscriber-interface group-interface sap static-host sla-profile
configure service vpls sap static-host sla-profile
configure service vprn interface sap static-host sla-profile
configure service vprn subscriber-interface group-interface sap static-host sla-profile

Description This command specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

The **no** form of this command reverts to the default.

Parameters *sla-profile-name* — Specifies the SLA profile name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile

Syntax **sla-profile** *sla-profile-name* [**create**]
no sla-profile *sla-profile-name*

Context **[Tree]** (config>subscr-mgmt sla-profile)

Full Context configure subscriber-mgmt sla-profile

Description This command configures an SLA profile mapping. Hosts associated with a subscriber are subdivided into Service Level Agreement (SLA) profiles. For each subscriber host an SLA profile can be specified. For a subscriber host, the SLA profile determines:

- The QoS-policies to use
  - The classification
  - The queues
  - The queue mapping
- The IP filters to use

The SLA profile also has the attribute host-limits which limits the total number of hosts (belonging to the same subscriber) on a certain SAP that can be using this SLA profile.

The **no** form of this command reverts to the default.

Parameters *sla-profile-name* — Specifies the name of the SLA profile.

create — Keyword used to create the SLA profile.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.251 sla-profile-map

sla-profile-map

Syntax **sla-profile-map**

Context **[Tree]** (config>subscr-mgmt>sub-ident-pol sla-profile-map)

Full Context configure subscriber-mgmt sub-ident-policy sla-profile-map

Description Commands in this context configure SLA profile mapping parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile-map

Syntax **sla-profile-map**

Context **[Tree]** (config>subscr-mgmt>sub-prof sla-profile-map)

Full Context configure subscriber-mgmt sub-profile sla-profile-map

Description Commands in this context configure SLA profile mapping.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.252 sla-profile-string

sla-profile-string

Syntax **sla-profile-string** *sla-profile-string*
no sla-profile-string

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ident-strings sla-profile-string)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings sla-profile-string)

Full Context configure subscriber-mgmt local-user-db ipoe host identification-strings sla-profile-string
configure subscriber-mgmt local-user-db ppp host identification-strings sla-profile-string

Description This command specifies the SLA profile string which is encoded in the identification strings.

The **no** form of this command returns to the default.

Parameters *sla-profile-string* — Specifies the SLA profile string, up to 16 characters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile-string

Syntax **sla-profile-string** *string*
no sla-profile-string

Context **[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile sla-profile-string)

Full Context configure subscriber-mgmt vrgw brg brg-profile sla-profile-string

Description This command configures the SLA profile string which will be used as a default for SLA-profile lookup. This string can be overridden during BRG or host authentication.

The **no** form of the command removes the string from the configuration.

Default no sla-profile-string

Parameters *string* — Specifies the string to use to look up the subscriber profile.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.253 slaac

slaac

Syntax **slaac**

Context **[Tree]** (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client slaac)
[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client slaac)

Full Context configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client slaac
configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client slaac

Description This command configures SLAAC for the DHCPv6 client.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.254 slaac-prefix

slaac-prefix

Syntax **slaac-prefix** *ipv6-address*
no slaac-prefix

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query slaac-prefix)

Full Context configure subscriber-mgmt wlan-gw ue-query slaac-prefix

Description This command enables matching on UEs with the specified SLAAC prefix.

The **no** form of this command disables matching on the SLAAC prefix.

Default no slaac-prefix

Parameters *ipv6-address* — Specifies the SLAAC prefix.

Values	
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.255 sleep

sleep

Syntax **sleep** [*seconds*]

Context **[Tree]** (global sleep)

Full Context global sleep

Description This command causes the console session to pause operation (sleep) for 1 second (default) or for the specified number of seconds.

Default sleep 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the number of seconds for the console session to sleep, expressed as a decimal integer.

Values 1 to 100

Default 1

23.256 slice-size

slice-size

Syntax **slice-size** *slice-size*
no slice-size

Context **[Tree]** (config>mirror>mirror-dest slice-size)

Full Context configure mirror mirror-dest slice-size

Description This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

23.258 slope-policy

slope-policy

Syntax **slope-policy** *name*
no slope-policy

Context **[Tree]** (config>port>access>egress>channel>pool slope-policy)
[Tree] (config>port>access>egress>pool slope-policy)
[Tree] (config>port>access>ingress>pool slope-policy)
[Tree] (config>port>network>egress>pool slope-policy)

Full Context configure port access egress channel pool slope-policy
configure port access egress pool slope-policy
configure port access ingress pool slope-policy
configure port network egress pool slope-policy

Description This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The policy is defined in the **config>qos>slope-policy** context.

Default slope-policy default

Parameters *name* — Specifies the policy name, a string up to 32 characters.

Platforms All

slope-policy

Syntax **slope-policy** *slope-policy-name*
no slope-policy

Context **[Tree]** (config>card>fp>egress>wred-queue-control slope-policy)

Full Context configure card fp egress wred-queue-control slope-policy

Description This command configures WRED slopes within the WRED mega-pool. The WRED slopes in the WRED mega-pool are used when WRED queues are requesting buffers from the mega-pool while they are over their CBS threshold. Once over the CBS threshold, the WRED queue stops receiving buffers from the CBS reserve in the mega-pool and starts competing for buffers in the shared portion of the mega-pool. If the packet resulting in the buffer request is inplus-profile, the packet will be associated with the highplus-slope. In-profile packets are associated with the high slope. Out-of-profile packets are associated with the low slope. Exceed-profile packets are associated with the exceed slope. While the queue is within its CBS threshold, the slopes are ignored.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Within the defined slope-policy, each slope is enabled or disabled (no shutdown or shutdown) and each slope's geometry is defined as percentages of shared portion depth. If a slope is shutdown, the related traffic uses the minimum of the queue MBS and egress WRED megapool size as a drop tail.

The slope-policy also defines the time average factor (TAF) value that is used to determine how the pool's weighted average depth is calculated. The higher the factor, the slower the average depth tracks the actual pool depth.

The **no** form of this command reverts to the default slope policy to the WRED mega-pool.

Default slope-policy default

Parameters *slope-policy-name* — Specifies which slope policy the system should apply to the WRED mega-pool. When slope-policy is not executed, the WRED mega-pool will use the default slope policy. The defined slope policy must already exist or the command will fail. 32 characters maximum.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Description This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The slope policy is defined in the **config**>**qos**>**slope-policy** context.

Parameters *slope-policy-name* — Specifies the name of the slope policy, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

slope-policy

Syntax **slope-policy** *policy-name*
no slope-policy

Context **[Tree]** (config>qos>hs-pool-policy>mid-tier>mid-pool slope-policy)
[Tree] (config>qos>hs-pool-policy>root-tier>root-pool slope-policy)

Full Context configure qos hs-pool-policy mid-tier mid-pool slope-policy
configure qos hs-pool-policy root-tier root-pool slope-policy

Description This command specifies the slope policy to be used to define the high, low, and exceed slopes within the pool. The slope (high, low, or exceed) used on the egress queue for the packet that generated the buffer request is also used in the mid-pool from the applied slope policy. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly-generated number. If the probability decision generates a rejection decision or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the port-class and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated pool.

Default slope-policy _tmnx_hs_default

Parameters *policy-name* — Specifies the slope policy associated with this pool, up to 32 characters.

Platforms 7750 SR-7/12/12e

slope-policy

Syntax **slope-policy** *policy-name*
no slope-policy

Context **[Tree]** (config>qos>hs-port-pool-policy>alt-port-class-pools>class-pool slope-policy)

configure qos hs-port-pool-policy std-port-class-pools class-pool slope-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the slope policy that is used to define the high, low, and exceed slopes within the port-class pool. The slope used on the egress queue for the packet that generated the buffer request is also used in the class-pool. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly generated number. If the probability decision generates a rejection or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the mid-tier and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated class-pool.

Default slope-policy _tmnx_hs_default

Parameters *policy-name* — Specifies the policy name, up to 32 characters. This parameter is required when executing the **slope-policy** command and must refer to an existing slope policy within the system. If a slope policy with the specified name does not exist, the **slope-policy** command fails without modifying the slope behavior on the pool. A non-existent slope-policy error is generated. After a slope policy is associated with any HSQ queue or buffer pool, the policy cannot be deleted.

Platforms 7750 SR-7/12/12e

slope-policy

Syntax **slope-policy** *name* [**create**]
no slope-policy *name*

Context **[Tree]** (config>qos slope-policy)

Full Context configure qos slope-policy

Description Commands in this context configure a QoS slope policy.

Default slope-policy "default"

Parameters *name* — The name of the slope policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Platforms All

slope-policy

Syntax **slope-policy** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy slope-policy)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure qos copy slope-policy

Description This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters **slope-policy** — Indicates that the source policy ID and the destination policy ID are slope policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

```
ALA-7>config>qos# copy slope-policy default sp1
MINOR: CLI Destination "sp1" exists - use {overwrite}.
ALA-7>config>qos#overwrite
```

23.260 slow-queue-threshold

slow-queue-threshold

Syntax **slow-queue-threshold** *kilobits-per-second*
no slow-queue-threshold

Context **[Tree]** (config>card>virt-sched-adj slow-queue-threshold)

Full Context configure card virtual-scheduler-adjustment slow-queue-threshold

Description This command overrides the system default rate threshold where policers and queues are placed in the “slow” queue category. Slow rate policers and queues use a different minimum rate calculation interval time than fast rate queues. The rate is determined based on the previous calculated offered rate for the policer or queue.

The default slow policer or queue rate is 1 Mb/s. The fast rate is derived by multiplying the slow rate by a factor of 1.5 resulting in a default fast rate of 1.5 Mb/s. The slow-queue-threshold command uses a “Kilobit-Per-Second” value to modify the default slow queue rate threshold and indirectly changes the fast queue rate threshold.

The **no** form of this command restores the default slow queue and fast rate thresholds.

Default no slow-queue-threshold

Parameters *kilobits-per-second* — Specifies that the kilobit-per-second parameter is required and is used to modify the default slow rate threshold. Defining a value of 0 forces all policers and queues to be treated as fast rate. Defining a value of 1000 (1 Mb/s) returns the threshold to the default value and is equivalent to executing **no slow-queue-threshold**.

The fast rate threshold is derived by multiplying the new slow rate threshold by a factor of 1.5.

Values 0 to 1000000 kb/s

Default 1000 kb/s

Full Context configure service vprn log snmp-trap-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Default There are no default SNMP trap groups.

Parameters *log-id* | *log-name* — Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

name *log-name* — Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

Platforms All

Context [Tree] (config>service>ies>sub-if>grp-if>ipv6>dhcp6 snooping)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6 snooping)

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 snooping
configure service vprn subscriber-interface group-interface ipv6 dhcp6 snooping

Description This command enables the group-interface to snoop DHCPv6 relay messages exchange between the subscriber host and the DHCPv6 server. A successful DHCPv6 address assignment triggers ESM DHCPv6 host creation and a release of the lease triggers host deletion. This feature is for ESMv6 applications where a Layer 3 aggregation network is upstream from the BNG.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.268 sntp

sntp

Syntax [**no**] **sntp**

Context [Tree] (config>system>time sntp)

Full Context configure system time sntp

Description This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

soft-quota-exhausted

Syntax [**no**] **soft-quota-exhausted**

Context **[Tree]** (config>aaa>isa-radius-policy>acct-update-triggers soft-quota-exhausted)
[Tree] (config>subscr-mgmt>wlan-gw>ue-query soft-quota-exhausted)

Full Context configure aaa isa-radius-policy acct-update-triggers soft-quota-exhausted
configure subscriber-mgmt wlan-gw ue-query soft-quota-exhausted

Description This command sends an interim update message when a soft volume quota is reached.

Default soft-quota-exhausted

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.272 soft-quota-exhausted-filter

soft-quota-exhausted-filter

Syntax **soft-quota-exhausted-filter** *dsm-ip-filter-name*
no soft-quota-exhausted-filter

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm soft-quota-exhausted-filter)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm soft-quota-exhausted-filter)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt soft-quota-exhausted-filter
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt soft-quota-exhausted-filter

Description This command applies a filter when a soft volume quota is reached. The filter replaces the currently applied filter (which can be preconfigured using the **vlan-range ip-filter** command or be set using RADIUS authentication/ CoA message) for the UE upon quota exhaustion. If the quota is extended using a RADIUS CoA message, the filter is automatically reverted. Configuration changes apply only to new DSM UEs and not to existing UEs.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.273 software-repository

software-repository

Syntax **software-repository** *repository-name*
no software-repository

Context **[Tree]** (config>system>satellite>eth-sat software-repository)
[Tree] (config>system>satellite>tdm-sat software-repository)

Full Context configure system satellite eth-sat software-repository
configure system satellite tdm-sat software-repository

Description This command binds the specified software repository to the associated satellite. The software repository is used to locate and serve the correct software image to the satellite at boot time.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The configured software repository is only used when the satellite boots. Changing the software repository for an active satellite does not have an effect until the next time a satellite boots.

A satellite cannot be booted if there is no software repository defined for it.

The **no** form of the command removes the software repository.

Default no software-repository

Parameters *repository-name* — Specifies a string, up to 32 characters, that uniquely identifies the software repository.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat software-repository

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat software-repository

software-repository

Syntax **software-repository** *repository-name* [**create**]
no software-repository *repository-name*

Context **[Tree]** (config>system software-repository)

Full Context configure system software-repository

Description This command creates or deletes an instance of a software repository. The instance is identified by a repository name.

A software repository is used to obtain files to upgrade software on certain subsystems of the router (for example, Ethernet satellites).

Up to three locations can be specified within a software repository for the router to access files in the repository. The router will first attempt to access the file at the primary location. If the primary location is not configured or the files are not found at the primary location, then the router will attempt to access the files at the secondary location. If the secondary location is not configured or the files are not found at the secondary location, then the router will attempt to access the files at the tertiary location. If the tertiary location is not configured or the files are not found at the tertiary location, then the software repository access will fail.

The **no** form of the command removes the software repository.

Parameters *repository-name* — Specifies a string, up to 32 characters, that uniquely identifies the software repository.

create — Specifies the keyword required when the software-repository context is first created. Once the context is created, it can be accessed without the **create** keyword.

23.274 solicit-delay

solicit-delay

Syntax **solicit-delay** *delay*
no solicit-delay

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)
[Tree] (config>service>vprn>sub-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection solicit-delay)

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection solicit-delay
configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection solicit-delay
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection solicit-delay

Description This command configures the default time to delay DHCPv6 Solicit messages. The delay is applied to all DHCPv6 Solicit messages for which no per DHCPv6 server or per client MAC delay or preference option value is configured.

The **no** form of this command removes the delay timeout.

Parameters *delay* — Specifies the default amount of time to delay DHCPv6 Solicit messages, in deciseconds.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

solicit-delay

Syntax **solicit-delay** *delay*
no solicit-delay

configure router dhcp6 local-dhcp-server lease-hold-time-for solicited-release
configure service vprn dhcp local-dhcp-server lease-hold-time-for solicited-release
configure service vprn dhcp6 local-dhcp-server lease-hold-time-for solicited-release

Description This command enables the server to hold up a lease even in case of solicited release; for example, when the server receives a normal DHCP release message.

The **no** form of this command disables the ability of the server to hold up a lease when a solicited release is received.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.276 sonet-sdh

sonet-sdh

Syntax **sonet-sdh**

Context **[Tree]** (config>port sonet-sdh)

Full Context configure port sonet-sdh

Description This command enables access to the context to configure SONET/SDH ports. This context can only be used when configuring an OC-3 and OC-12 SONET/SDH ports on an appropriate MDA.

This command also enables access to the context to configure SONET/SDH parameters for an Ethernet port in WAN PHY (xgig wan) mode.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The 10 Gigabit Ethernet LAN port also has SONET/SDH characteristics. However, these characteristics are predetermined and not configurable.

This command is supported by TDM satellite.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls mesh-sdp igmp-snooping static group source
configure service vpls mesh-sdp mld-snooping static group source
configure service vpls sap igmp-snooping static group source
configure service vpls sap mld-snooping static group source
configure service vpls spoke-sdp igmp-snooping static group source
configure service vpls spoke-sdp mld-snooping static group source

Description
This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters
ip-address — Specifies the IPv4 unicast address

src-ipv6-address — Specifies the IPv6 unicast address.

Platforms
All

source

Syntax
source *ip-address*
no source

Context
[Tree] (config>service>ies>if>sap>ip-tunnel source)
[Tree] (config>service>vprn>if>sap>ip-tunnel source)

Full Context
configure service ies interface sap ip-tunnel source
configure service vprn interface sap ip-tunnel source

Description
This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default
no source

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
	x	[0..FFFF]H
	d	[0..255]D

Syntax [**no**] **source** *unicast-ip-prefix/mask*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vprn>msdp source)

Full Context configure service vprn msdp source

Description This command limits the number of active source messages the router accepts from sources in the specified address range.

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the $ prompt to indicate that a new entity (source) is being created should be used.

The source active msdp messages are not rate limited based on the source address range.

The **no** form of this message removes the source active rate limiter for this source address range.

Parameters *unicast-ip-prefix* — Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

mask — Specifies the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

Platforms All

source *source-type* **level** *level*
no source *source-type*

Context **[Tree]** (config>app-assure>group>anl source)

Full Context configure application-assurance group access-network-location source

Description This command configures location sources for the dynamic experience management. The location source types are, for example, 3G and congestion point.

Default source mobile-3g

Parameters *source-type* — Specifies the location or access technology.

Values **access-point** — Provides Dynamic Experience Management (DEM) for the WLGW access point.

Note: The access points do not need to support the Nokia CEA function.

level — Specifies which congestion point within the specified source-type to monitor for congestion.

Values **MAC+VLAN** — WLGW access point (MAC) and radio (VLAN).

Note: The access points do not need to support the Nokia CEA function.

Syntax **source mep** *mep-id* **domain** *md-index* **association** *ma-index*
source mep *mep-id* **domain-name** *admin-name* **association-name** *admin-name*
no source

Context **[Tree]** (config>oam-pm>session>ethernet source)

Full Context configure oam-pm session ethernet source

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active, however the frames sent frames and received as seen under the **show >oam-pm>statistics>session** *session-name* command is zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name* should be used.

The **no** form of this command removes this session parameter.

Parameters *mep-id* — Specifies the maintenance association end point identifier of the launch point.

Values 1 to 8191

md-index — Specifies the maintenance domain (MD) index value of the launch point. The **domain-name** *admin-name* parameter is preferred for specifying the domain information.

Values 1 to 4294967295

ma-index — Specifies the maintenance association (MA) index value of the launch point. The **association-name** *ma-name* parameter is preferred for specifying the association information.

Values 1 to 4294967295

admin-name — Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

Platforms All

source

Syntax **source** *ip-address*
no source

Context **[Tree]** (config>oam-pm>session>ip source)

Full Context configure oam-pm session ip source

Description This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

Parameters **source** — Indicates the launch point.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address — Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

source

Syntax **source** {**line-ref** | **internal-clock**}

Context **[Tree]** (config>system>sync-if-timing>bits>output source)

Full Context configure system sync-if-timing bits output source

Description This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output. This is either the signal recovered directly from ref1, ref2 or ptp, or it is the output of the node's central clock. The directly recovered signal would be used when the BITS output signal is feeding into an external standalone timing distribution device (BITS/SASE). The specific directly recovered signal used is the best of the available signals based of the QL and/or the ref-order. The central clock output would be used when no BITS/SASE device is present and the BITS output signal is used to monitor the quality of the recovered clock within the system.

Default source line-ref

Parameters **line-ref** — Specifies that the BITS output timing is selected from one of the input references, without any filtering.

internal-clock — Specifies that the BITS output timing is driven from the system timing.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source

Syntax **source** *ip-address*
no source

Context **[Tree]** (config>router>if>if-attr>delay>dyn>twamp>ipv4 source)

Full Context configure router interface if-attribute delay dynamic twamp-light ipv4 source

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the unicast IPv4 address used as the source of the TWAMP Light test packet. When this command is not configured, the primary IPv4 address, or the reference IPv4 address in the case of unnumbered interfaces, is used as the source. This command can be used when the IPv4 primary address or reference interface is not the desired source address for the packet.

Changes are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the specified address, which causes the source address to be auto-learned.

Default no source

Parameters *ip-address* — Specifies TWAMP Light IPv4 source address.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source

Syntax **source** *ipv6-address*
no source

Context **[Tree]** (config>router>if>if-attr>delay>dyn>twamp>ipv6 source)

Full Context configure router interface if-attribute delay dynamic twamp-light ipv6 source

Description This command configures the IPv6 address used as the source of the TWAMP Light test packet. When this command is not configured, no source address is present and an error is raised to prevent the transmission of the test packet.

The IPv6 protocol can be enabled even without addressing. However, the test will not transmit packets. The link local address must be in the form fe80::/64 in accordance with RFC 4291, *IP Version 6 Addressing Architecture*.

The **no** form of this command removes the specified address.

Default no source

Parameters *ipv6-address* — Specifies the TWAMP Light IPv6 source address.

Values

ipv6-address:	x:x:x:x:x:x:x:x
	x - [0 to FFFF]H
	unicast and link local IPv6 address only

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>aaa>l2tp-acct-plcy>radius-acct-server source-address)

Full Context configure aaa l2tp-accounting-policy radius-accounting-server source-address

Description This command configures the source address of the RADIUS messages.

The **no** form of this command reverts to the default value.

Parameters *ip-address* — Specifies the source address to be used for NAT RADIUS accounting.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>system>management-interface>remote-management source-address)

Full Context configure system management-interface remote-management source-address

Description This command configures the address local to this device that NISH uses to connect to this node.

If this command is also configured for a specific manager in the **config**>**system**>**management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the source address based on the selected routing instance of the manager.

Parameters *ip-address* — Specifies the IP address that NISH managers use to connect to the node.

Values

ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d

[Tree] (config>subscr-mgmt>acct-plcy>server source-address)

Full Context configure subscriber-mgmt radius-accounting-policy radius-accounting-server source-address
configure subscriber-mgmt authentication-policy radius-authentication-server source-address

Description This command configures the source address of the RADIUS packet.

The system IP address must be configured in order for the RADIUS client to work. See Configuring a System Interface in the Router Configuration Guide.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if **no source-address** was given.

The **no** form of this command reverts to the default value.

Default System IP address

Parameters *ip-address* — Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax **source-address** *ip-address* [**allow-connections**]
no source-address

Context **[Tree]** (config>aaa>diam>node source-address)

Full Context configure aaa diameter node source-address

Description This command configures IPv4 source address that the SR OS node will use for its peering connection.

The **no** form of this command removes the IP address from the configuration.

Parameters *ip-address* — Specifies IP prefix for the IP match criterion in dotted decimal notation

Values 0.0.0.0 **to** 255.255.255.255

allow-connections — Specifies to accept peering connections on the configured source IPv4 address. The peer initiating the connection can only be an inter-chassis peer.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>redundancy>multi-chassis>peer source-address)

Platforms All

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>router>ldp>lsp-bfd source-address)

Full Context configure router ldp lsp-bfd source-address

Description This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, then an alternate routable IP address that is local to the source node should be used.

Default no source-address

Parameters *ip-address* — Specifies a routable IPv4 or IPv6 address that is local to the node.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF in hexadecimal
d — 0 to 255 in decimal

Full Context configure application-assurance radius-accounting-policy radius-accounting-server source-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the source address of the RADIUS packet. The system IP address must be configured in order for the RADIUS client to work. See “Configuring a System Interface” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide*. The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if no source address was given.

The **no** form of this command reverts to the default value, where the source address is the system IP address.

Default no source-address

Parameters *ip-address* — The IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 - 255.255.255.255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>service>ipfix>export-policy>collector source-address)

Full Context configure service ipfix ipfix-export-policy collector source-address

Description This command configures the source address from which UDP streams containing IPFIX flow records will be sourced.

Default no source-address

Parameters *ip-address* — Source IPv4 address from which UDP streams are sent.

Platforms All

source-address

Syntax **source-address** *ip-address*
no source-address

Context **[Tree]** (config>filter>gre-tun-tmp>ipv4 source-address)

Full Context configure filter gre-tunnel-template ipv4 source-address

Description This command defines the source IPv4 address to be used in the GRE IP header used to encapsulate the matching IPv4/IPv6 packet. This IP address can be configured as any value and is not validated against a local IP address. The **source-address** command must be configured for the template to be valid.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the source IP address configuration from the associated GRE tunnel template.

Parameters *ip-address* — Specifies the IPv4 address (in dotted decimal notation) to be used as the source address.

Platforms All

source-address

Syntax **source-address** [*ip-address*]
no source-address

Context **[Tree]** (config>filter>redirect-policy>dest>ping-test source-address)

Full Context configure filter redirect-policy destination ping-test source-address

Description This command configures the source address to use in the IP packet of the ping test for this destination.

Default no source-address

Parameters *ip-address* — The source address of the IP packet. This can be IPv4 only for an IPv4 destination and IPv6 only for an IPv6 destination.

Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms All

source-address

Syntax **source-address**

Context **[Tree]** (config>system>security source-address)

Full Context configure system security source-address

Description This command specifies the IP source address that is used in all unsolicited packets sent by the application.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This configuration applies to packets transmitted in-band (for example, a network port on an IOM) and does not apply to packets transmitted out-of-band on the management interface on the CPM ethernet port. Packets transmitted using the CPM ethernet port use the address of the CPM ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

Platforms All

source-address

Syntax **source-address** *ip-address*

Context **[Tree]** (config>system>security>dot1x>radius-plcy source-address)

Full Context configure system security dot1x radius-plcy source-address

Description This command configures the NAS IP address to be sent in the RADIUS packet.

The **no** form of this command reverts to the default value.

Parameters *ip-address* — Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255

Platforms All

source-address

Syntax **source-address** *ip-address*
source-address prefix-list *prefix-list-name*
no source-address

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from source-address)

Full Context configure router policy-options policy-statement entry from source-address

Description This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

Default no source-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values ipv4-address:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-list-name — The prefix list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

Full Context configure aaa diameter-peer-policy source-address

Description This command configures the IPv4 source address that the SR OS node uses for the peering policy.

The **no** form of this command removes the IP address from the configuration.

Parameters *ip-address* — Specifies the IP prefix for the IP match criterion in dotted decimal notation

Values 0.0.0.0 to 255.255.255.255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address

Syntax **source-address** *ipv6-address*
no source-address

Context **[Tree]** (config>router>segment-routing>srv6 source-address)

Full Context configure router segment-routing segment-routing-v6 source-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the global default source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. This value is inherited in the BGP and service contexts by default, but can be overwritten in each context. A maximum of 16 address values can be configured in all contexts in the system.

There is no default value for this command. A default source IPv6 address must be configured in this context or in the BGP or service context. The system does not check if the entered address is a valid local address.

The **no** form of this command removes the source IPv6 address from the configuration.

Parameters *ipv6-address* — Specifies the source IPv6 address of the SRv6.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

source-address

Syntax **source-address** *ipv6-address*
no source-address

Context **[Tree]** (config>router>bgp>srv6 source-address)

Full Context configure router bgp segment-routing-v6 source-address

Description This command configures the source IPv6 address for SRv6.

This command overrides the source IPv6 address for all address families in the base router instance. By default, BGP uses the value from the top level configuration under **config**>**router**>**segment-routing**>**segment-routing-v6**.

The **no** form of this command removes the source IPv6 address from the configuration.

Default no source-address

Parameters *ipv6-address* — Specifies the source IPv6 address of the SRv6.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

23.279 source-address-range

source-address-range

Syntax **source-address-range** *start-ip-address*
no source-address-range

Context **[Tree]** (config>aaa>isa-radius-plcy>servers source-address-range)

Full Context configure aaa isa-radius-policy servers source-address-range

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the first IP address in the range of IPv4 addresses that are assigned to a BB-ISA in a given NAT group for NAT RADIUS accounting. The IP addresses are unique within the NAT group and are used to bind the RADIUS client instantiated on each BB-ISA card. The number of IPv4 addresses allocated is equal to the number of BB-ISAs in a NAT group that are enabled for NAT RADIUS accounting. Although only the first IPv4 address is explicitly configured with this command, each internally allocated IPv4 address associated with the BB-ISA card can be seen in the routing table (via show commands) as /32 with protocol designation 'NAT'.

Default no source-address-range

Parameters *start-ip-address* — The starting IP address of the IP address range.

Values 0.0.0.0 - 255.255.255.255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-address-range

Syntax [**no**] **source-address-range start** *ip-address* **end** *ip-address*

Context **[Tree]** (config>service>vprn>wlan-gw>gtp>source-ranges source-address-range)

Full Context configure service vprn wlan-gw gtp source-ranges source-address-range

Description This command configures a range of IP addresses used by ISA MDA's as source address in GTP messages.

The **no** form of this command removes the IP address ranges.

Parameters **start** *ip-address* — Specifies the start of the source IP address range.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D

end *ip-address* — Specifies the end of the source IP address range.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0..FFFF]H

23.280 source-bmac

source-bmac

Syntax **source-bmac** *ieee-address*
no source-bmac

Context **[Tree]** (config>service>pbb source-bmac)

Full Context configure service pbb source-bmac

Description This command configures the source B-VPLS MAC address to use with PBB and provisions a chassis level source B-MAC.

Parameters *ieee-address* — The MAC address assigned to the B-MAC. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms All

source-bmac

Syntax **source-bmac** *ieee-address*

Context **[Tree]** (config>service>vpls>pbb source-bmac)

Full Context configure service vpls pbb source-bmac

Description This command configures the base source B-MAC for the B-VPLS. The first 32 bits must be the same with what is configured in the MC-LAG peer. If not configured here, it will inherit the chassis level B-MAC configured under the new PBB object added in the previous section. If the **use-sap-bmac** command is on, the value of the last 16 bits (lsb) of the source B-MAC must be part of the **reserved-source-bmac-lsb** configured at chassis level, under service PBB component. If that is not the case, the command will fail.

Platforms All

23.281 source-bmac-lsb

source-bmac-lsb

Syntax **source-bmac-lsb** *MAC-Lsb* [**es-bmac-table-size** *size*]
no source-bmac-lsb

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>system>bgp-evpn>eth-seg source-bmac-lsb)

Full Context configure service system bgp-evpn ethernet-segment source-bmac-lsb

Description This command configures the least significant two bytes of the B-MAC used as the source B-MAC for packets generated from the Ethernet-Segment in PBB-EVPN.

When the multi-homing mode is **all-active**, this value and the first high order four bytes must match on all the PEs that are part of the same Ethernet-Segment.

The **es-bmac-table-size** parameter modifies the default value (8) for the maximum number of virtual bmacs that can be associated to the Ethernet-Segment, that is, the es-bmacs. When the **source-bmac-lsb** is configured, the associated **es-bmac-table-size** is reserved out of the total FDB. The es-bmac will consume a separate B-MAC per B-VPLS that is linked to an Ethernet-Segment.

Parameters *MAC-Lsb* — Specifies the two least significant bytes of the es-bmac.

Values 1 to 65535, or xx-xx or xx:xx

size — Specifies the reserved space in the FDB for a specified es-bmac. By default the system reserves 8 entries for a specified Ethernet-Segment B-MAC.

Values 1 to 511999

Default 8

Platforms All

source-bmac-lsb

Syntax **source-bmac-lsb** *mac-lsb* **control-pw-vc-id** *vc-id*
no source-bmac-lsb

Context [Tree] (config>service>sdp source-bmac-lsb)

Full Context configure service sdp source-bmac-lsb

Description This command defines the 16 least significant bits (lsb) which, when combined with the 32 most significant bits of the PBB **source-bmac**, are used as the virtual backbone MAC associated with this SDP. The virtual backbone MAC is used as the source backbone MAC for traffic received on a PBB EPIPE spoke-SDP with **use-sdp-bmac** configured (that is, a redundant pseudowire) and forwarded into the B-VPLS domain.

The control-pw-vc-id defines VC identifier of the spoke-SDP relating to the control pseudowire whose status is to be used to determine whether SPBM advertises this virtual backbone MAC. This is a mandatory parameter when the **source-bmac-lsb** is added or changed. The spoke SDP must have the parameter **use-sdp-bmac** for the control pseudowire to be active.

Default no source-bmac-lsb

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mac-lsb* — Specifies the 16 least significant bits of the virtual backbone MAC associated with this SDP.

Values 1 to 65535 or xx-xx or xx:xx

control-pw-vc-id *vc-id* — Specifies the VC identifier of the control pseudowire.

Values 1 to 4294967295

23.282 source-class

source-class

Syntax **source-class** *source-index*
no source-class [*source-index*]

Context **[Tree]** (config>service>vprn>static-route-entry>indirect source-class)
[Tree] (config>service>vprn>static-route-entry>ipsec-tunnel source-class)
[Tree] (config>service>vprn>static-route-entry>next-hop source-class)

Full Context configure service vprn static-route-entry indirect source-class
configure service vprn static-route-entry ipsec-tunnel source-class
configure service vprn static-route-entry next-hop source-class

Description This command configures the policy accounting source-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

If source route policy accounting is enabled and a source-class index is configured, traffic with a source IP address matches the associated static route, the source accounting statistics for the specified class will be incremented.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

Default no source-class

Parameters *source-index* — Specifies an integer value for the accounting source class index.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class

Syntax **source-class** *source-index*

no source-class [*source-index*]

Context **[Tree]** (config>router>static-route-entry>indirect source-class)
[Tree] (config>router>static-route-entry>next-hop source-class)

Full Context configure router static-route-entry indirect source-class
configure router static-route-entry next-hop source-class

Description This command configures the policy accounting source-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

If source route policy accounting is enabled and a source-class index is configured, traffic with a source IP address matches the associated static route, the source accounting statistics for the specified class will be incremented.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

Default no source-class

Parameters *source-index* — Specifies an integer value for the accounting source class index.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class

Syntax **source-class** *index* [*index*]
source-class {*index* | **all**}

Context **[Tree]** (config>router>policy-acct-template source-class)

Full Context configure router policy-acct-template source-class

Description This command configures a source class index.

The **no** form of this command deletes the specified source class index.

Parameters *index* — Specifies the index value.

Values 1 to 255

all — Deletes all the source class indices.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class

Syntax **source-class** [*value*]
no source-class

© 2022 Nokia.

Context [Tree] (config>router>policy-options>policy-statement>entry>action source-class)
[Tree] (config>router>policy-options>policy-statement>default-action source-class)

Full Context configure router policy-options policy-statement default-action source-class
configure router policy-options policy-statement entry action source-class

Description This command specifies the policy accounting source class index to associate with matched routes.

Parameters *value* — Specifies the default operational source-class for this policy statement.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

23.283 source-destination-prefix

source-destination-prefix

Syntax [**no**] **source-destination-prefix**

Context [Tree] (config>cflowd>collector>aggregation source-destination-prefix)

Full Context configure cflowd collector aggregation source-destination-prefix

Description This command configures cflowd aggregation based on source and destination prefixes.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms All

23.284 source-ip

source-ip

Syntax **source-ip** *ip-address*
no source-ip

Context [Tree] (config>subscr-mgmt>shcv-policy>vpls source-ip)

Full Context configure subscriber-mgmt shcv-policy vpls source-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the IPv4 address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IPv4 address to be used as source address for connectivity verification in a VPLS service.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-ip

Syntax **source-ip** *ipv6-address*
no source-ip

Context **[Tree]** (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client source-ip)

23.286 source-ip-origin

source-ip-origin

Syntax **source-ip-origin** {**interface** | **vrrp**}
no source-ip-origin

Context **[Tree]** (config>subscr-mgmt>shcv-policy>layer-3 source-ip-origin)

Full Context configure subscriber-mgmt shcv-policy layer-3 source-ip-origin

Description This command selects the source IP address to be used for SHCV messages.

The **no** form of this command reverts to the default.

Parameters **interface** — Specifies to use the interface IP as the source address of SHCV.

vrrp — Specifies to use the VRRP configured IP as the source address of SHCV.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.287 source-mac

source-mac

Syntax **source-mac** *ieee-address*
no source-mac

Context **[Tree]** (config>subscr-mgmt>shcv-policy>vpls source-mac)

Full Context configure subscriber-mgmt shcv-policy vpls source-mac

Description Specifies the MAC address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

Parameters *ieee-address* — Specifies the 48-bit MAC address in the xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

23.288 source-override

source-override

Syntax **source-override** *ip-address* [**create**]
no source-override *ip-address*

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel source-override)

Full Context configure mcast-management multicast-info-policy bundle channel source-override

Description This command defines a multicast channel parameter override context for a specific multicast sender within the channel range. The specified sender's IP address must be the same IP type, IPv4 or IPv6, as defined in the **channel** command.

The **no** form of this command removes the specified sender override context from the channel range.

Parameters *ip-address* — Specifies either an IPv4 or IPv6 address and must be the same IP type as the containing **channel** command range.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

create — The **create** keyword is required if creating a new source override when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified source override IP address already exists.

Platforms All

23.289 source-port

source-port

Syntax **source-port** *port-num*
no source-port

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>video source-port)

Full Context configure mcast-management multicast-info-policy bundle video source-port

Description This command configures the source port for upstream RET requests. The **source-port** *port-num* value is the only configuration parameter in the bundle "default" context.

The **no** form of the command removes the value from the configuration.

Parameters *port-num* — Specifies the source port in the received RTP multicast stream.

Values 1024 to 65535

source-port

Syntax **source-port** *port-id*
no source-port

Context [Tree] (config>system>sync-if-timing>ref1 source-port)
[Tree] (config>system>sync-if-timing>ref2 source-port)

Full Context configure system sync-if-timing ref1 source-port
configure system sync-if-timing ref2 source-port

Description This command configures the source port for timing reference **ref1** or **ref2**. If the port is unavailable or the link is down, then the reference sources are re-evaluated according to the reference order configured in the **ref-order** command.

In addition to physical port on the 7750 SR, T1 or E1 channels on a channelized OC3/OC12/STM1/STM4 Circuit Emulation Service port can be specified if they are using adaptive timing.

There are restrictions on the source-port location for **ref1** and **ref2** based on platform. Refer to the description of the **ref1** command for details.

Default no source-port

Parameters *port-id* — Identifies the physical port in the *slot/mda/port*, **esat**-*id*/*slot*/*port*, or **pxc**-*id*.*sub-port* format.

Values *slot*/*mda*/*port* [.*channel*]

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-port

Syntax **source-port** *port*
source-port grpc
no source-port

Context [Tree] (config>system>management-interface>remote-management source-port)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system management-interface remote-management source-port

Description This command configures the TCP port local to this device that NISH uses to send packets to this node.

If this command is also configured for a specific manager in the **config**>**system**>**management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the default gRPC port, 57400.

Default source-port grpc

Parameters *port* — Specifies the TCP source port.

Values 1 to 65535

grpc — Keyword that specifies the default gRPC protocol port as the source port.

Platforms All

source-port

Syntax **source-port** *port*
source-port grpc
no source-port

Context **[Tree]** (config>system>management-interface>remote-management>manager source-port)

Full Context configure system management-interface remote-management manager source-port

Description This command configures the TCP port local to this device that this NISH manager uses to send packets to this node.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the source port to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters *port* — Specifies the TCP source port.

Values 1 to 65535

Default 57400

grpc — Keyword that specifies the default gRPC protocol port as the source port.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.290 source-prefix

source-prefix

Syntax [**no**] **source-prefix**

Context **[Tree]** (config>cflowd>collector>aggregation source-prefix)

Full Context configure cflowd collector aggregation source-prefix

Description This command configures cflowd aggregation based on source prefix information.

The **no** form of this command removes this type of aggregation from the collector configuration.

Platforms All

23.291 source-prefix-list

source-prefix-list

Syntax **source-prefix-list** *prefix-list-name*
no source-prefix-list

Context **[Tree]** (config>service>vprn>nat>inside source-prefix-list)
[Tree] (config>router>nat>inside source-prefix-list)

Full Context configure router nat inside source-prefix-list
configure service vprn nat inside source-prefix-list

Description This command references the **nat-prefix-list** that contains source IP addresses on the inside (private side).

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the **dnat-only** case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

Default none

Parameters *prefix-list-name* — Specifies the name, up to 32 characters in length, of the NAT prefix list that contains the source IP addresses (original IP addresses).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.292 source-udp-port

source-udp-port

Syntax **source-udp-port** *udp-port-number*
no source-udp-port

Context **[Tree]** (config>oam-pm>session>ip source-udp-port)

Full Context configure oam-pm session ip source-udp-port

Description This command should only be used if a TWAMP Client is used to establish a TCP connection and communicate the test parameters to a TWAMP Server over TWAMP TCP Control and the test is launched from OAM-PM (Session-Sender). This command should not be used when the reflection point is a TWAMP Light reflector that does not require TCP TWAMP Control. When this command is included, the source UDP range is restricted. When this command is omitted, the source UDP port is dynamically allocated by the system.

The **no** form of this command removes the source UDP port setting when the default allocation is used.

Parameters *udp-port-number* — Specifies the UDP source port.

Values 64374 to 64383

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.293 source-vtep-security

source-vtep-security

Syntax [**no**] **source-vtep-security**

Context **[Tree]** (config>service>vpls>vxlan source-vtep-security)

Full Context configure service vpls vxlan source-vtep-security

Description This command enables the outer IP Source Address lookup of incoming VXLAN packets, and discards those coming from untrusted VTEPs. The list of trusted VTEPs is shown in the **show service vxlan** command. Specifically, it shows the existing learned EVPN VTEPs (always trusted), and the statically configured VTEPs in any service (Epipe and VPLS).

The command is supported in VXLAN instances with static egress VTEPs or VXLAN instances with EVPN created VTEPs.

The **no** version of this command disables the outer IP source address lookup.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no source-vtep-security

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.294 sp-reverse-route

sp-reverse-route

Syntax **sp-reverse-route** [**ignore-default-route**]
no sp-reverse-route

Context **[Tree]** (config>ipsec>tnl-temp sp-reverse-route)

Full Context configure ipsec tunnel-template sp-reverse-route

Description This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

Default no sp-reverse-route

Parameters **ignore-default-route** — Specifies to ignore any full range traffic selector in TSi.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.295 space

space

Syntax [**no**] **space**

Context **[Tree]** (config>system>management-interface>cli>md-cli>environment>command-completion space)

Full Context configure system management-interface cli md-cli environment command-completion space

Description This command enables completion on the space character.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default space

Platforms All

23.296 spb

spb

Syntax **spb** [*isis-instance*] [**fid** *fid*] [**create**]
no spb

Context **[Tree]** (config>service>vpls spb)
[Tree] (config>service>vpls>sap spb)
[Tree] (config>service>vpls>spoke-sdp spb)

Full Context configure service vpls sap spb
configure service vpls spb
configure service vpls spoke-sdp spb

Description This command enables Shortest Path Bridging (SPB) on a B-VPLS instance. SPB uses IS-IS that supports multiple instances, therefore an instance must be specified. The declaration of SPB in this context is the control configuration for the SPB. This is an SPB management interface and it manages the configuration for IS-IS. Various parameters that define this SPB instance are configured under this SPB instance. Several of the parameters are shared with other B-VPLS service instances using SPB.

SPB enables an instance of IS-IS protocol with the **no shutdown** command. Alternatively, the IS-IS protocol instance under SPB is disabled with the **shutdown** command in the **config>service>vpls b-vpls>spb** context.

A Forwarding Identifier (FID) is optionally specified which is an abstraction of the BVID used for forwarding in SPB. When no FID is configured the control VPLS is advertised with FID value 1. When a FID value is specified, the control VPLS is advertised and associated with the FID value specified. The default algorithm for any FID declared or implicit is low-path-id. When a FID is specified, the ect-algorithm can be specified for the FID and changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID for a control instance cannot be changed after it is created. To change a FID the SPB component would have to be shutdown, deleted and re-created with a new FID.

Note: SPB operates with disable-learning, disable aging and discard-unknown. The state of these commands is ignored when SPB is configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no spb

Parameters *isis-instance* — Specifies the instance ID for an SPB IS-IS instance.

Values 1024 to 2047 (4 available)

Default 1024

FID — Specifies the FID value.

Values 1 to 4095

Default 1

Platforms All

23.297 spbm-control-vpls

spbm-control-vpls

Syntax **spbm-control-vpls** *service-id* **fid** *fid*
no spbm-control-vpls

Context **[Tree]** (config>service>vpls>b-vpls spbm-control-vpls)

Full Context configure service vpls b-vpls spbm-control-vpls

Description This command associates a user B-VPLS with a particular control B-VPLS and a FID. The ECT algorithm and the behavior of unicast and multicast come from the association to the FID.

A Forwarding Identifier (FID) is specified which is an abstraction of the BVID used for forwarding in SPB. The ect-algorithm is associated with the FID and can be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

Parameters *service-id* — The B-VPLS service identifier.

Values 1 to 2147483647 | *svc-name*: 64 characters max

fid — The forwarding identifier.

Values 1 to 4095

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.298 spe-address

spe-address

Syntax **spe-address** *global-id:prefix*
no spe-address

Context **[Tree]** (config>service>pw-routing spe-address)

Full Context configure service pw-routing spe-address

Description This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default no spe-address

Parameters *global-id* — Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values

<global-id:prefix>:	<global-id>:{<prefix>| <ipaddress>}
global-id	1 to 4294967295
prefix	1 to 4294967295
ipaddress	a.b.c.d

23.299 speed

speed

Syntax **speed** {**10** | **100** | **1000** | **10000** | **25000** | **40000** | **50000** | **100000**}

Context **[Tree]** (config>port>ethernet speed)

Full Context configure port ethernet speed

Description For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default dependent on port type

Parameters **10** — Sets the link to 10 Mb/s speed.

100 — Sets the link to 100 Mb/s speed.

1000 — Sets the link to 1000 Mb/s speed.

10000 — Sets the link to 10000 Mb/s speed.

25000 — Sets the link to 25000 Mb/s speed.

40000 — Sets the link to 40000 Mb/s speed.

50000 — Sets the link to 50000 Mb/s speed.

100000 — Sets the link to 100000 Mb/s speed.

Platforms All

speed

Syntax **speed** {**oc3** | **oc12**}
no speed

Context **[Tree]** (config>port>sonet-sdh speed)

Full Context configure port sonet-sdh speed

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the speed of a SONET/SDH port as either OC3 or OC12. The framer for this MDA operates in groups of four. Changing the port speed for a port requires resetting the framer and causes a slight disruption on all four ports. The first framer controls ports 1,2,3,4, the second framer controls ports 5,6,7,8 and so on.

To change the port speed on a SONET/SDH port, the port must be administratively shut down and all channels must be removed. When the port speed is changed, the default channel configuration is recreated.

The **no** form of this command reverts back to default.

This command is supported on TDM satellite.

Default speed oc12

Parameters **oc3** — Sets the speed of the port to OC-3.

oc12 — Sets the speed of the port to OC-12.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

speed

Syntax **speed** {**56** | **64**}

Context **[Tree]** (config>port>tdm>ds1>channel-group speed)
[Tree] (config>port>tdm>e1>channel-group speed)

Full Context configure port tdm ds1 channel-group speed
configure port tdm e1 channel-group speed

Description This command sets the speed of the DS-0 channels used in the associated channel-group.

Default speed 64

Parameters **56** — Specifies that 56k byte (7-bits per byte) encoding will be used for the associated DS-0 channels. This channel speed value is only supported on the m4-chds3-as and m12-chds3-as MDAs and on DS-1 channels (ESF and SF framing) and not on E-1 (G.704) channels.

64 — Specifies that 64k byte (8-bits per byte) encoding will be used for the associated DS-0 channels.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

speed

Syntax **speed** *speed*

Context **[Tree]** (bof speed)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context bof speed

Description This command configures the speed for the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).

If the port is configured to autonegotiate, this parameter is ignored.

Available speed options are dependent on the specific CPM variant in the system.

Default speed 100

Parameters *speed* — Sets the link speed, in Mb/s.

Values 10, 100, 1000

Platforms All

23.300 spf

spf

Syntax [**no**] **spf** [*level-number*] [*system-id*]

Context **[Tree]** (debug>router>isis spf)

Full Context debug router isis spf

Description This command enables debugging for IS-IS SFP.

The **no** form of the command disables debugging.

Parameters *system-id* — When specified, only the specified system-id is debugged. A 6-octet system identifier (xxxx.xxxx.xxxx).

level-number — Specifies the interface level (1, 2, or 1 and 2).

Platforms All

spf

Syntax **spf** [**type**] [*dest-addr*]
no spf

Context **[Tree]** (debug>router>ospf spf)
[Tree] (debug>router>ospf3 spf)

Full Context debug router ospf spf
debug router ospf3 spf

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables debugging for OSPF SPF. Information regarding overall SPF start and stop times will be shown. To see detailed information regarding the SPF calculation of a given route, the route must be specified as an optional argument.

Parameters *type* — Specifies the area to debug.

Values intra-area, inter-area, external

dest-addr — Specifies the destination IP address to debug.

Platforms All

23.301 spf-wait

spf-wait

Syntax **spf-wait** *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]
no spf-wait

Context **[Tree]** (config>service>vpls>b-vpls>spb>timers spf-wait)

Full Context configure service vpls b-vpls spb timers spf-wait

Description This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

Default no spf-wait

Parameters *spf-wait* — Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 to 120000

Default 10000

spf-initial-wait — Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 to 100000

Default 1000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

spf-second-wait — Specifies the hold time in milliseconds between the first and second SPF calculation.

Values 10 to 100000

Default 1000

spf-wait

Syntax **spf-wait** *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]
no spf-wait

Context **[Tree]** (config>service>vpls>spb>timers spf-wait)

Full Context configure service vpls spb timers spf-wait

Description This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, and so on, until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

Note: The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default spf-wait 10000 spf-initial-wait 1000 spf-second-wait 1000

Parameters *spf-wait* — Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 to 120000

Default 10000

initial-wait — Specifies the initial SPF calculation delay in milliseconds after a topology change

Values 10 to 100000

23.302 spi

spi

Syntax **spi** *spi*
no spi

Context **[Tree]** (config>ipsec>static-sa spi)

Full Context configure ipsec static-sa spi

Description This command configures the SPI key value for an IPsec manual SA.

This command specifies the SPI (Security Parameter Index) used to lookup the instruction to verify and decrypt the incoming IPsec packets when the value of the **direction** command is **inbound**.

The SPI value specifies the SPI that will be used in the encoding of the outgoing packets when the when the value of the **direction** command is **outbound**. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

If **no spi** is selected, then this static SA cannot be used.

The **no** form of this command reverts to the default value.

Default no spi

Parameters *spi* — Specifies the security parameter index for this SA.

Values 256 to 16383

Platforms All

23.303 spi-load-balancing

spi-load-balancing

Full Context configure subscriber-mgmt local-user-db ipoe host identification-strings spi-sharing-group-id
configure subscriber-mgmt local-user-db ppp host identification-strings spi-sharing-group-id

Description This command configures the SLA Profile Instance (SPI) sharing group identifier for an IPoE or PPPoE session. It overrides the default SPI sharing method (**def-instance-sharing**) configured in the SLA profile.

When an spi-sharing-group-id is configured, the IPoE or PPPoE session shares the SLA Profile Instance with other IPoE or PPPoE sessions from the same subscriber that: have the same SLA profile associated, are active on the same SAP, and have the same group identifier.

Configuring an **spi-sharing-group-id** *group-id* for an IPoE host, when the IPoE session is disabled on the group interface, results in a setup failure.

The **no** form of this command returns the SPI sharing group identifier to its default.

Parameters *group-id* — Specifies the SPI group identifier.

Values 0 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

spi-sharing-id

Syntax [**no**] **spi-sharing-id**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute spi-sharing-id)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute spi-sharing-id

Description This command enables RADIUS accounting messages to include the Alc-SPI-Sharing-Id RADIUS attribute. Together with the SLA profile name, this attribute provides details on the applicable SPI or queuing instance for this accounting session.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.306 split-horizon

split-horizon

Syntax **split-horizon**
no split-horizon

Context **[Tree]** (config>service>vprn>bgp split-horizon)
[Tree] (config>service>vprn>bgp>group split-horizon)
[Tree] (config>service>vprn>bgp>group>neighbor split-horizon)

Full Context configure service vprn bgp group neighbor split-horizon
configure service vprn bgp group split-horizon
configure service vprn bgp split-horizon

Description This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution: Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default no split-horizon

Platforms All

split-horizon

Syntax **split-horizon** {**enable** | **disable**}
no split-horizon

Context **[Tree]** (config>service>vprn>rip split-horizon)

configure service vprn rip group split-horizon
configure service vprn rip split-horizon
configure service vprn ripng group neighbor split-horizon
configure service vprn ripng group split-horizon
configure service vprn ripng split-horizon

Description This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as “counting to infinity”. Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default split-horizon enable

Parameters **enable** — Enables split horizon and poison reverse.

disable — Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

Full Context configure router rip group neighbor split-horizon
configure router rip group split-horizon
configure router rip split-horizon
configure router ripng group neighbor split-horizon
configure router ripng group split-horizon
configure router ripng split-horizon

Description This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as “counting to infinity”. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default enabled

Parameters **enable** — Specifies enable split horizon and poison reverse.

disable — Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

Platforms All

23.307 split-horizon-group

split-horizon-group

Syntax **split-horizon-group** [*group-name*] [**residential-group**] [**create**]

Context **[Tree]** (config>service>vpls split-horizon-group)

Full Context configure service vpls split-horizon-group

Description This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default A split horizon group is by default not created as a residential-group.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *group-name* — Specifies the name of the split horizon group to which the SDP belongs

residential-group — Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)
- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters split-horizon-group

Description This command specifies the name of the split horizon group to which the MSAP belongs.

Parameters *group-name* — Specifies the split horizon group name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

split-horizon-group

Syntax **split-horizon-group** *name*
no split-horizon-group

Context **[Tree]** (config>service>vpls>bgp-evpn>mpls split-horizon-group)

Full Context configure service vpls bgp-evpn mpls split-horizon-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS and spoke SDPs allows the integration of VPLS and EVPN-MPLS networks.

If the **split-horizon-group** command for **bgp-evpn>mpls>** is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS destinations. The configuration of **bgp-evpn>mpls> split-horizon-group** will only be allowed if **bgp-evpn>mpls** is shutdown; no changes are allowed when bgp-evpn>mpls is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS endpoints, MAC addresses will still be learned on them but they will not be advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel will be brought operationally down if the point-to-multipoint tunnel is operationally up.

Default no split-horizon-group

Parameters *name* — Specifies the split-horizon-group name.

Platforms All

split-horizon-group

Syntax **split-horizon-group** *group-name*

no split-horizon-group

Context [Tree] (config>service>pw-template split-horizon-group)

Full Context configure service pw-template split-horizon-group

Description This command creates a new split horizon group (SGH).

Comparing a “residential” SGH and a “regular” SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

Parameters *group-name* — Specifies the name of the split horizon group to which the SDP belongs.

residential-group — Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported
  - Double-pass queuing is not applicable
  - STP is disabled (can be enabled)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- ARP reply agent is not applicable on the 7750 SR and 7450 ESS (dhcp-lease-states are not supported on spoke SDPs)
- MAC pinning enabled per default (can be disabled)

23.308 spoke-sdp

spoke-sdp

Syntax **spoke-sdp** *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] [**create**]
no spoke-sdp *sdp-id*[**:***vc-id*]

Context **[Tree]** (config>service>vpls spoke-sdp)

Full Context configure service vpls spoke-sdp

Description This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. When removed, no packets are forwarded to the far-end router.

Default No *sdp-id* is bound to a service.

Special Cases **VPLS —** Several SDPs can be bound to a VPLS service. Each SDP must use unique *vc-ids*. An error message is generated if two SDP bindings with identical *vc-ids* terminate on the same router. Split horizon groups can only be created in the scope of a VPLS service.

Parameters *sdp-id* — Specifies the SDP identifier

Values 1 to 32767

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

vc-id — Specifies the virtual circuit identifier

Values 1 to 4294967295

vc-type — This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. Changing the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether — Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan — Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

group-name — Specifies the name of the split horizon group to which the SDP belongs

endpoint — Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint — Removes the association of a spoke SDP with an explicit endpoint name

root-leaf-tag — Specifies a tagging spoke SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

leaf-ac — Specifies an access (AC) spoke SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

Special Cases **VPLS —** Several SDPs can be bound to a VPLS service. Each SDP must use unique *vc-ids*. An error message is generated if two SDP bindings with identical *vc-ids* terminate on the same router. Split horizon groups can only be created in the scope of a VPLS service.

Parameters *sdp-id* — Specifies the SDP identifier.

Values 1 to 17407

vc-id — Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type — This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether — Defines the VC type as Ethernet. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

vlan — Defines the VC type as VLAN. The **ethernet**, **vlan,** and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. The VLAN VC-type requires at least one dot1Q tag within each encapsulated Ethernet packet transmitted to the far end.

group-name — Specifies the name of the split horizon group to which the SDP belongs.

root-leaf-tag — Specifies a SAP as a root leaf tag SDP. This option is only available when the VPLS is designated as an E-Tree VPLS.

leaf-tag-vid — Specifies to replace the outer SDP ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

leaf-ac — Specifies a SDP as a leaf access (AC) SDP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

create — Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Description This command binds a service to an existing Service Distribution Point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an IES service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down first before it can be deleted from the configuration.

Default no spoke-sdp

Special Cases **IES —** At most, only one *sdp-id* can be bound to an IES service.

Parameters *sdp-id* — Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

vc-id — Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type — Specifies the encapsulation and pseudowire type for the spoke SDP.

Values ether: specifies Ethernet pseudowire as the type of virtual circuit (VC) associated with the SDP binding

ipipe: specifies Ipipe pseudowire as the type of virtual circuit (VC) associated with the SDP binding

Default ether

create — Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default No *sdp-id* is bound to a service.

Parameters *sdp-id* — The SDP identifier.

Values 1 to 32767

vc-id — The virtual circuit identifier.

Values 1 to 4294967295

no-endpoint — Adds or removes a spoke SDP association.

endpoint-name — Specifies the name of the service endpoint.

icb — Configures the spoke SDP as an inter-chassis backup SDP binding.

Context **[Tree]** (config>service>epipe spoke-sdp)

Full Context configure service epipe spoke-sdp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an Epipe, VPLS, VPRN, VPRN service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an EPIPE service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default No *sdp-id* is bound to a service.

Special Cases **Epipe —** At most, only one *sdp-id* can be bound to an Epipe service. Since an Epipe is a point-to-point service, it can have, at most, two end points. The two end points can be one SAP and one SDP or two SAPs. Vc-switching VLLs are an exception. If the VLL is a “vc-switching” VLL, then the two endpoints must both be SDPs.

L2TPv3 SDP types are only supported on Epipe services and not other xpipe services.

Parameters *sdp-id* — The SDP identifier.

Values 1 to 17407

vc-id — The virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however it must be configured.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

vc-type — This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether — Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding.

vlan — Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

no-endpoint — Removes the association of a spoke SDP with an explicit endpoint name.

endpoint-name — Specifies the name of the service endpoint.

icb — Specifies the spoke SDP as an inter-chassis backup SDP binding.

Context **[Tree]** (config>mirror>mirror-dest spoke-sdp)
[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

Full Context configure mirror mirror-dest remote-source spoke-sdp
configure mirror mirror-dest spoke-sdp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

Default An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters *sdp-id:vc-id* — Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint — Removes the association of a SAP or a SDP with an explicit endpoint name.

name — Specifies the name of the endpoint associated with the SAP.

icb — Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

Context **[Tree]** (config>service>epipe spoke-sdp-fec)

Full Context configure service epipe spoke-sdp-fec

Description This command binds a service to an existing Service Distribution Point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters *spoke-sdp-fec-id* — An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

fec-type — An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type — An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name — Specifies the name of the service endpoint.

no endpoint — Adds or removes a spoke SDP association.

icb — Configures the spoke SDP as an inter-chassis backup SDP binding.

Context **[Tree]** (config>service>vprn>pim spt-switchover-threshold)

Full Context configure service vprn pim spt-switchover-threshold

Description This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

Parameters *grp-ip-address* — Specifies the multicast group address.

grp-ipv6-address — Specifies the multicast group address.

prefix-length — Specifies the address prefix length.

Values

grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D
prefix-length	[1 to 128]

mask — Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold — Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

Context **[Tree]** (config>router>pim spt-switchover-threshold)

Full Context configure router pim spt-switchover-threshold

Description This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters *grp-ipv4-prefix* — Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length — Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask — Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

grp-ipv6-prefix — Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
xx — 0 to FF (hex)

ipv6-prefix-length — Specifies the length of the IPv6 prefix.

Values 8 to 128

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

spt-threshold — Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

Values 1 to 4294967294, infinity

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis
configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-isis

Description This command selects the Segment Routing (SR) tunnel type programed by an IS-IS instance in TTM.

When the **sr-isis** value (or **sr-ospf**) is enabled, an SR tunnel to the BGP next hop is selected in the TTM from the lowest-numbered IS-IS (OSPF) instance.

The **no** form of this command disables the SR-ISIS setting for the auto-bind tunnel.

Default no sr-isis

Platforms All

sr-isis

Syntax [**no**] **sr-isis**

Context **[Tree]** (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-isis)

Full Context configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-isis

Description This command enables the use of SR-ISIS sourced tunnel entries in the TTM to resolve the associated static route next hop.

23.315 sr-label-index

sr-label-index

Syntax **sr-label-index** {*value* | *param-name*} [**prefer-igp**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no sr-label-index

Context [Tree] (config>router>policy-options>policy-statement>entry>action sr-label-index)
[Tree] (config>router>policy-options>policy-statement>default-action sr-label-index)

Full Context configure router policy-options policy-statement default-action sr-label-index
configure router policy-options policy-statement entry action sr-label-index

Description This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note: Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default no sr-label-index

Parameters *value* — Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name — Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

prefer-igp — A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

Platforms All

23.316 sr-labels

sr-labels

Syntax **sr-labels start** *start-value* **end** *end-value*
no sr-labels

Context **[Tree]** (config>router>mpls-labels sr-labels)

Full Context configure router mpls-labels sr-labels

Description This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default no sr-labels

Parameters *start-value* — Specifies the start label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 only)

end-value — Specifies the end label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 only)

Full Context configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter sr-policy
configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-policy

Description This command enables the use of segment routing (SR) policies to resolve the BGP next hop of certain BGP routes (depending on the context). The SR policies that are considered are statically configured in the local router or learned by BGP routes (AFI 1/SAFI 73). For a BGP route to be resolved by an SR policy, the highest numbered color-extended community attached to BGP route must match the color of the SR policy. Next hop resolution of VPN IP routes by SR policies is not supported.

The **no** form of this command disables the use of SR policies to resolve the BGP next hop of a BGP route.

The **no** form of this command removes SR-TE PCE-initiated LSP support. All PCE-initiated SR-TE LSPs are deleted.

Platforms All

sr-te

Syntax **sr-te** *value*
no sr-te

Context **[Tree]** (config>router>mpls>tunnel-table-pref sr-te)

Full Context configure router mpls tunnel-table-pref sr-te

Description This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default sr-te 8

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *value* — Specifies the tunnel table preference value for SR-TE LSP.

Values 1 to 255

Default 8

Platforms All

sr-te

Syntax [**no**] **sr-te**

Context **[Tree]** (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

Default no sr-te

Platforms All

sr-te

sr-te-lsp

Syntax [**no**] **sr-te-lsp** *lsp-name*

Context **[Tree]** (config>service>sdp sr-te-lsp)

Full Context configure service sdp sr-te-lsp

Description This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

23.327 src-access-list

src-access-list

Syntax **src-access-list** *list-name*
no src-access-list *list-name*

Context **[Tree]** (config>system>security>snmp src-access-list)

Full Context configure system security snmp src-access-list

Description This command is used to identify a list of source IP addresses that can be used to validate SNMPv1 and SNMPv2c requests once the list is associated with one or more SNMPv1 and SNMPv2c communities.

An src-address-list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the **community** regardless of which VPRN/VRF interface (or “Base” interface) the request arrived on. For example, if an SNMP request arrives on an interface in vprn 100 but the request is referencing a **community**, then the source IP address in the packet would be validated against the src-address-list configured for the **community**. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the request message’s source IP address does not match the *ip-address* of any of the **src-host**s contained in the list, then the request is discarded and logged as an SNMP authentication failure.

Using src-access-list validation can have an impact on the time it takes for an SR OS node to reply to an SNMP request. It is recommended to keep the lists short, including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named src-access-list. You cannot remove an **src-access-list** that is referenced by one or more **community** instances.

Parameters *list-name* — Configures the name or key of the **src-access-list**. The *list-name* parameter must begin with a letter (a-z or A-Z).

Context **[Tree]** (config>app-assure>group>gtp>gtp-fltr>imsi-apn-fltr>entry src-gsn)

Full Context configure application-assurance group gtp gtp-filter imsi-apn-filter entry src-gsn

Description This command configures a matching condition for the GSN IP address. The IP address value is checked only against the source IP address of the GTP packets that contain an APN IE or an IMSI IE.

Parameters *ip address* — Specifies a valid unicast address associated with the IMSI-APN filter entry.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name — Specifies an IP address prefix list for the source IP address match criteria, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.329 src-host

src-host

Syntax **src-host** *host-name* **address** *ip-address*
no src-host *host-name*

Context **[Tree]** (config>system>security>snmp>src-access-list src-host)

Full Context configure system security snmp src-access-list src-host

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to configure a source IP address entry that can be used to validate SNMPv1 and SNMPv2c requests.

The **no** form of this command removes the specified entry.

Parameters *host-name* — Configures the name of the **src-host** entry.

ip-address — Configures an allowed source address for SNMP requests. This can be an IPv4 or IPv6 address.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

23.330 src-ip

src-ip

Syntax **src-ip** {*ip-address/mask* | *ip-address netmask*}
src-ip {*ipv6-address* | *prefix-length*}
no src-ip

Context **[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match src-ip)
[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match src-ip)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match src-ip
configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match src-ip

Description This command configures the source IP match condition.

The **no** form of this command reverts to the default.

Parameters *ipv6-address* — Specifies the IPv6 address (applies only to the 7750 SR).

Values

ipv6-address	x:x:x:x:x:x:x:x (where x is [0 to FFFF]H)
	x:x:x:x:x:x:d.d.d.d (where d is [0 to 255]D)

prefix-length — Specifies the prefix length (applies only to the 7750 SR).

Values 1 to 128

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address/mask — Specifies the IPv4 address and mask.

Values ip-address a.b.c.d
mask 0 to 32

netmask — Specifies the mask, expressed as a dotted quad.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

src-ip

Syntax **src-ip** *ip-address*
no src-ip

Context **[Tree]** (config>redundancy>mc>peer>mc>l3-ring>connectivity-verify src-ip)

Full Context configure redundancy multi-chassis peer multi-chassis l3-ring connectivity-verify src-ip

Description This command specifies the source IP address used in ring-node connectivity verification of this ring node.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the source IP address used in ring-node connectivity verification of this ring node.

src-ip

Syntax **src-ip** *ip-address*
no src-ip

Context **[Tree]** (config>redundancy>mc>peer>mcr>node>cv src-ip)

Full Context configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-ip

Description This command specifies the source IP address used in the ring-node connectivity verification of this ring node.

Default no src-ip

Parameters *ip-address* — Specifies the source IP address.

Values a.b.c.d (no multicast address)

Platforms All

src-ip

Syntax **src-ip** {**eq** | **neq**} *ip-address*
src-ip {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*
no src-ip

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>match src-ip)

Full Context configure application-assurance group policy app-qos-policy entry match src-ip

Description This command specifies a source TCP/UDP address to use as match criteria.

Default no src-ip

Parameters **eq** — Specifies that a successful match occurs when the flow matches the specified address or prefix.

neq — Specifies that a successful match occurs when the flow does not match the specified address or prefix.

ip-address — Specifies a valid unicast address.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name — Specifies an IP prefix list name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-ip

Syntax **src-ip** *ip-address*
src-ip ip-prefix-list *ip-prefix-list-name*
no src-ip

Context **[Tree]** (config>app-assure>group>sess-fltr>entry>match src-ip)

Full Context configure application-assurance group session-filter entry match src-ip

Description This command specifies a source TCP/UDP address to use as match criteria.

Default no src-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies a valid unicast address.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name — Specifies an IP prefix list name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-ip

Syntax **src-ip** {**eq** | **neq**} *ip-address*
no src-ip

Context **[Tree]** (debug>app-assure>group>traffic-capture>match src-ip)

Full Context debug application-assurance group traffic-capture match src-ip

Description This command configures debugging on a source IP address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-ip

Syntax **src-ip** {ip-address/mask | *ip-address ipv4-address-mask*}

Context **[Tree]** (config>li>li-filter>li-ip-filter>entry>match src-ip)

Full Context configure li li-filter li-ip-filter entry match src-ip

Description This command configures source IP address LI filter match criterion.

The **no** form of this command removes any configured source IP. The match criterion is ignored.

Parameters *ip-address* — Specifies an address specified as dotted quad.

Values a.b.c.d

mask — Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values 1 to 32

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-address-mask — Any mask expressed in dotted quad notation.

Values 0.0.0.0 to 255.255.255.255

Platforms All

src-ip

Syntax **src-ip** {ipv6-address/prefix-length | *ipv6-address ipv6-address-mask*}
no src-ip

Context **[Tree]** (config>li>li-filter>li-ipv6-filter>entry>match src-ip)

Full Context configure li li-filter li-ipv6-filter entry match src-ip

Description This command configures source IPv6 address LI filter match criterion.

The **no** form of this command removes any configured source IPv6 address. The match criterion is ignored.

Parameters *ipv6-address* — Specifies an IPv6 address entered as:.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

prefix-length — Specifies a length.

Values 1 to 128

ipv6-address-mask — Specifies an IPv6 address mask expressed as:

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

[Tree] (config>qos>sap-egress>ip-criteria>entry>match src-ip)

Full Context configure qos sap-egress ip-criteria entry match src-ip
configure qos sap-ingress ip-criteria entry match src-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, e.g. 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Default no src-ip

Parameters *ip-address* — Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask — Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask — Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name — Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

src-ip

Syntax **src-ip** {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}
no src-ip

Context **[Tree]** (config>qos>sap-ingress>ipv6-criteria>entry>match src-ip)

Full Context configure qos sap-egress ipv6-criteria entry match src-ip
configure qos sap-ingress ipv6-criteria entry match src-ip

Description This command configures a source IPv6 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv6 address, specify the address and its associated mask, for example, 2001:db8:1000::/64.

The **no** form of this command removes the source IPv6 address match criterion.

Default no src-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ipv6-address* — Specifies the IPv6 address for the IP match criterion in hexadecimal digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

prefix-length — Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask — Specifies the IPv6 address mask.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

ipv6-prefix-list-name — Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

src-ip

Syntax **src-ip** {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *ip-prefix-list-name*}

Full Context configure qos network egress ip-criteria entry match src-ip
configure qos network egress ipv6-criteria entry match src-ip
configure qos network ingress ip-criteria entry match src-ip
configure qos network ingress ipv6-criteria entry match src-ip

Description This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask — Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask — Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name — Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched. IP prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address — Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask — Specifies the length of the ipv6-address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask — Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name — Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched. IPv6 prefix lists are only supported at a network ingress.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms All

configure filter ipv6-exception entry match src-ip
configure filter ipv6-filter entry match src-ip

Description This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of the command removes the source IP address match criterion.

Default no src-ip

Parameters *ip-address* — Specifies the destination IPv4 address specified in dotted decimal notation.

Values a.b.c.d

mask — Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask — Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list or **ipv6-prefix-list** *prefix-list-name* — Specifies to use a list of IP prefixes referred to by prefix-list-name, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address — Specifies an IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

prefix-length — Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask — Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d

Context [Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry src-ip)

Full Context configure system security management-access-filter ipv6-filter entry src-ip

Description This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion. This command only applies to the 7750 SR and 7950 XRS.

The **no** form of this command removes the source IPv6 address match criterion.

Default no src-ip

Parameters *ipv6-address/prefix-length* — Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D
prefix-length	1 to 128

ipv6-prefix-list-name — Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-ipv6-address

Syntax **src-ipv6-address** *ipv6-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no src-ipv6-address

Context [Tree] (config>test-oam>build-packet>header>ipv6 src-ipv6-address)
[Tree] (debug>oam>build-packet>packet>field-override>header>ipv6 src-ipv6-address)

Full Context configure test-oam build-packet header ipv6 src-ipv6-address
debug oam build-packet packet field-override header ipv6 src-ipv6-address

Description This command defines the source IPv6 address to be used in the IPv6 header.

The **no** form of the removes the source IPv6 address.

Parameters *ipv6-address* — Specifies the IPv6 source address to be used in the IPv6 header.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
x:	0 to FFFF]H
d:	[0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.334 src-mac

src-mac

Syntax **src-mac** *ieee-address*
no src-mac

Context [Tree] (config>redundancy>mc>peer>mc>l3-ring>connectivity-verify src-mac)

Full Context configure redundancy multi-chassis peer multi-chassis l3-ring connectivity-verify src-mac

Description This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

If all zeros are specified, then the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters *ieee-address* — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

src-mac

Syntax **src-mac** *ieee-address*
no src-mac

Context **[Tree]** (config>redundancy>mc>peer>mcr>node>cv src-mac)

Full Context configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-mac

Description This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeros (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

Default no src-mac

Parameters *ieee-address* — Specifies the source MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms All

src-mac

Syntax **src-mac** *ieee-address* [*ieee-address-mask*]
no src-mac

Context **[Tree]** (config>li>li-filter>li-mac-filter>entry>match src-mac)

Full Context configure li li-filter li-mac-filter entry match src-mac

Description This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Parameters *ieee-address* — Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask — Specifies a 48-bit mask that can be configured using:

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default **0xFFFFFFFFFFFF** (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

Platforms All

src-mac

Syntax **src-mac** *ieee-address* [*ieee-address-mask*]
no src-mac

Context **[Tree]** (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

Full Context configure qos sap-ingress mac-criteria entry match src-mac

Description This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default no src-mac

Parameters *ieee-address* — Enter the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask — This 48-bit mask can be configured using the following formats:

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

Platforms All

src-mac

Syntax **src-mac** *ieee-address* [*ieee-address-mask*]
no src-mac

Context **[Tree]** (config>filter>ip-filter>entry>match src-mac)
[Tree] (config>filter>ipv6-filter>entry>match src-mac)
[Tree] (config>filter>mac-filter>entry>match src-mac)

Full Context configure filter ip-filter entry match src-mac
configure filter ipv6-filter entry match src-mac
configure filter mac-filter entry match src-mac

Description Configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the source mac as the match criteria.

Default no src-mac

Parameters *ieee-address* — Specifies the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit; both upper and lower case are supported.

ieee-address-mask — Specifies the 48-bit mask to match a range of MAC address values.

To configure so that all packets with a source MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00

Default ff:ff:ff:ff:ff:ff (exact match)

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is an hexadecimal digit; both upper and lower case are supported.

Platforms All

src-mac

Syntax **src-mac** *ieee-address* [*ieee-address-mask*]
no src-mac

Context **[Tree]** (config>system>security>mgmt-access-filter>mac-filter>entry>match src-mac)

Full Context configure system security management-access-filter mac-filter entry match src-mac

Description This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default no src-mac

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ieee-address* — Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask — Specifies a 48-bit mask that can be configured using the formats listed in Table 131:

Table 131 **ieee-address-mask Formats**

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match src-port)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match src-port
configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match src-port
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match src-port
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match src-port

Description This command configures the source port match condition.

The **no** form of this command reverts to the default.

Parameters **lt | gt | eq** — Specifies the operators.

src-port-number — Specifies the source port number as a decimal hex or binary.

Values 0 to 65535

dst-port-number — Specifies the destination port number as a decimal hex or binary.

Values 0 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax **src-port** {**eq** | **neq**} *port-num*
src-port {**eq** | **neq**} **port-list** *port-list-name*
src-port {**eq** | **neq**} **range** *start-port-num end-port-num*
no src-port

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>match src-port)

Full Context configure application-assurance group policy app-qos-policy entry match src-port

Description This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

Default no src-port

Parameters **eq** — Specifies that a successful match occurs when the flow matches the specified port.

neq — Specifies that a successful match occurs when the flow does not match the specified port.

port-num — Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num — Specifies the start or end source port number.

Values 0 to 65535

port-list-name — Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax **src-port** {**eq** | **gt** | **lt**} *port-num*
src-port port-list *port-list-name*
src-port range *start-port-num end-port-num*
no src-port

Context **[Tree]** (config>app-assure>group>sess-fltr>entry>match src-port)

Full Context configure application-assurance group session-filter entry match src-port

Description This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no src-port

Parameters **eq** — Specifies that a successful match occurs when the flow matches the specified port.

gt — Specifies all port numbers greater than the port-number match.

lt — Specifies all port numbers less than the port-number match.

port-num — Specifies the source port number.

Values 0 to 65535

start-port-num end-port-num — Specifies the start or end source port number.

Values 0 to 65535

port-list-name — Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax **src-port** {**eq** | **neq**} *port-num*
no src-port

Context **[Tree]** (debug>app-assure>group>traffic-capture>match src-port)

Full Context debug application-assurance group traffic-capture match src-port

Description This command configures debugging on a source port.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

src-port

Syntax **src-port** {**lt** | **gt** | **eq**} *src-port-number*
src-port range *src-port-number src-port-number*
no src-port

Context **[Tree]** (config>li>li-filter>li-ip-filter>entry>match src-port)
[Tree] (config>li>li-filter>li-ipv6-filter>entry>match src-port)

Full Context configure li li-filter li-ip-filter entry match src-port
configure li li-filter li-ipv6-filter entry match src-port

Description This command configures a source TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the source port match criterion.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **lt** — Specifies all port numbers less than *src-port-number* match.

gt — Specifies all port numbers greater than *src-port-number* match.

eq — Specifies that *src-port-number* must be an exact match.

src-port-number — Specifies the source port number to be used as a match criteria expressed as a decimal integer.

Values [0..65535]D
[0x0..0xFFFF]H
[0b0..0b1111111111111111]B

configure qos sap-egress ipv6-criteria entry match src-port
configure qos sap-ingress ip-criteria entry match src-port
configure qos sap-ingress ipv6-criteria entry match src-port

Description This command configures a source TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default no src-port

Parameters **{lt | gt | eq}** *src-port-number* — The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the source port value, specified as a decimal integer.

Values 1 to 65535 (decimal)

range *start end* — The range of TCP or UDP port values to match, specified as between the *start* and *end* source port values inclusive.

Values 1 to 65535 (decimal)

Full Context configure qos network egress ip-criteria entry match src-port
configure qos network egress ipv6-criteria entry match src-port
configure qos network ingress ip-criteria entry match src-port
configure qos network ingress ipv6-criteria entry match src-port

Description This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default no src-port

Parameters **lt** — Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

gt — Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

eq — Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

src-port-number — The source port value, specified as a decimal integer.

Values 1 to 65535

port-list-name — Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start — Specifies the starting range of TCP or UDP source port values to match.

Values 1 to 65535

end — Specifies the end range of TCP or UDP source port values to match.

Values 1 to 65535

src-port

Syntax **src-port** {**lt** | **gt** | **eq**} *src-port-number*
src-port port-list *port-list-name*
src-port range *src-port-number src-port-number*
no src-port

Context **[Tree]** (config>filter>ip-exception>entry>match src-port)
[Tree] (config>filter>ip-filter>entry>match src-port)
[Tree] (config>filter>ipv6-exception>entry>match src-port)
[Tree] (config>filter>ipv6-filter>entry>match src-port)

Full Context configure filter ip-exception entry match src-port
configure filter ip-filter entry match src-port
configure filter ipv6-exception entry match src-port
configure filter ipv6-filter entry match src-port

Description This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq** 0" match criterion, may match non-initial fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

Default no src-port

Parameters **lt | gt | eq** — Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt specifies that all port numbers less than *src-port-number* match.

gt specifies that all port numbers greater than *src-port-number* match.

eq specifies that *src-port-number* must be an exact match.

src-port-number — Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

Values 0 to 65535

port-list-name — Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number src-port-number — Specifies inclusive port range between two src-port-number values.

src-port

Syntax **src-port** {*port-id* | **cpm** | **lag** *lag-id*}
no src-port

Context **[Tree]** (config>system>security>mgmt-access-filter>ip-filter>entry src-port)
[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry src-port)

Full Context configure system security management-access-filter ip-filter entry src-port
configure system security management-access-filter ipv6-filter entry src-port

Description This command restricts ingress management traffic to either the CPM/CCM Ethernet port or any other logical port (for example LAG) on the device.

When the source interface is configured, only management traffic arriving on those ports satisfy the match criteria.

The **no** form of this command reverts to the default value.

Default no src-port

Parameters *port-id* — Specifies the port ID in formats shown below.

Values

slot/*mda*/*port*[.*channel*]		
bundle-id	**bundle**-*type*-*slot*/*mda*.*bundle-num*	
	bundle	keyword
	type	**ima**, **fr**, or **ppp**
	bundle-num	1 to 336

23.338 src-route-option

src-route-option

Syntax **src-route-option** {**true** | **false**}
no source-route-option

Context **[Tree]** (config>filter>ip-filter>entry>match src-route-option)

Full Context configure filter ip-filter entry match src-route-option

Description This command enables source route option match conditions. When enabled, this filter should match if a (strict or loose) source route option is present/not present at any location within the IP header, as per the value of this object. The **no** form of the command removes the criterion from the match entry.

Default no src-route-option

Parameters **true** — Enables source route option match conditions.

false — Disables source route option match conditions.

Platforms All

23.339 src-tcp-port

src-tcp-port

Syntax **src-tcp-port** *tcp-port*
no src-tcp-port

Full Context configure router isis segment-routing srlb
configure router ospf segment-routing srlb

Description This command specifies the reserved label block to use for the Segment Routing Local Block (SRLB) for the specified IS-IS or OSPF instance. The named reserved label block must already have been configured under **config**>**router**>**mpls**>**mpls-labels**.

The **no** form of this command removes an SRLB.

Parameters *reserved-label-block-name* — Specifies the name of the reserved label block, up to 64 characters.

Platforms All

23.344 srlg

srlg

Syntax [**no**] **srlg**

Context **[Tree]** (config>router>mpls>lsp>secondary srlg)

Full Context configure router mpls lsp secondary srlg

Description This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).
- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

Default no srlg

Platforms All

23.345 srlg-database

srlg-database

Syntax [**no**] **srlg-database**

Context **[Tree]** (config>router>mpls srlg-database)

Full Context configure router mpls srlg-database

Description Commands in this context configure the link members of SRLG groups for the entire network at any node that needs to signal LSP paths (for example, a head-end node).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes the entire SRLG database. CSPF assumes all interfaces have no SRLG membership association if the database was not disabled with the command **config>router>mpls>user-srlg-db disable**.

Platforms All

23.346 srlg-enable

srlg-enable

Syntax [**no**] **srlg-enable**

Context **[Tree]** (config>router>route-next-hop-policy>template srlg-enable)

Full Context configure router route-next-hop-policy template srlg-enable

Description This command configures the SRLG constraint into the route next-hop policy template.

When this command is applied to a prefix, the LFA SPF will attempt to select an LFA next-hop, among the computed ones, which uses an outgoing interface that does not participate in any of the SLRGs of the outgoing interface used by the primary next-hop.

The SRLG criterion is applied before running the LFA next-hop selection algorithm.

The **no** form deletes the SRLG constraint from the route next-hop policy template.

Default no srlg-enable

Platforms All

23.347 srlg-frr

srlg-frr

Syntax **srlg-frr** [**strict**]
no srlg-frr

Context **[Tree]** (config>router>mpls srlg-frr)

Full Context configure router mpls srlg-frr

Description This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

Default no srlg-frr

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **strict** — Specifies the name of the SRLG group within a virtual router instance.

23.348 srlg-group

srlg-group

Syntax [**no**] **srlg-group** *group-name* [*group-name*]
no srlg-group

Context **[Tree]** (config>router>if>if-attribute srlg-group)
[Tree] (config>service>ies>if>if-attribute srlg-group)
[Tree] (config>service>vprn>if>if-attribute srlg-group)
[Tree] (config>router>mpls>if srlg-group)

Full Context configure router interface if-attribute srlg-group
configure router mpls interface srlg-group
configure service ies interface if-attribute srlg-group
configure service vprn interface if-attribute srlg-group

Description This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters *group-name* — Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

srlg-group

Syntax **srlg-group** *group-name* **value** *group-value* [**penalty-weight** *penalty-weight*]
no srlg-group *group-name*

Context **[Tree]** (config>router>if-attribute srlg-group)

Full Context configure router if-attribute srlg-group

Description This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *group-name* — Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value — Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

Values 0 to 4294967295

penalty-weight — Specifies the integer value of the penalty weight that is assigned to the SRLG group

no srrp *srrp-id*

Context **[Tree]** (config>service>ies>sub-if>grp-if srrp)
[Tree] (config>service>vprn>sub-if>grp-if srrp)

Full Context configure service ies subscriber-interface group-interface srrp
configure service vprn subscriber-interface group-interface srrp

Description This command creates a Subscriber Router Redundancy Protocol (SRRP) instance on a group IP interface. An SRRP instance manages all subscriber subnets within the group interfaces subscriber IP interface or other subscriber IP interfaces that are associated through a wholesale/retail relationship. Only one unique SRRP instance can be configured per group interface.

The **no** form of this command removes an SRRP instance from a group IP interface. Once removed, the group interface ignores ARP requests for the SRRP gateway IP addresses that may exist on subscriber subnets associated with the group IP interface. Then the group interface stops routing using the redundant IP interface associated with the group IP interface and will stop routing with the SRRP gateway MAC address. Ingress packets destined to the SRRP gateway MAC will also be silently discarded. This is the same behavior as a group IP interface that is disabled (shutdown).

The **no** form of this command removes the SRRP ID from the configuration.

Default no srrp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *srrp-id* — Specifies a 32 bit instance ID that must be unique to the system. The instance ID must also match the instance ID used by the remote router that is participating in the same SRRP context. SRRP is intended to perform a function similar to VRRP where adjacent IP hosts within local subnets use a default gateway to access IP hosts on other subnets.

ssap

Syntax **ssap** *ssap-value* [*ssap-mask*]
no ssap

Context **[Tree]** (config>system>security>mgmt-access-filter>mac-filter>entry>match ssap)

Full Context configure system security management-access-filter mac-filter entry match ssap

Description This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

The **no** form of this command removes the SSAP match criterion.

Default no ssap

Parameters *ssap-value* — Specifies the 8-bit SSAP match criteria value in hex.

Values 0x00 to 0xFF

ssap-mask — Specifies a range of SSAP values to use as the match criteria.

23.355 ssh

ssh

Syntax **ssh** *host* [**-l** *username*] [**-v** *ssh-version*] [{**router** *router-instance* | **service-name** *service-name*}] [**re-exchange-min** *minutes*] [**re-exchange-mbyte** *megabytes*]

Context **[Tree]** (global ssh)

Full Context global ssh

Description This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate a SSH session, with a key re-exchange, based on maximum megabytes or minutes, whichever occurs first. If the re-exchange options are not set, the default behavior will not perform a key re-exchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the “~” is the default escape character for SSH session.

Parameters *host* — Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface: up to 32 characters, mandatory for link local addresses
dns-name	up to128 characters

username — Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance — Specifies the router name or service ID.

Values

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

router-instance: *router-name* or *vprn-svc-id*

router-name	“Base”, “management”, “vpls-management”
vprn-svc-id	1 to 2147483647

Default Base

service-name — Specifies the service name, up to 64 characters.

minutes — Specifies the time interval after which the SSH client will initiate the key-re-exchange.

Values 1 to 1440 minutes

megabytes — Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key re-exchange.

Values 1 to 64000 megabytes

ssh

Syntax **ssh**

Context **[Tree]** (config>system>login-control ssh)
[Tree] (config>system>security ssh)

Full Context configure system login-control ssh
configure system security ssh

Description Commands in this context configure the SSH parameters.

Platforms All

23.356 ssh-max-sessions

ssh-max-sessions

Syntax **ssh-max-sessions** *number-of-sessions*
no ssh-max-sessions

Context **[Tree]** (config>system>security>cli-session-group ssh-max-sessions)
[Tree] (config>system>security>profile ssh-max-sessions)

Full Context configure system security cli-session-group ssh-max-sessions
configure system security profile ssh-max-sessions

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to limit the number of SSH-based CLI sessions available to all users that are part of a particular profile, or to all users of all profiles that are part of the same cli-session-group.

The **no** form of this command disables the command and the profile/group limit is not applied on the number of sessions.

Default no ssh-max-sessions

Parameters *number-of-sessions* — Specifies the maximum number of allowed SSH-based CLI sessions.

Values 0 to 50

Platforms All

23.357 ssh-reply

ssh-reply

Syntax [**no**] **ssh-reply**

Context **[Tree]** (config>service>ies>if>vrrp ssh-reply)

Full Context configure service ies interface vrrp ssh-reply

Description This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default no ssh-reply

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ssh-reply

Syntax [**no**] **ssh-reply**

Context **[Tree]** (config>service>vprn>if>vrrp ssh-reply)

Full Context configure service vprn interface vrrp ssh-reply

Description This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default no ssh-reply

Platforms All

ssh-reply

Syntax [**no**] **ssh-reply**

Context **[Tree]** (config>router>if>vrrp ssh-reply)

Full Context configure router interface vrrp ssh-reply

Description This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

Platforms All

23.358 ssm

ssm

Syntax **ssm**

Context **[Tree]** (config>port>ethernet ssm)

Full Context configure port ethernet ssm

Description This command enables the Ethernet Synchronization Messaging Channel (ESMC) for the Ethernet port. ESMC carries the Synchronization Status Message (SSM) code representing the quality level of the source of frequency of the central clock of the node.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.359 ssm-assert-compatible-mode

ssm-assert-compatible-mode

Syntax **ssm-assert-compatible-mode** [**enable** | **disable**]

Context **[Tree]** (config>service>vprn>pim ssm-assert-compatible-mode)

Full Context configure service vprn pim ssm-assert-compatible-mode

Description This command specifies whether SSM assert is enabled in compatibility mode for this PIM protocol instance. When enabled, for SSM groups, PIM will consider the SPT bit to be implicitly set to compute the value of CouldAssert (S,G,I) as defined in RFC 4601, *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When disabled, for SSM groups, PIM will not assume the SPT bit to be set. The SPT bit is set by Update_SPTbit(S,G,iif) macro defined in RFC 4601.

Default ssm-assert-compatible-mode disable

Parameters **enable** — enables SSM assert in compatibility mode for this PIM protocol instance

disable — disabled SSM assert in compatibility mode for this PIM protocol instance

Platforms All

23.360 ssm-bit

ssm-bit

Syntax **ssm-bit** *sa-bit*

Context **[Tree]** (config>system>sync-if-timing>bits ssm-bit)

Full Context configure system sync-if-timing bits ssm-bit

Description This command configures which sa-bit to use for conveying SSM information when the interface-type is E1.

Default ssm-bit 8

Parameters *sa-bit* — Specifies the sa-bit value.

Values 4 to 8

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.361 ssm-default-range-disable

ssm-default-range-disable

Syntax **ssm-default-range-disable ipv4**

Context **[Tree]** (config>service>vprn>pim ssm-default-range-disable)

Full Context configure service vprn pim ssm-default-range-disable

Description This command specifies whether to disable the use of default range (232/8) for SSM so that it can be used by ASM to process (*,G). When enabled, the use of default range is disabled for SSM and it can be used by ASM. When disabled, the SSM default range is enabled.

Default ssm-default-range-disable

Platforms All

23.362 ssm-groups

ssm-groups

Syntax [**no**] **ssm-groups**

Context **[Tree]** (config>service>vprn ssm-groups)

Full Context configure service vprn ssm-groups

Description This command enables access to the context to enable a source-specific multicast (SSM) configuration instance.

ssm-groups

Syntax [**no**] **ssm-groups**

Context **[Tree]** (config>router>pim ssm-groups)

Full Context configure router pim ssm-groups

Description Commands in this context enable an ssm-group configuration instance.

configure router mld ssm-translate

Description Commands in this context configure group ranges which are translated to SSM (S,G) entries. If the static entry needs to be created, it has to be translated from a IGMPv1 IGMPv2 request to a Source Specific Multicast (SSM) join. An SSM translate source can only be added if the starg command is not enabled. An error message is generated if you try to configure the **source** command with **starg** command enabled.

Platforms All

23.364 stable-pool-sizing

stable-pool-sizing

Syntax [**no**] **stable-pool-sizing**

Context **[Tree]** (config>card>fp stable-pool-sizing)

Full Context configure card fp stable-pool-sizing

Description This command provides a stable buffer pool allocation environment for all default port buffer pools on a forwarding plane. This stable environment is provided at the expense of optimal buffer allocation between the various port buffer pools. Normally, port pools are sized according to a ports relative bandwidth with other ports and the ability of a port to use pool buffers. As an example, on a forwarding plane with two potential MDAs and only one equipped, the normal behavior is to provide all available default pool buffers to the ports on the currently equipped MDA. If a second MDA is equipped in the future, buffers are freed from the existing MDA and provided to the ports on the new MDA. Stable pool sizing alters this

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

behavior by reserving buffers for both MDAs whether they are equipped or not thus preventing a resizing event when an MDA is equipped. In addition, existing ports on a module always receive their maximum bandwidth share of buffers independent on any sub-rate condition that may currently exist. This provides a stable amount of buffers to other ports on the module independent of link or configuration events that may occur on the port.

Stable pool sizing preserves the ability to modify the effective bandwidth used to determine a port's relative share of the available buffers through the use of the ing-percentage-of-rate and egr-percentage-of-rate commands under the port configuration. Changing the values associated with these commands will cause a reevaluation of buffer distribution and thus a possible resizing of pools on each port within the module. These commands have no effect on ports associated with other modules on the forwarding plane.

Stable pool sizing may be enabled or disabled at any time on a forwarding plane. The system will dynamically change the pool sizes according to the stable pool sizing state.

When a port connector breakout is configured, its ports is included in the stable pool sizing calculation. Consequently, adding or removing a port connector breakout to or from the configuration will cause the buffer pool allocation to be recalculated even when stable pool sizing is enabled.

The **no** form of this command disables stable pool sizing on a forwarding plane. Existing buffer pools are resized according to normal pool sizing behavior.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.365 stack

stack

Syntax **stack** [**ipv4**] [**ipv6-slaac**]
no stack

Context **[Tree]** (config>subscr-mgmt>pppoe-client-policy stack)

Full Context configure subscriber-mgmt pppoe-client-policy stack

Description This command defines which NCP session is started in the PPPoE client and how addresses are retrieved within that NCP session.

Default stack ipv4

Parameters **ipv4** — Indicates that IPCP should be started and used to retrieve an IPv4 address.

ipv6-slaac — Indicates that IPv6CP should be started and that SLAAC is used to retrieve an IPv6 prefix.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.366 stack-capability-signaling

stack-capability-signaling

Syntax [**no**] **stack-capability-signaling**

Context **[Tree]** (config>service>ipipe stack-capability-signaling)

Full Context configure service ipipe stack-capability-signaling

Description This command enables stack-capability signaling in the initial label mapping message of the Ipipe PW to indicate that IPv6 is supported.

When enabled, the 7750 SR includes the stack-capability TLV with the IPv6 stack bit set according to the **ce-address-discovery ipv6** keyword, and also checks the value of the stack-capability TLV received from the far end.

This command must be blocked if no **ce-address-discovery** is specified, or the **ipv6** keyword is not included with the **ce-address-discovery** command.

This command if only applicable to the Ipipe service and must be blocked for all other services.

This command has no effect if both SAPs on the Ipipe service are local to the node.

Default no stack-capability-signaling

Platforms All

23.367 stale-routes-time

23.369 standard-multi-instance

standard-multi-instance

Syntax [**no**] **standard-multi-instance**

Context **[Tree]** (config>service>vprn>isis standard-multi-instance)

Full Context configure service vprn isis standard-multi-instance

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) and **iid-tlv-enable** (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

The **no** form of this command removes the **standard-multi-instance** configuration.

Default no standard-multi-instance

23.370 standby

standby

Syntax [**no**] **standby**

Context **[Tree]** (config>router>mpls>lsp>secondary standby)

Full Context configure router mpls lsp secondary standby

Description The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

Context **[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile>dhcp-pool standby-ip-lifetime)

Full Context configure subscriber-mgmt vrgw brg brg-profile dhcp-pool standby-ip-lifetime

Description This command defines how long these addresses are kept aside when standby addresses are signaled to the pool. During this time these addresses can only be used by devices explicitly requesting the IP (for example, datatrigger or DHCP renew/rebind). When the timer expires the addresses will again become available for dynamic allocation.

Default standby-ip-lifetime hrs 6

Parameters *days* — Specifies the standby IP lifetime in days.

Values 1 to 3650

hrs — Specifies the standby IP lifetime in hours.

Values 1 to 23

min — Specifies the standby IP lifetime in minutes.

Values 1 to 59

sec — Specifies the standby IP lifetime in seconds.

Values 1 to 59

seconds — Specifies the lifetime of the standby IP addresses

Values 300 to 315446399

seconds — Specifies the lifetime in seconds.

Values 300 to 315446399

configure service epipe spoke-sdp standby-signaling-slave

Description When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

Default no standby-signaling-slave

23.379 start-avg

start-avg

Syntax **start-avg** *percent*
no start-avg

Context **[Tree]** (config>qos>slope-policy>exceed-slope start-avg)
[Tree] (config>qos>slope-policy>highplus-slope start-avg)
[Tree] (config>qos>slope-policy>high-slope start-avg)
[Tree] (config>qos>slope-policy>low-slope start-avg)

Full Context configure qos slope-policy exceed-slope start-avg
configure qos slope-policy high-slope start-avg
configure qos slope-policy highplus-slope start-avg
configure qos slope-policy low-slope start-avg

Description This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the start-avg value to the default setting. If the max-avg setting is smaller than the default, an error will occur and the start-avg setting will not be changed to the default.

Default start-avg 85 - Highplus slope default is 85% buffer utilization before discard probability starts to increase above zero.

start-avg 70 — High slope default is 70% buffer utilization before discard probability starts to increase above zero.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

start-avg 50 — Low slope default is 50% buffer utilization before discard probability starts to increase above zero.

start-avg 30 — Exceed slope default is 30% buffer utilization before discard probability starts to increase above zero.

Parameters *percent* — The percentage of the shared buffer space for the buffer pool at which point the drop probability starts to increase above zero. The value entered must be less than or equal to the current setting of **max-avg**. If the entered value is greater than the current value of **max-avg**, an error will occur and no change will take place.

Full Context configure router dhcp local-dhcp-server failover startup-wait-time
configure router dhcp server pool failover startup-wait-time
configure router dhcp6 local-dhcp-server failover startup-wait-time
configure router dhcp6 server pool failover startup-wait-time

Description This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

Default startup-wait-time min 2

Parameters *minutes* — Specifies the startup wait time, in minutes.

Values 1 to 59

seconds — Specifies the startup wait time, in seconds.

Values 1 to 59

hours — Specifies the startup wait time, in hours.

Values 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.383 stat-mode

stat-mode

Syntax **stat-mode** *stat-mode*
no stat mode

Context **[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>policer stat-mode)
[Tree] (config>subscr-mgmt>sla-prof>ingress>qos>queue stat-mode)
[Tree] (config>subscr-mgmt>sla-prof>egress>qos>policer stat-mode)
[Tree] (config>subscr-mgmt>sla-prof>egress>qos>queue stat-mode)

Full Context configure subscriber-mgmt sla-profile egress qos policer stat-mode
configure subscriber-mgmt sla-profile egress qos queue stat-mode
configure subscriber-mgmt sla-profile ingress qos policer stat-mode
configure subscriber-mgmt sla-profile ingress qos queue stat-mode

Description This command is used to configure the forwarding plane octet and packet counters of a policer or queue to count packets of a specific type or state. For example separate counters for IPv4/IPv6 or separate counters for offered high and low priority policed traffic.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For policers, this command overrides the policer stat-mode configuration as defined in the sap-ingress or sap-egress qos policy. For details on sap-ingress and sap-egress policer stat-mode, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide*. For use in Enhanced Subscriber Management (ESM) context only, an additional stat-mode enables separate counters for IPv4 and IPv6 packets.

When a policer's stat-mode is changed while the sla profile is in use, any previous counter values are lost and any new counters are set to zero.

For queues, this command sets the stat-mode. Queue stat-mode is only available for use in Enhanced Subscriber Management (ESM) context to enable separate IPv4/IPv6 counters.

A queue's stat-mode cannot be changed while the SLA profile is in use.

The **no** form of this command reverts to the default.

Default For policers, the default is no stat-mode override. The sap-ingress or sap-egress stat-mode is used instead.

For queues, the default is to count in-/out-of-profile octets and packets.

Parameters *stat-mode* — Specifies the stat mode for the policer.

For ingress and egress qos queue stat-mode overrides.

For ingress and egress qos policer stat-mode overrides, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the **sap-ingress** and **sap-egress policer stat-mode** parameters.

For use in Enhanced Subscriber Management (ESM) context only:

Values no-stats, minimal, offered-profile-no-cir, offered-priority-no-cir, offered-profile-cir, offered-priority-cir, offered-total-cir, offered-limited-profile-cir, offered-profile-capped-cir, offered-limited-capped-cir, v4-v6 (count IPv4 and IPv6 forwarded/dropped octets and packets separately)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt sla-profile egress qos queue stat-mode
- configure subscriber-mgmt sla-profile ingress qos queue stat-mode

Context [Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)
[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

Full Context configure card fp ingress access queue-group policer-override policer stat-mode
configure card fp ingress network queue-group policer-override policer stat-mode

Description This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters
- See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the policer stat-mode parameters.

configure service ipipe sap egress policer-override policer stat-mode
configure service ipipe sap ingress policer-override policer stat-mode

Description The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

Description The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of the command returns the policer's stat-mode setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

configure service ies interface sap ingress policer-override policer stat-mode

Description The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of this command returns the policer's stat-mode setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

Full Context configure service vprn interface sap egress policer-override policer stat-mode
configure service vprn interface sap ingress policer-override policer stat-mode

Description The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of this command returns the policer's stat-mode setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

[Tree] (config>qos>sap-ingress>policer stat-mode)

Full Context configure qos sap-ingress dynamic-policer stat-mode
configure qos sap-ingress policer stat-mode

Description This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 133.

Table 133 **Ingress Policer Stat Mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—

Table 133 **Ingress Policer Stat Mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters **no-stats** — Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal — Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

Dro. All	apd	AllPacketsDropped
	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir — Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 135.

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-priority-no-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 136.

	hof	HighPriorityOctetsForwarded
For. LowPrio	lpf	LowPriorityPacketsForwarded
	lof	LowPriorityOctetsForwarded

offered-profile-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 137.

	oof	OutOfProfileOctetsForwarded

offered-priority-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 138.

Table 138 **Ingress Accounting Statistics Collected in offered-priority-cir stat-mode**

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-total-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 139.

Table 139 **Ingress Accounting Statistics Collected in offered-total-cir stat-mode**

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-limited-profile-cir — Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 140.

	oof	OutOfProfileOctetsForwarded

offered-profile-cir — Counter resource allocation: 4

offered-profile-capped-cir — Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 141.

Table 141 **Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode**

offered-limited-capped-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the “offered undefined” statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 142.

stat-mode

Syntax **stat-mode** {**no-stats** | **minimal** | **offered-profile-no-cir** | **offered-profile-cir** | **offered-total-cir** | **offered-limited-capped-cir** | **offered-profile-capped-cir**}
no stat mode

Context **[Tree]** (config>qos>sap-egress>dyn-policer stat-mode)

Full Context configure qos sap-egress dynamic-policer stat-mode

Description The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 143.

Table 143 **Egress Policer Stat-mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters **no-stats** — Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal — Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 144.

offered-profile-no-cir — Counter resource allocation: 2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 145.

offered-profile-cir — Counter resource allocation: 4

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 146.

Show Output	Accounting Stats Collected	
	Field	**Field Description**
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-total-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 147.

	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 148.

offered-profile-capped-cir — Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 149.

Context **[Tree]** (config>qos>sap-egress>policer stat-mode)

Full Context configure qos sap-egress policer stat-mode

Description The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 150.

Table 150 **Egress Policer Stat-mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/ exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is reclassified at egress to inplus and/or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters **no-stats** — Counter resource allocation: 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal — Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 151.

offered-profile-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 153.

offered-total-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 154.

offered-limited-capped-cir — Counter resource allocation: 4

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 155.

offered-profile-capped-cir — Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 156.

offered-total-cir-exceed — Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

offered-four-profile-no-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

offered-total-cir-four-profile — Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 159.

stat-mode

Syntax **stat-mode** {**no-stats** | **minimal** | **offered-profile-no-cir** | **offered-priority-no-cir** | **offered-profile-cir** | **offered-priority-cir** | **offered-total-cir** | **offered-limited-profile-cir** | **offered-profile-capped-cir** | **offered-limited-capped-cir**}
no stat mode

Context **[Tree]** (config>qos>qgrps>ing>qgrp>policer stat-mode)

Full Context configure qos queue-group-templates ingress queue-group policer stat-mode

Description This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 160.

Table 160 **Stat Mode Descriptions**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.

Table 160 **Stat Mode Descriptions**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters **no-stats** — Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal — Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 161.

offered-profile-no-cir — Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 162.

offered-priority-no-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 163.

offered-profile-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 164.

offered-priority-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

offered-total-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

offered-limited-profile-cir — Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 167.

	oof	OutOfProfileOctetsForwarded

offered-profile-capped-cir — Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as ‘out-of-profile’ due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

offered-limited-capped-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 169.

no stat mode

Context **[Tree]** (cfg>qos>qgrps>egr>qgrp>policer stat-mode)

Full Context configure qos queue-group-templates egress queue-group policer stat-mode

Description The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 170.

Table 170 **Egress Policer Stat Mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—

Table 170 **Egress Policer Stat Mode Summary**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/ exceed entering policer	Inplus/in/out/ exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified to profile inplus and/or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/ exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters **no-stats** — Counter resource allocation: 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal — Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 171 (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 171 **Egress Accounting Statistics Collected in minimal stat-mode**

For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 172 (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-cir — Counter resource allocation: 4

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 173 (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir — Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 174 (the actual fields collected depends on the **record** configured in the applied accounting policy).

	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 175 (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-exceed — Counter resource allocation: 3

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 177 (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-four-profile-no-cir — Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 178 (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile — Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 179 (the actual fields collected depends on the **record** configured in the applied accounting policy).

Full Context configure router mpls lsp egress-statistics stat-mode
configure router mpls lsp ingress-statistics stat-mode
configure router mpls lsp-template egress-statistics stat-mode

Description This command sets the mode used for collecting LSP statistics.

The **no** form of this command reverts to the default.

Default stat-mode per-fc

Parameters **per-fc** — Specifies that RSVP-TE statistics will be collected per FC.

aggregate — Specifies that SR-TE statistics will be collected as an aggregate across all FCs.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp ingress-statistics stat-mode

23.384 state

state

Syntax [**no**] **state**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query state)

Full Context configure subscriber-mgmt wlan-gw ue-query state

Description This command enables matching on a specific UE state. Multiple states can be provisioned.

The **no** form of this command disables matching on the specified UE state (all UEs match).

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

state

Syntax **state** *state*
no state

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from state)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router policy-options policy-statement entry from state

Description This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default no state

Parameters *state* — Specifies the state.

Values
- srrp-master — Used in non-CUPS BNG resiliency. Identifies routes associated with an active SRRP instance.
- srrp-non-master — Used in non-CUPS BNG resiliency. Identifies routes associated with a standby SRRP instance.
- ipsec-master-with-peer — Used in stateful Multi-Chassis IPsec (MC-IPsec) redundancy. Identifies routes associated with an active MC-IPsec node with a reachable peer.
- ipsec-non-master — Used in stateful MC-IPsec redundancy. Identifies routes associated with a standby MC-IPsec node.
- ipsec-master-without-peer — Used in stateful MC-IPsec redundancy. Identifies routes associated with an active MC-IPsec node without a reachable peer.
- fsg-active — Used in BNG CUPS inter-UPF resiliency. Identifies routes associated with an FSG on the active BNG UPF. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes, but not loopback addresses.
- fsg-standby — Used in BNG CUPS inter-UPF resiliency. Identifies routes associated with an FSG on the standby BNG UPF. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes, but not loopback addresses.

23.386 state-timer

state-timer

Syntax **state-timer** *seconds* [**action** *action*]
no state-timer

Context **[Tree]** (config>router>pcep>pcc state-timer)

Full Context configure router pcep pcc state-timer

Description This command configures the state timer for PCE-initiated LSPs. The state timer must be set to a value greater than the redelegation timer.

The **no** form of the command sets this value to the default.

Default state-timer 180 action remove

Parameters *seconds* — Specifies the number of seconds before the state timer expires.

Values 1 to 3600

action — Specifies the actions that are taken on undelegated LSPs upon the state timer expiration.

Values remove, none

Default remove

23.389 stateless-aps-switchover

stateless-aps-switchover

Syntax [**no**] **stateless-aps-switchover**

Context **[Tree]** (config>port>ml-bundle>mlppp stateless-aps-switchover)

Full Context configure port multilink-bundle mlppp stateless-aps-switchover

Description This command specifies whether the bundle will perform a stateful or a stateless APS switchover.

The value can be changed for APS bundle protection groups of type MLPPP.

A stateless switchover implies that PPP is re-negotiated on each member link after the switchover. PPP negotiations may take a few seconds to complete.

A stateful switchover implies that after an APS switchover the PPP state of the bundle will be restored based on the bpgrp bundle state before the switchover.

The state cannot be changed for normal MLPPP bundles (only applicable for bpgrps).

The **no** form of this command disables stateless APS switchover.

Default no stateless-aps-switchover

Platforms 7450 ESS, 7750 SR-7/12/12e

configure service vpls sap mld-snooping static
configure service vpls spoke-sdp igmp-snooping static
configure service vpls spoke-sdp mld-snooping static

Description Commands in this context configure static group addresses. Static group addresses can be configured on a SAP or SDP. When present, either as a (*, g) or a (s,g) entry, multicast packets matching the configuration are forwarded even if no join message was registered for the specific group.

Platforms All

static

Syntax **static**

Context **[Tree]** (config>subscr-mgmt>igmp-policy static)
[Tree] (config>subscr-mgmt>mld-policy static)

Full Context configure subscriber-mgmt igmp-policy static
configure subscriber-mgmt mld-policy static

Description Commands in this context configure MLD static group membership parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

static

Syntax **static** *ip-address ieee-address*
no static *ip-address*

Context **[Tree]** (config>service>vpls>proxy-arp static)

Full Context configure service vpls proxy-arp static

Description This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either learned or CStatic (conditional static MAC) in order to become active.

Parameters *ip-address* — Specifies the IPv4 address for the static entry.

ieee-address — Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

Platforms All

static

Syntax **static** *ipv6-address ieee-address* {**host** | **router**}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no static *ipv6-address*

Context **[Tree]** (config>service>vpls>proxy-nd static)

Full Context configure service vpls proxy-nd static

Description This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters *ipv6-address* — Specifies the IPv6 address for the static entry.

ieee-address — Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

host — Specifies that the entry is type “host”.

router — Specifies that the entry is type “router”.

Platforms All

static

Syntax **static**

Context **[Tree]** (config>service>vprn>igmp>if static)

Full Context configure service vprn igmp interface static

Description This command tests forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms All

static

Syntax **static**

Context **[Tree]** (config>service>vprn>mld>if static)

Full Context configure service vprn mld interface static

Description This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

static

Syntax **static**

Context **[Tree]** (config>router>igmp>tunnel-interface static)

Full Context configure router igmp tunnel-interface static

Description Commands in this context configure static multicast receiver hosts on a tunnel interface associated with an RSVP P2MP LSP.

When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms All

static

Syntax **static**

Context **[Tree]** (config>router>mld>if static)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router mld interface static

Description This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms All

static

Syntax **static**

Context **[Tree]** (config>router>pim>rp static)
[Tree] (config>router>pim>rp>ipv6 static)

Full Context configure router pim rp ipv6 static
configure router pim rp static

Description Commands in this context configure static Rendezvous Point (RP) addresses for a multicast group range.

Entries can be created or destroyed. If no IP addresses are configured in the **config>router>pim>rp>static>address** context, then the multicast group to RP mapping is derived from the RP-set messages received from the Bootstrap Router.

Platforms All

static

Syntax **static** *microseconds*
no static

Context **[Tree]** (config>router>if>if-attribute>delay static)

Full Context configure router interface if-attribute delay static

Description This command configures the unidirectional link delay. By default there is no configured delay, the link delay metric TLV is pruned in the IGP.

The **no** form of this command removes the configured unidirectional link delay.

Default no static

Parameters *microseconds* — Specifies the unidirectional link delay in microseconds.

23.391 static-aa-sub

static-aa-sub

Syntax **static-aa-sub** *transit-aasub-name*
static-aa-sub *transit-aasub-name* **app-profile** *app-profile-name* [**create**]
no static-aa-sub *transit-aasub-name*

Context **[Tree]** (config>app-assure>group>transit-ip-policy static-aa-sub)

Full Context configure application-assurance group transit-ip-policy static-aa-sub

Description This command configures static transit aa-subs with a name and an app-profile. A new transit sub with both a name and an app-profile is configured with the create command. Static transit aa-sub must have an explicitly assigned app-profile. An existing transit sub can optionally be assigned a different app-profile, or this command can be used to enter the static-aa-sub context.

The **no** form of this command deletes the named static transit aa-sub from the configuration.

Parameters *transit-aasub-name* — Specifies the name of a transit subscriber up to 32 characters in length.

app-profile-name — Specifies the name of an existing application profile up to 32 characters in length.

create — Keyword used to create a new app-profile entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no static-arp *ip-address* [*ieee-mac-address*]

Context **[Tree]** (config>service>ies>if static-arp)
[Tree] (config>service>vprn>if static-arp)

Full Context configure service ies interface static-arp
configure service vprn interface static-arp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters *ip-address* — Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered — Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms All

Context **[Tree]** (config>router>if static-arp)

Full Context configure router interface static-arp

Description This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

Parameters *ieee-address* — Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered — Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms All

23.394 static-cak

static-cak

invalid}]
no static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number*

Context **[Tree]** (config>router>origin-validation static-entry)

Full Context configure router origin-validation static-entry

Description This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the base router.

Parameters *ip-prefix/ip-prefix-length* — Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2 — Specifies the maximum prefix length.

Values 1 to 128

as-number — Specifies as-number.

Values 0 to 4294967295

valid — Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

invalid — Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

[Tree] (config>service>vprn>sub-if>grp-if>sap static-host)

Full Context configure service ies subscriber-interface group-interface sap static-host
configure service vprn subscriber-interface group-interface sap static-host

Description This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters *ip-prefix[/prefix-length* — Specifies information for the specified IP address and mask.

mac-address — Specifies a MAC address. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force — Specifies the forced removal of the static host addresses.

create — Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Description This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

Parameters *ip-address* — Specify this optional parameter when defining a static host. The IP address must be specified for **anti-spoof ip**, **anti-spoof ip-mac** and **arp-reply-agent** (**arp-reply-agent** is supported by the 7450 ESS only). Only one static host may be configured on the SAP with a given IP address.

mac-address — Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and arp-reply-agent (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

force — Specifies the forced removal of the static host addresses.

23.400 static-label-range

static-label-range

Syntax **static-label-range** *static-range*
no static-label-range

Context **[Tree]** (config>router>mpls-labels static-label-range)

Full Context configure router mpls-labels static-label-range

Description This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default static-label-range 18400

Parameters *static-range* — Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

Values 0 to 262112

Default 18400

Platforms All

23.401 static-lsp

static-lsp

Syntax [**no**] **static-lsp** *lsp-name*

Context **[Tree]** (config>router>mpls static-lsp)

Full Context configure router mpls static-lsp

Description This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp** *lsp-name* command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

Parameters *lsp-name* — Specifies the name that identifies the LSP.

Values Up to 32 alphanumeric characters.

Platforms All

23.402 static-lsp-fast-retry

static-lsp-fast-retry

Syntax **static-lsp-fast-retry** *seconds*
no static-lsp-fast-retry

Context **[Tree]** (config>router>mpls static-lsp-fast-retry)

Full Context configure router mpls static-lsp-fast-retry

Description This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default no static-lsp-fast-retry

Parameters *seconds* — Specifies the value (in s), used as the fast retry timer for a static LSP.

Values 1 to 30

Platforms All

23.403 static-mac

static-mac

Syntax **static-mac** *ieee-mac-address* [**create**]
no static-mac *ieee-mac-address*

Context [Tree] (config>service>vpls>sap static-mac)
[Tree] (config>service>vpls>mesh-sdp static-mac)
[Tree] (config>service>vpls>spoke-sdp static-mac)

Full Context configure service vpls mesh-sdp static-mac
configure service vpls sap static-mac
configure service vpls spoke-sdp static-mac

Description This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the Service Distribution Point (SDP).

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note: Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

Parameters *ieee-mac-address* — Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

create — Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms All

static-mac

Syntax **static-mac**

Context [Tree] (config>service>vpls static-mac)

Full Context configure service vpls static-mac

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

Platforms All

static-mac

Syntax **static-mac**

Context **[Tree]** (config>service>vpls>interface static-mac)

Full Context configure service vpls interface static-mac

Description A set of conditional static MAC addresses can be created within a VPLS supporting bgp-evpn. Conditional static macs are also supported in B-VPLS with SPBM. Conditional Static MACs are dependent on the SAP/SDP state.

This command allows assignment of a set of conditional static MAC addresses to a SAP/spoke-SDP. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a bgp-evpn service are advertised as protected (EVPN will signal the mac as protected).

static-mac

Syntax **static-mac** *ieee-address* [**create**]
no static-mac *ieee-address*

Context **[Tree]** (config>service>vpls>endpoint static-mac)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls endpoint static-mac

Description This command assigns a static MAC address to the endpoint. In the FDB, the static MAC is then associated with the active spoke-SDP.

Parameters *ieee-address* — Specifies the static MAC address to the endpoint

Values 6-byte mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) Cannot be all zeros

create — This keyword is mandatory while creating a static MAC

Platforms All

23.404 static-policer

static-policer

Syntax [**no**] **static-policer** *policer-name* [**create**]

Context **[Tree]** (config>sys>security>dist-cpu-protection>policy static-policer)

Full Context configure system security dist-cpu-protection policy static-policer

Description Configures a static enforcement policer that can be referenced by one or more protocols in the policy. Once this **policer-name** is referenced by a protocol, then this policer will be instantiated for each object (for example, a SAP or network interface) that is created and references this policy. If there is no policer resource available on the associated card or fp then the object is be blocked from being created. Multiple protocols can use the same **static-policer**.

Parameters *policy-name* — Specifies the name of the policy, up to 32 characters.

Platforms All

23.405 static-policy

static-policy

Syntax [**no**] **static-policy** *policy-name*

Full Context configure service vprn mvpn provider-tunnel inclusive p2mp-sr static-policy
configure service vprn mvpn provider-tunnel selective multistream-spmsi static-policy
configure service vprn mvpn provider-tunnel selective p2mp-sr static-policy

Description This command assigns the specified static policy to the MVPN tunnel.

The **no** form of this command removes the static policy from the MVPN tunnel.

Default no static-policy

Parameters *policy-name* — Specifies the policy name, up to 32 characters.

Platforms All

static-policy

Syntax **static-policy** *name* [**create**]
no static-policy *name*

Context **[Tree]** (config>router>segment-routing>sr-policies static-policy)

Full Context configure router segment-routing sr-policies static-policy

Description This command creates a context to configure a segment routing policy. The resulting segment routing policy is targeted for local installation or propagation by BGP to another router.

The **no** form of this command deletes the statically defined segment routing policy.

Default no static-policy

Parameters *name* — Specifies the name assigned to the statically defined segment routing policy, up to 64 characters.

create — Keyword used to create the policy.

Platforms All

static-remote-aa-sub

Syntax **static-remote-aa-sub** *transit-aasub-name*
static-remote-aa-sub *transit-aasub-name* **app-profile** *app-profile-name* [**create**]
no static-remote-aa-sub *transit-aasub-name*

Context **[Tree]** (config>app-assure>group>transit-prefix-policy static-remote-aa-sub)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure application-assurance group transit-prefix-policy static-remote-aa-sub

Description This command configures static remote transit aa-subs with a name and an app-profile. Remote transit subscribers are configured for sites on the opposite side of the system as the parent SAP/spoke- SDP. A new remote transit sub with both a name and an app-profile is configured with the create command. Static remote transit aa-subs must have an explicitly assigned app-profile. An existing remote transit sub can optionally be assigned a different app-profile.

The **no** form of this command removes the name from the transit prefix policy.

Parameters *transit-aasub-name* — Specifies a transit aasub-name up to 32 characters.

app-profile-name — Specifies the name of an existing application profile up to 32 characters.

create — Keyword used to create a new app-profile entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.407 static-route

static-route

Syntax [**no**] **static-route** *route-name*

Context **[Tree]** (config>service>pw-routing static-route)

Full Context configure service pw-routing static-route

Description This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

static-route 0:0:next_hop_ip_addresss

or

static-route 0:0.0.0.0:next_hop_ip_address

The **no** form of this command removes a previously configured static route.

Parameters *route-name* — Specifies the static pseudowire route.

Values

route-name	<global-id>:<prefix>:<next-hop-ip_addr>
global-id	0 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

prefix	a.b.c.d | 0 to 4294967295
next-hop-ip_addr	a.b.c.d

Platforms All

static-route

Syntax [**no**] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

Context **[Tree]** (bof static-route)

Full Context bof static-route

Description This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default no static-route

Parameters *ip-prefix/ip-prefix-length* — Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32
	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces) *x:x:x:x:x:x:d.d.d.d* *x*: [0 to FFFF]H *d*: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces) *x:x:x:x:x:x:d.d.d.d* *x*: [0 to FFFF]H *d*: [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: IPv6 is applicable to the 7750 SR and 7950 XRS only.

mask — Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address — Specifies the next hop IP address used to reach the destination.

Platforms All

23.408 static-route-entry

static-route-entry

Syntax **static-route-entry** *ip-prefix*/*prefix-length* [**mcast**]
no static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

Context **[Tree]** (config>service>vprn static-route-entry)

Full Context configure service vprn static-route-entry

Description This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

Default No static routes are defined.

Parameters *ip-prefix/prefix-length* — The destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

mcast — Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms All

static-route-entry

Syntax [**no**] **static-route-entry** *ip-prefix*/*prefix-length* [**mcast**]

Context **[Tree]** (config>router static-route-entry)

Full Context configure router static-route-entry

Description This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default No static routes are defined.

Parameters *ip-prefix/prefix-length* — Specifies the destination address of the static route.

Values The following values apply to the 7750 SR and 7950 XRS:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x	[0 to FFFF]H
	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

Values The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

ip-address — Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

Values The following value applies to the 7450 ESS:

ipv4-address	a.b.c.d (host bits must be 0)

mcast — Indicates that static route being configured is used for multicast table only.

Description This command configures an HTTP header enrichment template field static string.

The **no** form of this command removes the template field static string.

Default no static-string

Parameters *static-string* — Specifies a static string.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.412 static-tunnel-redundant-next-hop

static-tunnel-redundant-next-hop

Syntax **static-tunnel-redundant-next-hop** *ip-address*
no static-tunnel-redundant-next-hop

Context **[Tree]** (config>service>ies>if static-tunnel-redundant-next-hop)
[Tree] (config>service>vprn>if static-tunnel-redundant-next-hop)

Full Context configure service ies interface static-tunnel-redundant-next-hop
configure service vprn interface static-tunnel-redundant-next-hop

Description This command specifies redundant next-hop address on public or private IPsec interface (with public or private tunnel-sap) for static IPsec tunnel. The specified next-hop address will be used by standby node to shunt traffic to master in case of it receives them. Refer to the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide* for information about IPsec commands and descriptions.

The next-hop address will be resolved in routing table of corresponding service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the address from the interface configuration.

Parameters *ip-address* — Specifies the static ISA tunnel redundant next-hop address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.413 station

station

Syntax **station** *station-name* [**create**]
no station *station-name*

Context **[Tree]** (config>bmp station)

Full Context configure bmp station

Description The command configures the BMP monitoring station name.

The **no** form of this command removes the station name from the configuration.

Parameters *station-name* — Specifies the station name of the BMP monitoring station up to 32 characters.

create — Keyword used to create the station name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms All

station

Syntax **station all**
station *name* [*name*]
no station

Context **[Tree]** (config>router>bgp>group>monitor station)

configure router bgp monitor station
configure service vprn bgp group monitor station
configure service vprn bgp group neighbor monitor station

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the set of BMP monitoring stations for which BMP messages are to be sent, at the global BGP instance level, per group or for a particular neighbor.

Whatever value is configured for the station parameter at the most specific BGP hierarchy level is used.

- If a station list or the **no station** command is configured at a neighbor context, then that value is used.
- If **no station** command is configured at the neighbor context, the group value is used.
- If a station list or the **no station** command is configured at a group context, then that value is used.
- If **no station** command is configured at the group context, the global value is used.
- If a station list or the **no station** command is configured at the global context, then that value is used.
- If **no station** command is configured at the global context, then a **no station** is assumed.

The **no** form of this command disables sending BMP messages to BMP monitoring stations.

Parameters *name* — Specifies up to eight station names up to 32 characters. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

all — Specifies all configured stations.

Platforms All

23.414 station-address

station-address

Syntax **station-address** *ip-address* | *ipv6-address* **port** *port*
no station-address

Context **[Tree]** (config>bmp>station>connection station-address)

Full Context configure bmp station connection station-address

Description This command configures the IP address and TCP port number of the remote BMP monitoring station. This is a mandatory parameter and must be configured before the associated station can transitioned out of the shut down state.

The **no** form of this command removes the configured station IP address and port number for the BMP session. The **no station-address** command cannot be accepted unless the BMP or station instance is shut down.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address — Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

port — Specifies the TCP (destination) port number to be used when establishing the connection to the associated BMP station.

Values 1 to 65535

Platforms All

23.415 statistic

statistic

Syntax **statistic type** *type* **name** *name*
no statistic

Context **[Tree]** (debug>wlan-gw>group statistic)

Full Context debug wlan-gw group statistic

Description This command enables debugging of the specified statistic. The first packet that causes an increase of the specified statistic is shown in debug output. After the first packet, debugging of the counter is stopped.

Parameters *type* — Displays the type of statistic to be debugged; for example, DHCP or RADIUS.

Values packet-errors, host-errors, bd-errors, forwarding, reassembly, aa, radius, arp, dhcp, dhcp6, icmp, icmp6

name — Specifies the name, up to 256 characters, of the statistic within that group. For a complete list, see the command **show isa wlan-gw-group** *wlan-gw-group-id* **member** *member-id* **statistics**.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.418 stats-report-interval

stats-report-interval

Syntax **stats-report-interval** [*seconds*]
no stats-report-interval

Context **[Tree]** (config>bmp>station stats-report-interval)

Full Context configure bmp station stats-report-interval

Description This command configures the frequency of sending statistics reporting messages to the BMP monitoring station.

The **no** form of this command removes the interval from the configuration.

Parameters *seconds* — Specifies the frequency of sending statistics reporting messages, in seconds, to the BMP monitoring station.

Values 15 to 65535

Platforms All

23.419 stats-type

stats-type

Syntax **stats-type** {**time** | **volume-time**}
no stats-type

Context **[Tree]** (config>service>dynsvc>acct-1 stats-type)
[Tree] (config>service>dynsvc>acct-2 stats-type)

Full Context configure service dynamic-services dynamic-services-policy accounting-1 stats-type
configure service dynamic-services dynamic-services-policy accounting-2 stats-type

Description This command configures the type of statistics to be reported in dynamic data services RADIUS accounting. A RADIUS specified Stats Type overrides the CLI configured value.

The **no** form of this command resets the default value.

Default stats-type volume-time

Parameters **time** — Only report Session-Time in the RADIUS Accounting Interim-Update and Stop message.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

volume-time — Report both Session-Time and Volume counter attributes in the RADIUS. Accounting Interim-Update and Stop messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stats-type

Syntax **stats-type** {**volume-time** | **time**}
no stats-type

Context **[Tree]** (config>service>dynsvc>ladb>user>idx>acct stats-type)

Full Context configure service dynamic-services local-auth-db user-name index accounting stats-type

Description This command specifies whether dynamic service accounting should be enabled or disabled for this destination. RADIUS accounting is enabled by specifying the stats type: volume and time or time only. This command overrides the local configured value in the dynamic services policy.

The **no** form of this command disables RADIUS accounting (**stats-type** off).

Parameters **volume-time | time** — Enables RADIUS accounting for this dynamic service and specifies if volume counters should be included (**volume-time**) or time only (**time**) in the RADIUS accounting messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.420 status-verify

configure service vprn interface sap ipsec-gw cert status-verify
configure service vprn interface sap ipsec-tunnel dynamic-keying cert status-verify

Description Commands in this context configure Certificate Status Verification (CSV) parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-gw cert status-verify
- configure service vprn interface sap ipsec-tunnel dynamic-keying cert status-verify
- configure service ies interface sap ipsec-gw cert status-verify
- configure ipsec ipsec-transport-mode-profile dynamic-keying cert status-verify

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying cert status-verify
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying cert status-verify
- configure service ies interface ipsec ipsec-tunnel dynamic-keying cert status-verify

23.421 std-acct-attributes

std-acct-attributes

Syntax [**no**] **std-acct-attributes**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute std-acct-attributes)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute std-acct-attributes

Description This command enables reporting of aggregated forwarded IPv4 and IPv6 octet, packet and gigaword counters using standard RADIUS attributes. This attribute is by default. It can be enabled simultaneously with detailed per queue or policer counters (**detailed-acct-attributes**).

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.422 std-port-class-pools

std-port-class-pools

Syntax **std-port-class-pools**

Context **[Tree]** (config>qos>hs-port-pool-policy std-port-class-pools)

Full Context configure qos hs-port-pool-policy std-port-class-pools

Description Commands in this context configure standard port-class pools parameters. Within this context, the corresponding port-class pools can be associated with a mid-pool, explicitly sized as a percentage of the mid-pool size, dynamically-sized based on relative port bandwidth, or have a slope policy applied.

Platforms 7750 SR-7/12/12e

23.423 steering-profile

steering-profile

Syntax **steering-profile** *steering-profile-name*
no steering-profile

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host steering-profile)

Full Context configure subscriber-mgmt local-user-db ppp host steering-profile

Description This command configures the steering profile for the specific host.

The **no** form of this command removes the steering profile for the host.

Parameters *steering-profile-name* — Specifies the name of the steering profile, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

steering-profile

Syntax **steering-profile** *steering-profile-name* [**create**]
no steering-profile *steering-profile-name*

Context **[Tree]** (config>subscr-mgmt steering-profile)

Full Context configure subscriber-mgmt steering-profile

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a steering profile mapping. A steering profile can be applied to each L2TP LAC subscriber host that requires traffic steering.

The **no** form of this command removes the specified steering profile.

Parameters *steering-profile-name* — Specifies the name of the steering profile, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

steering-profile

Syntax [**no**] **steering-profile**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute steering-profile)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute steering-profile

Description This command enables including the Alc-Steering-Profile RADIUS attribute.

The **no** form of the command disables including the Alc-Steering-Profile RADIUS attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.424 steering-route

steering-route

Syntax **steering-route** *ip-prefix/length*
no steering-route

Context **[Tree]** (config>service>vprn>nat>inside>redundancy steering-route)

Full Context configure service vprn nat inside redundancy steering-route

Description This command configures specifies the IP address and prefix length of the steering route. The steering route is used in the realm of this virtual router instance as an indirect next-hop for all the traffic that must be routed to the large scale NAT function.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

steering-route

Syntax **steering-route** *ip-prefix/length*
no steering-route

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>nat>inside>redundancy steering-route)

Full Context configure router nat inside redundancy steering-route

Description This command is optionally used in LSN44 multi-chassis redundancy when filters are used on the inside to send traffic destined for the LSN44 function to MS-ISA, where NAT is performed.

If configured, the steering-route is advertised only from the active LSN44 node: the purpose is to bring the LSN44 node activity awareness to downstream routers. In this fashion, downstream routers can make a more intelligent decision when forwarding traffic in the upstream direction. Based on the steering-route, traffic can be sent directly towards the active LSN44 node. This route avoids an extra forwarding hop which would ensue in the case without LSN44 activity awareness, where the upstream traffic can be forwarded to the standby LSN44 node and then to the active LSN44 node.

LSN44 node activity (active/standby) is evaluated per isa-group based on monitoring routes advertised on the outside.

The **no** form of the command removes the ip-prefix/length from the configuration.

Default none

Parameters *ip-prefix/length* — Specifies the IP address and length of the steering route.

Values

ip-prefix:	a.b.c.d
ip-prefix-length:	0 to 32

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.425 sticky-dest

sticky-dest

Syntax **sticky-dest** *hold-time-up*
sticky-dest no-hold-time-up
no sticky-dest

Context [Tree] (config>filter>ip-filter>entry sticky-dest)
[Tree] (config>filter>ipv6-filter>entry sticky-dest)
[Tree] (config>filter>mac-filter>entry sticky-dest)
[Tree] (config>filter>redirect-policy sticky-dest)

Full Context configure filter ip-filter entry sticky-dest
configure filter ipv6-filter entry sticky-dest

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure filter mac-filter entry sticky-dest
configure filter redirect-policy sticky-dest

Description This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default no sticky-dest

Parameters *hold-time-up* — Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

Platforms All

23.426 sticky-dr

sticky-dr

Syntax **sticky-dr** [**priority** *dr-priority*]
no sticky-dr

Context **[Tree]** (config>service>vprn>pim>if sticky-dr)

Full Context configure service vprn pim interface sticky-dr

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

Default no sticky-dr

Parameters **priority** *dr-priority* — Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

Values 1 to 4294967295

Platforms All

sticky-dr

Syntax **sticky-dr** [**priority** *dr-priority*]
no sticky-dr

Context **[Tree]** (config>router>pim>interface sticky-dr)

Full Context configure router pim interface sticky-dr

Description This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) will be modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

Default no sticky-dr

Parameters **priority** *dr-priority* — Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

23.427 sticky-ecmp

sticky-ecmp

Syntax **sticky-ecmp**
no sticky-ecmp

Context **[Tree]** (config>router>policy-options>policy-statement>entry>action sticky-ecmp)
[Tree] (config>router>policy-options>policy-statement>default-action sticky-ecmp)

Full Context configure router policy-options policy-statement default-action sticky-ecmp
configure router policy-options policy-statement entry action sticky-ecmp

Description This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

Default no sticky-ecmp

Platforms All

23.428 sticky-msaps

sticky-msaps

Syntax **sticky-msaps** [**idle-timeout** *seconds*]
no sticky-msaps

Context **[Tree]** (config>subscr-mgmt>msap-policy sticky-msaps)

Full Context configure subscriber-mgmt msap-policy sticky-msaps

Description This command prevents MSAPs associated with the specified MSAP policy from being deleted unless a manual **clear** command is issued. If this command is not enabled, an MSAP is deleted when a host creation fails or when a subscriber is no longer associated with the MSAP, for example, when a subscriber ends the session. This feature is useful for an operator who wants to keep historical statistics on MSAPs. It can also speed up host creation on an MSAP since the MSAP is already created. The **idle-timeout** parameter allows the removal of MSAPs that are idle for longer than the specified time.

The **no** form of this command allows an MSAP to be deleted when a host creation fails or when a subscriber is no longer associated with the MSAP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no sticky-msaps

Parameters *seconds* — Specifies the idle timeout, in seconds.

Values 5 to 604800

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stream-selection

Syntax [**no**] **stream-selection**

Context **[Tree]** (config>isa>video-group stream-selection)

Full Context configure isa video-group stream-selection

Description This command specifies whether or not stream selection is enabled on this video group.

The **no** form of the command disables **stream-selection** for the group.

Default no stream-selection

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

23.431 streaming

streaming

Syntax **streaming**

Context **[Tree]** (config>oam-pm streaming)

Full Context configure oam-pm streaming

Description This command specifies the context to configure the OAM-PM streaming template and its associated parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

streaming

Syntax **streaming**

Context **[Tree]** (config>system>snmp streaming)

Full Context configure system snmp streaming

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes. In higher latency networks, synchronizing router MIBs from network management via streaming takes less time than synchronizing via classic SNMP UDP requests. Streaming operates on TCP port 1491 and runs over IPv4 or IPv6.

Platforms All

23.432 strict

strict

Syntax [**no**] **strict**

Context **[Tree]** (config>app-assure>group>tcp-validate strict)

Full Context configure application-assurance group tcp-validate strict

Description This command specifies whether enforcement of TCP sequence and acknowledgment numbers is applied. If a packet does not meet the expected sequence or acknowledgment number, it is dropped.

This command should only be enabled if the expected bit error rate or packet loss is low. For example, if acknowledgments are lost before being detected by AA, the server timeouts are triggered and retransmissions occur. If **strict** is enabled, these retransmissions would resemble a reply attack and would be dropped by AA.

The **no** form of this command removes TCP sequence and acknowledgment number enforcement.

Default no strict

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.433 strict-adjacency-check

strict-adjacency-check

Syntax [**no**] **strict-adjacency-check**

Context **[Tree]** (config>service>vprn>isis strict-adjacency-check)

Full Context configure service vprn isis strict-adjacency-check

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Default no strict-adjacency-check

Platforms All

strict-adjacency-check

Syntax [**no**] **strict-adjacency-check**

Context **[Tree]** (config>router>isis strict-adjacency-check)

Full Context configure router isis strict-adjacency-check

strict-lsa-checking

Syntax [**no**] **strict-lsa-checking**

Context **[Tree]** (config>router>ospf>graceful-restart strict-lsa-checking)
[Tree] (config>router>ospf3>graceful-restart strict-lsa-checking)

Full Context configure router ospf graceful-restart strict-lsa-checking
configure router ospf3 graceful-restart strict-lsa-checking

Description This command indicates whether an OSPF restart helper should terminate graceful restart when there is a change to an LSA that would be flooded to the restarting router during the restart process.

The default OSPF behavior is to terminate a graceful restart if an LSA changes, which causes the OSPF neighbor to go down.

The **no** form of this command disables strict LSA checking.

Default strict-lsa-checking

23.435 strict-mode

strict-mode

Syntax [**no**] **strict-mode**

Context **[Tree]** (config>service>upnp>upnp-policy strict-mode)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service upnp upnp-policy strict-mode

Description This command enable UPnP strict mode. With strict-mode, system only allows changes to existing UPnP mapping if the request comes from same UPnP client.

Default no strict-mode

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.436 string

string

Syntax **string** *string*
no string

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident string)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification string

Description This command specifies the string from the Nokia vendor-specific sub-option (VSO) in Option 82 to match when the LUDB is accessed using a DHCPv4 server.

Note: This command is only used when **string** is configured as one of the **match-list** parameters.

The **no** form of this command removes the host identification string from the configuration.

Parameters *string* — Specifies the VSO string of this host, up to 255 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

string

23.437 strings-from-option

strings-from-option

Syntax **strings-from-option** *dhcp-option-number*
no strings-from-option

Context **[Tree]** (config>subscr-mgmt>sub-ident-pol strings-from-option)

Full Context configure subscriber-mgmt sub-ident-policy strings-from-option

Description This command enables DHCPv4 option processing on DHCP ACK for subscriber host identification.

The parameter *dhcp-option-number* specifies the DHCPv4 option number containing subscriber host identification strings such as subscriber ID, sub-profile, sla-profile strings, and so on. The identification strings can be inserted by an SR OS based DHCPv4 server via a local user database lookup.

Applicable to DHCPv4 hosts and PPP hosts that use the internal DHCP client to get an IPv4 address from an SR OS based DHCPv4 server.

The **no** form of this command reverts to the default.

Default no strings-from-option

Parameters *dhcp-option-number* — Specifies the DHCPv4 option number containing subscriber host identification strings.

Values 1 to 254

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.438 strip-label

strip-label

Syntax [**no**] **strip-label**

Context **[Tree]** (config>router>if strip-label)

Full Context configure router interface strip-label

Description This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed. However, IPv4 and IPv6 packets that arrive without any labels are supported on an interface with **strip-label** enabled.

This command operates in promiscuous mode. This means that the router does not filter on the destination MAC address of the Ethernet frames. In some network designs, multiple ports may be tapped and combined into interface toward the router. Promiscuous mode allows all of these flows to be processed without requiring the destination MAC address to be updated to match the router address.

This command is supported on:

- Optical ports for the 7750 SR and 7450 ESS
- IOM3-XP cards for the 7750 SR and 7450 ESS
- Null/Dot1q encaps
- Network ports
- IPv4
- IPv6

In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.

Packets that are subject to the strip-label action and are mirrored (using mirrors or lawful interception) will contain the original MPLS labels (and other L2 encapsulation) in the mirrored copy of the packet, as they appeared on the wire, when the mirror-dest type is the default type “ether”. If the mirror-dest type is “ip-only”, then the mirrored copy of the packet will not contain the original L2 encapsulation or the stripped MPLS labels.

The **no** form of this command removes the strip-label command.

Default no strip-label

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.439 strip-srv6-tlvs

strip-srv6-tlvs

Syntax **[no] strip-srv6-tlvs**

Context **[Tree]** (config>router>bgp>group>srv6>route>fam strip-srv6-tlvs)
[Tree] (config>router>bgp>group>neighbor>srv6>route>family strip-srv6-tlvs)

Full Context configure router bgp group neighbor segment-routing-v6 route-advertisement family strip-srv6-tlvs

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure router bgp group segment-routing-v6 route-advertisement family strip-srv6-tlvs

Description This command specifies that BGP routes that belong to the address family configured in the **family** command are advertised to peers with SRv6 TLVs removed. Locally or remotely added SRv6 TLVs can be removed.

The **no** form of this command configures the router not to strip SRv6 TLVs from the BGP routes advertised to peers.

Default no strip-srv6-tlvs

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

23.440 stub

stub

Syntax [**no**] **stub**

Context **[Tree]** (config>service>vprn>ospf>area stub)
[Tree] (config>service>vprn>ospf3>area stub)

Full Context configure service vprn ospf area stub
configure service vprn ospf3 area stub

Description This command enables access to the context to configure an OSPF stub area and adds/removes the stub designation from the area. External routing information is not flooded into stub areas. All routers in the stub area must be configured with the **stub** command. An OSPF area cannot be both an NSSA and a stub area. Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.

By default, an area is not a stub area.

The **no** form of this command removes the stub designation and configuration context from the area.

Default no stub — The area is not configured as a stub area.

Platforms All

23.443 sub-hosts-only

sub-hosts-only

Syntax [**no**] **sub-hosts-only**

Context **[Tree]** (config>service>vprn>igmp>grp-if sub-hosts-only)

Full Context configure service vprn igmp group-interface sub-hosts-only

Description This command enables the IGMP traffic from known hosts only.

The **no** form of this command disable the IGMP traffic from known hosts only

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only

Syntax [**no**] **sub-hosts-only**

Context **[Tree]** (config>router>igmp>group-interface sub-hosts-only)

Full Context configure router igmp group-interface sub-hosts-only

Description This command disables the processing of IGMP messages outside of the subscriber-host context. No other hosts outside of the subscriber-hosts can create IGMP states.

Disabling this command allows the creation of the IGMP states that correspond to the AN that operate in IGMP proxy mode. In this mode, the AN will hide source IP addresses of IGMP messages and will source IGMP messages with its own IP address. In this case, an IGMP state can be created under the **sap** context. This IGMP state creation under the SAP is controlled via the import policy under the group-interface.

The IGMP state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command disables the command.

Default sub-hosts-only

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only

Syntax [**no**] **sub-hosts-only**

Context **[Tree]** (config>router>mld>group-interface sub-hosts-only)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router mld group-interface sub-hosts-only

Description This command processes the handling of MLD joins received from hosts that are not known in subscriber management or on which no MLD policy is applied.

Disabling this command allows the creation of the MLD states that correspond to the AN that operate in MLD proxy mode. In this mode, the AN will hide source IP addresses of MLD messages and will source MLD messages with its own IP address. In this case, an MLD state can be created under the **sap** context. This MLD state creation under the SAP is controlled via the import policy under the group-interface.

The MLD state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command enables the command.

Default sub-hosts-only

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.444 sub-id

sub-id

Syntax [**no**] **sub-id**

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy>include sub-id)

Full Context configure service nat syslog syslog-export-policy include sub-id

Description This command includes the **sub-id** string in the flow log. The **sub-id** is applicable only in subscriber-aware NAT. If subscriber-aware NAT is not enabled, the **sub-id** string is set to '-'.

The **no** form of the command disables the feature.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.445 sub-ident-policy

sub-ident-policy

Syntax [**no**] **sub-ident-policy** *sub-ident-policy-name*

Context **[Tree]** (config>subscr-mgmt sub-ident-policy)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt sub-ident-policy

Description This command configures a subscriber identification policy. Each subscriber identification policy can have a default subscriber profile defined. The subscriber identification policy default subscriber profile overrides the system default and the subscriber SAP default subscriber profiles. Defining a subscriber identification policy default subscriber profile is optional.

The subscriber identification policy default subscriber profile cannot be defined with the subscriber profile name default.

Defining a subscriber profile as a subscriber identification policy default subscriber profile will cause all active subscribers currently associated with a subscriber SAP using the policy and associated with a subscriber policy through the system default or subscriber SAP default subscriber profiles to be reassigned to the subscriber policy defined as default on the subscriber identification policy.

Attempting to delete a subscriber profile that is currently defined as a default for a subscriber identification policy will fail.

When attempting to remove a subscriber identification policy default subscriber profile definition, the system will evaluate each active subscriber on all subscriber SAPs the subscriber identification policy is currently associated with that are using the default definition to determine whether the active subscriber can be either reassigned to a subscriber SAP default or the system default subscriber profile. If all active subscribers cannot be reassigned, the removal attempt will fail.

The **no** form of this command reverts to the default.

Parameters *sub-ident-policy-name* — Specifies the name of the subscriber identification policy, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy
configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy
configure subscriber-mgmt msap-policy sub-sla-mgmt sub-ident-policy

Description This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings such as a subscriber identifier, an sla-profile string, a sub-profile string and an app-profile string.

The subscriber identification policy performs following functions for subscriber hosts and sessions associated with the SAP or MSAP:

- mapping of sla-profile, sub-profile and app-profile strings obtained from authentication (for example, LUDB, RADIUS, Diameter, or Python) into profile names that are configured on the router
- for IPoE DHCPv4 hosts, the subscriber identification strings can be derived from the DHCP ACK message sent to the subscriber host using a Python script referenced in the sub-ident-policy
- for PPPoE hosts that get an IPv4 address via the PPPoE DHCPv4 client and for IPoE DHCPv4 hosts, an SR OS DHCPv4 server in combination with an LUDB returns the identification strings in a DHCPv4 option. The **strings-from-option** command in the sub-ident-policy tells the system from which option to extract the identification strings.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Parameters *sub-ident-policy-name* — Specifies a subscriber identification policy for this SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy

sub-ident-policy

Syntax [**no**] **sub-ident-policy** *policy-name*

Context **[Tree]** (debug>subscr-mgmt sub-ident-policy)

Full Context debug subscriber-mgmt sub-ident-policy

Description This command debugs subscriber identification policies.

The **no** form of this command disables debugging.

Parameters *policy-name* — Specifies the subscriber identification policy to debug.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-ident-policy

Syntax **sub-ident-policy** *sub-ident-policy-name*
no sub-ident-policy

Context **[Tree]** (config>app-assure>group>transit-ip-policy sub-ident-policy)

Full Context configure application-assurance group transit-ip-policy sub-ident-policy

Description This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscribermgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings. A subscriber identification string uniquely identifies a subscriber. For static hosts, the subscriber identification string is explicitly defined with each static subscriber host.

For dynamic hosts, the subscriber identification string must be derived from the DHCP ACK message sent to the subscriber host. The default value for the string is the content of Option 82 CIRCUIT-ID and REMOTE-ID fields interpreted as an octet string. As an option, the DHCP ACK message may be processed by a subscriber identification policy which has the capability to parse the message into an alternative ASCII or octet string value.

When multiple hosts on the same port are associated with the same subscriber identification string they are considered to be host members of the same subscriber.

A sub-ident-policy can also be used for identifying dynamic transit subscriber names.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

Default no sub-ident-policy

Parameters *sub-ident-policy-name* — Specifies the subscriber identification policy name, up to 32 characters.

Context [Tree] (config>subscr-mgmt sub-mcac-policy)

Full Context configure subscriber-mgmt sub-mcac-policy

Description This command creates a policy template with MCAC bandwidth limits that are applied to the subscriber.

Per interface mcac bandwidth limits are set directly under the interface (regular interface or group-interface) and no such policy templates are needed.

The need for a separate policy template for subscribers is due to the fact that groups of subscribers under the same group-interface can share certain settings that can be configured via this template.

To summarize, the MCAC bandwidth constraints for subscribers are defined in the sub-mcac-policy while the mcac bandwidth constraints for the interface are configured directly under the **igmp>interface>mcac** or **igmp>grp-if>mcac** context without the need for policy templates.

Note: The sub-mcac-policy only deals with the mcac bandwidth limits and not the channel bandwidth definitions. Channels bandwidth is defined in a different policy (in the **config>router>mcac** context) and that policy is applied on the interface level as follows:

- For group-interface: under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interface: under the **config>service/router>igmp>interface>mcac** context.

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command reverts to the default.

Parameters *policy-name* — Specifies the name of the policy up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

sub-mcac-policy

Syntax **sub-mcac-policy** *policy-name*
no sub-mcac-policy

Context [Tree] (config>subscr-mgmt>sub-prof sub-mcac-policy)

Full Context configure subscriber-mgmt sub-profile sub-mcac-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command references the policy template in which the mcac bandwidth limits are defined. Mcac for the subscriber is effectively enabled with this command when the sub-profile is applied to the subscriber. The bandwidth of the channels is defined in a different policy (under the **config>router>mcac** context) and this policy is applied on the interface level as follows:

- For group-interfaces under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interfaces under the **config>service/router>igmp>interface>mcac** context

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command removes the policy from the configuration.

Parameters *policy-name* — Specifies the policy name configured in the config>subscr-mgmt>sub-mcac-policy context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

23.452 sub-mgmt

sub-mgmt

Syntax **sub-mgmt** [**ipoe**] [**pppoe**]
no sub-mgmt

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync sub-mgmt)

Full Context configure redundancy multi-chassis peer sync sub-mgmt

Description This command specifies whether subscriber management information should be synchronized with the multi-chassis peer.

Default no sub-mgmt

Parameters **ipoe** — Specifies to synchronize IPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

pppoe — Specifies to synchronize PPPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-mgmt

Syntax [**no**] **sub-mgmt**

Context **[Tree]** (config>redundancy>multi-chassis>options sub-mgmt)

Full Context configure redundancy multi-chassis options sub-mgmt

Description This command enables the CLI context to configure subscriber management multi-chassis options parameters.

Default sub-mgmt

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.453 sub-mgmt-extensions

sub-mgmt-extensions

Syntax [**no**] **sub-mgmt-extensions**

Context **[Tree]** (config>fwd-path-ext>fpe sub-mgmt-extensions)

Full Context configure fwd-path-ext fpe sub-mgmt-extensions

Description This command configures FPE for subscriber management extensions. The FPE cannot be used for other applications but can be used for multiple subscriber management applications.

The **no** version of this command disables FPE for subscriber management extensions.

Default no sub-mgmt-extensions

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.454 sub-port

sub-port

Syntax **sub-port** *port-id* [**create**]
no sub-port *port-id*

Context **[Tree]** (config>port>ethernet>dot1x>macsec sub-port)

Full Context configure port ethernet dot1x macsec sub-port

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates a MACsec instance on a physical port, targeting the specific subset of traffic defined by the **encap-match** command.

The **no** form of this command removes the MACsec instance.

Parameters *port-id* — Specifies the sub-port id index.

Values 1 to 1023

create — Creates a new sub-port.

Platforms All

23.455 sub-profile

sub-profile

Syntax [**no**] **sub-profile**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute sub-profile)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute sub-profile

Description This command specifies that subscriber profile attributes should be included into RADIUS accounting messages.

The **no** form of this command excludes subscriber profile attributes into RADIUS accounting messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com

Description This command specifies an existing subscriber profile name to be associated with the static subscriber host.

The **no** form of this command reverts to the default.

Parameters *sub-profile-name* — Specifies the sub-profile name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile

Syntax [**no**] **sub-profile** *subscriber-profile-name*

Context **[Tree]** (config>subscr-mgmt sub-profile)

Full Context configure subscriber-mgmt sub-profile

Description Commands in this context configure a subscriber profile. A subscriber profile is a template used to define the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscribers using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

Subscribers are either explicitly mapped to a subscriber profile template or are dynamically associated by one of various non-provisioned subscriber profile definitions.

A subscriber host can be associated with a subscriber profile in the following ways, listed from lowest to highest precedence:

1. The subscriber profile named default.
2. The subscriber profile defined as the subscriber SAP default.
3. The subscriber profile found by the subscriber identification policy sub-profile-map.
4. The subscriber profile found by the subscriber identification policy explicit map.

In the event that no defaults are defined and the subscriber identification string is not explicitly provisioned to map to a subscriber profile, either the static subscriber host creation will fail or the dynamic subscriber host DHCP ACK is discarded.

Default Subscriber profile:

When a subscriber profile is created with the *subscriber-profile-name* default, it is used when no other subscriber profile is associated with the subscriber host by the system. Creating a subscriber profile with the *subscriber-profile-name* default is optional. If a default subscriber profile is not created, all subscriber hosts subscriber identification strings must match either a non-provisioned default or be provisioned as an explicit match to a subscriber profile.

The default profile has no effect on existing active subscriber on the system as they exist due to higher precedence mappings.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Attempting to delete any subscriber profile (including the profile named default) while in use by existing active subscribers will fail.

The **no** form of this command reverts to the default.

Parameters *subscriber-profile-name* — Specifies the name of the subscriber profile, up to 32 characters.

create — Keyword used to create the subscriber profile.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.456 sub-profile-map

sub-profile-map

Syntax **sub-profile-map**

Context **[Tree]** (config>subscr-mgmt>sub-ident-pol sub-profile-map)

Full Context configure subscriber-mgmt sub-ident-policy sub-profile-map

Description Commands in this context configure subscriber profile mapping parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.457 sub-profile-string

sub-profile-string

Syntax **sub-profile-string** *sub-profile-string*
no sub-profile-string

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ident-strings sub-profile-string)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings sub-profile-string)

Full Context configure subscriber-mgmt local-user-db ipoe host identification-strings sub-profile-string
configure subscriber-mgmt local-user-db ppp host identification-strings sub-profile-string

Description This command specifies the subscriber profile string which is encoded in the identification strings.

The **no** form of this command returns to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *sub-profile-string* — Specifies the subscriber profile string, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile-string

Syntax **sub-profile-string** *string*
no sub-profile-string

Context **[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile sub-profile-string)

Full Context configure subscriber-mgmt vrgw brg brg-profile sub-profile-string

Description This string will be used as a default for subscriber-profile lookup. This string can be overridden during BRG or host authentication. The **no** form of the command removes the string from the configuration.

Default no sub-profile-string

Parameters *string* — Specifies the string used to look up the subscriber profile.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.458 sub-ring

sub-ring

Syntax [**no**] **sub-ring** {**virtual-link** | **non-virtual-link**}

Context **[Tree]** (config>eth-ring sub-ring)

Full Context configure eth-ring sub-ring

Description This command specifies this ring-id to be sub-ring as defined in G.80312. By declaring this ring as a sub-ring object, this ring will only have one valid path and the sub-ring will be connected to a major ring or a VPLS instance.

The **virtual-link** keyword declares that a sub-ring is connected to another ring and control messages can be sent over the attached ring to the other side of the sub-ring.

The **non-virtual-link** channel parameter declares that a sub-ring may be connected to another ring or to a VPLS instance but no control messages from the sub-ring use the attached ring or VPLS instance. The non-virtual channel behavior is standard G.8032 capability.

The **no** form of this command deletes the sub-ring and its virtual channel associations.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no sub-ring

Parameters **virtual-link** — Specifies that the interconnection is to a ring and a virtual link will be used.

non-virtual-link — Specifies that the interconnection is to a ring or a VPLS instance and a virtual link will not be used.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.459 sub-sla-mgmt

sub-sla-mgmt

The **no** form of this command removes the parameters from the configuration.

Default sub-sla-mgmt

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.460 subject

subject

Syntax **subject** {**eq** | **neq**} *subject* [*regexp*]
no subject

Context **[Tree]** (config>service>vprn>log>filter>entry>match subject)

Full Context configure service vprn log filter entry match subject

Description This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Default no subject

Parameters **eq | neq** — This operator specifies the type of match. Valid operators are listed below.

Values

Operator	Notes
eq	equal to
neq	not equal to

subject — A string used as the subject match criterion.

regexp — Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms All

subject

Syntax **subject** {**eq** | **neq**} *subject* [*regexp*]
no subject

Context **[Tree]** (config>log>filter>entry>match subject)

Full Context configure log filter entry match subject

Description This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Parameters **eq** | **neq** — Specifies the match type. Valid operators are listed in Table 180.

Table 180 **Valid Operators**

Operator	Notes
eq	equal to
neg	not equal to

subject — Specifies a string up to 32 characters, used as the subject match criterion.

regexp — Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered. When the **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

23.461 subnet

subnet

Syntax **subnet** {*ip-address*/*mask* | *ip-address netmask*} [**create**]
no subnet {*ip-address*/*mask* | *ip-address netmask*}

Context **[Tree]** (config>router>dhcp>server>pool subnet)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>dhcp>server>pool subnet)

Full Context configure router dhcp local-dhcp-server pool subnet
configure service vprn dhcp local-dhcp-server pool subnet

Description This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters *ip-prefix/mask* — Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d
mask: 8 to 32

netmask — Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create — Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.462 subnet-check

subnet-check

Syntax [**no**] **subnet-check**

Context [Tree] (config>service>vprn>igmp>grp-if subnet-check)
[Tree] (config>service>vprn>igmp>if subnet-check)

Full Context configure service vprn igmp group-interface subnet-check
configure service vprn igmp interface subnet-check

Description This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

The **no** form of this command disables local subnet checking for IGMP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

All

- configure router igmp interface subnet-check

subnet-check

Syntax [**no**] **subnet-check**

Context **[Tree]** (config>router>mld>group-interface subnet-check)

Full Context configure router mld group-interface subnet-check

Description This command enables subnet checking for MLD messages received on this interface. All MLD packets with a source address that is not in the local subnet are dropped.

Default subnet-check

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.463 subnet-mask

subnet-mask

Syntax **subnet-mask** *ip-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no subnet-mask

Context [Tree] (config>router>dhcp>server>pool>subnet>options subnet-mask)
[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>options subnet-mask)

Full Context configure router dhcp local-dhcp-server pool subnet options subnet-mask
configure subscriber-mgmt local-user-db ipoe host options subnet-mask

Description This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

The **no** form of this command removes the address from the configuration.

Parameters *ip-address* — Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.464 subrate

subrate

Syntax **subrate** {**digital-link** | **larscom**} *rate-step*
no subrate

Context [Tree] (config>port>tdm>ds3 subrate)

Full Context configure port tdm ds3 subrate

Description This command configures the channel service unit (CSU) compatibility mode to interoperate with existing DS-3 subrate standards.

This configuration applies only for non-channelized DS-3s on ASAP TDM MDAs.

The **no** form of this command remove the subrate functionality.

Default no subrate

Parameters **digital-link** — Enables the Digital-Link (Quick Eagle) CSU compatibility mode.

larscom — Enables the Larscom CSU compatibility mode.

rate-step — Specifies the subrate value for the associated DS-3.

Values 1 to 147 (digital-link) 1 to 14 (larscom)

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

configure service ies subscriber-interface group-interface sap static-host subscriber
configure service vpls sap static-host subscriber
configure service vprn interface sap static-host subscriber
configure service vprn subscriber-interface group-interface sap static-host subscriber

Description This command specifies an existing subscriber identification profile to be associated with the static subscriber host.

Parameters *sub-ident* — Specifies the subscriber identification.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber

Syntax **subscriber** *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{[**mac** *ieee-address*] | **sla-profile** *sla-profile-name*}] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *family*]
no subscriber *sub-ident-string*

Context **[Tree]** (config>mirror>mirror-source subscriber)

Full Context configure mirror mirror-source subscriber

Description This command adds hosts of a subscriber to mirroring service.

Parameters *sub-ident-string* — Specifies the name of the subscriber identification policy.

sap-id — Specifies the physical port identifier portion of the SAP definition.

ip-address — Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ieee-address — Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name — Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts). The name can have up to 32 characters.

fc — Specifies the name of the forwarding class with which to associate traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

egress — Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress — Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

host-type — Specifies the host type for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

family — Specifies the IP family for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms All

subscriber

Syntax **subscriber** *sub-ident-string* [**sap** *sap-id* [**ip** *ip-address*] [**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] [**intercept-id** *intercept-id*] [**session-id** *session-id*] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *ip-family*]

no subscriber *sub-ident-string*

Context **[Tree]** (config>li>li-source subscriber)

Full Context configure li li-source subscriber

Description This command adds hosts of a subscriber to mirroring service.

Parameters *sub-ident-string* — Specifies the name of the subscriber identification policy.

sap-id — Specifies the physical port identifier portion of the SAP definition.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address — Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

Values 1.0.0.1 to 223.255.255.254

ieee-address — Specifies a MAC address when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name — Specifies an SLA profile name, up to 32 characters. Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts).

fc — The name of the forwarding class with which to associate LI traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

intercept-id — Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs.

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encap, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) For **nat li-source** entries that are using a mirror service that is not configured with routable encap

Values 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

session-id — Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-udp-shim**).

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

ingress — Specifies information for the ingress policy.

egress — Specifies information for the egress policy.

host-type — Specifies the host type for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipoe, ppp

ip-family — Specifies the IP family for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

Values any, ipv4, ipv6

Platforms All

subscriber

Syntax **subscriber** *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{**mac** *ieee-address*] | **sla-profile** *sla-profile-name*}] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] {[**ingress**] [**egress**]}
no subscriber *sub-ident-string*

Context **[Tree]** (debug>mirroring-source subscriber)

Full Context debug mirroring-source subscriber

Description This command adds hosts of a subscriber to mirroring service.

Parameters *sub-ident-string* — Specifies the name of the subscriber identification policy.

sap-id — Specifies the physical port identifier portion of the SAP definition.

ip-address — The service IP address (system IP address) of the remote 7750 SR or 7450 ESS device sending LI traffic.

Values 1.0.0.1 to 223.255.255.254

ieee-address — Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

sla-profile-name — Specifies the SLA profile name, up to 32 characters.

fc — Specifies name of the forwarding class with which to associate LI traffic.

Values be, l2, af, l1, h2, ef, h1, nc

ingress — Specifies information for the ingress policy.

egress — Specifies information for the egress policy.

23.466 subscriber-bw-limit

subscriber-bw-limit

Syntax **subscriber-bw-limit** *bandwidth*
no subscriber-bw-limit

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if subscriber-bw-limit)

Full Context configure mcast-management multicast-info-policy video-policy video-interface subscriber-bw-limit

Description This command configures of an egress per-subscriber bandwidth limit for the combined retransmission and Fast Channel Change (FCC) replies for requests received directed to the IP address. If the bandwidth for a request will exceed the bandwidth limit, the request is logged and dropped.

The **no** form of the command disables enforcement of an egress bandwidth limit.

Default no subscriber-bw-limit

Parameters *bandwidth* — The per-subscriber egress bandwidth limit for retransmission and FCC packets in kilobits per second expressed as an integer indicates infinity or no limit.

Values 1 to 4294967295 kb/s

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

23.467 subscriber-data

subscriber-data

Syntax [**no**] **subscriber-data**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes subscriber-data)

Full Context configure aaa isa-radius-policy acct-include-attributes subscriber-data

Description This command enables the inclusion of subscriber data attributes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command excludes subscriber data attributes.

Default no subscriber-data

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.468 subscriber-id

subscriber-id

Syntax **subscriber-id** *sub-ident-string*
no subscriber-id

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ident-strings subscriber-id)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings subscriber-id)

Full Context configure subscriber-mgmt local-user-db ipoe host identification-strings subscriber-id
configure subscriber-mgmt local-user-db ppp host identification-strings subscriber-id

Description This command specifies the subscriber ID which is encoded in the identification strings.

The **no** form of this command returns to the default.

Parameters *sub-ident-string* — Specifies the subscriber ID string, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-id

Syntax [**no**] **subscriber-id**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute subscriber-id)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute subscriber-id

Description This command specifies that subscriber ID attributes should be included into RADIUS accounting messages.

The **no** form of this command excludes subscriber ID attributes into RADIUS accounting messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

subscriber-id

Syntax [**no**] **subscriber-id**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes subscriber-id)

Full Context configure aaa isa-radius-policy acct-include-attributes subscriber-id

Description This command specifies that subscriber ID attributes should be included into RADIUS accounting messages.

Default no subscriber-id

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.469 subscriber-identification

subscriber-identification

Syntax **subscriber-identification**

Context **[Tree]** (config>router>nat>inside subscriber-identification)

Full Context configure router nat inside subscriber-identification

Description Commands in this context configure subscriber identification for Large Scale NAT.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.470 subscriber-interface

subscriber-interface

Syntax **subscriber-interface** *ip-int-name* [**create**] [**wan-mode** *mode*]
subscriber-interface *ip-int-name* [**create**] **fwd-service** *service-id* **fwd-subscriber-interface** *fwd-int-name* [**wan-mode** *mode*]
no subscriber-interface *ip-int-name*

Context **[Tree]** (config>service>ies subscriber-interface)
[Tree] (config>service>vprn subscriber-interface)

Full Context configure service ies subscriber-interface
configure service vprn subscriber-interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command allows the operator to create special subscriber-based interfaces. It is used to contain multiple group interfaces. Multiple subnets associated with the subscriber interface can be applied to any of the contained group interfaces in any combination. The subscriber interface allows subnet sharing between group interfaces.

The **no** form of this command reverts to the default.

Parameters *ip-int-name* — Specifies the interface name of a subscriber interface, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

create — Keyword used to create the subscriber interface.

fwd-service *service-id* — Specifies the wholesale service ID or service name.

Values *service-id*: 1 to 214748364
svc-name: A string up to 64 characters

ip-int-name — Specifies the wholesale subscriber interface.

wan-mode *mode* — Specifies the WAN mode as 64-bit or 128-bit. To change the WAN mode after creation, the interface must first be removed then recreated.

Values *mode64*, *mode128*

Default *mode64*

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.471 subscriber-interface-statistics

subscriber-interface-statistics

Syntax **subscriber-interface-statistics**

Context **[Tree]** (config>subscr-mgmt subscriber-interface-statistics)

Full Context configure subscriber-mgmt subscriber-interface-statistics

Description Commands in this context enable or disable the collection of subscriber interface statistics.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.472 subscriber-limit

subscriber-limit

Syntax **subscriber-limit** *limit*
no subscriber-limit

Context **[Tree]** (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context configure service vprn nat outside pool subscriber-limit

Description This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

Parameters *limit* — Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.473 subscriber-mgmt

subscriber-mgmt

Syntax **subscriber-mgmt**

Context **[Tree]** (config>service>ies subscriber-mgmt)
[Tree] (config>service>vprn subscriber-mgmt)

Full Context configure service ies subscriber-mgmt
configure service vprn subscriber-mgmt

Description Commands in this context configure per service subscriber management parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-mgmt

Syntax **subscriber-mgmt**

Context **[Tree]** (config subscriber-mgmt)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt

Description Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-mgmt

Syntax **subscriber-mgmt**

Context **[Tree]** (config>system>persistence subscriber-mgmt)

Full Context configure system persistence subscriber-mgmt

Description This command configures subscriber management persistence parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.474 subscriber-prefix-length

subscriber-prefix-length

Syntax **subscriber-prefix-length** *prefix-length*
no subscriber-prefix-length

Context **[Tree]** (config>service>vprn>nat>inside>dslite subscriber-prefix-length)

Full Context configure service vprn nat inside dual-stack-lite subscriber-prefix-length

Description This command configures the IPv6 prefix length of the DS-Lite subscribers.

The **no** form of this command reverts the default.

Default subscriber-prefix-length 128

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **prefix-length** *prefix-length* — Specifies the IPv6 prefix length of the DS-Lite subscriber.

Values 32 to 64, 128

Default 128

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

Syntax **subscriber-prefix-length** *prefix-length*
no subscriber-prefix-length

Context **[Tree]** (config>router>nat>inside>dual-stack-lite subscriber-prefix-length)

Full Context configure router nat inside dual-stack-lite subscriber-prefix-length

Description This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a giver inside routing context, the range of values of the **subscriber-prefix-length** depends on the value of *dslite-max-subscriber-limit* parameter as follows:

subscriber-prefix-length – n = [32..64,128]

where n = log2(dslite-max-subscriber-limit)

[or in an alternate form: dslite-max-subscriber-limit = 2^n.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

The **no** form of the command reverts to the default.

Default 128

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *prefix-length* — In non-deterministic DS-Lite this value can be [32..64,128], assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context. In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where n = log2(dslite-max-subscriber-limit). The value of 128 is allowed only when n=0 (each subscriber is mapped to a single outside IPv4 IP address).

Values 32 to 64

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-prefix-length

Syntax **subscriber-prefix-length** *prefix-length*
no subscriber-prefix-length

Context [Tree] (config>service>vprn>nat>inside>nat64 subscriber-prefix-length)
[Tree] (config>router>nat>inside>nat64 subscriber-prefix-length)

Full Context configure router nat inside nat64 subscriber-prefix-length
configure service vprn nat inside nat64 subscriber-prefix-length

Description This command specifies the IPv6 address prefix length to be used for the NAT64 subscribers in this virtual router instance.

Default subscriber-prefix-length128

Parameters *prefix-length* — Specifies the subscriber identification for Large Scale NAT.

Values 32 to 64, 128

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.475 subscriber-prefixes

subscriber-prefixes

Syntax **subscriber-prefixes**

Context [Tree] (config>service>ies>sub-if>ipv6 subscriber-prefixes)
[Tree] (config>service>vprn>sub-if>ipv6 subscriber-prefixes)

Full Context configure service ies subscriber-interface ipv6 subscriber-prefixes
configure service vprn subscriber-interface ipv6 subscriber-prefixes

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure aggregate off-link subscriber prefixes associated with this subscriber interface. Individual prefixes are specified under the prefix context list aggregate routes in which the next hop is indirect via the subscriber interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.476 subscriber-retention

subscriber-retention

Syntax **subscriber-retention** [**hrs** *hours*] [**min** *minutes*]
no subscriber-retention

Context **[Tree]** (config>service>nat>nat-policy>timeouts subscriber-retention)
[Tree] (config>service>nat>up-nat-policy>timeouts subscriber-retention)

Full Context configure service nat nat-policy timeouts subscriber-retention
configure service nat up-nat-policy timeouts subscriber-retention

Description This command specifies the subscriber retention timeout, which is the time a NAT subscriber and its associated IP address are kept after all hosts and associated port blocks have expired. If a NAT subscriber host appears before the retention timeout has elapsed, it is given the same outside IP address.

Default no subscriber-retention

Parameters **hrs** *hours* — Specifies the hours a subscriber's IP address is kept after all hosts and port blocks have expired.

Values 1 to 24

min *minutes* — Specifies the minutes a subscriber's IP address is kept after all hosts and port blocks have expired.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.477 subscriber-sap-id

subscriber-sap-id

Syntax [**no**] **subscriber-sap-id**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>ies>if>sap>static-host subscriber-sap-id)
[Tree] (config>service>ies>sub-if>grp-if>sap>static-host subscriber-sap-id)
[Tree] (config>service>vpls>sap>static-host subscriber-sap-id)
[Tree] (config>service>vprn>if>sap>static-host subscriber-sap-id)
[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host subscriber-sap-id)

Full Context configure service ies interface sap static-host subscriber-sap-id
configure service ies subscriber-interface group-interface sap static-host subscriber-sap-id
configure service vpls sap static-host subscriber-sap-id
configure service vprn interface sap static-host subscriber-sap-id
configure service vprn subscriber-interface group-interface sap static-host subscriber-sap-id

Description This command enables using the SAP ID as the subscriber ID.

Parameters **subscriber-sap-id** — Specifies to use the sap-id as the subscriber-id.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.478 subscription

subscription

Syntax **subscription** *percentage*
no subscription

Context [Tree] (config>router>rsvp>interface subscription)

Full Context configure router rsvp interface subscription

Description This command configures the percentage of the link bandwidth that RSVP can use for reservation and sets a limit for the amount of over-subscription or under-subscription allowed on the interface.

When the **subscription** is set to zero, no new sessions are permitted on this interface. If the *percentage* is exceeded, the reservation is rejected and a log message is generated.

The **no** form of this command reverts the *percentage* to the default value.

Default subscription 100

Parameters *percentage* — Specifies the percentage of the interface's bandwidth that RSVP allows to be used for reservations.

Values 0 to 1000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

subscription

Syntax **subscription** *subscription-id* **cancel**

Context **[Tree]** (admin>system>telemetry>grpc subscription)

Full Context admin system telemetry grpc subscription

Description This command cancels an active telemetry subscription.

Parameters *subscription-id* — Specifies the ID of the Telemetry subscription to cancel.

Values 0 to 4294967295

Platforms All

subscription

Syntax **subscription** *name* [**create**]
no subscription *name*

Context **[Tree]** (config>system>telemetry>persistent-subscriptions subscription)

Full Context configure system telemetry persistent-subscriptions subscription

Description Commands in this context configure persistent subscription commands.

The **no** form of this command removes the configuration.

Parameters *name* — Specifies the subscription name, up to 32 characters.

create — Keyword used to create the subscription.

Platforms All

23.479 subscription cancel-all

subscription cancel-all

Syntax **subscription cancel-all**

Context **[Tree]** (admin>system>telemetry>grpc subscription cancel-all)

Full Context admin system telemetry grpc subscription cancel-all

Description This command cancels all active Telemetry subscriptions.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.480 subtype

subtype

Syntax [**no**] **subtype** *tls extension subtype*

Context **[Tree]** (config>app-assure>group>http-enrich>tls-extension subtype)

Full Context configure application-assurance group http-enrich tls-extension subtype

Description This command configures a TLS subtype.

The **no** form of this command removes the TLS subtype from the configuration.

Parameters *tls extension subtype* — Specifies a TLS subtype, up to 32 characters

23.481 suggest-internal-objects

suggest-internal-objects

Syntax [**no**] **suggest-internal-objects**

Context **[Tree]** (environment suggest-internal-objects)

Full Context environment suggest-internal-objects

Description This command enables suggesting of internally created objects while auto completing.

The **no** form of the command disables the command.

Platforms All

23.482 summaries

summaries

Syntax [**no**] **summaries**

Context **[Tree]** (config>service>vprn>ospf>area>nssa summaries)

[Tree] (config>service>vprn>ospf3>area>nssa summaries)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn ospf area nssa summaries
configure service vprn ospf area stub summaries
configure service vprn ospf3 area nssa summaries

Description This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.

Default summaries — Summary routes are advertised by the ABR into the stub area or NSSA.

Platforms All

summaries

Syntax [**no**] **summaries**

Context **[Tree]** (config>router>ospf>area>nssa summaries)
[Tree] (config>router>ospf>area>stub summaries)
[Tree] (config>router>ospf3>area>nssa summaries)
[Tree] (config>router>ospf3>area>stub summaries)

Full Context configure router ospf area nssa summaries
configure router ospf area stub summaries
configure router ospf3 area nssa summaries
configure router ospf3 area stub summaries

Description This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR).

This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or NSSA area (default: summary).

By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas; only the default route is advertised by the ABR.

Default summaries

23.483 summary

summary

Syntax **summary**

Context **[Tree]** (config>filter>log summary)

Full Context configure filter log summary

Description Commands in this context configure log summarization. These settings will only be taken into account when syslog is the log destination.

Platforms All

summary

Syntax **summary** [*ip-address*]
no summary

Context **[Tree]** (debug>router>isis summary)

Full Context debug router isis summary

Description This command enables debugging for ISIS summary addresses.

The **no** form of the command disables the debugging.

Parameters *ip-address* — When specified, only packets with the specified address are debugged.

Platforms All

23.484 summary-address

summary-address

Syntax **summary-address** {*ip-prefix/mask* | *ip-prefix* [*netmask*]} [*level*] [**tag** *tag*]
no summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]}

Context **[Tree]** (config>service>vprn>isis summary-address)

Full Context configure service vprn isis summary-address

Description This command creates summary-addresses for the specified router or VPRN instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-prefix/mask* — Specifies information for the specified IP prefix and mask length.

Values

ip-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level — Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag *tag* — Assigns a route tag to the summary address.

Values 1 to 4294967295

Platforms All

summary-address

Syntax **summary-address** {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*]
no summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

Context **[Tree]** (config>router>isis summary-address)

Full Context configure router isis summary-address

Description This command creates summary-addresses.

Default no summary-address

Parameters *ip-prefix/ip-prefix-length* — Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H

	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask — Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level — Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag — Assigns a route tag to the summary address.

Values 1 to 4294967295

algo-id — Specifies the algorithm topology applied for the summary address. If no algo-id parameter is specified, the default is 0.

Values 0, 128 to 255

Platforms All

23.485 summary-crit

summary-crit

Syntax **summary-crit dst-addr**
summary-crit src-addr
no summary-crit

Context **[Tree]** (config>filter>log>summary summary-crit)

Full Context configure filter log summary summary-crit

Description This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default summary-crit src-addr

Parameters **dst-addr** — Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr — Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

Platforms All

23.486 super-backbone

super-backbone

Syntax [**no**] **super-backbone**

Context **[Tree]** (config>service>vprn>ospf super-backbone)

Full Context configure service vprn ospf super-backbone

Description This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected as either external or NSSA LSAs only.

Default no super-backbone

Platforms All

23.487 supplicant-timeout

supplicant-timeout

Syntax **supplicant-timeout** *seconds*
no supplicant-timeout

Context **[Tree]** (config>port>ethernet>dot1x supplicant-timeout)

Full Context configure port ethernet dot1x supplicant-timeout

Description This command configures the period during which the router waits for a client to respond to its EAPOL messages. When the supplicant-timeout expires, the 802.1x authentication session is considered to have failed.

The **no** form of this command returns the value to the default.

Default supplicant-timeout 30

Parameters *seconds* — Specifies the server timeout period in seconds.

Values 1 to 300

23.488 supported-features

supported-features

Syntax [**no**] **supported-features**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp supported-features)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp supported-features

Description This command includes the **supported-features** in CCR messages.

The **no** form of this command resets the command to the default setting.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.489 suppress

suppress

Syntax **suppress** *integer*
no suppress

Context **[Tree]** (config>router>policy-options>damping suppress)

Full Context configure router policy-options damping suppress

Description This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is removed from the route table or inclusion in advertisements.

The **no** form of this command removes the suppress parameter from the damping profile.

Default no suppress

Parameters *integer* — Specifies the suppress value expressed as a decimal integer.

Values 1 to 20000

configure service vprn ospf3 suppress-dn-bit

Description This command specifies whether to suppress the setting of the DN bit for OSPF LSA packets generated by this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets generated by this instance of the OSPF router will not be set. When disabled, this instance of the OSPF router will follow the normal procedure to determine whether to set the DN bit.

Default no suppress-dn-bit

Platforms All

23.492 suppress-lo-alarm

suppress-lo-alarm

Syntax [**no**] **suppress-lo-alarm**

Context **[Tree]** (config>port>sonet-sdh suppress-lo-alarm)

Full Context configure port sonet-sdh suppress-lo-alarm

Description This command enables the suppression of lower order alarms on SONET/SDH port such as MLPPP bundle alarms, DS1/E1 links alarms and 336 APS channel groups alarms.

The **no** form of this command disables the suppression of lower order alarms on SONET/SDH port.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.493 suppress-lsn-events

suppress-lsn-events

Syntax [**no**] **suppress-lsn-events**

Context **[Tree]** (configure>isa>wlan-gw-group>nat suppress-lsn-events)

Full Context configure isa wlan-gw-group nat suppress-lsn-events

Description This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time, either the SR OS event logging facility or the RADIUS logging facility. Note that SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility, for example, syslog, assuming that the events are enabled via the SR OS event-control (**config> log>event-control nat event generate**).

The **no** form of this command, the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility and RADIUS logging facility.

Default suppress-lsn-events

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

suppress-lsn-events

Syntax [**no**] **suppress-lsn-events**

Context **[Tree]** (config>isa>nat-group suppress-lsn-events)

Full Context configure isa nat-group suppress-lsn-events

Description This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time: either the SR OS event logging facility or the RADIUS logging facility. SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility; for example, syslog, assuming that the events are enabled via the event-control command (**config> log>event-control nat event generate**).

By explicitly disabling this command (**no suppress-lsn-events**), the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility, and the RADIUS logging facility.

23.494 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax [**no**] **suppress-lsn-sub-blks-free**

Context **[Tree]** (configure>isa>wlan-gw-group>nat suppress-lsn-sub-blks-free)

Full Context configure isa wlan-gw-group nat suppress-lsn-sub-blks-free

Description This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-blocks) is stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN is “LSN subscriber all blocks freed”. The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

23.495 suppress-standby-signaling

suppress-standby-signaling

Syntax [**no**] **suppress-standby-signaling**

Context **[Tree]** (config>service>vpls>endpoint suppress-standby-signaling)

Full Context configure service vpls endpoint suppress-standby-signaling

Description When this command is enabled, the pseudowire standby bit (value 0x00000020) will not be sent to T-LDP peer when the specified spoke is selected as a standby. This allows faster switchover as the traffic will be sent over this SDP and discarded at the blocking side of the connection. This is particularly applicable to multicast traffic.

Default suppress-standby-signaling

Platforms All

23.496 suppress-threshold

suppress-threshold

Syntax **suppress-threshold** *suppress-penalties* **reuse-threshold** *reuse-penalties*

Context **[Tree]** (config>port>ethernet>dampening suppress-threshold)

Full Context configure port ethernet dampening suppress-threshold

Description This command configures the penalties thresholds at which the port state events to the upper layer are dampened (suppress threshold) and then permitted (reuse threshold).

Parameters *suppress-penalties* — Specifies the threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again.

Values 1 to 20000

Default 2000

reuse-penalties — Specifies the threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.

Values 1 to 20000

Default 1000

23.499 svc-ping

svc-ping

Syntax **svc-ping** *ip-address* [**service** *service-id*] [**local-sdp**] [**remote-sdp**]

Context **[Tree]** (oam svc-ping)

Full Context oam svc-ping

Description This command tests a service ID for correct and consistent provisioning between two service end points.

The **svc-ping** command accepts a far-end IP address and a service ID for local and remote service testing. The following information can be determined from **svc-ping**:

Local and remote service existence

- Local and remote service state
- Local and remote service type correlation
- Local and remote customer association
- Local and remote service-to-SDP bindings and state
- Local and remote ingress and egress service label association

Unlike **sdp-ping**, only a single message is sent per command; no count nor interval parameter is supported and round trip time is not calculated. A time out value of 10 seconds is used before failing the request. The forwarding class is assumed to be Best-Effort Out-of-Profile.

If no request is sent or a reply is not received, all remote information is shown as N/A.

To terminate a **svc-ping** in progress, use the CLI break sequence <Ctrl-C>.

Upon request time out, message response, request termination, or request error the following local and remote information is displayed. See Table 181. Local and remote information is dependent upon service existence and reception of reply.

Table 181 **Svc-ping**

Field	Description	Values
Responding SDP-ID	The *sdp-id* used by the far end to respond to the **svc-ping** request. If the request was received without the **sdp-path** parameter, the responding router does not use an *sdp-id* as the return path, but the appropriate responding *sdp-id* is displayed. If a valid *sdp-id* return path is not found to the originating router that is bound to the *service-id*, Non-Existent is displayed.	*resp-sdp-id* Non-Existent
Responding SDP-ID Path Used	Whether the responding router used the responding *sdp-id* to respond to the **svc-ping** request. If the request was received via the originating *sdp-id* and a valid return *sdp-id* is found, operational and has a valid egress service label, the far-end router should use the *sdp-id* as the return *sdp-id*. If the far end uses the responding *sdp-id* as the return path, Yes is displayed. If the far end does not use the responding *sdp-id* as the return path, No is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Yes No —
Responding SDP-ID Administrative State	The administrative state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is administratively down, Admin-Down is displayed. If the return *sdp-id* is administratively up, Admin-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Admin-Up Admin-Up N/A
Responding SDP-ID Operational State	The operational state of the far-end *sdp-id* associated with the return path for *service-id*. When a return path is operationally down, Oper-Down is displayed. If the return *sdp-id* is operationally up, Oper-Up is displayed. If the responding *sdp-id* is non-existent, N/A is displayed.	Oper-Up Oper-Down —
Responding SDP-ID Binding Admin State	The local administrative state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Admin-Up Admin-Down —
Responding SDP-ID Binding Oper State	The local operational state of the responder's *sdp-id* binding to *service-id*. If an *sdp-id* is not bound to the service, N/A is displayed.	Oper-Up Oper-Down —
Originating VC-ID	The originator's VC-ID associated with the *sdp-id* to the far-end address that is bound to *service-id*. If the *sdp-id* signaling is off, *originator-vc-id* is 0. If the *originator-vc-id* does not exist, N/A is displayed.	*originator-vc-id* —

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 181 **Svc-ping**

Field	Description	Values
Responding VC-ID	The responder's VC-ID associated with the *sdp-id* to *originator-id* that is bound to *service-id*. If the *sdp-id* signaling is off or the service binding to *sdp-id* does not exist, *responder-vc-id* is 0. If a response is not received, N/A is displayed.	*responder-vc-id* —
Originating Egress Service Label	The originating service label (VC-Label) associated with the *service-id* for the originating *sdp-id*. If *service-id* does not exist locally, N/A is displayed. If *service-id* exists, but the egress service label has not been assigned, Non-Existent is displayed.	*egress-vc-label* — Non-Existent
Originating Egress Service Label Source	The originating egress service label source. If the displayed egress service label is manually defined, Manual is displayed. If the egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Manual Signaled —
Originating Egress Service Label State	The originating egress service label state. If the originating router considers the displayed egress service label operational, Up is displayed. If the originating router considers the egress service label inoperative, Down is displayed. If the *service-id* does not exist or the egress service label is non-existent, N/A is displayed.	Up Down —
Responding Service Label	The actual responding service label in use by the far-end router for this *service-id* to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* does exist remotely but the remote egress service label has not been assigned, Non-Existent is displayed.	*rec-vc-label* — Non-Existent
Responding Egress Service Label Source	The responder's egress service label source. If the responder's egress service label is manually defined, Manual is displayed. If the responder's egress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the responder or the responder's egress service label is non-existent, N/A is displayed.	Manual Signaled —

Table 181 **Svc-ping**

Field	Description	Values
Responding Service Label State	The responding egress service label state. If the responding router considers its egress service label operational, Up is displayed. If the responding router considers its egress service label inoperative, Down is displayed. If the *service-id* does not exist or the responder's egress service label is non-existent, N/A is displayed.	Up Down —
Expected Ingress Service Label	The locally assigned ingress service label. This is the service label that the far-end is expected to use for *service-id* when sending to the originating router. If *service-id* does not exist locally, N/A is displayed. If *service-id* exists but an ingress service label has not been assigned, Non-Existent is displayed.	*ingress-vc-label* — Non-Existent
Expected Ingress Label Source	The originator's ingress service label source. If the originator's ingress service label is manually defined, Manual is displayed. If the originator's ingress service label is dynamically signaled, Signaled is displayed. If the *service-id* does not exist on the originator or the originators ingress service label has not been assigned, N/A is displayed.	Manual Signaled —
Expected Ingress Service Label State	The originator's ingress service label state. If the originating router considers its ingress service label operational, Up is displayed. If the originating router considers its ingress service label inoperative, Down is displayed. If the *service-id* does not exist locally, N/A is displayed.	Up Down —
Responders Ingress Service Label	The assigned ingress service label on the remote router. This is the service label that the far end is expecting to receive for *service-id* when sending to the originating router. If *service-id* does not exist in the remote router, N/A is displayed. If *service-id* exists, but an ingress service label has not been assigned in the remote router, Non-Existent is displayed.	*resp-ingress-vc-label* — Non-Existent
Responders Ingress Label Source	The assigned ingress service label source on the remote router. If the ingress service label is manually defined on the remote router, Manual is displayed. If the ingress service label is dynamically signaled on the remote router, Signaled is displayed. If the *service-id* does not exist on the remote router, N/A is displayed.	Manual Signaled —

Table 181 **Svc-ping**

Field	Description	Values
Responders Ingress Service Label State	The assigned ingress service label state on the remote router. If the remote router considers its ingress service label operational, Up is displayed. If the remote router considers its ingress service label inoperative, Down is displayed. If the *service-id* does not exist on the remote router or the ingress service label has not been assigned on the remote router, N/A is displayed.	Up
		Down
		—

Parameters *ip-address* — Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

Values a.b.c.d

service-id — Specifies the service ID of the service being tested must be indicated with this parameter. The service ID need not exist on the local router to receive a reply message.

Values 1 to 2147483647, service-name: up to 64 characters

local-sdp — Specifies the **svc-ping** request message should be sent using the same service tunnel encapsulation labeling as service traffic. If **local-sdp** is specified, the command attempts to use an egress *sdp-id* bound to the service with the specified **far-end** IP address with the VC-Label for the service. The far-end address of the specified *sdp-id* is the expected *responder-id* within the reply received. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end; this can be IP/GRE or MPLS. On originator egress, the service-ID must have an associated VC-Label to reach the far-end address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **local-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 182 indicates whether a message is sent and how the message is encapsulated based on the state of the service ID.

Table 182 **Message Encapsulation**

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
Invalid Local Service	Yes	Generic IP/GRE OAM (PLP)	No	None
No Valid SDP-ID Bound	Yes	Generic IP/GRE OAM (PLP)	No	None

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 182 **Message Encapsulation**

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
SDP-ID Valid But Down	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid and Up, But No Service Label	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid, Up and Egress Service Label	Yes	Generic IP/GRE OAM (PLP)	Yes	SDP Encapsulation with Egress Service Label (SLP)

remote-sdp — Specifies **svc-ping** reply message from the **far-end** should be sent using the same service tunnel encapsulation labeling as service traffic.

If **remote-sdp** is specified, the **far-end** responder attempts to use an egress *sdp-id* bound to the service with the message originator as the destination IP address with the VC-Label for the service. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reply to the originator; this can be IP/GRE or MPLS. On responder egress, the service-ID must have an associated VC-Label to reach the originator address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **remote-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

Table 183 indicates how the message response is encapsulated based on the state of the remote service ID.

Table 183 **Message Response Encapsulation**

Remote Service State	Message Encapsulation	
	remote-sdp Not Specified	remote-sdp Specified
Invalid Ingress Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
Invalid Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
No Valid SDP-ID Bound on Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid But Down	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, but No Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)

Platforms All

23.500 svlan-statistics

svlan-statistics

Syntax **svlan-statistics**

Context **[Tree]** (config>subscr-mgmt svlan-statistics)

Full Context configure subscriber-mgmt svlan-statistics

Description Commands in this context enable subscriber VLAN statistics collection.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.501 swap

swap

Syntax **swap** {*out-label* | **implicit-null-label**} **nexthop** *ip-address*
no swap

Context **[Tree]** (config>router>mpls>if>label-map swap)

Full Context configure router mpls interface label-map swap

Description This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

Parameters *implicit-null-label* — Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label — Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address* — Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

Platforms All

23.502 sweep

sweep

Syntax **sweep start** *dispersion-start* **end** *dispersion-end*

Context **[Tree]** (config>port>dwdm>coherent sweep)

Full Context configure port dwdm coherent sweep

Description This command allows users to configure the dispersion sweep ‘start’ and ‘end’ values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters *dispersion-start* — Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end — Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

Default 2000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.503 switch-defined-cookie

switch-defined-cookie

Syntax [**no**] **switch-defined-cookie**

Context **[Tree]** (config>open-flow>of-switch>flowtable switch-defined-cookie)

Full Context configure open-flow of-switch flowtable switch-defined-cookie

Description This command enables OpenFlow switch-defined Flow Table cookie encoding for flowtable 0 that allows multi-service operation.

The **no** form of the command disables the above function.

Default no switch-defined-cookie

Platforms All

23.504 switch-fabric

switch-fabric

Syntax **switch-fabric**

Context **[Tree]** (config>system switch-fabric)

Full Context configure system switch-fabric

Description Commands in this context configure switch fabric parameters.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7, 7750 SR-7s, 7950 XRS

23.505 switching-mode

switching-mode

Syntax **switching-mode** {**bi-directional** | **uni-directional**}

Context **[Tree]** (config>port>aps switching-mode)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port aps switching-mode

Description This command configures the switching mode for the APS group.

Parameters **bi-directional** — Configures the group to operate in Bidirectional 1+1 Signaling APS mode.

uni-directional — Configures the group to operate in Unidirectional 1+1 Signaling APS mode.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

23.506 switching-type

switching-type

Syntax **switching-type** *switching-type*
no switching-type

Context **[Tree]** (config>router>gmpls>lsp switching-type)

Full Context configure router gmpls lsp switching-type

Description This command configures the type of switching required for the gLSP. As defined in RFC 3471. The default CLI value is **dcsc**, which indicates that Digital Channel Switch Capable (DCSC) should be signaled.

Default switching-type dcsc

Parameters *switching-type* — Specifies the required type of switching.

Values dcsc

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.507 switchover-exec

switchover-exec

Syntax **switchover-exec** *file-url*
no switchover-exec

Context **[Tree]** (config>system switchover-exec)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system switchover-exec

Description This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, debug (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

When the *file-url* parameter is not specified, no CLI script file is executed.

Default no switch-over-exec

Parameters *file-url* — Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*] 243 chars max directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Platforms All

23.508 symbol-monitor

symbol-monitor

Syntax **symbol-monitor**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>port>ethernet symbol-monitor)

Full Context configure port ethernet symbol-monitor

Description This command configures Ethernet Symbol Monitoring parameters. Support for symbol monitoring is hardware dependent. An error message indicating that the port setting cannot be modified will be presented when attempting to enable the feature or configure the individual parameters on unsupported hardware.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.509 sync

sync

Syntax [**no**] **sync**

Context [Tree] (config>redundancy>multi-chassis>peer sync)

Full Context configure redundancy multi-chassis peer sync

Description Commands in this context configure synchronization parameters.

Default no sync

Platforms All

23.510 sync-boot-env

sync-boot-env

Syntax **sync-boot-env**

Context [Tree] (admin>satellite>eth-sat sync-boot-env)

Full Context admin satellite eth-sat sync-boot-env

Description The command forces the specified Ethernet-satellite chassis to synchronize the boot image.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.511 sync-e

sync-e

Syntax [**no**] **sync-e**

Context **[Tree]** (config>card>mda sync-e)
[Tree] (config>card>xiom>mda sync-e)

Full Context configure card mda sync-e
configure card xiom mda sync-e

Description This command enables synchronous Ethernet on the MDA. Then any port on the MDA can be used as a source port in the sync-if-timing configuration.

The **no** form of this command disables synchronous Ethernet on the MDA.

Platforms 7750 SR-s

- configure card xiom mda sync-e

All

- configure card mda sync-e

sync-e

Syntax [**no**] **sync-e**

Context **[Tree]** (config>system>satellite>eth-sat sync-e)

Full Context configure system satellite eth-sat sync-e

Description This command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the host router's central clock.

To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports.

When the Ethernet satellite is configured for synchronous Ethernet, ESMC frames are enabled on the host ports. The SSM code-type used between the host and the satellite should be manually configured on the host ports to match the code-type desired on the satellite client ports. The code-type setting on the host ports does not restrict the code-type used on the satellite client ports, as those may be configured on an individual port basis.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.512 sync-if-timing

sync-if-timing

Syntax **sync-if-timing**

Context **[Tree]** (config>system sync-if-timing)

Full Context configure system sync-if-timing

Description This command creates or edits the context to create or modify timing reference parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sync-if-timing

Syntax **sync-if-timing**

Context **[Tree]** (debug sync-if-timing)

Full Context debug sync-if-timing

Description The context to debug synchronous interface timing references.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.513 synce

synce

Syntax **synce**

Context **[Tree]** (config>system>sync-if-timing synce)

Full Context configure system sync-if-timing synce

Description Commands in this context configure attributes related to the CPM/CCM SyncE/1588 ports.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

23.514 synchronize

synchronize

Syntax **synchronize** {**boot-env** | **config**}

Context **[Tree]** (config>redundancy synchronize)

Full Context configure redundancy synchronize

Description This command performs a synchronization of the standby CPMs images and/or config files to the active CPM. Either the **boot-env** or **config** parameter must be specified. In the **config>redundancy** context, this command performs an automatically triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPMs have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

Default no synchronize

Parameters **boot-env** — Synchronizes all files required for the boot process (loader, BOF, images, and config).

config — Synchronizes only the primary, secondary, and tertiary configuration files.

Default config

Platforms All

synchronize

Syntax **synchronize cert**
synchronize {**boot-env** | **config**}

Context **[Tree]** (admin>redundancy synchronize)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context admin redundancy synchronize

Description This command performs a synchronization of the standby CPM's images and/or configuration files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

The **no** form of the command removes the parameter from the configuration.

Default no synchronize

Parameters **cert** — Synchronizes the imported certificate/key/CRL files to the standby CPM.

boot-env — Synchronizes all files required for the boot process (loader, BOF, images, and config).

config — Synchronizes only the primary, secondary, and tertiary configuration files.

Platforms All

23.515 synchronous-execution

synchronous-execution

Syntax **synchronous-execution** *seconds*
synchronous-execution never

Context **[Tree]** (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context configure system management-interface operations global-timeouts synchronous-execution

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note: This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Caution: This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default synchronous-execution never

Parameters *seconds* — Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never — Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms All

23.516 syslog

syslog

Syntax **syslog script** *name*
no syslog

Context **[Tree]** (config>python>py-policy syslog)

Full Context configure python python-policy syslog

Description This command enables Python script to process syslog related messages and events.

The **no** form of this command disables the Python script to process syslog related messages and events.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *name* — Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms All

syslog

Syntax **syslog** *syslog-id* [**name** *syslog-name*]
no syslog *syslog-id*

Context **[Tree]** (config>service>vprn>log syslog)

Full Context configure service vprn log syslog

Description This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default No syslog IDs are defined.

Parameters *syslog-id* — Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name *syslog-name* — Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms All

syslog

Syntax **syslog**

Context **[Tree]** (config>app-assure>group>evt-log syslog)

Full Context configure application-assurance group event-log syslog

Description Commands in this context configure the target syslog server.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

syslog

Syntax **syslog**

Context **[Tree]** (config>service>nat syslog)

Full Context configure service nat syslog

Description Commands in this context configure syslog reporting of NAT flow parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog

Syntax **syslog** *syslog-id* [**name** *syslog-name*]
no syslog *syslog-id*

Context **[Tree]** (config>log syslog)

Full Context configure log syslog

Description Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config**>**log**.

The **no** form of this command removes the Syslog configuration.

Parameters *syslog-id* — Specifies the Syslog ID for the Syslog destination.

Values 1 to 10

name *syslog-name* — Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms All

Use subject to Terms available at: www.nokia.com

23.517 syslog-export-policy

syslog-export-policy

Syntax **syslog-export-policy** *policy-name*
no syslog-export-policy

Context **[Tree]** (config>service>nat>nat-policy syslog-export-policy)

Full Context configure service nat nat-policy syslog-export-policy

Description This command creates a syslog export policy with a set of transport parameters that will be used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the nat-policy applied to an inside routing context.

Default no syslog-export-policy

Parameters *policy-name* — Specifies the name of the syslog export policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog-export-policy

Syntax **syslog-export-policy** *name* [**create**]
no syslog-export-policy *name*

Context **[Tree]** (config>service>nat>syslog syslog-export-policy)

Full Context configure service nat syslog syslog-export-policy

Description This command creates a syslog export policy with a set of transport parameters that are used to transmit NAT flow records in syslog format to an external collector node. This policy name is then referenced from the NAT policy applied to an inside routing context.

The **no** form of the command removes the policy name from the configuration.

Parameters *name* — Specifies the syslog export policy name, up to 32 characters.

create — Keyword used to create the syslog export policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Platforms All

23.519 system-base-mac

system-base-mac

Syntax **system-base-mac** *mac-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no system-base-mac

Context [Tree] (bof system-base-mac)

Full Context bof system-base-mac

Description This command is used to specify the base MAC address for a VSR-based system. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each VSR instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

Default no system-base-mac

Parameters *mac-address* — Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS-20, 7950 XRS-20e, VSR

23.520 system-behavior

system-behavior

Syntax **system-behavior**

Context [Tree] (config>subscr-mgmt system-behavior)

Full Context configure subscriber-mgmt system-behavior

Description Commands in this context configure system-wide subscriber management behavior parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.521 system-filter

system-filter

Syntax **system-filter**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>filter system-filter)

Full Context configure filter system-filter

Description Commands in this context activate system filter policies.

Platforms All

23.522 system-id

system-id

Syntax **system-id** *system-id*
no system-id

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident system-id)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification system-id

Description This command specifies the system ID to match for a host lookup. When the LUDB is accessed through a DHCPv4 server, the system ID is matched against the Nokia vendor specific sub-option in DHCP Option 82.

Note: This command is only used when **system-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the system ID from the configuration.

Parameters *system-id* — Specifies the system ID, up to 255 characters

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

system-id

Syntax [**no**] **system-id**

Context [Tree] (config>service>vpls>sap>dhcp>option>vendor system-id)
[Tree] (config>service>vprn>if>dhcp>option>vendor system-id)
[Tree] (config>service>vprn>sub-if>grp-if>dhcp>option>vendor system-id)
[Tree] (config>service>ies>sub-if>grp-if>dhcp>option>vendor system-id)
[Tree] (config>subscr-mgmt>msap-policy>vpls-only>dhcp>option>vendor system-id)

Full Context configure service ies subscriber-interface group-interface dhcp option vendor-specific-option system-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vpls sap dhcp option vendor-specific-option system-id
configure service vprn interface dhcp option vendor-specific-option system-id
configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option system-id
configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option system-id

Description This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option system-id
- configure service ies subscriber-interface group-interface dhcp option vendor-specific-option system-id
- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option system-id

All

- configure service vpls sap dhcp option vendor-specific-option system-id
- configure service vprn interface dhcp option vendor-specific-option system-id

system-id

Syntax **system-id** *name*
no system-id

Context **[Tree]** (config>system>vsd system-id)

Full Context configure system vsd system-id

Description This command configures the DC GW system-id that is used for the configuration from VSD. VSD will identify the DC GW based on this identifier, hence it must be unique per VSD.

Parameters *name* — Specifies the name of the DC GW.

Platforms All

system-id

Syntax **system-id** *isis-system-id*
no system-id

Context **[Tree]** (config>service>vprn>isis system-id)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn isis system-id

Description This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default no system-id

Parameters *isis-system-id* — 12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms All

system-id

Syntax [**no**] **system-id**

Context **[Tree]** (config>router>if>dhcp>option>vendor-specific-option system-id)

Full Context configure router interface dhcp option vendor-specific-option system-id

Description This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

Default no system-id

Platforms All

system-id

Syntax **system-id** *isis-system-id*
no system-id

Context **[Tree]** (config>router>isis system-id)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router isis system-id

Description This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference:

1. **config>router>isis>system-id**
2. **config>router>isis>router-id**
3. **config>router>router-id**
4. **config>router>interface>system>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, the IS-IS instance must be **shutdown** and then **no shutdown**. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Parameters *isis-system-id* — Specifies 12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms All

23.523 system-ip-load-balancing

system-ip-load-balancing

Syntax [**no**] **system-ip-load-balancing**

Context **[Tree]** (config>system>load-balancing system-ip-load-balancing)

Full Context configure system load-balancing system-ip-load-balancing

Description This command enables the use of the system IP address in the ECMP hash algorithm to add a per system variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to the same ECMP/LAG path.

This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing algorithm, they will continue to use the default algorithm. By default, the IPv4 system IP address is used in the hash algorithm. When no IPv4 system IP address is configured, the IPv6 system IP address, when configured, is used in the hash algorithm.

The **no** form of the command resets the system wide algorithm to default.

Default no system-ip-load-balancing

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

23.524 system-mac

system-mac

Syntax **system-mac** *mac-address*
no system-mac

Context **[Tree]** (config>system>ned>profile system-mac)

Full Context configure system network-element-discovery profile system-mac

Description This command configures the MAC address to be advertised.

The **no** form of this command removes any explicitly defined MAC address and chassis MAC address will be advertised.

Default no system-mac

Parameters *mac-address* — Specifies the MAC address to be associated with the profile in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

Platforms All

23.525 system-priority

system-priority

Syntax **system-priority** *value*
no system-priority

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-ep system-priority)

Full Context configure redundancy multi-chassis peer mc-endpoint system-priority

Description This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

Default no system-priority

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *value* — Specifies the priority assigned to the local MC-EP peer.

Values 1 to 255

Platforms All

23.526 system-profile

system-profile

Syntax **system-profile** {**profile-a** | **profile-b**}
no system-profile

Context **[Tree]** (bof system-profile)

Full Context bof system-profile

Description This command configures the system profile in the BOF.

System profile none represents the existing system capabilities and allows FP3- and FP4-based hardware to co-exist within a system. This is indicated by the omission of the **system-profile** parameter in the BOF, except on 7750 SR-1 systems.

System profile **profile-a** is primarily targeted at subscriber services and layer 2 and 3 VPN business services.

System profile **profile-b** is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

System profile **profile-a** and **profile-b** are supported on 7950 XRS-20/20e, 7750 SR-1 and 7750 SR-12e systems, and support only FP4-based line cards.

The system profile on 7750 SR-1 systems should be set to **profile-a**. It is set by default to **profile-a** when the **system-profile** parameter is omitted from the BOF, or configured to an invalid value.

On 7950 XRS-20/20e and 7750 SR-12e systems, default system profile is none.

On all other systems, the **system-profile** parameter must not be configured in the BOF which sets the system profile to none.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Default none

Parameters **profile-a** — Specifies that the system profile is for subscriber services and Layer 2 and 3 VPN business services.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

profile-b — Specifies that the system profile is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

Platforms All

23.527 system-reserve

system-reserve

Syntax **system-reserve** *percent-of-buffers*
no system-reserve

Context **[Tree]** (config>qos>hs-pool-policy system-reserve)

Full Context configure qos hs-pool-policy system-reserve

Description This command defines the amount of HSQ IOM buffers that is set aside for internal system use. By default, 5% of the total buffer space is reserved for system internal queues. The command is provided for the case where the reserved buffer space is either insufficient or excessive. Exercise care when modifying this value.

When the system reserve value is changed, all the provisioned port-class, mid-tier, and root pool sizes are reevaluated and possibly changed.

Use the **show hs-pools** *card-slot-number* **fp** *forwarding-plane* **egress** command to display the current buffer allocation and buffer usage conditions on an HSQ IOM.

The **no** form of the command reverts to the default system reserve value.

Default system-reserve 5.0

Parameters *percent-of-buffers* — Specifies the percentage of HS buffers that are reserved for internal system use. This parameter is required when executing the **system-reserve** command. The parameter accepts a percent value with two decimal places (100th of a percent).

Values 1.00 to 30.00

Platforms 7750 SR-7/12/12e

Full Context configure port sonet-sdh path frame-relay t391dte
configure port tdm ds1 channel-group frame-relay t391dte
configure port tdm ds3 frame-relay t391dte
configure port tdm e1 channel-group frame-relay t391dte
configure port tdm e3 frame-relay t391dte

Description This command sets the DTE keepalive timer for the Frame Relay Local Management Interface (LMI).

This number specifies the period at which the DTE sends out a keepalive response request to the DCE and updates status depending on the DTE error threshold value.

The **no** form of this command returns the **t391dte** keepalive timer to the default value.

Default t391dte 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *keepalive* — Specifies the interval in seconds between status inquiries issued by the DTE.

Values 5 to 30

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.7 table-size

table-size

Syntax **table-size** *table-size*

Context **[Tree]** (config>service>vpls>proxy-arp table-size)
[Tree] (config>service>vpls>proxy-nd table-size)

Full Context configure service vpls proxy-arp table-size
configure service vpls proxy-nd table-size

Description This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default table-size 250

Parameters *table-size* — Specifies the table-size as number of entries for the service.

Values 1 to 16384

Platforms All

24.8 tacplus

tacplus

Syntax **no tacplus**
tacplus create

Context **[Tree]** (config>service>vprn>aaa>remote-servers tacplus)

Full Context configure service vprn aaa remote-servers tacplus

Description This command creates the context to configure TACACS+ authentication on the VPRN.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Platforms All

tacplus

Syntax [**no**] **tacplus**

Context **[Tree]** (config>system>security tacplus)

Full Context configure system security tacplus

Description This command creates the context to configure TACACS+ authentication on the router.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.9 tacplus-map-to-priv-lvl

tacplus-map-to-priv-lvl

Syntax **tacplus-map-to-priv-lvl** [*admin-priv-lvl*]
no tacplus-map-to-priv-lvl

Context **[Tree]** (config>system>security>password>enable-admin-control tacplus-map-to-priv-lvl)

Full Context configure system security password enable-admin-control tacplus-map-to-priv-lvl

Description When **tacplus-map-to-priv-lvl** is enabled, and tacplus authorization is enabled with the *use-priv-lvl* option, typing **enable-admin** starts an interactive authentication exchange from the node to the TACACS+ server. The start message (service=enable) contains the user-id and the requested *admin-priv-lvl*. Successful authentication results in the use of a new profile (as configured under **config>system>security>tacplus>priv-lvl-map**).

Platforms All

24.10 tag

tag

Syntax **tag** *tag*
no tag [*tag*]

Context **[Tree]** (config>service>vprn>static-route-entry tag)

Full Context configure service vprn static-route-entry tag

Description This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols.

The tag specified at this level of the static route causes tag values configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the tag association.

Default no tag

Parameters *tag* — Specifies an integer value.

Values 1 to 4294967295

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tag

Syntax **tag** *tag-value*
no tag [*tag-value*]

Full Context configure service vprn isis interface tag

Description This command configures a route tag to the specified IP address of an interface.

Parameters *tag* — Specifies the tag value.

Values 1 to 4294967295

Platforms All

tag

Syntax **tag** *tag*
no tag [*tag*]

Context **[Tree]** (config>router>static-route-entry tag)
[Tree] (config>router>static-route-entry>black-hole tag)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>router>static-route-entry>indirect tag)
[Tree] (config>router>static-route-entry>next-hop tag)

Full Context configure router static-route-entry black-hole tag
configure router static-route-entry indirect tag
configure router static-route-entry next-hop tag
configure router static-route-entry tag

Description This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols.

The tag specified at this level of the static route causes tag values configured under the next-hop, black-hole and indirect contexts of the static route to be ignored.

The **no** form of this command removes the tag association.

Default no tag

Parameters *tag* — Specifies an integer tag value.

Values 1 to 4294967295

Platforms All

tag

Syntax **tag** *tag*
no tag

Context [Tree] (config>router>isis>interface tag)

Full Context configure router isis interface tag

Description This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

Parameters *tag* — Specifies a route tag.

Values 1 to 4294967295

Platforms All

tag

Syntax **tag** *tag*
no tag

Context [Tree] (config>router>isis>interface tag)

Full Context configure router isis interface tag

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

Default no tag

Parameters *tag* — Specifies a route tag.

Values 1 to 4294967295

Platforms All

tag

Syntax **tag** {**no-tag** | *tag*}
no tag

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from tag)

Full Context configure router policy-options policy-statement entry from tag

Description This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

Default no tag

Parameters *tag* — Matches the configured tag value.

Values Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

no-tag — Specifies that no tag value is set.

Platforms All

tag

Syntax **tag** *tag*
no tag

Context **[Tree]** (config>router>policy-options>policy-statement>default-action tag)
[Tree] (config>router>policy-options>policy-statement>entry>action tag)

Full Context configure router policy-options policy-statement default-action tag

Use subject to Terms available at: www.nokia.com

configure router policy-options policy-statement entry action tag

Description This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default no tag

Parameters *tag* — Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:
IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295
RIP and RIPng: 0x0–0xFFFF or 1–65535
name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

Platforms All

tag

Syntax **tag** *tag-id*
no tag

Context **[Tree]** (config>qos>sap-ingress>ip-criteria>entry tag)
[Tree] (config>qos>sap-ingress>ipv6-criteria>entry tag)

Full Context configure qos sap-ingress ip-criteria entry tag
configure qos sap-ingress ipv6-criteria entry tag

Description This command associates a tag with the criteria entry.

Tag identifiers are not supported in SAP ingress QoS policies, MAC criteria statements, or in SAP egress QoS policies.

The **no** form of this command removes the tag.

Parameters *tag-id* — Specifies the tag ID.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tag

Syntax **tag** *tag*
no tag

Context **[Tree]** (config>router>isis>srv6>locator tag)

Full Context configure router isis segment-routing-v6 locator tag

Description This command configures a route tag to advertise in the locator TLV.

The **no** form of this command removes the tag value from the configuration.

Default no tag

Parameters *tag* — Specifies a route tag.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

24.11 tag-protocol-id

tag-protocol-id

Syntax **tag-protocol-id** *tag-protocol-id*
no tag-protocol-id

Context **[Tree]** (config>test-oam>build-packet>header>dot1q tag-protocol-id)
[Tree] (debug>oam>build-packet>packet>field-override>header>dot1q tag-protocol-id)

Full Context configure test-oam build-packet header dot1q tag-protocol-id
debug oam build-packet packet field-override header dot1q tag-protocol-id

Description This command defines the Dot1Q tag protocol ID to be used in the test Dot1Q header.

The **no** form of this command removes the tag protocol ID value.

Default tag-protocol-id 0x8100 (33024)

Parameters *tag-protocol-id* — Specifies the Dot1Q tag protocol ID to be used in the test Dot1Q header in either decimal or hexadecimal.

Values 1536 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tag-protocol-id

Syntax **tag-protocol-id** *tag-protocol-id*
no tag-protocol-id

Context **[Tree]** (config>test-oam>build-packet>header>pbb tag-protocol-id)

Full Context configure test-oam build-packet header pbb tag-protocol-id

Description This command defines the PBB Tag Protocol Identifier (TPID) to be used in the test PBB header.

The **no** form of this command reverts to the default.

Default tag-protocol-id 0x88E7 (35047)

Parameters *tag-protocol-id* — Specifies a tag Protocol Identifier (TPID) for a PBB packet header to be launched by the OAM **find-egress** tool.

Values 1536 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tag-protocol-id

Syntax **tag-protocol-id** *tag-protocol-id*
no tag-protocol-id

Context **[Tree]** (debug>oam>build-packet>packet>field-override>header>pbb tag-protocol-id)

Full Context debug oam build-packet packet field-override header pbb tag-protocol-id

Description This command defines the PBB TPID to be used in the PBB header.

The **no** form of this command reverts to the default.

Default tag-protocol-id 0

Parameters *tag-protocol-id* — Specifies a TPID for a PBB packet header to be launched by the OAM **find-egress** tool.

Values 1536 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.12 taii-type2

taii-type2

Syntax **taii-type2** *global-id:node-id:ac-id*
no taii-type2

Context **[Tree]** (config>service>apipe>spoke-sdp>pw-path-id taii-type2)
[Tree] (config>service>cpipe>spoke-sdp>pw-path-id taii-type2)
[Tree] (config>service>epipe>spoke-sdp>pw-path-id taii-type2)
[Tree] (config>service>vpls>spoke-sdp>pw-path-id taii-type2)

Full Context configure service apipe spoke-sdp pw-path-id taii-type2
configure service cpipe spoke-sdp pw-path-id taii-type2
configure service epipe spoke-sdp pw-path-id taii-type2
configure service vpls spoke-sdp pw-path-id taii-type2

Description This command configures the Target Individual Attachment Identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

Parameters *global-id* — Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id — Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id — Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe spoke-sdp pw-path-id taii-type2
- configure service epipe spoke-sdp pw-path-id taii-type2
- configure service vpls spoke-sdp pw-path-id taii-type2

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

- configure service apipe spoke-sdp pw-path-id taii-type2

© 2022 Nokia.

taii-type2

Syntax **taii-type2** *global-id:prefix:ac-id*
no taii-type2

Context **[Tree]** (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context configure service epipe spoke-sdp-fec taii-type2

Description taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters *global-id* — Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix — Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms All

taii-type2

Syntax **taii-type2** *global-id:node-id:ac-id*
no taii-type2

Context **[Tree]** (config>service>ies>if>spoke-sdp>pw-path-id taii-type2)

Full Context configure service ies interface spoke-sdp pw-path-id taii-type2

Description This command configures the target individual attachment identifier (TAII) for an MPLS-TP spoke-sdp. If this is configured on a spoke-sdp for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke-sdp.

Parameters *global-id* — Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP.

Values 0 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

node-id — Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP.

Values a.b.c.d or 0 to 4294967295

ac-id — Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke-SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Use subject to Terms available at: www.nokia.com

Full Context configure mirror mirror-dest remote-source spoke-sdp pw-path-id taii-type2
configure mirror mirror-dest spoke-sdp pw-path-id taii-type2

Description This command configures the target individual attachment identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

Parameters *global-id* — Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values 0 to 4294967295

node-id — Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

Values a.b.c.d or 0 to 4294967295

ac-id — Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.13 target-name

target-name

Syntax **target-name {node-name | user-agent | custom-string** *name***}**
no target-name

Context **[Tree]** (config>system>grpc-tunnel>tunnel target-name)

Full Context configure system grpc-tunnel tunnel target-name

Description This command assigns a target name that the node will register with.

The **no** form of this command removes the target name.

Default no target-name

Parameters **node-name** — Keyword to register the tunnel with the node name configured using the **configure system name** command.

user-agent — Keyword to register the tunnel with the user agent name string defined as *node-name:vendor:model:software-version*.

custom-string — Assigns an arbitrary string as the target name.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

name — Specifies a string, up to 64 characters, that defines the target name.

Platforms All

24.14 target-power

target-power

Syntax **target-power** *power*

Context **[Tree]** (config>port>dwdm>coherent target-power)

Full Context configure port dwdm coherent target-power

Description This command configures the target transmit optical power for the port.

Default target-power 1.00

Parameters *power* — Specifies the desired average output power in dBm.

Values -20.00 to 3.00

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.15 target-retry-wait

target-retry-wait

Syntax **target-retry-wait** *seconds*

Context **[Tree]** (config>li>x-interfaces>x3>timeouts target-retry-wait)

Full Context configure li x-interfaces x3 timeouts target-retry-wait

Description This command configures the retry interval for target tunnel set up.

Parameters *seconds* — Specifies the time that the system must wait before attempting another tunnel creation request to avoid overloading the LIC.

Values 300 to 1200

Default 300

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.16 target-type

target-type

Syntax **target-type {grpc-server | ssh-server | custom-type** *type***}**
no target-type

Context **[Tree]** (config>system>grpc-tunnel>tunnel>handler target-type)

Full Context configure system grpc-tunnel tunnel handler target-type

Description This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default no target-type

Parameters **grpc-server** — Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to “GNMI_GNOI”.

ssh-server — Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to “SSH”.

custom-type — Keyword that assigns an arbitrary string as the target type.

type — Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as “GNMI_GNOI” or “SSH” can also be used.

Platforms All

24.17 targeted-session

targeted-session

Syntax **targeted-session**

Context **[Tree]** (config>router>ldp targeted-session)

Full Context configure router ldp targeted-session

Description This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Platforms All

24.18 task-scheduling-int

task-scheduling-int

Syntax **task-scheduling-int** *percent-of-default*
no task-scheduling-int

Context **[Tree]** (config>card>virt-sched-adj task-scheduling-int)

Full Context configure card virtual-scheduler-adjustment task-scheduling-int

Description This command overrides the system default time between scheduling the hierarchical virtual scheduling task. By default, the system "wakes" the virtual scheduler task every 50ms; this is equivalent to five 10ms timer ticks. The task-scheduling-int command uses a percent value parameter to modify the number of timer ticks.

While the system accepts a wide range of percent values, the result is rounded to the nearest 10ms tick value. The fastest wake interval is 10ms (1 timer tick).

The **no** form of this command restores the default task scheduling interval of the card's hierarchical virtual scheduler task.

Parameters *percent-of-default:* — Specifies that the percent-of-default parameter is required and is used to modify the default task scheduling interval for the hierarchical virtual scheduling task on the card. Defining 100.00 percent is equivalent to removing the override.

Values 0.01% to 1000.00%

Default 100.00%

Platforms All

24.19 tcp

tcp

Syntax **tcp**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>test-oam>build-packet>header tcp)
[Tree] (debug>oam>build-packet>packet>field-override>header tcp)

Full Context configure test-oam build-packet header tcp
debug oam build-packet packet field-override header tcp

Description This command creates a TCP header and enables the context to define the associated parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.20 tcp-ack

tcp-ack

Syntax **tcp-ack** {**true** | **false**}
no tcp-ack

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match tcp-ack)
[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match tcp-ack)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match tcp-ack
configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match tcp-ack
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match tcp-ack
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match tcp-ack

Description This command configures the TCP ACK match condition.

The **no** form of this command reverts to the default.

Parameters **true** — Enables checking for the ACK bit.

false — Disables checking for the ACK bit.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tcp-ack

Syntax **tcp-ack** {**true** | **false**}
no tcp-ack

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>filter>ip-filter>entry>match tcp-ack)
[Tree] (config>filter>ipv6-filter>entry>match tcp-ack)

Full Context configure filter ip-filter entry match tcp-ack
configure filter ipv6-filter entry match tcp-ack

Description This command configures an IP filter match criterion based on the Acknowledgment (ACK) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-ack

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

tcp-ack

Syntax **tcp-ack** {**true** | **false**}
no tcp-ack

Context [Tree] (cfg>sys>sec>cpm>ip-filter>entry>match tcp-ack)
[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-ack)

Full Context configure system security cpm-filter ip-filter entry match tcp-ack
configure system security cpm-filter ipv6-filter entry match tcp-ack

Description This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note: An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

Default no tcp-ack

Parameters **true** — Specifies matching on IP or IPv6 packets that have the ACK bit set in the control bits of the TCP header of an IP or IPv6 packet.

false — Specifies matching on IP or IPv6 packets that do not have the ACK bit set in the control bits of the TCP header of the IP or IPv6 packet.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

24.21 tcp-adv-func

tcp-adv-func

Syntax **tcp-adv-func** *size*

Context **[Tree]** (config>isa>aa-grp>shared-resources tcp-adv-func)

Full Context configure isa aa-group shared-resources tcp-adv-func

Description This command configures the allocation of shared resource pool for TCP advanced functions.

Default tcp-adv-func 100

Parameters *size* — Specifies the allocation of the shared resource pool.

Values 0 to 100

24.22 tcp-client-reset

tcp-client-reset

Syntax [**no**] **tcp-client-reset**

Context **[Tree]** (config>app-assure>group>http-redirect tcp-client-reset)

Full Context configure application-assurance group http-redirect tcp-client-reset

Description This command enables an HTTP-redirect policy to initiate a TCP reset towards the client if the AA policy results in a redirect with packet drop but the http redirect cannot be delivered. Scenarios for this include HTTPs (TLS) sessions, blocking of non-HTTP TCP traffic, and blocking of existing flows after a policy re-evaluate of an existing subscriber.

The **no** form of this command disables the command.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.23 tcp-cwr

tcp-cwr

Syntax **tcp-cwr** {**true** | **false**}
no tcp-cwr

Context **[Tree]** (config>filter>ip-filter>entry>match tcp-cwr)
[Tree] (config>filter>ipv6-filter>entry>match tcp-cwr)

Full Context configure filter ip-filter entry match tcp-cwr
configure filter ipv6-filter entry match tcp-cwr

Description This command configures an IP filter match criterion based on the Congestion Window Reduced (CWR) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-cwr

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.24 tcp-ece

tcp-ece

Syntax **tcp-ece** {**true** | **false**}
no tcp-ece

Use subject to Terms available at: www.nokia.com

Default no tcp-ece

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.25 tcp-established

tcp-established

Syntax **tcp-established** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no tcp-established

Context **[Tree]** (config>service>nat>nat-policy>timeouts tcp-established)
[Tree] (config>service>nat>firewall-policy>timeouts tcp-established)
[Tree] (config>service>nat>up-nat-policy>timeouts tcp-established)

Full Context configure service nat firewall-policy timeouts tcp-established
configure service nat nat-policy timeouts tcp-established
configure service nat up-nat-policy timeouts tcp-established

Description This command configures the idle timeout applied to a TCP session in the established state.

Default tcp-established hrs 2 min 4

Parameters *hours* — Specifies the timeout hours field.

Values 1 to 24

minutes — Specifies the timeout minutes field.

Values 1 to 59

seconds — Specifies the timeout seconds field.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy timeouts tcp-established
- configure service nat up-nat-policy timeouts tcp-established

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-established

24.26 tcp-fin

tcp-fin

Syntax **tcp-fin** {**true** | **false**}
no tcp-fin

Context **[Tree]** (config>filter>ip-filter>entry>match tcp-fin)
[Tree] (config>filter>ipv6-filter>entry>match tcp-fin)

Full Context configure filter ip-filter entry match tcp-fin
configure filter ipv6-filter entry match tcp-fin

Description This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-fin

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.27 tcp-keepalive

tcp-keepalive

Syntax **tcp-keepalive**

Context **[Tree]** (config>system>grpc tcp-keepalive)

Full Context configure system grpc tcp-keepalive

Description Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time** seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

Platforms All

tcp-keepalive

Syntax **tcp-keepalive**

Context **[Tree]** (config>bmp>station>connection tcp-keepalive)

Full Context configure bmp station connection tcp-keepalive

Description Commands in this context configure TCP keepalive parameters for the station.

Platforms All

tcp-keepalive

Syntax **tcp-keepalive**

Context **[Tree]** (config>system>grpc-tunnel>destination-group tcp-keepalive)
[Tree] (config>system>telemetry>destination-group tcp-keepalive)

configure system telemetry destination-group tcp-keepalive

Description Commands in this context configure TCP keepalive commands.

Platforms All

24.28 tcp-mss

tcp-mss

Syntax **tcp-mss** *mss-value*
no tcp-mss

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>ies>if tcp-mss)
[Tree] (config>service>ies>if>ipv6 tcp-mss)

Full Context configure service ies interface ipv6 tcp-mss
configure service ies interface tcp-mss

Description This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default no tcp-mss

Parameters *mss-value* — The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

Platforms All

tcp-mss

Syntax **tcp-mss** *mss-value*
no tcp-mss

Context [Tree] (config>service>vprn>if tcp-mss)
[Tree] (config>service>vprn>if>ipv6 tcp-mss)
[Tree] (config>service>vprn>nw-if tcp-mss)

Full Context configure service vprn interface ipv6 tcp-mss
configure service vprn interface tcp-mss
configure service vprn network-interface tcp-mss

Description This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP or network interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default no tcp-mss

Parameters *mss-value* — Specifies the TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9746 = max-IP_MTU (9786)-40

Values 384 to 9746 (IPv4 or network)
1220 to 9726(IPv6)

© 2022 Nokia.

Platforms All

tcp-mss

Syntax **tcp-mss** *mss-value*
no tcp-mss

Context **[Tree]** (config>router>if tcp-mss)
[Tree] (config>router>if>ipv6 tcp-mss)

Full Context configure router interface ipv6 tcp-mss
configure router interface tcp-mss

Description This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default no tcp-mss

Parameters *mss-value* — Specifies the TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

Platforms All

tcp-mss

Syntax **tcp-mss** *mss-value*
no tcp-mss

Context **[Tree]** (config>router>bgp tcp-mss)
[Tree] (config>service>vprn>bgp tcp-mss)

Full Context configure router bgp tcp-mss
configure service vprn bgp tcp-mss

Description This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default no tcp-mss

Parameters *mss-value* — Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms All

tcp-mss

Syntax **tcp-mss ip-stack**
tcp-mss *mss-value*
no tcp-mss

Context **[Tree]** (config>router>bgp>group tcp-mss)
[Tree] (config>router>bgp>group>neighbor tcp-mss)
[Tree] (config>service>vprn>bgp>group tcp-mss)
[Tree] (config>service>vprn>bgp>group>neighbor tcp-mss)

Full Context configure router bgp group neighbor tcp-mss
configure router bgp group tcp-mss
configure service vprn bgp group neighbor tcp-mss
configure service vprn bgp group tcp-mss

Description This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no tcp-mss

Parameters *mss-value* — Specifies the TCP MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

ip-stack — This keyword requests that TCP MSS be derived from mechanisms and configurations outside of BGP, including the configuration of **tcp-mss** at the IP interface level. It provides a method to override inheritance within the BGP configuration.

Platforms All

24.29 tcp-mss-adjust

tcp-mss-adjust

Syntax **tcp-mss-adjust** *segment-size*
no tcp-mss-adjust

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw tcp-mss-adjust)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw tcp-mss-adjust)

Full Context configure service ies subscriber-interface group-interface wlan-gw tcp-mss-adjust
configure service vprn subscriber-interface group-interface wlan-gw tcp-mss-adjust

Description This command configures the TCP Maximum Segment Size (MSS) adjustment for the wlan-gw gateway.

The **no** form of this command disables adjusting tcp-mss values.

For DSM, this only applies to packets sent in the downstream direction (TCP SYN towards UE). For the upstream direction, it is also required to configure MSS adjust under the applicable NAT-policy.

Parameters *segment-size* — Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust

Syntax **tcp-mss-adjust** *segment-size*
no tcp-mss-adjust

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>group>aqp>entry>action tcp-mss-adjust)

Full Context configure application-assurance group app-qos-policy entry action tcp-mss-adjust

Description This command configures the value to adjust the TCP Maximum Segment Size (MSS) option. The no form of this command disables the segment size adjustment.

Default no tcp-mss-adjust

Parameters *segment-size* — Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

tcp-mss-adjust

Syntax **tcp-mss-adjust** *segment-size*
no tcp-mss-adjust

Context [Tree] (config>service>nat>nat-policy tcp-mss-adjust)
[Tree] (config>service>nat>firewall-policy tcp-mss-adjust)
[Tree] (config>service>nat>up-nat-policy tcp-mss-adjust)

Full Context configure service nat firewall-policy tcp-mss-adjust
configure service nat nat-policy tcp-mss-adjust
configure service nat up-nat-policy tcp-mss-adjust

Description This command configures the value to adjust the TCP Maximum Segment Size (MSS) option.

The **no** form of the command returns the segment size to the default.

Default no tcp-mss-adjust

Parameters *segment-size* — Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy tcp-mss-adjust
- configure service nat up-nat-policy tcp-mss-adjust

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy tcp-mss-adjust

tcp-mss-adjust

Syntax **tcp-mss-adjust**

© 2022 Nokia.

Context [Tree] (config>filter>ip-filter>entry>action tcp-mss-adjust)
[Tree] (config>filter>ipv6-filter>entry>action tcp-mss-adjust)

Full Context configure filter ip-filter entry action tcp-mss-adjust
configure filter ipv6-filter entry action tcp-mss-adjust

Description This command activates the adjustment of the TCP Maximum Segment Size (MSS) option of TCP packets matching the entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust

Syntax **tcp-mss-adjust** *segment-size*
no tcp-mss-adjust

Context [Tree] (config>service>nat>map-domain tcp-mss-adjust)

Full Context configure service nat map-domain tcp-mss-adjust

Description This command enables the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is re-written (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length.

If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.

Default no tcp-mss-adjust

Parameters *segment-size* — Specifies the maximum size of the segment.

Values 160 to 8626

Platforms VSR

24.30 tcp-ns

tcp-ns

Syntax **tcp-ns** {**true** | **false**}
no tcp-ns

Context [Tree] (config>filter>ip-filter>entry>match tcp-ns)
[Tree] (config>filter>ipv6-filter>entry>match tcp-ns)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure filter ip-filter entry match tcp-ns
configure filter ipv6-filter entry match tcp-ns

Description This command configures an IP filter match criterion based on the Nonce Sum (NS) TCP Flag bit, defined in RFC 3540, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-ns

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.31 tcp-optimizer

tcp-optimizer

Syntax **tcp-optimizer** *tcp-optimizer-name* [**create**]
no tcp-optimizer *tcp-optimizer-name*

Context **[Tree]** (config>app-assure>group tcp-optimizer)

Full Context configure application-assurance group tcp-optimizer

Description This command configures the TCP optimizer policy. When a TCP optimizer policy is removed or deleted, the existing flows using this policy are abandoned, and optimization is stopped. If, however, the TCP optimizer action is removed from a session-filter entry (in the **config>app-assure>group>sess-fltr>entry action** context), the existing flows are not affected.

The **no** form of this command removes the specified TCP optimizer policy.

Parameters *tcp-optimizer-name* — Specifies the name of the TCP optimizer policy, up to 32characters.

create — This keyword is mandatory when creating a TCP optimizer policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.32 tcp-option-number

tcp-option-number

Syntax **tcp-option-number**

Context **[Tree]** (config>system>security>keychain tcp-option-number)

Full Context configure system security keychain tcp-option-number

Description Commands in this context configure the TCP option number to be placed in the TCP packet header.

Platforms All

24.33 tcp-performance

tcp-performance

Syntax **tcp-performance**

Context **[Tree]** (config>app-assure>group>cflowd tcp-performance)

Full Context configure application-assurance group cflowd tcp-performance

Description Commands in this context configure Cflowd TCP performance export parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.34 tcp-psh

tcp-psh

Syntax **tcp-psh** {**true** | **false**}
no tcp-psh

Context **[Tree]** (config>filter>ip-filter>entry>match tcp-psh)
[Tree] (config>filter>ipv6-filter>entry>match tcp-psh)

Full Context configure filter ip-filter entry match tcp-psh
configure filter ipv6-filter entry match tcp-psh

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures an IP filter match criterion based on the Push (PSH) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-psh

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.35 tcp-rst

tcp-rst

Syntax **tcp-rst [min** *minutes*] **[sec** *sec*]
no tcp-rst

Context [Tree] (config>service>nat>nat-policy>timeouts tcp-rst)
[Tree] (config>service>nat>firewall-policy>timeouts tcp-rst)
[Tree] (config>service>nat>up-nat-policy>timeouts tcp-rst)

Full Context configure service nat firewall-policy timeouts tcp-rst
configure service nat nat-policy timeouts tcp-rst
configure service nat up-nat-policy timeouts tcp-rst

Description This command suspends the use of the outside TCP ports that have been used in translations for TCP connections that are closed via TCP RST. Once this timer expires, the outside ports can be reused for new TCP translations.

The **no** form of the command reverts to the default.

Default no tcp-rst

Parameters *minutes* — Specifies the timeout, in minutes, after receiving a RST and closing the session before going to the LISTEN state again.

Values 1 to 4

sec — Specifies the timeout, in seconds, after receiving a RST and closing the session before going to the LISTEN state again.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com

24.37 tcp-stack

tcp-stack

Syntax **tcp-stack** *tcp-stack-type*

Context [Tree] (config>app-assure>group>tcp-optimizer tcp-stack)

Full Context configure application-assurance group tcp-optimizer tcp-stack

Description This command configures the TCP stack used toward the subscriber.

- The TCP stack used toward the core network is new-reno, and it is not configurable.
- TCP BBR, TCP Illinois, and TCP Westwood implement a sender-side modification of the TCP congestion window algorithm that improves upon the performance of TCP Reno in wireless networks with lossy links.

The **no** form of this command reverts to the default.

Default tcp-westwood

Parameters *tcp-stack-type* — Specifies the TCP stack used toward the subscriber.

Values tcp-bbr | tcp-illinois | tcp-new-reno | tcp-westwood

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.38 tcp-syn

tcp-syn

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match tcp-syn
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match tcp-syn
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match tcp-syn

Description This command configures the TCP SYN match condition.

The **no** form of this command reverts to the default.

Parameters **true** — Enables checking for the SYN bit.

false — Disables checking for the SYN bit.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tcp-syn

Syntax **tcp-syn** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no tcp-syn

Context **[Tree]** (config>service>nat>nat-policy>timeouts tcp-syn)
[Tree] (config>service>nat>firewall-policy>timeouts tcp-syn)
[Tree] (config>service>nat>up-nat-policy>timeouts tcp-syn)

Full Context configure service nat firewall-policy timeouts tcp-syn
configure service nat nat-policy timeouts tcp-syn
configure service nat up-nat-policy timeouts tcp-syn

Description This command configures the timeout applied to a TCP session in the SYN state.

Default tcp-syn sec 15

Parameters *hours* — Specifies the timeout hours field.

Values 1 to 24

minutes — Specifies the timeout minutes field.

Values 1 to 59

seconds — Specifies the timeout seconds field.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts tcp-syn
- configure service nat nat-policy timeouts tcp-syn

- configure service nat firewall-policy timeouts tcp-syn

tcp-syn

Syntax **tcp-syn** {**true** | **false**}
no tcp-syn

Context **[Tree]** (config>filter>ip-filter>entry>match tcp-syn)
[Tree] (config>filter>ipv6-filter>entry>match tcp-syn)

Full Context configure filter ip-filter entry match tcp-syn
configure filter ipv6-filter entry match tcp-syn

Description This command configures an IP filter match criterion based on the Synchronize (SYN) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-syn

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

tcp-syn

Syntax **tcp-syn** {**true** | **false**}
no tcp-syn

Context **[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match tcp-syn)
[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-syn)

Full Context configure system security cpm-filter ip-filter entry match tcp-syn
configure system security cpm-filter ipv6-filter entry match tcp-syn

Description This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

Note: An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP or IPv6 address.

The **no** form of this command removes the criterion from the match entry.

Default no tcp-syn

Parameters **true** — Specifies matching on IP or IPv6 packets that have the SYN bit set in the control bits of the TCP header.

false — Specifies matching on IP or IPv6 packets that do not have the SYN bit set in the control bits of the TCP header.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service nat nat-policy timeouts tcp-transitory
configure service nat up-nat-policy timeouts tcp-transitory

Description This command configures the idle timeout applied to a TCP session in a transitory state.

Default tcp-transitory min 4

Parameters *hours* — Specifies the timeout hours field.

Values 1 to 24

minutes — Specifies the timeout minutes field.

Values 1 to 59

seconds — Specifies the timeout seconds field.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy timeouts tcp-transitory
- configure service nat up-nat-policy timeouts tcp-transitory

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-transitory

24.41 tcp-urg

tcp-urg

Syntax **tcp-urg** {**true** | **false**}
no tcp-urg

Context **[Tree]** (config>filter>ip-filter>entry>match tcp-urg)
[Tree] (config>filter>ipv6-filter>entry>match tcp-urg)

Full Context configure filter ip-filter entry match tcp-urg
configure filter ipv6-filter entry match tcp-urg

Description This command configures an IP filter match criterion based on the Urgent (URG) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default no tcp-urg

Parameters **true** — Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false — Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms All

24.42 tcp-validate

tcp-validate

Syntax **tcp-validate** *tcp-validate-name*
no tcp-validate

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action tcp-validate)

Full Context configure application-assurance group policy app-qos-policy entry action tcp-validate

Description This command assigns an existing TCP validation policy as an action on flows matching this AQP entry.

tcp-validate can only be called from AQP entries that:

- have no matching conditions that relate to information extracted from the incoming IP packets; for example, no application or IP address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- allow the following match conditions:
  - none
  - aa-sub
  - characteristic
  - traffic-direction (both only)

    traffic-direction cannot be unidirectional (from or to sub). It can either be set to both or left unspecified.

The **no** form of this command removes the TCP validation policy action from flows matching this AQP entry.

Default no tcp-validate

Parameters *tcp-validate-name* — Specifies the name of the TCP validation policy for this application assurance profile. The TCP validation policy is configured using the **config**>**app-assure**>**group**>**tcp-validate** *tcp-validate-name* command.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-validate

Syntax **tcp-validate** *tcp-validate-name* **direction** *direction* [**create**]
no tcp-validate *tcp-validate-name* **direction** *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca tcp-validate)

Full Context configure application-assurance group statistics threshold-crossing-alert tcp-validate

Description This command configures TCA for the counter, and enables the capture of drop or admit events due to the specified TCP validation function.

Parameters *tcp-validate-name* — Specifies the name of the TCP validation policy up to 32 characters.

direction — Specifies the traffic direction in relation to the AA subscriber.

Values from-sub, to-sub

create — This keyword is mandatory when creating a TCA instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-validate

Syntax **tcp-validate** *tcp-validate-name* [**create**]
no tcp-validate *tcp-validate-name*

Context **[Tree]** (config>app-assure>group tcp-validate)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure application-assurance group tcp-validate

Description This command configures a TCP validation policy.

The **no** form of this command removes the specified TCP validation policy.

Default no tcp-validate

Parameters *tcp-validate-name* — Specifies the name of the TCP validation policy up to 32 characters.

create — This keyword is mandatory when creating a TCP validation policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.43 tcp-validate-stats

tcp-validate-stats

Syntax [**no**] **tcp-validate-stats**

Context **[Tree]** (config>app-assure>group>statistics>aa-admit-deny tcp-validate-stats)

Full Context configure application-assurance group statistics aa-admit-deny tcp-validate-stats

Description This command configures whether to include or exclude TCP validation admit-deny statistics in accounting records.

Default no tcp-validate-stats

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.44 tdcm

tdcm

Syntax **tdcm**

Context **[Tree]** (config>port>dwdm tdcm)

Full Context configure port dwdm tdcm

Description This command configures the Tunable Dispersion Compensation Module parameters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.45 tdm

tdm

Syntax **tdm**

Context **[Tree]** (config>port tdm)

Full Context configure port tdm

Description Commands in this context configure DS-1/E-1 and DS-3/E-3 parameters for a port on a channelized MDA T1/E1. This context cannot be accessed on non-channelized MDAs.

TDM is a mechanism to divide the bandwidth of a stream into separate channels or time slots by assigning each stream a different time slot in a set. TDM repeatedly transmits a fixed sequence of time slots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

24.46 tdm-sat

tdm-sat

Syntax **tdm-sat** *sat-id* [**create**]
no tdm-sat *sat-id*

Context **[Tree]** (config>system>satellite tdm-sat)

Full Context configure system satellite tdm-sat

Description Commands in this context configure the specified TDM satellite.

The **no** form of the command deletes the specified TDM satellite.

Parameters *sat-id* — Specifies the satellite ID for the associated TDM satellite.

Values 1 to 20

create — The keyword used to create a new TDM satellite context. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.47 te

te

Syntax [**no**] **te**

Context **[Tree]** (debug>router>mpls>event te)

Full Context debug router mpls event te

Description This command debugs te events.

The **no** form of the command disables the debugging.

Platforms All

24.48 te-class

te-class

Syntax **te-class** *te-class-number* **class-type** *ct-number* **priority** *priority*
no te-class te-class-number

Context **[Tree]** (config>router>rsvp>diffserv-te te-class)

Full Context configure router rsvp diffserv-te te-class

Description This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in Table 184.

Table 184 **Default Class Type**

Class Type (CT internal)	LSP Priority
0	7
0	6

© 2022 Nokia.

Table 184 **Default Class Type**

Class Type (CT internal)	LSP Priority
0	5
0	4
0	3
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

Parameters **te-class** *te-class-number* — Specifies the TE class number.

Values 0 to 7

class-type *ct-number* — Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

priority *priority* — Specifies the LSP priority.

Values 0 to 7

Platforms All

24.49 te-down-threshold

te-down-threshold

Syntax **te-down-threshold** *threshold-level* [*threshold-level*]
no te-down-threshold

Context **[Tree]** (config>router>rsvp te-down-threshold)
[Tree] (config>router>rsvp>interface te-down-threshold)

Full Context configure router rsvp interface te-down-threshold
configure router rsvp te-down-threshold

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters *threshold-level* — Specifies the threshold level.

Values 0 to 100

Platforms All

24.50 te-link

te-link

Syntax [**no**] **te-link** *te-link-id*

Context **[Tree]** (config>router>lmp>peer te-link)

Full Context configure router lmp peer te-link

Description This command assigns a Traffic Engineering (TE) Link to a given LMP peer. The TE Link with ID *te-link-id* must already have been created under **config>router>lmp>te-link**.

Default no te-link

Parameters *te-link-id* — Specifies the ID of the TE Link.

Values 1 to 4294967295 | *te-link-name te-link-name*: 32 character (max) name of the TE Link

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

te-link

Syntax [**no**] **te-link** *te-link-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>lmp te-link)

Full Context configure router lmp te-link

Description This command creates a Traffic Engineering (TE) Link in LMP across a GMPLS UNI. An unsigned integer TE link ID must be specified when the TE Link is first created. Once the link is created, the user can configure the link name (that is 'link-name te-link-name'). From here, the user can refer to this TE Link by either the unsigned integer or the ASCII name.

Default no te-link

Parameters *te-link-id* — Specifies the ID of the TE Link.

Values 1 to 4294967295 | *te-link-name te-link-name*: 32 character (max) name of the TE Link

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

te-link

Syntax [**no**] **te-link** *te-link-id*

Context [Tree] (config>router>gmpls te-link)

Full Context configure router gmpls te-link

Description This command enables the use of a Traffic Engineering (TE) Link (which has previously been configured under **config>router>lmp**) in GMPLS.

The **no** form of this command resets the configuration to the default value.

Default no te-link

Parameters *te-link-id* — Specifies the ID or name of the configured TE Link.

Values 1 to 4294967295 | *te-link-name te-link-name*: 32 character maximum name of the TE Link

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.51 te-metric

te-metric

Syntax **te-metric** *value*
no te-metric

Context [Tree] (config>router>mpls>interface te-metric)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router mpls interface te-metric

Description This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters *value* — Specifies the metric value.

Values 1 to 16777215

Platforms All

24.52 te-threshold-update

te-threshold-update

Syntax [**no**] **te-threshold-update**

Context **[Tree]** (config>router>rsvp te-threshold-update)

Full Context configure router rsvp te-threshold-update

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to control threshold-based IGP TE updates. The **te-threshold-update** command must enable IGP TE update based only on bandwidth reservation thresholds per interface and must block IGP TE update on bandwidth changes for each reservation. Threshold levels can be defined using the **te-up-threshold** and **te-down-threshold** commands at the global RSVP or per-interface level.

The **no** form of this command should reset te-threshold-update to the default value and disable threshold based update.

Default no te-threshold-update

Platforms All

te-threshold-update

Syntax **te-threshold-update**
no te-threshold-update

24.54 tech-support

tech-support

Syntax **tech-support** [*file-url*]

Context **[Tree]** (admin tech-support)
[Tree] (admin>satellite>eth-sat tech-support)

Full Context admin satellite eth-sat tech-support
admin tech-support

Description This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: This command should only be used with authorized direction of Nokia support.

Parameters *file-url* — Specifies the file URL location to save the binary file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*] 199 chars max
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - 32 chars max, for link local addresses

24.59 telnet

telnet

Syntax **telnet** {*ip-address* | *dns-name*} [*port*] **service-name** *service-name* [**source** *ip-address*]
telnet {*ip-address* | *dns-name*} [*port*] [**router** *router-instance*] [**source** *ip-address*]

Context **[Tree]** (global telnet)

Full Context global telnet

Description This command opens a Telnet session to a remote host. In SR-series networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters *ip-address* — Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address* interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

Note: IPv6 applies to the 7750 SR and 7950 XRS.

dns-name — Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

port — Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance — Specifies the router name or service ID used to identify the router instance.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	“Base”, “management”, vpls-management”
vprn-svc-id	1 to 2147483647

Default Base

service-name — Specifies the service name, up to 64 characters.

source *ip-address* — Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d

24.61 telnet-reply

telnet-reply

Syntax [**no**] **telnet-reply**

Context **[Tree]** (config>service>ies>if>ipv6>vrrp telnet-reply)

Full Context configure service ies interface ipv6 vrrp telnet-reply

Description This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the telnet-reply configuration.

The **telnet-reply** command is only available in non-owner VRRP nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

Default no telnet-reply

Platforms All

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet Requests regardless of the telnet-reply configuration.

The telnet-reply command is only available in non-owner VRRP nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

Default no telnet-reply

Platforms All

telnet-reply

Syntax [**no**] **telnet-reply**

Context **[Tree]** (config>service>vprn>if>vrrp telnet-reply)
[Tree] (config>service>vprn>if>ipv6>vrrp telnet-reply)

Full Context configure service vprn interface ipv6 vrrp telnet-reply
configure service vprn interface vrrp telnet-reply

Description This command enables the non-owner master to reply to TCP port 23 Telnet Requests directed at the virtual router instance's IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet Requests regardless of the telnet-reply configuration.

The telnet-reply command is only available in non-owner **VRRP** nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

Default no telnet-reply

telnet-reply

Syntax [**no**] **telnet-reply**

Context **[Tree]** (config>router>if>vrrp telnet-reply)
[Tree] (config>router>if>ipv6>vrrp telnet-reply)

Full Context configure router interface ipv6 vrrp telnet-reply
configure router interface vrrp telnet-reply

Description This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

24.64 temp-flooding

temp-flooding

Syntax **temp-flooding flood-time**
no temp-flooding

Context **[Tree]** (config>service>vpls temp-flooding)
[Tree] (config>service>template>vpls-template temp-flooding)

Full Context configure service template vpls-template temp-flooding
configure service vpls temp-flooding

Description The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default no temp-flooding

Parameters *flood-time* — Specifies the flood time, in seconds

Values 3 to 600

[Tree] (config>app-assure>group>cflowd>tcp-perf template)
[Tree] (config>app-assure>group>cflowd>volume template)

Full Context configure application-assurance group cflowd comprehensive template
configure application-assurance group cflowd tcp-performance template
configure application-assurance group cflowd volume template

Description Commands in this context configure the template for cflowd comprehensive, TCP performance, or volume fields.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

template

Syntax **template** *template-id*
no template

Context **[Tree]** (config>app-assure>group template)
[Tree] (config>app-assure>group>http-error-redirect template)

Full Context configure application-assurance group http-error-redirect template
configure application-assurance group template

Description This command refers to the template of parameters passed from the AA-ISA to the redirect server via JavaScript in the redirect packet. The template is specific to the redirect server being used in the network.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Currently, two partners are used and tested with AA-ISA redirect solution, Barefruit and Xerocole.

The **no** form of this command reverts to the default.

Parameters *template-id* — Specifies an HTTP error redirect template.

1 = Barefruit specific template

2 = xerocole specific template.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

template

Syntax **template** *value*
no template

Context **[Tree]** (config>app-assure>group>http-notif template)

Full Context configure application-assurance group http-notification template

Description This command configures the template which defines the format and parameters included in the http notification message.

The **no** form of this command removes the template from the configuration.

Default no template

Parameters *value* — Specifies the template id of this HTTP Notification.

Values 1 — Javascript-url with SubID and optional Http-Url-Param

2 — Javascript-url and optional Http-Url-Param

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

template

Syntax **template** *template-id*
no template

Context **[Tree]** (config>app-assure>group>http-redirect template)

Full Context configure application-assurance group http-redirect template

Description This command configures the template that defines which parameters are appended to the HTTP host redirect field in the redirect message.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The HTTP redirect template provides HTTP 302 redirect containing only the URL specified in the redirect policy, with no other parameters.

The **no** form of this command removes the template from the configuration.

Default no template

Parameters *template-id* — Specifies the HTTP Policy Redirect template.

Values
1 — Javascript based redirect embedded in HTTP 200 OK response with a predefined number of arguments automatically appended to the redirect URL
2 — HTTP 302 Redirect with a predefined number of arguments automatically appended to the redirect URL.
3 — HTTP 302 Redirect with no parameters appended to the URL (empty).
4 — Empty Redirect format using Javascript.
5 — Redirect supporting macro substitution using HTTP 302.
6 — Redirect supporting macro substitution using Javascript.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

template

Syntax [**no**] **template** *template-name*

Context **[Tree]** (config>router>bier template)

Full Context configure router bier template

Description This command creates a BIER template to be assigned to IGP.

The **no** form of this command removes a specific template.

Parameters *template-name* — The name of the template to be created or removed, up to 32 characters.

Platforms All

template

Syntax [**no**] **template** *name*

Context **[Tree]** (config>router>route-next-hop-policy template)

Full Context configure router route-next-hop-policy template

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

Parameters *name* — Specifies the name of the template, up to 32 characters.

Platforms All

template

Syntax **template** *template-name*
no template

Context **[Tree]** (config>router>isis>level>bier template)

Full Context configure router isis level bier template

Description This command assigns a BIER template to an IS-IS level.

Use subject to Terms available at: www.nokia.com

The **no** form of this command removes templates from the IS-IS level.

Parameters *template-name* — Specifies the BIER template name.

Platforms All

template

Syntax **template** *template-name*
no template

Context **[Tree]** (config>router>ospf>area>bier template)

Full Context configure router ospf area bier template

Description This command configures an OSPF BIER template at the OSPF area level.

The **no** form of this command removes templates from the OSPF area.

Parameters *template-name* — The name of the template, up to 32 characters.

Platforms All

24.66 template-format

template-format

Syntax **template-format** {**format1** | **format2**}
no template-format

Context **[Tree]** (config>service>ipfix>ipfix-export-policy template-format)

Full Context configure service ipfix ipfix-export-policy template-format

Description This command selects one of two template formats that contains a set of element IDs and their interpretation in IPFIX NAT flow logging. The difference between the two formats is related to the fields conveying information about the translated source IP addresses and ports (outside IP addresses and ports). Further, format 1 conveys information about the translated source port (post NAT) in the sourceTransportPort information element while format 2 conveys this information in the postNAPTsourceTrasportPort element.

Further, format1 conveys information about the translated source port (post NAT) in the information element sourceTransportPort while a new information element postNAPTsourceTrasportPort is introduced in format2 to carry this information.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For more information about template formats, refer to “Template Formats” in the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide*, where the table lists supported information elements and their description for each format.

The **no** form of the command reverts to the default value.

Default template-format format1

Parameters **format1** — Specifies that template format 1 is used by the IPFIX collectors associated with this IPFIX Export policy.

format2 — Specifies that template format 2 is used by the IPFIX collectors associated with this IPFIX Export policy.

24.67 template-refresh-timeout

template-refresh-timeout

Syntax **template-refresh-timeout** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*] [**days** *days*]
no template-refresh-timeout

Context **[Tree]** (config>service>ipfix>export-policy>collector template-refresh-timeout)

Full Context configure service ipfix ipfix-export-policy collector template-refresh-timeout

Description This command configures the time interval in which Template Set messages are sent to the collector node. Template sets is an IPFIX message that defines fields for subsequent IPFIX messages but contains no data of its own. In other words, IPFIX data is not passed as set of TLVs, but instead data is encoded with a scheme defined through the Template Set message.

Default template-refresh-timeout min 10

Parameters *hours* — Specifies the time interval, in hours, after which IPFIX templates are resent to this collector.

Values 1 to 24

minutes — Specifies the time interval, in minutes, after which IPFIX templates are resent to this collector.

Values 1 to 59

seconds — Specifies the time interval, in seconds, after which IPFIX templates are resent to this collector.

Values 1 to 59

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

days — Specifies the time interval, in days, after which IPFIX templates are resent to this collector.

Values 1

24.69 template-set

template-set

Syntax **template-set** {**basic** | **mpls-ip** | **l2-ip** | **mpls-transport**}

Context **[Tree]** (config>cflowd>collector template-set)

Full Context configure cflowd collector template-set

Description This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.

Default template-set basic

Parameters **basic** — Specifies that basic flow data is sent.

mpls-ip — Specifies that extended flow data is sent that includes IP and MPLS flow information.

If the sampled traffic is part of a locally configured service or IPv4 or IPv6 traffic is being forwarded with an MPLS shortcut, then the MPLS labels associated with that service encapsulation are included in the extended flow data for both network ingress and egress sampling.

l2-ip — Specifies that extended flow data is sent that includes Layer 2 (Ethernet) and IP flow information. This template is only applicable for V10 (IPFIX) collectors.

mpls-transport — Specifies that cflowd can collect flow statistics for MPLS traffic using only the outer transport label, EXP bit value, and ingress interface as the flow identifier. This template enables the collection of flow statistics on a core router to develop LSP usage statistics.

24.71 terminate

terminate

Syntax [**no**] **terminate**

Context **[Tree]** (config>service>apipe>sap>atm>oam terminate)

Full Context configure service apipe sap atm oam terminate

Description This command specifies whether this SAP will act as an OAM termination point. ATM SAPs can be configured to tunnel or terminate OAM cells.

When configured to not terminate (the default is **no terminate**), the SAP will pass OAM cells through the VLL without inspecting them. The SAP will respond to OAM loopback requests that are directed to the local node by transmitting a loopback reply. Other loopback requests are transparently tunneled through the pseudowire. In this mode, it is possible to launch a loopback request toward the directly-attached ATM equipment and see the results of the reply.

When configured to terminate, the SAP will respond to AIS by transmitting RDI and will signal the change of operational status to the other endpoint (for example, through LDP status notifications). The SAP will respond to OAM loopback requests by transmitting a loopback reply. In this mode, it is possible to launch a loopback request toward the directly-attached ATM equipment and see the results of the reply.

For Apipe services, the user has the option of enabling or disabling this option for VC types atm-vcc and atm-sdu since these service types maintain the ATM layer and/or the AAL5 layer across the VLL. It is not supported on atm-vpc and atm-cell apipe vc types since the VLL must pass the VC level (F5) OAM cells.

The **terminate** option for OAM is the only and default mode of operation supported for an ATM SAP which is part of Epipe, Ipipe, VPLS, and IES/VPRN. This is because the ATM and AAL5 layers are terminated.

For Apipe services, the user has the option of enabling or disabling this option for vc types atm-vcc and atm-sdu since these service types maintain the ATM layer and/or the AAL5 layer across the VLL. It is not supported on atm-vpc and atm-cell Apipe vc types since the VLL must pass the VC level (F5).

The **terminate** option for OAM is the only and default mode of operation supported for an ATM SAP which is part of Epipe, Ipipe, VPLS, and IES/VPRN. This is because the ATM and AAL5 layers are terminated.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically “close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

Default no tertiary-ipv6-address

Parameters *ipv6-address* — Specifies the tertiary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms All

24.79 tertiary-location

tertiary-location

Syntax **tertiary-location** *file-url*
no tertiary-location

Context **[Tree]** (config>system>software-repository tertiary-location)

Full Context configure system software-repository tertiary-location

Description This command configures the tertiary location for the files in the software repository. See the **software-repository** command description for more information.

The **no** form of the command removes the tertiary location.

Parameters *file-url* — Specifies the tertiary location to be used to access the files in the software repository.

Values

file url	*local-url* | *remote-url*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

local-url	[*cflash-id/*][*file-path*]	up to 200 characters, including cflash-id directory length 99 characters each
remote-url	[{ftp://} *login:pswd@remote-locn/*][*file-path*] 243 characters maximum directory length, up to 99 characters each	
	remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
	ipv4-address	*a.b.c.d*
	ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*] *x:x:x:x:x:x:d.d.d.d*[*-interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:	

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.80 tertiary-url

tertiary-url

Syntax **tertiary-url** *url*
no tertiary-url

Context **[Tree]** (config>python>py-script tertiary-url)

Full Context configure python python-script tertiary-url

Description This command specifies the location of tertiary Python script. The system supports three locations for each Python-script. Users can store scripts file on either a local CF card or a FTP server.

The **no** form of this command removes the URL.

Parameters **url** — Specifies the tertiary URL of the Python script up to 180 characters, either a local CF card URL or a FTP server URL.

Platforms All

Use subject to Terms available at: www.nokia.com

24.81 test

test

Syntax [**no**] **test** *test-name* [**owner** *test-owner*]

Context **[Tree]** (config>saa test)

Full Context configure saa test

Description This command identifies a test and enables the context to provide the test parameters for the named test. After the creation of the test instance, the test can be started in the OAM context.

A test can only be modified while it is shut down.

The **no** form of this command removes the test from the configuration. To remove a test, it cannot be active at the time.

Parameters *test-name* — Identifies the SAA test name, up to 32 characters.

test-owner — Specifies the owner, up to 32 characters, of an SAA operation. If a value is not specified, the default owner is used.

Default "TiMOS CLI"

Platforms All

24.82 test-account

test-account

Syntax **test-account**

Context **[Tree]** (config>aaa>radius-srv-plcy>servers>health-check test-account)

Full Context configure aaa radius-server-policy servers health-check test-account

Description This command sets up a test account as a probing mechanism to check the connectivity of all configured RADIUS authentication servers within the RADIUS server policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.83 test-completion-enable

test-completion-enable

Syntax [**no**] **test-completion-enable**

Context **[Tree]** (config>saa>test>trap-gen test-completion-enable)

Full Context configure saa test trap-gen test-completion-enable

Description This command enables the generation of a trap when an SAA test completes.

The **no** form of this command disables the trap generation.

Platforms All

24.84 test-duration

test-duration

Syntax **test-duration** *seconds*
no test-duration

Context **[Tree]** (config>oam-pm>session>ethernet>slm test-duration)
[Tree] (config>oam-pm>session>ethernet>dmm test-duration)
[Tree] (config>oam-pm>session>ethernet>lmm test-duration)

Full Context configure oam-pm session ethernet dmm test-duration
configure oam-pm session ethernet lmm test-duration
configure oam-pm session ethernet slm test-duration

Description This optional command defines the length of time the test runs before stopping automatically. This command is only a valid option when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration and allow the test to run until manually stopped.

Parameters *seconds* — Specifies the number of seconds the test runs from its start time.

Values 1 to 86400

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

test-duration

Syntax **test-duration** *seconds*
no test-duration

Context **[Tree]** (config>oam-pm>session>ip>twamp-light test-duration)

Full Context configure oam-pm session ip twamp-light test-duration

Description This command defines the length of time the test runs before stopping automatically. This optional command is only valid when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration value and allows the TWAMP Light test to execute until it is stopped manually.

Parameters *seconds* — Specifies the length of time, in seconds, that the TWAMP Light test runs.

Values 1 to 86400

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-duration

Syntax **test-duration** *seconds*
no test-duration

Context **[Tree]** (config>oam-pm>session>mpls>dm test-duration)

Full Context configure oam-pm session mpls dm test-duration

Description This command defines the length of time the test runs before stopping automatically. This command is only valid when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**.

On-demand tests do not start until the **oam-pm>session>start** command has been issued and they stops when scheduled or the **oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration and allow the test to run until manually stopped.

Parameters *seconds* — Specifies the number of seconds the test runs from its start time.

Values 1 to 8640

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.85 test-fail-enable

test-fail-enable

Syntax [**no**] **test-fail-enable**

Context **[Tree]** (config>saa>test>trap-gen test-fail-enable)

Full Context configure saa test trap-gen test-fail-enable

Description This command enables the generation of a trap when a test fails. In the case of a ping test, the test is considered failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** parameter.

The **no** form of this command disables the trap generation.

Platforms All

24.86 test-fail-threshold

test-fail-threshold

Syntax **test-fail-threshold** *threshold*
no test-fail-threshold

Context **[Tree]** (config>saa>test>trap-gen test-fail-threshold)

Full Context configure saa test trap-gen test-fail-threshold

Description This command configures the threshold for trap generation on test failure.

This command has no effect when **test-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

Default test-fail-threshold 1

Parameters *threshold* — Specifies the number of consecutive test failures required to generate a trap.

Values 0 to 15

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.87 test-link

test-link

Syntax **test-link** *port-id*
no test-link

Context **[Tree]** (config>port>ml-bundle>ima>test-pattern-procedure test-link)

Full Context configure port multilink-bundle ima test-pattern-procedure test-link

Description This command specifies IMA members on which an IMA test pattern procedure is to be performed.

The **no** form of this command deletes the link from test-pattern procedure. The test-pattern procedure must be shutdown first.

Default no test-link

Parameters *port-id* — Specifies the port ID that verifies link connectivity within an IMA group.

Values

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b
	aps-id	aps-*group-id*[.*channel*]	
		aps	keyword
		group-id	1 to 128

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.88 test-oam

test-oam

Syntax **test-oam**

Context **[Tree]** (config test-oam)

Full Context configure test-oam

Description Commands in this context configure Operations, Administration, and Maintenance (OAM) test parameters.

Platforms All

24.89 test-pattern

test-pattern

Syntax **test-pattern** *pattern*
no test-pattern

Context **[Tree]** (config>port>ml-bundle>ima>test-pattern-procedure test-pattern)

Full Context configure port multilink-bundle ima test-pattern-procedure test-pattern

Description This command specifies the transmit test pattern in an IMA group loopback operation. This value can only be changed when the **test-pattern-procedure** command is shut down.

The **no** form of this command restores the test-pattern to the default.

Default test-pattern 0

Parameters *pattern* — Specifies an integer taking the following values:

Values 0 to 255

Platforms 7450 ESS, 7750 SR-7/12/12e

test-pattern

Syntax **test-pattern** {**all-zeros** | **all-ones**} [**crc-enable**]
no test-pattern

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>eth-tunnel>path>eth-cfm>mep>eth-test-enable test-pattern)

Full Context configure eth-tunnel path eth-cfm mep eth-test-enable test-pattern

Description This command configures the test pattern for eth-test frames.

The **no** form of this command removes the values from the configuration.

Parameters **all-zeros** — Specifies to use all zeros in the test pattern.

all-ones — Specifies to use all ones in the test pattern.

crc-enable — Generates a CRC checksum.

Default all-zeros

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Syntax **test-pattern** {**all-zeros** | **all-ones**} [**crc-enable**]
no test-pattern

Context [Tree] (config>lag>eth-cfm>mep>eth-test test-pattern)
[Tree] (config>port>ethernet>eth-cfm>mep>eth-test test-pattern)
[Tree] (config>router>if>eth-cfm>mep>eth-test test-pattern)

Full Context configure lag eth-cfm mep eth-test-enable test-pattern
configure port ethernet eth-cfm mep eth-test-enable test-pattern
configure router interface eth-cfm mep eth-test-enable test-pattern

Description This command specifies the test pattern of the ETH-TEST frames. This does not have to be configured the same on the sender and the receiver.

The **no** form of this command reverts to the default values.

Default test-pattern all-zeros

Parameters **all-zeros** — Specifies to use all zeros in the test pattern.

all-ones — Specifies to use all ones in the test pattern.

crc-enable — Generates a CRC checksum.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Syntax **test-pattern** {**all-zeros** | **all-ones**} [**crc-enable**]
no test-pattern

Context [Tree] (config>service>epipe>spoke-sdp>eth-cfm>mep>eth-test-enable test-pattern)

© 2022 Nokia.

24.90 test-pattern-procedure

test-pattern-procedure

Syntax **test-pattern-procedure**

Context **[Tree]** (config>port>ml-bundle>ima test-pattern-procedure)

Full Context configure port multilink-bundle ima test-pattern-procedure

Description Commands in this context configure IMA test pattern procedures. Note that this command and sub-commands are not saved in the router configuration between reboots.

Platforms 7450 ESS, 7750 SR-7/12/12e

24.91 tethering-detection

tethering-detection

Syntax **tethering-detection**

Context **[Tree]** (config>app-assure>group tethering-detection)

Full Context configure application-assurance group tethering-detection

Description Commands in this context configure tethering detection for the group. The **shutdown** and **no shutdown** commands are used in this context to enable or disable tethering detection.

Default tethering-detection shutdown

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.92 tethering-summary

tethering-summary

Syntax [**no**] **tethering-summary**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>group>statistics>aa-partition tethering-summary)

Full Context configure application-assurance group statistics aa-partition tethering-summary

Description This command enables tethering summary statistics collection within an aa-partition.

The **no** form of this command disables tethering summary statistics collection.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.93 third-party

third-party

Syntax [**no**] **third-party**

Context [Tree] (config>service>nat>pcp-server-policy>option third-party)

Full Context configure service nat pcp-server-policy option third-party

Description This command enables/disables support for the **third-party** option.

Default no third-party

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vprn bgp group third-party-nexthop
configure service vprn bgp third-party-nexthop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

Default no third-party-nexthop

Platforms All

24.95 three-way-hello

three-way-hello

Syntax [**no**] **three-way-hello**

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive>pim three-way-hello)

Full Context configure service vprn mvpn provider-tunnel inclusive pim three-way-hello

Description This command enables PIM three-way hello on the inclusive provider tunnel.

The **no** form of this command disables the PIM three-way hello.

Default disabled

Platforms All

three-way-hello

Syntax [**no**] **three-way-hello**

Context **[Tree]** (config>service>vprn>pim>if three-way-hello)

Full Context configure service vprn pim interface three-way-hello

Description This command configures the compatibility mode for enabling the three way hello.

Platforms All

three-way-hello

Syntax **three-way-hello** [**compatibility-mode**]
no three-way-hello

Context **[Tree]** (config>router>pim>interface three-way-hello)

Full Context configure router pim interface three-way-hello

Description This command sets the compatibility mode to enable three-way hello. By default, the value is disabled on all interface which specifies that the standard two-way hello is supported. When enabled, the three-way hello is supported.

The **no** form of this command disables three-way hello.

Default no three-way-hello

24.96 threshold

threshold

Syntax **threshold** *xpl-errors*

Context **[Tree]** (config>card>mda>egress-xpl threshold)

Full Context configure card mda egress-xpl threshold

Description This command configures the Egress XPL Error Threshold value used by the **fail-on-error** feature.

Default threshold 1000

Parameters *xpl-errors* — Specifies an upper limit on the frequency of Egress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window** *minutes* command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

Values 1 to 1000000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold

Syntax **threshold** *xpl-errors*

Context **[Tree]** (config>card>mda>ingress-xpl threshold)

Full Context configure card mda ingress-xpl threshold

Description This command configures the Ingress XPL Error Threshold value used by the **fail-on-error** feature.

Default threshold 1000

Parameters *xpl-errors* — Specifies an upper limit on the frequency of Ingress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window** *minutes* command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

Values 1 to 1000000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold

Syntax **threshold** *num-members*
no threshold

Context **[Tree]** (config>interface-group-handler threshold)

Full Context configure interface-group-handler threshold

Description This command identifies the minimum number of active links that must be present for the interface group handler to be active. A threshold of 1 effectively disables the effect of the interface group handler.

The **no** form of this command resets the threshold to 1.

Note that for APS configurations, if the ber-sd or ber-sf threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

Default threshold 1

Parameters *num-members* — Specifies the minimum number of active links that must be present for the interface group handler to be active.

Values 1 to 8

Platforms All

threshold

Syntax **threshold** {**ber-sd** | **ber-sf**} **rate** *threshold-rate*
no threshold {**ber-sd** | **ber-sf**}

Context **[Tree]** (config>port>sonet-sdh threshold)

Full Context configure port sonet-sdh threshold

Description This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

For APS configurations, if the **ber-sd** or **ber-sf** threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default threshold ber-sd rate 6 — Signal degrade BER threshold of 10-6.

threshold ber-sf rate 3 — Signal failure BER threshold of 10-3.

Parameters **ber-sd** — Specifies the BER that specifies signal degradation.

ber-sf — Specifies the BER that specifies signal failure.

threshold-rate — The BER negative exponent (n in 10-n), expressed as a decimal integer.

Values 3 to 9 (10-3 to 10-9) for ber-sd, 3 to 6 for ber-sf

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold

Syntax **threshold** {**ber-sd** | **ber-sf**} **rate** {**1** | **5** | **10** | **50** | **100**}
no threshold {**ber-sd** | **ber-sf**}

Context **[Tree]** (config>port>tdm>ds1 threshold)
[Tree] (config>port>tdm>e1 threshold)

Full Context configure port tdm ds1 threshold
configure port tdm e1 threshold

Description This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

The **no** form of this command reverts to the default value.

Default threshold ber-sd rate 5 threshold ber-sf rate 50

Parameters **ber-sd** — Specifies the BER that specifies signal degradation.

ber-sf — Specifies the BER that specifies signal failure.

rate — Specifies the number of errors, in millions.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

threshold

Syntax **threshold** *threshold*
no threshold

Context **[Tree]** (config>router>segment-routing>maintenance-policy threshold)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router segment-routing maintenance-policy threshold

Description This command configures the minimum number of S-BFD sessions that must be up in order to consider the SR policy candidate path to which the maintenance template is bound to be up. If it is below this number, then the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.

The **no** form of this command reverts to the default.

Default threshold 1

Parameters *threshold* — Specifies the minimum number of S-BFD sessions that must be up.

Values 1 to 32

Platforms All

threshold

Syntax **threshold**

Context **[Tree]** (config>test-oam>link-meas>template>asw threshold)
[Tree] (config>test-oam>link-meas>template>sw threshold)

Full Context configure test-oam link-measurement measurement-template aggregate-sample-window threshold
configure test-oam link-measurement measurement-template sample-window threshold

Description Commands in this context configure the applicable thresholds for the sample windows.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.99 throttle-rate

throttle-rate

Syntax **throttle-rate** *events* [**interval** *seconds*]
no throttle-rate

Context **[Tree]** (config>log throttle-rate)

Full Context configure log throttle-rate

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default throttle-rate 2000 interval 1

Parameters *events* — Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds — Specifies the number of seconds that an event throttling interval lasts.

Values 1 to 1200

Default 1

Platforms All

24.100 throughput-alarm

throughput-alarm

Syntax **throughput-alarm high-threshold** *Mbps* **low-threshold** *Mbps*
no throughput-alarm

Context **[Tree]** (config>li>x-interfaces>x3>alarms throughput-alarm)

Full Context configure li x-interfaces x3 alarms throughput-alarm

Description This command configures the thresholds for raising the throughput alarm. The throughput is shared with other ISA BB applications. The low threshold value must be configured with a smaller value than the high threshold.

The **no** form of this command reverts to the default values.

Parameters **high-threshold** *Mbps* — Specifies the high threshold value.

Values 1 to 4294967295

low-threshold *Mbps* — Specifies the low threshold value.

Values 1 to 4294967295

Full Context configure router ospf loopfree-alternates ti-lfa
configure router ospf3 loopfree-alternates ti-lfa

Description This command enables the use of the Topology-Independent LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

The **no** form of this command disables the use of the Topology-Independent LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no ti-lfa

Parameters **max-sr-frr-labels [***value***]]** — Specifies the maximum number of labels that the TI-LFA backup next hop can use. The TI-LFA algorithm uses this value to limit the search for the Q node from the P node on the post-convergence path.

Values 0 to 3

Default 2

Platforms All

24.102 tier

tier

Syntax **tier** {**1** | **2**}

Context **[Tree]** (config>qos>policer-control-policy tier)

Full Context configure qos policer-control-policy tier

Description This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

tier

Syntax [**no**] **tier** *tier*

Context **[Tree]** (config>qos>scheduler-policy tier)

Full Context configure qos scheduler-policy tier

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters *tier* — This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

Values 1 to 3

Platforms All

24.103 time

time

Syntax **time**

Context **[Tree]** (config>system time)

Full Context configure system time

Description Commands in this context configure the system time zone and time synchronization parameters.

Platforms All

24.104 time-average-factor

time-average-factor

Syntax **time-average-factor** *taf-value* [**dec-only**]
no time-average-factor

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>qos>adv-config-policy>child-control>offered-measurement time-average-factor)

Full Context configure qos adv-config-policy child-control offered-measurement time-average-factor

Description This command is used to weight the new offered rate with a portion of the previous offered rate. It would be expected that this command would mainly be used with the dec-only option enabled.

The adjustment to the offered rate is performed using the following formula when taf-value is not set to '0':

Adjusted_Rate = ((Prev_Offered_Rate x (taf-value – 1)) + New_Offered_Rate) / taf-value

If the dec-only option is specified, the adjustment is only applied when New_Offered_Rate is less than the Prev_Offered_Rate. When taf-value is set to '0', the adjustment is never applied.

The **no** form of this command is used to remove the time average factor adjustments to new offered rate measurements.

Parameters *taf-value* — The taf-value is specified as a whole number between 0 and 64. The value '0' has special meaning in that it disables the time average factor adjustment and has the same effect as no time-average-factor.

Default 0

Values 0 to 64

dec-only — This keyword is an optional parameter. When enabled, the time average factor adjustment is only applied if the new offered rate is decreasing compared to the previous offered rate. If the new offered rate is greater than the previous offered rate, the adjustment is not applied.

Platforms All

time-average-factor

Syntax **time-average-factor** *value*
no time-average-factor

Context [Tree] (config>qos>slope-policy time-average-factor)

Full Context configure qos slope-policy time-average-factor

Description This command sets a weighting factor to calculate the new shared buffer average utilization after assigning buffers for a packet entering a queue. To derive the new shared buffer average utilization, the buffer pool takes a portion of the previous shared buffer average and adds it to the inverse portion of the instantaneous shared buffer utilization.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **time-average-factor** command sets the weighting factor between the old shared buffer average utilization and the current shared buffer instantaneous utilization when calculating the new shared buffer average utilization

The TAF value applies to all high- and low-priority RED slopes for ingress and egress access buffer pools controlled by the slope policy.

The **no** form of this command restores the default setting.

Default time-average-factor 7

Parameters *value* — Represents the Time Average Factor (TAF), expressed as a decimal integer. The value specified for TAF affects the speed at which the shared buffer average utilization tracks the instantaneous shared buffer utilization. A low value weights the new shared buffer average utilization calculation more to the shared buffer instantaneous utilization; zero using it exclusively. A high value weights the new shared buffer average utilization calculation more to the previous shared buffer average utilization value.

Values 0 to 15

Platforms All

24.105 time-display

time-display

Syntax **time-display** {**local** | **utc**}

Context **[Tree]** (environment time-display)

Full Context environment time-display

Description This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs, traps and all other places where a time stamp is displayed.

In general all time stamps are shown in the time selected. This includes log entries destined for console/session, memory, or SNMP logs. Log files on compact flash are maintained and displayed in UTC format.

Default time-display local

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **local** — Indicates that local time should be used.

utc — Indicates that UTC time should be used.

Platforms All

time-display

Syntax **time-display** {**local** | **utc**}

Context **[Tree]** (config>system>management-interface>cli>md-cli>environment time-display)

Full Context configure system management-interface cli md-cli environment time-display

Description This command configures whether the time is displayed in coordinated Universal Time (UTC) or local time (as configured in **config**>**system**>**time**).

Default time-display local

Parameters **local** — Specifies that the local time zone is used.

utc — Specifies that UTC is used.

Platforms All

24.106 time-exceeded

time-exceeded

Syntax **time-exceeded** [*number seconds*]
no time-exceeded

Context **[Tree]** (config>service>ies>if>ipv6>icmp6 time-exceeded)

Full Context configure service ies interface ipv6 icmp6 time-exceeded

Description This command specifies whether time-exceeded ICMP messages should be sent. When enabled, ICMPv6 time-exceeded messages are generated by this interface.

When disabled, ICMPv6 time-exceeded messages are not sent.

The **no** form of this command reverts to the default.

Default time-exceeded 100 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *number* — Specifies the number of time-exceeded ICMP messages are to be issued in the time frame specified by the *seconds* parameter.

Values 10 to 2000

seconds — Specifies the time frame, in seconds, that is used to limit the number of time-exceeded ICMP message to be issued.

Values 1 to 60

Platforms All

time-exceeded

Syntax **time-exceeded** [*number seconds*]
no time-exceeded

time-limit

Syntax **time-limit** *limit-value*

Context **[Tree]** (config>call-trace>trace-profile time-limit)

Full Context configure call-trace trace-profile time-limit

Description This command specifies how long a trace may run before it is stopped.

Default time-limit 86400

Parameters *limit-value* — Specifies the maximum duration of a single call trace job in seconds. After reaching the limit the call trace job for a given host is automatically terminated.

Values 1 to 604800

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.109 time-range

time-range

Syntax **time-range daily start** *start-time* **end** *end-time* [**on** *day* [*day*]]
time-range weekly start *start-time* **end** *end-time*
no time-range

Context **[Tree]** (config>app-assure>group>tod-override time-range)

Full Context configure application-assurance group policer tod-override time-range

Description This command configures up to seven time-ranges applicable to a particular override-id. The time-range can be configured as daily or weekly policies.

When using a daily override the operator can select which days during the week from Sunday to Saturday it is applicable along with the start/end hour/min time range repeated over these days.

When using a weekly override the operator can select between which days in the week the policy start up to the hours/min for both start day and end day.

Default no time-range

Parameters **daily** — Schedule the override as a daily occurrence.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

weekly — Schedule the override as a weekly occurrence.

Values

start-time	daily	<hh>:<mm>
	weekly	<day>,<hh>:<mm>
		<hh> : 0..23
		<mm> : 0 | 15 | 30 | 45
end-time	daily	<hh>:<mm>
	weekly	<day>,<hh>:<mm>
		<hh> 0..23
		<mm> 0 | 15 | 30 | 45
day	sunday | monday | tuesday | wednesday | thursday | friday | saturday

Syntax **timeout** *seconds*

Context **[Tree]** (config>subscr-mgmt>pfcp-association>tx timeout)

Full Context configure subscriber-mgmt pfcp-association tx timeout

Description This command configures the timeout period, after which, a message is considered unanswered. This timeout value is also known as T1.

Default timeout 5

Parameters *seconds* — Specifies the timeout value, in seconds.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This value must be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

Values 1 to 30

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>service>vprn>aaa>remote-servers>radius timeout)

Full Context configure service vprn aaa remote-servers radius timeout

Description This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *seconds* — Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>service>vprn>aaa>remote-servers>tacplus timeout)

Full Context configure service vprn aaa remote-servers tacplus timeout

Description This command configures the number of seconds the router waits for a response from a TACACS+ server.

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *seconds* — Specifies the number of seconds the router waits for a response from a TACACS+ server, expressed as a decimal integer.

Values 1 to 90

Use subject to Terms available at: www.nokia.com

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>router>mpls>lsp-self-ping timeout)

Full Context configure router mpls lsp-self-ping timeout

Description This command configures a timeout value for LSP Self Ping. The LSP Self Ping timer is started when the RESV message is received for an LSP. The system then periodically sends LSP Self Ping packets until the timer expiry or the receipt of the first LSP Self Ping reply, whichever comes first. If the timeout expires before an LSP Self Ping packet is received, then the configured **timeout-action** is performed.

The **no** form of this command reverts to the default value.

Default timeout 300

Parameters *seconds* — Specifies the value, in seconds, of the fast retry timer for a secondary path.

Values 3 to 3600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

timeout

Syntax **timeout** *seconds*

Context **[Tree]** (config>system>file-trans-prof timeout)

Full Context configure system file-transmission-profile timeout

Description This command specifies timeout value in seconds for transport protocol. The timeout is the maximum waiting time to receive any data from the server (e.g., FTP or HTTP server).

Default timeout 60

Parameters *seconds* — Specifies the connection timeout (in seconds) for the file transmission.

Values 1 to 3600

Platforms All

timeout

Syntax **timeout** [**sec** *seconds*] [**min** *minutes*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no timeout

Context **[Tree]** (config>aaa>isa-radius-plcy>servers timeout)

Full Context configure aaa isa-radius-policy servers timeout

Description This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of the command reverts to the default value.

Default timeout sec 5

Parameters *seconds* — Specifies the wait for a response from a RADIUS server, in seconds.

minutes — Specifies the wait for a response from a RADIUS server, in minutes.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

timeout

Syntax **timeout** *timeout*
no timeout

Context **[Tree]** (config>test-oam>ldp-treetrace>path-discovery timeout)

Full Context configure test-oam ldp-treetrace path-discovery timeout

Description This command configures the time the node waits for the response to an LSP Trace message discovering the path of an LDP FEC before it declares failure. After consecutive failures equal to the **retry-count** parameter, the node gives up.

The **no** form of this command resets the timeout to its default value.

Default timeout 30

Parameters *timeout* — Specifies the *timeout* parameter, in seconds, within a range of 1 to 60, expressed as a decimal integer.

Values 1 to 60

Platforms All

timeout

Syntax **timeout** *timeout*
no timeout

Context **[Tree]** (config>test-oam>ldp-treetrace>path-probing timeout)

Full Context configure test-oam ldp-treetrace path-probing timeout

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the time the node waits for the response to an LSP Ping message probing the path of an LDP FEC before it declares failure. After consecutive failures equal to the **retry-count** parameter, the node gives up.

The **no** form of this command resets the time out to its default value.

Default timeout 1

Parameters *timeout* — Specifies the timeout parameter, in minutes, expressed as a decimal integer.

Values 1 to 3

Platforms All

timeout

Syntax **timeout** *timeout*
no timeout

Context **[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy timeout)

Full Context configure saa test type-multi-line lsp-ping sr-policy timeout

Description This command configures the number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of the request probes.

The **no** form of this command reverts to the default value.

Default timeout 5

Parameters *timeout* — Specifies the timeout value in seconds.

Values 1 to 10

Default 5

Platforms All

timeout

Syntax **timeout** *timeout*
no timeout

Context **[Tree]** (config>saa>test>type-multi-line>lsp-trace>sr-policy timeout)

Full Context configure saa test type-multi-line lsp-trace sr-policy timeout

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *timeout* — Specifies the timeout value in seconds.

Values 1 to 60

Default 3

Platforms All

timeout

Syntax **timeout** [*seconds*]
no timeout

Context **[Tree]** (config>filter>redirect-policy>dest>ping-test timeout)

Full Context configure filter redirect-policy destination ping-test timeout

Description Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default timeout 1

Parameters *seconds* — Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>vrrp>vrrp-policy-id>priority-event>host-unreachable timeout)

Full Context configure vrrp vrrp-policy-id priority-event host-unreachable timeout

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default timeout 1

Parameters *seconds* — The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

timeout

Syntax **timeout** *timeout*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no timeout

Context **[Tree]** (config>service>sdp>keep-alive timeout)

Full Context configure service sdp keep-alive timeout

Description This command configures the time interval that the SDP waits before tearing down the session.

Default timeout 5

Parameters **timeout** — Specifies the timeout time, in seconds.

Values 1 to 10

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>system>security>radius timeout)

Full Context configure system security radius timeout

Description This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *seconds* — Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>system>security>tacplus timeout)

Full Context configure system security tacplus timeout

Description This command configures the number of seconds the router waits for a response from a TACACS+ server.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *seconds* — The number of seconds the router waits for a response from a TACACS+ server, expressed as a decimal integer.

Values 1 to 90

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>system>security>ldap timeout)

Full Context configure system security ldap timeout

Description The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default timeout 3

Parameters *seconds* — The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>system>security>dot1x>radius-plcy timeout)

Full Context configure system security dot1x radius-plcy timeout

Description This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default timeout 3

Parameters *seconds* — Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms All

timeout

Syntax **timeout** *seconds*
no timeout

Context **[Tree]** (config>test-oam>icmp>ping-template timeout)

Full Context configure test-oam icmp ping-template timeout

Description This command configures the time the function waits before declaring an ICMP echo request packet is lost. This is the timer used to time out the interval transmitted packets. The timeout can be equal to or lower than the interval but not higher.

The **no** form of this command reinstates the default value for timeout.

Default timeout 5

Parameters *seconds* — Specifies the time, in seconds, before declaring an ICMP echo request being lost.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.112 timeout-action

timeout-action

Syntax **timeout-action** *action*
no timeout-action

Context **[Tree]** (config>router>l2tp>tunnel-selection-blacklist timeout-action)
[Tree] (config>service>vprn>l2tp>tunnel-selection-blacklist timeout-action)

Full Context configure router l2tp tunnel-selection-blacklist timeout-action
configure service vprn l2tp tunnel-selection-blacklist timeout-action

Description This command defines an action that is executed on the entity (peer/tunnel) in the denylist once the entity becomes eligible for selection again.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Default timeout-action remove-from-blacklist

Parameters *action* — Specifies the Action to be taken when a tunnel or peer has been in the denylist for the max-period of time.

Values **remove-from-blacklist** — The peer or tunnel in the denylist is removed completely from the denylist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the denylist. The first such session will try to setup the tunnel, while the other is buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it is placed in the denylist again. Consequently, all new sessions are re-negotiated over an alternate tunnel.

try-one-session — Once the max-time expired, the peer or tunnel in the denylist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the denylist is still unavailable.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout-action

Syntax **timeout-action** {**retry** | **switch**}
no timeout-action

Context **[Tree]** (config>router>mpls>lsp-self-ping timeout-action)

Full Context configure router mpls lsp-self-ping timeout-action

Description This command configures an action that the router takes when the timeout LSP self ping timeout timer expires. The lsp-self-ping timer is started when the RESV is received for an LSP. If the retry is configured and the timeout expires before an LSP self ping packet is received, then the system tears down the candidate path and goes back to CSPF for a new path. If the switch is configured and the timeout expires before an LSP self ping packet is received, then the system switches to the candidate path.

The **no** form of this command reverts to the default value.

Default timeout-action retry

Parameters **retry** — Specifies to retry the candidate path when the timeout expires.

switch — Specifies to switch to the candidate path when the timeout expires.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Description Commands in this context configure SPB timers.

Platforms All

timers

Syntax [**no**] **timers**

Context **[Tree]** (config>service>vprn>isis timers)

Full Context configure service vprn isis timers

Description This command configures the IS-IS timer values.

Default n/a

Platforms All

timers

Syntax **timers**

Context **[Tree]** (config>service>vprn>ospf timers)
[Tree] (config>service>vprn>ospf3 timers)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn ospf timers
configure service vprn ospf3 timers

Description Commands in this context configure OSPF timers. Timers control the delay between receipt of a LSA requiring a Dijkstra (Shortest Path First (SPF)) calculation and the minimum time between successive SPF calculations.

Changing the timers affect CPU utilization and network reconvergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase reconvergence time.

Platforms All

timers

Syntax **timers** *update timeout flush*
no timers

Context **[Tree]** (config>service>vprn>rip timers)
[Tree] (config>service>vprn>rip>group timers)
[Tree] (config>service>vprn>rip>group>neighbor timers)
[Tree] (config>service>vprn>ripng timers)
[Tree] (config>service>vprn>ripng>group timers)
[Tree] (config>service>vprn>ripng>group>neighbor timers)

Full Context configure service vprn rip group neighbor timers
configure service vprn rip group timers
configure service vprn rip timers
configure service vprn ripng group neighbor timers
configure service vprn ripng group timers
configure service vprn ripng timers

Description This command configures the values for the update, timeout, and flush timers:

- **update timer**
  Determines how often RIP updates are sent.
- **timeout timer**
  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.
- **flush timer**
  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default no timers

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *update* — The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout — The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush — The RIP flush timer value in seconds.

Values 1 to 1200

Default 120

Platforms All

Syntax **timers** [**neighbor** *ip-address* | **group** *name*]
no timers

Context **[Tree]** (debug>router>bgp timers)

Full Context debug router bgp timers

Description This command logs all BGP timer events to the debug log.

The **no** form of this command disables debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

configure router ripng timers

Description This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. After the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default timers 30 180 120

Parameters *update* — Specifies the RIP update timer value in seconds expressed as a decimal integer.

Values 1 to 600

timeout — Specifies the RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 to 1200

flush — Specifies the RIP flush timer value in seconds expressed as a decimal integer.

Values 1 to 1200

24.115 timeslots

timeslots

Syntax **timeslots** *timeslots*
no timeslots

Context **[Tree]** (config>port>tdm>ds1>channel-group timeslots)
[Tree] (config>port>tdm>e1>channel-group timeslots)

Full Context configure port tdm ds1 channel-group timeslots
configure port tdm e1 channel-group timeslots

Description This command defines the list of DS-0 timeslots to be used in the DS-1 or E-1 channel-group. The timeslots are defaulted as defined below when encap-type is set **to/from atm**. ATM channel groups do not allow timeslots to change.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes DS-0 timeslots from a channel group.

Parameters *timeslots* — Specifies the timeslot(s) to be associated with the channel group. The value can consist of a list of timeslots. Each member of the list can either be a single timeslot or a range of timeslots.

Values 1 to 24 for DS-1 interfaces (the full range is auto-configured for ATM channel groups and cannot be changed) 2 to 32 for E-1 interfaces (the 2 to 16,18 to 32 ranges are auto-configured for ATM channel groups and cannot be changed)

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

24.116 timestamp

timestamp

Syntax [**no**] **timestamp**

Context **[Tree]** (config>system>management-interface>cli>md-cli>environment>prompt timestamp)

Full Context configure system management-interface cli md-cli environment prompt timestamp

Description This command displays the timestamp before the first prompt line.

The **no** form of this command suppresses the timestamp before the first prompt line.

Default timestamp

Platforms All

24.117 timestamp-format

timestamp-format

Syntax **timestamp-format** *timestamp-format*

Context **[Tree]** (config>test-oam>link-meas>template>twl timestamp-format)

Full Context configure test-oam link-measurement measurement-template twamp-light timestamp-format

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the format of the timestamp used in the TWAMP Light PDU.This configuration places the requested timestamp format in the packet using the appropriate epoch. This is unrelated to any time distribution protocol being used to synchronize time between clocks.

Default timestamp-format ntp

Parameters *parameter* — Specifies the timestamp format to be used in the TWAMP Light PDU.

Values ntp, ptp

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.118 timing

timing

Syntax **timing frames-per-delta-t** *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*
no timing

Context **[Tree]** (config>oam-pm>session>ethernet>lmm>availability timing)

Full Context configure oam-pm session ethernet lmm availability timing

Description This command defines various availability parameters for LMM availability testing. This command does not define the probe interval. Validation occurs when the LMM test is activated using the **no shutdown** command. The maximum size of the availability window cannot exceed 100 seconds (100 000 milliseconds). LMM test activation fails if the availability window exceeds the maximum value.

The **no** form of this command restores the default values for all timing parameters, and uses those values to compute availability and set the loss frequency.

Parameters *frames* — Specifies the number of SLM frames that define the size of the small measurement window. Each delta-t is marked as a high-loss interval or non-high-loss interval based on the **flr-threshold**. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas — Specifies the number of consecutive delta-t measurement intervals that make up the sliding window over which availability and unavailability determined. Transitions from one state to another occurs when the **consec-delta-t** are in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

threshold — Specifies the number of consecutive unavailable delta-t intervals that, when reached or exceeded, increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold of consecutive unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is incremented during times of availability.

Values 1 to 9

Default 5

Platforms All

timing

Syntax **timing frames-per-delta-t** *frames* **consec-delta-t** *deltas* **interval** *milliseconds* **chli-threshold** *threshold*
no timing

Context **[Tree]** (config>oam-pm>session>ethernet>slm timing)

Full Context configure oam-pm session ethernet slm timing

Description This command defines various availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and use those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or operator configured.

Parameters *frames* — Specifies the of SLM frames that define the size of the delta-t (small measurement window). Each delta-t is marked as available or unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval.

Values 1 to 50

Default 10

deltas — Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the consec-delta-t is in a new state.

Values 2 to 10

Default 10

milliseconds — Specifies the number of milliseconds between the transmission of the SLM frames. By design, the default value for the SLM interval is different than the default interval for DMM.

Values 100, 1000

Default 100

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

threshold — Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

Values 1 to 9

Default 5

Platforms All

timing

Syntax **timing frames-per-delta-t** *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*
no timing

Context **[Tree]** (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context configure oam-pm session ip twamp-light loss timing

Description This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters *frames* — Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas — Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

24.119 tls

tls

Syntax **tls**

Context **[Tree]** (config>system>security tls)

Full Context configure system security tls

Description This command configures TLS parameters.

Platforms All

24.120 tls-client-profile

tls-client-profile

Syntax **tls-client-profile** *profile-name*
no tls-client-profile

Context **[Tree]** (config>open-flow>of-switch>of-controller tls-client-profile)

Full Context configure open-flow of-switch of-controller tls-client-profile

Description This command configures the use of Transport Layer Security (TLS) on the control channel to a given OpenFlow controller for this OpenFlow switch.

The **no** form of this command deletes removed TLS from the control channel.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *profile-name* — Specifies the use of TLS for the control channel. A named TLS profile must also be specified, referring to a TLS profile configured under **config**>**system**>**security**>**tls**.

Platforms All

tls-client-profile

Syntax **tls-client-profile** *name*
no tls-client-profile

Context **[Tree]** (config>system>grpc-tunnel>destination-group tls-client-profile)
[Tree] (config>system>telemetry>destination-group tls-client-profile)

Full Context configure system telemetry destination-group tls-client-profile
configure system telemetry destination-group tls-client-profile

Description This command configures a TLS client profile to a destination group.

This command is mutually exclusive with the **allow-unsecured-connection** command.

The **no** form of this command removes the TLS client profile.

Default no tls-client-profile

Parameters *name* — Specifies the TLS client profile name, up to 32 characters.

Platforms All

tls-client-profile

Syntax **tls-client-profile** *tls-client-profile*
no tls-client-profile

Context **[Tree]** (config>log>syslog tls-client-profile)
[Tree] (config>service>vprn>log>syslog tls-client-profile)

Full Context configure log syslog tls-client-profile
configure service vprn log syslog tls-client-profile

Description This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *tls-client-profile* — Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

Platforms All

tls-client-profile

Syntax **tls-client-profile** *profile-name*
no tls-client-profile

Context **[Tree]** (config>router>pcep>pcc>peer tls-client-profile)

Full Context configure router pcep pcc peer tls-client-profile

Description This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

Default no tls-client-profile

Parameters *profile-name* — Specifies the TLS client profile name, up to 32 characters.

Platforms All

24.121 tls-extension

tls-extension

Syntax **tls-extension**

Context **[Tree]** (config>app-assure>group>http-enrich tls-extension)

Full Context configure application-assurance group http-enrich tls-extension

Description Commands in this context configure the TLS extension field name.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.122 tls-profile

tls-profile

Syntax **tls-profile** *tls-profile-name*
no tls-profile

Context **[Tree]** (config>system>security>ldap>server tls-profile)

Full Context configure system security ldap server tls-profile

Description This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

Parameters *tls-profile-name* — Specifies the TLD profile for encryption.

Platforms All

24.123 tls-re-negotiate-timer

tls-re-negotiate-timer

Syntax **tls-re-negotiate-timer** *timer-min*
no tls-re-negotiate-timer

Context **[Tree]** (config>system>security>tls>server-tls-profile tls-re-negotiate-timer)

Full Context configure system security tls server-tls-profile tls-re-negotiate-timer

Description This command configures the timed interval after which the server is triggered to send a Hello request message to all clients and force a renegotiation of the symmetric encryption key. When an interval of 0 is configured, the server will never send a hello request message.

Default tls-re-negotiate-timer 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *timer-min* — Specifies the interval, in minutes, after which the server is triggered to send a Hello request message.

Values 0 to 65000

Platforms All

24.124 tls-server-profile

tls-server-profile

Syntax **tls-server-profile** *name*
no tls-server-profile

Context **[Tree]** (config>system>grpc tls-server-profile)

Full Context configure system grpc tls-server-profile

Description This command adds a configured TLS server profile to the gRPC session. The TLS server is used for encryption of the gRPC session. gRPC will not transmit any PDUs if there is a TLS server profile assigned to it and the TLS connection is down.

The **no** form of this command removes the specified TLS server profile from the gRPC session.

Parameters *name* — Specifies the name of the TLS server profile configured under the **config**>**system**>**security**>**tls** context.

Platforms All

tls-server-profile

Syntax **tls-server-profile** *name*
no tls-server-profile

Context **[Tree]** (config>router>pcep>pce tls-server-profile)

Full Context configure router pcep pce tls-server-profile

Description This command configures a TLS server profile on the PCE. When a TLS server profile is configured, the PCE accepts TLS handshakes from the PCC. Because SR OS supports a strict TLS mode only, both the PCE and the PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes the specified TLS server profile.

Default no tls-server-profile

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *name* — Specifies the name of the TLS server profile, up to 32 characters.

24.125 tls-wait-timer

tls-wait-timer

Syntax **tls-wait-timer** *tls-wait-timer*
no tls-wait-timer

Context **[Tree]** (config>router>pcep>pcc>peer tls-wait-timer)

Full Context configure router pcep pcc peer tls-wait-timer

Description This command configures the time that the PCC waits before declaring a TLS handshake failure if the handshake is not established.

The **no** form of this command reverts to the default.

Default tls-wait-timer 60

Parameters *tls-wait-timer* — Specifies the time, in seconds.

Values 60 to 255

Platforms All

24.126 to

to

Syntax **to** *ip-address*

Context **[Tree]** (config>router>gmpls>lsp to)

Full Context configure router gmpls lsp to

Description This command specifies the GMPLS loopback address of the far-end UNI-C router for a GMPLS LSP. When creating a GMPLS LSP, this command is mandatory.

Parameters *ip-address* — Specifies the system IP address of the far-end UNI-C router.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

to

Syntax **to** [*ip-address* | **node-id** [*a.b.c.d* | *1...4294967295*]]

Context **[Tree]** (config>router>mpls>lsp to)

Full Context configure router mpls lsp to

Description This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default no default

Parameters *ip-address* — Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

node-id *a.b.c.d.* | *1...4294967295* — 4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

Platforms All

to

Syntax **to** *ip-address*

Context **[Tree]** (config>router>mpls>static-lsp to)

Full Context configure router mpls static-lsp to

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

Parameters *ip-address* — Specifies the system IP address of the egress router.

Platforms All

to

Syntax **to memory** [*size*]
to netconf [*size*]
to session
to snmp [*size*]

Context **[Tree]** (config>li>log>log-id to)

Full Context configure li log log-id to

Description Commands in this context configure the destination type for the event log.

The source of the data stream must be specified in the **from** command prior to configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of a memory log, NETCONF log, or SNMP log needs to be modified, the log ID must be removed and then re-created.

Parameters *size* — The size parameter indicates the number of events that can be stored into memory.

Default 100

Values 50 to 1024

Platforms All

to

Syntax **to** *ipv4-address*
no to

Context **[Tree]** (config>oam-pm>session>mpls>lsp>rsvp-auto to)

Full Context configure oam-pm session mpls lsp rsvp-auto to

Description This command specifies an IPv4 address used (with the LSP template) to identify the LSP to be tested.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions, the **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and the **config>router>mpls> lsp-template**. The **to** address is the same address configured as the **from** address for the **config>router>policy-options>policy-statement>entry>from**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

Parameters *ipv4-address* — Specifies the IPv4 address.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to

Syntax **to file** *file-id*

Context **[Tree]** (config>log>accounting-policy to)

Full Context configure log accounting-policy to

Description This command specifies the destination for the accounting records selected for the accounting policy.

Parameters *file-id* — Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Values 1 to 99

Platforms All

to

Syntax [**no**] **to**

Context **[Tree]** (config>router>policy-options>policy-statement>entry to)

Full Context configure router policy-options policy-statement entry to

Description This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

Platforms All

to

Syntax **to cli** [*size*]
to console
to file *log-file-id*
to memory [*size*]
to netconf [*size*]
to session
to snmp [*size*]
to syslog *syslog-id*

Context **[Tree]** (config>log>log-id to)

Full Context configure log log-id to

Description This command specifies a destination for the log data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters **cli** — Specifies that events selected for the log are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools**>**perform**>**log**>**subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console — Specifies that events selected for the log are directed to the console. If the console is not connected, all the entries are dropped.

file *log-file-id* — Specifies that events selected for the log are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config**>**log**>**file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear**>**log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

Values 1 to 99, *name* (up to 64 characters max)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

memory — Specifies that events selected for the log are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf — Specifies that events selected for the log are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session — Specifies that events selected for the log are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

size — Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp — Specifies that events selected for the log are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

syslog *syslog-id* — Specifies that events selected for the log are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config**>**log**>**syslog** *syslog-id* context.

Values 1 to 10

Platforms All

24.127 to-aa-sub-counters

to-aa-sub-counters

Syntax **to-aa-sub-counters**
no to-aa-sub-counters

Context **[Tree]** (config>log>acct-policy>cr>aa to-aa-sub-counters)

Full Context configure log accounting-policy custom-record aa-specific to-aa-sub-counters

Description Commands in this context configure Application Assurance “to subscriber” counter parameters and only applies to the 7750 SR.

The **no** form of this command excludes the “to subscriber” count.

configure system security keychain direction uni receive entry tolerance

Description This command configures the amount of time that an eligible receive key should overlap with the active send key or to never expire.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the duration that an eligible receive key overlaps with the active send key.

Values 0 to 4294967294 seconds

forever — Specifies that an eligible receive key overlap with the active send key forever.

Platforms All

24.134 tos-marking-state

tos-marking-state

Syntax **tos-marking-state** {**trusted** | **untrusted**}
no tos-marking-state

Context **[Tree]** (config>service>ies>if tos-marking-state)
[Tree] (config>service>ies>sub-if>grp-if tos-marking-state)
[Tree] (config>service>vprn>interface tos-marking-state)
[Tree] (config>service>vprn>sub-if>grp-if tos-marking-state)

Full Context configure service ies interface tos-marking-state
configure service ies subscriber-interface group-interface tos-marking-state
configure service vprn interface tos-marking-state
configure service vprn subscriber-interface group-interface tos-marking-state

Description This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default tos-marking-state trusted

Parameters **trusted** — The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted — Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no tos-marking-state

Context **[Tree]** (config>service>vprn>nw-if tos-marking-state)

Full Context configure service vprn network-interface tos-marking-state

Description This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** tos-marking-state command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default tos-marking-state trusted

Parameters **trusted** — The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted — Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms All

tos-marking-state

Syntax **tos-marking-state** {**trusted** | **untrusted**}
no tos-marking-state

Context **[Tree]** (config>router>if tos-marking-state)

Full Context configure router interface tos-marking-state

Description This command is used on a network IP interface to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all IES and network IP interface as untrusted. When the ingress network IP interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing. The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

Use subject to Terms available at: www.nokia.com

The **no** form of this command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default tos-marking-state trusted

Parameters **trusted** — Specifies that the default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set

untrusted — Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms All

24.135 total

total

Syntax **total** *percent*

Context **[Tree]** (config>isa>video-group>watermark>bandwidth total)
[Tree] (config>isa>video-group>watermark>session total)

Full Context configure isa video-group watermark bandwidth total
configure isa video-group watermark session total

Description This command sets the watermark to trigger the SNMP trap if the combined FCC and RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

Default total 90

Parameters *percent* — Specifies the percentage of the system resources per ISA.

Values 1 to 99

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.136 total-capacity

total-capacity

Syntax **total-capacity** *capacity*
no total-capacity

Context **[Tree]** (config>mcast-mgmt>chassis-level>plane-capacity total-capacity)

Full Context configure mcast-management chassis-level per-mcast-plane-capacity total-capacity

Description This command configures the total multicast plane capacity supported individually by all switch fabric multicast planes.

The multicast plane capacity is determined based on the provisioned line cards and switch fabrics in the chassis.

The **no** form of this command reverts to the default.

Parameters *capacity* — Specifies the multicast plane capacity in Mb/s.

Values 2000, 4000, 5250, 8250, 15000, 19000, dynamic (Specifies that multicast plane capacity is determined based on provisioned line cards and switch fabrics in the chassis.)

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

24.137 total-flow-duration

total-flow-duration

Syntax [**no**] **total-flow-duration**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-sub-cntr total-flow-duration)

Full Context configure log accounting-policy custom-record aa-specific aa-sub-counters total-flow-duration

Description This command includes the total flow duration flow count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.138 total-flows-completed-count

total-flows-completed-count

Syntax [**no**] **total-flows-completed-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-sub-cntr total-flows-completed-count)

Full Context configure log accounting-policy custom-record aa-specific aa-sub-counters total-flows-completed-count

Description This command includes the total flows completed count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.139 tp-tunnel-id-range

tp-tunnel-id-range

Syntax **tp-tunnel-id-range** *start-id end-id*
no tp-tunnel-id-range

Context **[Tree]** (config>router>mpls>mpls-tp tp-tunnel-id-range)

Full Context configure router mpls mpls-tp tp-tunnel-id-range

Description This command configures the range of MPLS tunnel IDs reserved for MPLS-TP LSPs. The maximum difference between the start-id and end-id is 4K.

The tunnel ID referred to here is the RSVP-TE tunnel ID. This maps to the MPLS-TP Tunnel Number. There are some cases where the dynamic LSPs may have caused fragmentation to the number space such that contiguous range [*end-id* – *start-id*] is not available. In these cases, the command will fail.

There are no default values for the *start-id* and *end-id* of the tunnel id range, and they must be configured to enable MPLS-TP.

Default no tp-tunnel-id-range

Parameters *start-id* — Specifies the start ID.

Values 1 to 61440

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

end-id — Specifies the end ID.

Values 1 to 61440

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.140 trace

trace

Syntax **trace sap** *sap-id* [**mac** *ieee-address*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]
trace mac *ieee-address* [**sap** *sap-id*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]
trace circuit-id *circuit-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]
trace remote-id *remote-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]
no trace [**sap** *sap-id*] [**mac** *ieee-address*] [{**circuit-id** *circuit-id* | **remote-id** *remoteid*}]
no trace name *trace-name*

Context **[Tree]** (debug>call-trace>ipoe trace)

Full Context debug call-trace ipoe trace

Description This command enables tracing for IPoE sessions specified by the configured parameters. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

Parameters *circuit-id* — Specifies a circuit ID that is used to filter sessions to trace. The *circuit-id* and *remote-id* parameters are mutually exclusive.

ieee-address — Specifies a MAC address that is used to identify a session to trace, in the format “ab:cd:ef:01:23:45”. A wildcard character can be used to match all remaining octets; for example, the format “ab:cd:ef:*” can be used to filter by OUI.

num — Specifies the maximum number of jobs that may be started with this rule.

Values 1 to 50

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

remote-id — Specifies a remote ID that is used to filter sessions to trace. The *remote-id* and *circuit-id* parameters are mutually exclusive.

sap-id — Specifies a SAP to trace. The following formats are accepted:

- *port*/*lag*/*pw-port*:*svlan.cvlan*
- *port*/*lag*/*pw-port*:*vlan*
- *port*/*lag*/*pw-port*
- *port*/*lag*/*pw-port*:*vlan*.*
- *port*/*lag*/*pw-port*:* (also matches *.*)

trace-existing-sessions — Specifies that existing IPoE sessions is traced. If this parameter is not included, only new IPoE sessions is traced.

trace-name — Specifies the name by which the trace is referenced, up to 16 characters.

trace-profile-name — Specifies the name of the trace profile to be applied. The default parameters is used if a trace profile is not specified.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.141 trace-profile

trace-profile

Syntax **trace-profile** *profile-name* [**create**]
no trace-profile *profile-name*

Context **[Tree]** (config>call-trace trace-profile)

Full Context configure call-trace trace-profile

Description This command creates a profile that can be applied to a specific trace job.

Parameters *profile-name* — Specifies the unique name of the call trace profile.

create — Keyword used to create the trace profile instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.142 trace-string

trace-string

Syntax **trace-string** [*trace-string*]
no trace-string

Context **[Tree]** (config>port>sonet-sdh>path trace-string)

Full Context configure port sonet-sdh path trace-string

Description This command specifies that a J1-path-trace that identifies the circuit is inserted continuously at source. This can be checked against the expected value by the receiver. If no trace string is entered then a null string is used.

The **no** form of this command resets the string to its default.

This command is supported on TDM satellite.

Default The default J1 value is *Alcatel XXX YYY* where XXX is the platform number, such as “7750” or “7450”, and YYY is the platform acronym, such as “SR” or “ESS”. The value does not change when the encap-type changes. The J1 string contains all zeros for a non-provisioned path.

Parameters *trace-string* — Specifies either a string up to 62 bytes for SONET or 15 bytes for SDH. If the string contains spaces, enclose it in quotation marks. String ‘zeros’ will send all zeros in the J1 bytes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.143 traceroute

traceroute

Syntax **traceroute** *ip-address* | *dns-name* [**probe-count** *probes-per-hop*] [**detail**] [**dest-port** *port-number*] [**dest-port-udp-fixed**] [**min-ttl** *min-ttl*] [**no-dns**] [**protocol udp | tcp**] [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**size** *pad-size*] [**source** *ip-address*] [**tos** *type-of-service*] [**ttl** *max-ttl*] [**wait** *milliseconds*]

Context **[Tree]** (global traceroute)

Full Context global traceroute

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description The IP traceroute utility determines the route to a destination address. DNS lookups of the responding hosts are enabled by default.

The following shows a traceroute example.

```
*A:ALA-1# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
 1  192.168.xx.xx4 0.000 ms  0.000 ms  0.000 ms
*A:ALA-1#
```

Parameters **dest-port-udp-fixed** — Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

dns-name — Specifies the DNS name, up to 63 characters, of the far-end device to which to send the traceroute request message.

detail — Displays additional information about the resulting packet.

ip-address — Specifies the far-end IP address to which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]

max-ttl — Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds — Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

Values 1 to 60000

Default 5000

min-ttl — Specifies the IP TTL in the initial traceoute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no-dns — Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

pad-size — Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

port-number — Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

probes-per-hop — Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol udp | tcp — Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service — Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management
vprn-svc-id: 1 to 2147483647

Default Base

router-instance — Specifies the preferred method for entering a service name. Stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, *cpm-vr-name*, vpls-management
vprn-svc-name: up to 64 characters
cpm-vr-name: up to 32 characters

service-name — Specifies the alias function that allows the service-name to be used, converted and stored as service ID.

source *ip-address* — Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

type-of-service — Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

Default 0

Output The following are examples of traceroute information.

traceroute for IPv4 SR policy with icmp-tunneling

24.144 traceroute-reply

traceroute-reply

Syntax [**no**] **traceroute-reply**

Context **[Tree]** (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context configure service ies interface ipv6 vrrp traceroute-reply

Description This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Default no traceroute-reply

Platforms All

traceroute-reply

Syntax [**no**] **traceroute-reply**

Context **[Tree]** (config>service>ies>if>vrrp traceroute-reply)

Full Context configure service ies interface vrrp traceroute-reply

Description This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

24.145 track-accounting

track-accounting

Syntax **track-accounting** [**start**] [**stop**][**interim-update**][**accounting-on**] [**accounting-off**]
no track-accounting

Context **[Tree]** (config>router>radius-proxy>server>cache track-accounting)
[Tree] (config>service>vprn>radius-proxy>server>cache track-accounting)

Full Context configure router radius-proxy server cache track-accounting
configure service vprn radius-proxy server cache track-accounting

Description This command specifies the type of RADIUS accounting packets from RADIUS client (a WIFI AP) that the router should track.

The **no** form of this command removes the parameters from the configuration.

Parameters **start** — Specifies that the router will update the associated ESM-host with the RADIUS client (for example, a WIFI AP) that generated the accounting-start. This is required in cases where a UE roams to a new AP that does not re-authenticate due to key caching.

stop — Specifies that the router will remove the corresponding ESM host and forward the accounting-stop packet to the external RADIUS server.

accounting-on | accounting-off — Specifies that the router will remove all ESM hosts associated with the RADIUS client (a WIFI AP), and forward the accounting-on packet to the external RADIUS server.

interim-update — Specifies that the router will update the associated ESM-host with the RADIUS client (a WIFI AP) that generated the interim-update. The interim-updates with the updated information are sent to the RADIUS server as scheduled.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.146 track-authentication

track-authentication

Syntax **track-authentication** [**accept**]
no track-authentication

Context **[Tree]** (config>router>radius-proxy>server>cache track-authentication)
[Tree] (config>service>vprn>radius-proxy>server>cache track-authentication)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router radius-proxy server cache track-authentication
configure service vprn radius-proxy server cache track-authentication

Description This command specifies if RADIUS authentication (from the AP) should be tracked in order to update the ESM host with the RADIUS client (for example, WIFI AP) on UE mobility. It also specifies the authentication packet from RADIUS client (for example, a WIFI AP) that the router should track for mobility.

The **no** form of this command stops tracking authentication for UE mobility.

Default track-authentication accept

Parameters **accept** — Indicates access-accept is tracked for mobility.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.147 track-delete-hold-time

track-delete-hold-time

Syntax **track-delete-hold-time** *seconds*
no track-delete-hold-time

Context **[Tree]** (config>router>radius-proxy>server>cache track-delete-hold-time)

Full Context configure router radius-proxy server cache track-delete-hold-time

Description This command specifies the delete hold-time in case the DHCP host gets a trigger to delete from the matched RADIUS Proxy server.

The **no** form of this command reverts to the default.

Default track-delete-hold-time 0

Parameters *seconds* — Specifies the delete hold time, in seconds.

Values 0 to 600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-mobility

Syntax **track-mobility**

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range track-mobility)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range track-mobility)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility

Description Commands in this context configure RADIUS-proxy cache information required for subscribers that are created via data-triggered authentication. The RADIUS proxy cache enables efficient handling of UE mobility.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.149 track-password-change

track-password-change

Syntax [**no**] **track-password-change**

Context **[Tree]** (config>service>vprn>l2tp>group>l2tpv3 track-password-change)

Full Context configure service vprn l2tp group l2tpv3 track-password-change

Description This command enables tracking of password changes, allowing password tunnel passwords to be changed without bringing down active tunnels or sessions. This is only supported with L2TPv3.

The **no** form of this command disables password change tracking.

Default no track-password-change

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.150 track-srrp

track-srrp

Syntax **track-srrp** *srrp-instance* **peer** *ip-address* **sync-tag** *sync-tag*
no track-srrp *srrp-instance*

Context **[Tree]** (config>router>l2tp>failover track-srrp)
[Tree] (config>service>vprn>l2tp>failover track-srrp)

Full Context configure router l2tp failover track-srrp
configure service vprn l2tp failover track-srrp

Description This command sets the sync-tag to be used to synchronize the tunnels with track-srrp *srrp-id* to MCS *peer IP-@*. The same sync-tag should be configured on the MCS peer.

The **no** form of this command reverts to the default.

Default Removes the sync-tag for the indicated track-srrp.

Parameters *srrp-instance* — Specifies the Simple Router Redundancy Protocol (SRRP) instance used for Multi-Chassis redundancy failover that is associated with this Layer Two Tunneling Protocol Tunnel.

sync-tag — Specifies a synchronization tag to be used while synchronizing with the peer.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp

Syntax [**no**] **track-srrp** [*srrp-instance*]

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync>track-srrp-instances track-srrp)

Full Context configure redundancy multi-chassis peer sync track-srrp-instances track-srrp

Description This command configures a tracked SRRP instance.

The **no** form of this command removes the SRRP instance identifier from the configuration.

Parameters *srrp-instance* — Indicates the unique identifier of the tracked SRRP instance.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

track-srrp

Syntax **track-srrp** *srrp-id*
no track-srrp

Context **[Tree]** (config>service>vpls>sap track-srrp)

Full Context configure service vpls sap track-srrp

Description This command configures the SRRP instance this capture SAP will track. This is a capture SAP level command. This command is important in PPPoE deployments with MSAPs. PPPoE operation requires that the MAC address learned by the client at the very beginning of the session negotiation phase remains unchanged for the lifetime of the session (RFC 2516). This command ensures that the virtual MAC address used during the PPPoE session negotiation phase on the capture SAP is the same virtual MAC address that is used by the SRRP on the group interface on which the session is established. Therefore, it is mandated that the SRRP instance (and implicitly the group-interface) where the session belongs to is known in advance. If the group interface name for the session is returned by the RADIUS, it must be ensured that this group interface is the one on which the tracked SRRP instance is configured. PPPoE sessions on the same capture SAP cannot be shared across multiple group interfaces, but instead they all must belong to a single group interface that is known in advance.

The same restrictions apply to IPoE clients in MC Redundancy scenario if they are to be supported concurrently on the same capture SAP as PPPoE.

The supported capture SAP syntax is this:

sap <port-id>:X.* capture-sap

The capture SAP syntax that is not supported is this:

sap <port-id>:*.* capture-sap

The **no** form of this command removes the SRRP ID from this configuration.

Parameters *srrp-id* — Specifies the SRRP instance number.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context [Tree] (config>router>pim>interface tracking-support)

Full Context configure router pim interface tracking-support

Description This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to enable join message suppression. This capability allows for upstream routers to explicitly track join membership.

The **no** form of this command disables tracking support.

Default no tracking-support

Platforms All

24.153 traffic

traffic

Syntax **traffic** [**sir** *sir-val*] [**pir** *pir-val*] [**mir** *mir-val*] [**mbs** *mbs-val*] [**cdvt** *cdvt-val*]
no traffic

Context [Tree] (config>qos>atm-td-profile traffic)

Full Context configure qos atm-td-profile traffic

Description This command is used to configure traffic attributes of an ATM traffic profile as per ATM Forum Traffic Management Specification Version 4.1.

The traffic parameters of a traffic descriptor that are configurable depends on the service category of this traffic descriptor profile (see the **config>qos>atm-td-profile service-category** command).

Table 185 lists which traffic descriptor parameters are applicable for what service category and what are configuration rules between the parameters. **Y** indicates the parameter can be configured for a given service category and will be defaulted if not provided, an **N/A** indicates the parameter cannot be configured for a given service category (an error will be returned). If an applicable parameter is not specified, the current value will be preserved.

Table 185 **Traffic Descriptor Parameter Support by Service Category**

Service Category	SIR	PIR	MBS	MIR	CDVT
CBR		✓			✓
rt-VBR	✓	✓ (must be >= SIR)	✓		✓

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 185 **Traffic Descriptor Parameter Support by Service Category**

Service Category	SIR	PIR	MBS	MIR	CDVT
Nrt-VBR	✓	✓ (must be >= SIR)	✓		✓
UBR		✓			
UBR with MIR		✓ (must be >= MIR		✓ (non-zero MIR specified)	

When a traffic descriptor profile is used to define egress scheduling, the following describes how traffic rates are used to derive scheduling weight:

1. UBR PVCCs (i.e., MIR = 0) are assigned weight value of 1
2. UBR with MIR PVCCs are assigned weight value in the inclusive range from 1 to 255 based on the MIR rate
3. rt-VBR and nrt-VBR PVCCs are assigned weight value in the inclusive range from 1 to 255 based on the SCR rate
4. CBR PVCCs are assigned weight value in the inclusive range from 1 to 255 based on the PIR rate

The scheduling weight is derived from the traffic rate based on the following formula:

If traffic rate <= 32 kb/s, then weight = 1

If 32 kb/s < traffic rate < 8160 kb/s, then weight = floor (traffic rate / 32)

If traffic rate >= 8160 kb/s, then weight = 255

The configuration of weight unit (32 kb/s) is left for future releases.

Since the SAR operates in cells/second with 1 cell granularity, PIR and SCR values programmed need to be converted to cells per second. When converting values to be used for scheduler, the result is rounded up to the next cell when required by conversion.

When any of SIR, PIR, or MIR is greater than the physical maximum port/channel capacity for a given PVCC, then the maximum physical port/channel capacity is used in BW accumulation and when configuring the H/W for that PVCC.

Hardware- enforceable mbs is in the inclusive range from 3 to 256 000 cells. Any value outside of that range will be accepted and rounded up/down to the minimum/maximum enforceable value.

The **no** form of this command restores traffic parameters to their defaults for a given service category.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ATM traffic parameter default values are listed in Table 186 in kb/s.

Table 186 **ATM Traffic Parameter Defaults**

Service Category	Traffic Parameter Defaults
CBR:	
PIR	0
rt-VBR and nrt-VBR	
PIR	0
SCR	0
MBS	32
UBR (by default UBR is without MIR)	
PIR	0
MIR	0

Parameters **sir** *sir-val* — Sustained Information Rate (including cell overhead) in kilobits per second.

Values 0 to 4294967295

pir *pir-val* — Peak Information Rate (including cell overhead) in kilobits per second.

Values 0 to 4294967295

mir *mir-val* — Minimum Desired Information Rate (including cell overhead) in kilobits per second.

Values 0 to 4294967295

mbs *mbs-val* — Maximum Burst Size in cells.

Values 0 to 4294967295

cdvt *cdvt-val* — The Cell Delay Variation Tolerance (CDVT), in microseconds.

Default Depending upon a given service category:
CBR/RT-VBR/NRT-VBR 250

Values 0 to 4294967295

24.154 traffic-capture

traffic-capture

Syntax [**no**] **traffic-capture**

Context **[Tree]** (debug>app-assure>group traffic-capture)

Full Context debug application-assurance group traffic-capture

Description This command configures debugging for traffic capture.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.155 traffic-class

traffic-class

Syntax **traffic-class** *traffic-class*
no traffic-class

Context **[Tree]** (config>test-oam>build-packet>header>mpls traffic-class)
[Tree] (debug>oam>build-packet>packet>field-override>header>mpls traffic-class)

Full Context configure test-oam build-packet header mpls traffic-class
debug oam build-packet packet field-override header mpls traffic-class

Description This command defines the traffic class value to be used in the MPLS header.

The **no** form of this command removes the traffic class value.

Default traffic-class 0 (BE)

Parameters *traffic-class* — Specifies the MPLS traffic class to be used in the MPLS header.

Values 0 to 7

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>subscr-mgmt>msap-policy>atm>ingress traffic-desc)

Full Context configure service ies subscriber-interface group-interface sap atm egress traffic-desc
configure service ies subscriber-interface group-interface sap atm ingress traffic-desc
configure service vprn subscriber-interface group-interface sap atm egress traffic-desc
configure service vprn subscriber-interface group-interface sap atm ingress traffic-desc
configure subscriber-mgmt msap-policy atm egress traffic-desc
configure subscriber-mgmt msap-policy atm ingress traffic-desc

Description This command assigns an ATM traffic descriptor profile to a SAP.

When configured under the ingress context, the specified traffic descriptor profile defines the traffic contract for ATM cells received from the SAP. When configured under the egress context, the specified traffic descriptor profile defines the traffic contract for ATM cells transmitted into the SAP.

The **no** form of this command reverts the traffic descriptor to the default traffic descriptor profile.

Default traffic-desc 1

Parameters *traffic-desc-profile-id* — Specifies an existing ATM traffic descriptor profile. Traffic descriptor profiles are configured in the **config>qos>atm-td-profile** context.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

traffic-desc

Syntax **traffic-desc** *traffic-desc-profile-id*

configure service ies interface sap atm ingress traffic-desc
configure service vpls sap atm egress traffic-desc
configure service vpls sap atm ingress traffic-desc
configure service vprn interface sap atm egress traffic-desc
configure service vprn interface sap atm ingress traffic-desc

Description This command assigns an ATM traffic descriptor profile to a SAP or to an IES or VPRN interface.

When configured under the ingress context, the specified traffic descriptor profile defines the traffic contract for ATM cells received from the SAP or interface. When configured under the egress context, the specified traffic descriptor profile defines the traffic contract for ATM cells transmitted into the SAP or interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts the traffic descriptor to the default traffic descriptor profile.

Default traffic-desc 1

Parameters *traffic-desc-profile-id* — Specifies an existing ATM traffic descriptor profile. Traffic descriptor profiles are configured in the **config>qos>atm-td-profile** context.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

24.157 traffic-direction

traffic-direction

Syntax **traffic-direction** {**subscriber-to-network** | **network-to-subscriber** | **both**}

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>match traffic-direction)

Full Context configure application-assurance group policy app-qos-policy entry match traffic-direction

Description This command specifies the direction of traffic where the AQP match entry will be applied.

To use a policer action with the AQP entry the match criteria must specify a traffic-direction of either subscriber-to-network or network-to-subscriber.

Default traffic-direction both

Parameters **subscriber-to-network** — Traffic from a local subscriber will match this AQP entry.

network-to-subscriber — Traffic to a local subscriber will match this AQP entry.

both — Combines subscriber-to-network and network-to-subscriber.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.158 traffic-engineering

traffic-engineering

Syntax [**no**] **traffic-engineering**

Context **[Tree]** (config>router>isis traffic-engineering)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router isis traffic-engineering

Description This command enables this IS-IS instance to advertise TE link attributes for RSVP-TE and SR-TE enabled interfaces.

Default no traffic-engineering

Platforms All

traffic-engineering

Syntax [**no**] **traffic-engineering**

Context **[Tree]** (config>router>ospf traffic-engineering)

Full Context configure router ospf traffic-engineering

Description This command enables the advertisement of the traffic engineering information for the router and its links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering of this router are limited to calculations based on link and nodal constraints.

The **no** form of this command disables the advertisement of the traffic engineering information.

Default no traffic-engineering

Platforms All

24.159 traffic-engineering-options

traffic-engineering-options

Syntax [**no**] **traffic-engineering-options**

Context **[Tree]** (config>router>isis traffic-engineering-options)

Full Context configure router isis traffic-engineering-options

Description Commands in this context configure advanced traffic-engineering options.

The **no** form of this command deletes the context.

Default no traffic-engineering-options

Description Commands in this context configure the advanced traffic-engineering options.

The **no** form of this command removes the context to configure the advanced traffic-engineering options.

Default no traffic-engineering-options

Platforms All

24.160 traffic-rate-delta

traffic-rate-delta

Syntax **traffic-rate-delta** *rate*
no traffic-rate-delta

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive>umh-rm traffic-rate-delta)
[Tree] (config>service>vprn>mvpn>pt>selective>umh-rm>group>source traffic-rate-delta)

Full Context configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring traffic-rate-delta
configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source traffic-rate-delta

Description This command configures the bandwidth delta upwards of which the traffic is switched from the primary UMH to the backup UMH.

The **no** form of this command removes UMH redundancy with bandwidth monitoring.

Default 1

Parameters *rate* — Specifies the bandwidth delta, in kbps.

Values 1 to 4294967294

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.161 traffic-type

traffic-type

Syntax [**no**] **traffic-type**

Context **[Tree]** (config>app-assure>group>statistics>aa-partition traffic-type)

Full Context configure application-assurance group statistics aa-partition traffic-type

Description This command enables traffic type statistics collection within an aa-partition.

The no form of this command disables traffic type statistics collection.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.162 transaction-timer

transaction-timer

Syntax **transaction-timer** *seconds*
no transaction-timer

Context **[Tree]** (config>aaa>diam-peer-plcy transaction-timer)
[Tree] (config>aaa>diam-peer-plcy>peer transaction-timer)

Full Context configure aaa diameter-peer-policy peer transaction-timer
configure aaa diameter-peer-policy transaction-timer

Description This command defines the time-out value for the Base Diameter messages (CER, DPR). When the transaction-timer expires, an appropriate action is taken for each message type.

This timer is used in the following cases:

- Opening the TCP connection (and completing the 3-way handshake) - if the TCP ACK is not received within the time specified by the transaction-timer, the TCP connection is closed and the connection-timer is started waiting for the new connection to be initiated
- Capability Exchange — If the response to the CER message (CEA) is not received within the time specified by the transaction-timer, the peer connection is closed and the connection-timer is started waiting for the new connection to be initiated.
- Peer disconnect Request — If the response to the DPR message is not received (DPA) within the time specified by the **transaction-timer**, the peer connection is closed.

This command is applicable only to legacy implementations of Diameter base in the SR OS.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Parameters *seconds* — Specifies the policy peer transaction timer, in seconds.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.163 transceiver

transceiver

Syntax **transceiver**

Context **[Tree]** (config>port transceiver)

Full Context configure port transceiver

Description Commands in this context configure transceiver parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.164 transform

transform

Syntax **transform** *transform-id* [*transform-id*]
no transform

Context **[Tree]** (config>ipsec>tnl-temp transform)

Use subject to Terms available at: www.nokia.com

configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform
configure service vprn interface sap ipsec-gw transform
configure service vprn interface sap ipsec-tunnel transform

Description This command associates the IPsec transform sets allowed for this the CHILD_SA. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

The **no** form of this command removes the transform ID from the configuration.

Default no transform

Parameters *transform-id* — Specifies a number to identify a tranform used for CHILD_SA negotiation. Up to four transform ID can be specified.

Values 1 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec ipsec-transport-mode-profile dynamic-keying transform
- configure ipsec tunnel-template transform

VSR

- configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform
- configure service ies interface ipsec ipsec-tunnel dynamic-keying transform
- configure router interface ipsec ipsec-tunnel dynamic-keying transform

transform

Syntax **transform** *transform-id* [*transform-id*]
no transform

Context **[Tree]** (config>service>vprn>if>sap>ipsec-tun>dyn transform)

Full Context configure service vprn interface sap ipsec-tunnel dynamic-keying transform

Description This command associates the IPsec transform sets allowed for this tunnel. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

Default no transform

Parameters *transform-id* — Specifies the value used for transforms for dynamic keying.

Values 1 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.165 transit

transit

Syntax **transit** [**inherit** | **all** | **vc-only** | **none**]

Context **[Tree]** (config>service>vprn>ttl-propagate transit)

Full Context configure service vprn ttl-propagate transit

Description This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default transit inherit

Parameters *inherit* — specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

none — specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only — specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all — specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Platforms All

24.166 transit-auto-create

transit-auto-create

Syntax **transit-auto-create**

Context **[Tree]** (config>app-assure>group>transit-ip-policy transit-auto-create)

Full Context configure application-assurance group transit-ip-policy transit-auto-create

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables seen-IP auto creation of transit subscribers using the transit-IP-policy name and subscriber IP address as the AA-sub name. The default app-profile configured against the transit-ip-policy is applied to these subscribers.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.167 transit-delay

transit-delay

Syntax **transit-delay** *seconds*
no transit-delay

Context **[Tree]** (config>service>vprn>ospf>area>if transit-delay)
[Tree] (config>service>vprn>ospf3>area>if transit-delay)

[Tree] (config>service>vprn>ospf3>area>virtual-link transit-delay)
[Tree] (config>service>vprn>ospf>area>sham-link transit-delay)

Full Context configure service vprn ospf area interface transit-delay
configure service vprn ospf area sham-link transit-delay
configure service vprn ospf area virtual-link transit-delay
configure service vprn ospf3 area interface transit-delay
configure service vprn ospf3 area virtual-link transit-delay

Description This command configures the estimated time, in seconds, that it takes to transmit a LSA on the interface or virtual link or sham-link.

The **no** form of this command reverts to the default delay time.

Default transit-delay 1

Parameters *seconds* — The transit delay in seconds expressed as a decimal integer.

Values 0 to 3600

Platforms All

transit-delay

Syntax **transit-delay** *seconds*
no transit-delay

Context **[Tree]** (config>router>ospf>area>interface transit-delay)
[Tree] (config>router>ospf>area>virtual-link transit-delay)
[Tree] (config>router>ospf3>area>interface transit-delay)

[Tree] (config>router>ospf3>area>virtual-link transit-delay)

Full Context configure router ospf area interface transit-delay
configure router ospf area virtual-link transit-delay
configure router ospf3 area interface transit-delay
configure router ospf3 area virtual-link transit-delay

Description This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.

The **no** form of this command reverts to the default delay time.

Default transit-delay 1

Parameters *seconds* — Specifies the transit delay in seconds expressed as a decimal integer.

Values 1 to 1800

Platforms All

24.168 transit-ip-policy

transit-ip-policy

Syntax **transit-ip-policy** *ip-policy-id* [**create**]
no transit-ip-policy *ip-policy-id*

Context [Tree] (config>app-assure>group transit-ip-policy)

Full Context configure application-assurance group transit-ip-policy

Description This command defines a transit AA subscriber IP policy. Transit AA subscribers are managed by the system through the use of this policy assigned to services, which determines how transit subs are created and removed for that service.

The **no** form of this command deletes the policy from the configuration. All associations must be removed in order to delete a policy.

Parameters *ip-policy-id* — An integer that identifies a transit IP profile entry.

Values 1 to 65535

create — Keyword used to create the entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

configure service vprn interface spoke-sdp transit-policy

Description This command associates a transit AA subscriber IP or prefix policy to the service. The transit policy must be defined prior to associating the policy with a SAP in the **config**>**app-assure**>**group**>**transit-ip-policy** or **transit-prefix-policy** context.

The **no** form of this command removes the association of the policy to the service.

Default no transit-policy

Parameters *ip-aasub-policy-id* — Specifies a transit IP policy ID.

Values 1 to 65535

prefix-aasub-policy-id — Specifies a transit prefix policy ID.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

transit-policy

Syntax **transit-policy prefix** *prefix-aasub-policy-id*
no transit-policy

Context **[Tree]** (config>service>ipipe>sap transit-policy)
[Tree] (config>service>ipipe>spoke-sdp transit-policy)

Full Context configure service ipipe sap transit-policy
configure service ipipe spoke-sdp transit-policy

Description This command associates an AA transit policy to the service. The transit IP policy must be defined prior to associating the policy with a SAP in the **config>application assurance>group>policy>transit-ip-policy** context.

Transit AA subscribers are managed by the system through this service policy, which determines how transit subs are created and removed for that service.

The no form of this command removes the association of the policy to the service.

Default no transit-policy

Parameters *prefix-aasub-policy-id* — Specifies an integer identifying a prefix transit profile entry.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

24.171 transit-prefix-ipv4-entries

transit-prefix-ipv4-entries

Syntax **transit-prefix-ipv4-entries** *entries*
no transit-prefix-ipv4-entries

Context **[Tree]** (config>isa>aa-grp transit-prefix-ipv4-entries)

Full Context configure isa application-assurance-group transit-prefix-ipv4-entries

Description This command defines the number of transit-prefix IPv4 entries for an ISA.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default no transit-prefix-ipv4-entries

Parameters *entries* — Specifies an integer that determines the number of transit-prefix-ipv4 entries.

Values 0 to 16383

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.172 transit-prefix-ipv4-remote-entries

transit-prefix-ipv4-remote-entries

Syntax **transit-prefix-ipv4-remote-entries** *entries*
no transit-prefix-ipv4-remote-entries

Context **[Tree]** (config>isa>aa-grp transit-prefix-ipv4-remote-entries)

Full Context configure isa application-assurance-group transit-prefix-ipv4-remote-entries

Description This command configures the ISA-AA-group transit prefix IPv4 remote entry limit. This entry space is allocated on the IOM within a common area with the second MDA/ISA position of the IOM and also used for IPv4filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv4 entries should be set to allow sufficient space on the IOM for SDP IPv4 filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default no transit-prefix-ipv4-remote-entries

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *entries* — Specifies the ISA-AA-Group transit prefix IPv4 remote entry limit.

Values 0 to 2047

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.173 transit-prefix-ipv6-entries

transit-prefix-ipv6-entries

Syntax **transit-prefix-ipv6-entries** *entries*
no transit-prefix-ipv6-entries

Context **[Tree]** (config>isa>aa-grp transit-prefix-ipv6-entries)

Full Context configure isa application-assurance-group transit-prefix-ipv6-entries

Description This command configures the ISA-AA-group transit prefix IPv6 entry limit for each ISA in the group. This entry space is allocated on the IOM within a common area with the second MDA / ISA position of the IOM and also used for ipv6-filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP ipv6-filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default no transit-prefix-ipv6-entries

Parameters *entries* — Specifies the ISA-AA-Group transit prefix IPv6 entry limit.

Values 0 to 8191

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.174 transit-prefix-ipv6-remote-entries

transit-prefix-ipv6-remote-entries

Syntax **transit-prefix-ipv6-remote-entries** *entries*
no transit-prefix-ipv6-remote-entries

Context **[Tree]** (config>isa>aa-grp transit-prefix-ipv6-remote-entries)

Full Context configure isa application-assurance-group transit-prefix-ipv6-remote-entries

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the ISA-AA-group transit prefix IPv6 remote entry limit. This entry space is allocated on the IOM within a common area with the second MDA/ISA position of the IOM and also used for IPv6filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP IPv6 filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

Default no transit-prefix-ipv6-remote-entries

Parameters *entries* — Specifies the ISA-AA-Group transit prefix IPv6 remote entry limit.

Values 0 to 1023

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.175 transit-prefix-policy

transit-prefix-policy

Syntax **transit-prefix-policy** *prefix-policy-id* [**create**]
no transit-prefix-policy *prefix-policy-id*

Context **[Tree]** (config>app-assure>group transit-prefix-policy)

Full Context configure application-assurance group transit-prefix-policy

Description This command defines a transit aa subscriber prefix policy. Transit AA subscribers are managed by the system through the use of this policy assigned to services, which determines how transit subs are created and removed for that service.

The **no** form of this command deletes the policy from the configuration. All associations must be removed in order to delete a policy.

Parameters *prefix-policy-id* — Indicates the transit prefix policy to which this subscriber belongs.

Values 1 to 65535

create — Mandatory keyword used when creating transit prefix policy. The create keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.176 transmission-profile

transmission-profile

Syntax **transmission-profile** *name*
no transmission-profile

Context **[Tree]** (config>system>security>pki>ca-profile>ocsp transmission-profile)

Full Context configure system security pki ca-profile ocsp transmission-profile

Description This command specifies the transmission-profile for OCSP. When specified, this configuration overrides the **service** *service-id* or **service** *service-name* configured in the **config>system>security>pki>ca-profile>ocsp** context.

The **no** form of the command removes the profile name from the configuration.

Default no transmission-profile

Parameters *name* — Specifies the file transmission profile name, up to 32 characters.

Platforms All

transmission-profile

Syntax **transmission-profile** *name*
no transmission-profile

Context **[Tree]** (config>system>security>pki>est-profile transmission-profile)

Full Context configure system security pki est-profile transmission-profile

Description This command specifies the transmission profile name created in the **config**>**system file-transmission-profile** context for the EST profile.

The **no** form of the command removes the name from the EST profile configuration.

Default no transmission-profile

Parameters *name* — Specifies the file transmission profile name, up to 32 characters.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.177 transmit-interval

transmit-interval

Syntax [**no**] **transmit-interval** *interval* [**multiplier** *multiplier*]

Context **[Tree]** (config>port>ethernet>efm-oam transmit-interval)

Full Context configure port ethernet efm-oam transmit-interval

Description This command configures the transmit interval of OAM PDUs.

Default transmit-interval 10 multiplier 5

Parameters *interval* — Specifies the transmit interval, in 100 milliseconds.

Values 1 to 600

multiplier — Specifies the multiplier for transmit-interval to set local link down timer.

Values 2 to 5

Platforms All

transmit-interval

Syntax **transmit-interval** *transmit-interval*
no transmit-interval

Context **[Tree]** (config>lag>bfd>family transmit-interval)

Full Context configure lag bfd family transmit-interval

Description This command specifies the transmit timer used for micro-BFD session over the associated LAG links.

The **no** form of this command removes the transmit timer from the configuration.

Default transmit-interval 100

Parameters *transmit-interval* — Specifies the interval value, in milliseconds.

Values 10 to 100000

Default 100 for CPM3 or later, 1000 for all others

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

transmit-interval

Syntax **transmit-interval** *transmit-interval*
no transmit-interval

Context **[Tree]** (config>router>bfd>bfd-template transmit-interval)

Full Context configure router bfd bfd-template transmit-interval

Description This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default transmit-interval 100

Parameters *transmit-interval* — Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms All

24.178 transmit-period

transmit-period

Syntax **transmit-period** *seconds*
no transmit-period

Context **[Tree]** (config>port>ethernet>dot1x transmit-period)

Full Context configure port ethernet dot1x transmit-period

Description This command configures the period after which the router sends a new EAPOL request message.

The **no** form of this command returns the value to the default.

Default transmit-period 30

Parameters *seconds* — Specifies the server transmit period in seconds.

Values 1 to 3600

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.179 transport

transport

Syntax **transport tcp port** *port*
no transport

Context **[Tree]** (config>aaa>diam-peer-plcy>peer transport)

Full Context configure aaa diameter-peer-policy peer transport

Description This command defines the destination TCP port of the connection channel.

This command is applicable only to legacy implementations of Diameter base in the SR OS.

The **no** form of this command reverts to the default.

Default transport tcp port 3868

Parameters *port* — Specifies the transport protocol port number used toward this policy peer.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.180 transport-address

transport-address

Syntax **transport-address** {**interface** | **system**}
no transport-address

Context **[Tree]** (config>router>ldp>if-params>if>ipv4 transport-address)
[Tree] (config>router>ldp>if-params>if>ipv6 transport-address)
[Tree] (config>router>ldp>if-params>ipv4 transport-address)
[Tree] (config>router>ldp>if-params>ipv6 transport-address)

Full Context configure router ldp interface-parameters interface ipv4 transport-address
configure router ldp interface-parameters interface ipv6 transport-address
configure router ldp interface-parameters ipv4 transport-address
configure router ldp interface-parameters ipv6 transport-address

Description This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **config**>**router**>**ldp**>**if-params**>**ipv6**>**transport-address** command is not supported on the 7450 ESS.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default system

Parameters **interface** — Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system — Specifies the system IP address is used to set up the LDP session between neighbors.

Platforms All

24.181 transport-encryption

transport-encryption

Syntax **transport-encryption**

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync transport-encryption)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure redundancy multi-chassis peer sync transport-encryption

Description Commands in this context configure MCS applications that need to encrypt synchronized states for transportation .

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.182 transport-tunnel

transport-tunnel

Syntax **transport-tunnel**

Context **[Tree]** (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

Platforms All

24.183 transport-type

transport-type

Syntax **transport-type** {**ip**}
no transport-type

Context **[Tree]** (config>router>l2tp>l2tpv3 transport-type)
[Tree] (config>service>vprn>l2tp>l2tpv3 transport-type)

Full Context configure router l2tp l2tpv3 transport-type
configure service vprn l2tp l2tpv3 transport-type

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the transport type to be used to carry the L2TPv3 tunnel. Currently, only IP transport is supported.

The **no** form of this command returns the **transport-type** to the default value.

Default no transport-type

Parameters **ip** — Specifies that IP should be used as the transport type for the L2TPv3 tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.184 trap-gen

trap-gen

Syntax **trap-gen**

Context **[Tree]** (config>saa>test trap-gen)

Full Context configure saa test trap-gen

Description Commands in this context configure trap generation for the SAA test.

Platforms All

24.185 trap-target

trap-target

Syntax **trap-target name address** *ip-address* [**port port**] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]
no trap-target *name*

Context **[Tree]** (config>service>vprn>log>snmp-trap-group trap-target)

Full Context configure service vprn log snmp-trap-group trap-target

Description This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default No SNMP trap targets are defined.

Parameters *name* — specifies the name of the trap target up to 28 characters in length

address *ip-address* — The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface: 32 characters maximum, mandatory for link local addresses

The ipv6-address applies to the 7750 SR.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

port — Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1 | *snmpv2c* | *snmpv3* — Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community | *security-name* — Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community — The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

security-name — The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy} — Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay — Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

trap-target

Syntax **trap-target** *name* [**address** *ip-address*] [**port** *port*] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]

no trap-target *name*

Context **[Tree]** (config>log>snmp-trap-group trap-target)

Full Context configure log snmp-trap-group trap-target

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note: If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters *name* — Specifies the name of the trap target, up to 28 characters.

ip-address — Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group. ipv6 applies to the 7750 SR only.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

port — Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1 | *snmpv2c* | *snmpv3* — Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

The user name must be configured.

The v3 access group must be configured.

The v3 notification view must be configured.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

community | *security-name* — Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name — Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name — Specifies the *security-name* as defined in the **config>system> security>user** context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

security-level {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**} — Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay — Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note: Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under the **config>log>app-route-notifications** context can help reduce the probability of lost events.

Platforms All

24.186 tree

tree

Syntax **tree** [**detail**] [**flat**]

Context **[Tree]** (global tree)

Full Context global tree

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command displays the command hierarchy structure of the current working context.

Parameters **detail** — Displays parameter information for each command shown in the tree output.

flat — Displays the full context on each line.

24.187 trigger

trigger

Syntax **trigger** *trigger-type*

Context **[Tree]** (config>subscr-mgmt>shcv-policy trigger)

Full Context configure subscriber-mgmt shcv-policy trigger

Description This command enables to context to configure SHCV triggers.

Parameters *trigger-type* — Specifies the trigger SHCV properties for the subscriber management group-interface.

Values

ip-conflict — Upon detecting an IP conflict for the new host, a trigger SHCV is sent using a unicast ARP/NS. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

host-limit-exceeded — Upon exceeding the limit for (**sla-profile host-limits** or **session-limits**, **sub-profile host-limits** or **session-limits**, **ipoe-session sap-session-limit**, **ipoe-session session-limit**, and **arp-host host-limit**), a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

inactivity — A trigger SHCV is sent to the idle host to verify the host's connectivity to the BNG. An unresponsive host is removed from the system.

mobility — Detects an IP or MAC conflict between different SAPs. Upon detecting a MAC or an IP conflict, a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mac-learning — Specifies the trigger SHCV properties to learn the MAC address of static hosts. Upon a **no shutdown**, a trigger SHCV is sent to the host to learn the host's MAC address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

trigger

Syntax **trigger** [**data**] [**iapp**] [**control**]
no trigger

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>mobility trigger)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>mobility trigger)

Full Context configure service ies subscriber-interface group-interface wlan-gw mobility trigger
configure service vprn subscriber-interface group-interface wlan-gw mobility trigger

Description This command specifies the type of packet used as a mobility trigger.

The **no** form of this command removes the parameters from the configuration and disables data-plane mobility.

Parameters **data** — Specifies that data traffic be used as a trigger.

iapp — Specifies that Inter Access Point Protocol (IAPP) messages be used as a trigger.

control — Specifies that control traffic can be used as a trigger.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

trigger

Syntax [**no**] **trigger** [**neighbor** *ip-int-name* | *ip-address*]

Context **[Tree]** (debug>router>rip trigger)

Full Context debug router rip trigger

Description This command enables debugging for RIP trigger updates.

Parameters *ip-int-name* **|** *ip-address* — Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms All

trigger

Syntax [**no**] **trigger** [**neighbor** *ip-int-name* | *ipv6-address*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (debug>router>ripng trigger)

Full Context debug router ripng trigger

Description This command enables debugging for RIP trigger updates.

Parameters *ip-int-name* | *ipv6-address* — Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms All

24.188 trigger-alarm-msg

trigger-alarm-msg

Syntax **trigger-alarm-msg** *message-string*
no trigger-alarm-msg

Context [Tree] (config>system>alarm-contact-input trigger-alarm-msg)

Full Context configure system alarm-contact-input trigger-alarm-msg

Description This command configures a message string to send with SNMP trap and log event messages that are generated when the system generates an alarm. The system generates the default message “Alarm Input Triggered” if no message is configured. The **trigger-alarm-msg** string is included in the log event when the pin changes from the normal state.

The **no** form of this command reverts to the default message “Alarm Input Triggered”.

Default no-trigger-alarm-msg

Parameters *message-string* — Specifies a printable character string, up to 160 characters.

Platforms 7750 SR-a

24.189 trigger-entry

trigger-entry

Syntax [**no**] **trigger-entry** *entry-id*

Context [Tree] (config>log>event-trigger>event trigger-entry)

Full Context configure log event-trigger event trigger-entry

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

Parameters *entry-id* — Specifies the identifier of the EHS event trigger entry.

Values 1 to 1500

Platforms All

24.190 trigger-fault

trigger-fault

Syntax **trigger-fault** {**dying-gasp** | **critical-event**}
no trigger-fault

Context **[Tree]** (config>port>ethernet>efm-oam trigger-fault)

Full Context configure port ethernet efm-oam trigger-fault

Description This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to “Link Up”. If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an Up operational state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without having to wait for protocol timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

Default no trigger-fault

Parameters **dying-gasp** — Keyword to set the dying gasp flag.

critical-event — Keyword to set the critical event flag.

Platforms All

Use subject to Terms available at: www.nokia.com

24.191 trigger-packet

trigger-packet

Syntax **trigger-packet** [**dhcp**] [**pppoe**] [**arp**] [**dhcp6**] [**ppp**] [**rtr-solicit**] [**data**]
no trigger-packet

Context **[Tree]** (config>service>vpls>sap trigger-packet)

Full Context configure service vpls sap trigger-packet

Description This command enables triggering packet to initiate RADIUS authentication that provides a service context. The authentication, together with the service context for this request, creates a managed SAP. The VLAN is the same as the triggering packet. This SAP behaves as a regular SAP but the configuration is not user-editable and not maintained in the configuration file. The managed SAP remains active as long as the session is active.

The **no** form of this command reverts to the default.

Parameters **dhcp** — Specifies whether the receipt of DHCP trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

pppoe — Specifies whether the receipt of PPPoE trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

arp — Indicates that ARP is the type of trigger packets for this entry.

dhcp6 — Indicates that DHCP6 is the type of trigger packets for this entry.

ppp — Indicates that PPP is the type of trigger packets for this entry.

rtr-solicit — Indicates that router solicit is the type of trigger packets for this entry.

data — Indicates that data is the type of trigger packets for this entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.192 triggered-policy

triggered-policy

Syntax [**no**] **triggered-policy**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router triggered-policy)

Full Context configure router triggered-policy

Description This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default no triggered-policy

Platforms All

24.193 triggered-updates

triggered-updates

Syntax **triggered-updates**

Context [Tree] (config>subscr-mgmt>acct-plcy triggered-updates)

Full Context configure subscriber-mgmt radius-accounting-policy triggered-updates

Description Commands in this context configure non-periodic accounting updates that are triggered by specific events.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.194 trust-anchor

trust-anchor

Syntax [**no**] **trust-anchor** *ca-profile-name*

Context **[Tree]** (config>ipsec>trust-anchor-profile trust-anchor)

Full Context configure ipsec trust-anchor-profile trust-anchor

Description This command specifies a CA profile as a trust anchor CA. Up to 8 multiple trust anchors can be specified in a single trust anchor profile.

The **no** form of this command removes the name from the configuration.

Parameters *ca-profile-name* — Specifies the name of the trust anchor profile, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

trust-anchor

Syntax [**no**] **trust-anchor** *ca-profile-name*

Context **[Tree]** (config>system>security>tls>trust-anchor-profile trust-anchor)

Full Context configure system security tls trust-anchor-profile trust-anchor

Description This command configures a trust anchor with a CA profile used by the TLS profile. Up to eight CA profiles can be configured under the trust anchor. TLS will read the CA profiles one by one to try to authenticate the server certificate.

Parameters *ca-profile-name* — Specifies the name of the TLS trust anchor, up to 32 characters.

Platforms All

24.195 trust-anchor-profile

trust-anchor-profile

- configure router interface dhcp trusted
- configure service ies interface dhcp trusted
- configure service vprn interface dhcp trusted

24.197 ts-list

ts-list

Syntax **ts-list** *list-name* [**create**]
no ts-list *list-name*

Context **[Tree]** (config>ipsec ts-list)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure ipsec ts-list

Description This command creates a new traffic selector (TS).

The **no** form of this command removes the list name from the configuration.

Parameters *list-name* — Specifies the name of the TS-list.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.198 ts-location

ts-location

Syntax **ts-location** *file-url*
no ts-location

Context **[Tree]** (config>system>security>tech-support ts-location)

Full Context configure system security tech-support ts-location

Description The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the ts-location is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

Default no ts-location

Parameters *file-url* — Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, cf1:\) is blocked for local compact flash destinations. A sub-directory (for example, cf2:\tech-support) must be used if local cf is the location.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*] 247 chars max

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

configure mcast-management multicast-info-policy bundle channel video analyzer alarms ts-sync-loss
configure mcast-management multicast-info-policy bundle video analyzer alarms ts-sync-loss

Description This command configures the analyzer to check for synchronization loss errors.

Default no ts-sync-loss

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

24.201 ttl

ttl

Syntax **ttl** *value*

Context **[Tree]** (config>subscr-mgmt>pfcp-association>tx ttl)

Full Context configure subscriber-mgmt pfcp-association tx ttl

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures initial TTL value that is sent in the IP header.

Default ttl 255

Parameters *value* — Specifies the TTL value, in seconds.

This value must be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ttl

Syntax **ttl** *hops*
no ttl

Context **[Tree]** (config>router>lmp>peer>control-channel ttl)

Full Context configure router lmp peer control-channel ttl

Description This command configures the time to live (TTL) for all packets (GMPLS RSVP and LMP) on the IP control channel, which allows the TTL to be optimized for multi-hop communication networks between the GMPLS UNI-C and UNI-N.

Default ttl 1

Parameters *hops* — The TTL value for the packets.

Values 1 to 255

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax **ttl** *label-ttl*
no ttl

Context **[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy ttl)

Full Context configure saa test type-multi-line lsp-ping sr-policy ttl

Description This command configures a time-to-live value for the MPLS label.

The **no** form of this command reverts to the default value.

Default ttl 255

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *label-ttl* — Specifies the time-to-live value.

Values 1 to 255

Default 255

Platforms All

ttl

Syntax **ttl min-ttl** *min-label-ttl* **max-ttl** *max-label-ttl*
no ttl

Context **[Tree]** (config>saa>test>type-multi-line>lsp-trace>sr-policy ttl)

Full Context configure saa test type-multi-line lsp-trace sr-policy ttl

Description This command configures minimum and maximum time-to-live values.

The **no** form of this command removes the configuration.

Parameters *min-label-ttl* — Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-label-ttl — Specifies the maximum TTL value in the MPLS label for the LDP treetrace test, expressed as a decimal integer.

Values 1 to 255

Default 30

Platforms All

ttl

Syntax **ttl** *time-to-live*
no ttl

Context **[Tree]** (config>oam-pm>session>ip ttl)

Full Context configure oam-pm session ip ttl

Description This command defines the value of the TTL field of the packet header.

The **no** form of this command restores the default value.

Default ttl 225

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *time-to-live* — Specifies the value to be used in the TTL field.

Values 1 to 255

Default 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax **ttl** *time-to-live*
no ttl

Context **[Tree]** (config>oam-pm>session>mpls ttl)

Full Context configure oam-pm session mpls ttl

Description This command defines the value of the MPLS TTL for DM packets.

The **no** form of this command reverts the default value.

Default ttl 255

Parameters *time-to-live* — Specifies the value to be used in the TTL field.

Values 1 to 255

Default 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax **ttl** *value*
no ttl

Context **[Tree]** (config>test-oam>icmp>ping-template ttl)

Full Context configure test-oam icmp ping-template ttl

Description This command configures the TTL value used in the outgoing ping packet. The interface being tested must be directly connected on the same subnet.

The **no** form of this command reinstates the default value for TTL.

Default ttl 1

Parameters *value* — Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ttl

Syntax **ttl** *time-to-live*

Context **[Tree]** (config>test-oam>link-meas>template>twl ttl)

Full Context configure test-oam link-measurement measurement-template twamp-light ttl

Description This command configures the Time to Live (TTL) value in the TWAMP Light test packet.

Default ttl 1

Parameters *time-to-live* — Specifies the value to be used in the TTL field.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl

Syntax **ttl** {**lt** | **gt** | **eq**} *ttl-value*
ttl range *ttl-value ttl-value*
no ttl

Context **[Tree]** (config>filter>ip-filter>entry>match ttl)

Full Context configure filter ip-filter entry match ttl

Description This command configures the Time To Live (TTL) match criteria.

The **no** form of this command removes the configuration.

Default no ttl

Parameters **lt** — Specifies “less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies “greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies “equal to”.

ttl-value — Specifies the maximum TTL value.

Values 0 to 255

Platforms All

24.202 ttl-expired

ttl-expired

Syntax **ttl-expired** *number seconds*
no ttl-expired [*number seconds*]

Context **[Tree]** (config>service>ies>if>icmp ttl-expired)
[Tree] (config>service>ies>sub-if>grp-if>icmp ttl-expired)
[Tree] (config>service>vprn>sub-if>grp-if>icmp ttl-expired)

Full Context configure service ies interface icmp ttl-expired
configure service ies subscriber-interface group-interface icmp ttl-expired
configure service vprn subscriber-interface group-interface icmp ttl-expired

Description This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

Default ttl-expired 100 10

Parameters *number* — The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds — The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface icmp ttl-expired
- configure service vprn subscriber-interface group-interface icmp ttl-expired

All

- configure service ies interface icmp ttl-expired

no ttl-expired

Context [Tree] (config>subscr-mgmt>git>ipv4>icmp ttl-expired)

Full Context configure subscriber-mgmt group-interface-template ipv4 icmp ttl-expired

Description This command configures the rate at which ICMP TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables limiting of the rate at which TTL expired messages are generated on the router interface.

Default ttl-expired number 100 seconds 10

Parameters *number* — Specifies the maximum number of ICMP TTL expired messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds — Specifies the time, in seconds, used to limit the number of ICMP TTL expired messages that can be generated, expressed as a decimal integer.

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.203 ttl-propagate

ttl-propagate

Syntax **ttl-propagate**

Context **[Tree]** (config>service>vprn ttl-propagate)

Full Context configure service vprn ttl-propagate

Description Commands in this context configure TTL propagation for transit and locally generated packets in a given VPRN routing context.

Platforms All

ttl-propagate

Syntax **ttl-propagate**

Context **[Tree]** (config>router ttl-propagate)

Full Context configure router ttl-propagate

Description Commands in this context configure TTL propagation for transit and locally generated packets in the Global Routing Table (GRT) and VPRN routing contexts

Platforms All

24.204 ttl-security

ttl-security

Syntax **ttl-security** *min-ttl-value*
no ttl-security

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy ttl-security)

Full Context configure subscriber-mgmt bgp-peering-policy ttl-security

Description This command configures the TTL security parameters for incoming packets.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *min-ttl-value* — Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ttl-security

Syntax **ttl-security** *min-ttl-value*
no ttl-security

Context **[Tree]** (config>service>vprn>bgp>group ttl-security)
[Tree] (config>service>vprn>bgp>group>neighbor ttl-security)

Full Context configure service vprn bgp group neighbor ttl-security
configure service vprn bgp group ttl-security

Description Configure TTL security parameters for incoming packets.

Parameters *min-ttl-value* — Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Default 1

Platforms All

ttl-security

Syntax **ttl-security** *min-ttl-value*
no ttl-security

Context **[Tree]** (config>router>bgp>group ttl-security)
[Tree] (config>router>bgp>group>neighbor ttl-security)
[Tree] (config>router>ldp>tcp-session-params>peer-transport ttl-security)
[Tree] (config>system>login-control>ssh ttl-security)
[Tree] (config>system>login-control>telnet ttl-security)

Full Context configure router bgp group neighbor ttl-security
configure router bgp group ttl-security
configure router ldp tcp-session-parameters peer-transport ttl-security
configure system login-control ssh ttl-security
configure system login-control telnet ttl-security

Description This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *min-ttl-value* — Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Platforms All

24.205 tunnel

tunnel

Syntax **tunnel** *tunnel-name* [**create**]
no tunnel *tunnel-name*

Context **[Tree]** (config>router>l2tp>group tunnel)
[Tree] (config>service>vprn>l2tp>group tunnel)

Full Context configure router l2tp group tunnel
configure service vprn l2tp group tunnel

Description This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).

The **no** form of this command removes the tunnel name from the configuration.

Parameters *tunnel-name* — Specifies a valid string to identify an L2TP, up to 32 characters.

create — Mandatory keyword to create a new tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax **tunnel** *connection-id*

Context **[Tree]** (debug>router>l2tp tunnel)

Full Context debug router l2tp tunnel

Description This command enables debugging for an L2TP tunnel.

Parameters *connection-id* — Specifies the connection ID of the L2TP session associated with this session.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tunnel

Syntax **tunnel** *service-id* **backbone-dest-mac** *mac-name* **isid** *ISID*
tunnel *service-id* **backbone-dest-mac** *ieee-address* **isid** *ISID*
no tunnel

Context **[Tree]** (config>service>epipe>pbb tunnel)

Full Context configure service epipe pbb tunnel

Description This command configures a Provider Backbone Bridging (PBB) tunnel with Backbone VPLS (B-VPLS) service information.

Parameters *service-id* — Specifies the B-VPLS service for the PBB tunnel associated with this service.

Values *service-id*: 1 to 2147483648
svc-name: 64 characters maximum

backbone-dest-mac *mac-name* — Specifies the backbone destination MAC name for PBB packets up to 32 characters in length.

backbone-dest-mac *ieee-address* — Specifies the backbone destination MAC-address for PBB packets as xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

isid *ISID* — Specifies a 24 bit service instance identifier for the PBB tunnel associated with this service. As part of the PBB frames, it is used at the destination PE as a demultiplexer field.

Values 0 to 16777215

Platforms All

tunnel

Syntax **tunnel** *ipsec-tunnel-name* [**detail**] [**no-dpd-debug**] [**display-keys**]
no tunnel *ipsec-tunnel-name*

Context **[Tree]** (debug>ipsec tunnel)

Full Context debug ipsec tunnel

Description This command enables debugging for specified IPsec tunnel.

Note: Up to 16 IPsec tunnels are allowed, to enable debugging, at a time.

Parameters *ipsec-tunnel-name* — Specifies the name of ipsec-tunnel, up to 32 characters.

detail — Displays detailed debug information.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no-dpd-debug — Stops logging IKEv1 and IKEv2 DPD events for less noise during debug.

display-keys — Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax [**no**] **tunnel** *ip-address*

Context **[Tree]** (debug>router>rib-api tunnel)

Full Context debug router rib-api tunnel

Description This command enables debugging for the specified RIB-API tunnel.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the RIB-API tunnel.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Platforms All

tunnel

Syntax **tunnel** *name* **[create]**
no tunnel *name*

Context **[Tree]** (config>system>grpc-tunnel tunnel)

Full Context configure system grpc-tunnel tunnel

Description Commands in this context configure gRPC tunnel parameters for the specified tunnel. There can be multiple tunnels to one or more destinations.

The **no** form of this command removes the specified gRPC tunnel.

Parameters *name* — Specifies the tunnel name, up to 32 characters.

create — Keyword used to create a tunnel.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.206 tunnel-client-attrs

tunnel-client-attrs

Syntax [**no**] **tunnel-client-attrs**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute tunnel-client-attrs)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute tunnel-client-attrs

Description This command specifies that tunnel attributes should be included into RADIUS accounting messages.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.207 tunnel-dot1q

tunnel-dot1q

Syntax [**no**] **tunnel-dot1q**

Context **[Tree]** (config>port>ethernet>dot1x tunnel-dot1q)

Full Context configure port ethernet dot1x tunnel-dot1q

Description This command configures the tunneling of single tagged (dot1q) dot1x packets arriving on the port. When enabled, the router extracts these packets to the CPM.

The **no** form of this command disables the tunelling of the dot1q dot 1x packets on the port.

Default tunnel-dot1q

Platforms All

24.208 tunnel-down-damp-time

tunnel-down-damp-time

Syntax **tunnel-down-damp-time** *seconds*
no tunnel-down-damp-time

Context **[Tree]** (config>router>ldp tunnel-down-damp-time)

Full Context configure router ldp tunnel-down-damp-time

Description This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

Default no tunnel-down-damp-time (which equals a value of 3 seconds)

Parameters *seconds* — Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms All

Use subject to Terms available at: www.nokia.com

24.209 tunnel-encaps

tunnel-encaps

Syntax **tunnel-encaps**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw tunnel-encaps)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw tunnel-encaps)

Full Context configure service ies subscriber-interface group-interface wlan-gw tunnel-encaps
configure service vprn subscriber-interface group-interface wlan-gw tunnel-encaps

Description Commands in this context configure tunnel encapsulation parameters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.210 tunnel-endpoint

tunnel-endpoint

Syntax **tunnel-endpoint** [**tunnel-spf**] [**tunnel-leak** *ip-address*]
no tunnel-endpoint

Context **[Tree]** (debug>router>isis tunnel-endpoint)

Full Context debug router isis tunnel-endpoint

Description This command enables debugging for an ISIS tunnel endpoint.

The **no** form of the command disables the debugging.

Parameters **tunnel-spf** — Debugs tunnel SPF information.

ip-address — When specified, only packets with the specified address are debugged.

Platforms All

tunnel-endpoint

Syntax **tunnel-endpoint** [**tunnel-spf** *ip-address*] [**tunnel-leak** *ip-address*]

Context **[Tree]** (debug>router>ospf tunnel-endpoint)
[Tree] (debug>router>ospf3 tunnel-endpoint)

Full Context debug router ospf tunnel-endpoint

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

debug router ospf3 tunnel-endpoint

Description This command enables debugging for OSPF tunnel endpoints.

Parameters **tunnel-spf** — Specifies the tunnel SPF IP address.

tunnel-leak — Specifies the tunnel leak IP address.

ip-address — Specifies the IP address.

Platforms All

24.211 tunnel-endpoint-id

tunnel-endpoint-id

Syntax **tunnel-endpoint-id** *tunnel-endpoint-id*
no tunnel-endpoint-id

Context **[Tree]** (config>test-oam>build-packet>header>gtp-user tunnel-endpoint-id)

Full Context configure test-oam build-packet header gtp-user tunnel-endpoint-id

Description This command defines the GTP tunnel endpoint ID for the GTP user header.

The **no** form of this command removes the tunnel endpoint ID value.

Default tunnel-endpoint-id 0

Parameters *tunnel-endpoint-id* — Specifies the GTP tunnel endpoint ID to be used in the test GTP header.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tunnel-endpoint-id

Syntax **tunnel-endpoint-id** *tunnel-endpoint-id*
no tunnel-endpoint-id

Context **[Tree]** (debug>oam>build-packet>packet>field-override>header>gtp-user tunnel-endpoint-id)

Full Context debug oam build-packet packet field-override header gtp-user tunnel-endpoint-id

Description This command debugs the GTP tunnel endpoint ID for the GTP user header.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the tunnel endpoint ID value.

Default no override

Parameters *tunnel-endpoint-id* — Specifies the GTP tunnel endpoint ID to be used in the test GTP header.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.212 tunnel-far-end

tunnel-far-end

Syntax **tunnel-far-end** *ip-address* | *ipv6-address*
no tunnel-far-end [*ip-address* | *ipv6-address*]

Context **[Tree]** (config>service>sdp tunnel-far-end)

Full Context configure service sdp tunnel-far-end

Description This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the “hello” message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default no tunnel-far-end

Parameters *ip-address* **|** *ipv6-address* — Specifies the system address of the far-end router for the SDP in dotted decimal notation.

Platforms All

configure service ies eth-cfm tunnel-fault
configure service ies interface sap eth-cfm tunnel-fault
configure service ies subscriber-interface group-interface sap eth-cfm tunnel-fault
configure service ipipe eth-cfm tunnel-fault
configure service ipipe sap eth-cfm tunnel-fault
configure service vpls eth-cfm tunnel-fault
configure service vpls sap eth-cfm tunnel-fault
configure service vprn eth-cfm tunnel-fault
configure service vprn interface sap eth-cfm tunnel-fault
configure service vprn subscriber-interface group-interface sap eth-cfm tunnel-fault

Description Allows the individual service SAPs to react to changes in the tunnel MEP state. When tunnel-fault accept is configured at the service level, the SAP will react according to the service type, Epipe will set the operational flag and VPLS, IES and VPRN SAP operational state will become down on failure or up on clear. This command triggers the OAM mapping functions to mate SAPs and bindings in an Epipe service as well as setting the operational

flag. If AIS generation is the requirement for the Epipe services this command is not required. See the **ais-enable** command under the **config>service>epipe>sap>eth-cfm>ais-enable** context for more details. This works in conjunction with the tunnel-fault accept on the individual SAPs. Both must be set to accept to react to the tunnel MEP state. By default the service level command is “ignore” and the SAP level command is “accept”. This means simply changing the service level command to “accept” will enable the feature for all SAPs. This is not required for Epipe services that only wish to generate AIS on failure.

Default tunnel-fault ignore (Service Level)

tunnel-fault accept (SAP Level for Epipe and VPLS)

Parameters **accept** — Shares fate with the facility tunnel MEP.

ignore — Does not share fate with the facility tunnel MEP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn subscriber-interface group-interface sap eth-cfm tunnel-fault

24.214 tunnel-group

tunnel-group

Syntax **tunnel-group** *tunnel-group-id* [**create**]
tunnel-group *tunnel-group-id* **isa-scale-mode** *isa-scale-mode* [**create**]
no tunnel-group *tunnel-group-id*

Context **[Tree]** (config>isa tunnel-group)

Full Context configure isa tunnel-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type. On VSR, **isa-scale-mode** must be specified, which defines the number of tunnels on each ISA.

The **no** form of this command deletes the specified tunnel group from the configuration

Parameters *tunnel-group-id* — Identifies the tunnel group.

Values 1 to 16

isa-scale-mode — Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group.

Values tunnel-limit-32k, where k equals 1024

create — Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-group

Syntax **tunnel-group** *tunnel-group-id* [**create**]
no tunnel-group *tunnel-group-id*

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-ipsec tunnel-group)

Full Context configure redundancy multi-chassis peer mc-ipsec tunnel-group

Description This command enables multi-chassis redundancy for specified tunnel-group; or enters an already configured tunnel-group context. The configured tunnel-group could failover independently.

The **no** form of this command removes the tunnel group ID from the configuration.

Parameters *tunnel-group-id* — Specifies the tunnel-group identifier.

Values 1 to 16

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-group

Syntax **tunnel-group** *tunnel-group-id* **sync-tag** *tag-name* [**create**]
no tunnel-group *tunnel-group-id*

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync tunnel-group)

Full Context configure redundancy multi-chassis peer sync tunnel-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables multi-chassis synchronization of IPsec states of specified tunnel-groups with a peer. The **sync-tag** parameter is used to match corresponding tunnel-group on both peers. IPsec states will be synchronized between tunnel-groups with same sync-tag.

Parameters *tunnel-group-id* — Specifies the ID of the tunnel group.

tag-name — Specifies the name of the sync-tag.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.215 tunnel-id

tunnel-id

Syntax **tunnel-id** *tunnel-id*
no tunnel-id

Context **[Tree]** (config>test-oam>build-packet>header>l2tp tunnel-id)
[Tree] (debug>oam>build-packet>packet>field-override>header>l2tp tunnel-id)

Full Context configure test-oam build-packet header l2tp tunnel-id
debug oam build-packet packet field-override header l2tp tunnel-id

Description This command defines the tunnel ID to be used in the L2TP header.

The **no** form of this command removes the tunnel ID value.

Default tunnel-id 0

Parameters *tunnel-id* — Specifies the L2TP tunnel ID to be used in the L2TP header.

Values 0 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.216 tunnel-interface

tunnel-interface

Syntax [**no**] **tunnel-interface** {**rsvp-p2mp** *lsp-name* | **ldp-p2mp** *p2mp-id* **sender** *sender-address* [**root-node**]}

Context **[Tree]** (config>router tunnel-interface)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>router>igmp tunnel-interface)

Full Context configure router igmp tunnel-interface
configure router tunnel-interface

Description This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters **rsvp-p2mp** *lsp-name* — Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id* — Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)
1 to 8192 (on root node)

sender *sender-address* — Specifies the sender IP address: a.b.c.d.

Platforms All

tunnel-interface

Syntax **tunnel-interface** [**rsvp-p2mp** *lsp-name*] [**sender** *ip-address*] [**detail**]
tunnel-interface [**ldp-p2mp** *p2mp-id*] [**sender** *ip-address*] [**detail**]
no tunnel-interface [**rsvp-p2mp** *lsp-name*] [**sender** *ip-address*]
no tunnel-interface [**ldp-p2mp** *p2mp-id*] [**sender** *ip-address*]

Context **[Tree]** (debug>router>pim tunnel-interface)

Full Context debug router pim tunnel-interface

Description This command enables debugging for PIM tunnel interfaces.

The **no** form of this command disables debugging for PIM tunnel interfaces.

Parameters *lsp-name* — Specifies the LSP for RSVP P2MP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address — Specifies the IP address of the sender.

p2mp-id — Specifies the P2MP ID for LDP P2MP.

detail — Displays detailed information for PIM tunnel interfaces.

Platforms All

tunnel-interface

Syntax [**no**] **tunnel-interface rsvp-p2mp** *lsp-name* **sender** *ip-address*

Context **[Tree]** (config>router>pim tunnel-interface)

Full Context configure router pim tunnel-interface

Description This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces in PIM and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

The **no** form of this command removes the tunnel parameters.

Parameters *lsp-name* — Specifies the LSP, up to 32 characters.

ip-address — Specifies the sender IP address.

Platforms All

24.217 tunnel-local-address

tunnel-local-address

Syntax **tunnel-local-address** *ip-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no tunnel-local-address

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query tunnel-local-address)

Full Context configure subscriber-mgmt wlan-gw ue-query tunnel-local-address

Description This command enables matching on UEs that are active on a tunnel which is connected to the specified IP address on the WLAN-GW.

The **no** form of this command disables matching on the local tunnel address.

Default no tunnel-local-address

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the local tunnel.

Values	
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.218 tunnel-mtu

tunnel-mtu

Syntax **tunnel-mtu** *mtu-bytes*
no tunnel-mtu

Context **[Tree]** (config>service>vprn>nat>inside>dslite>address tunnel-mtu)

Full Context configure service vprn nat inside dual-stack-lite address tunnel-mtu

Description This command configures the DS-Lite tunnel MTU for this DS-Lite address.

The **no** form of this command reverts the default.

Default tunnel-mtu 1500

Parameters *mtu-bytes* — Specifies the DS-Lite tunnel MTU.

Values 512 to 9212

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tunnel-mtu

Syntax **tunnel-mtu** *mtu-bytes*
no tunnel-mtu

Context **[Tree]** (config>router>nat>inside>dual-stack-lit>address tunnel-mtu)

Full Context configure router nat inside dual-stack-lit address tunnel-mtu

Description This command sets the size of the payload in IPv6 packet in downstream DS-Lite direction. The payload is, in essence, the tunneled IPv4 packet.

tunnel-mtu

Syntax **tunnel-mtu** *bytes*
no tunnel-mtu

Context **[Tree]** (config>router>isis>segment-routing tunnel-mtu)

Full Context configure router isis segment-routing tunnel-mtu

Description This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default no tunnel-mtu

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *bytes* — Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

Platforms All

tunnel-mtu

Syntax **tunnel-mtu** *bytes*
no tunnel-mtu

Context **[Tree]** (config>router>ospf>segm-rtng tunnel-mtu)
[Tree] (config>router>ospf3>segm-rtng tunnel-mtu)

Full Context configure router ospf segment-routing tunnel-mtu
configure router ospf3 segment-routing tunnel-mtu

Description This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)×4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default no tunnel-mtu

Parameters *bytes* — Specifies the size of the MTU in bytes.

Values 512 to 9786

Platforms All

tunnel-next-hop

Syntax **tunnel-next-hop**

Context **[Tree]** (config>router>static-route-entry>indirect tunnel-next-hop)

Full Context configure router static-route-entry indirect tunnel-next-hop

Description Commands in this context configure the static route's nexthop to be resolved to an indirect tunnel next-hop.

Platforms All

tunnel-next-hop

Syntax **tunnel-next-hop**

Context **[Tree]** (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context configure router isis igp-shortcut tunnel-next-hop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note: An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms All

tunnel-next-hop

Syntax **tunnel-next-hop**

Context **[Tree]** (config>router>ospf>igp-shortcut tunnel-next-hop)
[Tree] (config>router>ospf3>igp-shortcut tunnel-next-hop)

Full Context configure router ospf igp-shortcut tunnel-next-hop
configure router ospf3 igp-shortcut tunnel-next-hop

Description Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note: An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

24.221 tunnel-port-policy

tunnel-port-policy

Syntax **tunnel-port-policy** [*tunnel-port-policy*]
no tunnel-port-policy

Context **[Tree]** (config>isa>wlan-gw-group tunnel-port-policy)

Full Context configure isa wlan-gw-group tunnel-port-policy

Description This command configures the tunnel port policy of this WLAN Gateway ISA group. If a tunnel port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that policy. This policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **tunnel-port-policy** name from the configuration.

Default no-tunnel-policy

Parameters *tunnel-port-policy* — Specifies the tunnel port policy of this WLAN Gateway ISA group, up to 32 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.222 tunnel-qinq

tunnel-qinq

Syntax [**no**] **tunnel-qinq**

Context **[Tree]** (config>port>ethernet>dot1x tunnel-qinq)

Full Context configure port ethernet dot1x tunnel-qinq

Description This command configures the tunneling of double tagged (QinQ) dot1x packets. When enabled, the router extracts the packets to the CPM.

The **no** form of this command disables the tunelling of the QinQ dot1x packets on the port.

Default tunnel-qinq

24.223 tunnel-query

tunnel-query

Syntax **tunnel-query** *query-id* [**name** *name*] [**create**]
no tunnel-query *query-id*

Context **[Tree]** (config>subscr-mgmt>wlan-gw tunnel-query)

Full Context configure subscriber-mgmt wlan-gw tunnel-query

Description This command creates a tunnel query where filter criteria over WLAN-GW tunnels are defined. This query can later be used to retrieve the state of the tunnels and Layer 2 access points (which are modeled as tunnels) matching the configured criteria.

The **no** form of this command removes the query.

Parameters *query-id* — Specifies the ID assigned to a query.

Values 1 to 1024

name — Specifies the name assigned to a query, up to 32 characters.

create — Creates a tunnel query.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.224 tunnel-remote-address

tunnel-remote-address

Syntax **tunnel-remote-address** *ip-address*
no tunnel-remote-address

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query tunnel-remote-address)

Full Context configure subscriber-mgmt wlan-gw ue-query tunnel-remote-address

Description This command enables matching on UEs that are active on a tunnel with the specified source IP address.

The **no** form of this command disables matching on the remote tunnel address.

Default no tunnel-remote-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the remote tunnel.

Values	
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.225 tunnel-resource-limit

tunnel-resource-limit

Syntax **tunnel-resource-limit direction** *direction* [**create**]
no tunnel-resource-limit direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>gtp-filter tunnel-resource-limit)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter tunnel-resource-limit

Description This command configures a TCA for the counter capturing the usage of the total number of GTP tunnel resources. A tunnel-resource-limit TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or from the network side (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.226 tunnel-router

tunnel-router

Syntax **tunnel-router** *router-instance*
no tunnel-router

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>subscr-mgmt>wlan-gw>ue-query tunnel-router)

Full Context configure subscriber-mgmt wlan-gw ue-query tunnel-router

Description This command enables matching on UEs that are active on a tunnel which is terminated in the specified router instance.

The **no** form of this command disables matching on the tunnel router instance.

Default no tunnel-router

Parameters *router-instance* — Specifies the routing instance.

Values *router-name* - Base
vprn-svc-id - 1 to 2147483647

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.227 tunnel-selection-blacklist

tunnel-selection-blacklist

Syntax **tunnel-selection-blacklist**

Context [Tree] (config>router>l2tp tunnel-selection-blacklist)
[Tree] (config>service>vprn>l2tp tunnel-selection-blacklist)

Full Context configure router l2tp tunnel-selection-blacklist
configure service vprn l2tp tunnel-selection-blacklist

Description Commands in this context configure L2TP tunnel selection denylist parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.228 tunnel-server-attrs

tunnel-server-attrs

Syntax [**no**] **tunnel-server-attrs**

Context [Tree] (config>subscr-mgmt>auth-policy>include-radius-attribute tunnel-server-attrs)
[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute tunnel-server-attrs)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute tunnel-server-attrs
configure subscriber-mgmt authentication-policy include-radius-attribute tunnel-server-attrs

Description This command enables the generation of the tunnel-server RADIUS attribute.

The **no** form of this command disables the generation of the **tunnel-server-attrs** RADIUS attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.229 tunnel-session-limit

tunnel-session-limit

Syntax **tunnel-session-limit** *session-limit*
tunnel-session-limit unlimited
no tunnel-session-limit

Context **[Tree]** (config>router>l2tp tunnel-session-limit)
[Tree] (config>service>vprn>l2tp tunnel-session-limit)

Full Context configure router l2tp tunnel-session-limit
configure service vprn l2tp tunnel-session-limit

Description This command configures the L2TP session limit for each tunnel of the specified router.

The **no** form of this command removes the tunnel session limit value from the configuration.

Default no tunnel-session-limit

Parameters *session-limit* — Specifies the allowed number of sessions within the given context.

Values 1 to 65535

unlimited — Specifies to use the maximum number of sessions available.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.230 tunnel-source-ip

tunnel-source-ip

Syntax **tunnel-source-ip** *ipv6-address/prefix-length*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no tunnel-source-ip

Context [Tree] (config>router>wlan-gw>xconnect tunnel-source-ip)
[Tree] (config>service>vprn>wlan-gw>xconnect tunnel-source-ip)

Full Context configure router wlan-gw xconnect tunnel-source-ip
configure service vprn wlan-gw xconnect tunnel-source-ip

Description This command configures the IPv6 address and prefix for the tunnel source.

The **no** form of this command removes IPv6 address and prefix length from the cross-connect configuration.

Parameters *ipv6-address/prefix-length* — Specifies the tunnel source IPv6 address and prefix length of the cross-connect.

Values ipv6-address/prefix: ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D
(no multicast address)
prefix-length [1 to 128]

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.231 tunnel-table

tunnel-table

Syntax **tunnel-table** [*ip-address*] [{**ldp** | **rsvp** [**tunnel-id** *tunnel-id*] | **sdp** [**sdp-id** *sdp-id*}]]

Context [Tree] (debug>router>ip tunnel-table)

Full Context debug router ip tunnel-table

Description This command enables debugging for tunnel tables.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

24.232 tunnel-table-pref

tunnel-table-pref

Syntax **tunnel-table-pref** *preference*
no tunnel-table-pref

Context **[Tree]** (config>router>ldp tunnel-table-pref)

Full Context configure router ldp tunnel-table-pref

Description This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default tunnel-table-pref 9

Parameters *preference* — Specifies the preference value.

Values 1 to 255

Default 9

Platforms All

tunnel-table-pref

Syntax **tunnel-table-pref**

Context **[Tree]** (config>router>mpls tunnel-table-pref)

Full Context configure router mpls tunnel-table-pref

Description Commands in this context configure the tunnel table preference for RSVP-TE LSP and SR-TE LSP tunnel types.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

tunnel-table-pref

Syntax **tunnel-table-pref** *preference-value*
no tunnel-table-pref

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy tunnel-table-pref)

Full Context configure router mpls forwarding-policies forwarding-policy tunnel-table-pref

Description This command configures the TTM preference value of an MPLS forwarding policy.

The *preference-value* parameter is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command removes the configured TTM preference parameter value of the MPLS forwarding policy and assigns the default value.

Default no tunnel-table-pref

Parameters *preference-value* — Specifies the preference value.

Values 1 to 255

Default 4

Platforms All

tunnel-table-pref

Syntax **tunnel-table-pref** *preference*
no tunnel-table-pref

Context **[Tree]** (config>router>isis>segment-routing tunnel-table-pref)

Full Context configure router isis segment-routing tunnel-table-pref

Description This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default tunnel-table-pref 11

Parameters *preference* — Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

Platforms All

tunnel-table-pref

Syntax **tunnel-table-pref** *preference*
no tunnel-table-pref

Context **[Tree]** (config>router>ospf>segm-rtng tunnel-table-pref)
[Tree] (config>router>ospf3>segm-rtng tunnel-table-pref)

Full Context configure router ospf segment-routing tunnel-table-pref
configure router ospf3 segment-routing tunnel-table-pref

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default tunnel-table-pref 10

24.233 tunnel-template

tunnel-template

Syntax **tunnel-template** *tunnel-template-id*
no tunnel-template

Context **[Tree]** (config>ipsec>client-db>client tunnel-template)

Full Context configure ipsec client-db client tunnel-template

Description This command specifies the tunnel template to be used for tunnel setup.

The **no** form of this command reverts to the default.

Default no tunnel-template

Parameters *tunnel-template-id* — Specifies the identifier of the tunnel template.

Values 1 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-template

Syntax **tunnel-template** *ipsec-template-identifier* [**create**]
no tunnel-template *ipsec-template-identifier*

Context **[Tree]** (config>ipsec tunnel-template)

Full Context configure ipsec tunnel-template

Description This command creates a tunnel template. Up to 2000 templates are allowed.

Parameters *ipsec-template-identifier* — Specifies the template identifier.

Values 1 to 2048

create — Mandatory keyword used when creating a tunnel-template in the IPsec context. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

24.234 tunnel-termination

tunnel-termination

Syntax **tunnel-termination** {*ip-address* | *ipv6-address*} **fpe** *fpe-id* [**create**]
no tunnel-termination {*ip-address* | *ipv6-address*}

Context **[Tree]** (config>service>vprn>vxlan tunnel-termination)

Full Context configure service vprn vxlan tunnel-termination

Description This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured FPE when the destination IP address matches the configured tunnel termination IP address. Because the IP address is registered, the system can respond to ICMP packets directed to it.

The **no** form of this command removes the non-system IP address as the tunnel termination IP address.

Parameters *ip-address* | *ipv6-address* — Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

Values ip-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
where:
x: [0 to FFFF]H
d: [0 to 255]D

fpe-id — Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create — Mandatory keyword to create the FPE.

Platforms All

tunnel-termination

Syntax **tunnel-termination** *ip-address* **fpe** *fpe-id* [**create]**
no tunnel-termination *ip-address*

Context **[Tree]** (config>service>system>vxlan tunnel-termination)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service system vxlan tunnel-termination

Description This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured Forwarding Path Extension (FPE) when the destination IP address matches the configured tunnel-termination IP address. The IP address is also registered, which enables the system to respond to ICMP packets directed to it.

Parameters *ip-address* — Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

fpe-id — Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

Values 1 to 64

create — Creates the FPE.

Platforms All

tunnel-termination

Syntax **tunnel-termination** [*ip-address* | *ipv6-address*] **fpe** *fpe-id* [**create**]
no tunnel-termination [*ip-address* | *ipv6-address*]

Context **[Tree]** (config>service>system>gre-eth-bridged tunnel-termination)

Full Context configure service system gre-eth-bridged tunnel-termination

Description This command configures an end-point IP address for a GRE tunnel carrying Ethernet payload that is to be terminated on a PW SAP. It also associates this IP address with the FPE object that is providing cross-connect logic between the tunnel and the PW port. This IP address fully supports ICMP protocols such as PING, traceroute, and others.

Parameters *ip-address* — The tunnel end-point IP address in the SR OS node.

ipv6-address — The tunnel end-point IPv6 address in the SR OS node.

fpe *id* — The FPE ID that is providing cross-connect service between the GRE tunnel and the PW port.

Values 1 to 64

Platforms All

24.235 tunnel-type

tunnel-type

Syntax **tunnel-type** {**gre** | **l2tp** | **l2** | **vxlan** | **not-specified**}

no tunnel-type

Context [Tree] (config>subscr-mgmt>wlan-gw>ue-query tunnel-type)

Full Context configure subscriber-mgmt wlan-gw ue-query tunnel-type

Description This command enables matching on UEs that are active on a tunnel of the specified type. The **not-specified** value disables matching on the tunnel type.

The **no** form of this command reverts to the default.

Default tunnel-type not-specified

Parameters **gre** — Specifies that the tunnel is of type GRE.

l2tp — Specifies that the tunnel is of type L2TPv3.

l2 — Specifies that the UE is connected over a Layer 2 access point.

vxlan — Specifies that the tunnel is of type VXLAN.

not-specified — Specifies that no tunnel type matches on UEs.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.236 tunneling

tunneling

Syntax [**no**] **tunneling**

Context [Tree] (config>port>ethernet>efm-oam tunneling)

Full Context configure port ethernet efm-oam tunneling

Description This command enables EFM OAM PDU tunneling. Enabling tunneling will allow a port mode Epipe SAP to pass OAM frames through the pipe to the far end.

The **no** form of this command disables tunneling.

Default no tunneling

Platforms All

tunneling

Syntax [**no**] **tunneling**

Context [Tree] (config>port>ethernet>dot1x tunneling)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port ethernet dot1x tunneling

Description This command enables the tunneling of untagged 802.1x frames received on a port and is supported only when **dot1x port-control** is set to **force-auth**. 802.1x tunneling is applicable to both Epipe and VPLS services using either a null SAP or a default SAP on a dot1q port. When configured, untagged 802.1x frames will be switched into the service with the corresponding supported SAP.

The **no** form of this command disables tunneling of untagged 802.1x frames.

Default no tunneling

Platforms All

tunneling

[Tree] (config>router>ldp>targ-session>peer-template tunneling)

Full Context configure router ldp targeted-session peer tunneling
configure router ldp targeted-session peer-template tunneling

Description This command enables LDP over tunnels.

The **no** form of this command disables tunneling.

Default no tunneling

Platforms All

tunneling

Syntax [**no**] **tunneling**

Context **[Tree]** (config>router>ldp>targ-session>auto-tx>ipv4 tunneling)
[Tree] (config>router>ldp>targ-session>auto-rx>ipv4 tunneling)

Full Context configure router ldp targeted-session auto-rx ipv4 tunneling
configure router ldp targeted-session auto-tx ipv4 tunneling

Description This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the local system from sending FEC/label bindings.

two-way-slm-test

Syntax **two-way-slm-test** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**send-count** *send-count*] [**size** *data-size*] [**timeout** *timeout*] [**interval** *interval*]

Context **[Tree]** (oam>eth-cfm two-way-slm-test)

Full Context oam eth-cfm two-way-slm-test

Description This command configures an Ethernet CFM two-way SLM test in SAA.

Parameters *mac-address* — Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

remote-mepid *mep-id* — Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id* — Specifies the local MEP ID.

Values 1 to 8191

md-index — Specifies the MD index.

Values 1 to 4294967295

ma-index — Specifies the MA index.

Values 1 to 4294967295

priority — Specifies the priority.

Values 0 to 7

Default 7

send-count — Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

data-size — Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

Values 0 to 1500

Default 0

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

Values 1 to 10

Default 5

interval — Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.241 tx

tx

Syntax **tx**

Context **[Tree]** (config>subscr-mgmt>pfcp-association tx)

Full Context configure subscriber-mgmt pfcp-association tx

Description Commands in this context configure parameters that determine how PFCP messages are sent.

Default tx

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tx

Syntax **tx auto-generated**
tx bytes *byte-string* [*byte-string*...(up to 64 byte-strings max, 64 bytes max)]
tx string *identifier*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no tx

Context [Tree] (config>port>otu>pm-tti tx)

Full Context configure port otu pm-tti tx

Description This command enables the user to configure the transmit (tx) trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

Parameters **auto-generated** — Specifies to use the system generated (default) TTI.

identifier — Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0.

byte-string — Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings. Up to 64 byte strings can be specified in a single statement.

Values 0 to FF, in hexadecimal byte notation

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax **tx** *byte*
tx auto

Context [Tree] (config>port>otu>psi-payload tx)

Full Context configure port otu psi-payload tx

Description This command allows the user to configure the transmit payload type value in byte 0 of the payload structure identifier (PSI) of the OPU overhead.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default 3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

Parameters **auto** — Transmits the standard value in the payload type field.

byte — Specifies the transmit payload type value in bytes.

Values [00 to FF] Hexadecimal notation

Default 00

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax **tx auto-generated**
tx bytes *byte-string* [*byte-string*)]
tx string *identifier*
no tx

Context **[Tree]** (config>port>otu>sm-tti tx)

Full Context configure port otu sm-tti tx

Description This command allows the user to configure the transmit (tx) trail trace identifier (TTI) for section monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

Default Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- Nodename — The first section is the name of the node.
- iomnum — The second section contains the IOM slot number.
- mdanum — The third section contains the MDA slot number.
- portnum — The fourth section contains the port number.
- dwdmchan — The fifth section contains the DWDM channel number (see the table “DWDM Channel Numbers” in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

Parameters **auto-generated** — Specifies to use the system generated (default) TTI.

identifier — Sets the SM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

byte-string — Sets the SM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

Syntax **tx** {**string** *identifier* | **bytes** *byte-sequence* | **auto-generated**}

Context **[Tree]** (config>port>otu>psi-trace tx)

Full Context configure port otu psi-trace tx

Description This command allows the user to configure the transmit trace in bytes 1 to 255 (skipping byte 0) of the payload structure identifier (PSI) of the OPU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 255 bytes.

Default Blank (all zeros)

Parameters **auto-generated** — Sets the default PSI trace.

identifier — Sets the PSI trace to the string provided by the user. If the string is less than 255 bytes, the remaining bytes will be set to 0.

byte-sequence — [byte1 byte2 to byte64] Sets the PSI trace to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

Values 0 to FF, in hexadecimal byte notation

24.242 tx-credit-max

tx-credit-max

Syntax **tx-credit-max** *count*
no tx-credit-max

Context **[Tree]** (config>system>lldp tx-credit-max)

Full Context configure system lldp tx-credit-max

Description This command configures the maximum consecutive LLDPDUs transmitted.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no tx-credit-max

Parameters *count* — Specifies the maximum consecutive LLDPDUs transmitted.

Values 1 to 100

Default 5

Platforms All

24.243 tx-dus

tx-dus

Syntax [**no**] **tx-dus**

Context **[Tree]** (config>port>ethernet>ssm tx-dus)
[Tree] (config>port>sonet-sdh tx-dus)

Full Context configure port ethernet ssm tx-dus
configure port sonet-sdh tx-dus

Description This command forces the QL value transmitted from the SSM channel of the SONET/SDH port or the Synchronous Ethernet port to be set to QL-DUS/QL-DNU. This capability is provided to block the use of the interface from the SR/ESS for timing purposes.

This command is supported on TDM satellite.

Default no tx-dus

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh tx-dus

Description This command enables the transmission of the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards.

The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

The **config**>**eth-cfm**>**system**>**grace-tx-enable** command must be configured to instruct the system that the node is capable of transmitting expected defect windows to the peers. Only one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED) may be transmitted.

The **no** form of this command disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default tx-eth-vsm-grace

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.246 tx-hold-multiplier

tx-hold-multiplier

Syntax **tx-hold-multiplier** *multiplier*
no tx-hold-multiplier

Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>lldp tx-hold-multiplier)

Full Context configure system lldp tx-hold-multiplier

Description This command configures the multiplier of the tx-interval.

The **no** form of this command reverts to the default value.

Default no tx-hold-multiplier

Parameters *multiplier* — Specifies the multiplier of the tx-interval.

Values 2 to 10

Default 4

Platforms All

24.247 tx-interval

tx-interval

Syntax **tx-interval** *interval*
no tx-interval

Context [Tree] (config>system>lldp tx-interval)

Full Context configure system lldp tx-interval

Description This command configures the LLDP transmit interval time.

The **no** form of this command reverts to the default value.

Default no tx-interval

Parameters *interval* — Specifies the LLDP transmit interval time.

Values 5 to 32768

Default 30

Platforms All

24.248 tx-mgmt-address

tx-mgmt-address

Syntax **tx-mgmt-address** [**system**] [**system-ipv6**] [**oob**] [**oob-ipv6**]
no tx-mgmt-address

Context **[Tree]** (config>port>ethernet>lldp>dstmac tx-mgmt-address)

Full Context configure port ethernet lldp dest-mac tx-mgmt-address

Description This command specifies which management address to transmit. The operator can choose to send the system IPv4 address, the system IPv6 address, the out-of-band IPv4 address, the out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol in order to send the management address.

The **no** form of the command resets value to the default.

Default no tx-mgmt-address

Parameters **system** — Specifies to use the system IP address. The system address will only be transmitted once it has been configured if this parameter is specified.

system-ipv6 — Specifies to use the system IPv6 address. The system address will only be transmitted once it has been configured if this parameter is specified.

oob — Specifies to use the out-of-band IPv4 address for active CPM.

oob-ipv6 — Specifies to use the out-of-band IPv6 address for active CPM.

Platforms All

24.249 tx-timer

tx-timer

Syntax **tx-timer** *seconds*
no tx-timer

Context **[Tree]** (config>subscr-mgmt>diameter-application-policy tx-timer)

Full Context configure subscriber-mgmt diameter-application-policy tx-timer

Description This command defines the time-out period for the application’s request messages (CCR-I/U/T).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **on-failure** configuration determines the action that taken once the message times out.

The **no** form of this command reverts to the default value.

Default tx-timer 10

Parameters *seconds* — Specifies the Tx Timer value (in seconds) for this policy.

Values 10 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.250 tx-tlvs

tx-tlvs

Syntax **tx-tlvs** [**port-desc**] [**sys-name**] [**sys-desc**] [**sys-cap**]
no tx-tlvs

Context **[Tree]** (config>port>ethernet>lldp>dstmac tx-tlvs)

Full Context configure port ethernet lldp dest-mac tx-tlvs

Description This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default no tx-tlvs

Parameters **port-desc** — Indicates that the LLDP agent should transmit port description TLVs.

sys-name — Indicates that the LLDP agent should transmit system name TLVs.

sys-desc — Indicates that the LLDP agent should transmit system description TLVs.

sys-cap — Indicates that the LLDP agent should transmit system capabilities TLVs.

24.251 tx-while-sync-uncertain

tx-while-sync-uncertain

Syntax [**no**] **tx-while-sync-uncertain**

Context **[Tree]** (config>system>ptp tx-while-sync-uncertain)

Full Context configure system ptp tx-while-sync-uncertain

Description This command configures the local PTP clock to transmit Announce messages to downstream clocks, indicating it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the SyncUncertain state is true.

The **no** form of this command prevents the local PTP clock from sending Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the **no** form of this command is used while the clock's SyncUncertain state is true, unicast negotiation grant requests are not granted and current grants are canceled.

Default tx-while-sync-uncertain

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

24.252 type

type

Syntax [**no**] **type** {**internal** | **external**}

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy type)

Full Context configure subscriber-mgmt bgp-peering-policy type

Description This command designates the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of **external** indicates that the peer is an EBGP peer.

By default, the OS derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

Parameters **internal** — Configures the peer as internal.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

external — Configures the peer as external.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

type

Syntax [**no**] **type**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query type)

Full Context configure subscriber-mgmt wlan-gw tunnel-query type

Description This command enables matching on specific tunnel types. If no tunnel type match criteria is specified, type matching is implicitly disabled.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

type

Syntax **type** [*type*] [**vendor-id** *vendor-id*]
no type

Context **[Tree]** (config>router>radius-proxy>server>attribute-matching type)
[Tree] (config>service>vprn>radius-proxy>server>attribute-matching type)

Full Context configure router radius-proxy server attribute-matching type
configure service vprn radius-proxy server attribute-matching type

Description This command specifies the RADIUS VSA type for the entries to be matched with.

Parameters type — Specifies the RADIUS server policy matching attribute-type.

Values 1 to 255

vendor-id — Specifies the vendor ID number.

Values 1 to 16777215, **nokia**

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

type

Syntax [**no**] **type** {**internal** | **external**}

Context **[Tree]** (config>service>vprn>bgp>group type)
[Tree] (config>service>vprn>bgp>group>neighbor type)

Full Context configure service vprn bgp group neighbor type
configure service vprn bgp group type

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command designates the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of external indicates that the peer is an EBGP peer.

By default, the OS derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no type

Parameters **internal** — Configures the peer as internal.

external — Configures the peer as external.

no type — Type of neighbor is derived on the local AS specified.

Platforms All

type

Syntax **type** [**hub** | **spoke** | **subscriber-split-horizon**]
no type

Context **[Tree]** (config>service>vprn type)

Full Context configure service vprn type

Description This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default no type

Parameters **hub** — Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke — Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon — Controls the flow of traffic for wholesale subscriber applications.

type

Syntax **type** [**head-end** | **tail-end**]

Context **[Tree]** (config>gmpls-tun-grp type)

Full Context configure gmpls-tun-grp type

Description This command configures whether a GMPLS tunnel group is at the head-end or tail-end of the set of member GMPLS LSPs from the perspective of GMPLS LSP setup. It can only configured if the GMPLS tunnel group has no members; for example, if none have yet been configured.

Default type head-end

Parameters **head-end** — Sets the GMPLS tunnel group to operate as a head-end.

tail-end — Sets the GMPLS tunnel group to operate as a tail-end.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type

Syntax [**no**] **type**

Context **[Tree]** (config>saa>test type)

Full Context configure saa test type

Description This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

Platforms All

type

Syntax **type** *filter-type*
no type

Context **[Tree]** (config>qos>sap-ingress>ip-criteria type)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>qos>sap-ingress>ipv6-criteria type)

Full Context configure qos sap-ingress ip-criteria type
configure qos sap-ingress ipv6-criteria type

Description This command sets the **ip-criteria** and **ipv6-criteria** type to control the type of match entries configurable in this context.

Default type normal

Parameters *filter-type* — Specifies which type of entries that the **ip-criteria** and **ipv6-criteria** statements can contain.

Values **normal** — Regular match criteria are allowed; VXLAN VNI matching is not allowed.

tagged-entries — Specifies that entries within that criteria statement are tagged. Tagged entries are not populated by default, they are only populated when their tag value is activated using the criteria override under an Ethernet SAP.

The **type** can only be changed from **normal** to **tagged-entries** if there are no **ip-criteria** or **ipv6-criteria** entries configured and the SAP ingress QoS policy is not applied to any object.

A SAP ingress QoS policy configured with a criteria statement with **type tagged-entries** is not supported within an SLA profile, sub profile or MSAP policy, or under an IES/VPRN group interface SAP.

The configuration of **type tagged-entries** is mutually exclusive with the configuration of the **match dst-port** in the same criteria statement.

vxlan-vni — Matching is allowed on a VXLAN VNI for VXLAN and VXLAN GPE frames.

The type cannot be changed when **ip-criteria** or **ipv6-criteria** entries are configured. If there are no **ip-criteria** or **ipv6-criteria** entries configured, the type can be changed from **vxlan-vni** to **normal**. The type can only be changed from **normal** to **vxlan-vni** if there are no **ip-criteria** or **ipv6-criteria** entries configured but it is necessary that the SAP ingress QoS policy is also not applied to any object in order to change from **normal** to **vxlan-vni**.

A SAP ingress QoS policy configured with **type vxlan-vni** can be applied to any Ethernet SAPs, except for a PW-SAP, B-VPLS SAP, or CCAG SAP, in any applicable service.

Context [Tree] (config>qos>sap-ingress>mac-criteria type)

Full Context configure qos sap-ingress mac-criteria type

Description This command sets the mac-criteria type.

Default type normal

Parameters *filter-type* — Specifies which type of entries this MAC filter can contain.

Values **normal** — Regular match criteria are allowed; ISID match not allowed.

vid — Configures the VID filter type used to match on ethernet_II frame types. This allows matching VLAN tags for explicit filtering.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type

Syntax **type** *redirect-list-type*
no type

Context [Tree] (config>qos>queue-group-redirect-list type)

Full Context configure qos queue-group-redirect-list type

Description This command configures the type of a queue group redirect list. The default value is **vxlan-vni**, which is the only possible value.

Parameters *redirect-list-type* — Specifies the type of the queue group redirect list. The queue group redirect list is used to match VXLAN VNIs in IPv4 and IPv6 VXLAN or VXLAN GPE packets.

Values vxlan-vni

Platforms All

type

Syntax **type** {**normal** | **src-mac** | **packet-length**| **destination-class**}

Context [Tree] (config>filter>ip-filter type)
[Tree] (config>filter>ipv6-filter type)

Full Context configure filter ip-filter type
configure filter ipv6-filter type

Description This command configures the filter policy type. The policy type defines the list of match criteria supported in a filter policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default type normal

Parameters **normal** — Specifies the default filter policy type.

src-mac — Specifies the source MAC filter policy type to match on source MAC addresses in VPLS services.

packet-length — Specifies the packet-length filter policy type to match on the total packet length.

destination-class — Specifies the destination-class filter policy. This filter policy type is supported on egress networks, IES, VPRN, and R-VPLS interfaces.

Platforms All

type

Syntax **type** *filter-type*

Context **[Tree]** (config>filter>mac-filter type)

Full Context configure filter mac-filter type

Description This command configures the MAC Filter Policy type as being either normal, ISID or VID.

Default type normal

Parameters *filter-type* — Specifies which type of entry this MAC filter can contain.

Values **normal** — regular match criteria are allowed; ISID or VID filter match criteria not allowed

isid — only ISID match criteria are allowed

vid — only VID match criteria are allowed on ethernet_II frame types

Platforms All

type

Syntax **type** *schedule-type*

Context **[Tree]** (config>system>cron>sched type)

Full Context configure system cron schedule type

Description This command specifies how the system should interpret the commands contained within the schedule node.

Default type periodic

Parameters *schedule-type* — Specifies the type of schedule for the system to interpret the commands contained within the schedule node.

Values periodic — Specifies a schedule which runs at a given interval. The interval must be specified for this feature to run successfully.

calendar — Specifies a schedule which runs based on a calendar. The month, weekday, day-of-month, and minute parameters must be specified for this feature to run successfully.

oneshot — Specifies a schedule which runs one time only. As soon as the first event specified in these parameters takes place and the associated event occurs, the schedule enters a shutdown state. The month, weekday, day-of-month, and minute parameters must be specified for this feature to run successfully.

Default periodic

Platforms All

Syntax **type** {**1** | **2**}
no type

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from type)

Full Context configure router policy-options policy-statement entry from type

Description This command configures an OSPF type metric as a match criterion in the route policy statement entry.

If no type is specified, any OSPF type is considered a match.

The **no** form of this command removes the OSPF type match criterion.

Default no type

Parameters **1** — Matches OSPF routes with type 1 LSAs.

2 — Matches OSPF routes with type 2 LSAs.

Platforms All

type

Syntax **type** {*type* | *param-name*}
no type

Context **[Tree]** (config>router>policy-options>policy-statement>default-action type)
[Tree] (config>router>policy-options>policy-statement>entry>action type)

Full Context configure router policy-options policy-statement default-action type
configure router policy-options policy-statement entry action type

Description This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

Default type 2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *type* — Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

param-name — The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

25.3 udp-dst

udp-dst

Syntax **udp-dst** *udp-port*
no udp-dst

Context **[Tree]** (config>li>mirror-dest-template>layer-3-encap udp-dst)

Full Context configure li mirror-dest-template layer-3-encap udp-dst

Description This command configures the destination UDP port to be used in the UDP header of the routable LI encapsulation.

Parameters *udp-port* — Specifies the destination UDP port.

Values 1 to 65535

Platforms All

25.4 udp-dst-port

udp-dst-port

Syntax **udp-dst-port** *port*
no udp-dst-port

Context **[Tree]** (config>mcast-mgmt>mcast-rprt-dest udp-dst-port)

Full Context configure mcast-management mcast-reporting-dest udp-dst-port

Description This command specifies the UDP destination port of the external node to which IGMP events are exported.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *port* — Specifies the UDP port to send multicast reports.

Values 1 to 65535

Platforms All

25.5 udp-inbound-refresh

udp-inbound-refresh

Syntax [**no**] **udp-inbound-refresh**

Context **[Tree]** (config>service>nat>nat-policy udp-inbound-refresh)
[Tree] (config>service>nat>firewall-policy udp-inbound-refresh)
[Tree] (config>service>nat>up-nat-policy udp-inbound-refresh)

Full Context configure service nat firewall-policy udp-inbound-refresh
configure service nat nat-policy udp-inbound-refresh
configure service nat up-nat-policy udp-inbound-refresh

Description This command enables UDP session timeout extended on inbound traffic.

The **no** form of the command disables UDP session timeout extended on inbound traffic.

Default no udp-inbound-refresh

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy udp-inbound-refresh
- configure service nat up-nat-policy udp-inbound-refresh

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy udp-inbound-refresh

25.6 udp-initial

udp-initial

Syntax **udp-initial** [**min** *minutes*] [**sec** *seconds*]
no udp-initial

Context **[Tree]** (config>service>nat>nat-policy>timeouts udp-initial)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>nat>firewall-policy>timeouts udp-initial)
[Tree] (config>service>nat>up-nat-policy>timeouts udp-initial)

Full Context configure service nat firewall-policy timeouts udp-initial
configure service nat nat-policy timeouts udp-initial
configure service nat up-nat-policy timeouts udp-initial

Description This command configures the UDP mapping timeout applied to new sessions.

Default udp-initial sec 15

Parameters *minutes* — Specifies the timeout minutes field.

Values 1 to 59

seconds — Specifies the timeout seconds field.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy timeouts udp-initial
- configure service nat up-nat-policy timeouts udp-initial

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts udp-initial

25.7 udp-port

udp-port

Syntax **udp-port** *udp-port-number*

Context [Tree] (config>service>vprn>mtrace2 udp-port)
[Tree] (config>router>mtrace2 udp-port)

Full Context configure router mtrace2 udp-port
configure service vprn mtrace2 udp-port

Description This command specifies the destination and listening port for the **mtrace2** command. When it is configured, this command generates Mtrace2 packets with the configured UDP port, and also listens on the same port for any incoming Mtrace2 packets.

Port 33435 is the IANA-assigned port for Mtrace2. On several operating systems (for example, Linux OS, SR OS), this port is also used by traceroute. On SR OS, if port 33435 is configured as the Mtrace2 port, SR OS does not respond to traceroute on this port.

Default 5000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *udp-port-number* — Specifies the UDP port for the test.

Values 1024 to 49151

Platforms All

25.8 udp-return-object

udp-return-object

Syntax **udp-return-object** *ip-address*
no udp-return-object

Context **[Tree]** (config>oam-pm>session>mpls>lsp>rsvp udp-return-object)
[Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto udp-return-object)

Full Context configure oam-pm session mpls lsp rsvp udp-return-object
configure oam-pm session mpls lsp rsvp-auto udp-return-object

Description This command configures the destination IP address used by the far end of the test to send a test response. The UDP port in the UDP-Return Object is set to 64353 for MPLS DM PDUs.

RSVP tunnels are unidirectional and must include a configured local address for the responder can route the response back by the IP control plane. If the configuration is absent, the DN test fails to activate. If the configured IP address is not a local address, the command fails.

The **no** form of this command removes the udp-return-object IP address.

Parameters *ip-address* — Specifies the destination IP.

Values
ipv4-address -a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0..FFFF]H
d: [0..255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.9 udp-src

udp-src

Syntax **udp-src** *udp-port*
no udp-src

Context **[Tree]** (config>li>mirror-dest-template>layer-3-encap udp-src)

Full Context configure li mirror-dest-template layer-3-encap udp-src

Description This command configures the source UDP port to be used in the UDP header of the routable LI encapsulation.

Parameters *udp-port* — Specifies the source UDP port.

Values 1 to 65535

Platforms All

25.10 ue

ue

Syntax **ue** *ieee-address* [**profile** *trace-profile-name*]
no ue *ieee-address*

Context **[Tree]** (debug>call-trace>wlan-gw ue)

Full Context debug call-trace wlan-gw ue

Description This command starts tracing the UE with the specified MAC address. The trace is started with default parameters or optionally parameters specified in the trace-profile.

The **no** form of this command stops the trace and make sure no new traces are started.

Parameters *ieee-address* — Displays information about the MAC address of this UE.

trace-profile-name — Specifies the name of a configured trace profile.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

25.11 ue-creation-type

ue-creation-type

Syntax [**no**] **ue-creation-type**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes ue-creation-type)

Full Context configure aaa isa-radius-policy acct-include-attributes ue-creation-type

Description This command enables including the Alc-Wlan-Ue-Creation-Type.

Default no ue-creation-type

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.12 ue-query

ue-query

Syntax **ue-query** *query-id* [**name** *name*] [**create**]
no ue-query *query-id*

Context **[Tree]** (config>subscr-mgmt>wlan-gw ue-query)

Full Context configure subscriber-mgmt wlan-gw ue-query

Description This command creates a UE query where filter criteria over WLAN-GW ISA UEs are defined. This query can later be used to retrieve state of the UEs matching the configured criteria.

The **no** form of this command removes the query.

Parameters *query-id* — Specifies the ID assigned to a query.

Values 1 to 1024

name — Specifies the name assigned to a query, up to 32 characters.

create — Creates a UE query.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

25.13 ue-state

ue-state

Syntax [**no**] **ue-state**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query ue-state)

Full Context configure subscriber-mgmt wlan-gw tunnel-query ue-state

Description This command enables matching on a specific UE state. Multiple states can be provisioned. If no UE state specifier is configured, UE state matching is disabled (all UEs match).

This match criteria can be combined with minimum and maximum match criteria, which will then apply only to UEs of the specified state.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.14 uli

uli

Syntax [**no**] **uli**

Context **[Tree]** (config>subscr-mgmt>auth-plcy>include-radius-attribute uli)

Full Context configure subscriber-mgmt authentication-policy include-radius-attribute uli

Description This command enables the inclusion of the User Location Information in AAA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

uli

Syntax [**no**] **uli**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute uli)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute uli

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command, in case of ESM over GTP access, includes the ULI VSA in accounting. This VSA contains the last VSA as received via GTP. To generate a triggered interim update whenever ULI changes, the **config>subscr-mgmt>acct-plcy>triggered-updates>gtp-mobility** command is used.

The **no** form of this command disables inclusion of the ULI VSA.

Default no uli

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.15 umh-pe

umh-pe

Syntax **umh-pe** *ip-address* **standby** *ip-address*
no umh-pe *ip-address*

Context **[Tree]** (config>service>vprn>mvpn>umh-pe-backup umh-pe)

Full Context configure service vprn mvpn umh-pe-backup umh-pe

Description This command assigns a standby PE to each primary PE that must be selected as an alternative PE in case the UFD session on tunnel from primary PE is detected down. Standby for a PE cannot be modified without shutting down the MVPN instance.

If a primary PE is not assigned a standby PE then the UMH selection would fall back to the default method.

Platforms All

25.16 umh-pe-backup

umh-pe-backup

Syntax **umh-pe-backup**

Context **[Tree]** (config>service>vprn>mvpn umh-pe-backup)

Full Context configure service vprn mvpn umh-pe-backup

Description This command enables context to configure primary and standby upstream PE association for the MVPN.

[Tree] (config>service>vprn>mvpn>pt>selective umh-rate-monitoring)

Full Context configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring
configure service vprn mvpn provider-tunnel selective umh-rate-monitoring

Description Commands in this context configure bandwidth monitoring for UMH redundancy.

Platforms All

25.18 umh-selection

umh-selection

Syntax **umh-selection** {**highest-ip** | **hash-based** | **tunnel-status** | **unicast-rt-pref**}
no umh-selection

Context **[Tree]** (config>service>vprn>mvpn umh-selection)

Full Context configure service vprn mvpn umh-selection

Description This command specifies which UMH selection mechanism to use, highest IP address, hash based or provider tunnel status.

The **no** form of this command resets it back to default.

Default umh-selection highest-ip

Parameters **highest-ip** — Specifies that the highest next-hop IP address is selected as UMH. The RTM may have just one next-hop to the source, but **highest-ip** uses all of the next-hops available to BGP that appear in the BGP database.

hash-based — Specifies that the UMH selection is based on hash-based procedures set out in RFC6513, section 5.1.3. The RTM may have just one next-hop to the source, but **hash-based** uses all of the next-hops available to BGP that appear in the BGP database.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tunnel-status — Specifies that UMH selection is based on the state of the tunnel as well as the available unicast routes through the tunnel. Not supported for IPv6.

unicast-rt-pref — When selected, best unicast route will decide which UMH is chosen. All PE routers shall prefer the same route to the UMH for the UMH selection criterion (for example BGP path selection criteria must not influence one PE to choose different UMH from another PE).

Platforms All

25.19 unavailability-event

unavailability-event

Syntax **unavailability-event** {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]
no unavailability-event {**forward** | **backward** | **aggregate**}

Context **[Tree]** (config>oam-pm>session>ethernet>slm>loss-events unavailability-event)
[Tree] (config>oam-pm>session>ethernet>lmm>loss-events unavailability-event)
[Tree] (config>oam-pm>session>ip>twamp-light>loss-events unavailability-event)

Full Context configure oam-pm session ethernet lmm loss-events unavailability-event
configure oam-pm session ethernet slm loss-events unavailability-event
configure oam-pm session ip twamp-light loss-events unavailability-event

Description This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default no unavailability-event forward

no unavailability-event backward

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no unavailability-event aggregate

Parameters **forward** — Specifies the threshold is applied to the forward direction count.

backward — Specifies the threshold is applied to the backward direction count.

aggregate — Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold — Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold — Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the unavailability counter must be 0.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure oam-pm session ip twamp-light loss-events unavailability-event

25.23 unconstrained-bw

unconstrained-bw

Syntax **unconstrained-bw** *bandwidth* **mandatory-bw** *mandatory-bw*
no unconstrained-bw

Context **[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac unconstrained-bw)
[Tree] (config>subscr-mgmt>sub-mcac-plcy unconstrained-bw)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac unconstrained-bw
configure subscriber-mgmt sub-mcac-policy unconstrained-bw

Description This command configures the bandwidth for the interface or subscriber's multicast CAC policy traffic. When disabled (**no unconstrained-bw**), there is no checking of bandwidth constraints on the interface or subscriber level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface and subscriber check, the bundle checks are performed.

The **no** form of this command reverts to the default.

Parameters *bandwidth* — Specifies bandwidth assigned for interface's MCAC policy traffic, in kilobits per second (kb/s).

Values 0 to 2147483647

mandatory-bw — Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface in kilobits per second (kb/s).

If the *bandwidth* value is 0, no mandatory channels are allowed. If the value of *bandwidth* is '-1', then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*, An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

Values 0 to 2147483647

Full Context configure service vprn igmp group-interface mcac unconstrained-bw
configure service vprn igmp interface mcac unconstrained-bw
configure service vprn mld group-interface mcac unconstrained-bw
configure service vprn mld interface mcac unconstrained-bw
configure service vprn pim interface mcac unconstrained-bw

Description This command configures the bandwidth for the interface's multicast CAC policy traffic. When disabled (**no unconstrained-bw**) there will be no checking of bandwidth constraints on the interface level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface check, the bundle checks are performed.

Parameters *bandwidth* — The bandwidth assigned for the interface's MCAC policy traffic in kb/s.

Values 0 to 2147483647

mandatory-bw *mandatory-bw* — Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface, in kb/s.

If the *bandwidth* value is 0, no mandatory channels are allowed. If *bandwidth* is not configured, then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*, An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

Values 0 to 2147483647

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router mcac if-policy unconstrained-bw
configure router mld group-interface mcac unconstrained-bw
configure router mld interface mcac unconstrained-bw
configure router pim interface mcac unconstrained-bw

Description This command enables MCAC (or HMCAC) function on the corresponding level (subscriber, group-interface or redirected interface). When MCAC (or HMCAC) is enabled and a channel definition policy is referenced, admission control is performed. The allocated bandwidth for optional channels should not exceed the unconstrained-bw minus the mandatory-bw. The mandatory channels have to stay below the specified value for the mandatory-bw.

In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface or the group-interface against the bandwidth limits defined there.

In case that redirection is enabled and HMCAC enabled, the channel definition policy must be referenced under the redirected interface level. If it is referenced under the group-interface level, it will be ignored.

Subscriber MCAC (only subscriber is checked for available resources) is supported only with direct subscriber replication (no redirection). In this case the channel definition policy must be referenced under the group-interface.

If the redirection is enabled but the policy is referenced only under the group-interface, no admission control is executed (HMCAC or MCAC).

The **no** form of this command removes the values from the configuration.

Default no unconstrained-bw

Parameters *bandwidth* — Specifies the unconstrained bandwidth in kb/s for the MCAC policy.

Values 0 to 2147483647

© 2022 Nokia.

25.24 unconsumed-agg-rate

unconsumed-agg-rate

Syntax **unconsumed-agg-rate percent** *percent-of-unconsumed-agg-rate*
no unconsumed-agg-rate

Context **[Tree]**
(config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance unconsumed-agg-rate)

Full Context configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-agg-rate

Description This command configures the percentage of the unconsumed aggregate rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-agg-rate percent** to its default value.

Default unconsumed-agg-rate 100.00

Parameters *percent-of-unconsumed-agg-rate* — Specifies the percentage of the unconsumed aggregate rate that can be given to a queue.

Values 0.00 to 100.00

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

Description This command configures the percentage of the unconsumed higher tier rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-higher-tier-rate percent** to its default value.

Default unconsumed-higher-tier-rate 100.00

Parameters *percent-of-unconsumed-higher-tier-rate* — Specifies the percentage of the unconsumed higher tier rate that can be given to a queue.

Values 0.00 to 100.00

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.26 underflow-limit

underflow-limit

Syntax **underflow-limit** *number* **threshold** *percent* [**bw** *bandwidth-in-mbps*]
no underflow-limit

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth underflow-limit)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth underflow-limit)

Full Context configure router mpls lsp auto-bandwidth underflow-limit
configure router mpls lsp-template auto-bandwidth underflow-limit

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the threshold N configured as part of this command. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last N consecutive underflow samples.

A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the thresholds configured as part of this command.

The **no** form of this command disables underflow-triggered automatic bandwidth adjustment.

Default no underflow-limit

Parameters *number* — Specifies the number of consecutive underflow samples that triggers an underflow auto-bandwidth adjustment attempt.

Values 0 to 10

percent — Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth, for counting an underflow sample.

Values 0 to100

bandwidth-in-mbps — Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) relative to the current bandwidth, for counting an underflow sample.

Values 0 to 6400000

Platforms All

25.27 undet-availability-event

undet-availability-event

Syntax **undet-availability-event** {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]
no undet-availability-event {**forward** | **backward** | **aggregate**}

configure oam-pm session ip twamp-light loss-events undet-availability-event

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command sets the threshold to be applied to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined available. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default no undet-availability-event forward

no undet-availability-event backward

no undet-availability-event aggregate

Parameters **forward** — Specifies the threshold is applied to the forward direction count.

backward — Specifies the threshold is applied to the backward direction count.

aggregate — Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold — Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold — Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no unique-sid-per-sap

Context **[Tree]** (config>subscr-mgmt>ppp-policy unique-sid-per-sap)

Full Context configure subscriber-mgmt ppp-policy unique-sid-per-sap

Description This command assigns a unique session ID to each PPPoE session active on a single SAP.

On a capture SAP, a unique session ID is assigned per capture SAP: multiple sessions that are active on the same or different MSAP have a unique session ID per capture SAP.

With the optional parameter **per-msap**, a unique session ID is assigned per MSAP:

- multiple sessions that are active on the same MSAP have a unique session ID per MSAP
- multiple sessions that are active on different MSAPs are not guaranteed to have a unique session ID

The session ID range is 1 to 8191.

By default, all PPPoE sessions with a different client MAC address and active on a given SAP or MSAP have a session ID of 1 (**sid-allocation sequential**) or a random value in the range 1 to 8191 (**sid-allocation random**).

The **no** form of this command reverts to the default.

Parameters **per-msap** — Assigns a unique session ID for PPPoE sessions that are active on the same MSAP. This parameter has no effect on regular SAPs.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.36 unknown-arp-request-flood-evpn

unknown-arp-request-flood-evpn

Syntax [**no**] **unknown-arp-request-flood-evpn**

Context **[Tree]** (config>service>vpls>proxy-arp unknown-arp-request-flood-evpn)

Full Context configure service vpls proxy-arp unknown-arp-request-flood-evpn

Description This command controls whether unknown ARP-requests are flooded into the EVPN network. By default, the system floods ARP-requests, including EVPN (with source squelching), if there is no active proxy-arp entry for the requested IP.

The **no** form of the command will only flood to local SAPs/SDP-bindings and not to EVPN destinations.

Default unknown-arp-request-flood-evpn

Platforms All

25.37 unknown-mac-route

unknown-mac-route

Syntax [**no**] **unknown-mac-route**

Context **[Tree]** (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context configure service vpls bgp-evpn unknown-mac-route

Description This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7750 SR, 7450 ESS, or 7950 XRS can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Context **[Tree]** (config>qos>sap-ingress>fc unknown-policer)

Full Context configure qos sap-ingress fc unknown-policer

Description Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters *policer-id* — When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group — Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

unknown-protocol

Syntax **unknown-protocol** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no unknown-protocol

Context **[Tree]** (config>service>nat>firewall-policy>timeouts unknown-protocol)

Full Context configure service nat firewall-policy timeouts unknown-protocol

Description This command configures the timeout interval for unknown protocol mappings.

The **no** form of the command reverts the timeout interval to the default of 5 minutes.

Default unknown-protocol min 5

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *hours* — Specifies the number of hours in the unknown protocol mapping timeout interval.

Values 0 to 24

minutes — Specifies the number of minutes in the unknown protocol mapping timeout interval.

Values 1 to 59

seconds — Specifies the number of seconds in the unknown protocol mapping timeout interval.

Values 0 to 59

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.42 unknown-protocols

unknown-protocols

Syntax **unknown-protocols**

Context **[Tree]** (config>service>nat>firewall-policy unknown-protocols)

Full Context configure service nat firewall-policy unknown-protocols

Description Commands in this context configure the treatment of flows of unknown Layer 4 protocols, which are protocols that cannot be natively handled by the system.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.43 unknown-queue

unknown-queue

Syntax **unknown-queue** *queue-id* [**group** *queue-group-name*]
no unknown-queue

Context **[Tree]** (config>qos>sap-ingress>fc unknown-queue)

Full Context configure qos sap-ingress fc unknown-queue

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters *queue-id* — Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

group *queue-group-name* — This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

Platforms All

unknown-queue

Syntax **unknown-queue** *queue-id*
no unknown-queue

Context **[Tree]** (config>qos>shared-queue>fc unknown-queue)

Full Context configure qos shared-queue fc unknown-queue

Description This command configures the unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters *queue-id* — The *queue-id* must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

Values 25 to 32

25.44 unnumbered

unnumbered

Syntax **unnumbered** [*ip-int-name* | *ip-address*]
no unnumbered

Context **[Tree]** (config>service>vprn>sub-if unnumbered)
[Tree] (config>service>ies>sub-if unnumbered)

Full Context configure service ies subscriber-interface unnumbered
configure service vprn subscriber-interface unnumbered

Description This command can be configured only for subscriber interfaces that do not have an IPv4 address explicitly configured and is therefore operationally in a DOWN state. By configuring this command, the subscriber interface borrows the IPv4 address from the referenced interface (directly or indirectly via IP address) that must be operationally UP and located in the same routing instance as the subscriber interface. This allows the subscriber interface to be operationally UP and consequently allow forwarding of the subscriber traffic.

Such interface is referred as unnumbered interface, since it does not have explicitly configured a unique IP address. Subscriber hosts under the unnumbered subscriber interface are installed in the fib as /32 hosts.

Without this command the subscriber interface is operationally DOWN and subscriber-host instantiation is not possible.

This command is mutually exclusive with the allow-unmatched-subnets command under the same CLI hierarchy.

The operation of IPv6 host is not affected by this command.

The **no** form of this command reverts to the default.

Parameters *ip-int-name* — Specifies the interface name from which an IPv4 address is borrowed.

ip-address — Specifies the IP address from an optionally up interface that is used for subscriber interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Syntax **unnumbered** [{*ip-int-name* | *ip-address*}]
no unnumbered

Context **[Tree]** (config>router>if unnumbered)

Full Context configure router interface unnumbered

Description This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default no unnumbered

Parameters *ip-int-name* | *ip-address* — Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

Description This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default unreachables 100 10

Parameters *number* — Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds — Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.47 untrusted

untrusted

Syntax **untrusted** [**default-forwarding** *default-forwarding*]
no untrusted

Context **[Tree]** (config>router>if untrusted)

Full Context configure router interface untrusted

Description This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no untrusted

Parameters *default-forwarding* — Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

Syntax **up-count** *up-count*
no up-count

Context **[Tree]** (config>port>sonet-sdh>path>cisco-hdlc up-count)
[Tree] (config>port>tdm>ds1>channel-group>cisco-hdlc up-count)
[Tree] (config>port>tdm>ds3>cisco-hdlc up-count)
[Tree] (config>port>tdm>e1>channel-group>cisco-hdlc up-count)
[Tree] (config>port>tdm>e3>cisco-hdlc up-count)

Full Context configure port sonet-sdh path cisco-hdlc up-count
configure port tdm ds1 channel-group cisco-hdlc up-count
configure port tdm ds3 cisco-hdlc up-count
configure port tdm e1 channel-group cisco-hdlc up-count
configure port tdm e3 cisco-hdlc up-count

Description This command configures the number of continual keepalive packets that have to be received in order to declare the link up. It is expected that the nodes at the two endpoints of the cHDLC link are provisioned with the same values.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default up-count 1

Parameters *up-count* — Specifies the number of continual keepalive packets that must be received in order to declare the link up.

Values 1 to 3

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path cisco-hdlc up-count

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm ds3 cisco-hdlc up-count
- configure port tdm ds1 channel-group cisco-hdlc up-count
- configure port tdm e1 channel-group cisco-hdlc up-count
- configure port tdm e3 cisco-hdlc up-count

25.51 up-link

up-link

Syntax **up-link gbr** *rate* **mbr** *rate*
no up-link

Context **[Tree]** (config>subscr-mgmt>gtp>peer-profile>ggsn>qos up-link)
[Tree] (config>subscr-mgmt>gtp>peer-profile>pgw>qos up-link)
[Tree] (config>subscr-mgmt>gtp>peer-profile>mme>qos up-link)

Full Context configure subscriber-mgmt gtp peer-profile ggsn qos up-link
configure subscriber-mgmt gtp peer-profile mme qos up-link
configure subscriber-mgmt gtp peer-profile pgw qos up-link

Description This command configures the up-link bitrate in kb/s to be used in the GTP messages.

The **no** form of this command reverts to the default.

Default up-link gbr 5000 mbr 5000 - for ggsn

up-link gbr 0 mbr 0 - for mme and pgw

Parameters **gbr** *rate* — Specifies the uplink Guaranteed Bit Rate (GBR) to be used in the GTP messages as QOS IE (GTPv1) or Bearer QOS (GTPv2).

mbr *rate* — Specifies the uplink Maximum Bit Rate (MBR) to be used in the GTP messages as QOS IE (GTPv1) or Bearer QOS (GTPv2).

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

25.52 up-nat-policy

up-nat-policy

Syntax **up-nat-policy** *name* [**create**]

Context **[Tree]** (config>service>nat up-nat-policy)

Full Context configure service nat up-nat-policy

Description This command creates a NAT policy template for BNG CUPS UPF. This template is instantiated for a set of subscribers sharing in a NAT pool. The policy includes parameters that define the BNG CUPS UPF NAT behavior, such as, but not limited to, the following:

- ALGs
- filtering mode
- watermarks
- ports and NAT flow limits
- priority NAT flows
- protocol timers

When the BNG CPF does not receive the NAT policy template, a default template takes effect if it is configured on the BNG UPF. The name of the default NAT policy template on the BNG UPF must equal default.

Parameters **create** — Keyword required to create a new NAT policy for BNG CUPS UPF.

name — Specifies the UP NAT policy name, up to 32 characters. The name default has a special meaning representing the default NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.53 up-resiliency

up-resiliency

Syntax **up-resiliency**

Context **[Tree]** (config>subscr-mgmt up-resiliency)

Full Context configure subscriber-mgmt up-resiliency

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure the inter-UPF resiliency in a CUPS system.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

up-resiliency

Syntax **up-resiliency**

Context **[Tree]** (config>service>ies>subscriber-mgmt up-resiliency)
[Tree] (config>service>vprn>subscriber-mgmt up-resiliency)
[Tree] (config>service>vpls>sap>pfcp up-resiliency)

Full Context configure service ies subscriber-mgmt up-resiliency
configure service vpls sap pfcp up-resiliency
configure service vprn subscriber-mgmt up-resiliency

Description Commands in this context configure inter-UPF resiliency service parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.54 up-threshold

up-threshold

Syntax **up-threshold** *percent-change* [**bw** *absolute-change*]

Context **[Tree]** (config>router>rsvp>dbw-accounting up-threshold)

Full Context configure router rsvp dbw-accounting up-threshold

Description This command sets the minimum change (in percent of the latest advertised value) above which an increase in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB or MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

Default up-threshold 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *percent-change* — Specifies the minimum increase in MRLB/MRB, expressed in percent.

Values 0 to 100

absolute-change — Specifies the minimum increase in MRLB/MRB, expressed in Mb/s.

Values 0 to 1000000

25.55 update

update

Syntax **update** [**neighbor** *ip-address* | **group** *name*]
no update

Context **[Tree]** (debug>router>bgp update)

Full Context debug router bgp update

Description This command decodes and logs all sent and received update messages in the debug log.

The **no** form of this command disables debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms All

© 2022 Nokia.

25.57 update-interval

update-interval

Syntax **update-interval** [**hrs** *hours*] [**min** *minutes*] [**days** *days*]
no update-interval

Context [Tree] (config>service>dynsvc>acct-1 update-interval)
[Tree] (config>service>dynsvc>acct-2 update-interval)

Full Context configure service dynamic-services dynamic-services-policy accounting-1 update-interval
configure service dynamic-services dynamic-services-policy accounting-2 update-interval

Description This command specifies the interval between each RADIUS Accounting Interim-Update message (minimum 5 minutes; maximum 180 days).

The **no** form of this command disables the sending of Accounting Interim-Update messages.

A RADIUS specified Accounting Interim Interval overrides the CLI configured value.

Default no update-interval (do not send Accounting Interim-Update messages)

Parameters *hrs* — specifies the interval in hours.

Values 1 to 23

min — Specifies the interval in minutes.

Values 1 to 59

days — specifies the interval in days.

Values 1 to 180

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax **update-interval** [**hrs** *hours*] [**min** *minutes*] [**days** *days*]
no update-interval

Context [Tree] (config>service>dynsvc>ladb>user>idx>acct update-interval)

Full Context configure service dynamic-services local-auth-db user-name index accounting update-interval

Description This command specifies the time between each dynamic data service accounting interim update for this accounting destination. This command overrides the local configured value in the dynamic services policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the generation of interim accounting updates to this destination.

The minimum update interval is 5 minutes.

Parameters *hours* — Specifies the interval in hours.

Values 1 to 23

minutes — Specifies the interval in minutes.

Values 1 to 59

days — Specifies the interval in days.

Values 1 to 180

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax **update-interval** *minutes*
no update-interval

Context **[Tree]** (config>subscr-mgmt>acct-plcy update-interval)

Full Context configure subscriber-mgmt radius-accounting-policy update-interval

Description This command specifies the interval at which accounting data of subscriber hosts is updated in a RADIUS Accounting Interim-Update message. Requires interim-update to be enabled when specifying the accounting mode in the radius accounting policy.

A RADIUS specified interim interval (attribute [85] Acct-Interim-Interval) overrides the CLI configured value.

The **no** form of this command reverts to the default.

Parameters *minutes* — Specifies the interval, in minutes, at which accounting data of subscriber hosts is updated.

Values 5 to 259200

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

update-interval

Syntax **update-interval** *minutes* [**jitter** *seconds*]
no update-interval

Context **[Tree]** (config>ipsec>rad-acct-plcy update-interval)

Full Context configure ipsec radius-accounting-policy update-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

Default update-interval 10

Parameters *minutes* — Specifies the interval in minutes.

Values 5 to 259200

seconds — Specifies the jitter as the number of seconds when the system sends each interim-update packet.

Values 0 to 3600

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.58 update-interval-jitter

update-interval-jitter

Syntax **update-interval-jitter absolute** *seconds*
no update-interval-jitter

Context **[Tree]** (config>service>dynsvc>acct-1 update-interval-jitter)
[Tree] (config>service>dynsvc>acct-2 update-interval-jitter)

Full Context configure service dynamic-services dynamic-services-policy accounting-1 update-interval-jitter
configure service dynamic-services dynamic-services-policy accounting-2 update-interval-jitter

Description This command specifies the absolute maximum random delay introduced on the update interval between two RADIUS Accounting Interim Update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero sends the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

Default no update-interval-jitter (10% of the configured update-interval)

Parameters *seconds* — Specifies the absolute maximum jitter value in seconds.

Values 0 to 3600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

update-interval-jitter

Syntax **update-interval-jitter absolute** *seconds*
no update-interval-jitter

Context **[Tree]** (config>subscr-mgmt>acct-plcy update-interval-jitter)

Full Context configure subscriber-mgmt radius-accounting-policy update-interval-jitter

Description This command specifies the absolute maximum random delay introduced on the update interval between two accounting interim update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero will send the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

Parameters *seconds* — Specifies the absolute maximum jitter value in seconds.

Values 0 to 36000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.59 update-timer

update-timer

Syntax **update-timer** *seconds*
no update-timer

Context **[Tree]** (config>router>rsvp>te-threshold-update update-timer)

Full Context configure router rsvp te-threshold-update update-timer

Description This command is to control timer-based IGP TE updates. Timer-based IGP updates can be enabled by specifying a non-zero time value. Default value of update-timer is 0.

The **no** form of this command should reset update-timer to the default value and disable timer-based IGP update.

Default no update-timer

Parameters *seconds* — Specifies the time in seconds.

Values 0 to 300

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

25.60 updated-error-handling

updated-error-handling

Syntax [**no**] **updated-error-handling**

Context **[Tree]** (config>service>vprn>bgp>group updated-error-handling)
[Tree] (config>service>vprn>bgp>group>neighbor updated-error-handling)

Full Context configure service vprn bgp group neighbor updated-error-handling
configure service vprn bgp group updated-error-handling

Description This command controls whether SR OS utilizes the new neighbor-complete bit when processing optional transitive path attributes and advertising them to the associated BGP neighbor.

This command also control if SR OS utilizes the error handling mechanism for optional-transitive path attributes.

Default no updated-error-handling

25.61 updates

updates

Syntax [**no**] **updates** [**neighbor** *ip-int-name* | *ip-address*]

Context **[Tree]** (debug>router>rip updates)

Full Context debug router rip updates

Description This command enables debugging for RIP updates.

Parameters *ip-int-name* **|** *ip-address* — Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms All

updates

Syntax [**no**] **updates** [**neighbor** *ip-int-name* | *ipv6-address*]

Context **[Tree]** (debug>router>ripng updates)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug router ripng updates

Description This command enables debugging for RIP updates.

Parameters *ip-int-name* | *ipv6-address* — Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms All

25.62 upf-data-endpoint

upf-data-endpoint

Syntax **upf-data-endpoint interface** *interface-name* **fpe** *fep-id*
no upf-data-endpoint

Context **[Tree]** (config>router>gtp upf-data-endpoint)
[Tree] (config>service>vprn>gtp upf-data-endpoint)

Full Context configure router gtp upf-data-endpoint
configure service vprn gtp upf-data-endpoint

Description This command configures the GTP - User Plane (GTP-U) endpoint used by BNG CUPS FWA sessions.

The **no** form of the command disables GTP-U termination for BNG CUPS FWA sessions.

Default no upf-data-endpoint

Parameters *interface-name* — Specifies an interface name on which GTP-U packets terminate. The name must start with a letter and can be up to 32 characters.

fpe-id — Specifies the forwarding path extension (FPE) ID used to encapsulate and decapsulate GTP-U traffic.

Values 1 to 64

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.63 upgrade

upgrade

Syntax **upgrade** *index* **path** *upgrade-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no upgrade *index*

Context [Tree] (config>card upgrade)
[Tree] (config>card>mda upgrade)
[Tree] (config>card>xiom upgrade)

Full Context configure card mda upgrade
configure card upgrade
configure card xiom upgrade

Description This command assigns a license level upgrade to the card, XIOM, or XMA. There can be multiple upgrades applied to a card, XIOM, or XMA. The first upgrade must use index 1 and then next index 2 and so on. Also, when removing upgrades, the largest index must be removed first and then the next largest removed and so on.

The path indicates the starting level and the new level that will apply due to the upgrade. For example, "cr1200g-cr1600g" can be applied to an XMA that is currently at the cr1200g level and after application of the upgrade, the operational level of the XMA shall be cr1600g.

There must be an upgrade license available for the path specified. Available upgrades can be checked using the **show licensing entitlements** command.

Note: Some upgrades require a hard reset of the card or MDA to take effect. In general, this is required when the Full Duplex bandwidth is being changed.

Parameters *index* — Specifies the order of the upgrade.

Values 1 to 6

upgrade-name — Specifies the upgrade name to be applied, up to 32 characters.

Platforms 7450 ESS, 7750 SR

- configure card upgrade

7750 SR-s

- configure card xiom upgrade

7750 SR-s, 7950 XRS

- configure card mda upgrade

upgrade

Syntax **upgrade**

Context [Tree] (admin>app-assure upgrade)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context admin application-assurance upgrade

Description Use this command to load a new isa-aa.tim file as part of a router-independent signature upgrade. An AA ISA reboot is required.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.64 uplink

uplink

Syntax [**no**] **uplink**

Context **[Tree]** (config>router>gtp uplink)
[Tree] (config>service>vprn>gtp uplink)

Full Context configure router gtp uplink
configure service vprn gtp uplink

Description This command enables GTP configuration related to a GTP uplink using the Gn, S2a, or S2b interface.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax **uplink arbiter** *arbiter-name*
uplink policer *policer-id*
uplink queue *queue-id*
uplink scheduler *scheduler-name*
no uplink

Context **[Tree]** (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping uplink)

Full Context configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping uplink

Description When enabled, the uplink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified ingress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/ RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

Default no uplink

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *arbiter-name* — Specifies the name of the arbiter to be overridden, up to 32 characters.

policer-id — Specifies the ID of the policer to be overridden.

Values 1 to 63

queue-id — Specifies the ID of the queue to be overridden.

Values 1 to 32

scheduler-name — Specifies the name of the scheduler to be overridden, up to 32 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Syntax **uplink** *port-id*
uplink system-default
uplink none

Context **[Tree]** (config>system>satellite>port-template>port uplink)

Full Context configure system satellite port-template port uplink

Description This command configures the uplink association to be used for the associated satellite port.

Parameters *port-id* — Specifies the satellite physical port ID. This must use the format *slot*/*mda*/*port*. All satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

system-default — Specifies that the uplink association is returned to the system default.

none — Clears the uplink association.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

25.65 uplink-forwarding-while-standby

uplink-forwarding-while-standby

Syntax [**no**] **uplink-forwarding-while-standby**

Context **[Tree]** (config>subscr-mgmt>up-resiliency>fsg-template uplink-forwarding-while-standby)

Full Context configure subscriber-mgmt up-resiliency fate-sharing-group-template uplink-forwarding-while-standby

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command allows a standby BNG UPF to forward uplink traffic. To prevent the possibility of packet replication towards the network, this command should only be enabled if the access network is provisioned not to replicate unicast packets to the BNG UPF.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.66 uplink-initial-wait

uplink-initial-wait

Syntax **uplink-initial-wait** *seconds*

Context **[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile uplink-initial-wait)

Full Context configure subscriber-mgmt vrgw brg brg-profile uplink-initial-wait

Description This command specifies how long to wait for the uplink to fully establish when using a non-routed uplink such as a PPPoE client. During this initial wait time, setup of devices in the home is blocked.

After the timer expires, if an uplink was successful on only one of two IP stacks, devices continue to be configured with the successful IP stack. Control plane message for the failed IP stack are dropped.

Default uplink-initial-wait 30

Parameters *seconds* — Specifies the timeout in seconds.

Values 10 to 300

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.67 uplink-mbr-gbr

uplink-mbr-gbr

Syntax **uplink-mbr-gbr arbiter** *arbiter-name*
uplink-mbr-gbr policer *policer-id*
uplink-mbr-gbr queue *queue-id*
uplink-mbr-gbr scheduler *scheduler-name*
no uplink-mbr-gbr

Context **[Tree]** (config>subscr-mgmt>sla-prof>pfcp>seq uplink-mbr-gbr)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt sla-profile pfcp-mappings session-qer uplink-mbr-gbr

Description This command configures the uplink MBR/GBR to QoS override mapping.

The **no** form of the command disables the uplink MBR/GBR mapping.

Default no uplink-mbr-gbr

Parameters *arbiter-name* — Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

policer-id — Specifies the policer ID target of the MBR/GBR override.

Values 1 to 63

queue-id — Specifies the queue ID target of the MBR/GBR override.

Values 1 to 8

scheduler-name — Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.68 upnp

upnp

Syntax **upnp**

Context **[Tree]** (config>service upnp)

Full Context configure service upnp

Description Commands in this context configure UPnP parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.69 upnp-mappings

upnp-mappings

Syntax **upnp-mappings** [*upnp-mappings*]
no upnp-mappings

Context **[Tree]** (config>isa>wlan-gw-group>nat>session-limits upnp-mappings)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure isa wlan-gw-group nat session-limits upnp-mappings

Description This command limits the number of Universal Plug 'n Play mappings per member

The **no** form of this command reverts to the default value.

Default upnp-mappings 524288

Parameters *upnp-mappings* — specifies, for each MDA in this ISA group, the maximum number of Universal Plug 'n Play (UPnP) mappings.

Values 1 to 524288

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-mappings

Syntax **upnp-mappings** *limit* **no upnp-mappings**

Context **[Tree]** (config>isa>nat-group>session-limits upnp-mappings)

Full Context configure isa nat-group session-limits upnp-mappings

Description This command specifies the maximum number of UPnP mappings per ISA.

Default 524288

Parameters *limit* — Specifies the maximum number of UPnP mappings.

Values 1 to 524288

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.70 upnp-policy

upnp-policy

Syntax **upnp-policy** *policy-name* [**create**]
no upnp-policy *policy-name*

Context **[Tree]** (config>service>upnp upnp-policy)

Full Context configure service upnp upnp-policy

Description This command creates a new upnp-policy or enters the configuration context of an existing upnp-policy.

The **no** form of the command removes the upnp-policy policy-name from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default none

Parameters *policy-name* — Specifies the name of the UPnP policy up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-policy

Syntax **upnp-policy** *policy-name*
no upnp-policy

Context **[Tree]** (config>subscr-mgmt>sub-prof upnp-policy)

Full Context configure subscriber-mgmt sub-profile upnp-policy

Description This command enables UPnP IGD services for the subscriber. All ESM hosts of the subscriber could use the UPnP protocol to create port mapping. This feature only support L2-Aware NAT host.

UPnP parameters are defined in the referenced upnp-policy configured in the **config> service>upnp** context.

Default no upnp-policy

Parameters *policy-name* — Specifies the UPnP policy associated with this subscriber profile up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.71 upstream-ip-filter

upstream-ip-filter

Syntax **upstream-ip-filter** *filter-id*
no upstream-ip-filter

Context **[Tree]** (config>service>vprn>nat>outside upstream-ip-filter)
[Tree] (config>router>nat>outside upstream-ip-filter)

Full Context configure router nat outside upstream-ip-filter
configure service vprn nat outside upstream-ip-filter

Description This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no upstream-ip-filter

Parameters *filter-id* — Specifies the identifier of an IP filter.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.72 upstream-ipv6-filter

upstream-ipv6-filter

Syntax **upstream-ipv6-filter** *filter-id*
no upstream-ipv6-filter

Context **[Tree]** (config>router>nat>outside upstream-ipv6-filter)
[Tree] (config>service>vprn>nat>outside upstream-ipv6-filter)

Full Context configure router nat outside upstream-ipv6-filter
configure service vprn nat outside upstream-ipv6-filter

Description This command configures the ipv6-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance. This is useful for shared v6 filters that apply to all v6 DSM hosts.

Default no upstream-ipv6-filter

Parameters *filter-id* — Specifies the identifier of an ipv6-filter.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.73 url

url

Syntax **url** *rdr-url-sting*
no url

Context **[Tree]** (config>subscr-mgmt>http-rdr-plcy url)

Full Context configure subscriber-mgmt http-redirect-policy url

Description This command configures the HTTP URL to re-direct the matching traffic to. It also can specify inclusion of original URL, MAC address and IP address of the subscriber in the redirect URL.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *rdr-url-sting* — Specifies the URL to redirect to.

Values		
rdr-url-string		Up to 255 characters
macro substitutions:		
	$URL	Request-URI in the HTTP GET Request received
	$MAC	A string that represents the MAC address of the subscriber host
	$IP	A string that represents the IP address of the subscriber host

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

url

Syntax **url** *url-string* [**service-id** *service-id*]
url *url-string* [**service-name** *service-name*]
no url

Context **[Tree]** (config>system>security>pki>ca-profile>cmpv2 url)

Full Context configure system security pki ca-profile cmpv2 url

Description This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

Default no url

Parameters *url-string* — Specifies the HTTP URL of the CMPv2 server up to 180 characters.

service-id *service-id* — Specifies the service instance that used to reach CMPv2 server.

Values Service ID: 1 to 2147483647
base-router: 0

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

url

Syntax **url** *url*
no url

Context **[Tree]** (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note: The URL must point to a DER encoded CRL.

Default no url

Parameters *url* — Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms All

url

Syntax **url** *url-string* [**service-id** *service-id*]
url *url-string* [**service-name** *service-name*]
no url

Context **[Tree]** (config>system>security>pki>ca-profile>cmp2 url)

Full Context configure system security pki ca-profile cmp2 url

Description This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

Note: If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *url-string* — Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id *service-id* — Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

service-name *service-name* — Identifies the service, up to 64 characters.

25.74 url-entry

url-entry

Syntax **url-entry** *entry-id* [**create**]
no url-entry *entry-id*

Context **[Tree]** (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

Parameters *entry-id* — Specifies a URL configured on this system.

Values 1 to 8

create — Creates an auto URL entry.

Platforms All

25.75 url-filter

url-filter

Syntax **url-filter** *url-filter-name* [**characteristic** *characteristic-name*]
no url-filter

Context **[Tree]** (config>app-assure>group>aqp>entry>action url-filter)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure application-assurance group app-qos-policy entry action url-filter

Description This command configures a url-filter action for flows matching this entry.

Parameters *url-filter-name* — Specifies the name of the url-filter policy.

characteristic-name — Specifies the name of the characteristic.

url-filter

Syntax **url-filter** *url-filter-name* [**create**]
no url-filter *url-filter-name*

Context **[Tree]** (config>app-assure>group url-filter)

Full Context configure application-assurance group url-filter

Description This command configures a URL filter action for flows of a specific type matching this entry.

If no URL filters are specified then no URL filters will be evaluated.

Parameters *url-filter-name* — Specifies the Application-Assurance URL filter that will be evaluated.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.76 url-list

url-list

Syntax **url-list** *url-list-name* [**create**]
no url-list *url-list-name*

Context **[Tree]** (config>app-assure>group url-list)

Full Context configure application-assurance group url-list

Description This command configures a url-list object. The url-list points to a file containing a list of URLs located on the system Compact Flash. The url-list is then referenced in a url-filter object in order to filter and redirect subscribers when a URL from this file is accessed.

The **no** form of this command removes the url-list object.

Parameters *url-list-name* — Specify the Application-Assurance url-list

create — Keyword used to create the URL list.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

url-list

Syntax **url-list** *url-list-name* **upgrade**

Context **[Tree]** (admin>app-assure>group url-list)

Full Context admin application-assurance group url-list

Description This command upgrades the URL list.

Parameters *url-list-name* — Specifies the application assurance URL list, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.77 urpf-check

urpf-check

Syntax [**no**] **urpf-check**

Context **[Tree]** (config>service>ies>if urpf-check)
[Tree] (config>service>ies>if>ipv6 urpf-check)
[Tree] (config>service>ies>sub-if>grp-if>ipv6 urpf-check)
[Tree] (config>service>vprn>if urpf-check)
[Tree] (config>service>vprn>nw-if urpf-check)
[Tree] (config>service>vprn>if>ipv6 urpf-check)
[Tree] (config>service>vprn>sub-if>grp-if urpf-check)

Full Context configure service ies interface ipv6 urpf-check
configure service ies interface urpf-check
configure service ies subscriber-interface group-interface ipv6 urpf-check
configure service vprn interface ipv6 urpf-check
configure service vprn interface urpf-check
configure service vprn network-interface urpf-check
configure service vprn subscriber-interface group-interface urpf-check

Description This command enables unicast RPF (uRPF) check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Default no urpf-check

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface urpf-check
- configure service ies subscriber-interface group-interface ipv6 urpf-check

All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service ies interface urpf-check
- configure service vprn network-interface urpf-check
- configure service vprn interface urpf-check
- configure service vprn interface ipv6 urpf-check
- configure service ies interface ipv6 urpf-check

urpf-check

Syntax [**no**] **urpf-check**

Context **[Tree]** (config>subscr-mgmt>git>ipv4 urpf-check)

Full Context configure subscriber-mgmt group-interface-template ipv4 urpf-check

Description This command enables the uRPF check on this interface.

The **no** form of this command disables the uRPF check on this interface.

Default no urpf-check

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

urpf-check

Syntax **urpf-check**
no urpf-check

Context **[Tree]** (config>service>vprn>network>ingress urpf-check)

Full Context configure service vprn network ingress urpf-check

Description This command enables the unicast RPF (uRPF) check of network ingress traffic to include traffic associated with the VPRN if the incoming network interface is configured with the **urpf-selected-vprns** command

If the command is not configured, then traffic associated with this VPRN that arrives on a network interface with **urpf-selected-vprns** configured bypasses the uRPF checking options specified for that network interface.

Default no urpf-check

Platforms All

urpf-check

Syntax [**no**] **urpf-check**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>if urpf-check)
[Tree] (config>router>if>ipv6 urpf-check)

Full Context configure router interface ipv6 urpf-check
configure router interface urpf-check

Description This command enables unicast RPF (uRPF) Check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Platforms All

25.78 urpf-selected-vprns

urpf-selected-vprns

Syntax [**no**] **urpf-selected-vprns**

Context [Tree] (config>router>if urpf-selected-vprns)

Full Context configure router interface urpf-selected-vprns

Description This command enables uRPF checking of incoming traffic on the network interface for the following packets.

- Packets associated with the global routing table (base router) context.
- Packets associated with VPRNs that have enabled the uRPF check using the **config**>**service**>**vprn**>**network**>**ingress**>**urpf-check** command.

If the command is not configured, the default action is to perform uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** configuration options of the network interface.

Default no urpf-selected-vprns

Platforms All

25.79 usage-monitoring

usage-monitoring

Syntax [**no**] **usage-monitoring**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>group>statistics>aa-sub usage-monitoring)

Full Context configure application-assurance group statistics aa-sub usage-monitoring

Description This command enables Gx usage monitoring the given AA group/partition. It can only be enabled if there is enough usage monitoring resources for all existing subs. Once disabled, all monitoring instances for AA subscribers are silently removed (no PCRF notifications) and all subsequent AA Gx usage monitoring messages are ignored.

Default no usage-monitoring.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.80 use-arp

use-arp

Syntax [**no**] **use-arp**

Context [Tree] (config>service>vprn>if>dhcp use-arp)
[Tree] (config>service>ies>if>dhcp use-arp)

Full Context configure service ies interface dhcp use-arp
configure service vprn interface dhcp use-arp

Description This command enables the use of ARP to determine the destination hardware address.

The **no** form of this command disables the use of ARP to determine the destination hardware address.

Platforms All

25.81 use-bgp-routes

use-bgp-routes

Syntax [**no**] **use-bgp-routes**

Context [Tree] (config>service>vprn>bgp>next-hop-res use-bgp-routes)

Full Context configure service vprn bgp next-hop-resolution use-bgp-routes

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

Default no use-bgp-routes

Platforms All

use-bgp-routes

Syntax [**no**] **use-bgp-routes**

Context **[Tree]** (config>router>bgp>next-hop-res use-bgp-routes)

Full Context configure router bgp next-hop-resolution use-bgp-routes

Description This command specifies whether to use BGP routes to recursively resolve the BGP next-hop of unlabeled IPv4 and unlabeled IPv6 routes. Up to four levels of recursion are supported.

The **no** form of this command reverts to the default behavior. By default, a BGP route is not resolvable by another BGP route.

Default no use-bgp-routes

Platforms All

use-bgp-routes

Syntax **use-bgp-routes**

Context **[Tree]** (config>router>bgp>next-hop-res>lbl-routes use-bgp-routes)

Full Context configure router bgp next-hop-resolution labeled-routes use-bgp-routes

Description Commands in this context configure labeled route options for next-hop resolution.

Platforms All

Use subject to Terms available at: www.nokia.com

25.82 use-broadcast-address

use-broadcast-address

Syntax [**no**] **use-broadcast-address**

Context **[Tree]** (config>port>ethernet>dwl use-broadcast-address)

Full Context configure port ethernet down-when-looped use-broadcast-address

Description This command specifies whether or not the down when looped destination MAC address is the broadcast address, or the local port MAC address, as specified in the port's MAC address.

Platforms All

25.83 use-broadcast-mac

use-broadcast-mac

Syntax [**no**] **use-broadcast-mac**

Context **[Tree]** (config>service>ipipe>sap use-broadcast-mac)

Full Context configure service ipipe sap use-broadcast-mac

Description This command enables the user of a of broadcast MAC on SAP.

An Ipipe VLL service with the command enabled forwards unicast IP packets using the broadcast MAC address until the ARP cache is populated with a valid entry for the CE IP and MAC addresses.

The **no** form of this command enables the user of a of broadcast MAC on SAP.

Default no use-broadcast-mac

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

25.84 use-def-mcast

use-def-mcast

Syntax [**no**] **use-def-mcast**

Context **[Tree]** (config>service>vpls>isid-policy>entry use-def-mcast)

Full Context configure service vpls isid-policy entry use-def-mcast

Description The **use-def-mcast** option prevents local installation of the ISIDs in the range in the MFIB and uses the default multicast tree instead for a B-VPLS. In a node that does not have I-VPLS or static-isids, this command prevents the building of an MFIB entry for this ISID when received in a SPBM TLV and allows the broadcast of ISID based traffic on the default multicast tree. If an **isid-policy** exists, the core nodes can have this policy to prevent connectivity problems when some nodes are advertising an ISID and others are not. In a I-VPLS service if the customer MAC (C-MAC) is unknown, a frame will have the Multicast DA for an ISID (PBB-OUI + ISID) flooded on the default multicast tree and not pruned.

Default no use-def-mcast

Platforms All

25.85 use-default-template

use-default-template

Syntax [**no**] **use-default-template**

Context **[Tree]** (config>service>vprn>aaa>remote-servers>radius use-default-template)
[Tree] (config>service>vprn>aaa>rmt-srv>tacplus use-default-template)

Full Context configure service vprn aaa remote-servers radius use-default-template
configure service vprn aaa remote-servers tacplus use-default-template

Description This command specifies whether the RADIUS default user template is actively applied to the RADIUS user if no VSAs are returned with the auth-accept from the RADIUS server. When enabled, the radius_default user-template is actively applied if no VSAs are returned with the auth-accept from the RADIUS server and radius authorization is enabled.

The no form of this command disables the use of the RADIUS default template.

Default no use-default-template

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

use-default-template

Syntax [**no**] **use-default-template**

Context **[Tree]** (config>system>security>tacplus use-default-template)

Full Context configure system security tacplus use-default-template

Description This command specifies whether the **user-template tacplus_default** is actively applied to the TACACS+ user. When enabled, some parameters of the **user-template tacplus_default** are actively applied to all users that authenticate via TACACS+. See the **user-template tacplus_default** command for more details.

When disabled, the parameters of the template are not applied to TACACS+ users, and TACACS+ users can not connect to an SR OS router since the user access parameters are not available. In this case, TACACS+ can only be used for accounting.

Default use-default-template

Platforms All

use-default-template

Syntax [**no**] **use-default-template**

Context **[Tree]** (config>system>security>radius use-default-template)

Full Context configure system security radius use-default-template

Description This command specifies whether the RADIUS default user template is actively applied to the RADIUS user if no VSAs are returned with the auth-accept from the RADIUS server. When enabled, the radius_default user-template is actively applied if no VSAs are returned with the auth-accept from the RADIUS server and radius authorization is enabled.

The **no** form of this command disables the use of the RADIUS default template.

Default no use-default-template

Platforms All

use-default-template

Syntax [**no**] **use-default-template**

Context **[Tree]** (config>system>security>ldap use-default-template)

Full Context configure system security ldap use-default-template

Description This command specifies whether or not the default template is to be actively applied to LDAP users.

configure subscriber-mgmt sub-ident-policy sub-profile-map use-direct-map-as-default
configure subscriber-mgmt sub-profile sla-profile-map use-direct-map-as-default

Description This command enables direct mapping of the profiles as default. With this flag, a string returned in authentication is used as the named profile. If the named profiled cannot be found, the default profile is used.

The **no** form of this command disables direct mapping.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

25.87 use-es-bmac

use-es-bmac

Syntax [**no**] **use-es-bmac**

Context **[Tree]** (config>service>vpls>pbb use-es-bmac)

Full Context configure service vpls pbb use-es-bmac

Description This command is only supported in B-VPLS instances where BGP-EVPN is enabled and controls the source B-MAC used by the system for packets coming from the SAP or spoke-SDPs when they belong to an EVPN Ethernet-Segment.

If enabled, the system will use a source B-MAC derived from the source-bmac (high order four bytes) and the least significant two bytes configured in **config>service>system>bgp-evpn>eth-seg>source-bmac-lsb** for all the packets coming from the local ethernet-segment.

If **no use-es-bmac** is configured, the system will use the regular source-bmac (provided by the **config>service>vpls>pbb>source-bmac** command, or the chassis bmac if the source-bmac is not configured).

Default no use-es-bmac

Platforms All

25.88 use-gi-address

use-gi-address

Syntax **use-gi-address** [**scope** *scope*]

Context **[Tree]** (config>router>dhcp>server use-gi-address)
[Tree] (config>service>vprn>dhcp>server use-gi-address)

Full Context configure router dhcp local-dhcp-server use-gi-address
configure service vprn dhcp local-dhcp-server use-gi-address

Description This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

Parameters *scope* — Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.89 use-ingress-l2tp-dscp

use-ingress-l2tp-dscp

Syntax [**no**] **use-ingress-l2tp-dscp**

Context **[Tree]** (config>subscr-mgmt>sla-prof>egress use-ingress-l2tp-dscp)

Full Context configure subscriber-mgmt sla-profile egress use-ingress-l2tp-dscp

Description This command enables the use of the DSCP marking taken from the L2TP header received on an L2TP Access Concentrator (LAC) for egress classification for the subscriber host using the associated sla-profile.

This command is ignored if the ingress packet is not identified as an L2TP packet.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.90 use-lag-port-weight

use-lag-port-weight

Syntax [**no**] **use-lag-port-weight**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac>mc-constraints use-lag-port-weight)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac mc-constraints use-lag-port-weight

Description This command enables port weight to be used when determining available bandwidth per level when LAG ports go down/come up. The command is required for proper operation on mixed port-speed LAGs and can be used for non-mixed port-speed LAGs as well.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

use-lag-port-weight

Syntax **use-lag-port-weight**

Full Context configure router mpls lsp auto-bandwidth use-last-adj-bw

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the carryover of the last adjusted bandwidth from the previous path to the new path, whether primary or secondary, when the LSP switches between paths. It also creates a context for the configuration of the retry limit for secondary paths.

The **no** form of this command disables the carryover of the last adjusted bandwidth from the previous path to the new path.

Default no use-last-adj-bw

Platforms All

25.92 use-link-address

use-link-address

Syntax **use-link-address** [**scope** *scope*]
no use-link-address

Context **[Tree]** (config>router>dhcp6>server use-link-address)
[Tree] (config>service>vprn>dhcp6>server use-link-address)

Full Context configure router dhcp6 local-dhcp-server use-link-address
configure service vprn dhcp6 local-dhcp-server use-link-address

Description This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default scope subnet

Parameters *scope* — Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

use-outside-ip-address

Syntax [**no**] **use-outside-ip-address**

Context **[Tree]** (config>li use-outside-ip-address)

Full Context configure li use-outside-ip-address

Description This command enables LI to be performed on an L2-Aware NAT subscriber after NAT. The LI traffic will contain the subscriber's outside public IP address instead of the default private IP address.

The **no** form of this command disables the use of the outside public IP address for the L2-Aware NAT subscriber.

Platforms All

25.94 use-pool-from-client

use-pool-from-client

Syntax **use-pool-from-client delimiter** *delimiter*
use-pool-from-client
no use-pool-from-client

Context **[Tree]** (config>router>dhcp>server use-pool-from-client)
[Tree] (config>service>vprn>dhcp>server use-pool-from-client)

Full Context configure router dhcp local-dhcp-server use-pool-from-client
configure service vprn dhcp local-dhcp-server use-pool-from-client

Description This command enables the use of the pool indicated by DHCP client. When enabled, the IP address pool to be used by this server is the pool is indicated by the vendor-specific sub-option 13 of the DHCP option 82. When disabled or if there is no sub-option 13 in the DHCP message, the pool selection falls back to the **use-gi-address** configuration.

The **no** form of this command disables the use of the pool indicated by DHCP client.

Parameters *delimiter* — A single ASCII character specifies the delimiter of separating primary and secondary pool names in Option82 VSO.

25.95 use-sap-bmac

use-sap-bmac

Syntax [**no**] **use-sap-bmac**

Context **[Tree]** (config>service>vpls>pbb use-sap-bmac)

Full Context configure service vpls pbb use-sap-bmac

Description This command enables on a per BVPLS basis the use of source B-MACs allocated to multi-homed SAPs (assigned to an MC-LAG) in the related IVPLS or Epipe service. The command will fail if the value of the source-bmac assigned to the BVPLS is the hardware (chassis) B-MAC. That is, the **source-bmac** must be a configured one.

Default no use-sap-bmac

Platforms All

25.96 use-sdp-bmac

use-sdp-bmac

Syntax [**no**] **use-sdp-bmac**

Context **[Tree]** (config>service>epipe>spoke-sdp use-sdp-bmac)

Full Context configure service epipe spoke-sdp use-sdp-bmac

Description This command indicates that this spoke SDP is expected to be part of a redundant pseudowire connected to a PBB Epipe service. Enabling this parameter will cause traffic forwarded from this spoke SDP into the B-VPLS domain to use a virtual backbone MAC as its source MAC address when both this, and the control pseudowire, are in the active state on this BEB. This virtual backbone MAC is derived from the SDP source-bmac-lsb configuration.

This command will fail when configuring it under a spoke SDP within a PBB-Epipe that is connected to a B-VPLS with mac-notification enabled.

Default no use-sdp-bmac

Platforms All

25.98 use-vrtr-if-index

use-vrtr-if-index

Syntax [**no**] **use-vrtr-if-index**

Context **[Tree]** (config>cflowd use-vrtr-if-index)

Full Context configure cflowd use-vrtr-if-index

Description This command is used to export flow data using interface indexes (ifIndex values), which can be used directly as the index into the IF-MIB tables for retrieving interface statistics. Specifically, if this command is enabled, the ingressInterface (ID=10) and egressInterface (ID= 14) fields in IP flow templates used to export the flow data to cflowd version 9 and version 10 collectors will be populated with the IF-MIB ifIndex of that interface. In addition, for version 10 templates, two fields are available in the IP flow templates to specify the virtual router ID associated with the ingress and egress interfaces.

The **no** form of this command removes the command from the active configuration and causes cflowd to return to the default behavior of populating the ingress and egress interface ID with the global IF index IDs.

Default no use-vrtr-if-index

Platforms All

25.99 user

user

Syntax [**no**] **user** *user-name*

Context **[Tree]** (config>system>security user)

Full Context configure system security user

Description This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

Parameters *user-name* — Specifies the name of the user up to 32 characters.

Platforms All

25.100 user-db

user-db

Syntax **user-db** *local-user-db-name*
no user-db

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host user-db)

Full Context configure subscriber-mgmt local-user-db ppp host user-db

Description This command specifies local user database for PPP PAP/CHAP access.

With this configuration, system will access the specified DB again during PPP PAP/CHAP phase.

This configuration only becomes effective when system is accessing parent DB during PPPoE discovery phase.

The **no** form of this command removes the name from the configuration.

Parameters *local-user-db-name* — Specifies the name of the local user database for PAP/CHAP access.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn l2tp group tunnel ppp user-db

Description This command configures the local user database to use for PPP PAP/CHAP authentication.

Default no user-db

Parameters *local-user-db-name* — Specifies the local user database name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax **user-db** *local-user-db-name*
no user-db

Context **[Tree]** (config>service>ies>sub-if>grp-if>wpp user-db)
[Tree] (config>service>vprn>sub-if>grp-if>wpp user-db)

Full Context configure service ies subscriber-interface group-interface wpp user-db
configure service vprn subscriber-interface group-interface wpp user-db

Description This command configures the user database.

Note: If configured, the values configured under grp-if will only be used if there is no corresponding value returned from LUDB lookup.

This command specifies the LUDB system use to lookup while creating initial host before WPP authentication. LUDB could return WPP attributes such as portal name, **initial-sla-profile**, **initial-sub-profile**, and so on LUDB is configured in **config>subscr-mgmt>local-user-db** context.

The **no** form of this command reverts to the default.

Parameters *local-user-db-name* — Specifies the Local User Database name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure service ies subscriber-interface group-interface ipv6 router-solicit user-db

Description This command enables the use of the local-user-database for authentication.

The **no** form of this command reverts to the default.

Parameters *local-user-db-name* — Specifies the name of the local-user-database to authenticate the router-solicit. The local-user-database can also return a static prefix or a pool name for address assignment.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

Syntax **user-db** *local-user-db-name*
no user-db

Context **[Tree]** (config>service>vpls>sap>ipoe-session user-db)
[Tree] (config>service>ies>sub-if>grp-if>ipoe-session user-db)
[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session user-db)

Full Context configure service ies subscriber-interface group-interface ipoe-session user-db
configure service vpls sap ipoe-session user-db
configure service vprn subscriber-interface group-interface ipoe-session user-db

Description This command configures the local user database to use for IPoE session authentication.

When configured on a capture SAP, the group interface must have the same local user database configured.

On a wlan-gw group interface, the **no** form of this command indicates that the user database is picked from the following sources in the order shown:

1. dhcp
2. ipv6>dhcp6
3. ipv6>router-solicit

If no user database can be found in any of these locations, processing continues as if no user database was configured. This behavior is for backwards compatibility reasons only; when using a LUDB, it should be explicitly added to the IPoE session configuration.

The **no** form of this command reverts to the default.

Parameters *local-user-db-name* — Specifies the local user database name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 user-ident
configure service vprn subscriber-interface group-interface ipv6 dhcp6 user-ident

Description This feature is only applicable when DHCPv6-snooping is enabled. The Ethernet header MAC address on DHCPv6 is used as the default key host identification. This command allows addition the keys for identifying the DHCPv6 host. The *interface-id* can be included in addition to the MAC key to further differentiate each DHCPv6 host.

The **no** form of this command reverts to the default.

Default user-ident mac

Parameters *user-ident* — Specifies the DHCP6 user-identification for this interface.

Values **mac** — Specifies to use only the Ethernet MAC of the DHCPv6 message to identify the host.

mac-interface-id — Specifies to additionally use the interface-id to identify the DHCPv6 host.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-ident

Syntax **user-ident** *user-ident*
no user-ident

[Tree] (config>service>vprn>dhcp>server user-ident)

Full Context configure router dhcp local-dhcp-server user-ident
configure service vprn dhcp local-dhcp-server user-ident

Description This command configures the user identification method for the DHCPv4 server.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the reverts to the default.

Default user-ident mac-circuit-id

Parameters *user-ident* — Specifies the user identification method

Values
- **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.
- **circuit-id** — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.
- **mac** — Specifies to use the MAC address of the DHCPv4 client as the user identification method.
- **mac-circuit-id** — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.
- **remote-id** — Specifies to use the MAC address of the remote end as the user identification method.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-ident

Syntax **user-ident** *user-ident*
no user-ident

Context **[Tree]** (config>router>dhcp6>server user-ident)
[Tree] (config>service>vprn>dhcp6>server user-ident)

Full Context configure router dhcp6 local-dhcp-server user-ident
configure service vprn dhcp6 local-dhcp-server user-ident

Description This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix “stickiness” for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default user-ident duid

Parameters *user-ident* — Specifies the user identification method.

Values
- **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.
- **interface-id** — Specifies the IPv6 interface-id option.
- **interface-id-link-local** — Specifies the interface-id and link-local address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp user-location-info
configure subscriber-mgmt diameter-application-policy nasreq include-avp user-location-info

Description This command enables the inclusion of the 3GPP-User-Location-Information AVP as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.104 user-name

user-name

Syntax **user-name** *name* [**create**]
no user-name *name*

Context **[Tree]** (config>service>dynsvc>ladb user-name)

Full Context configure service dynamic-services local-auth-db user-name

Description This command creates a user name entry in the local authentication database. The user name entry is used to match with the user name of a local authenticated dynamic service data trigger. The user name of a dynamic service data trigger is fixed to the **sap-id**. When matched, the corresponding authentication data is used to set up the dynamic data services.

The **no** form of this command removes the user name entry from the local authentication database configuration.

Parameters *name* — Specifies the user name entry name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name

Syntax [**no**] **user-name**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute user-name)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute user-name

Description This command enables the inclusion of the **user-name** attribute.

The **no** form of this command disables the inclusion of the **user-name** attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name

Syntax **user-name** *user-name*
no user-name

Context **[Tree]** (config>aaa>radius-srv-plcy>servers>health-check>test-account user-name)

Full Context configure aaa radius-server-policy servers health-check test-account user-name

Description This command specifies the username that the test account will use to send its access requests to probe the RADIUS servers.

The no form of this command removes the username from the test-account configuration.

Parameters *user-name* — Specifies the probing username, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name

Syntax [**no**] **user-name**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes user-name)

Full Context configure aaa isa-radius-policy acct-include-attributes user-name

Description This command enables the inclusion of user name attributes.

The **no** form of the command excludes user name attributes.

Default no user-name

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.105 user-name-format

user-name-format

Syntax **user-name-format** *format* [**mac-format** *mac-format*]
user-name-format *format* **append** [*domain-name*] [**mac-format** *mac-format*]
user-name-format *format* **append** *domain-name*
user-name-format *format* **default-domain** *domain-name* [**mac-format** *mac-format*]
user-name-format *format* **replace** *domain-name* [**mac-format** *mac-format*]
user-name-format *format* **strip** [**mac-format** *mac-format*]
no user-name-format

Context **[Tree]** (config>subscr-mgmt>auth-policy user-name-format)

Full Context configure subscriber-mgmt authentication-policy user-name-format

Description This command defines the format of the “user-name” field in the session authentication request sent to the RADIUS server.

The **no** form of this command switches to the default format, **mac**.

Default By default, the MAC source address of the DHCPv4 DISCOVER or DCHPv6 SOLICIT message is used in the user-name field.

Parameters *format* — Specifies the user name format in RADIUS message.

Values ascii-converted-circuit-id, ascii-converted-tuple, circuit-id, dhcp-client-vendor-opts, mac, mac-giaddr, tuple

ascii-converted-circuit-id — Identical to circuit-id, but the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

ascii-converted-tuple — Identical to tuple, but the circuit-id part of the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the circuit-id

circuit-id — If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

dhcp-client-vendor-opts — IPoEv4 host (IPoE session enabled or disabled on group-interface) — The RADIUS user-name is a concatenation of the DHCPv4 Client Identifier Option 61, an “@” delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

IPoEv6 host (IPoE session enabled on group-interface) — The RADIUS user-name is a concatenation of the identifier field of a type 2 DUID in the DHCPv6 Client Identifier Option 1, the "@" delimiter, and the opaque data field of the first vendor class data in the DHCPv6 Vendor Class Option 16. Non-printing characters in the DHCP option values are converted as described below.

IPoEv6 host (IPoE session disabled on group-interface) — The MAC source address of the DHCPv6 SOLICIT message.

In the absence of a DHCPv4 Client Identifier Option 61 or a DHCPv6 Client Identifier Option 1 containing a DUID type 2, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60 or a DHCPv6 Vendor Class Option 16, the "@" delimited is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac — The MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field. The format of the MAC address string used as the user name in the RADIUS authentication requests uses lowercase hex digits, and ":" as the inter-digit separator, for example, 00:11:22:aa:bb:cc is valid but 00-11-22-AA-BB-CC will return an error. The RADIUS server must be configured accordingly, otherwise the authentication request will fail.

mac-giaddr — A concatenation of the MAC address and the Relay Agent IP address (giaddr)

tuple — Specifies that the concatenation of MAC source address and circuit-ID are used in the user-name field

mac-format — Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8 7xxx style
	XY-	00-0C-F1-99-85-B8 IEEE canonical style
	mmmm.	0002.03aa.abff Cisco style

append — Specifies the data type which is an enumerated integer that indicates what needs to be appended to the user-name sent to the RADIUS server.

Values 1 — nothing 2 — domain name

domain — Specifies to user the domain name. In some instances it is desired to add a domain only to usernames which have omitted the domain (@domain). In these instances a default-domain can be appended to usernames which lack a @domain.

append — Adds a "@" delimiter and the specified string after the PAP/CHAP username. No allowance is made for the presence of an existing domain or @ delimited.

replace — Replaces the character-string after the "@" delimiter with the string specified.

strip — Removes all characters after and including the "@" delimiter.

For example:

```
Command: append
```

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

```
String:     domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com

Command: append
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net@domainA-1.com

Command: strip
String:
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser

Command: replace
String:     domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@domainA-1.com

Command: default-domain
String:    domainA-1.com
PAP/CHAP User:    someuser@existing-domain.net
Resulting User:    someuser@existing-domain.net

Command: default-domain
String: domainA-1.com
PAP/CHAP User:    someuser
Resulting User:    someuser@domainA-1.com
```

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name-format

Syntax **user-name-format** *format*
no user-name-format

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-format)

Full Context configure subscriber-mgmt diameter-application-policy nasreq user-name-format

Description This command defines the format of the User-Name AVP value in Diameter NASREQ AA-Requests for IPoE hosts.

The **no** form of this command reverts to the default.

Parameters *format* — Specifies the format of the User-Name AVP value.

Values **mac** — Specifies to use the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message in the user-name field. The format of the MAC address string is defined with the **mac-forma**t CLI command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

circuit-id — Specifies to use the circuit ID to identify the user toward the server. If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.

tuple — Specifies to use a concatenation of MAC source address and circuit-ID.

ascii-converted-circuit-id — Identical to circuit-id, but the user name is a string of hex digits, for use if there is binary data in the circuit-id.

ascii-converted-tuple — Specifies a string of hex digits, for use if there is binary data in the circuit-id.

dhcp-client-vendor-opts — Specifies to use a concatenation of the DHCPv4 Client Identifier Option 61, the "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

In the absence of a DHCPv4 Client Identifier Option 61, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60, the "@" delimiter is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

mac-giaddr — Specifies to use a concatenation of MAC source address and DHCP GI address.

nas-port-id — Specifies to use a value of the nas-port-id with format defined in the include-avp section.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-name-format

Syntax **user-name-format** *user-name-format* [**mac-format** *mac-format*]
no user-name-format

Context **[Tree]** (config>aaa>isa-radius-plcy user-name-format)

Full Context configure aaa isa-radius-policy user-name-format

Description This command defines the format of the user-name field in the session authentication request sent to the RADIUS server. For authentication of IPv6 triggers (ICMPv6, DHCPv6, IPv6 data-trigger) the user-name format will always fall back to mac only.

The **no** form of the command switches to the default format, **mac**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default user-name-format mac mac-format alu (the MAC source address of the DHCP DISCOVER message is used in the user-name field)

Parameters *user-name-format* — Specifies the user name format in RADIUS message.

mac-format — Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8 Nokia 7xxx style
	XY-	00-0C-F1-99-85-B8 IEEE canonical style
	mmmm.	0002.03aa.abff Cisco style

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

25.106 user-name-operation

user-name-operation

Syntax **user-name-operation** *operation* [**domain** *domain-name*]
no user-name-operation

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-operation)

Full Context configure subscriber-mgmt diameter-application-policy nasreq user-name-operation

Description This command enables domain name manipulation of the user name, such as append, strip, replace or add as default.

For IPoE, this command only applies when **user-name-format** is configured to **dhcp-client-vendor-opts**.

The **no** form of this command reverts to the default.

Parameters *operation* — Specifies the user name manipulations with respect to domain name values.

Values
- **append-domain** – appends an “@” delimiter with the specified domain-name at the end of the user-name, independent if a domain name was already present
- **strip-domain** – removes all characters after and including the “@” delimiter
- **default-domain** – adds an “@” delimiter and the specified domain name to user-names that have no domain name present
- **replace-domain** – replaces the characters after the “@” delimiter with the specified domain-name

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

domain-name — Specifies the domain name string to be used in the specified operation, up to 128 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.107 user-srlg-db

user-srlg-db

Syntax **user-srlg-db** [**enable** | **disable**]

Context **[Tree]** (config>router>mpls user-srlg-db)

Full Context configure router mpls user-srlg-db

Description This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

Default user-srlg-db disable

25.108 user-template

user-template

Syntax **user-template** {**tacplus_default** | **radius_default** | **ldap-default**}

Context **[Tree]** (config>system>security user-template)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system security user-template

Description This command configures default security user template parameters.

Parameters **tacplus_default** — Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the “profile” are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default — Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default — Specifies the default LDAP user template.

Platforms All

25.109 username

username

Syntax **username** *user-name*
username *user-name* **no-domain**
username *user-name* **domain-only**
no username

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>host-ident username)

Full Context configure subscriber-mgmt local-user-db ppp host host-identification username

Description This command specifies the PPPoE username to match for a host lookup. When **no-domain** or **domain-only** is specified, the username "user[@domain]" is converted to a user and a domain entity by splitting it on the first @-sign before matching on the specific entity.

Note: This command is only used when **username** is configured as one of the **match-list** parameters.

The **no** form of this command removes the username from the configuration.

Parameters *username* — Specifies the user name, up to 253 characters, of this host. For example, “jane@nokia.com”.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no-domain — Only the user user part of the username is specified and used for matching. For example "jane".

domain-only — Only the domain part of the username is specified and used for matching, for example, nokia.com.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

username

Syntax [**no**] **username** *username*

Context **[Tree]** (debug>service>id>ppp username)

Full Context debug service id ppp username

Description This command enable PPP debug for the specified username. since not all PPP packets contain username, so a MAC debug filter is created automatically when system sees a PPP packet contain the specified username.

Multiple username filters can be specified in the same debug command.

The **no** form of this command disables debugging.

Parameters *user-name* — Specifies the PPP username.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

25.110 usm-community

usm-community

Syntax **usm-community** *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context **[Tree]** (config>system>security>snmp usm-community)

Full Context configure system security snmp usm-community

Description This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters *community-string* — Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group — Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**>**access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name — Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

Platforms All

25.111 util-stats-interval

util-stats-interval

Syntax **util-stats-interval** *seconds*

Context **[Tree]** (config>port>ethernet util-stats-interval)

Full Context configure port ethernet util-stats-interval

Description This command configures the interval used to calculate the utilization statistics.

Port utilization statistics are only available for physical Ethernet ports on a host system. These statistics are not available for the following:

- Ethernet ports on an Ethernet satellite
- Ethernet ports on a VSR
- PXC ports
- vsm-cca-xp ports

© 2022 Nokia.

26 v Commands

26.1 v4-routed-override-filter

v4-routed-override-filter

Syntax **v4-routed-override-filter** *ip-filter-id*
no v4-routed-override-filter

Context **[Tree]** (config>service>ies>if>vpls>egress v4-routed-override-filter)

Full Context configure service ies interface vpls egress v4-routed-override-filter

Description This command configures an IPv4 filter ID that are applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to the VPLS endpoint, if configured.

Parameters *ip-filter-id* — Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Platforms All

v4-routed-override-filter

Syntax **v4-routed-override-filter** *ip-filter-id*
no v4-routed-override-filter

Context **[Tree]** (config>service>ies>if>vpls>ingress v4-routed-override-filter)

Full Context configure service ies interface vpls ingress v4-routed-override-filter

Description This command configures an IPv4 filter ID that is applied to all ingress packets entering the VPLS or I-VPLS service. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed. The IPv4 routed packets use any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface use the IPv4 ingress filter applied to the packets virtual port, when defined.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-filter-id* — Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Platforms All

v4-routed-override-filter

Syntax **v4-routed-override-filter** *ip-filter-id*
no v4-routed-override-filter

Context **[Tree]** (config>service>vprn>if>vpls>egress v4-routed-override-filter)

Full Context configure service vprn interface vpls egress v4-routed-override-filter

Description This command configures an IPv4 filter ID that is applied to packets egressing the VPRN R-VPLS interface. The filter overrides the existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress VPRN R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to VPLS endpoint, if configured.

Parameters *ip-filter-id* — Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Platforms All

v4-routed-override-filter

Syntax **v4-routed-override-filter** *ip-filter-id*
no v4-routed-override-filter

Context **[Tree]** (config>service>vprn>if>vpls>ingress v4-routed-override-filter)

Full Context configure service vprn interface vpls ingress v4-routed-override-filter

Description This command configures an IPv4 filter ID that is applied to all ingress packets entering the VPLS service. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv4 routed packet's will use the any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface will use the IPv4 ingress filter applied to the packets virtual port, when defined.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-filter-id* — Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

26.2 v6-aggregate-stats

v6-aggregate-stats

Syntax [**no**] **v6-aggregate-stats**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute v6-aggregate-stats)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute v6-aggregate-stats

Description This command enables reporting of IPv6 aggregated forwarded octet and packet counters using RADIUS VSAs. Disabled by default. It requires **stat-mode v4-v6** for policers and queues for which the IPv6 aggregate forwarded packets should be counted.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.3 v6-frag-header

v6-frag-header

Syntax [**no**] **v6-frag-header**

Context **[Tree]** (config>service>nat>map-domain>ip-fragmentation v6-frag-header)

Full Context configure service nat map-domain ip-fragmentation v6-frag-header

Description This command enables and disables the insertion of the fragmentation header in an IPv6 packet when translating non-fragmented IPv4 packet with DF=0. This option is disabled by default and the size of the IPv6 packet is reduced by 8 bytes.

Default no v6-frag-header

Platforms VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.4 v6-routed-override-filter

v6-routed-override-filter

Syntax **v6-routed-override-filter** *ipv6-filter-id*
no v6-routed-override-filter

Context **[Tree]** (config>service>ies>if>vpls>egress v6-routed-override-filter)

Full Context configure service ies interface vpls egress v6-routed-override-filter

Description This command configures an IPv6 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv6 routed packets uses the IPv6 egress filter applied to VPLS endpoint, if configured

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

Platforms All

v6-routed-override-filter

Syntax **v6-routed-override-filter** *ipv6-filter-id*
no v6-routed-override-filter

Context **[Tree]** (config>service>ies>if>vpls>ingress v6-routed-override-filter)

Full Context configure service ies interface vpls ingress v6-routed-override-filter

Description This command configures an IPv6 filter ID that is applied to all ingress packets entering the VPLS or I-VPLS service. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use any existing ingress IPv6 filter on the VPLS virtual port.

The no v6-routed-override-filter command is used to remove the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface will use the IPv6 ingress filter applied to the packet's virtual port, when defined.

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

v6-routed-override-filter

Syntax **v6-routed-override-filter** *ipv6-filter-id*
no v6-routed-override-filter

Context **[Tree]** (config>service>vprn>if>vpls>egress v6-routed-override-filter)

Full Context configure service vprn interface vpls egress v6-routed-override-filter

Description This command configures an IPv6 filter ID that is applied to packets egressing the VPRN R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of the command removes the IPv4 routed override filter from the egress VPRN R-VPLS interface. When removed, egress IPv6 packets will use the IPv6 egress filter applied to the VPLS endpoint, if configured.

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

Platforms All

v6-routed-override-filter

Syntax **v6-routed-override-filter** *ipv6-filter-id*
no v6-routed-override-filter

Context **[Tree]** (config>service>vprn>if>vpls>ingress v6-routed-override-filter)

Full Context configure service vprn interface vpls ingress v6-routed-override-filter

Description This command configures an IPv6 filter ID that is applied to all ingress packets entering the VPLS service. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use the any existing ingress IPv6 filter on the VPLS virtual port.

The **no** form of the command removes the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface uses the IPv6 ingress filter applied to the packet's virtual port, when defined.

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

26.5 valid-lifetime

valid-lifetime

Syntax **valid-lifetime** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no valid-lifetime

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>lease-split valid-lifetime)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>lease-split valid-lifetime)
[Tree] (config>service>ies>sub-if>ipv6>dhcp6>relay>lease-split valid-lifetime)
[Tree] (config>service>vprn>sub-if>ipv6>dhcp6>relay>lease-split valid-lifetime)

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 relay lease-split valid-lifetime
configure service ies subscriber-interface ipv6 dhcp6 relay lease-split valid-lifetime
configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay lease-split valid-lifetime
configure service vprn subscriber-interface ipv6 dhcp6 relay lease-split valid-lifetime

Description This command configures the DHCPv6 lease split valid lifetime (short lease time). DHCPv6 lease split is active when enabled and for all IA_NA and IA_PD options in the transaction the configured lease split valid lifetime (short lease time) is less than or equal to the renew time T1 committed by the server (long renew time) or 50 percent of the preferred lifetime committed by the server when T1 committed by the server equals zero.

The **no** form of this command reverts to the default value.

Default valid-lifetime hrs 1

Parameters [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*] — Specifies the valid lifetime values

Values

days:	0 to 3650
hours:	0 to 23
minutes:	0 to 59
seconds	0 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime

Syntax **valid-lifetime** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
valid-lifetime infinite
no valid-lifetime

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ipv6-lease-times valid-lifetime)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>ipv6-lease-times valid-lifetime)
[Tree] (config>service>ies>sub-if>grp-if>ipv6>dhcp6>proxy-server valid-lifetime)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>proxy-server valid-lifetime)

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime
configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime
configure subscriber-mgmt local-user-db ipoe host ipv6-lease-times valid-lifetime
configure subscriber-mgmt local-user-db ppp host ipv6-lease-times valid-lifetime

Description This command configured valid-lifetime for DHCPv6 lease (address/prefix).

The valid lifetime is the length of time an address/prefix remains in the valid state (for example, the time until invalidation). The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address/prefix becomes invalid and must not be used in communications. RFC 2461, sec 6.2.1 recommends default value of 30 days.

Each address/prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (DHCP server, RADIUS, ESM). To request an extension of the lifetimes assigned to an address, the client sends a Renew message to the addressing authority. The addressing authority sends a Reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption.

The lifetimes are transmitted from the addressing authority to the client in the IA option on the top level (not the address or prefix level).

The **no** form of this command reverts to the default.

Default valid-lifetime days 1

Parameters **infinite** — Specifies that the valid lifetime is infinite.

Values

days:	0 to 49710
hours:	0 to 23
minutes:	0 to 59
seconds	0 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime

Syntax **valid-lifetime** *seconds*
valid-lifetime infinite
no valid-lifetime

Context **[Tree]** (config>subscr-mgmt>rtr-adv>pfx-opt>stateful valid-lifetime)
[Tree] (config>subscr-mgmt>rtr-adv>pfx-opt>stateless valid-lifetime)

Full Context configure subscriber-mgmt router-advertisement-policy prefix-options stateful valid-lifetime
configure subscriber-mgmt router-advertisement-policy prefix-options stateless valid-lifetime

Description This command specifies the time for this prefix to remain valid.

The **no** form of this command reverts to the default.

Default valid-lifetime 86400

Parameters *seconds* — Specifies the time, in seconds, for the prefix to remain preferred.

Values 0, 900 to 86400

infinite — Specifies that the time never expires.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime

Syntax **valid-lifetime** *seconds*
valid-lifetime infinite
no valid-lifetime

Context **[Tree]** (config>service>ies>if>ipv6>dhcp6>pfx-delegate>prefix valid-lifetime)

Full Context configure service ies interface ipv6 dhcp6-server prefix-delegation prefix valid-lifetime

Description This command configures the time, in seconds, that the prefix is valid.

The **no** form of this command reverts to the default value.

Default valid-lifetime 2592000 (30 days)

Parameters *seconds* — Specifies the time, in seconds, that this prefix remains valid.

Values 1 to 4294967294

infinite — Specifies that this prefix remains valid infinitely. The value 4294967295 is interpreted as infinite.

configure service vprn subscriber-interface ipv6 router-advertisements prefix-options valid-lifetime

Description This command specifies the remaining time for this prefix to be valid for the purpose of on-link determination.

The **no** form of this command reverts to the default.

Default valid-lifetime 86400

Parameters *seconds* — Specifies the time for the prefix to remain valid on this interface in seconds.

Values 0 to 4294967295

infinite — Specifies that the remaining time will never expire. The value 4294967295 is interpreted as infinite.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime

Syntax **valid-lifetime** {*seconds* | **infinite**}

Context **[Tree]** (config>service>vprn>router-advert>if valid-lifetime)

Full Context configure service vprn router-advert interface valid-lifetime

Description This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default valid-lifetime 2592000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the remaining length of time in seconds that this prefix will continue to be valid.

Values 0 to 429496729

infinite — Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

valid-lifetime

Syntax **valid-lifetime** {*seconds* | **infinite**}
no valid-lifetime

Context **[Tree]** (config>router>router-advert>if>prefix valid-lifetime)

Full Context configure router router-advertisement interface prefix valid-lifetime

Description This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default valid-lifetime 2592000

Parameters *seconds* — Specifies the remaining length of time in seconds that this prefix will continue to be valid.

infinite — Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms All

26.6 validate

validate

Syntax **validate** [*file-url*]

Context **[Tree]** (admin>system>license validate)

Full Context admin system license validate

Description This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.
- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note: If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters *file-url* — Specifies the file URL location to read the license file.

Values local-url, remote-url

Note: IPv6 addresses apply only to 7750 SR and 7950 XRS.

Platforms All

validate

Syntax [**no**] **validate**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization validate)

Full Context configure system security profile netconf base-op-authorization validate

Description This command enables the NETCONF validate operation.

The **no** form of this command disables the operation.

Default no validate

Note: The operation is enabled by default in the built-in system-generated administrative profile.

Platforms All

26.7 validate-dest-prefix

validate-dest-prefix

Syntax **validate-dest-prefix**
no validate-dest-prefix

Context **[Tree]** (config>service>vprn>bgp>flowspec validate-dest-prefix)

Full Context configure service vprn bgp flowspec validate-dest-prefix

Description This command enables or disables validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent.

A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true:

- it was originated outside the local AS of the receiving BGP router
- the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix

An invalid route is retained in the BGP but it is not used for filtering traffic or propagated to other BGP routers.

The **no** form of this command disables the validation procedure based on destination-prefix.

Default no validate-dest-prefix

Platforms All

validate-dest-prefix

Syntax [**no**] **validate-dest-prefix**

Context **[Tree]** (config>router>bgp>flowspec validate-dest-prefix)

Full Context configure router bgp flowspec validate-dest-prefix

Description This command enables or disables validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent.

A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true:

- it was originated outside the local AS of the receiving BGP router

© 2022 Nokia.

26.8 validate-gtp-tunnels

validate-gtp-tunnels

Syntax **validate-gtp-tunnels direction** *direction* [**create**]
no validate-gtp-tunnels direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>gtp-filter validate-gtp-tunnels)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-gtp-tunnels

Description This command configures a TCA for the counter capturing drops due to the validation of GTP tunnel check. A validate-gtp-tunnels drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a validate-gtp-tunnels TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

validate-gtp-tunnels

Syntax [**no**] **validate-gtp-tunnels**

Context **[Tree]** (config>app-assure>group>gtp>gtp-fltr>gtp-tunnel-database validate-gtp-tunnels)

Full Context configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-gtp-tunnels

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures GTP tunnel validation. This allows for validation of TEIDs and is a prerequisite for sequence checking and UE IP address validation. This command applies only when AA GTP FW is deployed on S8/S5/Gp/Gn interfaces.

The **gtpc-inspection** command must be enabled before using this command.

The **no** form of this command disables GTP tunnel validation.

Default no validate-gtp-tunnels

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.9 validate-next-hop

validate-next-hop

Syntax [**no**] **validate-next-hop**

Context **[Tree]** (config>service>vprn>static-route-entry>next-hop validate-next-hop)

Full Context configure service vprn static-route-entry next-hop validate-next-hop

Description This optional command tracks the state of the next hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next hop is not reachable and is removed from the ARP or Neighbor Cache, the next hop will no longer be considered valid and the associated static route state removed from the active route-table.

When the next hop is reachable again and present in the ARP/Neighbor Cache, the static route is considered valid and is subject to being placed into the active route-table.

Default no validate-next-hop

Platforms All

validate-next-hop

Syntax [**no**] **validate-next-hop**

Context **[Tree]** (config>router>static-route-entry>next-hop validate-next-hop)

Full Context configure router static-route-entry next-hop validate-next-hop

Description This optional command tracks the state of the next-hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next-hop is not reachable and is removed from the ARP or Neighbor Cache, the next-hop will no longer be considered valid and the associated static-route state removed from the active route-table.

26.10 validate-redirect-ip

validate-redirect-ip

Syntax **validate-redirect-ip**
no validate-redirect-ip

Context **[Tree]** (config>service>vprn>bgp>flowspec validate-redirect-ip)

Full Context configure service vprn bgp flowspec validate-redirect-ip

Description This command enables procedures to validate the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the redirect-to-IPv4 action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec-IPv4 route is considered invalid and not installed as a filter rule if the FlowSpec-IPv4 route is deemed to have originated in a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a flow-spec route is determined from its AS path.

The **no** form of this command disables the check described above.

Default no validate-redirect-ip

Platforms All

validate-redirect-ip

Syntax [**no**] **validate-redirect-ip**

Context **[Tree]** (config>router>bgp>flowspec validate-redirect-ip)

Full Context configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-sequence-number

Description This command configures GTP sequence number checking. GTP packets that fail the sequence number check are discarded.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command disables GTP sequence number checking.

Default no validate-sequence-number

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.12 validate-source-ip-addr

validate-source-ip-addr

Syntax [**no**] **validate-source-ip-addr**

Context **[Tree]** (config>app-assure>group>gtp>gtp-fltr>gtp-tunnel-database validate-source-ip-addr)

Full Context configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-source-ip-addr

Description This command configures the checking for spoofed or invalid UE IP addresses. Upstream GTP packets that contain invalid UE IP addresses are discarded. When a packet is dropped due to **source-ip-address** “invalid source IP add”, the statistics counter is updated.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command disables the checking for spoofed or invalid UE IP addresses.

Default no validate-source-ip-addr

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.13 validate-src-ip-addr

validate-src-ip-addr

Syntax **validate-src-ip-addr direction** *direction* [**create**]
no validate-src-ip-addr direction *direction*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>group>statistics>tca>gtp-filter validate-src-ip-addr)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-src-ip-addr

Description This command configures a TCA for the counter capturing drops due to the GTP filter anti-spoofing of the UE IP address check. A validate-src-ip-addr drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**). The **create** keyword is mandatory when creating a validate-src-ip-addr TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.14 validity-time

validity-time

Syntax **validity-time** *seconds*
no validity-time

Context [Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c validity-time)

Full Context configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit validity-time

Description This command configures the validity time for the interim credit allocated to rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active. When either the allocated interim credit is consumed or the validity time expires, a new attempt is made to establish a Diameter Gy session with the Online Charging Server (OCS).The validity time applies to all interim credit allocated via the **config>subscr-mgmt>diam-appl-plcy** *application-policy-name*>**gy>extended-failure-handling>interim-credit>volume** and **config>subscr -mgmt>category-map** *category-map-name*>**category** *category-name*>**default-credit** CLI commands.

A validity time value of 0 (zero) disables the validity time for the assigned interim credit.

The **no** form of this command resets the value to the default value.

Default validity-time 1800

Parameters *seconds* — Specifies the validity time, in seconds, applicable to the interim credit.

Values 0 to 4294967295

© 2022 Nokia.

[Tree] (config>service>vprn>sub-if>ipv6>dhcp6>relay>asel>clnt-mac>pref-opt value)

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac preference-option value
configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac preference-option value
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection client-mac preference-option value

Description This command configures the preference option value for DHCPv6 clients with an odd or an even source MAC address. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message for these DHCPv6 clients.

The **no** form of this command removes the configuration.

© 2022 Nokia.

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection server preference-option value
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection server preference-option value

Description This command configures the preference option value. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message from the server.

The **no** form of this command removes the configuration.

Parameters *value* — Specifies the preference option value for DHCPv6 advertise messages from the server.

Values 0 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.16 vas-filter

vas-filter

Syntax **vas-filter** *name* [**create**]
no vas-filter *name*

Context **[Tree]** (config>subscr-mgmt>isa-svc-chain vas-filter)

Full Context configure subscriber-mgmt isa-service-chaining vas-filter

Description This command configures a Value Added Service filter.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the VAS filter name from the configuration.

Default This command configures a value added service (VAS) filter that can be associated to an L2-aware NAT host, and is matched on the NAT ISA to select flows for a host that needs to be steered to remote value-added services.

Parameters *name* — Specifies a VAS filter name, up to 32 characters.

create — Keyword used to create the VAS filter instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.17 vas-if-type

vas-if-type

Syntax **vas-if-type** {**to-from-access** | **to-from-network** | **to-from-both**}
no vas-if-type

Context **[Tree]** (config>service>ies>if vas-if-type)

Full Context configure service ies interface vas-if-type

Description This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

Default no vas-if-type

Parameters **to-from-access** — Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

to-from-network — Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

to-from-both — Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

26.18 vc-id

vc-id

Syntax **vc-id** *vc-id*
no vc-id

Context **[Tree]** (config>service>epipe>sap>l2tpv3-session vc-id)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vpls>sap>l2tpv3-session vc-id)

Full Context configure service epipe sap l2tpv3-session vc-id
configure service vpls sap l2tpv3-session vc-id

Description This command specifies the VC-ID for the L2TPv3 session.

The **no** form of this command deletes the VC-ID configuration.

Parameters *vc-id* — Specifies the VC-ID, up to 64 characters.

Values 1 to 4294967295

Platforms All

26.19 vc-id-range

vc-id-range

Syntax **vc-id-range** *from* [**to** *vc-id*]
no vc-id-range *from*

Context [Tree] (config>service>system>bgp-evpn>ethernet-segment vc-id-range)

Full Context configure service system bgp-evpn ethernet-segment vc-id-range

Description This command determines the VC-IDs associated with the virtual Ethernet Segment on a specific SDP based on the following considerations:

- VC-IDs for manual spoke-SDP and BGP-AD are included in the range.
- Th mesh-sdp VC-IDs are not allowed on a SDP used by a virtual ES.
- A maximum of 8 ranges are allowed.
- A range can be comprised of a single VC-ID.
- A **vc-id-range** can be comprised of a single VC-ID.
- Shutting down the ES is not required prior to making changes.

The **no** form of the command removes the configured range. Only the first VC-ID value is required to remove the range.

Parameters *vc-id* — Specifies the VC-ID. When configuring a range of VC-IDs (and not a single value), the value of the second VC-ID must be greater than the first VC-ID.

Values 1 to 4294967295

26.21 vc-range

vc-range

Syntax **vc-range** *num* **vpi-range** *vpi-range* **vci-range** *vci-range*
no vc-range num

Context **[Tree]** (config>service>vpls>sap>atm vc-range)

Full Context configure service vpls sap atm vc-range

Description This command configures ATM Virtual Circuit ranges and is supported only in max16k-vc ATM MDA mode. An ATM MDA supports a number of passive (or listening) VCs, of which a subset can be simultaneously active.

The **no** form of this command reverts to the default.

Parameters *num* — Specifies the VC range.

Values 1 to 5 (Five ranges are supported to accommodate non-contiguous ranges of VPI/VCI pairs.

vci-range *vci-range* — Specifies the VCI range.

Values 1, 2, 5 to 65535 (Contiguous VCI ranges in the form of x-y.)

vpi-range vpi-range. — Specifies the VPI range.

Values 0 to 255 for UNI
0 to 4095 for NNI
(Contiguous VPI range in the form of x-y)

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

26.22 vc-threshold

vc-threshold

Syntax **vc-threshold** *buffer-threshold*

Context **[Tree]** (config>port>sonet-sdh>path>atm>custom-buffer-mode vc-threshold)

Full Context configure port sonet-sdh path atm custom-buffer-mode vc-threshold

Description This command configures the ATM port VC threshold.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *buffer-threshold* — specifies the VC buffer threshold for all VCs configured on this port.

Values 190 to 117000

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

26.23 vc-type

vc-type

Syntax **vc-type** {**ether** | **vlan**}
no vc-type

Context **[Tree]** (config>service>sdp>binding>pw-port vc-type)

Full Context configure service sdp binding pw-port vc-type

Description This command sets the forwarding mode for the pseudowire port. The vc-type is signaled to the peer, and must be configured consistently on both ends of the pseudowire. vc-type VLAN is only configurable with dot1q encapsulation on the pseudowire port. The tag with vc-type vlan only has significance for transport, and is not used for service delineation or ESM. The top (provider tag) is stripped while forwarding out of the pseudowire, and a configured vlan-tag (for vc-type vlan) is inserted when forwarding into the pseudowire. With vc-type ether, the tags if present (max 2), are transparently preserved when forwarding in our out of the pseudowire.

The **no** form of the command reverts to the default value.

Default vc-type ether

Parameters **ether** — Specifies **ether** as the virtual circuit (VC) associated with the SDP binding.

vlan — Specifies **vlan** as the virtual circuit (VC) associated with the SDP binding.

Platforms All

vc-type

Syntax **vc-type** {**ether** | **vlan**}

Context **[Tree]** (config>service>pw-template vc-type)

Full Context configure service pw-template vc-type

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters **ether** — Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan — Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

Context [Tree] (oam vccv-ping)
[Tree] (config>saa>test>type vccv-ping)

Full Context configure saa test type vccv-ping
oam vccv-ping

Description This command configures a Virtual Circuit Connectivity Verification (VCCV) ping test. A vccv-ping test checks connectivity of a VLL inband. It checks to verify that the destination (target) PE is the egress for the Layer 2 FEC. It provides for a cross-check between the dataplane and the control plane. It is inband which means that the **vccv-ping** message is sent using the same encapsulation and along the same path as user packets in that VLL. The **vccv-ping** test is the equivalent of the lsp-ping test for a VLL service. The vccv-ping reuses an lsp-ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.

Note that VCCV ping can be initiated on T-PE or S-PE. If initiated on the S-PE, the **reply-mode** parameter must be used with the **ip-routed** value The ping from the T-PE can have either values or can be omitted, in which case the default value is used.

If a VCCV ping is initiated from T-PE to neighboring a S-PE (one segment only), then it is sufficient to only use the **spoke-sdp-fec-id** parameter. However, if the ping is across two or more segments, at least the **spoke-sdp-fec-id**, **src-ip-address** *ip-addr*, **dst-ip-address** *ip-addr*, **ttl** *vc-label-ttl* parameters are used where:

- The **src-ip-address** is system IP address of the router preceding the destination router.
- The *vc-label-ttl* parameter must have a value equal or higher than the number of pseudowire segments.

Note that VCCV ping is a multi-segment pseudowire. For a single-hop pseudowire, only the peer VCCV CC bit of the control word is advertised when the control word is enabled on the pseudowire.

VCCV ping on multi-segment pseudowires require that the control word be enabled in all segments of the VLL. If the control word is not enabled on a spoke SDP, it is signaled peer VCCV CC bits to the far end, consequently the **vccv-ping** cannot be successfully initiated on that specific spoke SDP.

Use subject to Terms available at: www.nokia.com

If the **saii-type-2** and **taii-type-2** parameters are specified by the user of this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke-sdp indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the user must enter the **saii** and **taii** in accordance with the direction of the pseudowire as seen from the node on which the **vccv-ping** command is executed. However, the values of the **saii** and **taii** sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for FEC129 type 2 pseudowire reflects the order of the **saii** and **taii** stored on the targeted node.

This command, when used with the **static** option, configures a Virtual Circuit Connectivity Verification (VCCV) ping test for static MPLS-TP pseudowires used in a VLL service. It checks to verify that the destination (target) PE is the egress for the Static PW FEC. It provides for a cross-check between the dataplane and the configuration. The **vccv-ping static** command reuses an **lsp-ping** message format and can be used to test an MPLS-TP pseudowire VLL configured over an MPLS SDP. VCCV Ping for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-ping static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. If the **target-fec-type** option is not specified, then the target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source node ID, source global ID, and destination global ID and destination node ID in the **vccv-ping** command (or taken from the pseudowire context if omitted from the command).

The **target-fec-type** option allows the user to test a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-ping** command is issued. This is applicable for performing VCCV ping on an MS-PW comprised of static PW FEC segments and dynamically signaled PW ID FEC segments.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters *sdp-id:vc-id* — Specifies that if a FEC 128 PW is tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767
vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel} — Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

src-ip-address *ip-addr* — Specifies the source IP address.

Values a.b.c.d

dst-ip-address *ip-addr* — Specifies the destination IP address.

Values a.b.c.d

src-ip-address *ip-addr* — Specifies the source IP address.

Values a.b.c.d

pw-id — Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

target-fec-type — Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW 00000000000000000000000000000000000000000000000000000000000000000000000000000000 segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

attachment-group-identifier — Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

Values 0 to 4294967295

pw-path-id-saii *global-id:node-id:ac-id* — Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pw-path-id-taii *global-id:node-id:ac-id* — Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d
1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id*:*prefix*:*ac-id* — Specifies that if a FEC129 AII Type 2 pseudowire is tested, then the source attachment individual identifier (SAII) must be indicated. The **saii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

taii-type2 *global-id:prefix:ac-id* — Specifies that if a FEC129 AII Type 2 pseudowire is tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

Default 0

node-id — Specifies the node-id on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d
1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

spoke-sdp-fec-id — Specifies that if a FEC 129 PW is tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The *spoke-sdp-fec-id* must already exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send **vccv-ping** message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip} — Specifies the associated channel encapsulation format to use for the VCCV ping echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values **ipv4** – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

non-ip –MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

Default non-ip

global-id — Specifies the MPLS-TP global ID for the far end node of the pseudowire under test. If this is not entered, then the *dest-global-id* is taken from the pseudowire context.

Values 0 to 4294967295

Default 0

node-id — Specifies the MPLS-TP node ID of the far end node for the pseudowire under test. If this is not entered, then the *dest-global-id* is taken from the pseudowire context.

Values ipv4-formatted address: a.b.c.d
1 to 4294967295

Default 0

sender-src-address *ip-addr* — Specifies the 4-octet IPv4 address of the node originating the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

remote-dst-address *ip-addr* — Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-type — Specifies the PW type value of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** *pw-id-fec*.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

send-count — Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message interval value must have expired before the next message request is sent.

Values 1 to 100

Default 1

fc-name — Specifies the **fc** parameter be used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end 7750 SR that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating SR.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

The ToS byte is not modified. Table 187 summarizes this behavior.

Table 187 **vccv-ping Request Packet and Behavior**

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 187 **vccv-ping Request Packet and Behavior**

Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out} — Specifies the profile state of the MPLS echo request encapsulation.

Default out

interval — Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

octets — Specifies the size, in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

vc-label-ttl — Specifies the time-to-live value for the vc-label of the echo request message. The outer label TTL is still set to the default of 255 regardless of this value.

Values 1 to 255

Default 1

Output The following output is an example of VCCV ping information.

Context [Tree] (oam vccv-trace)
[Tree] (config>saa>test>type vccv-trace)

Full Context configure saa test type vccv-trace
oam vccv-trace

Description This command configures a Virtual Circuit Connectivity Verification (VCCV) automated trace test. The automated VCCV-trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. This is equivalent to LSP-Trace and is an iterative process by which the source T-PE or S-PE node sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. In each iteration, the T-PE builds the MPLS echo request message in a way like VCCV-Ping. The first message with TTL=1 has the next-hop S-PE T-LDP session source address in the Remote PE Address field in the PW FEC TLV. Each S-PE which terminates and processes the message includes in the MPLS echo reply message the FEC 128 TLV corresponding the PW segment to its downstream node. The source T-PE or S-PE node can then build the next echo reply message with TTL=2 to test the next-next hop for the MS-PW. It copies the FEC TLV it received in the echo reply message into the new echo request message. The process is terminated when the reply is from the egress T-PE or when a time out occurs.

The user can specify to display the result of the VCCV-trace for a fewer number of PW segments of the end-to-end MS-PW path. In this case, the **min-ttl** and **max-ttl** parameters are configured accordingly. However, the T-PE/S-PE node still probes all hops up to **min-ttl** to correctly build the FEC of the desired subset of segments.

Note that if the **saii-type-2** and **taii-type-2** parameters are specified this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke SDP indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the use must enter the saii and taii in accordance with the direction of pseudowire as seen from the node on which the **vccv-trace** command is executed. However, the values of the saii and taii sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC129 type 2 pseudowire reflects the order of the saii and taii stored on the targeted node.

This command, when used with the **static** option, configures a VCCV-automated trace test for static MPLS-TP pseudowires used in a VLL service. VCCV trace for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-trace static** can only be initiated on a T-PE. Both the echo request and reply messages are send using the same, in-band, encapsulation. The target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source Node ID, source global ID, and destination global ID and destination node ID taken from the pseudowire context.

The **target-fec-type** option allows the user to perform a vccv-trace to a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-trace** command is issued. This is applicable for performing VCCV ping on an MS-PW comprised of static PW FEC segments and dynamically signaled PW ID FEC segments.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *sdp-id:vc-id* — Specifies that if a FEC 128 PW is being tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

Values sdp-id: 1 to 32767
vc-id: 1 to 4294967295

reply-mode {ip-routed | control-channel} — Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

Default control-channel

target-fec-type — Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

Values **pw-id-fec** — Indicates that FEC element for the remote target PW 00000000000000000000000000000000000000000000000000000000000000000000000000000000 segment is of type PW ID (FEC128).

static-pw-fec — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

attachment-group-identifier — Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

Values 0 to 4,294,967,295

pw-path-id-saii *global-id:node-id:ac-id* — Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d
1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pw-path-id-taii *global-id:node-id:ac-id* — Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type** *static-pw-fec*.

global-id — Specifies the global ID of the SAII of the targeted static PW FEC element.

Values 0 to 4294967295

Default 0

node-id — Specifies the node ID of the far-end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

saii-type2 *global-id:prefix:ac-id* — If a FEC129 AII Type 2 pseudowire is being tested, then the source attachment individual identifier (SAII) must be indicated.

The **saii-type2** parameter is mutually exclusive with the **sdp-id:vc-id** parameter.

global-id — Specifies the global ID of this T-PE node.

Values 1 to 4294967295

prefix — Specifies the prefix on this T-PE node that the spoke SDP is associated with.

ac-id — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

taii-type2 *global-id:prefix:ac-id* — Specifies that if a FEC129 AII Type 2 pseudowire is being tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

global-id — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

Values 0 to 4294967295

node-id — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

Values ipv4-formatted address: a.b.c.d

1 to 4294967295

ac-id — Specifies an unsigned integer representing a locally unique TAII for the pseudowire being tested at the far end T-PE.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

spoke-sdp-fec-id — Specifies that if a FEC 129 PW is being tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The **spoke-sdp-fec-id** needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

spoke-sdp-fec is mutually exclusive with the *sdp-id:vc-id* parameter.

Values 1 to 4294967295

assoc-channel {ipv4 | non-ip} — Specifies the associated channel encapsulation format to use for the VCCV trace echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

Values ipv4 – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip – MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

Default non-ip

src-ip-address *ipv4-address* — Specifies the 4-octet IPv4 address of the source node.

Values a.b.c.d

sender-src-address *ipv4-address* — Specifies the 4-octet IPv4 address of the node originating the VCCV trace.

Values a.b.c.d

remote-dst-address *ipv4-address* — Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

Values a.b.c.d

pw-id — Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

Values 1 to 4294967295

pw-type — Specifies the PW type of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different form the local FEC type and the **target-fec-type** is **pw-id-fec**.

Values atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

fc-name — Specifies the FC and profile parameters are used to indicate the forwarding class of the VCCV trace echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

The ToS byte is not modified. Table 188 summarizes this behavior.

Table 188 **vccv trace Request Packet and Behavior**

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet{tos=1, fc2, profile2}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 188 **vccv trace Request Packet and Behavior**

Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

profile {in | out} — Specifies the profile state of the VCCV trace echo request packet.

Default out

interval-value — Specifies the interval parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 255

Default 1

no-response-count — Specifies the maximum number of consecutive VCCV trace echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL value.

Values 1 to 255

Default 5

max-vc-label-ttl — Specifies the TTL value for the VC label of the echo request message for the last hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. The outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 8

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

min-vc-label-ttl — Specifies the TTL value for the VC label of the echo request message for the first hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. Note that the outer label TTL is still set to the default regardless of the value of the VC label.

Values 1 to 255

Default 1

probe-count — Specifies the number of VCCV trace echo request messages to send per TTL value.

Values 1 to 10

Default 1

octets — Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout-value — Specifies the *timeout* parameter, in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response are not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

Output

26.26 ve-id

ve-id

Syntax **ve-id** *value*
no ve-id

Context **[Tree]** (config>service>epipe>bgp-vpws>ve-name ve-id)
[Tree] (config>service>epipe>bgp-vpws>remote-ve-name ve-id)

Full Context configure service epipe bgp-vpws remote-ve-name ve-id
configure service epipe bgp-vpws ve-name ve-id

Description This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default no ve-id

Parameters *value* — A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

Values 1 to 65535

Platforms All

ve-id

Syntax **ve-id** *ve-id-value*
no ve-id

Context **[Tree]** (config>service>vpls>bgp-vpls>ve-name ve-id)

Full Context configure service vpls bgp-vpls ve-name ve-id

Description This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default no ve-id

Parameters *value* — Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

Values 1 to 65535

Platforms All

26.27 ve-name

ve-name

Syntax [**no**] **ve-name** *name*

Context **[Tree]** (config>service>epipe>bgp-vpws ve-name)

Full Context configure service epipe bgp-vpws ve-name

Description This command configures the name of the local VPWS instance in this service.

The **no** form of this command removes the ve-name.

Parameters *name* — Specifies a site name up to 32 characters in length.

Platforms All

ve-name

Syntax **ve-name** *name*
no ve-name

Context **[Tree]** (config>service>vpls>bgp-vpls ve-name)

Full Context configure service vpls bgp-vpls ve-name

Description This command creates or edits a ve-name. Just one ve-name can be created per BGP VPLS instance.

The **no** form of this command removes the configured ve-name from the bgp vpls node. It can be used only when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-name configured.

Default no ve-name

Parameters *name* — Specifies the A character string to identify the VPLS Edge instance up to 32 characters in length

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping version

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the version of IGMP which is running on an MSAP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new “wrong version” counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Default version 3

Parameters *version* — Specifies the IGMP version.

Values 1, 2, 3

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

version

Syntax **version** *version*

Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vprn>igmp>if version)

Full Context configure service vprn igmp interface version

Description This command specifies the IGMP version. If routers run different versions of IGMP, they will negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version. For IGMP to function correctly, all routers on a LAN should be configured to run the same version of IGMP on that LAN.

For IGMPv3, a multicast router that is also a group member performs both parts of IGMPv3, receiving and responding to its own IGMP message transmissions as well as those of its neighbors.

Default version 3

Parameters *version* — Specifies the IGMP version number.

Values 1, 2, 3

Platforms All

version

Syntax **version** *version*
no version

Context [Tree] (config>service>vprn>mld>if version)

Full Context configure service vprn mld interface version

Description This command specifies the MLD version. If routers run different versions, they will negotiate the lowest common version of MLD that is supported by hosts on their subnet and operate in that version. For MLD to function correctly, all routers on a LAN should be configured to run the same version of MLD on that LAN.

Default version 2

Parameters *version* — Specifies the MLD version number.

Values 1, 2

Platforms All

Full Context configure service nat pcp-server-policy version

Description This command configures the accepted protocol version range.

Default version minimum 1 maximum 1

Parameters *minimum* — Specifies the minimum protocol version supported by the PCP servers using this PCP policy.

Values 1 to 255

maximum — Specifies the maximum protocol version supported by the PCP servers using this PCP policy.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

version

Syntax **version** *version*
no version

Context **[Tree]** (config>router>igmp>group-interface version)
[Tree] (config>router>igmp>if version)

Full Context configure router igmp group-interface version
configure router igmp interface version

Description This command specifies the IGMP version. If routers run different versions of IGMP, they will negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version. For IGMP to function correctly, all routers on a LAN should be configured to run the same version of IGMP on that LAN.

For IGMPv3, a multicast router that is also a group member performs both parts of IGMPv3, receiving and responding to its own IGMP message transmissions as well as those of its neighbors.

Default version 3

Parameters *version* — Specifies the IGMP version number.

Values 1, 2, 3

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure router mld interface version

version

Syntax **version** *version*
no version

Context **[Tree]** (config>service>pw-template>igmp-snooping version)

Full Context configure service pw-template igmp-snooping version

Description This command specifies the version of IGMP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new “wrong version” counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Default version 3

Parameters *version* — Specifies the IGMP version.

Values 1, 2, 3

Platforms All

version

Syntax **version** *file-url* [**check**]

Context **[Tree]** (file version)

Full Context file version

Description This command displays the version of an SR OS *.tim image file.

Parameters *file-url* — Specifies the file name of the target file.

Values

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including *cflash-id* directory length up to 99 characters each
remote-url	[{ftp://| tftp://}*login*:*pswd*@*remote-locn*/ [*file-path*] up to 247 characters directory length 199 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:

check — Validates the SR OS *.tim image file.

Output The following output is an example of SR OS version information.

Sample Output

```
A:Redundancy>file cf3:\ # version  ftp://test:1234@192.0.2.79/usr/global/images/6.1/

version

Syntax **version** *ssh-version*
no version

Context **[Tree]** (config>system>security>ssh version)

Full Context configure system security ssh version

Description This command configures the SSH protocol version that is supported by the SSH server.

The **no** form of this command removes the SSH version from the configuration.

Parameters *ssh-version* — Specifies the SSH version.

Values 1 — Specifies that the SSH server will only accept connections from clients that support SSH protocol version 1 2 — Specifies that the SSH server will accept connections from clients supporting either SSH protocol version 2 1-2 — Specifies that the SSH server will accept connections from clients supporting either SSH protocol version 1, or SSH protocol version 2 or both.

Note: Values “1” and “1-2” are not permitted in FIPS-140-2 mode.

Full Context configure mcast-management multicast-info-policy bundle channel source-override video
configure mcast-management multicast-info-policy bundle channel video
configure mcast-management multicast-info-policy bundle video

Description Commands in this context configure video parameters.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

26.35 video-group

video-group

Syntax **video-group** *video-group-id* [**create**]
no video-group *video-group-id*

Context **[Tree]** (config>isa video-group)

Full Context configure isa video-group

Description This command configures an ISA video group.

Parameters *video-group-id* — Specifies a video group ID.

Values 1 to 4

create — Keyword required when first creating the configuration context. Once the context is created, one can navigate into the context without the **create** keyword.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

video-group

Syntax **video-group** *video-group-id*
video-group disable

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no video-group

Context [Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>video video-group)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video video-group)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video video-group)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video video-group
configure mcast-management multicast-info-policy bundle channel video video-group
configure mcast-management multicast-info-policy bundle video video-group

Description This command assigns a video group ID to the channel.

Parameters *video-group-id* — specifies the identifier for this video group. The video group must have been configured in the **config>isa** context.

Values 1 to 4

disable — Explicitly disables the video group within the policy.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

26.36 video-interface

video-interface

Syntax **video-interface** *ip-address* [**create**]
no video-interface *ip-address*

Context [Tree] (config>mcast-mgmt>mcast-info-plcy>video-policy video-interface)

Full Context configure mcast-management multicast-info-policy video-policy video-interface

Description This command creates a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface ip address, the parameters defined within this context have no effect.

The **no** form of the command deletes the video interface policy context.

Parameters *ip-address* — The IP address of a video interface provisioned within the context of a service to which the Multicast Information Policy is assigned. If the IP address does not match the IP address assigned to a video interface, the parameters defined within this context have no effect.

create — Mandatory keyword needed when creating a new video interface within the video policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

video-interface

Syntax **video-interface** *ip-int-name* [**create**]
no video-interface *ip-int-name*

Context **[Tree]** (config>service>ies video-interface)
[Tree] (config>service>vpls video-interface)
[Tree] (config>service>vprn video-interface)

Full Context configure service ies video-interface
configure service vpls video-interface
configure service vprn video-interface

Description This command creates a video interface within the service. The video interface and associated IP addresses are the addresses to which clients within the service will send requests. The video interface must be associated with an ISA group using the video-sap command and have IP addresses for it to be functional.

The **no** form of the command deletes the video interface. The video interface must be administratively shut down before issuing the **no video-interface** command.

Default none

Parameters *ip-int-name* — Specifies the name of the video interface, up to 32 characters. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

create — This keyword is mandatory when creating a video interface.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

video-interface

Syntax [**no**] **video-interface** *video-ip-int-name*

Context **[Tree]** (debug>service>id video-interface)

Full Context debug service id video-interface

Description This command enables debugging for video interfaces.

The **no** form of the command disables the video interface debugging.

Parameters *video-ip-int-name* — Specifies the video interface name.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.37 video-policy

video-policy

Syntax **video-policy**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy video-policy)

Full Context configure mcast-management multicast-info-policy video-policy

Description Commands in this context configure video interfaces and video services.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

26.38 video-sap

video-sap

Syntax **video-sap** *video-group-id*

Context **[Tree]** (config>service>ies>video-interface video-sap)
[Tree] (config>service>vpls>video-interface video-sap)
[Tree] (config>service>vprn>video-interface video-sap)

Full Context configure service ies video-interface video-sap
configure service vpls video-interface video-sap
configure service vprn video-interface video-sap

Description This command configures a service video interface association with a video group.

The **no** form of the command removes the video group association.

Default none

Parameters *video-group-id* — Specifies the video group ID number.

Values 1 to 4

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.39 video-template

video-template

Syntax **video-template**

Context **[Tree]** (config>app-assure>group>cflowd>rtp-perf video-template)

Full Context configure application-assurance group cflowd rtp-performance video-template

Description Commands in this context configure the video template for cflowd fields.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.40 view

view

Syntax **view** [*line*]

Context **[Tree]** (candidate view)

Full Context candidate view

Description This command displays the candidate configuration along with line numbers that can be used for editing the candidate configuration.

Parameters *line* — Displays the candidate configuration starting at the point indicated by the following options (the display is not limited to the current CLI context/branch).

Values

line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

view

Syntax **view** [*checkpoint-id* | **rescue** | **latest-rb**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (admin>rollback view)

Full Context admin rollback view

Description This command displays the checkpoint.

Parameters **latest-rb** — Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id — Indicates rollback checkpoint file to be viewed. Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

Values 1 to 9

rescue — Displays the rescue configuration.

Platforms All

view

Syntax **view** {**bootup-cfg** | **active-cfg** | **candidate-cfg** | **latest-rb**| *checkpoint-id* | **rescue**}

Context [Tree] (admin view)

Full Context admin view

Description The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the **admin** context.

Parameters **bootup-cfg** — Specifies the bootup configuration.

active-cfg — Specifies current running configuration.

candidate-cfg — Specifies candidate configuration.

latest-rb — Specifies the latest configuration.

checkpoint-id — Specifies a specific checkpoint file configuration.

Values 1 to 9

rescue — Specifies a rescue checkpoint configuration.

Platforms All

view

Syntax **view** *view-name* **subtree** *oid-value*
no view *view-name* [**subtree** *oid-value*]

Context [Tree] (config>system>security>snmp view)

Full Context configure system security snmp view

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

Parameters *view-name* — Specifies a view name, up to 32 characters.

oid-value — Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

26.41 virtual-chassis-identifier

virtual-chassis-identifier

Syntax **virtual-chassis-identifier** *dual-homing-key*
no virtual-chassis-identifier

Context **[Tree]** (config>subscr-mgmt>wlan-gw virtual-chassis-identifier)

Full Context configure subscriber-mgmt wlan-gw virtual-chassis-identifier

Description This command specifies a virtual chassis identifier that can link two wlan-gws together.

The **no** form of this command removes the dual-homing-key.

Parameters *dual-homing-key* — Specifies the name of the dual homing key, up to 16 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.42 virtual-link

virtual-link

Syntax [**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context **[Tree]** (config>service>vprn>ospf>area virtual-link)
[Tree] (config>service>vprn>ospf3>area virtual-link)

Full Context configure service vprn ospf area virtual-link
configure service vprn ospf3 area virtual-link

Description This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default No virtual link is defined.

Parameters *router-id* — The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area *area-id* — The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

virtual-link

Syntax [**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context **[Tree]** (config>router>ospf>area virtual-link)
[Tree] (config>router>ospf3>area virtual-link)

Full Context configure router ospf area virtual-link
configure router ospf3 area virtual-link

Description This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

By default, no virtual link is defined.

Default no virtual-link

Parameters *router-id* — Specifies the router ID of the virtual neighbor in IP address dotted decimal notation.

area-id — Specifies the area-id that identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms All

26.43 virtual-neighbor

virtual-neighbor

Syntax **virtual-neighbor** [*router-id*]
no virtual-neighbor

Context **[Tree]** (debug>router>ospf virtual-neighbor)
[Tree] (debug>router>ospf3 virtual-neighbor)

Full Context debug router ospf virtual-neighbor
debug router ospf3 virtual-neighbor

Description This command enables debugging for an OSPF virtual neighbor.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *router-id* — Specifies the router ID of the virtual neighbor.

Platforms All

26.44 virtual-scheduler-adjustment

virtual-scheduler-adjustment

Syntax **virtual-scheduler-adjustment**

Context **[Tree]** (config>card virtual-scheduler-adjustment)

Full Context configure card virtual-scheduler-adjustment

Description Commands in this context configure the virtual scheduler processing on the card. This is only applicable to queues and to policers parented to a scheduler.

Platforms All

26.45 virtual-subnet

virtual-subnet

Syntax [**no**] **virtual-subnet**

Context **[Tree]** (config>service>ies>sub-if>dhcp virtual-subnet)
[Tree] (config>service>vprn>sub-if>dhcp virtual-subnet)

Full Context configure service ies subscriber-interface dhcp virtual-subnet
configure service vprn subscriber-interface dhcp virtual-subnet

Description This command enables a virtual-subnet for DHCPv4 hosts under the subscriber interface. With this command configured, the system will snoop and record the default router address in the DHCP ACK message for the DHCPv4 ESM host. The system could answer ping or traceroute request even if the default router address is not configured on the subscriber-interface.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.46 vlan

vlan

Syntax **vlan** [*vlan-encap*]

Context **[Tree]** (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

Full Context configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

Description This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters *vlan-encap* — Specifies the node cc VLAN IP.

Platforms All

vlan

Syntax **vlan** *tag*
no vlan

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query vlan)

Full Context configure subscriber-mgmt wlan-gw ue-query vlan

Description This command enables matching on UEs, based on the VLAN tag within the tunnel, which typically used to indicate an SSID.

The **no** form of this command disables matching on the VLAN.

Default no vlan

Parameters *tag* — Specifies the VLAN tag.

Values 0 to 4096

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan

Syntax **vlan start** [*value*] **end** [*value*] **retail-svc-id** *service-id*
no vlan start [*value*] **end** [*value*]

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>retailer vlan)

Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>retailer vlan)

Full Context configure service ies subscriber-interface group-interface wlan-gw retailer vlan
configure service vprn subscriber-interface group-interface wlan-gw retailer vlan

Description This command creates a mapping from a range of VLANs (appearing in the wlan-gw encapsulated Layer 2 frame) to a retail service ID.

The **no** form of this command removes the parameters from the configuration.

Parameters **start** — Specifies the start VLAN tag of this range.

Values 0 to 4095

end — Specifies the end VLAN tag of this range.

Values 0 to 4095

retail-svc-id *service-id* — Specifies the identifier of the retail service to be used by default of a value in the retail service map of this interface.

Values 1 to 2147483650
svc-name: up to 64 characters

vlan

Syntax **vlan** *vlan-encap*
no vlan

Context [Tree] (config>redundancy>mc>peer>mcr>node>cv vlan)

Full Context configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify vlan

Description This command specifies the VLAN tag used for the Ring-node Connectivity Verification of this ring node. It is only meaningful if the value of service ID is not zero. A zero value means that no VLAN tag is configured.

Default no vlan

Parameters *vlan-encap* — Specifies the VLAN tag.

Values

vlan-encap:	dot1q	qtag, *
	qinq	qtag1.qtag2, qtag1.*, 0.*
	qtag	0 to 4094
	qtag1	1 to 4094
	qtag2	0 to 4094

vlan

Syntax **vlan** *vlan-id*
no vlan

Context **[Tree]** (cfg>eth-cfm>domain>assoc>bridge vlan)

Full Context configure eth-cfm domain association bridge-identifier vlan

Description This command configures the bridge identifier primary VLAN ID. This is informational only, and no verification is done to ensure MEPs on this association are on the configured VLAN.

The **no** form of this command reverts to the default value.

Default no vlan

Parameters *vlan-id* — Specifies a VLAN ID monitored by MA.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

26.47 vlan-id

vlan-id

Syntax **vlan-id** *service-port-vlan-id*
no vlan-id

Context **[Tree]** (config>app-assure>group>evt-log>syslog vlan-id)

Full Context configure application-assurance group event-log syslog vlan-id

Description This command configures the service port VLAN ID to be used by application assurance to inject the syslog events inband. This VLAN ID needs also to be configured for application assurance interface.

Default no vlan-id

Parameters *service-port-vlan-id* — Specifies the service port VLAN identifier.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

vlan-id

Syntax **vlan-id** *service-port-vlan-id*
no vlan-id

Context **[Tree]** (config>app-assure>group>http-redirect>captive-redirect vlan-id)

Full Context configure application-assurance group http-redirect captive-redirect vlan-id

Description This command configures the VLAN ID for captive redirect. Captive redirect uses the provisioned VLAN ID to send the HTTP response to subscribers; therefore this VLAN ID must be properly assigned in the same VPN as the subscriber.

Parameters *service-port-vlan-id* — Specifies the VLAN ID.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

Syntax **vlan-id** *service-port-vlan-id*
no vlan-id

Context **[Tree]** (config>app-assure>group>url-filter>icap vlan-id)

Full Context configure application-assurance group url-filter icap vlan-id

Description This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic mapping to a pre-configured aa-interface.

Default no vlan-id

Parameters *service-port-vlan-id* — Specifies the VLAN ID.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

Syntax **vlan-id** *vlan-id*
no vlan-id

Context **[Tree]** (config>app-assure>group>url-filter>web-service vlan-id)

Full Context configure application-assurance group url-filter web-service vlan-id

Description This command configures the VLAN ID on which the AA ISA emits the traffic mapping to a preconfigured AA interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the VLAN ID configuration.

Default no vlan-id

Parameters *vlan-id* — Specifies the VLAN ID to connect to the web service.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

Syntax **vlan-id** *vlan-id*
no vlan-id

Context **[Tree]** (config>test-oam>build-packet>header>dot1q vlan-id)
[Tree] (debug>oam>build-packet>packet>field-override>header>dot1q vlan-id)

Full Context configure test-oam build-packet header dot1q vlan-id
debug oam build-packet packet field-override header dot1q vlan-id

Description This command defines the Dot1Q VLAN ID to be used in the test Dot1Q header.

The **no** form of this command removes the VLAN ID value.

Parameters *vlan-id* — Specifies the Dot1Q VLAN ID to be used in the test Dot1Q header.

Values 0 to 4095

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vlan-id

Syntax **vlan-id** *service-port-vlan-id*
no vlan-id

Context **[Tree]** (config>app-assure>group>cflowd>dir-exp vlan-id)

Full Context configure application-assurance group cflowd direct-export vlan-id

Description This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic.

The **no** form of this command removes the VLAN ID from the configuration.

Default no vlan-id

Parameters *service-port-vlan-id* — Specifies the VLAN ID of the service port.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.48 vlan-mismatch-timeout

vlan-mismatch-timeout

Syntax **vlan-mismatch-timeout** *seconds*
no vlan-mismatch-timeout

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication vlan-mismatch-timeout

Description This command configures the timeout value for the RADIUS proxy cache if a packet is received with a non-matching VLAN tag. The new timeout value is the lesser of the **vlan-mismatch-timeout** value and the currently remaining proxy cache timeout value.

The **no** form of this command disables the timeout behavior. The cache timeout value will remain unchanged.

Parameters *seconds* — Specifies the timeout value for the RADIUS proxy cache, in seconds.

Values 5 to 60

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.49 vlan-range

vlan-range

Syntax [**no**] **vlan-range** [*vlan-range*]

Context **[Tree]** (config>service>vpls>stp>mst-instance vlan-range)

Full Context configure service vpls stp mst-instance vlan-range

Description This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

Parameters *vlan-range* — The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

Platforms All

vlan-range

Syntax **vlan-range** *from* [**to** *to*]
no vlan-range *from*

Context **[Tree]** (config>connection-profile-vlan vlan-range)

Full Context configure connection-profile-vlan vlan-range

Description This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters *from* — Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

to — Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

26.50 vlan-tag-ranges

vlan-tag-ranges

Syntax **vlan-tag-ranges**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw vlan-tag-ranges)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw vlan-tag-ranges)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges

Description Commands in this context configure VLAN-to-retail-map parameters to map dot1q tags to the retail service ID. The WIFI AP inserts a dot1Q tag in the Layer 2 frame within the GRE tunnel to indicate the retail service provider for the subscriber.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.51 vlan-translation

vlan-translation

Syntax **vlan-translation** {*vlan-id* | **copy-outer**}
no vlan-translation

Context **[Tree]** (config>service>epipe>sap>ingress vlan-translation)
[Tree] (config>service>vpls>sap>ingress vlan-translation)

Full Context configure service epipe sap ingress vlan-translation
configure service vpls sap ingress vlan-translation

Description This command configures ingress VLAN translation. If enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the copy-outer keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- Dot1q saps
- QinQ saps with qinq-vlan-translation
- Connection profile VLAN SAPs if the **copy-outer** option is configured

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** version of the command disables VLAN translation.

Default no vlan-translation

Parameters *vlan-id* — Specifies the VLAN id.

Values 0 to 4094

copy-outer — Specifies to use the outer VLAN id.

Platforms All

26.52 vlan-vc-etype

vlan-vc-etype

Syntax **vlan-vc-etype** *ethernet-type*
no vlan-vc-etype [*ethernet-type*]

Context **[Tree]** (config>service>sdp vlan-vc-etype)

Full Context configure service sdp vlan-vc-etype

Description This command configures the VLAN VC EtherType.

The **no** form of this command returns the value to the default.

Default no vlan-vc-etype

Parameters *ethernet-type* — Specifies a valid VLAN etype identifier.

Values 0x0600 to 0xffff

Platforms All

26.53 vlan-vc-tag

vlan-vc-tag

Syntax **vlan-vc-tag** *vlan-id*
no vlan-vc-tag [*vlan-id*]

Context **[Tree]** (config>service>vpls>spoke-sdp vlan-vc-tag)
[Tree] (config>service>vpls>mesh-sdp vlan-vc-tag)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls mesh-sdp vlan-vc-tag
configure service vpls spoke-sdp vlan-vc-tag

Description This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default no vlan-vc-tag

Parameters *vlan-id* — Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms All

vlan-vc-tag

Syntax **vlan-vc-tag** *vlan-id*
no vlan-vc-tag

Context **[Tree]** (config>service>sdp>binding>pw-port vlan-vc-tag)

Full Context configure service sdp binding pw-port vlan-vc-tag

Description This command sets tag relevant for vc-type vlan mode. This tag is inserted in traffic forwarded into the pseudowire.

The **no** form of the command reverts to the default value.

Default no vlan-vc-tag

Parameters *vlan-id* — Specifies the VLAN ID value.

Values 0 to 4094

Platforms All

vlan-vc-tag

Syntax **vlan-vc-tag** *tag*
no vlan-vc-tag *tag*

Context **[Tree]** (config>service>epipe>spoke-sdp vlan-vc-tag)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service epipe spoke-sdp vlan-vc-tag

Description This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default no vlan-vc-tag

Parameters *tag* — Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms All

vlan-vc-tag

Syntax **vlan-vc-tag** *vlan-id*
no vlan-vc-tag

Context **[Tree]** (config>service>pw-template vlan-vc-tag)

Full Context configure service pw-template vlan-vc-tag

Description This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default no vlan-vc-tag

Parameters *vlan-id* — Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.54 vm

vm

Syntax **vm** *vm-id* [**create**]
no vm *vm-id*

Context **[Tree]** (config>esa vm)

Full Context configure esa vm

Description This command configures or creates an ESA-VM instance.

The **no** form of this command removes the ESA-VM from the system.

Parameters *vm-id* — Specifies the VM identifier.

Values 1 to 4

create — Mandatory keyword used when creating an ESA-VM in the config context

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

26.55 vm-traffic-distribution-by-ip

vm-traffic-distribution-by-ip

Syntax [**no**] **vm-traffic-distribution-by-ip**

Context **[Tree]** (config>isa>aa-grp vm-traffic-distribution-by-ip)

Full Context configure isa application-assurance-group vm-traffic-distribution-by-ip

Description This command enables the distribution of packets by IP address across virtual CPUs of a data plane VM. This allows support for AA subscribers whose bandwidth exceeds the processing throughput of a single vCPU.

The **no** form of this command enables traffic distribution by AA subscriber.

Default no vm-traffic-distribution-by-ip

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.56 vm-traffic-distribution-by-teid

vm-traffic-distribution-by-teid

Syntax [**no**] **vm-traffic-distribution-by-teid**

Context **[Tree]** (config>isa>aa-grp vm-traffic-distribution-by-teid)

Full Context configure isa application-assurance-group vm-traffic-distribution-by-teid

Description This command configures AA in VSR mode to load-balance traffic across different VM cores using TEID. Load-balancing is required when VSR is deployed on 3GPP S5/S8 (Gn/Gp) interfaces to provide GTP firewalling.

The **no** form of this command disables load-balancing of the traffic across the VM cores.

Default no vm-traffic-distribution-by-teid

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.57 vm-type

vm-type

Syntax **vm-type** *vm-type*
no vm-type

Context **[Tree]** (config>esa>vm vm-type)

Full Context configure esa vm vm-type

Description This command configures the type of ESA-VM instance.

The **no** form of this command removes the specified VM type.

Parameters *vm-type* — Specifies the VM type.

Values **aa** — Specifies Application Assurance feature support.
bb — Specifies broadband feature support, such as NAT.
tunnel — Specifies tunnel feature support, such as IPsec tunnels.
video — Specifies video feature support, such as FCC and RET (for 7750 SR and 7750 SR-12e only).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.58 vmep-filter

vmep-filter

Syntax [**no**] **vmep-filter**

Context **[Tree]** (config>service>vpls>eth-cfm>sap vmep-filter)
[Tree] (config>service>vpls>eth-cfm>spoke-sdp vmep-filter)
[Tree] (config>service>vpls>eth-cfm>mesh-sdp vmep-filter)

Full Context configure service vpls eth-cfm mesh-sdp vmep-filter
configure service vpls eth-cfm sap vmep-filter
configure service vpls eth-cfm spoke-sdp vmep-filter

Description Suppress eth-cfm PDUs based on level lower than or equal to configured Virtual MEP. This command is not supported under a B-VPLS context. This will also delete any MIP configured on the SAP or Spoke-SDP.

The **no** form of this command reverts to the default values.

Default no vmep-filter

26.59 voice-template

voice-template

Syntax **voice template**

Context **[Tree]** (config>app-assure>group>cflowd>rtp-perf voice-template)

Full Context configure application-assurance group cflowd rtp-performance voice-template

Description Commands in this context configure the voice template for cflowd fields.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.60 volume

volume

Syntax **volume** *credits* {**bytes** | **kilobytes** | **megabytes** | **gigabytes**}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no volume

Context [Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c volume)

Full Context configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit volume

Description This command configures the default volume interim credit that is allocated to all rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active and for which no default credit is configured at the category map category level.

The **no** form of this command resets the value to the default value.

Default volume 500 megabytes

Parameters *credits* — Specifies the amount of volume credit that is allocated by default to all rating groups of a Diameter Gy session when EFH is active.

Values 1 to 4294967295

bytes | **kilobytes** | **megabytes** | **gigabytes** — Specifies whether credits are in bytes, kilobytes, megabytes, or gigabytes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

volume

Syntax **volume**

Context [Tree] (config>app-assure>group>cflowd volume)

Full Context configure application-assurance group cflowd volume

Description This command configures the cflowd volume export.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.61 volume-quota-direction

volume-quota-direction

Syntax **volume-quota-direction {both | ingress | egress}**
no volume-quota-direction

Context [Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

Description This command specifies whether volume quota is applied in the egress (downstream), ingress (upstream), or both directions. Configuration changes apply only to new DSM UEs and not to existing UEs.

Parameters **both** — Enforces the volume quota on the packets ingressing and egressing the WLAN-GW combined.

ingress — Enforces the volume quota on packets ingressing the WLAN-GW from the UE (upstream).

egress — Enforces the volume quota on packets egressing the WLAN-GW to the UE (downstream).

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

26.62 volume-stats-type

volume-stats-type

Syntax **volume-stats-type** {**ip** | **default**}
no volume-stats-type

Context [Tree] (config>subscr-mgmt>sub-prof volume-stats-type)

Full Context configure subscriber-mgmt sub-profile volume-stats-type

Description This command enables the reporting of Layer 3 (IP) based subscriber host volume accounting data.

By default, subscriber host volume accounting data includes Layer 2 header octets and can be configured to include a fixed packet byte offset or last-mile encapsulation overhead.

The **no** form of this command reverts to the default.

Default volume-stats-type default

Parameters **default** — Specifies that the subscriber host volume accounting data is reported including the Layer 2 header octets and optional delta's introduced by configuration (for example: packet byte offset, last mile aware shaping, and so on).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip — Specifies that the subscriber host volume accounting data reporting is based on Layer 3 (IP) packet sizes. This includes subscriber host ingress/egress queue and policer stats in snmp, CLI show commands, RADIUS and XML accounting, and Diameter Gx usage monitoring. RADIUS and Diameter (DCCA) based credit control volume quota are interpreted as Layer 3 (IP).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.63 vpi

vpi

Syntax **vpi** *vpi* **egress-traffic-desc** *atm-td-profile-id*
no vpi *vpi*

Context **[Tree]** (config>port>sonet-sdh>path>atm vpi)

Full Context configure port sonet-sdh path atm vpi

Description This command enables the ATM VP shaper under the ATM port. The type of ATM shaper are CBR or rt/nrt-VBR as defined by the traffic descriptor. It cannot be a UBR service-type.

All VCs within the shaper degrades into a UBR type service class. For example, when a CBR type VC is associated with the shaper, it degrades into a UBR type VC. Scheduling traffic amongst VCs within the shaper is based on WRR using the weight parameter.

If the VP shaper is deleted, the VCs that were under it is restored to their original service category.

The VP shaper is statically configured and instantiated upon configuration.

A VP shaper can be seamlessly added to or removed from the active VCs in the system.

The **no** form of this command reverts to the default.

Parameters *vpi* — Specifies the VP identifier.

Values 0 to 4095

atm-td-profile-id — Specifies the ATM traffic description ID.

Values 1 to 1000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.64 vpls

vpls

Syntax **vpls** *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**b-vpls** | **i-vpls**] [**etree**] [**name** *name*]
no vpls *service-id*

Context **[Tree]** (config>service vpls)

Full Context configure service vpls

Description This command creates or edits a Virtual Private LAN Services (VPLS) instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

To create a management VPLS on the 7450 ESS, the m-vpls keyword must be specified. See section **Hierarchical VPLS Redundancy** for an introduction to the concept of management VPLS.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — Specifies unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer *customer-id* — Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id — Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number

Values 1 to 2147483647

Default null (0)

create — Keyword used to create the service ID. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

m-vpls — Specifies a management VPLS

e-tree — Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

b-vpls | i-vpls — Creates a backbone-vpls or ISID-vpls

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

name *name* — Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Platforms All

vpls

Syntax **vpls** *service-name*
no vpls

Context **[Tree]** (config>service>ies>if vpls)

Full Context configure service ies interface vpls

Description The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

VPRN Hardware Dependency

When a service name is bound to a VPRN IP interface, all SAPs associated with the VPRN service must be on hardware based on the FlexPath2 forwarding plane. Currently, these include the IOM3-XP and the various IMM modules. If any SAPs are associated with the wrong hardware type, the service name binding to the VPRN IP interface fails. Once an IP interface within the VPRN service is bound to a service name, attempting to create a SAP on excluded hardware fails.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters *service-name* — The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

Platforms All

vpls

Syntax **vpls** *service-id*

Context **[Tree]** (config>subscr-mgmt>shcv-policy vpls)

Full Context configure subscriber-mgmt shcv-policy vpls

Description Commands in this context configure SHCV behavior in VPLS services. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 2 Services and EVPN Guide: VLL, VPLS, PBB, and EVPN* for VPLS service command syntax and descriptions.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

26.65 vpls-group

vpls-group

Syntax **vpls-group** *vpls-group-id* [**create**]
no vpls-group *vpls-group-id*

Context **[Tree]** (config>service>vpls vpls-group)

Full Context configure service vpls vpls-group

Description This command defines a vpls-group index. Multiple vpls-group commands can be specified to allow the use of different VPLS and SAP templates for different ranges of service ids. A vpls-group can be deleted only in shutdown state. Multiple commands under different vpls-group ids can be issued and can be in progress at the same time.

Default no vpls-group

Parameters *vpls-group-id* — Specifies the ID associated with the VPLS group

Values 1 to 4094

Platforms All

26.66 vpls-id

vpls-id

Syntax **vpls-id** *vpls-id*

Context **[Tree]** (config>service>vpls>bgp-ad vpls-id)

Full Context configure service vpls bgp-ad vpls-id

Description This command configures the VPLS ID component that is signaled in one of the extended community attributes (*ext-comm*).

Values and format (6 bytes, other 2 bytes of type-subtype is automatically generated)

Parameters *vpls-id* — Specifies a globally unique VPLS ID for BGP auto-discovery in this VPLS service

Values vpls-id: <ip-addr:comm-val>| <as-number:ext-comm-val>
ip-addr: a.b.c.d
comm-val: [0 to 65535]

© 2022 Nokia.

26.67 vpls-only-sap-parameters

vpls-only-sap-parameters

Syntax **vpls-only-sap-parameters**

Context **[Tree]** (config>subscr-mgmt>msap-policy vpls-only-sap-parameters)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters

Description Commands in this context configure MSAP VPLS properties.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.68 vpls-sap-template

vpls-sap-template

Syntax **vpls-sap-template** *name/id* **create**
[**no**] **vpls-sap-template** *name/id*

Context **[Tree]** (config>service>template vpls-sap-template)

Full Context configure service template vpls-sap-template

Description This is the command used to create a SAP template to be used in a vpls-template. Only certain existing VPLS SAP attributes can be changed in the vpls-sap-template, not in the instantiated VPLS SAP

The following SAP attributes are set in the instantiated saps (no configuration allowed):

description: “Sap <sap-id> controlled by MVRP service <svc id>” – auto generated

shutdown: no shutdown

Parameters *name/id* — Specifies the name in ASCII or the template ID

Values 1 to 2147483647

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

26.69 vpls-template

vpls-template

Syntax **vpls-template** *name/id* **create**
[**no**] **vpls-template** *name/id*

Context **[Tree]** (config>service>template vpls-template)

Full Context configure service template vpls-template

Description This command is used to create a vpls-template to be used to auto-instantiate a range of VPLS services. Only certain existing VPLS attributes specified in the command reference section can be changed in the vpls-template, not in the instantiated VPLS. The following attributes are automatically set in the instantiated VPLSs (no template configuration necessary) and the operator cannot change these values.

vpn-id: none

description: “Service <svc id> auto-generated by control VPLS <svc-id>”

service-name: “Service <svc id>” (Auto-generated)

shutdown: no shutdown

Following existing attributes can be set by the user in the instantiated VPLSs:

[no] sap

All the other VPLS attributes are not supported.

Parameters *name/id* — Specifies the name in ASCII or the template ID

Values name: ASCII string

Values ID: [1 to 2147483647]

Platforms All

26.70 vpls-template-binding

vpls-template-binding

Syntax **vpls-template-binding** *name/id*
no vpls-template-binding

Context **[Tree]** (config>service>vpls>vpls-group vpls-template-binding)

Full Context configure service vpls vpls-group vpls-template-binding

Description This command configures the binding to a VPLS template to be used to instantiate pre-provisioned data VPLS using as input variables the service IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related VPLS instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group id is in no shutdown state. Any changes to the vpls-template-binding require the vpls-group to be in shutdown state.

Default no vpls-template-binding

Parameters *name/id* — Specifies the name or the ID of the VPLS template

Values 1 to 1024

26.73 vpn-domain

vpn-domain

Syntax **vpn-domain** [*type* {**0005** | **0105** | **0205** | **8005**}] **id** *id*
no vpn-domain

Context **[Tree]** (config>service>vprn>ospf vpn-domain)

Full Context configure service vprn ospf vpn-domain

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vprn>ospf3** context.

This command is not supported in OSPF3.

Default no vpn-domain

Parameters *id* — Specifies the OSPF VPN domain in the “xxxx.xxxx.xxxx” format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

type — Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

Values 0005, 0105, 0205, 8005

Platforms All

26.74 vpn-family-policy

vpn-family-policy

Syntax **vpn-family-policy** *policy-name*
no vpn-family-policy

Context **[Tree]** (config>router>bgp>next-hop-resolution vpn-family-policy)

Full Context configure router bgp next-hop-resolution vpn-family-policy

Description This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default no vpn-family-policy

Parameters *policy-name* — Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

Platforms All

26.75 vpn-gre-source-ip

vpn-gre-source-ip

Syntax **vpn-gre-source-ip** *ip-address*
no vpn-gre-source-ip

Context **[Tree]** (config>service>system vpn-gre-source-ip)

Full Context configure service system vpn-gre-source-ip

Description This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters *ip-address* — Specifies the IPv4 address (a.b.c.d).

Platforms All

26.76 vpn-ipv4

vpn-ipv4

Syntax **vpn-ipv4 send** *send-limit* **receive** [**none**]
vpn-ipv4 send *send-limit*
no vpn-ipv4

Context **[Tree]** (config>router>bgp>add-paths vpn-ipv4)
[Tree] (config>router>bgp>group>add-paths vpn-ipv4)
[Tree] (config>router>bgp>group>neighbor>add-paths vpn-ipv4)

Full Context configure router bgp add-paths vpn-ipv4
configure router bgp group add-paths vpn-ipv4
configure router bgp group neighbor add-paths vpn-ipv4

Description This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default no vpn-ipv4

Parameters *send-limit* — Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

Values 1 to 16, none, multipaths

receive — Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

none — Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

Platforms All

no vport *name*

Context **[Tree]** (config>port>ethernet>access>egress vport)
[Tree] (config>port>sonet-sdh>path>access>egress vport)

Full Context configure port ethernet access egress vport
configure port sonet-sdh path access egress vport

Description This command configures a scheduling node, referred to as virtual port, within the context of an egress Ethernet port. The Vport scheduler operates either like a port scheduler with the difference that multiple Vport objects can be configured on the egress context of an Ethernet port, or it can be an aggregate rate when an egress port-scheduler policy is applied to the port.

The Vport is always configured at the port level even when a port is a member of a LAG.

When a port scheduler policy is applied to a Vport the following command is used:

config>**port**>**ethernet**>**access**>**egress**>**vport**>**port-scheduler-policy** *port-scheduler-policy-name*

The CLI will not allow the user to apply a port scheduler policy to a Vport if one has been applied to the port. Conversely, the CLI will not allow the user to apply a port scheduler policy to the egress of an Ethernet port if one has been applied to any Vport defined on the access egress context of this port. The **agg-rate**, along with an egress port-scheduler, can be used to ensure that a given Vport does not oversubscribe the port's rate.

SAP and subscriber host queues can be port-parented to a Vport scheduler in a similar way they port-parent to a port scheduler or can be port-parented directly to the egress port-scheduler if the **agg-rate** is used.

When the Vport uses an aggregate rate, the following command is used:

configure>port>ethernet>access>egress>vport>agg-rate-limit

The **no** form of this command removes the Vport name from the configuration.

Parameters *name* — Specifies the name of the Vport scheduling node and can be up to 32 ASCII characters. This does not need to be unique within the system but is unique within the port or a LAG.

26.80 vport-hashing

vport-hashing

Syntax [**no**] **vport-hashing**

Context **[Tree]** (config>subscr-mgmt>sub-prof vport-hashing)

Full Context configure subscriber-mgmt sub-profile vport-hashing

Description This command enables LAG Vport ID hashing. When enabled, Vport ID hashing can span multiple forwarding complexes on egress LAG. The default is to perform Vport ID hashing on egress and requires all active LAG members to be on the same forwarding complex.

Note: LAG hashing parameters that are configured under **config>lag**, for example, **per-link-hash**, take precedence and are incompatible with the **vport-hashing** command.

The **no** form of this command enables the default behavior.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

26.81 vprn

vprn

Syntax **vprn** *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]
no vprn *service-id*

Context **[Tree]** (config>service vprn)

Full Context configure service vprn

Description This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters *service-id* — Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7750 SR on which this service is defined.

Values

service-id:	1 to 2147483648
svc-name:	64 characters maximum

customer-id — Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name *name* — This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

vprn

Syntax [**no**] **vprn** *service-id* **interface** *ip-int-name*
[**no**] **vprn** *service-id* **network-interface** *ip-int-name*
[**no**] **vprn** *service-id* **subscriber-interface** *ip-int-name* **group-interface** *ip-int-name*

Context **[Tree]** (config>cflowd>collector>exp-filter>if-list>svc vprn)

Full Context configure cflowd collector export-filter interface-list service vprn

Description This command configures which VPRN service interfaces' flow data is being sent to this collector.

The **no** form of the command removes the values from the configuration.

Parameters *service-id* — Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

Values *service-id*:1 to 2147483647
svc-name:64 characters maximum

interface *ip-int-name* — Specifies the name of an IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

network-interface *ip-int-name* — Specifies the name of a network interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

subscriber-interface *ip-int-name* — Specifies an interface name of a subscriber interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

group-interface *ip-int-name* — Specifies an interface name of a group interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

Syntax **vprn** *service-id* **ofc-loopback** *ip-address*
no vprn

Context **[Tree]** (config>open-flow>of-switch>of-controller vprn)

Full Context configure open-flow of-switch of-controller vprn

Description This command specifies the *service-id* of the VPRN to use for the OpenFlow control channel. The loopback address for the OF control channel in the VPRN is specified using the **ofc-loopback** option.

The **no** form of this command reverts the control channel to using base routing.

Parameters *service-id* — Specifies the service ID for a VPRN instance.

Values {*service-id* | *service-name*}
service-id: 1 to 2147483647
service-name: up to 64 characters (*service-name* is an alias for input only. The *service-name* gets replaced with an id automatically by SR OS in the configuration).

ip-address — Specifies the loopback IP address in the VPRN for the OpenFlow channel to the controller.

Values ip-address: a.b.c.d

[Tree] (config>router>mpls>lsp-template vprn-auto-bind)

Full Context configure router mpls lsp vprn-auto-bind
configure router mpls lsp-template vprn-auto-bind

Description This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default vprn-auto-bind include

Parameters **include** — Allows an associated LSP to be used by auto-bin for vprn services

exclude — Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

26.84 vprn-local

vprn-local

Syntax **vprn-local** [{**none** | **all** | **vc-only**}]

Context **[Tree]** (config>router>ttl-propagate vprn-local)

Full Context configure router ttl-propagate vprn-local

Description This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 3107 label route or a 6PE route.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default vprn-local vc-only

Parameters **none** — Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all — Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only — Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Platforms All

26.85 vprn-network-exceptions

vprn-network-exceptions

Syntax **vprn-network-exceptions** *number seconds*
no vprn-network-exceptions

Context **[Tree]** (config>system>security vprn-network-exceptions)

Full Context configure system security vprn-network-exceptions

Description This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters *number* — Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds — Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

Platforms All

26.86 vprn-ping

vprn-ping

Syntax **vprn-ping** {*service-id* | **service** *service-name*} **source** *ip-address* **destination** *ip-address* [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *size*] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**timeout** *timeout*] [**interval** *interval*]

Context **[Tree]** (oam vprn-ping)
[Tree] (config>saa>test>type vprn-ping)

Full Context configure saa test type vprn-ping
oam vprn-ping

Description This command performs a VPRN ping and applies only to the 7750 SR and 7950 XRS.

Parameters *service-id* — Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-ping service** *service-name* variant can be used in all configuration modes.

Values 1 to 2147483647

service-name — Specifies the VPRN service name to diagnose or manage, up to 64 characters.

source *ip-address* — Specifies an unused IP address in the same network that is associated with the VPRN.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

destination *ip-address* — Specifies the IP address to be used as the destination for performing a VPRN ping operation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

fc-name — Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile state of the MPLS echo request encapsulation.

Default out

size — Specifies the OAM request packet size in bytes, expressed as a decimal integer.

Values 1 to 9786

Default 72

vc-label-ttl — Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count — Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

return-control — Specifies the response to come on the control plane.

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval — Specifies the interval time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

fc-name — Specifies the forwarding class of the MPLS echo request encapsulation.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile state of the MPLS echo request encapsulation.

Default out

size — Specifies the OAM request packet size in bytes.

Values 1 to 9786

Default 1

min-vc-label-ttl — Specifies the minimum TTL value in the VC label for the trace test.

Values 1 to 255

Default 1

max-vc-label-ttl — Specifies the maximum TTL value in the VC label for the trace test.

Values 1 to 255

Default 4

send-count — Specifies the number of OAM requests sent for a TTL value.

Values 1 to 10

Default 1

return-control — Specifies the OAM reply to a data plane OAM request be sent using the control plane instead of the data plane.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

interval — Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

26.88 vprn-transit

vprn-transit

Syntax **vprn-transit** [{**none** | **all** | **vc-only**}]

Context **[Tree]** (config>router>ttl-propagate vprn-transit)

Full Context configure router ttl-propagate vprn-transit

Description This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 3107 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

26.89 vrf-export

vrf-export

Syntax **vrf-export** *plcy-or-long-expr* [*plcy-or-expr*]
no vrf-export

Context **[Tree]** (config>service>vprn>bgp-evpn>mpls vrf-export)
[Tree] (config>service>vprn>bgp-ipvpn>mpls vrf-export)
[Tree] (config>service>vprn>bgp-ipvpn>srv6 vrf-export)

Full Context configure service vprn bgp-evpn mpls vrf-export
configure service vprn bgp-ipvpn mpls vrf-export
configure service vprn bgp-ipvpn segment-routing-v6 vrf-export

Description This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **config>router>policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no vrf-export

Parameters *plcy-or-long-expr* — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

Full Context configure service vprn bgp-evpn mpls vrf-import
configure service vprn bgp-ipvpn mpls vrf-import
configure service vprn bgp-ipvpn segment-routing-v6 vrf-import

Description This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **config>router>policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

Note: Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

Default no vrf-import

Parameters *plcy-or-long-expr* — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

no vrf-import

Context **[Tree]** (config>service>vprn>mvpn vrf-import)

Full Context configure service vprn mvpn vrf-import

Description This command specifies the import policy to control MVPN routes imported to the local VRF from other VRFs on the same or remote PE routers.

Default vrf-import unicast

Parameters **unicast** — Specifies to use a unicast VRF import policy for the MVPN.

plcy-or-long-expr — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters in length composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

plcy-or-expr — Specifies the route policy statement name or a policy logical expression. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. Up to 14 policies can be specified in a single statement.

[Tree] (config>service>vprn>bgp-ipvpn>mpls vrf-target)
[Tree] (config>service>vprn>bgp-ipvpn>srv6 vrf-target)

Full Context
configure service vprn bgp-evpn mpls vrf-target
configure service vprn bgp-ipvpn mpls vrf-target
configure service vprn bgp-ipvpn segment-routing-v6 vrf-target

Description
This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default
no vrf-target

Parameters
ext-comm — Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}
ip-addr:	a.b.c.d
comm-val:	[0 to 65535]
2byte-asnumber:	[0 to 65535]
ext-comm-val:	[0 to 4294967295]
4byte-asnumber:	[0 to 4294967295]

import *ext-community* — Specifies communities allowed to be received from remote PE neighbors.

export *ext-community* — Specifies communities allowed to be sent to remote PE neighbors.

26.93 vrrp

vrrp

Syntax **vrrp** *virtual-router-id* [**owner**] [**passive**] [**monitor-oper-group** *group-name*]
no vrrp *virtual-router-id*

Context **[Tree]** (config>service>ies>if vrrp)
[Tree] (config>service>ies>if>ipv6 vrrp)

Full Context configure service ies interface ipv6 vrrp
configure service ies interface vrrp

Description This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Special Cases **Virtual Router Instance Owner IP Address Conditions —** The virtual router instance **owner** can be created before assigning the parent IP interface primary or secondary IP addresses. In this case, the virtual router instance is not associated with an IP address. The operational state of the virtual router instance is down.

VRRP Owner Command Exclusions — By specifying the VRRP *vrid* as **owner**, the following commands are no longer available:

- **vrrp priority —** The virtual router instance **owner** is hard-coded with a **priority** value of 255 and cannot be changed.
- **vrrp master-int-inherit** — Owner virtual router instances do not accept VRRP advertisement messages. The advertisement interval field is not evaluated and cannot be inherited.
- **ping-reply**, **telnet-reply,** and **ssh-reply —** The **owner** virtual router instance always allows ping, telnet and SSH if the management and security parameters are configured to accept them on the parent IP interface.
- **vrrp shutdown —** The **owner** virtual router instance cannot be shut down on the **vrrp** node. If this were allowed, VRRP messages would not be sent, but the parent IP interface address would continue to respond to ARPs and forward IP packets. Another virtual router instance may detect the missing master due to the termination of VRRP advertisement messages and become master. This

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

would result in two routers responding to ARP requests for the same IP addresses. To shut down the **owner** virtual router instance, use the **shutdown** command in the parent IP interface context. This prevents VRRP participation, IP ARP reply, and IP forwarding. To continue parent IP interface ARP reply and forwarding without VRRP participation, remove the **vrrp** *vrid* instance.

- **traceroute-reply**

VRRP Passive Command Exclusions — By specifying the VRRP *vrid* as **passive**, the following commands related to the master election and processing of VRRP advertisement messages are no longer available:

- **vrrp priority**
- **policy**
- **preempt**
- **master-int-inherit**
- **standby-forwarding**
- **int-delay**
- **message-interval**
- **authentication-key**
- **bfd-enable**
- **monitor-oper-group**

Parameters *virtual-router-id* — Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner — Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive — Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name — Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

vrrp

Syntax **vrrp** *virtual-router-id* [**owner**] [**passive**] [**monitor-oper-group** *group-name*]
no vrrp *virtual-router-id*

Context **[Tree]** (config>service>vprn>if vrrp)

Full Context configure service vprn interface vrrp

Description This command creates or edits a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. One, both, or none may be defined as owner. The nodal context of **vrrp** *virtual-router-id* is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shut down in order to remove the virtual router instance.

Special Cases **Virtual Router Instance Owner IP Address Conditions —** The virtual router instance **owner** can be created prior to assigning the parent IP interface primary or secondary IP addresses. In this case, the virtual router instance is not associated with an IP address. The operational state of the virtual router instance is down.

VRRP Owner Command Exclusions — By specifying the VRRP *vrid* as **owner**, the following commands are no longer available:

- **vrrp priority —** The virtual router instance **owner** is hard-coded with a **priority** value of 255 and cannot be changed.
- **vrrp master-int-inherit** — Owner virtual router instances do not accept VRRP advertisement messages; the advertisement interval field is not evaluated and cannot be inherited.
- **ping-reply**, **telnet-reply** and **ssh-reply —** The **owner** virtual router instance always allows Ping, Telnet and SSH if the management and security parameters are configured to accept them on the parent IP interface.
- **vrrp shutdown —** The **owner** virtual router instance cannot be shut down on the **vrrp** node. If this was allowed, VRRP messages would not be sent, but the parent IP interface address would continue to respond to ARPs and forward IP packets. Another virtual router instance may detect the missing master due to the termination of VRRP advertisement messages and become master. This would result in two routers responding to ARP requests for the same IP addresses. To shut down the **owner** virtual router instance, use the **shutdown** command in the parent IP interface context. This will prevent VRRP participation, IP ARP reply and IP forwarding. To continue parent IP interface ARP reply and forwarding without VRRP participation, remove the **vrrp** *vrid* instance.
- **traceroute-reply**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

VRRP Passive Command Exclusions — By specifying the VRRP *vrid* as **passive**, the following commands related to the master election and processing of VRRP advertisement messages are no longer available:

- **vrrp priority**
- **policy**
- **preempt**
- **master-int-inherit**
- **standby-forwarding**
- **int-delay**
- **message-interval**
- **authentication-key**
- **bfd-enable**
- **monitor-oper-group**

Parameters *virtual-router-id* — Specifies a new virtual router ID or one that can be modified on the IP interface.

Values 1 to 255

owner — Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. Once created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive — Identifies this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operational-up), or the **init** state (if the interface is operational-down). The **passive** keyword is not required when entering the *vrid* for editing purposes. Once a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name — Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with specified operation group.

Context [Tree] (config>service>vprn>if vrrp)

Full Context configure service vprn interface vrrp

Description This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Special Cases

Virtual Router Instance Owner IP Address Conditions — The virtual router instance **owner** can be created before assigning the parent IP interface primary or secondary IP addresses. In this case, the virtual router instance is not associated with an IP address. The operational state of the virtual router instance is down.

VRRP Owner Command Exclusions — By specifying the VRRP *vrid* as **owner**, the following commands are no longer available:

- **vrrp priority —** The virtual router instance **owner** is hard-coded with a **priority** value of 255 and cannot be changed.
- **vrrp master-int-inherit** — Owner virtual router instances do not accept VRRP advertisement messages. The advertisement interval field is not evaluated and cannot be inherited.
- **ping-reply**, **telnet-reply,** and **ssh-reply —** The **owner** virtual router instance always allows ping, telnet and SSH if the management and security parameters are configured to accept them on the parent IP interface.
- **vrrp shutdown —** The **owner** virtual router instance cannot be shut down on the **vrrp** node. If this were allowed, VRRP messages would not be sent, but the parent IP interface address would continue to respond to ARPs and forward IP packets. Another virtual router instance may detect the missing master due to the termination of VRRP advertisement messages and become master. This would result in two routers responding to ARP requests for the same IP addresses. To shut down the **owner** virtual router instance, use the **shutdown** command in the parent IP interface context. This prevents VRRP participation, IP ARP reply, and IP forwarding. To continue parent IP interface ARP reply and forwarding without VRRP participation, remove the **vrrp** *vrid* instance.
- **traceroute-reply**

VRRP Passive Command Exclusions — By specifying the VRRP *vrid* as **passive**, the following commands related to the master election and processing of VRRP advertisement messages are no longer available:

- **vrrp priority**
- **policy**
- **preempt**

vrrp

Syntax **vrrp** *virtual-router-id* [**owner**] [**passive**] [**monitor-oper-group** *group-name*]
no vrrp *virtual-router-id*

Context **[Tree]** (config>router>if vrrp)
[Tree] (config>router>if>ipv6 vrrp)

Full Context configure router interface ipv6 vrrp
configure router interface vrrp

Description This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default no vrrp — No VRRP virtual router instance is associated with the IP interface.

Special Cases **Virtual Router Instance Owner IP Address Conditions —** The virtual router instance **owner** can be created prior to assigning the parent IP interface primary or secondary IP addresses. In this case, the virtual router instance is not associated with an IP address. The operational state of the virtual router instance is down.

VRRP Owner Command Exclusions — By specifying the VRRP *vrid* as **owner**, the following commands are no longer available:

- **vrrp priority —** The virtual router instance **owner** is hard-coded with a **priority** value of 255 and cannot be changed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- **vrrp master-int-inherit** — Owner virtual router instances do not accept VRRP advertisement messages; the advertisement interval field is not evaluated and cannot be inherited.
- **ntp-reply, ping-reply**, **telnet-reply,** and **ssh-reply —** The **owner** virtual router instance always allows Ping, Telnet and SSH if the management and security parameters are configured to accept them on the parent IP interface.
- **vrrp shutdown —** The **owner** virtual router instance cannot be shut down on the **vrrp** node. If this was allowed, VRRP messages would not be sent, but the parent IP interface address would continue to respond to ARPs and forward IP packets. Another virtual router instance may detect the missing master due to the termination of VRRP advertisement messages and become master. This would result in two routers responding to ARP requests for the same IP addresses. To shut down the **owner** virtual router instance, use the **shutdown** command in the parent IP interface context. This prevents VRRP participation, IP ARP reply and IP forwarding. To continue parent IP interface ARP reply and forwarding without VRRP participation, remove the **vrrp** *vrid* instance.
- **traceroute-reply**

VRRP Passive Command Exclusions — By specifying the VRRP *vrid* as **passive**, the following commands related to the master election and processing of VRRP advertisement messages are no longer available:

- **vrrp priority**
- **policy**
- **preempt**
- **master-int-inherit**
- **standby-forwarding**
- **int-delay**
- **message-interval**
- **authentication-key**
- **bfd-enable**

Parameters *virtual-router-id* — The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner — Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

passive — Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name — Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

Context **[Tree]** (config>system vsd)
[Tree] (config>system>security>cli-script>authorization vsd)

Full Context configure system security cli-script authorization vsd
configure system vsd

Description Commands in this context configure authorization for the VSD server.

The **no** form of this command removes all authorizations for the VSD server.

Platforms All

vsd

Syntax **vsd script** *script*
no vsd

Context **[Tree]** (config>python>python-policy vsd)

Full Context configure python python-policy vsd

Description This command defines the python script for the Python policy sent by the VSD.

Parameters *script* — Specifies the VSD script that points at the python-script command.

Platforms All

vsd

Syntax **vsd**

Context **[Tree]** (debug vsd)

Full Context debug vsd

Description Commands in this context provide debug vsd functionality.

Platforms All

26.95 vsd-domain

vsd-domain

Syntax **vsd-domain** *name*
no vsd-domain

Context **[Tree]** (config>service>vpls vsd-domain)
[Tree] (config>service>vprn vsd-domain)

Full Context configure service vpls vsd-domain
configure service vprn vsd-domain

Description This command associates a previously configured vsd-domain to an existing VPRN or VPLS service. The vsd-domain is a tag used between the VSD and the 7750 SR, 7450 ESS, or 7950 XRS to correlate configuration parameters to a service.

Parameters *name* — Specifies the vsd-domain name.

Platforms All

26.96 vsd-password

vsd-password

Syntax **vsd-password** *password* [{**hash** | **hash2**}]
no vsd-password

Context **[Tree]** (config>system>security>password vsd-password)

Full Context configure system security password vsd-password

Description This command configures the password required to access the **enable-vsd-config** mode. The **enable-vsd-config** mode allows editing of services provisioned by the VSD in fully dynamic mode (or by the **tools perform service vsd evaluate-script** command.

Parameters *password* — Specifies the password required to login as authorized user in the **enable-vsd-config** mode.

hash — Specifies that the primary hashing sequence should be used.

hash2 — Specifies that the secondary hashing sequence should be used.

26.97 vsi-export

vsi-export

Syntax **vsi-export** *policy-name* [*policy-name*]
no vsi-export

Context **[Tree]** (config>service>vpls>bgp-ad vsi-export)
[Tree] (config>service>vpls>bgp vsi-export)

Full Context configure service vpls bgp vsi-export
configure service vpls bgp-ad vsi-export

Description This command specifies the name of the VSI export policies to be used for BGP EVPN, BGP auto discovery, BGP VPLS, BGP VPWS, and BGP multi-homing if these features are configured in this VPLS service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

Default no vsi-export

Parameters *policy-name* — Specifies up to five policy names, up to 32 characters.

Platforms All

vsi-export

Syntax **vsi-export** *policy-name* [*policy-name*]
no vsi-export

Context **[Tree]** (config>service>epipe>bgp vsi-export)

Full Context configure service epipe bgp vsi-export

Description This command specifies the name of the VSI export policies to be used for BGP EVPN, BGP VPWS and BGP multi-homing if these features are configured in this Epipe service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no vsi-export

Parameters *policy-name* — Specifies up to five policy names, up to 32 characters.

Platforms All

26.98 vsi-id

vsi-id

Syntax **vsi-id**

Context **[Tree]** (config>service>vpls>bgp-ad vsi-id)

Full Context configure service vpls bgp-ad vsi-id

Description Commands in this context configure the Virtual Switch Instance Identifier (VSI-ID).

Platforms All

26.99 vsi-import

vsi-import

Syntax **vsi-import** *policy-name* [*policy-name*]
no vsi-import

Context **[Tree]** (config>service>vpls>bgp-ad>vsi-id vsi-import)
[Tree] (config>service>vpls>bgp vsi-import)

Full Context configure service vpls bgp vsi-import
configure service vpls bgp-ad vsi-id vsi-import

Description This command specifies the name of the VSI import policies to be used for BGP EVPN, BGP auto discovery, BGP VPLS, BGP VPWS, and BGP multi-homing if these features are configured in this VPLS service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no vsi-import

Parameters *policy-name* — Specifies up to five policy names, up to 32 characters.

Platforms All

vsi-import

Syntax **vsi-import** *policy-name* [*policy-name*]
no vsi-import

Context **[Tree]** (config>service>epipe>bgp vsi-import)

Full Context configure service epipe bgp vsi-import

Description This command specifies the name of the VSI import policies to be used for BGP EVPN, BGP VPWS and BGP multi-homing if these features are configured in this Epipe service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

Default no vsi-import

Parameters *policy-name* — Specifies up to five policy names, up to 32 characters.

Platforms All

26.100 vxlan

vxlan

Syntax **vxlan vni** *vni*
no vxlan

Context **[Tree]** (config>subscr-mgmt>isa-svc-chain>evpn>export vxlan)

Full Context configure subscriber-mgmt isa-service-chaining evpn export vxlan

Description This command configures a VXLAN VNI that is sent in EVPN routes advertised to the service chaining.

The **no** form of this command removes the VNI from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *vni* — Specifies the VNI of the VXLAN created by the EVPN service.

Values 1 to 16777215

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vxlan

Syntax [**no**] **vxlan**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>type vxlan)

Full Context configure subscriber-mgmt wlan-gw tunnel-query type vxlan

Description This command enables matching on VXLAN tunnels.

The **no** form of this command disables matching on VXLAN tunnels, unless no other tunnel type specifier is configured.

Default no vxlan

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vxlan

Syntax **vxlan** [**bgp** *bgp*] [**vxlan-instance** *vxlan-instance*]
no vxlan [**bgp** *bgp*]

Context **[Tree]** (config>service>epipe>bgp-evpn vxlan)
[Tree] (config>service>vpls>bgp-evpn vxlan)

Full Context configure service epipe bgp-evpn vxlan
configure service vpls bgp-evpn vxlan

Description Commands in this context configure the VXLAN parameters when BGP EVPN is used as the control plane. In VPLS services, instance BGP 1 or BGP 2 can be configured, as well as VXLAN instances 1 or 2. Up to two instances of this command can be configured in the same service, as long as the BGP instance and the VXLAN instance are different in both commands. In Epipe services, only BGP instance 1 and VXLAN instance 1 is supported. If the BGP or VXLAN instance are not specified, the instances are by default set to 1.

The **no** version of this command will remove the vxlan instance from the service.

Parameters **bgp** — Indicates the BGP instance identifier.

Values 1 to 2

vxlan-instance — Indicates the VXLAN instance identifier.

Values 1 to 2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

vxlan

Syntax **vxlan vni** *vni-id* [**create**] [**instance** *instance-id*]
no vxlan [**vni** *vni-id*] [**instance** *instance-id*]

Context **[Tree]** (config>service>epipe vxlan)

Full Context configure service epipe vxlan

Description This command enables the use of VXLAN in the Epipe service.

The **no** version of this command will remove the VXLAN instance from the service.

Parameters *vni-id* — Specifies the VXLAN network identifier configured in the Epipe service. When EVPN is used in the control plane, the configured VNI is encoded in the MPLS field of the NLRI. The VPLS service is operationally up when the **vxlan vni** *vni-id* is successfully created.

Values 1 to 16777215

Default 1

instance-id — Specifies the VXLAN instance identifier.

Values 1, 2

create — Mandatory keyword that creates a VXLAN instance.

Platforms All

vxlan

Syntax **vxlan vni** *vni-id* [**create**] [**instance** *instance-id*]
no vxlan [**vni** *vni-id*] [**instance** *instance-id*]

Context **[Tree]** (config>service>vpls vxlan)

Full Context configure service vpls vxlan

Description This command enables the use of VXLAN in the VPLS service.

The **no** version of this command will remove the VXLAN instance from the service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *vni-id* — Specifies the VXLAN network identifier configured in the VPLS service. When EVPN is used in the control plane, the configured VNI is encoded in the MPLS field of the NLRI. The VPLS service is operationally up when the **vxlan vni** *vni-id* is successfully created.

Values 1 to 16777215

Default 1

instance-id — Specifies the VXLAN instance identifier.

Values 1, 2

create — Mandatory keyword that creates a VXLAN instance.

Platforms All

vxlan

Syntax **vxlan**

Context **[Tree]** (config>service>vprn vxlan)

Full Context configure service vprn vxlan

Description Commands in this context configure VXLAN parameters in the VPRN.

Platforms All

vxlan

Syntax **vxlan**

Context **[Tree]** (config>service>system vxlan)

Full Context configure service system vxlan

Description Commands in this context configure the vxlan global parameters.

Platforms All

vxlan

Syntax [**no**] **vxlan vtep** *vtep* **vni** *vni-id*

Context **[Tree]** (debug>service>id>igmp-snooping vxlan)

Full Context debug service id igmp-snooping vxlan

Description This command shows IGMP packets for a specific VXLAN binding.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the debugging for that VXLAN binding.

Parameters **vtep** — IP address of the VXLAN Termination Endpoint

vni — VXLAN Network Identifier of the VXLAN binding

Values 1 to 16777215

Platforms All

vxlan

Syntax [**no**] **vxlan vtep** *vtep* **vni** *vni-id*

Context **[Tree]** (debug>service>id>mld vxlan)

Full Context debug service id mld-snooping vxlan

Description This command shows MLD packets for a specific VXLAN binding.

The **no** form of this command disables the debugging for that VXLAN binding.

Parameters **vtep** — IP address of the VXLAN Termination Endpoint

vni — VXLAN Network Identifier of the VXLAN binding

Values 1 to 16777215

Platforms All

vxlan

Syntax **vxlan** [**router** *router-name*]
vxlan service-name *service-name*
no vxlan

Context **[Tree]** (config>fwd-path-ext>fpe vxlan)

Full Context configure fwd-path-ext fpe vxlan

Description This command informs the system about the cross-connect type that is required for non-system IPv4 and IPv6 VXLAN termination. Internally, it triggers the automatic creation of two internal IP interfaces in the PXC ports and enables those internal interfaces to process and terminate VXLAN.

If no parameters are used, the VXLAN termination occurs in the base router; however, when the FPE is used for static VXLAN termination (no BGP-EVPN services), non-system IPv4 and IPv6 VXLAN can be terminated in a VPRN service. In this case, the VPRN router instance or service name must be configured with the **vxlan-termination** command.

The **no** form of this command disables the cross-connect type from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no vxlan-termination

Parameters *router-name* — Specifies the router instance for VXLAN termination.

Values

router-name: *router-name* or *vprn-svc-id*

router-name	"Base"
vprn-svc-id	1 to 2147483647

Default Base

service-name — Specifies the service name that identifies the VPRN for VXLAN termination, up to 64 characters.

Platforms All

26.101 vxlan-ipv4-tep-ecmp

vxlan-ipv4-tep-ecmp

Syntax [**no**] **vxlan-ipv4-tep-ecmp**

Context **[Tree]** (config>service>vpls>allow-ip-int-bind vxlan-ipv4-tep-ecmp)

Full Context configure service vpls allow-ip-int-bind vxlan-ipv4-tep-ecmp

Description This command enables and disables ECMP on VXLAN IPv4 destinations for R-VPLS services. When this command is enabled, packets entering a VPRN connected to an R-VPLS that is terminating on a VXLAN IPv4 destination are looked up in the routing table. If the next hop is a VXLAN IPv4 TEP, the packets are distributed based on per-flow load-balancing.

This command can only be used in FP3- (or higher) routers. R-VPLS per-flow load-balancing for VXLAN IPv6 destinations works by default without this command.

The **no** version of this command reverts the process to the default behavior of per-remote VTEP load-balancing.

Default no vxlan-ipv4-tep-ecmp

Platforms All

Use subject to Terms available at: www.nokia.com

26.102 vxlan-ping

vxlan-ping

Syntax **vxlan-ping test-id** *test-id* **service** *vpls-service-id* **dest-vni** *vxlan-network-id* **outer-ip-destination** *ipv4-address* [**outer-ip-source-udp** *udp-port-number*] [**outer-ip-ttl** *time-to-live*] [**inner-l2** *ieee-address*] [**inner-ip-source** *ipv4-address*] [**inner-ip-destination** *ipv4-address*] [**i-flag-on**] [**end-system** *ieee-address*] [**send-count** *packets*] [**interval** *interval-time*] [**timeout** *timeout-time*] [**padding** *tlv-size* [**reflect-pad**]] [**fc** *fc-name*] [**profile** {**in** | **out**}] [**reply-mode** {**overlay** | **udp**}]

Context **[Tree]** (oam vxlan-ping)

Full Context oam vxlan-ping

Description Operational command used to validate the VXLAN Tunnel Endpoint (VXLAN) connectivity between peers.

Parameters *test-id* — Specifies a value to identify the originator handle of the specific request. Each active test requires a unique test identifier.

Values 1 to 2147483647

vpls-service-id — Specifies the VPLS service used to launch the request and by extension pick up the source VNI information.

Values

service-id: 1 to 2147483647

svc-name: up to 64 characters

vxlan-network-id — Specifies the target Vxlan network identifier on the terminating VTEP.

Values 1 to 16777215

outer-ip-destination *ipv4-address* — Specifies the IPv4 address of the terminating VTEP.

Values a.b.c.d

udp-port-number — Optional outer source UDP port number.

Values 1 to 65535

Default System-generated UDP port number

time-to-live — Specifies the optional outer time to live.

Values 1 to 255

Default 255

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

inner-l2 *ieee-address* — Specifies the destination MAC address used in the inner VXLAN header.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

inner-ip-source *ipv4-address* — Specifies the inner source IPv4 address.

Values a.b.c.d

Default System IPv4 Address

inner-ip-destination *ipv4-address* — Specifies the inner destination IPv4 address. Must be in the range 127/8.

Values 127.0.0.0 to 127.0.0.8

Default 127.0.0.1

i-flag-on — Sets the VNI Validation bit to 1, indicating that the OAMPDU contains a valid VNI.

Default i-flag set to “0” which prevents the OAMPDU form being forwarded beyond the terminating VTEP.

end-system *ieee-address* — Optional command to include the sub TLV to validate an end system MAC address in the FDB. Only one MAC address may be included.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Default 00:00:00:00:00:00

packets — Specifies the number of VXLAN ping requests to transmit.

Values 1 to 1024

Default 1

interval-time — Specifies the probe interval, in seconds.

Values 0.1, 1 to 10

Default 1

timeout-time — Specifies the packet time out value, in seconds.

Values 1 to 10

Default 5

tlv-size — Specifies whether to include the Pad TLV and specifies the number of octets that defines the entire size of the pad TLV, including the type (2B), the length field (2B), the padding (variable).

Values 0, 5 to 2000

Default 0

reflect-pad — Instructs the responder to include the pad-tlv in the echo response. This option is not supported when the reply mode is “UDP”.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

fc-name — Indicates the forwarding class that is exposed to the QoS policy as input into generating the outer CoS.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Defines the frame's disposition that is exposed to the QoS policy as input into generating the outer CoS.

Default in

reply-mode {overlay | udp} — Instructs the responder how to route the VXLAN response.

Values **udp**: responds using UDP over the IP network. The default must be changed if the VTEP uses anything other than an IPv4 System Address as the source.

overlay: responds using the VXLAN overlay for the service

Default udp

Platforms All

26.103 vxlan-port

vxlan-port

Syntax **vxlan-port** [**4789** | **8472**]
no vxlan-port

Context **[Tree]** (config>router>vrgw>lanext vxlan-port)

Full Context configure router vrgw lanext vxlan-port

Description This command specifies the destination UDP port for both ingress and egress VXLAN packets for HLE services.

The **no** form of this command reverts to the default.

Default vxlan-port 4789

Parameters **4789 | 8472** — Specifies the destination UDP port.

Values 4789, 8472

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

26.104 vxlan-src-vtep

vxlan-src-vtep

Syntax **vxlan-src-vtep** {*ip-address* | *ipv6-address*}
no vxlan-src-vtep

Context **[Tree]** (config>service>epipe vxlan-src-vtep)
[Tree] (config>service>vpls vxlan-src-vtep)

Full Context configure service epipe vxlan-src-vtep
configure service vpls vxlan-src-vtep

Description This command enables the router to use the configured IP address as the tunnel source IP address (source VTEP) when originating VXLAN-encapsulated frames for this service. This IP address is also used to set the BGP NLRI next hop in EVPN route advertisements for the service.

Default no vxlan-src-vtep

Parameters *ip-address* — Specifies the non-system IPv4 address that terminates VXLAN for a service.

ipv6-address — Specifies the IPv6 address that terminates VXLAN for a service.

Platforms All

26.105 vxlan-vni

vxlan-vni

Syntax **vxlan-vni** [**eq** *vxlan-vni-id* | **range** *start end*]
no vxlan-vni

Context **[Tree]** (config>qos>sap-ingress>ip-criteria>entry>match vxlan-vni)
[Tree] (config>qos>sap-ingress>ipv6-criteria>entry>match vxlan-vni)

Full Context configure qos sap-ingress ip-criteria entry match vxlan-vni
configure qos sap-ingress ipv6-criteria entry match vxlan-vni

Description This command configures a VXLAN or VXLAN GPE VNI to be used as a SAP QoS policy match criterion. A range of VNIs to be matched can be specified by including the keyword **range** with a *start* and *end* VNI. This command requires the **type** to be set to **vxlan-vni** in the related **ip-criteria** or **ipv6-criteria** context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

See Virtual Network Identifier (VNI) Classification for the list of restrictions for this command.

Default no vxlan-vni

Parameters **eq** *vxlan-vni-id* — Specifies the VXLAN or VXLAN GPE VNI to be matched in the SAP ingress QoS classification. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

range *start end* — Identifies a range of VNIs to be used as matching criteria. The *start* value must be lower than the *end* value. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
[0b1 to 0b111111111111111111111111] (Binary)

Platforms All

26.106 vxlan-vtep-range

vxlan-vtep-range

Syntax **vxlan-vtep-range start** [*ip-address* | *ipv6-address*] **end** [*ip-address* | *ipv6-address*]
no vxlan-vtep-range

Context **[Tree]** (config>router>isa-svc-chain vxlan-vtep-range)

Full Context configure router isa-service-chaining vxlan-vtep-range

Description This command specifies the address range to be used as the local VXLAN VTEP on the ISA for service chaining. The system allocates one address for each ISA in the NAT group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the IP or IPv6 addresses from the configuration.

Parameters **start** — Specifies the start address of the VXLAN VTEP range.

end — Specifies the end address of the VXLAN VTEP range.

ip-address — Specifies an IPv4 address start and end range.

Values ipv4-address - a.b.c.d

ipv6-address — Specifies an IPv6 address start and end range

Syntax **vxlan-vtep-range start** *ip-address* | *ipv6-address* **end** *ip-address* | *ipv6-address*
no vxlan-vtep-range

Context **[Tree]** (config>router>vrgw>lanext vxlan-vtep-range)

Full Context configure router vrgw lanext vxlan-vtep-range

Description This command specifies the address range to be used as the local VXLAN VTEP on the ISA for HLE services. The system allocates one address for each ISA in the WLAN GW group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the values from the configuration.

Parameters **start** — Specifies the start of the VXLAN VTEP range.

end — Specifies the end of the VXLAN VTEP range.

ip-address **|** *ipv6-address* — Specifies the range of VXLAN VTEP addresses.

Values <ip-address| ipv6-address : ipv4-address - a.b.c.d
ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d

27 w Commands

27.1 wa-shared-high-wmark

wa-shared-high-wmark

Syntax **wa-shared-high-wmark** *percent*
no wa-shared-high-wmark

Context **[Tree]** (config>isa>aa-grp>qos>egress>from-sub wa-shared-high-wmark)
[Tree] (config>isa>aa-grp>qos>egress>to-sub wa-shared-high-wmark)

Full Context configure isa application-assurance-group qos egress from-subscriber wa-shared-high-wmark
configure isa application-assurance-group qos egress to-subscriber wa-shared-high-wmark

Description This command configures the high watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool for each ISA. When a buffer pool is not in the overload state and the wa-shared buffer utilization for an ISA crosses above the high watermark value in the ISA **from-subscriber** buffer pool enters an overload state and an overload notification is raised.

The **no** form of this command reverts to the default.

Default wa-shared-high-wmark max

Parameters *percent* — Specifies the weighted average shared buffer utilization high watermark.

Values 1 to 100, **max** percent (disabled)

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.2 wa-shared-low-wmark

wa-shared-low-wmark

Syntax **wa-shared-low-wmark** *percent*
no wa-shared-low-wmark

Context **[Tree]** (config>isa>aa-grp>qos>egress>from-sub wa-shared-low-wmark)
[Tree] (config>isa>aa-grp>qos>egress>to-sub wa-shared-low-wmark)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure isa application-assurance-group qos egress from-subscriber wa-shared-low-wmark
configure isa application-assurance-group qos egress to-subscriber wa-shared-low-wmark

Description This command configures the low watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool. When a buffer pool is in an overloaded state and the wa-shared buffer utilization for an ISA drops below low watermark value ISA **from-subscriber** buffer pool leaves the overload state and a is sent to indicate the overload state has cleared.

The **no** form of this command reverts to the default.

Default wa-shared-low-wmark 0

Parameters *percent* — Specifies the weighted average shared buffer utilization low watermark.

Values 0 to 99

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.3 wait

wait

Syntax **wait** *seconds*

Context **[Tree]** (bof wait)

Full Context bof wait

Description This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console.

When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF).

Only one **wait** command can be defined in the BOF.

Default wait 3

Parameters *seconds* — Specifies the time to pause at the start of the boot process, in seconds.

Values 1 to10

Platforms All

© 2022 Nokia.

27.4 wait-for-up-timer

wait-for-up-timer

Syntax **wait-for-up-timer** *seconds*
no wait-for-up-timer

Context **[Tree]** (config>router>mpls>lsp>bfd wait-for-up-timer)
[Tree] (config>router>mpls>lsp>primary>bfd wait-for-up-timer)
[Tree] (config>router>mpls>lsp>secondary>bfd wait-for-up-timer)
[Tree] (config>router>mpls>lsp-template>bfd wait-for-up-timer)

Full Context configure router mpls lsp bfd wait-for-up-timer
configure router mpls lsp primary bfd wait-for-up-timer
configure router mpls lsp secondary bfd wait-for-up-timer
configure router mpls lsp-template bfd wait-for-up-timer

Description This command configures the time to wait for a BFD to come up in seconds. This timer is applicable to SR-TE LSPs, including auto-LSPs and PCE-initiated LSPs, as well as RSVP-TE LSPs. In case of SR-TE LSPs, this timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a path or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the IOM and the retry timer is started.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

Default no wait-for-up-timer

Parameters *seconds* — Specifies the BFD wait for up timer in seconds.

Values 0 to 60

Default 4

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp-template bfd wait-for-up-timer

wait-for-up-timer

Syntax **wait-for-up-timer** *seconds*
no wait-for-up-timer

Context **[Tree]** (config>service>epipe>spoke-sdp>bfd wait-for-up-timer)
[Tree] (config>service>ies>interface>spoke-sdp>bfd wait-for-up-timer)
[Tree] (config>service>vpls>spoke-sdp>bfd wait-for-up-timer)
[Tree] (config>service>vprn>interface>spoke-sdp>bfd wait-for-up-timer)

Full Context configure service epipe spoke-sdp bfd wait-for-up-timer
configure service ies interface spoke-sdp bfd wait-for-up-timer
configure service vpls spoke-sdp bfd wait-for-up-timer
configure service vprn interface spoke-sdp bfd wait-for-up-timer

Description This command configures the time interval, in seconds, that is used to wait for a BFD session to come up.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP to use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

The **no** form of this command disables the timer.

Default no wait-for-up-timer

Parameters *seconds* — Specifies the wait interval, in seconds, for the BFD up timer.

Values 1 to 60

Platforms All

27.5 wait-to-restore

wait-to-restore

Syntax **wait-to-restore** *interval*
no wait-to-restore

Context **[Tree]** (config>router>mpls>mpls-tp>protection-template wait-to-restore)

Full Context configure router mpls mpls-tp protection-template wait-to-restore

Description This command configures the WTR timer. It determines how long to wait until the active path of an MPLS-TP LSP is restored to the working path following the clearing of a defect on the working path. It is applicable to revertive mode, only.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default wait-to-restore 300

Parameters *interval* — Specifies the WTR timer interval in 1 second increments.

Values 0 to 720 seconds

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-to-restore

Syntax **wait-to-restore** *minutes*
no wait-to-restore

Context **[Tree]** (config>system>sync-if-timing wait-to-restore)

Full Context configure system sync-if-timing wait-to-restore

Description This command configures the time for the Wait to Restore timer. A previously failed input reference must be valid for the time specified before it is used for either the BITSout or the central clock input reference.

The **no** form of this command disables the timer.

Default no wait-to-restore

Parameters *minutes* — Specifies a value representing the number of minutes for the wait to restore timeout.

Values 1 to 12

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

27.7 warm-standby

warm-standby

Syntax **warm-standby**

Context **[Tree]** (config>redundancy>multi-chassis>peer warm-standby)

Full Context configure redundancy multi-chassis peer warm-standby

Description This command enables Oversubscribed Multi-Chassis Redundancy (OMCR) model where subscriber hosts are synchronized between the two chassis only in the control plane and are kept there (as part of the Multi-Chassis Synchronization (MCS) state) until the switchover occurs. Link or nodal failure will trigger the switchover at which point the subscriber hosts are being fully instantiated in the control and the forwarding plane. This approach allows oversubscription of the resources in the central standby (or protecting) node that is backing-up several active nodes. The total number of protected subscribers in the OMCR cluster exceeds the forwarding capacity of the protecting node. This is achievable by not fully occupying the resources for the subscriber hosts until the failure occurs.

The restoration times depend on the amount of the subscriber hosts that are affected by the switchover and it is related to the time needed for the full instantiation of the subscribers in the forwarding plane.

Although this command is configured on a peer level, the warm-standby property is a nodal characteristic. In other words, mixing of N:1 and 1:1 (hot standby) mode in the central standby node is not supported. Consequently all peers on the central standby node must be configured for warm-standby (N:1), or all peers must be configured for hot-standby (1:1) by omitting the warm-standby keyword from the configuration.

The peer of the central backup node is not aware of the redundancy model supported. In in other words, the peer of the central-backup node does not know whether it peers with a warm-standby peer or host-standby-peer.

27.9 watchdog-timer

watchdog-timer

Syntax **watchdog-timer** *seconds*
no watchdog-timer

Context [Tree] (config>aaa>diam-peer-plcy watchdog-timer)
[Tree] (config>aaa>diam-peer-plcy>peer watchdog-timer)

Full Context configure aaa diameter-peer-policy peer watchdog-timer
configure aaa diameter-peer-policy watchdog-timer

Description This command configures the interval between consecutive watchdog messages. On the first timeout of the DWR, the SR OS node will resend the DWR message. The peer is still operational during this time. On the second timeout, the peer transitions into a suspended mode and the peer-failover procedure is initiated (if the peer-failover is enabled by configuration). In this state the peer is not used for new transactions. At the same time, the cooldown procedure is started which means that it would take three successful DWR/DWA message exchanges to reinstate the peer in a fully operation state.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

On the third timeout, the peer is removed and its connection is closed.

This command is applicable only to legacy implementations of Diameter base in the SR OS.

The **no** form of this command reverts to the default.

Default watchdog-timer 30

Parameters *seconds* — Specifies the device watchdog timer, in seconds, used by this policy peer.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

watchdog-timer

Syntax **watchdog-timer** *seconds*
no watchdog-timer

Context **[Tree]** (config>aaa>diam>node>peer watchdog-timer)

Full Context configure aaa diameter node peer watchdog-timer

Description Watchdog messages are used to verify liveliness of a Diameter peer. A single watchdog messages will be sent to a peer in case that no traffic is received from it within a configured watchdog-timer. This watchdog request message will solicit a watchdog answer message from the peer. If no traffic (watchdog answer or otherwise) is received from the peer in response to watchdog request while the watchdog timer is running, the peer will be put in suspicious state and a peer failover routine will be triggered.

The peer will be closed after it has been in suspicious mode for the duration of one more watchdog-timer interval without receiving any traffic from it.

Once the peer is recovered, it will take 3 successful exchanges of diameter watchdog messages (DWR/DWA) for the peer to becomes used again in Diameter forwarding. This behavior is described in RFC 3539, §3.4.1, *Authentication, Authorization and Accounting (AAA) Transport Profile*).

This command is not applicable to legacy implementations of Diameter base in the SR OS.

The **no** form of this command removes the watchdog timer value from the configuration.

Default watchdog-timer 30

Parameters *seconds* — Specifies the device watchdog timer, in seconds, used on all connections by this peer.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

27.13 web-service-url-filter

web-service-url-filter

Syntax **web-service-url-filter** *size*

Context **[Tree]** (config>isa>aa-grp>shared-resources web-service-url-filter)

Full Context configure isa application-assurance-group shared-resources web-service-url-filter

Description This command configures the amount of shared memory to be used by the web service URL filter cache.

Default web-service-url-filter 100

Parameters *size* — Specifies the amount of shared memory as a percentage.

Values 0 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.14 weekday

weekday

Syntax **weekday** {*weekday-number* [..*weekday-number*] | *day-name* [..*day-name*] | **all**}
no weekday

Context **[Tree]** (config>system>cron>sched weekday)

Full Context configure system cron schedule weekday

Description This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default no weekday

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *weekday-number* — Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name — Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

all — Specifies all days of the week.

Platforms All

27.15 weight

weight

Syntax **weight** *initial-weight-percentage weight-change-percentage*
no weight

Context **[Tree]** (config>subscr-mgmt>sla-profile>egress>bonding-selection weight)

Full Context configure subscriber-mgmt sla-profile egress bonding-selection weight

Description This command configures the initial (and also the maximum) weight of the preferred connection and the value with which it can change.

The **no** form of this command resets the weight to the default.

Default weight 100 5

Parameters *initial-weight-percentage* — Specifies the initial or maximum weight, as a percentage of the offered weight.

Values 1 to 100

weight-change-percentage — Specifies the weight change, as a percentage.

Values 0 to 10

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

weight

Syntax **weight** *weight*
no weight

Context **[Tree]** (config>qos>atm-td-profile weight)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure qos atm-td-profile weight

Description VCs within the VP tunnel are serviced by a single scheduler assigned to each VP tunnel. VCs within the shaped VP tunnel are degraded from the originally assigned service category to a common UBR service category (default traffic descriptor). Scheduling between VCs are based on WRR with a weight parameter that can be explicitly configured in the ATM traffic descriptor profile. If weight is not specifically configured, the defaults are taken.

The explicitly configured weight parameter is honored only on the ATM MDA in the max16k-vc mode. On all other ATM capable MDAs (ASAP or ATM MDA in max8k-vc mode), the weight parameter is ignored.

The **no** form of this command reverts to the default.

Default VC degraded from CBR = weight 10

VC degraded from rt-VBR = weight 7

VC degraded from nrt-VBR = weight 5

VC degraded from UBR+ = weight 2

VC degraded from UBR = weight 1

Parameters *weight* — Specifies the weight parameter value.

Values 1 to 255

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

weight

Syntax **weight** *weight-value*
no weight

Context **[Tree]** (config>qos>mlppp-profile-egress>class weight)

Full Context configure qos mlppp-profile-egress class weight

Description This command configures the WRR weight scheduling parameter for each MLPPP class queue for this profile.

Parameters *weight-value* — Specifies the weight scheduling parameter.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

weight

Syntax **weight** *weight*
no weight

Context **[Tree]** (config>qos>mc-fr-profile-egress>class weight)

Full Context configure qos mc-fr-profile-egress class weight

Description This command configures the WRR weight scheduling parameter for each Frame Relay scheduling class queue for this profile.

The weight parameter is not applicable to class 0 because the class 0 queue is serviced by the scheduler with the highest priority all the time over all other class queues.

After Class 0 queue packets are serviced, Class 1 queue packets are the next priority up to a rate of MIR. Beyond MIR, Class1, Class2, and Class 3 queues are serviced in proportion to the configured weights.

Parameters *weight* — Specifies the weight schedule.

Values 1 to 100

Default weight 1 — class 1 (not configurable)
weight 90 — class 2
weight 10 — class 3

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

weight

Syntax **weight** *weight*
no weight

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy>segment-list weight)

Full Context configure router segment-routing sr-policies static-policy segment-list weight

Description This command associates a weight value with a segment list of a statically-defined segment routing policy in order to achieve weighted ECMP behavior. Weight is an optional parameter.

When any segment-list in the active policy has a weight greater than 1, traffic matching the policy will be load-balanced across the segment lists according to their relative weight values.

The **no** form of this command reverts to the default value.

Default weight 1

Parameters *weight* — Specifies the weight value.

Values 1 to 4294967295

Platforms All

27.16 weight-down

weight-down

Syntax [**no**] **weight-down** *lag-ports-down-weight*

Context **[Tree]** (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context configure vrrp policy priority-event lag-port-down weight-down

Description This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-threshold or port threshold. The command is required for correct operation on mixed port-speed LAGs and can be used for non-mixed port-speed LAGs as well.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default no weight-down

Parameters *lag-ports-down-weight* — The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

27.17 weight-threshold

weight-threshold

Syntax **weight-threshold** *value* [**action** {**dynamic-cost** | **static-cost** | **down**}] [**cost** *static-cost*]
no weight-threshold

Context **[Tree]** (config>lag weight-threshold)

Full Context configure lag weight-threshold

Description This command configures the behavior for the Link Aggregation Group (LAG) if the total weight of operational links is equal to or below the configured threshold level. The command can be used for mixed port-speed LAGs and for LAGs with all ports of equal speed.

The **no** form of this command disables the weight-threshold operation in LAG.

Default weight-threshold 0 action down

Parameters *value* — The decimal integer threshold number of operational links for the LAG at or below which the configured action will be invoked. If the number of operational links exceeds the **weight-threshold** value, any action taken for being below the threshold value will cease.

Values 0 to 63

action — Specifies the action to take if the number of active links in the LAG is at or below the threshold value.

dynamic-cost — Specifies that dynamic costing is activated. As a result the LAG remains operationally up with a cost relative to the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

static-cost — Specifies that static costing will be activated. As a result, the LAG will remain operationally up with the configured cost, regardless of the number of operational links. The link will only be regarded as operationally down when all links in the LAG are down.

down — Specifies the LAG is brought operationally down if the number of operational links is equal to or less than the configured threshold value. The LAG is only regarded as up once the number of operational links exceeds the configured threshold value.

static-cost — The decimal integer static cost of the LAG.

Values 1 to 16777215

27.18 weighted-ecmp

weighted-ecmp

Syntax [**no**] **weighted-ecmp**

Context **[Tree]** (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel weighted-ecmp)

Full Context configure service vprn bgp-ipvpn mpls auto-bind-tunnel weighted-ecmp

Description This command enables weighted ECMP for packets using tunnels that a VPRN automatically binds to. When weighted ECMP is enabled, packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP.

The **no** form of this command disables weighted ECMP for next hop tunnel selection.

Default no weighted-ecmp

Platforms All

weighted-ecmp

Syntax **weighted-ecmp** [**strict**]
no weighted-ecmp

Context **[Tree]** (config>service>vprn weighted-ecmp)

Full Context configure service vprn weighted-ecmp

Description This command enables weighted load-balancing for IS-IS, OSPF, and static ECMP routes in the VPRN instance. Weighted ECMP can be performed when all next hops are configured with non-zero load-balancing weights. Weighted ECMP support for IS-IS, OSPF and static ECMP routes applies to both IPv4 and IPv6.

The **no** form of this command restores regular ECMP spraying of packets to IS-IS, OSPF and static route destinations.

Default no weighted-ecmp

Parameters **strict** — Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

Platforms All

weighted-ecmp

Syntax [**no**] **weighted-ecmp**

Context **[Tree]** (config>router>ldp weighted-ecmp)

Full Context configure router ldp weighted-ecmp

Description This command enables weighted ECMP on LDP using RSVP LSPs or SR-TE LSPs. LDP labeled packets are sprayed across the RSVP or SR-TE LSP ECMP in proportion to the configured **load-balancing-weight** of LSPs.

The **no** form of this command removes weighted ECMP.

Default no weighted-ecmp

Platforms All

weighted-ecmp

Syntax **weighted-ecmp** [**strict**]
no weighted-ecmp

Context **[Tree]** (config>router weighted-ecmp)

Full Context configure router weighted-ecmp

Description This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default no weighted-ecmp

Parameters **strict** — Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

Platforms All

weighted-ecmp

Syntax [**no**] **weighted-ecmp**

Context **[Tree]** (config>service>sdp weighted-ecmp)

Full Context configure service sdp weighted-ecmp

Description This command enables weighted ECMP on an SDP. When weighted ECMP is enabled, packets from services using the SDP are sprayed across LSPs in the ECMP set to the SDP far end according to the outcome of the hash algorithm and the configured load-balancing weight of each LSP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** version of this command disables weighted ECMP for next-hop tunnel selection.

Default no weighted-ecmp

Platforms All

weighted-ecmp

Syntax [**no**] **weighted-ecmp**

Context **[Tree]** (config>router>bgp>next-hop-res weighted-ecmp)

Full Context configure router bgp next-hop-resolution weighted-ecmp

Description This command enables weighted ECMP for next-hop tunnel selection for 6PE. When weighted ECMP is enabled, the RSVP-TE tunnel used to forward 6PE packets to the ECMP next hop is chosen according to the outcome of the hash on the packet at the normalized load-balancing weight of the tunnel.

The **no** version of this command disables weighted ECMP for next-hop tunnel selection for 6PE.

Default no weighted-ecmp

27.19 wide-metrics-only

wide-metrics-only

Syntax [**no**] **wide-metrics-only**

Context **[Tree]** (config>service>vprn>isis>level wide-metrics-only)

Full Context configure service vprn isis level wide-metrics-only

Description This command enables the exclusive use of wide metrics in the LSPs for the level number. Narrow metrics can have values between 1 and 63. IS-IS can generate two TLVs, one for the adjacency and one for the IP prefix. In order to support traffic engineering, wider metrics are required. When wide metrics are used, a second pair of TLVs are added, again, one for the adjacency and one for the IP prefix.

By default, both sets of TLVs are generated. When wide-metrics-only is configured, IS-IS only generates the pair of TLVs with wide metrics for that level.

The **no** form of this command reverts to the default value.

window

Syntax **window** *deciseconds*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame window)

Full Context configure port ethernet efm-oam link-monitoring errored-frame window

Description This command defines the size of the window using a 100ms base *deciseconds*. Errors are accumulated until the end of the window. At the end of the window the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Default window 10

Parameters *deciseconds* — The number of 100ms increments. Must be specified in increments of 10 (full seconds).

Values 10 to 600

Platforms All

window

Syntax **window** *packets*

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame-period window)

Full Context configure port ethernet efm-oam link-monitoring errored-frame-period window

Description This command defines the size of the window based on a packet receive rate. The minimum serviceable rate is the number of minimum size packets that can be received in one second. The window receive count value will be polled at a minimum one second intervals to see if the window size has been reached. Errors are accumulated until the end of the window. At the end of the window the actual errors are compared to the thresholds to determine if a threshold has been crossed. There is no mid-window threshold checking. The window represents a unique non-overlapping period of time.

Parameters *packets* — Specifies the number of received packets in one second.

Values 1 to 4294967295

Default 1488095

Platforms All

27.26 window-integrity

window-integrity

Syntax **window-integrity** *percentage*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no window-integrity

Context [Tree] (config>oam-pm>streaming>delay-template window-integrity)

Full Context configure oam-pm streaming delay-template window-integrity

Description This command specifies the integrity of the sample window. A percentage value that suggests the measurement has enough samples (integrity) to be considered representative for that sample window. The configured percentage considers the interval of the test PDUs, and the length of the sample window to determine the number of packets required in the sample.

(((window-integrity %) x (sample-window length (s) x pps per test (interval)).

Ensure that the percentage and the combination of sample window and packet per second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, then the value has integrity and the suspect flag is set to false for that streamed result.

If the count is less than the computed number of required samples, then the suspect flag is set to true for that streamed result.

Regardless of the integrity, the average values are streamed. It is up to the higher level systems to interrogate the suspect flag and determine if the value that is set should be used, discarded, or reported separately.

The **no** form of this command reverts to the default.

Default window-integrity 50

Parameters *percentage* — Specifies the window integrity percentage.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax **window-integrity** *percent*
no window-integrity

Context [Tree] (config>test-oam>link-meas>template>asw window-integrity)

Full Context configure test-oam link-measurement measurement-template aggregate-sample-window window-integrity

Description This command determines whether the aggregate sample window is integral based on the number of samples received from the sample window, comparing the number of samples to the percentage configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The range is from 0 to 100. The number of samples is computed as follows:

(window-integrity (%)) x (((aggregate-sample-window length (s)) / (sample-window length (s)))

For an aggregate sample window that does not reach the integrity, the value is not considered as representative and is used for threshold comparison.

If the number of samples in the aggregate sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the aggregate sample window results are compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default window-integrity 0

Parameters *percent* — Specifies the percentage of successful sent and received request-response pairs.

Zero indicates any amount of integrity is acceptable for report to the routing engine.

Values 0 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-integrity

Syntax **window-integrity** *percent*
no window-integrity

Context **[Tree]** (config>test-oam>link-meas>template>sw window-integrity)

Full Context configure test-oam link-measurement measurement-template sample-window window-integrity

Description This command specifies the integrity of the sample window. A percentage value indicates when the sample window has enough samples to be considered representative for that window (integrity). The configured percentage considers the interval of probes and the length of the sample window to determine the number of packets required in the sample:

(window-integrity (%)) x (((sample-window length (s)) / pps per test (interval)))

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Ensure that the percentage and the combination of sample window and the packet-per-second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the sample window does not have integrity and the sample window results are not compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

Default window-integrity 0

Parameters *percent* — Specifies the percentage of successful sent and received request-response pairs.

A value of 0 indicates any amount of integrity acceptable for report to the routing engine.

Values 0 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

Description This command configures the identifier of the WLAN Gateway ISA group that processes the cross-connect.

The **no** form of this command removes the NAT group IP from the cross-connect configuration.

Parameters *nat-group-id* — Specifies the identifier of the ISA group.

Values 1 to 4

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax **wlan-gw-group** *group-id*
no wlan-gw-group

Context **[Tree]** (config>router>vrgw>lanext wlan-gw-group)

Full Context configure router vrgw lanext wlan-gw-group

Description This command specifies the WLAN GW group that is used for HLE services.

The **no** form of this command removes the group from the configuration.

Parameters *group-id* — Specifies the WLAN GW group ID.

Values 1 to 4

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax **wlan-gw-group** *wlan-gw-group-id* [**member** *member-id*]
no wlan-gw-group

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query wlan-gw-group)

Full Context configure subscriber-mgmt wlan-gw ue-query wlan-gw-group

Description This command enables matching on UEs, based on the WLAN-GW group ID and, optionally, the specific ISA member they are installed on.

The **no** form of this command disables matching on the WLAN-GW group.

Default no wlan-gw-group

Parameters *wlan-gw-group-id* — Specifies the WLAN-GW group ID.

Values 1 to 4

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

member-id — Specifies the ISA member ID within the group.

Values 1 to 255

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax **wlan-gw-group** *group-id* [**create**] [**redundancy** *unit*]
no wlan-gw-group *group-id*

Context **[Tree]** (config>isa wlan-gw-group)

Full Context configure isa wlan-gw-group

Description This command creates a WLAN GW group that contains a set of ISAs to be used in WLAN-GW functionality. A WLAN-GW group can also be used where a NAT group is expected. The WLAN-GW group ID shares the same number space with the NAT group.

At most, one WLAN-GW group may be configured.

The optional redundancy parameter determines the provisioning and redundancy mode.

- IOM mode

  A whole IOM is added to the group. The IOM must be fully provisioned with BB ISA modules. In IOM mode, when a single ISA fails, the entire IOM is considered to have failed and all subscribers are recovered on a backup IOM.
- ISA mode

  BB ISA modules are added separately with no restriction put on other MDAs in the IOM. When a single ISA fails, a backup ISA will try to recover as many subscribers as possible but may run out of resources (for example, queues, policers, host entries) during the recovery process. It is recommended to pair ISAs with MDAs and services that do not consume many IOM resources.

The **no** form of this command removes the group.

Parameters *group-id* — Specifies WLAN Gateway Integrated Service Adaptor (ISA) Groups.

Values 1 to 4

unit — Specifies the provisioning and redundancy mode.

Values mda or iom

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax **wlan-gw-group** *group-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no wlan-gw-group

Context [Tree] (config>service>ies>sub-if>grp-if>wlan-gw wlan-gw-group)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw wlan-gw-group)

Full Context configure service ies subscriber-interface group-interface wlan-gw wlan-gw-group
configure service vprn subscriber-interface group-interface wlan-gw wlan-gw-group

Description This command specifies the ID of the **wlan-gw-group** that the **wlan-gw** gateway binds to.

The **no** form of this command removes the value from the **wlan-gw** configuration.

Parameters *group-id* — Specifies the ISA WLAN-GW group.

Values 1 to 4

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group

Syntax **wlan-gw-group** *nat-group-id*
no wlan-gw-group

Context [Tree] (config>service>vprn>sub-if>wlan-gw>pool-manager wlan-gw-group)
[Tree] (config>service>ies>sub-if>wlan-gw>pool-manager wlan-gw-group)

Full Context configure service ies subscriber-interface wlan-gw pool-manager wlan-gw-group
configure service vprn subscriber-interface wlan-gw pool-manager wlan-gw-group

Description This command specifies the ISA WLAN gateway group.

Parameters *nat-group-id* — Specifies the identifier of the WLAN gateway group.

Values 1 to 4

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

27.30 working-bundle

working-bundle

Syntax [**no**] **working-bundle** *bundle-id*

Context [Tree] (config>port>multilink-bundle working-bundle)

Full Context configure port multilink-bundle working-bundle

Description This command configures a working bundle that is part of this BPGrp.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *bundle-id* — Specifies the working multilink bundle in the bundle protection group. The command syntax must be configured as follows:

Values bundle-*type-slot/mda.bundle-num*

bundle-PPP or IMA-*slot/mda.bundle-num*	Creates an MLPPP or IMA bundle.
where:	**bundle**: keyword *slot*: IOM/MDA slot numbers *bundle-num*: 1 to 336

For example: router1>config>port>ml-bundle> working-bundle bundle-ima-1/1.1

Platforms 7450 ESS, 7750 SR-7/12/12e

27.31 working-circuit

working-circuit

Syntax **working-circuit** *port-id* [**number** *number*]
no work-circuit [**number** *number*]

Context **[Tree]** (config>port>aps working-circuit)

Full Context configure port aps working-circuit

Description This command configures a physical port that will act as the working circuit for this APS group. The working circuit port must contain only the default configuration and cannot be part of another APS group. The working circuit must be created before the protection circuit.

When a port is a working circuit of an APS group, the configuration available under **config>port** *port-id* context (including submenus) is not allowed for that port unless it is a part of the noted exceptions.

When a port is being configured as a working circuit of an APS group, all common configuration as described above and all service configurations related to the APS port is operationally inherited by the working circuit from the aps-*group-id*. If the working circuit cannot inherit that configuration, for example, due to resource limitations, the configuration attempt fails and an error is returned to the user.

Before a working circuit can be removed from an APS group, the working circuit port must be shutdown. The inherited configuration for the circuit and APS operational commands for that circuit are not preserved when the circuit is removed from the APS group.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note that all configurations for aps-*group-id* under the **config>port** context and its submenus and all configuration for services that use this aps-*group-id* is preserved as a non-activated configuration since the APS group no longer has any physical circuits assigned.

The **no** form of this command removes the working-circuit. The working circuit can only be removed from the configuration after the protect circuit has been removed.

Parameters *port-id* — Specifies the physical port that will act as the working circuit for this APS group in the following format:

port-id	*slot*/*mda*/*port*		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

number — Specifies the APS channel number; value is 1 or 2.

Modifying Hold-Down Timer Values

Note that for APS configurations, the **config>port>sonet-sdh hold-time down** and **config>port>sonet-sdh hold-time up** default values are 100 ms and 500 ms respectively. But, if there is a large difference in the transmission delay between the APS working (**working-circuit**) and protect line (**config>port>aps protect-circuit**), it is highly recommended that you increase the default timer on the working line accordingly with the transmission delay present on the protect line.

The following output shows an example of the timers on POS interfaces.

```

27.32 working-path

working-path

Syntax **working-path** *path-name*
no working-path

Context **[Tree]** (config>router>gmpls>lsp working-path)

Full Context configure router gmpls lsp working-path

Description This command specifies the working path for a GMPLS LSP. One working path must be specified for each GMPLS LSP. The path-name parameter must correspond to a path defined under **config>router>gmpls>path**.

The **no** form of the command removes the working-path definition.

Default no working-path

Parameters *path-name* — Specifies the name of the path used by the working path.

Values 32 characters maximum text string

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.33 working-tp-path

working-tp-path

Syntax [**no**] **working-tp-path**

Context **[Tree]** (config>router>mpls>lsp working-tp-path)

Full Context configure router mpls lsp working-tp-path

Description This command creates or edits the working path for an MPLS-TP LSP. At least one working path (but not more than one working path) must be created for an MPLS-TP LSP. If MPLS-TP linear protection is also configured, then this is the path that is used as the default working path for the LSP, and it must be created prior to the protect path. The working-tp-path can only be deleted if no protect-tp-path exists for the LSP.

The following commands are applicable to the working-tp-path: **lsp-num, in-label, out-label, mep, shutdown**.

Default no working-tp-path

27.35 wrap-around

wrap-around

Syntax [**no**] **wrap-around**

Context **[Tree]** (config>filter>log wrap-around)

Full Context configure filter log wrap-around

Description This command configures a memory filter log to log until full or to store the most recent log entries (circular buffer).

Specifying **wrap-around** configures the memory filter log to store the most recent filter log entries (circular buffer). When the log is full, the oldest filter log entries are overwritten with new entries.

The **no** form of the command configures the memory filter log to accept filter log entries until full. When the memory filter log is full, filter logging for the log filter ID ceases.

Default wrap-around

Platforms All

27.36 wred-queue

wred-queue

Syntax **wred-queue** [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]
no wred-queue

Context **[Tree]** (config>qos>sap-egress>queue wred-queue)

Full Context configure qos sap-egress queue wred-queue

Description This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default no wred-queue

Parameters *slope-policy-name* — Specifies an existing slope policy that is used to override the default WRED slope policy.

mode — Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

Default native

slope-usage — Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

wred-queue

Syntax **wred-queue** [**policy** *slope-policy-name*] [**mode** {**native** | **pool-per-queue**}] [**slope-usage** {**default** | **exceed-low**}]
no wred-queue

Context **[Tree]** (config>qos>qgrps>egr>qgrp>queue wred-queue)

Full Context configure qos queue-group-templates egress queue-group queue wred-queue

Description This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED
  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.
- Pool per queue WRED
  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default no wred-queue

Parameters *slope-policy-name* — Specifies an existing slope policy that is used to override the default WRED slope policy.

mode {native | pool-per-queue} — Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low} — Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

Default exceed-low

Syntax [**no**] **writable-running**

Context **[Tree]** (config>system>netconf>capabilities writable-running)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system netconf capabilities writable-running

Description This command enables support of the writable-running capability in the SR OS NETCONF server. If writable-running is disabled then requests that reference the running datastore as a target return an error, and when a NETCONF client establishes a new session the writable-running capability is not advertised in the SR OS <hello>.

When **management-interface configuration-mode** is set to **model-driven**, then the writable-running capability is disabled, even if **writable-running** is configured.

The **no** form of the command disables of the writable-running capability in the SR OS NETCONF server.

Default no writable-running

Platforms All

27.39 write

write

Syntax **write** {*user-name* | *broadcast*} *message*

Context **[Tree]** (global write)

Full Context global write

Description This command sends a console message to a specific user or to all users with active console sessions.

Parameters *user-name* — Specifies the name of a user, up to 32 characters, with an active console session to which to send a console message.

Values any valid CLI username

broadcast — Sends the *message-string* to all users logged into the router.

message — Specifies the message string to send. Allowed values are any string, up to 256 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Use subject to Terms available at: www.nokia.com

27.40 write-algorithm

write-algorithm

Syntax **write-algorithm** {**hash** | **hash2** | **custom** | **cleartext**}
no write-algorithm

Context **[Tree]** (config>system>security>management-interface>classic-cli write-algorithm)

Full Context configure system security management-interface classic-cli write-algorithm

Description This command specifies how encrypted configuration secrets are output from the system. For example, how encrypted secrets are displayed in the output of the info command, and how they are written to the saved configuration file.

The **no** form of this command reverts to the default value.

Default write-algorithm hash2

Parameters **hash** — Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the read-algorithm should be **hash** as well.

hash2 — Specifies hash2 which is module-specific.

custom — Specifies the custom encryption to management interface.

cleartext — Specifies that the phrase is displayed as clear text everywhere.

Platforms All

27.41 wrr-group

wrr-group

Syntax **wrr-group** *group-id* **sched-class** *class-id*
wrr-group *group-id* **unattached**
no wrr-group *group-id*

Context **[Tree]** (config>qos>hs-attachment-policy wrr-group)

Full Context configure qos hs-attachment-policy wrr-group

Description This command defines how the specified group ID is attached to the scheduler. A WRR group may have one of two attachment states:

- directly attached to a scheduler class

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- unattached

A WRR group provides a weighted scheduling context for its member queues, collapsing the queues into a single scheduling class.

The following WRR membership restrictions apply:

- Two groups are supported: WRR-group 1 and WRR-group 2.
- Up to six of the eight queues can become members of WRR groups (the sum of the membership of both groups cannot exceed six queues). All six queues can be placed in a single WRR group or they can be spread between the two groups.
- All queues within a group must have contiguous queue IDs.
- When both groups are configured to have queue members, the queue IDs in group 1 must be lower than the queue IDs in group 2.

The **queue** *queue-id* attachment command is used to define WRR group membership.

The **no** form of the command reverts to the default unattached attachment state for the group ID.

Default wrr-group group-id unattached

Parameters *group-id* — Specifies the WRR group identifier. The *group-id* parameter is required when executing the **wrr-group** attachment command.

Values 1, 2

sched-class — Specifies a direct attachment between the WRR group and one of the six scheduling classes. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

class-id — Specifies the scheduling class associated with this WRR group. The **sched-class** keyword specifies the attachment between the group ID and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the WRR group's attached scheduling class. Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the **wrr-group** attachment command fails and the current attachment for the *group-id* is unchanged.

Values 1 to 6

unattached — Indicates that the group ID is not attached to any scheduling class or WRR group. Queues that are members of the unattached WRR group do not forward any packets. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

27.42 wtr-annexb

wtr-annexb

Syntax **wtr-annexb** *minutes*

Context **[Tree]** (config>port>aps wtr-annexb)

Full Context configure port aps wtr-annexb

Description This command waits to restore for Annex B mode operation. The delay after which the newly active section becomes the primary section after a switch-over from the primary section to the secondary section occurs and the switch request clears normally.

Parameters *minutes* — Specifies the time, in minutes, to wait to restore for Annex B mode operation.

Values 0 to 60

Default 5

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.

28 x Commands

28.1 x-interfaces

x-interfaces

Syntax x-interfaces

Context **[Tree]** (config>li x-interfaces)

Full Context configure li x-interfaces

Description Commands in this context configure LI X1, X2, and X3 interfaces.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

28.2 x1

x1

Syntax **x1**

Context **[Tree]** (config>li>x-interfaces x1)

Full Context configure li x-interfaces x1

Description Commands in this context configure the LI X1 interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

28.3 x2

x2

Syntax **x2**

Context **[Tree]** (config>li>x-interfaces x2)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure li x-interfaces x2

Description Commands in this context configure the LI X2 interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

28.4 x3

x3

Syntax **x3**

Context **[Tree]** (config>li>x-interfaces x3)

Full Context configure li x-interfaces x3

Description Commands in this context configure the LI X3 interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

28.5 xc

xc

Syntax **xc** [**detail**]
no xc

Context **[Tree]** (debug>router>mpls>event xc)

Full Context debug router mpls event xc

Description This command debugs cross connect events.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about cross connect events.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

28.6 xcon

xcon

Syntax [**no**] **xcon**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state xcon)

Full Context configure subscriber-mgmt wlan-gw tunnel-query ue-state xcon

Description This command enables matching on tunnels with cross-connect UEs.

The **no** form of this command disables matching on cross-connect UEs, unless UE state matching is disabled altogether.

Default no xcon

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.7 xconnect

xconnect

Syntax **xconnect**

Context **[Tree]** (config>router>wlan-gw xconnect)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>vlan-tag-ranges>range xconnect)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>vlan-tag-ranges>range xconnect)

Full Context configure router wlan-gw xconnect
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range xconnect
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range xconnect

Description Commands in this context configure WLAN-GW cross-connect UE-related parameters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

xconnect

Syntax **xconnect**

Context **[Tree]** (config>card>mda xconnect)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>card>xiom>mda xconnect)

Full Context configure card mda xconnect
configure card xiom mda xconnect

Description This command creates a loopback (cross-connect) in the MAC chip and does not require a faceplate port.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure card mda xconnect

7750 SR-s

- configure card xiom mda xconnect

28.8 xconnect-tunnel-home-address

xconnect-tunnel-home-address

Syntax [**no**] **xconnect-tunnel-home-address**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute xconnect-tunnel-home-address)
[Tree] (config>subscr-mgmt>auth-plcy>include xconnect-tunnel-home-address)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute xconnect-tunnel-home-address
configure subscriber-mgmt authentication-policy include-radius-attribute xconnect-tunnel-home-address

Description This command enables the generation of the Cross Connect Tunnel Home Address RADIUS attribute.

The **no** form of the command reverts to the default value.

Default no xconnect-tunnel-home-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

xconnect-tunnel-home-address

Syntax [**no**] **xconnect-tunnel-home-address**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-home-address)
[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes xconnect-tunnel-home-address)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-home-address
configure aaa isa-radius-policy auth-include-attributes xconnect-tunnel-home-address

Description This command enables the cross connect tunnel home address RADIUS attribute.

Default no xconnect-tunnel-home-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.9 xconnect-tunnel-local-ipv6-address

xconnect-tunnel-local-ipv6-address

Syntax [**no**] **xconnect-tunnel-local-ipv6-address**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-local-ipv6-address)

Full Context configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-local-ipv6-address

Description This command enables the generation of the cross connect tunnel local IPv6 address RADIUS attribute.

Default no xconnect-tunnel-local-ipv6-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.10 xconnect-tunnel-remote-ipv6-address

xconnect-tunnel-remote-ipv6-address

Syntax [**no**] **xconnect-tunnel-remote-ipv6-address**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-remote-ipv6-address)

Full Context configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-remote-ipv6-address

Description This command enables the generation of the cross connect tunnel remote IPv6 address RADIUS attribute.

Default no xconnect-tunnel-remote-ipv6-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

28.11 xconnect-tunnel-service

xconnect-tunnel-service

Syntax [**no**] **xconnect-tunnel-service**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-service)

Full Context configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-service

Description This command enables the generation of the cross connect tunnel service RADIUS attribute.

Default no xconnect-tunnel-service

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.12 xconnect-tunnel-type

xconnect-tunnel-type

Syntax [**no**] **xconnect-tunnel-type**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-type)

Full Context configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-type

Description This command enables the generation of the cross connect tunnel type RADIUS attribute.

Default no xconnect-tunnel-type

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

28.13 xgig

xgig

Syntax **xgig** {**lan** | **wan**}

Context **[Tree]** (config>port>ethernet xgig)

Full Context configure port ethernet xgig

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a 10 Gb/s interface to be in Local or Wide Area Network (LAN or WAN) mode. When configuring the port to be in WAN mode certain SONET/SDH parameters can be changed to reflect the SONET/SDH requirements for this port.

When the port is configured for LAN mode, all SONET/SDH parameters are pre-determined and not configurable.

Default xgig lan

Parameters **lan** — Sets the port to operate in LAN mode.

wan — Sets the port to operate in WAN mode.

Platforms All

28.14 xiom

xiom

Syntax [**no**] **xiom**

Context **[Tree]** (config>card xiom)

Full Context configure card xiom

Description This command configures an XIOM in one of the slots of an XCM. An XIOM can be used instead of an XMA and operates as a carrier module to support MDA-s modules.

Parameters *xiom-slot* — Specifies the XIOM identifier.

Values x1 or x2

Platforms 7750 SR-s

28.15 xiom-type

xiom-type

Syntax **xiom-type** *xiom-type* [**level** *xiom-level*]
no xiom-type

Context **[Tree]** (config>card>xiom xiom-type)

Full Context configure card xiom xiom-type

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command adds an XIOM to the device configuration for the slot. The XIOM type can be preprovisioned, which means that the XIOM does not have to be installed in the chassis.

An XIOM must be provisioned before an MDA-s, connector, or port can be configured.

An XIOM can only be provisioned in a slot that is vacant. No other XIOM or XMA can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An XIOM can only be provisioned in a slot if the XIOM type is allowed in the slot. An error message is generated if an attempt is made to provision an XIOM type that is not allowed.

If an XIOM is inserted that does not match the configured XIOM type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct XIOM type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled XIOM is removed from the chassis. The alarm is cleared when the correct XIOM type is installed or the configuration is modified. A log event is issued when a XIOM is removed that is administratively disabled.

XIOMs are controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the XIOM type. An XIOM cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by XIOM type.

The provisioned license level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if a configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that XIOM.

The **no** form of this command removes the XIOM from the configuration.

Parameters *xiom-type* — Specifies the type of XIOM to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported xiom-types and their CLI strings. In addition, the command can be queried to check which xiom-types are relevant for the active platform type.

xiom-level — Specifies the license level of the XIOM, up to 32 characters. Possible values vary by XIOM type.

28.16 xmpp

xmpp

Syntax **xmpp**

Context **[Tree]** (config>system xmpp)

Full Context configure system xmpp

Description Commands in this context configure xmpp.

Platforms All

xmpp

Syntax **xmpp** [**connection**] [**gateway**] [**message**] [**vsd**] [**iq**] [**all**]
no xmpp

Context **[Tree]** (debug>system xmpp)

Full Context debug system xmpp

Description This command enables the debug for XMPP messages sent or received by the 7750 SR, 7450 ESS, or 7950 XRS.

Parameters **connection** — Filters only the messages related to the XMPP connection.

gateway — Filters the messages related to the gateway.

message — Filters only the messages.

vsd — Filters the VSD messages.

iq — Filters the IQ messages between the gateway and the VSD.

all — Includes all the above.

29 y Commands

29.1 yang-modules

yang-modules

Syntax **yang-modules**

Context **[Tree]** (config>system>management-interface yang-modules)

Full Context configure system management-interface yang-modules

Description Commands in this context configure YANG module parameters.

The **yang-modules** settings affect the data sent in a NETCONF <hello>, data populated in the RFC 6022 /netconf-state/schemas list, data returned in a <get-schema> request, and data populated in the RFC 8525 /yang-library. See the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*, sections “NETCONF Monitoring” and “YANG Library” for more information.

Platforms All

29.2 yellow-differential-delay

yellow-differential-delay

Syntax **yellow-differential-delay** *yellow-diff-delay*
no yellow-differential-delay

Context **[Tree]** (config>port>multilink-bundle yellow-differential-delay)

Full Context configure port multilink-bundle yellow-differential-delay

Description This command sets the yellow warning threshold for the differential delay for members within a multilink bundle. If circuit’s delay exceeds the yellow-differential delay value, a log message and SNMP trap is sent. This command is only valid for MLPPP bundles. The differential delay is calculated as the round-trip differential delay for MLPPP bundles.

The **no** form of this command removes the yellow-differential-delay.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *yellow-diff-delay* — Specifies the maximum yellow differential delay threshold value, in milliseconds.

Values 1 to 25

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

30 z Commands

30.1 zone

zone

Syntax **zone** {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]
no zone

Context **[Tree]** (config>system>time zone)

Full Context configure system time zone

Description This command sets the time zone and/or time zone offset for the device.

The SR-series router OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default zone UTC 00

Parameters *std-zone-name* — Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

non-std-zone-name — Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm] — Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59

Default hours: 0 minutes: 0

Platforms All

30.2 zone-channel

zone-channel

Syntax **zone-channel** *mcast-address* **source** *ip-address* **adi-channel-name** *channel-name*
no zone-channel *mcast-address* **source** *ip-address*

Context **[Tree]** (config>service>ies>video-interface>channel zone-channel)
[Tree] (config>service>vprn>video-interface>channel zone-channel)

Full Context configure service ies video-interface channel zone-channel
configure service vprn video-interface channel zone-channel

Description This command configures zone-channel parameters or ad insertion. The channel configuration along with the zone-channel configuration associates a network channel to a zone-channel and builds the store and forward relationship.

Parameters *mcast-address* — Specifies the IP multicast group address for which this entry contains information.

source *ip-address* — Specifies the type of address to be used for a source address.

adi-channel-name *channel-name* — Specifies the name for this zone channel.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e
