Description The mac-advertisement command enables the advertisement in BGP of the learned macs on SAPs and SDP bindings. When the mac-advertisement is disabled, the local macs will be withdrawn in BGP.

Default mac-advertisement

Platforms All

17.5 mac-criteria

mac-criteria

Syntax [**no**] **mac-criteria**

Context **[Tree]** (config>qos>sap-ingress mac-criteria)

Full Context configure qos sap-ingress mac-criteria

Description The **mac-criteria** based SAP ingress policies are used to select the appropriate ingress queue and corresponding forwarding class for matched traffic.

This command is used to enter the node to create or edit policy entries that specify MAC criteria.

Router implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

The **no** form of this command deletes all the entries specified under this node. When mac-criteria entries are removed from a SAP ingress policy, the mac-criteria is removed from all services where that policy is applied.

17.8 mac-filter

mac-filter

Syntax **mac-filter** *mac-filter-id* **entry** *entry-id* [*entry-id*]
no mac-filter *mac-filter-id* [**entry** *entry-id*]

Context **[Tree]** (config>mirror>mirror-source mac-filter)

Full Context configure mirror mirror-source mac-filter

Description This command enables mirroring of packets that match specific entries in an existing MAC filter.

The **mac-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The MAC filter must already exist in order for the command to execute. Filters are configured in the config>filter context. If the MAC filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not be generated but mirroring will not be enabled (there are no packets to mirror). Once the filter is defined to a SAP or MAC interface, mirroring is enabled.

If the MAC filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the MAC filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within a MAC filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any MAC filters are mirrored. Mirroring of MAC filter entries must be explicitly defined.

The **no mac-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *mac-filter-id*.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *mac-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters *mac-filter-id* — Specifies the MAC filter ID whose entries are mirrored. If the *mac-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *mac-filter-id* is defined on a SAP.

entry-id — Specifies the MAC filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space. Up to 8 entry IDs may be specified in a single command.

Each *entry-id* must exist within the *mac-filter-id*. If the *entry-id* is renumbered within the MAC filter definition, the old *entry-id* is removed from the list and the new *entry-id* will need to be manually added to the list if mirroring is still desired.

If no *entry-id* entries are specified in the command, mirroring will not occur for that MAC filter ID. The command will have no effect.

Platforms All

mac-filter

Syntax [**no**] **mac-filter** *mac-filter-id*

Context **[Tree]** (config>li>li-filter-block-reservation>li-reserved-block mac-filter)

Full Context configure li li-filter-block-reservation li-reserved-block mac-filter

Description This command configures to which normal MAC filters the entry reservation is applied.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

Parameters *mac-filter-id* — The filter identification identifies the normal MAC filters.

Values {*filter-id* | *filter-name*}

filter-id:	1 to 65535
filter-name:	up to 64 characters (*filter-name* is an alias for input only. The *filter-name* gets replaced with an id automatically by SR OS in the configuration).

Use subject to Terms available at: www.nokia.com

mac-filter

Syntax [**no**] **mac-filter** *mac-filter-id*

Context **[Tree]** (config>li>li-filter-assoc>li-mac-fltr mac-filter)

Full Context configure li li-filter-associations li-mac-filter mac-filter

Description Specifies the MAC filter(s) into which the entries from the specified **li-mac-filter** are to be inserted. The **li-mac-filter** and **mac-filter** must already exist before the association is made. If the normal MAC filter is deleted then the association is also removed (and not re-created if the MAC filter comes into existence in the future).

The **no** form of this command removes the MAC filter ID from the configuration.

Parameters *mac-filter-id* — Specifies a filter identification to identify the MAC filter.

Values 1 to 65536, *name*: up to 64 characters

Platforms All

mac-filter

Syntax **mac-filter** *mac-filter-id* **entry** *entry-id* [*entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** [*session-id*] [[*session-id*]]]
no mac-filter *mac-filter-id*

Context **[Tree]** (config>li>li-source mac-filter)

Full Context configure li li-source mac-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing MAC filter. Multiple entries can be created using unique *entry-id* numbers within the filter. The router implementation exits the filter on the first match found and executes the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** for it to be considered complete. Entries without the **action** keyword will be considered incomplete and hence will be rendered inactive.

An *entry-id* within an MAC filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

The **no** form of this command removes the specified entry from the IP or MAC filter. Entries removed from the IP or MAC filter are immediately removed from all services or network ports where that filter is applied.

Parameters *mac-filter-id* — Specifies the MAC filter ID. If the *mac-filter-id* does not exist, an error will occur and the command will not execute.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

entry-id — The MAC filter entries to use as match criteria.

intercept-id — Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encap, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) — For nat li-source entries that are using a mirror service that is not configured with routable encapsulation

Values 1 to 1,073,741,824 (30b) — For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

Values 1 to 536,870,912 (29b) — For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

session-id — Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

mac-filter

Syntax **mac-filter** *mac-filter-id* **entry** *entry-id* [*entry-id*]
no mac-filter *mac-filter-id* [**entry** *entry-id*]

Context **[Tree]** (debug>mirror-source mac-filter)

Full Context debug mirror-source mac-filter

Description This command enables mirroring of packets that match specific entries in an existing MAC filter.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **mac-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The MAC filter must already exist in order for the command to execute. Filters are configured in the config>filter context. If the MAC filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not be generated but mirroring will not be enabled (there are no packets to mirror). Once the filter is defined to a SAP or MAC interface, mirroring is enabled.

If the MAC filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the MAC filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within a MAC filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any MAC filters are mirrored. Mirroring of MAC filter entries must be explicitly defined.

The **no mac-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *mac-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *mac-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters *mac-filter-id* — The MAC filter ID whose entries are mirrored. If the *mac-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *mac-filter-id* is defined on a SAP.

entry-id — The MAC filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space. Up to 8 entry IDs may be specified in a single command.

Each *entry-id* must exist within the *mac-filter-id*. If the *entry-id* is renumbered within the MAC filter definition, the old *entry-id* is removed from the list and the new *entry-id* will need to be manually added to the list if mirroring is still desired.

If no *entry-id* entries are specified in the command, mirroring will not occur for that MAC filter ID. The command will have no effect.

mac-filter

Syntax **mac-filter** *filter-id* [**create**] [**name** *name*]
mac-filter {*filter-id* | *filter-name*}
no mac-filter {*filter-id* | *filter-name*}

Context **[Tree]** (config>filter mac-filter)

Full Context configure filter mac-filter

Description This command, creates a configuration context for the specified MAC filter policy.

The **no** form of the command deletes the MAC filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

Parameters *filter-id* — Specifies the MAC filter policy ID expressed as a decimal integer.

Values 1 to 65535

create — This keyword is required to create the configuration context. After it is created, the context can be enabled with or without the **create** keyword.

name — Configures an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

Values *name*: 64 characters maximum

filter-name — A string of up to 64 characters uniquely identifying this MAC filter policy

mac-filter

Syntax **ip-filter** *src-filter-id* [**src-entry** *src-entry-id*] **to** *dst-filter-id* [**dst-entry** *dst-entry-id*] [**overwrite**]

Context **[Tree]** (config>filter>copy mac-filter)

Full Context configure filter copy mac-filter

Description This command copies an existing filter entry for a specific filter ID to another filter ID. The **copy** command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

Parameters *src-filter-id* — Identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword (**mac-filter**).

dst-filter-id — Identifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

overwrite — Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

configure service vpls proxy-nd dynamic mac-list

Description This command associates a previously created MAC list to a dynamic IP. The MAC list is created using the **config**>**service**>**proxy-arp-nd**>**mac-list** command.

The **no** form of the command deletes the association of the MAC list and the dynamic IP.

Parameters *name* — The name of the MAC list previously created using the **config**>**service**>**proxy-arp-nd**>**mac-list** command.

Platforms All

mac-list

Syntax **mac-list** *name* [**create**]
no mac-list *name*

Context **[Tree]** (config>service mac-list)

Full Context configure service mac-list

Description This command configures a MAC list name. The MAC list is composed of a list of MAC addresses and masks, which along with Auto-Learn Mac Protect (ALMP) can be used to exclude certain MACs from being protected in a given object. This is typically used on SAPs and spoke SDPs configured with ALMP where certain MACs must be able to move to other objects (for example, VRRP virtual MACs).

The **no** form of this command removes the MAC list name.

Parameters *name* — Specifies the MAC list name, up to 32 characters.

create — Keyword used to create the MAC list.

Use subject to Terms available at: www.nokia.com

17.14 mac-move

mac-move

Syntax [**no**] **mac-move**

Context **[Tree]** (config>service>vpls mac-move)
[Tree] (config>service>template>vpls-template mac-move)

Full Context configure service template vpls-template mac-move
configure service vpls mac-move

Description Commands in this context configure MAC move attributes. A sustained high re-learn rate can be a sign of a loop somewhere in the VPLS topology. Typically, STP detects loops in the topology, but for those networks that do not run STP, the mac-move feature is an alternative way to protect your network against loops.

When enabled in a VPLS, **mac-move** monitors the re-learn rate of each MAC. If the rate exceeds the configured maximum allowed limit, it disables the SAP where the source MAC was last seen. The SAP can be disabled permanently (until a **shutdown**/**no shutdown** command is executed) or for a length of time that grows linearly with the number of times the specified SAP was disabled. You have the option of marking a SAP as non-blockable in the **config>service>vpls>sap>limit-mac-move** or **config>service>vpls>spoke-sdp>limit-mac-move** contexts. This means that when the re-learn rate has exceeded the limit, another (blockable) SAP will be disabled instead.

The **mac-move** command enables the feature at the service level for SAPs and spoke-SDPs, as only those objects can be blocked by this feature. Mesh SDPs are never blocked, but their re-learn rates (sap-to-mesh/spoke-to-mesh or vice versa) are still measured.

The operation of this feature is the same on the SAP and spoke-SDP. For example, if a MAC address moves from SAP to SAP, from SAP to spoke-SDP, or between spoke-SDPs, one will be blocked to prevent thrashing. If the MAC address moves between a SAP and mesh SDP or spoke-SDP and mesh SDP combinations, the respective SAP or spoke-SDP will be blocked.

mac-move will disable a VPLS port when the number of relearns detected has reached the number of relearns needed to reach the move-frequency in the 5-second interval. For example, when the move-frequency is configured to 1 (relearn per second) mac-move will disable one of the VPLS ports when 5 relearns were detected during the 5-second interval because then the average move-frequency of 1 relearn per second has been reached. This can already occur in the first second if the real relearn rate is 5 relearns per second or higher.

The **no** form of this command disables MAC move.

17.15 mac-move-level

mac-move-level

Syntax **mac-move-level** {**primary** | **secondary**| **tertiary**}

Context **[Tree]** (config>service>template>vpls-sap-template mac-move-level)

Full Context configure service template vpls-sap-template mac-move-level

Description When a sap is instantiated using vpls-sap-template, if the MAC move feature is enabled at VPLS level, the command mac-move-level indicates whether the sap should be populated as primary-port, secondary-port or tertiary-port in the instantiated VPLS.

Default no mac-move-level; SAP is populated as a tertiary-port

Platforms All

17.16 mac-name

mac-name

Syntax **mac-name** *name ieee-address*
no mac-name *name*

Context **[Tree]** (config>service>pbb mac-name)

Full Context configure service pbb mac-name

Description This command configures the MAC name for the MAC address. It associates an ASCII name with an IEEE MAC to improve the PBB Epipe configuration. It can also change the dest-BMAC in one place instead of 1000s of Epipe.

Parameters *name* — Specifies the MAC name up to 32 characters in length.

ieee-address — The MAC address assigned to the MAC name. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

17.17 mac-notification

mac-notification

Syntax **mac-notification**

Context **[Tree]** (config>service mac-notification)

Full Context configure service mac-notification

Description This command controls the settings for the MAC notification message.

The mac-notification message must be generated under the following events:

1. When enabled in the BVPLS using **no shutdown**, a MAC notification will be sent for every active MC-LAG link. The following 3 cases assume no shutdown in the BVPLS.
2. Whenever a related MC-LAG link becomes active (the related MC-LAG link has at least 1 SAP associated with the BVPLS) if the MC-LAG peering is initialized and the PE peers are synchronized.
3. First SAP on an active MC-LAG is associated (via IVPLS/Epipe) with the BVPLS
4. The link between IVPLS/Epipe and BVPLS is configured and there are I-SAPs configured on an active MC-LAG link.

The MAC notification is not sent for the following events:

1. Change of source-bmac or source-bmac-lsb
2. On changes of use-sap-bmac parameter
3. If MC-LAG peering is not (initialized and in sync).

17.18 mac-ping

mac-ping

Syntax **mac-ping service** *service-id* **destination** *dst-ieee-address* [**source** *src-ieee-address*] [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**interval** *interval*] [**timeout** *timeout*]

Context **[Tree]** (oam mac-ping)
[Tree] (config>saa>test>type mac-ping)

Full Context configure saa test type mac-ping
oam mac-ping

Description This command determines the existence of an egress SAP binding of a given MAC within a VPLS service.

A **mac-ping** packet is sent via the data plane.

A **mac-ping** is forwarded along the flooding domain if no MAC address bindings exist. If MAC address bindings exist, then the packet is forwarded along those paths, provided they are active. A response is generated only when there is an egress SAP binding for that MAC address or if the MAC address is a “local” OAM MAC address associated with the device’s control plan.

A **mac-ping** reply can be sent using the data plane or the control plane. The **return-control** option specifies the reply be sent using the control plane. If **return-control** is not specified, the request is sent using the data plane.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A **mac-ping** with data plane reply can only be initiated on nodes that can have an egress MAC address binding. A node without a FDB and without any SAPs cannot have an egress MAC address binding, so it is not a node where replies in the data plane are trapped and sent up to the control plane.

A control plane request is responded to via a control plane reply only.

By default, MAC OAM requests are sent with the system or chassis MAC address as the source MAC. The **source** option allows overriding of the default source MAC for the request with a specific MAC address.

When a **source** *ieee-address* value is specified and the source MAC address is locally registered within a split horizon group (SHG), then this SHG membership is used as if the packet originated from this SHG. In all other cases, SHG 0 (zero) is used. If the **mac-trace** is originated from a non-zero SHG, such packets do not go out to the same SHG.

Parameters *service-id* — Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647
service-name: up to 64 characters

dst-ieee-address — Specifies the destination MAC address for the OAM MAC request.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

src-ieee-address — Specifies the source MAC address from which the OAM MAC request originates. By default, the system MAC address for the chassis is used.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

Default The system MAC address.

fc-name — Specifies that the **fc** parameter be used to test the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile state of the MPLS echo request encapsulation.

Default out

octets — Specifies the MAC OAM request packet size in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6 byte PAD header and a byte payload of 0xAA as necessary. If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9198

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

vc-label-ttl — Specifies the TTL value in the VC label for the OAM MAC request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count — Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message *interval* value must be expired before the next message request is sent.

Values 1 to 100

Default 1

return-control — Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane.

interval — Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

[Tree] (config>service>vpls>endpoint mac-pinning)

Full Context configure service vpls endpoint mac-pinning
configure service vpls mesh-sdp mac-pinning
configure service vpls sap mac-pinning
configure service vpls spoke-sdp mac-pinning

Description This command disables re-learning of MAC addresses on other SAPs within the VPLS. The MAC address will remain attached to a given SAP for duration of its age-timer.

The age of the MAC address entry in the FDB is set by the age timer. If **mac-aging** is disabled on a given VPLS service, any MAC address learned on a SAP or SDP with **mac-pinning** enabled will remain in the FDB on this SAP or SDP forever.

Every event that would otherwise result in re-learning is logged (MAC address; original-SAP; new-SAP).

The **no** form of the command enables re-learning of MAC addresses.

Note: MAC addresses learned during DHCP address assignment (DHCP snooping enabled) are not impacted by this command. MAC-pinning for such addresses is implicit.

Default no mac-pinning — When a SAP or spoke SDP is part of a Residential Split Horizon Group (RSHG), MAC pinning is activated at creation of the SAP. Otherwise MAC pinning is not enabled by default.

Platforms All

mac-pinning

Syntax [**no**] **mac-pinning**

Context [Tree] (config>service>pw-template mac-pinning)

Full Context configure service pw-template mac-pinning

Description Enabling this command will disable re-learning of MAC addresses on other SAPs within the service. The MAC address will remain attached to a given SAP for duration of its age-timer.

The age of the MAC address entry in the FDB is set by the age timer. If **mac-aging** is disabled on a given VPLS service, any MAC address learned on a SAP or SDP with **mac-pinning** enabled will remain in the FDB on this SAP or SDP forever. Every event that would otherwise result in re-learning will be logged (MAC address; original-SAP; new-SAP).

17.21 mac-populate

mac-populate

Syntax **mac-populate** {*service-id* | **service** *service-name*} **mac** *ieee-address* [**flood**] [**age** *seconds*] [**force**] [**target-sap** *sap-id*]

Context **[Tree]** (oam mac-populate)

Full Context oam mac-populate

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command populates the FDB with an OAM-type MAC entry indicating the node is the egress node for the MAC address and optionally floods the OAM MAC association throughout the service. The **mac-populate** command installs an OAM MAC into the service FDB indicating the device is the egress node for a MAC address. The MAC address can be bound to a SAP (the **target-sap**) or can be associated with the control plane in that any data destined to the MAC address is forwarded to the control plane (CPM). As a result, if the service on the node has neither a FDB nor an egress SAP, then it is not allowed to initiate a **mac-populate**.

The MAC address that is populated in the FDBs in the provider network is given a type OAM, so that it can be treated distinctly from regular dynamically learned or statically configured MACs. Note that OAM MAC addresses are operational MAC addresses and are not saved in the device configuration. An exec file can be used to define OAM MACs after system initialization.

The **force** option in **mac-populate** forces the MAC in the table to be type OAM in the case it already exists as a dynamic, static or an OAM induced learned MAC with some other type binding.

An OAM-type MAC cannot be overwritten by dynamic learning and allows customer packets with the MAC to either ingress or egress the network while still using the OAM MAC entry.

The **flood** option causes each upstream node to learn the MAC (that is, populate the local FDB with an OAM MAC entry) and to flood the request along the data plane using the flooding domain. The flooded **mac-populate** request is sent via the data plane.

An **age** can be provided to age an OAM MAC using a specific interval. By default, OAM MAC addresses are not aged and can be removed with a **mac-purge** or with an FDB clear operation.

When split horizon group (SHG) is configured, the flooding domain depends on which SHG the packet originates from. The **target-sap** *sap-id* value dictates the originating SHG information.

Parameters *service-id* — Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647

service-name — Specifies the name of the service to diagnose or manage. 64 characters maximum.

ieee-address — Specifies the MAC address to be populated.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

flood — Sends the OAM MAC populate to all upstream nodes.

seconds — Specifies the age for the OAM MAC, in seconds, expressed as a decimal integer.

Values 1 to 65535

Default 3600

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

force — Converts the MAC to an OAM MAC.

sap-id — Specifies the local target SAP bound to a service on which to associate the OAM MAC. By default, the OAM MAC is associated with the control place, that is, it is associated with the CPU on the router.

When the **target-sap** *sap-id* value is not specified the MAC is bound to the CPM or CFM. The originating SHG is 0 (zero). When the **target-sap** *sap-id* value is specified, the originating SHG is the SHG of the target-sap.

17.24 mac-purge

mac-purge

Syntax **mac-purge** {*service-id* | **service** *service-name*} **target** *ieee-address* [**flood**] [**force**] [**register**]

Context **[Tree]** (oam mac-purge)

Full Context oam mac-purge

Description This command removes an OAM-type MAC entry from the FDB and optionally floods the OAM MAC removal throughout the service. A **mac-purge** can be sent via the forwarding path or via the control plane.

When sending the MAC purge using the data plane, the TTL in the VC label is set to 1.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A MAC address is purged only if it is marked as OAM. A mac-purge request is an HVPLS OAM packet, with the following fields. The Reply Flags is set to 0 (since no reply is expected), the Reply Mode and Reserved fields are set to 0. The Ethernet header has source set to the (system) MAC address, the destination set to the broadcast MAC address. There is a VPN TLV in the FEC Stack TLV to identify the service domain.

If the **register** option is provided, the R bit in the Address Delete flags is turned on.

The **flood** option causes each upstream node to be sent the OAM MAC delete request and to flood the request along the data plane using the flooding domain. The flooded **mac-purge** request is sent via the data plane.

The **register** option reserves the MAC for OAM testing where it is no longer an active MAC in the FDB for forwarding, but it is retained in the FDB as a registered OAM MAC. Registering an OAM MAC prevents relearns for the MAC based on customer packets. Relearning a registered MAC can only be done through a **mac-populate** request. The originating SHG is always 0 (zero).

Parameters *service-id* — Specifies the service ID of the service to diagnose or manage.

Values 1 to 2147483647

service-name — Specifies the name, up to 64 characters, of the service to diagnose or manage.

ieee-address — Specifies the MAC address to be purged.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

flood — Sends the OAM MAC purge to all upstream nodes.

force — Purges the entry regardless of the entry's originating node.

register — Reserves the MAC for OAM testing.

Platforms All

17.25 mac-refresh

mac-refresh

Syntax **mac-refresh** *refresh interval*
no mac-refresh

Context **[Tree]** (config>service>ipipe>sap mac-refresh)

Full Context configure service ipipe sap mac-refresh

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the interval between ARP requests sent on this Ipipe SAP. When the SAP is first enabled, an ARP request will be sent to the attached CE device and the received MAC address will be used in addressing unicast traffic to the CE. Although this MAC address will not expire while the Ipipe SAP is enabled and operational, it is verified by sending periodic ARP requests at the specified interval.

The **no** form of this command restores mac-refresh to the default value.

Default mac-refresh 14400

Parameters *refresh interval* — Specifies the interval, in seconds, between ARP requests sent on this Ipipe SAP.

Values 0 to 65535

Platforms All

17.26 mac-subnet-length

mac-subnet-length

Syntax **mac-subnet-length** *subnet-length*
no mac-subnet-length

Context **[Tree]** (config>service>vpls mac-subnet-length)

Full Context configure service vpls mac-subnet-length

Description This command specifies the number of bits to be considered when performing MAC learning (MAC source) and MAC switching (MAC destination). Specifically, this value identifies how many bits, starting from the beginning of the MAC address are used. For example, if the mask-value of 28 is used, MAC learning only performs a lookup for the first 28 bits of the source MAC address when comparing with existing FDB entries. Then, it installs the first 28 bits in the FDB while zeroing out the last 20 bits of the MAC address. When performing switching in the reverse direction, only the first 28 bits of the destination MAC address are used to perform a FDB lookup to determine the next hop.

The **no** form of this command switches back to full MAC lookup.

Default mac-subnet-length 48

Parameters *subnet-length* — Specifies the number of bits to be considered when performing MAC learning or MAC switching.

Values 24 to 48

Platforms All

Use subject to Terms available at: www.nokia.com

17.27 mac-trace

mac-trace

Syntax **mac-trace service** *service-id* **destination** *ieee-address* [**source** *ieee-address*] [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**min-ttl** *vc-label-ttl*] [**max-ttl** *vc-label-ttl*] [**probe-count** *send-count*] [**return-control**] [**interval** *interval*] [**timeout** *timeout*]

Context **[Tree]** (oam mac-trace)
[Tree] (config>saa>test>type mac-trace)

Full Context configure saa test type mac-trace
oam mac-trace

Description This command displays the hop-by-hop path for a destination MAC address within a VPLS.

The MAC traceroute operation is modeled after the IP traceroute utility which uses ICMP echo request and reply packets with increasing TTL values to determine the hop-by-hop route to a destination IP. The MAC traceroute command uses Nokia OAM packets with increasing TTL values to determine the hop-by-hop route to a destination MAC.

In a MAC traceroute, the originating device creates a MAC ping echo request packet for the MAC to be tested with increasing values of the TTL. The echo request packet is sent via the data plane and awaits a TTL exceeded response or the echo reply packet from the device with the destination MAC. The devices that reply to the echo request packets with the TTL exceeded and the echo reply are displayed.

When a **source** *ieee-address* value is specified and the source MAC address is locally registered within a split horizon group (SHG), then this SHG membership is used as if the packet originated from this SHG. In all other cases, SHG 0 (zero) is used. Note that if the **mac-ping** is originated from a non-zero SHG, such packets do not go out to the same SHG.

Parameters *service-id* — Specifies the service ID of the service to diagnose or manage.

This variant of the command is only supported in the classic configuration-mode (**configure system management-interface configuration-mode classic**).

Values {*id* | *svc-name*}

service-id: 1 to 2147483647
svc-name: up to 64 characters

destination *ieee-address* — Specifies the destination MAC address to be traced.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

source *ieee-address* — The source MAC address from which the OAM MAC request originates. By default, the system MAC address for the chassis is used.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx
All zeros and multicast is not allowed.

Default The system MAC address

fc-name — Specifies the forwarding class to test the forwarding class of the ICMP echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile state of the ICMP echo request encapsulation.

Default out

octets — Specifies the MAC OAM request packet size in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6 byte PAD header and a byte payload of 0xAA as necessary. If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9198

min-ttl *vc-label-ttl* — Specifies the minimum TTL value in the VC label for the MAC trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-ttl *vc-label-ttl* — Specifies the maximum TTL value in the VC label for the MAC trace test, expressed as a decimal integer.

Values 1 to 255

Default 4

send-count — Specifies the number of MAC OAM requests sent for a TTL value, expressed as a decimal integer.

Values 1 to 100

Default 1

return-control — Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane.

interval — Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 5

17.31 magic-number

magic-number

Syntax [**no**] **magic-number**

Context **[Tree]** (config>port>ml-bundle>mlppp magic-number)

Full Context configure port multilink-bundle mlppp magic-number

Description This command allows loopback detection to be enabled and disabled for MLPPP bundles. It is disabled by default. When the magic number option is disabled, the magic number option will not be requested when a member is trying to bring up the LCP layer on a member link; if the remote peer requests this option, it will be rejected. When transmitting echo-requests a magic number of 0 is used. When responding to echo-requests a magic number of 0 is sent.

The magic number option is sent to the remote peer during protocol negotiation. If this option is rejected by the remote peer, the router will bring the link up but will be unable to detect loopbacks since the router will always send a magic number of 0 in the echo messages. If this option is accepted by the remote peer, the router will send echo messages with randomly generated magic-numbers. If the SR receives a config-req with the same magic number that was sent out, the router will calculate a new magic number to use and send out another config-request. If the router is persistently seeing the randomly generated magic number in the received config-req, the router will declare a loopback.

The **no** form of this command disables the loopback detection.

Default no magic-number

Platforms 7450 ESS, 7750 SR-7/12/12e

17.32 main-ct-retry-limit

main-ct-retry-limit

Syntax **main-ct-retry-limit** *number*
no main-ct-retry-limit

Context **[Tree]** (config>router>mpls>lsp main-ct-retry-limit)
[Tree] (config>router>mpls>lsp-template main-ct-retry-limit)

Full Context configure router mpls lsp main-ct-retry-limit
configure router mpls lsp-template main-ct-retry-limit

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the maximum number of retries the LSP primary path should be retried with the LSP Diff-Serv main Class Type (CT).

When an unmapped LSP primary path goes into retry, it uses the main CT until the number of retries reaches the value of the new main-ct-retry-limit parameter. If the path did not come up, it must start using the backup CT at that point in time. By default, this parameter is set to infinite value. The new main-ct-retry-limit parameter has no effect on an LSP primary path which retries due to a failure event.

An unmapped LSP primary path is a path which has never received a Resv in response to the first Path message sent. This can occur when performing a “shut/no-shut” on the LSP or LSP primary path or when the node reboots. An unmapped LSP primary path goes into retry if the retry timer expired or the head-end node received a PathErr message before the retry timer expired.

If the user entered a value of the main-ct-retry-limit parameter that is greater than the value of the LSP retry-limit, the number of retries will still stop when the LSP primary path reaches the value of the LSP retry-limit. In other words, the meaning of the LSP retry-limit parameter is not changed and always represents the upper bound on the number of retries. The unmapped LSP primary path behavior applies to both CSPF and non-CSPF LSPs.

The **no** form of this command sets the parameter to the default value of zero (0) which means the LSP primary path will retry forever.

Default no main-ct-retry-limit

Parameters *number* — Specifies the number of times MPLS will attempt to re-establish the LSP primary path using the Diff-Serv main CT. Allowed values are integers in the range of zero (0) to 10,000, where zero indicates to retry infinitely.

Values 0 to 1000, integer

Platforms All

17.33 maintenance-policy

maintenance-policy

Syntax [**no**] **maintenance-policy** *maintenance-policy-name*

Context **[Tree]** (config>router>segment-routing maintenance-policy)

Full Context configure router segment-routing maintenance-policy

Description This command configures a named maintenance policy that can be applied to SR Policy candidate paths that are either statically configured or imported via BGP. A maintenance policy is used to configure seamless BFD and protection for an SR Policy candidate path.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A maintenance policy must be administratively disabled in order to change any of the parameters.

A maintenance policy cannot be enabled unless a **mode**, **bfd-enable**, and **bfd-template** are configured.

If a maintenance-template is administratively disabled, then all candidate paths to which it is applied are deprogrammed from the data path.

The **no** form of this command removes the specified maintenance policy.

Parameters *maintenance-policy-name* — Specifies the name of the maintenance policy, up to 32 characters and cannot start with a space or underscore.

Platforms All

maintenance-policy

Syntax [**no**] **maintenance-policy** *maintenance-policy-name*

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy maintenance-policy)

Full Context configure router segment-routing sr-policies static-policy maintenance-policy

Description This command applies a named maintenance policy to the static SR policy path. The maintenance policy must exist under the **config**>**router**>**segment-routing** context.

The **no** form of this command removes the specified maintenance policy.

Parameters *maintenance-policy-name* — Specifies the name of the maintenance policy, up to 32 characters and cannot start with a space or underscore.

17.35 managed-routes

managed-routes

Syntax **managed-routes**

Context **[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host managed-routes)
[Tree] (config>service>vprn>sub-if>grp-if>sap>static-host managed-routes)

Full Context configure service ies subscriber-interface group-interface sap static-host managed-routes
configure service vprn subscriber-interface group-interface sap static-host managed-routes

Description Commands in this context configure managed route parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.36 managed-vlan-list

managed-vlan-list

Syntax **managed-vlan-list**

Context **[Tree]** (config>service>vpls>sap managed-vlan-list)

Full Context configure service vpls sap managed-vlan-list

Description Commands in this context configure VLAN ranges to be managed by a management VPLS. The list indicates, for each SAP, the ranges of associated VLANs that will be affected when the SAP changes state. This managed-vlan-list is not used when STP mode is MSTP in which case the vlan-range is taken from the **config>service>vpls>stp>msti** configuration.

This command is only valid when the VPLS in which it is entered was created as a management VPLS.

Platforms All

17.37 management

management

Syntax **management** [**create**]

Use subject to Terms available at: www.nokia.com

no management

Context [Tree] (config>service>vprn management)

Full Context configure service vprn management

Description Commands in this context configure node management within the VPRN.

Parameters **create** — Creates a management server entry.

Platforms All

management

Syntax **management**

Context [Tree] (config>system>security management)

Full Context configure system security management

Description Commands in this context allow access to management servers.

Platforms All

17.38 management-access-filter

management-access-filter

Syntax [**no**] **management-access-filter**

Context [Tree] (config>system>security management-access-filter)

Full Context configure system security management-access-filter

Description This command creates the context to edit management access filters and to reset match criteria.

Management access filters control all traffic in and out of the CPM. They can be used to restrict management of the router by other nodes outside either specific (sub)networks or through designated ports.

Management filters, as opposed to other traffic filters, are enforced by system software.

The **no** form of this command removes management access filters from the configuration.

17.39 management-interface

management-interface

Syntax **management-interface**

Context **[Tree]** (config>system management-interface)

Full Context configure system management-interface

Description Commands in this context configure management interface parameters.

Platforms All

management-interface

Syntax **management-interface**

Context **[Tree]** (config>system>security management-interface)

Full Context configure system security management-interface

Description Commands in this context configure the selection of a management interface for hash configuration. The management interfaces are **classic-cli**, **md-cli**, **netconf**, or **grpc**.

Platforms All

17.40 manager

manager

Syntax **manager** *manager-name* [**create**]
no manager *manager-name*

Context **[Tree]** (config>system>management-interface>remote-management manager)

Full Context configure system management-interface remote-management manager

Description This command configures a name for the manager. This name identifies the specified SR OS node in the network.

The **no** form of this command removes the remote manager configuration.

Default system-name

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *manager-name* — Specifies the name of the remote manager, up to 32 characters.

Platforms All

17.41 manager-address

manager-address

Syntax **manager-address** *ip-address* | *fqdn*
no manager-address

Context **[Tree]** (config>system>management-interface>remote-management>manager manager-address)

Full Context configure system management-interface remote-management manager manager-address

Description This command configures the destination IP address or FQDN of the manager.

The no form of this command removes the configured IP address or FQDN of the configured manager.

Parameters *ip-address* — Specifies the IP address, up to 255 characters.

fqdn — Specifies the FQDN, up to 255 characters.

Platforms All

17.42 manager-port

manager-port

Syntax **manager-port** *port*
no manager-port

Context **[Tree]** (config>system>management-interface>remote-management>manager manager-port)

Full Context configure system management-interface remote-management manager manager-port

Description This command assigns a destination TCP port to be used for opening gRPC connections to the specified remote manager.

The **no** form of this command reverts the destination TCP port for the remote manager to the default gRPC port (57400).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *port* — Specifies the TCP destination port.

Values 1 to 65535

Default 57400

Platforms All

17.43 manual

manual

Syntax **manual**

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg>service-carving manual)

Full Context configure service system bgp-evpn ethernet-segment service-carving manual

Description Commands in this context manually configure the service-carving algorithm, that is, configure the EVIs or ISIDs for which the PE is DF.

Platforms All

17.44 manual-keying

manual-keying

Syntax [**no**] **manual-keying**

Context **[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel manual-keying)

- configure router interface ipsec ipsec-tunnel manual-keying
- configure service vprn interface ipsec ipsec-tunnel manual-keying

17.45 map

map

Syntax **map start** *lsn-sub-address* **end** *lsn-sub-address* **to** *outside-ip-address*
no map start *lsn-sub-address* **end** *lsn-sub-address*

Context **[Tree]** (config>service>vprn>nat>inside>deterministic>prefix map)
[Tree] (config>router>nat>inside>deterministic>prefix map)

Full Context configure router nat inside deterministic prefix map
configure service vprn nat inside deterministic prefix map

Description This command is applicable to prefixes in deterministic NAT (LSN44 and DS-Lite) and static 1:1 NAT (LSN44). In deterministic NAT, its purpose is to split the number of subscribers within the configured prefix over available sequence of outside IP addresses. In static 1:1 NAT, its purpose it to statically map source IPv4 address of an LSN44 subscriber to a configured IPv4 address on the public side.

In deterministic NAT, there are several rules guiding the usage of the map statement:

- If the number of subscribers per configured prefix is greater than the subscriber-limit per outside IP parameter (2^n), then the lowest n bits of the map start <i*nside-addr-start*> must be set to 0.

  Subscriber in LSN44 is equals to an inside IPv4 address, while in DS-Lite, the subscriber can be an IPv6 address or IPv6 prefix. If the **subscriber-prefix-length** command is set to 128, then the subscriber in DS-Lite is an IPv6 address. Otherwise it will be an IPv6 prefix with length in the range [32 to 64] as set by the **subscriber-prefix-length** command.
- If the number of subscribers per configured prefix is equal or less than the subscriber-limit per outside IP parameter (2^n), then only one map command for this prefix is allowed. In this case there is no restriction on the lower n bits of the map start *lsn-sub-address*. The range of the inside IP addresses in such map statement represents the prefix itself.
- *outside-ip-address* in the map statements must be unique amongst all map statements referencing the same pool. In other words, two map statements cannot reference the same *outside-ip-address* in a pool.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To modify map statements in classic CLI, the corresponding prefix must be in a shutdown mode.

In classic CLI, **map** statements can be configured automatically by the system, as soon as the prefix is enabled (no shutdown state) or they can be configured manually by the operator while the prefix is disabled.

In MD-CLI, the **map** statement must be configured by the operator, but the t**ools perform nat deterministic calculate-maps** command can be used to produce system-generated maps. The **calculate-maps** command outputs a set of system-generated map statements. The **map** parameters can then be copied and pasted into an MD-CLI candidate configuration by the operator.

The following is an example of the map statement for the LSN44 case:

- The subscriber-limit in the pool is 128
- The pool has an address range 192.168.0.1 - 192.168.0.10
- The prefix is 10.0.0.0/24
- The map statement is configured as:

  map start 10.0.0.0 end 10.0.0.255 to 192.168.0.1

Since each outside IP address can accommodate only 128 hosts, the subscribers (IPv4 addresses in LSN44) from the 10.0.0.0/24 prefix will be split and mapped into two outside IP addresses

10.0.0.0 – 10.0.0.127 (10.0.0.0/25) - 192.168.0.1

10.0.0.128 – 10.0.0.255 (10.0.0.128/25) - 192.168.0.2

The first IP address range will be mapped to the ‘to’ address in the map statement => 192.168.0.1. The second IP address range will be mapped into the next consecutive IP address in the pool assuming that this IP address is free. In this case this consecutive address (192.168.0,2) would not be shown in the map statement.

For Deterministic DS-Lite, the example would be:

- The subscriber-limit in the pool is 128
- The pool has an address range 192.168.0.1 - 192.168.0.10
- The prefix is 2001:db8::/56
- The subscriber-prefix-length = 64
- The map statement is configured as:

  map start 2001:db8::/64 end 2001:db8::FF:0:0:0:0/64 to 192.168.0.1

There are 256 DS-Lite subscribers within the 2001:db8::/56 prefix. Each subscriber will be a /64 IPv6 prefix as dictated by the subscriber-prefix-length command.

Since each outside IP address can accommodate only 128 hosts, the subscribers from the 2001:db8::/56 prefix will be split and mapped into two outside IP addresses

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

2001:db8:: – 2001:db8:0:7F:: (2001:db8::/57) - 192.168.0.1

2001:db8:0:80:: – 2001:db8:0:FF::(2001:db8:0:FF::/57) - 192.168.0.2

The first IP prefix range will be mapped to the 'to' address in the map statement => 192.168.0.1. The second IP prefix range will be mapped into the next consecutive IP address in the pool assuming that this IP address is free. In this case this consecutive address (192.168.0,2) would not be shown in the map statement.

Default By default in classic CLI only, the system will automatically divide the prefix and create the map statements when the prefix command is enabled (no shutdown). However, this automatic map provisioning can be overruled by manual configuration in classic CLI, and must be provided in MD-CLI..

Parameters *inside-ip-start* — Start IPv4/v6 address or IPv6 prefix on the inside.

inside-ip-end — End IPv4/v6 address or IPv6 prefix on the inside. The number of subscribers (range of inside IPv4 addresses in LSN44 or IPv6 addresses or prefixes in DS-Lite) in the map statement does not have to be a power of 2. Rather it has to be a multiple of a power of two ? m * 2^n, where m is the number of consecutive outside IP addresses to which the subscribers are mapped and the 2^n is the subscriber-limit per outside IP.

outside-ip-start — The first outside IPv4 address in the pool to which the subscribers are mapped. In case that the number of subscribers in the map statement is larger than the subscriber-limit for the *outside-ip address*, the consecutive outside IP addresses will be used for additional mappings. Those additional (consecutive) outside IP addresses are not shown in the map statement (only the first address is shown in the map statement).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

map

Syntax [**no**] **map**

Context **[Tree]** (config>service>nat>pcp-server-policy>opcode map)

Full Context configure service nat pcp-server-policy opcode map

Description This command enables/disables support for the **map** opcode.

Default no map

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

17.46 map-domain

map-domain

Syntax **map-domain** *domain-name* [**create**]
no map-domain

Context **[Tree]** (config>service>nat map-domain)

Full Context configure service nat map-domain

Description This command creates a MAP domain template, which is used to define MAP rules and parameters specific to the MAP domain. A MAP domain represents a set of CEs that share the same default gateway (BR's IPv6 prefix - DMR rule) and a set of basic MAP rules (BMRs). As a bordering node between the IPv6 and IPv4 realm, the BR performs stateless IPv4 and IPv6 translation based on MAP rules.

A MAP domain can be instantiated within a routing context by referencing an existing MAP domain template in the context.

Parameters *domain-name* — Specifies the name of the MAP domain, up to 32 characters. The MAP domain name has local significance.

Platforms VSR

map-domain

Syntax **map-domain** *domain-name*
no map-domain *domain-name*

Context **[Tree]** (config>service>vprn>nat>map map-domain)
[Tree] (config>router>nat>map map-domain)

Full Context configure router nat map map-domain
configure service vprn nat map map-domain

Description This command instantiates a MAP-T domain within a routing context, assuming that the MAP-T domain template is administratively enabled (**no shutdown**). When the MAP-T is instantiated, the forwarding for the MAP-T domain is enabled and its routes can be exported in routing protocols.

Multiple MAP-T domains can be instantiated within a routing context.

Interactions:

The referenced MAP domain is defined under the **config**>**service**>**nat** hierarchy.

Parameters *domain-name* — Specifies the name of the MAP domain template, up to 32 characters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms VSR

17.47 mapping

mapping

Syntax **mapping** *mapping*

Context **[Tree]** (config>port>tdm>ds3>atm mapping)

Full Context configure port tdm ds3 atm mapping

Description This command configures the ATM cell mapping for DS-3 channels. The mapping value specifies the cell mapping that is to be used on this ATM interface.

Default mapping direct

Parameters *mapping* — The mapping value specifies the cell mapping that is to be used on this ATM interface.

Values direct — Specifies direct cell mapping. plcp — Specifies PLCP cell mapping.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

17.48 mapping-limit

mapping-limit

Syntax **mapping-limit** *limit*
no mapping-limit

Context **[Tree]** (config>service>upnp>upnp-policy mapping-limit)

Full Context configure service upnp upnp-policy mapping-limit

Description This command specifies the maximum number of UPnP mapping per subscriber.

The **no** form of the command reverts to the default.

Default mapping-limit 256

Parameters *limit* — Specifies the upper limit of the number of UPnP mappings per subscriber.

Values 1 to 256

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.49 mapping-rule

mapping-rule

Syntax **mapping-rule** *map-rule-name* [**create**]
no mapping-rule *map-rule-name*

Context **[Tree]** (config>service>nat>map-domain mapping-rule)

Full Context configure service nat map-domain mapping-rule

Description This command provides a CLI context for configuring MAP rules.

Parameters *map-rule-name* — Specifies the name of the MAP rule; the name has a local significance.

Platforms VSR

17.50 mapping-server

mapping-server

Syntax [**no**] **mapping-server**

Context **[Tree]** (config>router>isis>segment-routing mapping-server)

Full Context configure router isis segment-routing mapping-server

Description Commands in this context configures the Segment Routing mapping server feature in an IS-IS instance.

SR mapping server enables the configuration and advertisement, via IS-IS, of the node SID index for IS-IS prefixes of routers which are in the LDP domain. This is performed in the router acting as a mapping server, which uses a prefix-SID sub-TLV within the SID/Label binding TLV in IS-IS.

The **no** form of this command deletes all node SID entries in the IS-IS instance.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mapping-server

Syntax [**no**] **mapping-server**

Context **[Tree]** (config>router>ospf>segm-rtng mapping-server)

Full Context configure router ospf segment-routing mapping-server

Description Commands in this context configure the Segment Routing mapping server feature in an OSPF instance.

The mapping server feature allows the configuration and advertisement in OSPF of the node SID index for OSPF prefixes of routers which are in the LDP domain. This is performed in the router acting as a mapping server and using a prefix-SID sub-TLV within the Extended Prefix Range TLV in OSPF.

The **no** form of this command deletes all node SID entries in the OSPF instance.

Platforms All

17.51 maps-to

maps-to

Syntax **maps-to fc** *fc-name* **profile** *profile*

Context **[Tree]** (config>qos>post-policer-mapping>fc maps-to)

Full Context configure qos post-policer-mapping fc maps-to

Description This command remaps the forwarding class and profile state of an egress policed packet that is to be mapped to another forwarding class and profile, where the profile state is that of the resulting profile after the packet has been processed by the egress policer.

The new forwarding class is used to select the egress queue on which the post-policer traffic is placed. The new profile is used to determine the congestion control handling in that queue, specifically the drop tail or slope that is applied to the traffic.

The **maps-to** command parameters can be overwritten by reissuing the command with a different FC or profile.

The traffic remarking is based on the marking configured for the forwarding class and profile of the traffic after being policed but before it is remapped.

Parameters *fc-name* — Specifies one of the eight forwarding classes supported by the system.

Values be, l2, af, l1, h2, ef, h1, nc

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

profile — Specifies one of the egress packet profile states.

Values exceed, in, inplus, out

17.52 mark

mark

Syntax **mark** *entity* **high** *percentage-high* **low** *percentage-low*
no mark *entity*

Context **[Tree]** (config>isa>wlan-gw-group>watermarks mark)

Full Context configure isa wlan-gw-group watermarks mark

Description This command enables a watermark notification. If the watermark is set, it generates a notification when the corresponding resource consumption goes above the high percentage. No additional notifications are sent until resource consumption goes under the low watermark, upon which, a notification is sent indicating the high watermark is no longer hit.

The **no** form of this command disables the watermark notification.

Parameters *entity* — Specifies which watermark to set.

Values user-equipment | bridge-domain | radius-proxy-client

percentage-high — Specifies the high watermark in percentage of total resources available.

Values 1 to 100

percentage-low — Specifies the low watermark in percentage of total resources available.

Values 0 to 99

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.53 mask

mask

Syntax **mask type** *match-type* {[**prefix-string** *prefix-string* | **prefix-length** *prefix-length*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[**suffix-string** *suffix-string* | **suffix-length** *suffix-length*]}
no mask type *match-type*
mask type *dhcp-match-type* {[**prefix-string** *prefix-string* | **prefix-length** *prefix-length*]
[**suffix-string** *suffix-string* | **suffix-length** *suffix-length*]}
no mask type *dhcp-match-type*

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp mask)
[Tree] (config>subscr-mgmt>loc-user-db>ipoe mask)

Full Context configure subscriber-mgmt local-user-db ipoe mask
configure subscriber-mgmt local-user-db ppp mask

Description This command configures the IPoE mask.

The **no** form of this command removes the mask parameters from the configuration.

Parameters *ppp-match-type* — Specifies the sub-option inserted by the PPPoE intermediate agent.

Values circuit-id, remote-id, sap-id, service-name, username

dhcp-match-type — The data type represents the type of matching done to identify a DHCP host.

Values circuit-id, option60, remote-id, sap-id, string, system-id

prefix-string — Specifies a substring that is stripped of the start of the incoming circuit ID before it is matched against the value configured in the DHCP or PPPoE circuit ID.

This string can only contain printable ASCII characters. The “*” character is a wildcard that matches any substring. If a "\" character is masked, use the escape key so it becomes "\\".

Values up to 127 characters, “*”

prefix-length — Specifies the number of characters to remove from the start of the incoming circuit ID before it is matched against the value configured in the circuit ID.

Values 1 to 127

suffix-string — Specifies a substring that is stripped of the end of the incoming circuit ID before it is matched against the value configured in circuit ID.

This string can only contain printable ASCII characters. The “*” character is a wildcard that matches any substring. If a "\" character is masked, use the escape key so it becomes "\\".

Values up to 127 characters

suffix-length — Specifies the number of characters to remove from the end of the incoming circuit ID before it is matched against the value configured in the circuit ID.

Values 1 to 127

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mask

Syntax **mask** *mask-value* [**type** {**included** | **excluded**}]
no mask

Context **[Tree]** (config>system>security>snmp>view>view-name mask)

Full Context configure system security snmp view view-name mask

Description The mask value and the mask type, along with the *oid-value* configured in the **view** command, determines the access of each sub-identifier of an object identifier (MIB subtree) in the view.

Each bit in the mask corresponds to a sub-identifier position. For example, the most significant bit for the first sub-identifier, the next most significant bit for the second sub-identifier, and so on. If the bit position on the sub-identifier is available, it can be included or excluded.

For example, the MIB subtree that represents MIB-II is 1.3.6.1.2.1. The mask that catches all MIB-II would be 0xfc or 0b11111100.

Only a single mask may be configured per view and OID value combination. If more than one entry is configured, each subsequent entry overwrites the previous entry.

The **no** form of this command removes the mask from the configuration.

Parameters *mask-value* — The mask value associated with the OID value determines whether the sub-identifiers are included or excluded from the view. (Default: all 1s)

The mask can be entered either:

- In hex. For example, 0xfc.
- In binary. For example, 0b11111100.

Note: If the number of bits in the bit mask is less than the number of sub-identifiers in the MIB subtree, then the mask is extended with ones until the mask length matches the number of sub-identifiers in the MIB subtree.

type — Specifies to include or exclude MIB subtree objects.

Values **included** - All MIB subtree objects that are identified with a 1 in the mask are available in the view.

excluded - All MIB subtree objects that are identified with a 1 in the mask are denied access in the view.

Default **included**

17.54 mask-reply

mask-reply

Syntax [**no**] **mask-reply**

Context **[Tree]** (config>service>ies>if>icmp mask-reply)
[Tree] (config>service>ies>sub-if>grp-if mask-reply)
[Tree] (config>service>vprn>if mask-reply)
[Tree] (config>service>vprn>if>icmp mask-reply)
[Tree] (config>service>vprn>nw-if>icmp mask-reply)

Full Context configure service ies interface icmp mask-reply
configure service ies subscriber-interface group-interface mask-reply
configure service vprn interface icmp mask-reply
configure service vprn interface mask-reply
configure service vprn network-interface icmp mask-reply

Description This command enables responses to Internet Control Message Protocol (ICMP) mask requests on the router interface.

If a local node sends an ICMP mask request to the router interface, the **mask-reply** command configures the router interface to reply to the request.

By default, the router instance replies to mask requests.

The **no** form of this command disables replies to ICMP mask requests on the router interface.

Default mask-reply — Specifies to reply to ICMP mask requests.

Platforms All

mask-reply

Syntax [**no**] **mask-reply**

Context **[Tree]** (config>subscr-mgmt>git>ipv4>icmp mask-reply)

Full Context configure subscriber-mgmt group-interface-template ipv4 icmp mask-reply

Description This command enables responses to ICMP mask requests on the router interface. If a local node sends an ICMP mask request to the router interface, the router interface replies to the request.

By default, the router instance replies to mask requests.

The **no** form of this command disables replies to ICMP mask requests on the router interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default mask-reply

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mask-reply

Syntax [**no**] **mask-reply**

Context **[Tree]** (config>router>if>icmp mask-reply)

Full Context configure router interface icmp mask-reply

Description This command enables responses to ICMP mask requests on the router interface.

If a local node sends an ICMP mask request to the router interface, the **mask-reply** command configures the router interface to reply to the request.

The **no** form of this command disables replies to ICMP mask requests on the router interface.

Default mask-reply — Replies to ICMP mask requests.

Description This command allows the master instance to dictate the master down timer (non-owner context only).

Default no master-int-inherit

Platforms All

master-int-inherit

Syntax [**no**] **master-int-inherit**

Context **[Tree]** (config>router>if>vrrp master-int-inherit)
[Tree] (config>router>if>ipv6>vrrp master-int-inherit)

Full Context configure router interface ipv6 vrrp master-int-inherit
configure router interface vrrp master-int-inherit

Description This command enables the virtual router instance to inherit the master VRRP router's advertisement interval timer which is used by backup routers to calculate the master down timer.

The **master-int-inherit** command is only available in the non-owner nodal context and is used to allow the current virtual router instance master to dictate the master down timer for all backup virtual routers. The **master-int-inherit** command has no effect when the virtual router instance is operating as master.

If **master-int-inherit** is not enabled, the locally configured **message-interval** must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command restores the default operating condition which requires the locally configured **message-interval** to match the received VRRP advertisement message advertisement interval field value.

Default no master-int-inherit — The virtual router instance does not inherit the master VRRP router's advertisement interval timer and uses the locally configured message interval.

Platforms All

17.56 master-only

master-only

Syntax **master-only** {**true** | **false**}

Context **[Tree]** (config>system>ptp>port master-only)

Full Context configure system ptp port master-only

Description This command is used to restrict the local port to never enter the slave state. Use the command to ensure that the 7750 SR never draws synchronization from the attached external device.

This parameter is only effective when the profile is set to g8275dot1-2014.

Note: The ITU-T G.8275.1 (07/2014) recommendation used the term notSlave for this functionality; however, the IEEE has added this capability into the next edition of the 1588 standard using the term masterOnly. These are equivalent.

Default master-only true

Parameters **true** — Enables the **master-only** parameter of the PTP port.

false — Disables the **master-only** parameter of the PTP port.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.57 master-selection-mode

master-selection-mode

Syntax **master-selection-mode** *mode*

Context **[Tree]** (config>app-assure>aarp master-selection-mode)

Full Context configure application-assurance aarp master-selection-mode

Description This command configures the AARP mode of operation with the peer instance. The modes affect the AARP state machine behavior according to the desired behavior. Minimize-switchover will change AARP state based on Master ISA failure, and be non-revertive in that when the priority ISA returns a switch does not occur, which is optimal for AA flow identification. Inter-chassis efficiency mode considers both priority (revertive) and the endpoint status of the AARP instance and will switch activity in case of EP failure in order to avoid sending all the traffic over the ICL. The priority-based-balance mode will be revertive after a priority master returns to service, but excludes EP status. The master-selection-mode configuration must match on both peer AARP instances, or the AARP operational status will stay down.

Default master-selection-mode minimize-switchovers

Parameters *mode* — Specifies the AARP master selection mode.

Values **minimize-switchovers** — Optimal AA flow detection continuity by minimizing AARP switchovers.

inter-chassis-efficiency — Minimizes inter-chassis traffic.

priority-based-balance — AA load balance between AARP peers based on configured priority.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache match

Description This command specifies in what DHCPv6 option to retrieve the value to be used as lookup key in the RADIUS proxy cache.

The **no** form of this command reverts to the default.

Default match mac

Parameters **circuit-id** — Specifies to use the circuit Id to match against.

mac — Specifies the MAC address to match against.

remote-id — Specifies the remote ID to match against.

option *number* — Specifies the option number that the DHCP server uses to send the identification strings to the client.

Values 1 to 254

option6 *number* — Specifies the DHCPv6 option to retrieve the value to be used as lookup key in the RADIUS proxy cache.

Values 1 to 65535

match

Syntax **match protocol** {**any** | **icmp** | **tcp** | **udp** | **gre**}
no match

Context **[Tree]** (config>subscr-mgmt>isa-filter>ipv6>entry match)

Full Context configure subscriber-mgmt isa-filter ipv6 entry match

Description This command creates a match context for this entry. The **protocol** value specifies which Layer-4 protocol the packet should match.

The **no** form of this command removes the match context of this entry.

Default match protocol any

Parameters *protocol* — Specifies that the only supported match context is **protocol**.

any — Specifies to match any protocol.

icmp — Specifies to match ICMP packets in a v4 filter.

tcp — Specifies to match TCP packets.

udp — Specifies to match UDP packets.

gre — Specifies to match GRE over IP packets.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

match

Syntax [**no**] **match**

Context **[Tree]** (config>service>mrp>mrp-policy>entry match)

Full Context configure service mrp mrp-policy entry match

Description This command creates the context for entering/editing match criteria for the mrp-policy entry. When the match criteria have been satisfied the action associated with the match criteria is executed. In the current implementation just one match criteria (ISID based) is possible in the entry associated with the mrp-policy. Only one match statement can be entered per entry.

The **no** form of this command removes the match criteria for the entry-id.

Platforms All

Use subject to Terms available at: www.nokia.com

match

Syntax **match**

Context **[Tree]** (config>service>vprn>bgp>group>dynamic-neighbor match)

Full Context configure service vprn bgp group dynamic-neighbor match

Description This command configures match conditions for the dynamic neighbors.

Platforms All

match

Syntax [**no**] **match**

Context **[Tree]** (config>service>vprn>log>filter>entry match)

Full Context configure service vprn log filter entry match

Description This command creates context to enter/edit match criteria for a filter entry. When the match criteria is satisfied, the action associated with the entry is executed.

If more than one match parameter (within one match statement) is specified, then all the criteria must be satisfied (AND functional) before the action associated with the match is executed.

Use the **match** command to display a list of the valid applications.

Match context can consist of multiple match parameters (application, event-number, severity, subject), but multiple **match** statements cannot be entered per entry.

The **no** form of this command removes the match criteria for the *entry-id*.

Default no match

Platforms All

match

Syntax **match**

Context **[Tree]** (config>app-assure>group>policy>aqp>entry match)

Full Context configure application-assurance group policy app-qos-policy entry match

Description Commands in this context configure flow match rules for this AQP entry. A flow matches this AQP entry only if it matches all the match rules defined (logical and of all rules). If no match rule is specified, the entry will match all flows.

match

Syntax **match protocol** *ip-protocol*
no match

Context **[Tree]** (config>service>nat>nat-classifier>entry match)

Full Context configure service nat nat-classifier entry match

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures an IP protocol to be used as a nat-classifier match criterion. When the match criteria have been satisfied the action associated with the match criteria is executed.

The **no** form of the command removes the match criteria for the entry-id.

Default match protocol udp

Parameters **protocol** *ip-protocol* — Specifies the text value representing the IP protocol to be used as a match criterion.

Values udp, tcp

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

match

Syntax **match** [**frame-type** *frame-type*]
no match

Context **[Tree]** (config>li>li-filter>li-mac-filter>entry match)

Full Context configure li li-filter li-mac-filter entry match

Description Commands in this context configure match criteria for the filter entry and specifies an Ethernet frame type for the entry.

If more than one match criteria (within one match statement) are configured then all criteria must be satisfied (and function) for a match to occur.

A match context may consist of multiple match criteria, but multiple match statements cannot be entered per entry.

The **no** form of this command removes the match criteria for the entry.

Parameters *frame-type* — Filters can continue to be edited by all users even when an li-source references an entry in that filter.

Values 802dot3, 802dot2-llc, 802dot2-snap, ethernet_II

Default 802dot3

Platforms All

match

Syntax **match** [**protocol** *protocol-id*]
no match

Context **[Tree]** (config>li>li-filter>li-ip-filter>entry match)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure li li-filter li-ip-filter entry match

Description This command enables context to enter match criteria for LI IPv4 filter and optionally allows specifying protocol value to match on.

If more than one match criterion are configured then all criteria must be satisfied for a match to occur (logical “AND”). Multiple criteria must be configured within a single match context for a given entry.

The **no** form of this command removes the match criteria for the entry.

Parameters *protocol-id* — Configures the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP(1), TCP(6), UDP(17).

Values 0 to 255 (values can be expressed in decimal, hexadecimal, or binary - DHB)

Keywords for the 7750 SR:

none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

Keywords for the 7450 ESS:

none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

* — udp/tcp wildcard

Protocol	Protocol ID	Description
icmp	1	Internet Control Message
igmp	2	Internet Group Management
ip	4	IP in IP (encapsulation)
tcp	6	Transmission Control
egp	8	Exterior Gateway Protocol
igp	9	Any private interior gateway (used by Cisco for IGRP)
udp	17	User Datagram
rdp	27	Reliable Data Protocol
ipv6	41	IPv6
ipv6-route	43	Routing Header for IPv6
ipv6-frag	44	Fragment Header for IPv6
idrp	45	Inter-Domain Routing Protocol
rsvp	46	Reservation Protocol
gre	47	General Routing Encapsulation

Platforms All

match

Syntax **match** [**next-header** *next-header*]
no match

Context **[Tree]** (config>li>li-filter>li-ipv6-filter>entry match)

Full Context configure li li-filter li-ipv6-filter entry match

Description Commands in this context enter match criteria for an LI IPv6 filter and optionally allows specification IPv6 next-header value to match on.

If more than one match criterion are configured, then all criteria must be satisfied for a match to occur (logical “AND”). Multiple criteria must be configured within a single match context for a given entry.

The **no** form removes the match criteria for the entry.

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the IPv6 next header to match. This parameter is analogous to the protocol parameter used in IP filter match criteria.

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

match

Syntax **match** [**protocol** *protocol-id*]
no match

Context **[Tree]** (config>qos>sap-egress>ip-criteria>entry match)
[Tree] (config>qos>sap-ingress>ip-criteria>entry match)

Full Context configure qos sap-egress ip-criteria entry match
configure qos sap-ingress ip-criteria entry match

Description This command creates a context to configure match criteria for SAP QoS policy match criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (AND function) before the action associated with the match is executed.

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

It is possible that a SAP policy includes the **dscp** map command, the **dot1p** map command, and an IP match criteria. When multiple matches occur for the traffic, the order of precedence is used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters **protocol** *protocol-id* — Specifies an IP protocol to be used as a SAP QoS policy match criterion.

The protocol type such as TCP / UDP / OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), UDP(17)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 80 lists the IP protocols and their respective IDs and descriptions.

Values The following values apply to the 7750 SR and 7950 XRS:

protocol-id: 0 to 255 protocol numbers accepted in decimal, hexadecimal, or binary

keywords: none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

Values The following values apply to the 7450 ESS:

keywords: none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

* — udp/tcp wildcard

Table 80 **IP Protocol Names**

Protocol	Protocol ID	Description
icmp	1	Internet Control Message
igmp	2	Internet Group Management
ip	4	IP in IP (encapsulation)
tcp	6	Transmission Control
egp	8	Exterior Gateway Protocol
igp	9	Any private interior gateway (used by Cisco for their IGRP)
udp	17	User Datagram
rdp	27	Reliable Data Protocol
ipv6	41	IPv6
ipv6-route	43	Routing Header for IPv6
ipv6-frag	44	Fragment Header for IPv6
idrp	45	Inter-Domain Routing Protocol
rsvp	46	Reservation Protocol
gre	47	General Routing Encapsulation
ipv6-icmp	58	ICMP for IPv6
ipv6-no-nxt	59	No Next Header for IPv6

match

Syntax **match** [**next-header** *next-header*]
no match

Context **[Tree]** (config>qos>sap-ingress>ipv6-criteria>entry match)
[Tree] (config>qos>sap-egress>ipv6-criteria>entry match)

Full Context configure qos sap-egress ipv6-criteria entry match
configure qos sap-ingress ipv6-criteria entry match

Description This command creates a context to configure match criteria for ingress SAP QoS policy match IPv6 criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (logical AND) before the action associated with the match is executed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be created per entry.

A SAP ingress policy may include the **dscp** map command, the **dot1p** map command, and an IPv6 match criteria. When multiple matches occur for the traffic, the following order of precedence is used to arrive at the final action.

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the IPv6 next header to match.

On the 7750 SR and 7950 XRS, the protocol type such as TCP, UDP, or OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6) and UDP(17).

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D
[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp
* - udp/tcp wildcard

match

Syntax **match** [**frame-type** {**802dot3** | **802dot2-llc** | **802dot2-snap** | **ethernet-II** | **atm**}]
no match

Context **[Tree]** (config>qos>sap-ingress>mac-criteria>entry match)

Full Context configure qos sap-ingress mac-criteria entry match

Description This command creates a context for entering/editing match MAC criteria for ingress SAP QoS policy match criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (AND function) before the action associated with the match will be executed.

A **match** context can consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters **frame-type** — The **frame-type** keyword configures an Ethernet frame type or an ATM frame type to be used for the MAC filter match criteria.

Values 802dot3, 802dot2-llc, 802dot2-snap, ethernet_II, atm

Default 802dot3

802dot3 — Specifies the frame type is Ethernet IEEE 802.3.

802dot2-llc — Specifies the frame type is Ethernet IEEE 802.2 LLC.

802dot2-snap — Specifies the frame type is Ethernet IEEE 802.2 SNAP.

ethernet-II — Specifies the frame type is Ethernet Type II.

atm — Specifies the frame type as ATM cell. The user is not allowed to configure entries with frame type of atm and a frame type of other supported values in the same QoS policy. This parameter applies only to the 7750 SR and 7950 XRS.

Platforms All

match

Syntax **match** [**protocol** *protocol-id*]
no match

Context **[Tree]** (config>qos>network>ingress>ip-criteria>entry match)
[Tree] (config>qos>network>egress>ip-criteria>entry match)

Full Context configure qos network egress ip-criteria entry match
configure qos network ingress ip-criteria entry match

Description This command creates a context to configure match criteria for a network QoS policy. When the match criteria have been satisfied, the action associated with it is executed.

If more than one match criteria (within one match statement) are configured, then all criteria must be satisfied before the associated action with the match is executed.

A match context can consist of multiple match criteria, but multiple match statements cannot be entered per entry.

A network QoS policy can include the DSCP map command, the dot1p map command (ingress only), the prec map command (egress only), and an IP match criteria. When multiple matches occur for the traffic, the order of precedence is used to arrive at the final action. The order of precedence is as follows:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- 802.1p bits (ingress only)
- DSCP
- prec (egress only)
- IP quintuple

The **no** form of this command removes the match criteria for the entry identifier.

Parameters **protocol** *protocol-id* — Specifies an IP protocol to be used as an ingress or egress network QoS policy match criterion.

The protocol type is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), and UDP(17).

Values *protocol-id*: 0 to 255 protocol numbers accepted in decimal, hexadecimal, or binary

keywords: none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

* — udp/tcp wildcard

Table 81 lists the protocols and their protocol IDs and descriptions.

Context **[Tree]** (config>qos>network>ingress>ipv6-criteria>entry match)
[Tree] (config>qos>network>egress>ipv6-criteria>entry match)

Full Context configure qos network egress ipv6-criteria entry match
configure qos network ingress ipv6-criteria entry match

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates a context to configure match criteria for a network QoS policy match IPv6 criteria. When the match criteria have been satisfied, the action associated with the match criteria is executed.

If more than one match criteria (within one match statement) are configured, all criteria must be satisfied (logical AND) before the action associated with the match is executed.

A match context can consist of multiple match criteria, but multiple match statements cannot be created per entry.

A network policy can include the DSCP map command, the dot1p map command (ingress only), the prec map command (egress only), and an IPv6 match criteria. When multiple matches occur for the traffic, the following order of precedence is used to arrive at the final action.

- 802.1p bits (ingress only)
- DSCP
- prec (egress only)
- IP quintuple

The **no** form of this command removes the match criteria for the entry identifier.

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the next header to match.

The protocol type is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), and UDP(17).

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D
[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp
* - udp/tcp wildcard

match

Syntax **match** *field-value* **instance** *instance-id*
no match *field-value*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>qos>queue-group-redirect-list match)

Full Context configure qos queue-group-redirect-list match

Description This command configures the value of the field in the ingress or egress packet which, when matched, will cause the packet to be redirected to the specified queue group instance. The *field-value* is dependent on the setting of the **type** and therefore must be a valid VXLAN VNI.

A maximum of 16 match statements are supported in a queue group redirect list.

The **no** form of this command removes the match statement from the redirect list.

Parameters *field-value* — Specifies the value of the field in the ingress or egress packet which, when matched, will cause the packet to be redirected to the specified queue group instance. Because the only permitted **type** is **vxlan-vni**, the field must be a valid VXLAN VNI. The VNI can be specified in any of the available formats but is always shown in decimal.

Values 1 to 16777215 (Decimal)
0x1 to 0xFFFFFF (Hexadecimal)
0b1 to 0b111111111111111111111111 (Binary)

instance-id — Specifies the instance of the queue group template to which the VXLAN traffic is redirected. The traffic can be redirected to the default instance, which is the instance specified with the QoS policy under the SAP ingress or egress.

Values 1 to 65535

Platforms All

match

Syntax **match** [**protocol** *protocol-id*]
match protocol none
no match

Context [Tree] (config>filter>ip-exception>entry match)

Full Context configure filter ip-exception entry match

Description Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied the action associated with the match criteria is executed.

A **match** context may consist of multiple match criteria, but multiple **match** statements cannot be entered per entry. More precisely, the command can be entered multiple times but this only results in modifying the *protocol-id*. and does not affect the underlying match criteria configuration.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none** (keyword). As per above, **match protocol none** is however not equivalent to **no match**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default match protocol none

Parameters *protocol-id* — Configures and IP protocol to be used as an IP filter match criterion. The protocol type, such as TCP or UDP, is identified by its respective protocol number.

Values protocol-number: [0..255]D

[0x0..0xFF]H

[0b0..0b11111111]B

protocol-name:0 to 255 in decimal format. Values can also be specified in hexadecimal format, in binary format, or using the following keywords:

IPv4 filter keywords: none (default), icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

IP exception filter keywords: none, icmp, igmp, ospf-igp, pim, rsvp, tcp, udp, vrrp

* — udp/tcp wildcard

match protocol none
no match

Context **[Tree]** (config>filter>ip-filter>entry match)

Full Context configure filter ip-filter entry match

Description Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied, the action associated with the match criteria is executed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A match context may consist of multiple match criteria, but multiple match statements cannot be created per entry. More precisely, the **protocol** command can be entered multiple times but this only results in modifying the *protocol-id*. Matching on more than one protocol can be achieved using the protocol-list match criteria in an IP filter policy.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none**. However, **match protocol none** is not equivalent to **no match**.

Default match protocol none

Parameters *protocol-id* — *protocol-number* | *protocol-name*

protocol-number — Specifies the protocol number value to be configured as a match criterion. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

Values [0..255]D, [0x0..0xFF]H, [0b0..0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values IPv4 filter keywords: none (default), icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

***** — udp/tcp

Full Context configure filter ipv6-exception entry match

Description Commands in this context enter match criteria for the IPv6 filter exception. When the match criteria have been satisfied, the action associated with the match criteria is executed.

The **no** form of the command removes all the match criteria from the IPv6 filter exception.

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the next header to match.

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D
[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp

Full Context configure filter ipv6-filter entry match

Description Commands in this context enter match criteria for the filter entry. When the match criteria have been satisfied, the action associated with the match criteria is executed.

A match context may consist of multiple match criteria, but multiple match statements cannot be created per entry. More precisely, the **next-header** command can be entered multiple times, but this only results in modifying the *protocol-id*. Matching on more than one protocol can be achieved using the **next-header-list** match criteria.

The **no** form of the command removes all the match criteria from the filter entry and sets the *protocol-id* of the match command to **none**. However, **match next-header none** is not equivalent to **no match**.

Default match next-header none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the IPv6 next header to match. This parameter is analogous to the protocol parameter used in IPv4 filter match command.

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D
[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp
* - udp/tcp wildcard

protocol-list-name — Specifies the name of the protocol list, up to 32 characters.

no match

Context **[Tree]** (config>filter>mac-filter>entry match)

Full Context configure filter mac-filter entry match

Description This command creates the context for entering/editing match criteria for the filter entry and specifies an Ethernet frame type for the entry.

A **match** context may consist of multiple match criteria, but multiple **match** statements cannot be entered per entry.

The **no** form of the command removes the match criteria for the *entry-id*.

Parameters **frame-type** — The **frame-type** keyword configures an Ethernet frame type to be used for the MAC filter match criteria.

Default **802dot3**

Values 802dot3, 802dot2-llc, 802dot2-snap, ethernet_II

802dot3 — Specifies the frame type is Ethernet IEEE 802.3.

802dot2-llc — Specifies the frame type is Ethernet IEEE 802.2 LLC.

802dot2-snap — Specifies the frame type is Ethernet IEEE 802.2 SNAP.

ethernet_II — Specifies the frame type is Ethernet Type II.

Table 84 **IP Protocol Names**

Protocol	Protocol ID	Description
rsvp	46	Reservation Protocol
gre	47	General Routing Encapsulation
ipv6-icmp	58	ICMP for IPv6
ipv6-no-nxt	59	No Next Header for IPv6
ipv6-opts	60	Destination Options for IPv6
iso-ip	80	ISO Internet Protocol
eigrp	88	EIGRP
ospf-igp	89	OSPFIGP
ether-ip	97	Ethernet-within-IP Encapsulation
encap	98	Encapsulation Header
pnni	102	PNNI over IP
pim	103	Protocol Independent Multicast
vrrp	112	Virtual Router Redundancy Protocol
l2tp	115	Layer Two Tunneling Protocol
stp	118	Spanning Tree Protocol
ptp	123	Performance Transparency Protocol
isis	124	ISIS over IPv4
crtp	126	Combat Radio Transport Protocol
crudp	127	Combat Radio User Datagram

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

match

Syntax **match** [**next-header** *next-header*]
no match

Context **[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry match)

Full Context configure system security cpm-filter ipv6-filter entry match

Description This command specifies match criteria for the IP filter entry.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the match criteria for the *entry-id*.

Parameters *next-header — protocol-number*, *protocol-name*

Specifies the next header to match.

The protocol type such as TCP, UDP or OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6) and UDP(17).

protocol-number — Specifies the protocol number value to be configured as a match criterion.

Values [0 to 255]D
[0x0 to 0xFF]H
[0b0 to 0b11111111]B

protocol-name — Specifies the protocol name to be configured as a match criterion.

Values none, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp
* - udp/tcp wildcard

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

match

Syntax **match** *command-string*
no match

Context **[Tree]** (config>system>security>profile>entry match)

Full Context configure system security profile entry match

Description This command configures a command or subtree commands in subordinate command levels are specified.

Because the OS exits when the first match is found, subordinate levels cannot be modified with subsequent action commands. More specific action commands should be entered with a lower entry number or in a profile that is evaluated prior to this profile.

All commands below the hierarchy level of the matched command are denied.

The **no** form of this command removes a match condition.

Parameters *command-string* — Specifies the CLI command or CLI tree level that is the scope of the profile entry.

Platforms All

Use subject to Terms available at: www.nokia.com

match

Syntax **match**

Context **[Tree]** (config>router>bgp>group>dynamic-neighbor match)

Full Context configure router bgp group dynamic-neighbor match

Description This command configures match conditions for the dynamic neighbors.

Platforms All

17.59 match-circuit-id

match-circuit-id

Syntax [**no**] **match-circuit-id**

Context **[Tree]** (config>service>ies>sub-if>grp-if>dhcp match-circuit-id)
[Tree] (config>service>vprn>sub-if>dhcp match-circuit-id)
[Tree] (config>service>vprn>sub-if>grp-if>dhcp match-circuit-id)

Full Context configure service ies subscriber-interface group-interface dhcp match-circuit-id
configure service vprn subscriber-interface dhcp match-circuit-id
configure service vprn subscriber-interface group-interface dhcp match-circuit-id

Description This command enables Option 82 circuit ID on relayed DHCP packet matching. For routed CO, the group interface DHCP relay process is stateful. When packets are relayed to the server the virtual router ID, transaction ID, SAP ID, and client hardware MAC address of the relayed packet are tracked.

When a response is received from the server the virtual router ID, transaction ID, and client hardware MAC address must be matched to determine the SAP on which to send the packet out. In some cases, the virtual router ID, transaction ID, and client hardware MAC address are not guaranteed to be unique.

When the **match-circuit-id** command is enabled this as part of the key is used to guarantee correctness in our lookup. This is only needed when dealing with an IP aware DSLAM that proxies the client hardware MAC address.

The **no** form of this command disables Option 82 circuit ID on relayed DHCP packet matching.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.60 match-list

match-list

Syntax **match-list** *ppp-match-type-1* [*ppp-match-type-2*]
no match-list

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp match-list)

Full Context configure subscriber-mgmt local-user-db ppp match-list

Description This command specifies the type of matching done to identify a host. There are different match-types for PPPoE hosts of which a maximum of three can be specified.

The **no** form of this command reverts to the default.

Parameters *match-type-x* — Specifies up to three matching types to identify a host.

Values For PPP: circuit-id, derived-id, mac, remote-id, sap-id, encap-tag-range, encap-tag-separate-range, service-name, username

Note: The format of *remote-id* in IPv6 is different that the format of *remote-id* in IPv4; IPv6 *remote-id* contains *enterprise-id* filed that is also honored in matching.

circuit-id — Specifies to use the circuit ID to match against.

derived-id — Specifies the value extracted by Python script during processing of DHCP Discover/Solicit/Request/Renew/Rebind Messages (client to server bound messages). The value is stored in the DHCP Transaction Cache (DTC) in a variable named alc.dtc.derivedId. This value has a lifespan of a DHCP transaction (a single pair of messages exchanged between the client and the server, for example DHCP Discover and DHCP Offer).

encap-tag-separate-range — Specifies the match encapsulation inner and outer tag in two separate ranges.

encap-tag-range — Specifies to match tag ranges for inner and outer tags.

mac — Specifies to use the MAC address to match against.

remote-id — Specifies to use the remote ID to match against.

sap-id — Specifies the SAP ID on which DHCPv4 packet are received. The SAP ID is inserted as ALU VSO (82,9,4) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group-interface CLI hierarchy, the group interface and the service ID must be known before the SAP ID can be used for LUDB match.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

service-id — Specifies the service ID of the ingress SAP for DHCPv4 packets. The service ID is inserted as ALU VSO (82,9,3) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay.

system-id — Specifies the system ID of the node name configured under the **system>name** CLI hierarchy. The system ID is inserted as ALU VSO (82,9,1) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service-id must be known before the system ID can be used for LUDB match.

username — Specifies the user name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

match-list

Syntax **match-list** *ipoe-match-type-1* [*ipoe-match-type-2*]
no match-list

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe match-list)

Full Context configure subscriber-mgmt local-user-db ipoe match-list

Description This command specifies the type of matching done to identify a host. There are different match-types for IPoE hosts of which a maximum of four can be specified.

The **no** form of this command reverts to the default.

Parameters *match-type-x* — Specifies up to four matching types to identify a host.

Values For IPoE: circuit-id, derived-id, dual-stack-remote-id, encap-tag-range, encap-tag-separate-range, ip, mac, option60, remote-id, sap-id, service-id, string, system-id

Note: The format of *remote-id* in IPv6 is different that the format of remote-id in IPv4; IPv6 *remote-id* contains *enterprise-id* filed that is also honored in matching.

circuit-id — Specifies to use the circuit ID to match against.

derived-id — Specifies the value extracted by Python script during processing of DHCP Discover/Solicit/Request/Renew/Rebind Messages (client to server bound messages). The value is stored in the DHCP Transaction Cache (DTC) in a variable named alc.dtc.derivedId. This value has a lifespan of a DHCP transaction (a single pair of messages exchanged between the client and the server, for example DHCP Discover and DHCP Offer).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

dual-stack-remote-id — Specifies the enterprise-id in IPv6 remote-id is stripped off before LUDB matching is performed. Processing of IPv4 remote ID remains unchanged. This will allow a single host entry in LUDB for dual-stack host where host identification is performed based on the remote ID field.

encap-tag-separate-range — Specifies the match encapsulation inner and outer tag in two separate ranges.

encap-tag-range — Specifies to match tag ranges for inner and outer tags.

ip — Specifies the source IPv4/IPv6 address of a data-trigger packet.

mac — Specifies to use the MAC address to match against.

option-60 — Specifies to use Option60 to match against.

remote-id — Specifies to use the remote ID to match against.

sap-id — Specifies the SAP ID on which DHCPv4 packet are received. The SAP ID is inserted as ALU VSO (82,9,4) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service ID must be known before the SAP ID can be used for LUDB match.

service-id — Specifies the service ID of the ingress SAP for DHCPv4 packets. The service ID is inserted as ALU VSO (82,9,3) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay.

string — Specifies the custom string configured under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. The string is inserted as ALU VSO (82,9,5) by the DHCPv4 relay in router. Since the **dhcp-relay** configuration is enabled under the group-interface CLI hierarchy, the group-interface and the service ID must be known before the string can be used for LUDB match.

system-id — Specifies the system ID of the node name configured under the **system>name** CLI hierarchy. The system ID is inserted as ALU VSO (82,9,1) by the DHCPv4 relay in router. This is enabled via configuration under the vendor-specific-option CLI hierarchy of the DHCPv4 relay. Since the **dhcp-relay** configuration is enabled under the group interface CLI hierarchy, the group interface and the service ID must be known before the system ID can be used for LUDB match.

Full Context configure service ies interface sap ingress match-qinq-dot1p
configure service ies subscriber-interface group-interface sap ingress match-qinq-dot1p
configure service vpls sap ingress match-qinq-dot1p
configure service vprn subscriber-interface group-interface sap ingress match-qinq-dot1p

Description This command specifies which dot1Q tag position dot1P bits in a QinQ encapsulated packet should be used to evaluate dot1P QoS classification.

The **match-qinq-dot1p** command allows the top or bottom PBits to be used when evaluating the applied sap-ingress QoS policy's dot1P entries. The **top** and **bottom** keywords specify which position should be evaluated for QinQ encapsulated packets.

By default, the bottom-most service delineating dot1Q tag's dot1P bits are used. Table 85 defines the default behavior for dot1P evaluation when the **match-qinq-dot1p** command is not executed.

Table 85 **Default QinQ and TopQ SAP Dot1P Evaluation**

configure service ipipe sap ingress match-qinq-dot1p

Description This command specifies which Dot1Q tag position Dot1P bits in a QinQ encapsulated packet should be used to evaluate Dot1P QoS classification.

The **match-qinq-dot1p** command allows the top or bottom PBits to be used when evaluating the applied sap-ingress QoS policy's Dot1P entries. The **top** and **bottom** keywords specify which position should be evaluated for QinQ encapsulated packets.

The setting also applies to classification based on the DE indicator bit.

The **no** form of this command reverts the dot1p and de bits matching to the default tag.

By default, the bottom most service delineating Dot1Q tags Dot1P bits are used. Table 88 defines the default behavior for Dot1P evaluation.

Table 88 **Default QinQ and TopQ SAP Dot1P Evaluation**

Port / SAP Type	Existing Packet Tags	PBits Used for Match
Null	None	None

Table 90 **Bottom Position QinQ and TopQ SAP Dot1P Evaluation**

Port / SAP Type	Existing Packet Tags	PBits Used for Match
QinQ / QinQ	TopQ BottomQ	BottomQ PBits

Table 91 **Egress SAP Types**

Egress SAP Type	Ingress Packet Preserved Dot1P State	Marked (or Remarked) PBits
Null	No preserved Dot1P bits	None
Null	Preserved Dot1P bits	Preserved tag PBits remarked using dot1p-value
Dot1Q	No preserved Dot1P bits	New PBits marked using dot1p-value
Dot1Q	Preserved Dot1P bits	Preserved tag PBits remarked using dot1p-value
TopQ	No preserved Dot1P bits	TopQ PBits marked using dot1p-value
TopQ	Preserved Dot1P bits (used as TopQ and BottomQ PBits)	TopQ PBits marked using dot1p-value, BottomQ PBits preserved
QinQ	No preserved Dot1P bits	TopQ PBits and BottomQ PBits marked using dot1p-value
QinQ	Preserved Dot1P bits (used as TopQ and BottomQ PBits)	TopQ PBits and BottomQ PBits marked using dot1p-value

The QinQ and TopQ SAP PBit/DEI bit marking follows the default behavior defined in the preceding table when **qinq-mark-top-only** is not specified.

The dot1p *dot1p-value* command must be configured without the qinq-mark-top-only parameter to remove the TopQ PBits only marking restriction.

A QinQ-encapsulated Ethernet port can have two different sap types:

For a TopQ SAP type, only the outer (top) tag is explicitly specified. For example, **sap 1/1/1:10.***

For QinQ SAP type, both inner (bottom) and outer (top) tags are explicitly specified. For example, **sap 1/1/1:10.100**.

17.63 match-radius-proxy-cache

match-radius-proxy-cache

Syntax **match-radius-proxy-cache**

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host match-radius-proxy-cache)

Full Context configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache

Description Commands in this context configure RADIUS proxy cache match parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.64 max

max

Syntax **max** *num-sessions*
no max

Context **[Tree]** (config>service>nat>nat-policy>session-limits max)
[Tree] (config>service>nat>firewall-policy>session-limits max)
[Tree] (config>service>nat>up-nat-policy>session-limits max)

Full Context configure service nat firewall-policy session-limits max
configure service nat nat-policy session-limits max
configure service nat up-nat-policy session-limits max

Description This command configures the session limit of this policy. The session limit is the maximum number of sessions allowed for a subscriber associated with this policy.

Default max 65535

Parameters *num-sessions* — Specifies the session limit.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy session-limits max
- configure service nat nat-policy session-limits max

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy session-limits max

17.65 max-admin-down-time

max-admin-down-time

Syntax **max-admin-down-time** [[*down-interval*] | **infinite**]
no max-admin-down-time

Context **[Tree]** (config>lag>bfd>family max-admin-down-time)

Full Context configure lag bfd family max-admin-down-time

Description This command specifies the maximum amount of time the router will continue to forward traffic over a link after the micro-BFD sessions has transitioned to a Down state because it received an ADMIN-DOWN state from the far-end. This timer provide the administrator the configured amount of time to disable or de-provision the micro-BFD session on the local node before forwarding is halted over the associated link(s).

The **no** form of this command removes the time interval from the configuration.

Default max-admin-down-time 0

Parameters *down-interval* — Specifies the amount of time, in seconds.

Values -1 to 3600

infinite — Specifies no end time to forward traffic.

Platforms All

17.66 max-advertisement

max-advertisement

Syntax **max-advertisement** *seconds*
no max-advertisement

Context **[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv max-advertisement)
[Tree] (config>service>ies>sub-if>grp-if>ipv6 max-advertisement)

[Tree] (config>service>vprn>sub-if>grp-if>ipv6>rtr-adv max-advertisement)
[Tree] (config>subscr-mgmt>rtr-adv-plcy max-advertisement)

Full Context configure service ies subscriber-interface group-interface ipv6 max-advertisement

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service ies subscriber-interface group-interface ipv6 router-advertisements max-advertisement
configure service ies subscriber-interface ipv6 router-advertisements max-advertisement
configure service vprn router-advert interface max-advertisement
configure service vprn subscriber-interface group-interface ipv6 max-advertisement
configure service vprn subscriber-interface group-interface ipv6 router-advertisements max-advertisement
configure service vprn subscriber-interface ipv6 router-advertisements max-advertisement
configure subscriber-mgmt router-advertisement-policy max-advertisement

Description This command specifies the maximum time allowed between sending unsolicited router advertisements from this interface.

The **no** form of this command reverts to the default.

Default max-advertisement 1800

Parameters *seconds* — Specifies the maximum advertisement interval, in seconds.

Values 900 to 1800

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.67 max-advertisement-interval

max-advertisement-interval

Syntax [**no**] **max-advertisement-interval** *seconds*

Context **[Tree]** (config>service>vprn>router-advert>if max-advertisement-interval)
[Tree] (config>router>router-advert>if max-advertisement-interval)

Full Context configure router router-advertisement interface max-advertisement-interval
configure service vprn router-advertisement interface max-advertisement-interval

Description This command configures the maximum interval between sending router advertisement messages.

Default max-advertisement-interval 600

Parameters *seconds* — Specifies the maximum interval in seconds between sending router advertisement messages.

Values 4 to 1800

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.68 max-age

max-age

Syntax **max-age** *max-age*
no max-age [*max-age*]

Context **[Tree]** (config>service>vpls>stp max-age)
[Tree] (config>service>template>vpls-template>stp max-age)

Full Context configure service template vpls-template stp max-age
configure service vpls stp max-age

Description This command indicates how many hops a BPDU can traverse the network starting from the root bridge. The message age field in a BPDU transmitted by the root bridge is initialized to 0. Each other bridge will take the message_age value from BPDUs received on their root port and increment this value by 1. The message_age therefore reflects the distance from the root bridge. BPDUs with a message age exceeding max-age are ignored.

STP uses the max-age value configured in the root bridge. This value is propagated to the other bridges via the BPDUs.

The **no** form of this command returns the max age to the default value.

Default max-age 20

Parameters *max-age* — The max info age for the STP instance in seconds. Allowed values are integers in the range 6 to 40.

Platforms All

17.69 max-attempts

max-attempts

Syntax **max-attempts** *count*
max-attempts infinite
no max-attempts

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c max-attempts)

Full Context configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit max-attempts

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the maximum number of attempts made to establish a new Diameter Gy session with the Online Charging Server (OCS) when Extended Failure Handling (EFH) is active.

A new attempt is made when the volume or time interim credit of a rating group is consumed or when the validity time expires for a rating group.

When the maximum number of attempts is reached, the user session associated with the Diameter session is terminated (the corresponding subscriber hosts are deleted from the system).

The **no** form of this command resets the value to the default value.

Default max-attempts 10

Parameters *count* — Specifies the maximum number attempts that is made to establish a Diameter Gy session with the OCS when EFH is active.

Values 1 to 4294967295

infinite — Specifies that an unlimited number of attempts is made to establish a Diameter Gy session with the OCS when EFH is active.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.70 max-auth-req

max-auth-req

Syntax **max-auth-req** *max-auth-request*

Context **[Tree]** (config>port>ethernet>dot1x max-auth-req)

Full Context configure port ethernet dot1x max-auth-req

Description This command configures the maximum number of times that the router will send an access request RADIUS message to the RADIUS server. If a reply is not received from the RADIUS server after the specified number attempts, the 802.1x authentication procedure is considered to have failed.

The **no** form of this command returns the value to the default.

Default max-auth-req 2

Parameters *max-auth-request* — The maximum number of RADIUS retries.

Values 1 to 10

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.71 max-avg

max-avg

Syntax **max-avg** *percent*
no max-avg

Context **[Tree]** (config>qos>slope-policy>exceed-slope max-avg)
[Tree] (config>qos>slope-policy>highplus-slope max-avg)
[Tree] (config>qos>slope-policy>high-slope max-avg)
[Tree] (config>qos>slope-policy>low-slope max-avg)

Full Context configure qos slope-policy exceed-slope max-avg
configure qos slope-policy high-slope max-avg
configure qos slope-policy highplus-slope max-avg
configure qos slope-policy low-slope max-avg

Description Sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability rises directly to one. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the max-avg value to the default setting. If the current **start-avg** setting is larger than the default, an error will occur and the max-avg setting will not be changed to the default.

Default max-avg 100 - Highplus slope default is 100% buffer utilization before discard probability is 1.

max-avg 90 — High slope default is 90% buffer utilization before discard probability is 1.

max-avg 75 — Low slope default is 75% buffer utilization before discard probability is 1.

max-avg 55 — Exceed slope default is 55% buffer utilization before discard probability is 1.

Parameters *percent* — The percentage of the shared buffer space for the buffer pool at which point the drop probability becomes one. The value entered must be greater or equal to the current setting of **start-avg**. If the entered value is smaller than the current value of **start-avg**, an error will occur and no change will take place.

Values 0 to 100

Platforms All

Use subject to Terms available at: www.nokia.com

17.72 max-bandwidth

max-bandwidth

Syntax **max-bandwidth** *number-links*
no max-bandwidth

Context **[Tree]** (config>port>ml-bundle>ima max-bandwidth)

Full Context configure port multilink-bundle ima max-bandwidth

Description This command specifies the number of links used to determine the maximum configurable bandwidth that is allowed to be used for this IMA group.

The maximum bandwidth is computed as:

Maximum Configurable ATM Bandwidth (MCAB) =

(number-links) * (M-1)/M * (2048/2049) * primary member link speed

Where: M is the IMA frame size (128)
Primary member link speed is either E-1 — 1920 kb/s or DS-1 — 1539 kb/s. E-1 speed is used for a group with no members.

The total ATM bandwidth of services over shaped VCs cannot exceed the MCAB value as result of adding more services or removing member links.

The **no** form of this command resets the max-bandwidth to its default value.

Default max-bandwidth 8

Parameters *number-links* — Specifies the number of links that determines the maximum configurable bandwidth that is allowed to be used for this IMA group.

Values 1 to 8

Platforms 7450 ESS, 7750 SR-7/12/12e

max-bandwidth

Syntax **max-bandwidth** *bandwidth-in-mbps*
no max-bandwidth

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth max-bandwidth)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth max-bandwidth)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router mpls lsp auto-bandwidth max-bandwidth
configure router mpls lsp-template auto-bandwidth max-bandwidth

Description This command configures the maximum bandwidth that auto-bandwidth allocation is allowed to request for an LSP.

The LSP maximum applies whether the bandwidth adjustment is triggered by normal adjust-interval expiry, the overflow limit having been reached, or manual request.

The **no** form of this command reverts to the default value.

The max-bandwidth must be greater than the min-bandwidth.

Default max-bandwidth 100000

Parameters *bandwidth-in-mbps* — Specifies the maximum bandwidth in Mb/s.

Values 0 to 6400000

Platforms All

17.73 max-burst

max-burst

Syntax **max-burst** *number*
no max-burst

Context **[Tree]** (config>router>rsvp>msg-pacing max-burst)

Full Context configure router rsvp msg-pacing max-burst

Description This command specifies the maximum number of RSVP messages that are sent in the specified period under normal operating conditions.

Default max-burst 650

Parameters *number* — Specifies the maximum number of RSVP messages to be sent in increments of 10.

Values 100 to 1000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.74 max-burst-size

max-burst-size

Syntax **max-burst-size** *size* [**bytes** | **kilobytes**]
no max-burst-size

Context **[Tree]** (config>router>policy-acct-template>policer max-burst-size)

Full Context configure router policy-acct-template policer max-burst-size

Description This command configures the MBS for the policer. When this threshold value is exceeded, packets are considered violating and are dropped.

When this value is not configured, the default value is dependent on the peak-rate setting. When peak-rate is set to max or is greater than or equal to the FP capacity (overriding an explicitly configured MBS value), the default value is 16 megabytes; otherwise the value is capped at 3988 kilobytes with a minimum of 256 bytes.

The **no** form of this command reverts to the default value.

Parameters *size* — Specifies the maximum number of RSVP messages to be sent in increments of 10.

Values 0 to 16777216 | **default**

bytes — Specifies that the value is in bytes.

kilobytes — Specifies that the value is in kilobytes.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

17.75 max-bypass-associations

max-bypass-associations

Syntax **max-bypass-associations** *integer*
no max-bypass-associations

Context **[Tree]** (config>router>mpls max-bypass-associations)

Full Context configure router mpls max-bypass-associations

Description This command allows the user to set a maximum number of LSP primary path associations with each manual or dynamic bypass LSP that is created in the system.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, a Point of Local Repair (PLR) node will associate a maximum of 1000 primary LSP paths with a given bypass before using the next available manual bypass or signaling a new dynamic bypass.

Note that a new bypass LSP may need to be signaled if the constraint of a given primary LSP path is not met by an existing bypass LSP even if the max-bypass-associations for this bypass LSP has not been reached.

The **no** form of this command reinstates the default value of this parameter.

Default max-bypass-associations 1000

Parameters *integer* — Configures the number of LSP primary path associations

Values 100 to 131072

Platforms All

17.76 max-bypass-plr-associations

max-bypass-plr-associations

Syntax **max-bypass-plr-associations** *plr-value*
no max-bypass-plr-associations

Context **[Tree]** (config>router>mpls max-bypass-plr-associations)

Full Context configure router mpls max-bypass-plr-associations

Description This command enables the configuration of the maximum number of Points of Local Repair (PLRs) per RSVP-TE bypass LSP.

A PLR summarizes the constraints applied to the computation of the path of the bypass LSP. It consists of the avoid link/node constraint, and potentially other TE constraints such as exclude SRLG, that are needed to protect against the failure of the primary path of the RSVP-TE LSP that is associated with this bypass LSP.

Additional PLRs with the same avoid link/node constraint are associated with the same bypass to minimize the number of bypass LSPs created. This command controls the maximum number of such PLRs.

Because MPLS saves only the PLR constraints of the first LSP that triggered the dynamic bypass creation, subsequent LSPs for the same avoid link/node and with the non-strict bypass SRLG disjointness enabled may be associated with the same bypass. This is even in cases where there exists a bypass LSP path that strictly satisfies the SRLG constraint.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the maximum PLRs per bypass is configured with a value of 1, MPLS triggers the signaling of a new dynamic bypass LSP for each new PLR and saves each PLR constraint separately with its own bypass. As a result, when MPLS re-optimizes a bypass LSP it guarantees that SRLG disjointness of that PLR are checked and enforced.

The **no** form of this command returns the command to its default value.

Default max-bypass-plr-associations 16

Parameters *plr-value* — Configures the number of LSP primary path associations

Values 1 to 16

Default 16

Platforms All

17.77 max-cells

max-cells

Syntax **max-cells** *cell-count*
no max-cells [*cell-count*]

Context **[Tree]** (config>service>apipe>spoke-sdp>cell-concat max-cells)

Full Context configure service apipe spoke-sdp cell-concatenation max-cells

Description This command enables the configuration of the maximum number of ATM cells to accumulate into an MPLS packet. The remote peer will also signal the maximum number of concatenated cells it is willing to accept in an MPLS packet. When the lesser of (the configured value and the signaled value) number of cells is reached, the MPLS packet is queued for transmission onto the pseudowire. It is ensured that the MPLS packet MTU conforms to the configured service MTU.

The **no** form of this command sets max-cells to the value '1' indicating that no concatenation will be performed.

Parameters *cell-count* — Specifies the maximum number of ATM cells to be accumulated into an MPLS packet before queuing the packet for transmission onto the pseudowire.

Values 1 to 128

Default 1

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.78 max-cleared

max-cleared

Syntax **max-cleared** *maximum*

Context **[Tree]** (config>system>alarms max-cleared)

Full Context configure system alarms max-cleared

Description This command configures the maximum number of cleared alarms that the system will store and display.

Default max-cleared 500

Parameters *maximum* — Specifies the maximum number of cleared alarms, up to 500.

Platforms All

17.79 max-completed

max-completed

Syntax **max-completed** *unsigned*

Context **[Tree]** (config>system>script-control>script-policy max-completed)

Full Context configure system script-control script-policy max-completed

Description This command is used to configure the maximum number of script run history status entries to keep.

Default max-completed 1

Parameters *unsigned* — Specifies the maximum number of script run history status entries to keep.

Values 1 to 1500

Default 1

Platforms All

17.80 max-conn-prefix

max-conn-prefix

Syntax **max-conn-prefix** *count*
no max-conn-prefix

Context **[Tree]** (config>test-oam>twamp>server>prefix max-conn-prefix)

Full Context configure test-oam twamp server prefix max-conn-prefix

Description This command configures the maximum number of control connections by clients with an IP address in a specific prefix. A new control connection is rejected if accepting it would cause either the prefix limit defined by this command or the server limit (max-conn-server) to be exceeded.

The **no** form of this command returns the value to the default.

Default max-conn-prefix 32

Parameters *count* — Specifies the maximum number of control connections.

Values 0 to 64

Default 32

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.81 max-conn-server

max-conn-server

Syntax **max-conn-server** *count*
no max-conn-server

Context **[Tree]** (config>test-oam>twamp>server max-conn-server)

Full Context configure test-oam twamp server max-conn-server

Description This command configures the maximum number of TWAMP control connections from all TWAMP clients. A new control connection is rejected if accepting it would cause either this limit or a prefix limit (max-conn-prefix) to be exceeded.

The **no** form of this command returns the value to the default.

Default max-conn-server 32

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *count* — Specifies the maximum number of control connections.

Values 0 to 64

Default 32

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.82 max-data-size

max-data-size

Syntax **max-data-size** *bytes*

Context **[Tree]** (config>sflow>receiver max-data-size)

Full Context configure sflow receiver max-data-size

Description This configures the maximum data size for sFlow UDP datagrams sent to the collector.

To restore default configuration, execute max-data-size 1400.

Default max-data-size 1400

Parameters *bytes* — Specifies the data size.

Values 200 to 1500

Platforms 7750 SR, 7750 SR-s, 7950 XRS

17.83 max-debounce-time

max-debounce-time

Syntax **max-debounce-time** *max-debounce-time*
no max-debounce-time

Context **[Tree]** (config>redundancy>mc>peer>mcr>ring>in-band-control-path max-debounce-time)
[Tree] (config>redundancy>mc>peer>mc>l3-ring>in-band-control-path max-debounce-time)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure redundancy multi-chassis peer mc-ring ring in-band-control-path max-debounce-time

Description This command configures the inband control path maximum debounce time.

The **no** form of this command reverts to the default.

Default max-debounce-time 10

Parameters *max-debounce-time* — Specifies the maximum debounce time on the transition of the operational state of the inband control connection.

Values 5 to 200 seconds

Platforms All

17.84 max-decrement

max-decrement

Syntax **max-decrement** {**percent** *percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}
no max-decrement

Context **[Tree]** (config>qos>adv-config-policy>child-control>offered-measurement max-decrement)

Full Context configure qos adv-config-policy child-control offered-measurement max-decrement

Description This command is used to limit how fast a child queue or policer can 'give up' bandwidth that it has been allotted from the virtual scheduler in a single iteration. If the child's new offered rate has decreased by more than the maximum decrement limit, the system ignores the new offered rate and instead uses the old offered rate less the maximum decrement limit.

A possible reason to define a maximum decrement limit is to allow a child queue or policer to hold on to a portion of bandwidth that has been distributed by the parent virtual scheduler in case the child's offered rate fluctuates in an erratic manor. The max-decrement limit has a dampening effect to changes in the offered rate.

A side effect of using a maximum decrement limit is that unused bandwidth allocated to the child queue or policer will not be given to another child as quickly. This may result in an underrun of the virtual scheduler's aggregate rate.

The max-decrement limit has no effect on any increase in a child's offered rate. If the rate increase is above the change sensitivity, the new offered rate is immediately used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the max-decrement command is used with a percent-based value, the decrement limit will be a function of the configured PIR value on the policer or queue. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the percent-rate command with the local parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

Except for the overall cap on the offered input into the virtual scheduler, the child's administrative PIR has no effect on the calculated sensitivity if an explicit rate is specified.

If the child's administrative PIR is modified while a percent based max-decrement is in effect, the system automatically uses the new relative maximum decrement limit value the next time the child's offered rate is determined.

When the max-decrement command is not specified or removed, the virtual scheduler does not limit a decreasing offered rate to a specific limit.

The **no** form of this command is used to remove any currently configured maximum decrement limit for all child policers and queues associated with the policy.

Parameters *percent-of-admin-pir* — When the percent qualifier is used, this parameter specifies the percentage of the child's administrative PIR that should be used as the decrement limit to offered rate change. If a value of 100 or 100.00 is used, the system will interpret this equivalent to **no max-decrement**.

Values 1.00 to 100.00

rate-in-kilobits-per-second — When the rate qualifier is used, this parameter specifies an explicit rate, in kb/s, that should be used as the child's offered rate change sensitivity value. If a rate sensitivity of 0 is specified, the system interprets this equivalent to **no max-decrement**.

Values 0 to 100,000,000

Platforms All

17.85 max-delay

max-delay

Syntax **max-delay** *delay-time*
no max-delay [*delay-time*]

Context **[Tree]** (config>service>apipe>spoke-sdp>cell-concat max-delay)

Full Context configure service apipe spoke-sdp cell-concatenation max-delay

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the configuration of the maximum amount of time to wait while performing ATM cell concatenation into an MPLS packet before transmitting the MPLS packet. This places an upper bound on the amount of delay introduced by the concatenation process. When this amount of time is reached from when the first ATM cell for this MPLS packet was received, the MPLS packet is queued for transmission onto the pseudowire.

The **no** form of this command resets max-delay to its default value.

Parameters *delay-time* — Specifies the maximum amount of time, in hundreds of microseconds, to wait before transmitting the MPLS packet with whatever ATM cells have been received. For example, to bound the delay to 1 ms the user would configure 10 (hundreds of microseconds). The delay-time is rounded up to one of the following values 1, 5, 10, 50, 100, 200, 300 and 400.

Values 1 to 400

Default 400

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

17.86 max-description-size

max-description-size

Syntax **max-description-size** *size*
no max-description-size

Context **[Tree]** (config>service>nat>pcp-server-policy max-description-size)

Full Context configure service nat pcp-server-policy max-description-size

Description This command specifies the maximum length of mapping descriptions made by the PCP servers using this PCP policy.

Default max-description-size 64

Parameters *size* — Specifies the maximum length of mapping descriptions made by the PCP servers.

Values 1 to 64

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-drop-count

Syntax **max-drop-count** *count*
no max-drop-count

Context **[Tree]** (config>service>sdp>keep-alive max-drop-count)

Full Context configure service sdp keep-alive max-drop-count

Description This command configures the number of consecutive SDP keepalive failed request attempts or remote replies that can be missed after which the SDP is operationally downed. If the **max-drop-count** consecutive keepalive request messages cannot be sent or no replies are received, the SDP-ID will be brought operationally down by the keepalive SDP monitoring.

The **no** form of this command reverts the **max-drop-count** *count* value to the default settings.

Default max-drop-count 3

Parameters **count** — Specifies the number of consecutive SDP keepalive requests that are failed to be sent or replies missed, expressed as a decimal integer.

Values 1 to 5

Platforms All

17.88 max-ecmp-routes

max-ecmp-routes

Syntax **max-ecmp-routes** *max-routes*
no max-ecmp-routes

Context **[Tree]** (config>router>ldp max-ecmp-routes)

Full Context configure router ldp max-ecmp-routes

Description This command sets the maximum number of ECMP routes that LDP may use to resolve the next hop for a FEC.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: The system-wide maximum number of ECMP routes is limited by the **config**>**router**>**ecmp** command. This command, under the LDP context, simply allows LDP to use more than 32 routes, if they are available in RTM or TTM. When configured, the actual number of ECMP routes used by LDP is therefore min[**config**>**router**>**ecmp**, **config**>**router**>**ldp**>**max-ecmp-routes**].

The **no** form of this command reverts to the default value.

Default max-ecmp-routes 32

Parameters *max-routes* — Specifies the maximum number of routes.

Values 1 to 64

Platforms All

17.89 max-entries

max-entries

Syntax **max-entries** *count*
no max-entries

Context **[Tree]** (config>python>py-pol>cache max-entries)

Full Context configure python python-policy cache max-entries

Description This command configures the maximum number of Python cache entries that can be stored in the cache of this Python policy.

If the limit has been reached, a Python exception will be thrown when requested to store another data structure.

The **no** form of this command reverts to the default.

Default max-entries 128000

Parameters *count* — Specifies the maximum number of cache entries allowed.

Values 1 to 1000000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

max-entries

Syntax **max-entries** *max-entries*
no shutdown

Context **[Tree]** (config>app-assure>group>evt-log max-entries)

Full Context configure application-assurance group event-log max-entries

Description This command configures the number of entries in the buffer.

Default max-entries 500

Parameters *max-entries* — Specifies the maximum number of entries for the event log.

Values 1 to 100000

Default 500

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-entries

Syntax **max-entries** *max-entries*
no max-entries

Context **[Tree]** (conf>router>segment-routing>srv6>loc>static-function max-entries)

Full Context configure router segment-routing segment-routing-v6 locator static-function max-entries

Description This command configures the maximum number of entries from the function field that must be reserved for static End, End.X, or a service SID function assignment.

The **no** form of this command reverts to the default value.

Default max-entries 1

Parameters *max-entries* — Specifies the maximum number of entries for the SRv6 locator.

Values 1 to 1048575

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

17.90 max-entry-lifetime

max-entry-lifetime

Syntax **max-entry-lifetime** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no max-entry-lifetime

Context [Tree] (config>python>py-pol>cache max-entry-lifetime)

Full Context configure python python-policy cache max-entry-lifetime

Description This command configures the maximum allowed lifetime for each entry of the Python cache of this Python policy.

When adding data to the Python cache the lifetime of the given object must always be specified. If the specified lifetime is bigger than the configured value, then the value of the **max-entry-lifetime** will be used instead of the lifetime that was specified.

The **no** form of this command reverts to the default.

Default max-entry-lifetime days 1

Parameters **days** *days* — Specifies the maximum lifetime that can be set on a cache entry in days.

Values 0 to 7

Default 1

hrs *hours* — Specifies the maximum lifetime that can be set on a cache entry in hours.

Values 0 to 23

min *minutes* — Specifies the maximum lifetime that can be set on a cache entry in minutes.

Values 0 to 59

sec *seconds* — Specifies the maximum lifetime that can be set on a cache entry in seconds.

Values 0 to 59

Platforms All

17.91 max-fail

max-fail

Syntax **max-fail** *no-response-count*
no max-fail

Context [Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy max-fail)

Full Context configure saa test type-multi-line lsp-trace sr-policy max-fail

Description This command configures the maximum number of consecutive MPLS echo requests that do not receive a reply before the trace operation fails for a TTL.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default max-fail 5

Parameters *no-response-count* — Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer, that do not receive a reply before the trace operation fails for a TTL.

Values 1 to 255

Default 5

Platforms All

17.92 max-files-number

max-files-number

Syntax **max-files-number** *number*

Context **[Tree]** (config>call-trace max-files-number)

Full Context configure call-trace max-files-number

Description This command configures the maximum number of files call trace can create.

Default max-files-number 200

Parameters *number* — Specifies the maximum number of all call trace log files stored on all compact flash cards together.

Values 1 to 1024

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.93 max-fragment-delay

max-fragment-delay

Syntax **max-fragment-delay** *milliseconds*
no max-fragment-delay

Context **[Tree]** (config>router>l2tp>group>mlppp max-fragment-delay)
[Tree] (config>router>l2tp>group>tunnel>mlppp max-fragment-delay)
[Tree] (config>service>vprn>l2tp>group>mlppp max-fragment-delay)

[Tree] (config>service>vprn>l2tp>group>tunnel>mlppp max-fragment-delay)

Full Context configure router l2tp group mlppp max-fragment-delay
configure router l2tp group tunnel mlppp max-fragment-delay
configure service vprn l2tp group mlppp max-fragment-delay
configure service vprn l2tp group tunnel mlppp max-fragment-delay

Description This command is applicable only to LNS. It determines the maximum fragment delay caused by the transmission that will be imposed on a link.

Fragmentation can be used to interleave high priority packet in-between low priority fragments on a MLPPPoX session with a single link or on a MLPPPoX session with multiple links to better load balance traffic over multiple member links.

Default no max-fragment-delay

Parameters *milliseconds* — Specifies the interval, in milliseconds.

Values 5 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

17.94 max-groups

max-groups

Syntax **max-groups** *max-groups*
no max-groups

Context [Tree] (config>service>vprn>igmp>grp-if max-groups)
[Tree] (config>service>vprn>igmp>if max-groups)

Full Context configure service vprn igmp group-interface max-groups
configure service vprn igmp interface max-groups

Description This command configures the maximum number of groups for which IGMP can have local receiver information based on received IGMP reports on this interface. When this configuration is changed dynamically to a value lower than currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed.

The **no** form of this command removes the value.

Parameters *max-groups* — Specifies the maximum number of groups for this interface.

Values 1 to 16000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service vprn igmp group-interface max-groups

All

- configure service vprn igmp interface max-groups

max-groups

Syntax **max-groups** *value*
no max-groups

Context **[Tree]** (config>service>vprn>mld>if max-groups)

Full Context configure service vprn mld interface max-groups

Description This command specifies the maximum number of groups for which MLD can have local receiver information based on received MLD reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed.

Default 0 (no limit to the number of groups)

Parameters *value* — Specifies the maximum number of groups for this interface.

Values 1 to 16000

Platforms All

max-groups

Syntax **max-groups** *value*
no max-groups

Context **[Tree]** (config>service>vprn>pim>if max-groups)

Full Context configure service vprn pim interface max-groups

Description This command configures the maximum number of groups for which PIM can have downstream state based on received PIM Joins on this interface. This does not include IGMP local receivers on the interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed. When this object has a value of 0, there is no limit to the number of groups.

Parameters *value* — Specifies the maximum number of groups for this interface.

Values 1 to 16000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

max-groups

Syntax **max-groups** *value*
no max-groups

Context **[Tree]** (config>router>igmp>group-interface max-groups)
[Tree] (config>router>igmp>if max-groups)

Full Context configure router igmp group-interface max-groups
configure router igmp interface max-groups

Description This command specifies the maximum number of groups for which IGMP can have local receiver information based on received IGMP reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed. This command is applicable for IPv4 and IPv6.

The **no** form of the command sets no limit to the number of groups.

Default no max-groups

Parameters *value* — Specifies the maximum number of groups for this interface.

Values 1 to 16000

configure service vprn interface sap ipsec-tunnel max-history-esp-key-records

Description This command enables the system to keep records of CHILD-SA keys. There is a system wide limit of maximum number of IPsec tunnels that save keys. If the number of tunnel exceeds that limit, the system does not save keys for the new tunnels. Contact Nokia support for details of the limitation.

This command is ignored if the **config>ipsec>no show-ipsec-keys** command is configured.

The **no** form of this command prevents the system from keeping records.

Default no max-history-esp-key-records

Parameters *max-records* — Specifies the maximum number of recent records.

Values 1 to 48

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec ipsec-transport-mode-profile max-history-esp-key-records
- configure service ies interface sap ipsec-gw max-history-esp-key-records
- configure service vprn interface sap ipsec-gw max-history-esp-key-records
- configure service vprn interface sap ipsec-tunnel max-history-esp-key-records

VSR

- configure service ies interface ipsec ipsec-tunnel max-history-esp-key-records
- configure router interface ipsec ipsec-tunnel max-history-esp-key-records
- configure service vprn interface ipsec ipsec-tunnel max-history-esp-key-records

17.99 max-igmp-latency

max-igmp-latency

Syntax **max-igmp-latency** *milli-seconds*

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if max-igmp-latency)

Full Context configure mcast-management multicast-info-policy video-policy video-interface max-igmp-latency

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description After the subscriber requests a fast channel change using RTCP, the video ISA bursts the video content as unicast to the subscriber. When the unicasted content has caught up to the multicast, the video ISA sends a notification message using RTCP to the subscriber to switch over to multicast with an IGMP request. When the notification message from the video ISA is sent, the **max-igmp-latency** timer starts. The video ISA continues to send unicast video until the **max-igmp-latency** expires or until the subscriber, using RTCP, informs the video ISA of the exact sequence number to stop (whichever occurs first). The **max-igmp-latency** is the maximum delay that the multicast router takes to respond and deliver the multicast upon the subscriber IGMP request.

Parameters *milli-seconds* — The maximum delay in milli-seconds.

Values 10 to 1000

Default 100

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

17.100 max-lanext-bd

max-lanext-bd

Syntax **max-lanext-bd** [*value*]

Full Context configure service ies subscriber-interface group-interface wlan-gw max-lanext-bd
configure service vprn subscriber-interface group-interface wlan-gw max-lanext-bd

Description This command specifies the maximum number of HLE BDs for this group interface.

The **no** form of this command disables HLE for the group interface.

Parameters *value* — Specifies the maximum number of Bridged Domains for this interface.

Values 1 to 131071

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.101 max-lease-time

max-lease-time

Syntax **max-lease-time** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no max-lease-time

Context **[Tree]** (config>router>dhcp>server>pool max-lease-time)

Full Context configure router dhcp local-dhcp-server pool max-lease-time

Description This command configures the maximum lease time.

The **no** form of this command reverts to the default.

Default max-lease-time days 10

Parameters *max-lease-time* — Specifies the maximum lease time.

Values

days	0 to 3650
hours	0 to 23
minutes	0 to 59
seconds	0 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.102 max-lifetime

max-lifetime

Syntax **max-lifetime** *hours*
no max-lifetime

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>ccrt-replay max-lifetime)
[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>ccrt-replay max-lifetime)

Full Context configure subscriber-mgmt diameter-application-policy gx ccrt-replay max-lifetime
configure subscriber-mgmt diameter-application-policy gy ccrt-replay max-lifetime

Description This command specifies the maximum period of time that CCR-T messages for Diameter Gx or Gy sessions that belong to the Diameter application policy are replayed.

The **no** form of this command resets the maximum lifetime to the default value setting.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default max-lifetime 24

Parameters *hours* — Specifies the maximum lifetime after which the CCR-T messages are no longer replayed.

Values 1 to 24

Default 24

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.103 max-links

max-links

Syntax **max-links** *max-links*
no max-links

Context **[Tree]** (config>router>l2tp>group>mlppp max-links)
[Tree] (config>router>l2tp>group>tunnel>mlppp max-links)
[Tree] (config>service>vprn>l2tp>group>mlppp max-links)
[Tree] (config>service>vprn>l2tp>group>tunnel>mlppp max-links)

Full Context configure router l2tp group mlppp max-links
configure router l2tp group tunnel mlppp max-links
configure service vprn l2tp group mlppp max-links
configure service vprn l2tp group tunnel mlppp max-links

Description This command is applicable only to LNS. It determines the maximum number of links that can be put in a bundle.

Any attempt of a session to join a bundle that is above the max-link limit will be rejected.

If interleaving is configured, it is recommended that max-links be set to 1 or a version of the command is used (no max-links). Both have the same effect.

The configuration under the tunnel hierarchy will override the configuration under the group hierarchy.

The **no** form of this command limits the number of links in the bundle to 1.

Default no max-links

Parameters *max-links* — Specifies the maximum number of links in a bundle.

Values 1 to 8

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.104 max-list-length

max-list-length

Syntax **max-list-length unlimited**
max-list-length *count*
no max-list-length

Context **[Tree]** (config>router>l2tp>tunnel-sel max-list-length)
[Tree] (config>service>vprn>l2tp>tunnel-sel max-list-length)

Full Context configure router l2tp tunnel-selection-blacklist max-list-length
configure service vprn l2tp tunnel-selection-blacklist max-list-length

Description This command specifies the number of tunnels or peers that can be in the **tunnel-selection-blacklist**. If a tunnel or peer needs to be added to the denylist and the denylist is full, the system removes the item (tunnel or peer) from the denylist that was in this denylist for the longest time.

The **no** form of this command reverts to the default.

Default max-list-length unlimited

Parameters **unlimited** — Specifies there is no limit.

count — Specifies how many items (tunnels or peers) can be in the denylist.

Values 1 to 65635

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.105 max-lockout-hosts

max-lockout-hosts

Syntax **max-lockout-hosts** *hosts*
no max-lockout-hosts

Context **[Tree]** (config>subscr-mgmt>host-lockout-plcy max-lockout-hosts)

Full Context configure subscriber-mgmt host-lockout-policy max-lockout-hosts

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description When a client enters lockout, authentication and ESM host creation is suppressed. A lightweight context maintains the lockout state and the timeouts for the client in lockout. This command allows the number of lockout contexts to be configured per SAP. If the number of existing contexts reaches the configured count, incoming hosts that fail authentication or creation are not subject to lockout, and are retried as normal.

The **no** form of this command reverts to the default value.

Default max-lockout-hosts 100

Parameters *hosts* — Specifies the maximum number of lockout host.

Values 1 to 32000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.106 max-mac

max-mac

Syntax **max-mac** [*value*]
no max-mac

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>access max-mac)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>access max-mac)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext access max-mac
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext access max-mac

Description This command specifies the maximum number of allowed MAC addresses on the access side of HLE.

The **no** form of this command reverts to the default.

Default max-mac 20

Parameters *value* — Specifies the maximum number of MAC entries in bridged domains.

Values 1 to 128

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

max-mac

Syntax **max-mac** [*value*]
no max-mac

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>xconnect max-mac)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>xconnect max-mac)

Full Context configure service ies subscriber-interface group-interface wlan-gw ranges range vrgw lanext xconnect max-mac
configure service vprn subscriber-interface group-interface wlan-gw ranges range vrgw lanext xconnect max-mac

Description This command specifies the maximum number of allowed MAC in the bridge domain.

The **no** form of this command reverts to the default.

Default max-mac 20

Parameters *value* — Specifies the maximum number of MAC entries in bridged domains.

Values 1 to 128

max-mac

Syntax **max-mac** [*value*]
no max-mac

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>network max-mac)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>network max-mac)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext network max-mac
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext network max-mac

Description This command specifies the maximum number of allowed VM MAC addresses on the access side of HLE.

The **no** form of this command reverts to the default.

Default max-mac 20

Parameters *value* — Specifies the maximum number of VM MAC entries in bridged domains.

Values 1 to 128

17.107 max-msg-count

max-msg-count

Syntax **max-msg-count** *count*

Context **[Tree]** (config>system>telemetry>notification-bundling max-msg-count)

Full Context configure system telemetry notification-bundling max-msg-count

Description This command sets the maximum number of notifications that can be bundled in a single telemetry message.

The **no** form of this command returns the message count to the default value.

Default max-msg-count 100

Parameters *count* — Specifies the maximum of notifications that can be bundled in a single telemetry message.

Values 2 to 1000

Platforms All

17.108 max-msg-size

max-msg-size

Syntax **max-msg-size** *number*
no max-msg-size

Context **[Tree]** (config>system>grpc max-msg-size)

Full Context configure system grpc max-msg-size

Description This command configures the maximum rx message size that can be received.

The **no** form of this command reverts to the default.

Default max-msg-size 512

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *number* — Specifies the message size, in MB.

Values 1 to 1024

Default 512

Platforms All

17.109 max-nbr-mac-addr

max-nbr-mac-addr

Syntax **max-nbr-mac-addr** *table-size*
no max-nbr-mac-addr

Context **[Tree]** (config>service>template>vpls-sap-template max-nbr-mac-addr)
[Tree] (config>service>vpls>endpoint max-nbr-mac-addr)
[Tree] (config>service>vpls>sap max-nbr-mac-addr)
[Tree] (config>service>vpls>spoke-sdp max-nbr-mac-addr)
[Tree] (config>service>vpls>vxlan max-nbr-mac-addr)

Full Context configure service template vpls-sap-template max-nbr-mac-addr
configure service vpls endpoint max-nbr-mac-addr
configure service vpls sap max-nbr-mac-addr
configure service vpls spoke-sdp max-nbr-mac-addr
configure service vpls vxlan max-nbr-mac-addr

Description This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this SAP, spoke-SDP, endpoint, or VXLAN instance.

When the configured limit is reached, and **discard-unknown-source** is enabled for this SAP, spoke-SDP, or static VXLAN instance (see **config>service>vpls>sap discard-unknown-source** or **config>service>vpls>spoke-sdp discard-unknown-source**), then packets with unknown source MAC addresses are discarded.

The **no** form of the command restores the global MAC learning limitations for the SAP or spoke-SDP, or VXLAN instance.

Default no max-nbr-mac-addr

Parameters *table-size* — Specifies the maximum number of learned and static entries allowed in the FDB of this service.

Values 1 to 511999 for the 7750 SR
1 to 131071 for the 7450 ESS

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.115 max-path

max-path

Syntax **max-path** *max-paths*
no max-path

Context **[Tree]** (config>test-oam>ldp-treetrace>path-discovery max-path)

Full Context configure test-oam ldp-treetrace path-discovery max-path

Description This command configures the maximum number of ECMP paths the path discovery attempts to discover for each run every **interval** minute.

The **no** form of this command resets the time out to its default value.

Default no max-path

Parameters *max-paths* — Specifies the tree discovery maximum path.

Values 1 to 128

Platforms All

17.116 max-payload-length

max-payload-length

Syntax **max-payload-length direction** *direction* [**create**]
no max-payload-length direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>gtp-filter max-payload-length)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter max-payload-length

Description This command configures a TCA for the counter capturing drops due to the GTP filter maximum payload length. A maximum payload length drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a maximum payload length drop TCA.

Default none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-payload-length

Syntax **max-payload-length** *bytes*
no max-payload-length

Context **[Tree]** (config>app-assure>group>gtp>gtp-filter max-payload-length)

Full Context configure application-assurance group gtp gtp-filter max-payload-length

Description This command specifies the maximum allowed GTP payload size.

The **no** form of this command removes this GTP message length filter.

Default no max-payload-length

Parameters *bytes* — Specifies the packet length in bytes.

Values 0 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.117 max-peer

max-peer

Syntax **max-peer** *max-peer*
no max-peer

Context **[Tree]** (config>port>ethernet>dot1x>macsec>sub-port max-peer)

Full Context configure port ethernet dot1x macsec sub-port max-peer

Description This command configures the max peer allowed under this MACsec instance.

Note: The peer establishment is a race condition and first come first serve. On any security zone, only 32 peers can be supported. See SA Exhaustion Behavior for more details.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the value to the default.

Default no max-peer

Parameters *max-peer* — The maximum number of peers supported on this port.

Values 0 to 32

Platforms All

17.118 max-percent-rate

max-percent-rate

Syntax **max-percent-rate** *percentage* [**local-limit** | **reference-port-limit**]
no max-percent-rate

Context **[Tree]** (config>qos>plcr-ctrl-plcy>root max-percent-rate)

Full Context configure qos policer-control-policy root max-percent-rate

Description This command configures the maximum percentage rate for the policer control policy.

The **no** form of this command removes the configuration.

Parameters *percentage* — Specifies the percentage.

Values 0.01 to 100.00

local-limit — Keyword used to specify the local limit.

reference-port-limit — Keyword used to specify the reference port limit.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

17.119 max-prob

max-prob

Syntax **max-prob** *percent*
no max-prob

Context **[Tree]** (config>qos>slope-policy>exceed-slope max-prob)
[Tree] (config>qos>slope-policy>highplus-slope max-prob)
[Tree] (config>qos>slope-policy>high-slope max-prob)

Use subject to Terms available at: www.nokia.com

[Tree] (config>qos>slope-policy>low-slope max-prob)

Full Context configure qos slope-policy exceed-slope max-prob
configure qos slope-policy high-slope max-prob
configure qos slope-policy highplus-slope max-prob
configure qos slope-policy low-slope max-prob

Description Sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the maximum non-one packet discard probability value before the packet discard probability rises directly to one. The percent parameter is expressed as a percentage of packet discard probability where always discard is a probability of 1. A **max-prob** value of 80 represents 80% of 1, or a packet discard probability of 0.8.

The **no** form of this command restores the **max-prob** value to the default setting.

Default max-prob 80

Parameters *percent* — The maximum drop probability percentage corresponding to the **max-avg,** expressed as a decimal integer.

Values 0 to 100

Platforms All

17.120 max-queue-size

max-queue-size

Syntax **max-queue-size** *queue-size*
no max-queue-size

Context [Tree] (config>qos>mlppp-profile-egress>class max-queue-size)

Full Context configure qos mlppp-profile-egress class max-queue-size

Description This command configures the maximum queue size for each MLPPP class queue for this profile.

Parameters *queue-size* — Specifies the maximum queue size in ms of buffer space.

Values 1 to 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-queue-size

Syntax **max-queue-size** *queue-size*

max-rate

Syntax **max-rate** {*rate* | **max**}
no max-rate

Context **[Tree]** (config>subscr-mgmt>sub-prof>ingress>policer-control-policy max-rate)
[Tree] (config>subscr-mgmt>sub-prof>egress>policer-control-policy max-rate)

Full Context configure subscriber-mgmt sub-profile egress policer-control-policy max-rate
configure subscriber-mgmt sub-profile ingress policer-control-policy max-rate

Description The **max-rate** command defines the parent policer's PIR leaky bucket's decrement rate. A parent policer is created for each time the policer-control-policy is applied to either a SAP or subscriber instance. Packets that are not discarded by the child policers associated with the SAP or subscriber instance are evaluated against the parent policer's PIR leaky bucket.

For each packet, the bucket is first decremented by the correct amount based on the decrement rate to derive the current bucket depth. The current depth is then compared to one of two discard thresholds associated with the packet. The first discard threshold (discard-unfair) is applied if the FIR (Fair Information Rate) leaky bucket in the packet's child policer is in the confirming state. The second discard threshold (discard-all) is applied if the child policer's FIR leaky bucket is in the exceed state. Only one of the two thresholds is applied per packet. If the current depth of the parent policer PIR bucket is less than the threshold value, the parent PIR bucket is in the conform state for that particular packet. If the depth is equal to or greater than the applied threshold, the bucket is in the violate state for the packet.

If the result is "conform," the bucket depth is increased by the size of the packet (plus or minus the per-packet-offset setting in the child policer) and the packet is not discarded by the parent policer. If the result is "violate," the bucket depth is not increased and the packet is discarded by the parent policer. When the parent policer discards a packet, any bucket depth increases (PIR, CIR and FIR) in the parent policer caused by the packet are canceled. This prevents packets that are discarded by the parent policer from consuming the child policers PIR, CIR and FIR bandwidth.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

The **no** form of this command reverts to the default.

Default max-rate max

Parameters *rate* — Specifies the max rate in kilobits per second. Defining the *rate* value is mutually exclusive with the **max** parameter. The *rate* (in kilobits per second) value must be defined as an integer that represents the number of kilobytes that the parent policer is decremented per second. The actual decrement is performed per packet based on the time that has elapsed since the last packet associated with the parent policer.

Values 0 to 2000000000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

max — Specifies the maximum frame-based bandwidth limit of this policer. The **max** parameter is mutually exclusive with defining a *rate* (in kilobits per second) value. When max is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when a **no max-rate** command is executed. In order for the parent policer to be effective, a *rate* (in kilobits per second) value should be specified.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-rate

Syntax **max-rate** {*rate* | **max**}
no max-rate

Full Context configure card fp ingress access queue-group policer-control-override max-rate
configure card fp ingress network queue-group policer-control-override max-rate

Description This command defines the parent policer's PIR leaky bucket's decrement rate. A parent policer is created for each time the policer-control-policy is applied to either a SAP or subscriber instance. Packets that are not discarded by the child policers associated with the SAP or subscriber instance are evaluated against the parent policer's PIR leaky bucket.

For each packet, the bucket is first decremented by the correct amount based on the decrement rate to derive the current bucket depth. The current depth is then compared to one of two discard thresholds associated with the packet. The first discard threshold (discard-unfair) is applied if the FIR (Fair Information Rate) leaky bucket in the packet's child policer is in the confirming state. The second discard threshold (discard-all) is applied if the child policer's FIR leaky bucket is in the exceed state. Only one of the two thresholds is applied per packet. If the current depth of the parent policer PIR bucket is less than the threshold value, the parent PIR bucket is in the conform state for that particular packet. If the depth is equal to or greater than the applied threshold, the bucket is in the violate state for the packet.

If the result is "conform," the bucket depth is increased by the size of the packet (plus or minus the per-packet-offset setting in the child policer) and the packet is not discarded by the parent policer. If the result is "violate," the bucket depth is not increased and the packet is discarded by the parent policer. When the parent policer discards a packet, any bucket depth increases (PIR, CIR and FIR) in the parent policer caused by the packet are canceled. This prevents packets that are discarded by the parent policer from consuming the child policers PIR, CIR and FIR bandwidth.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the policer-control-policy's parent policer maximum rate to **max**.

Default max-rate max

Parameters *rate* — Specifies that a kilobits-per-second value is mutually exclusive with the **max** keyword. The kilobits-per-second value must be defined as an integer that represents the number of kilobytes that the parent policer will be decremented per second. The actual decrement is performed per packet based on the time that has elapsed since the last packet associated with the parent policer.

Values 0 to 2000000000

max — The **max** keyword is mutually exclusive with defining a kilobits-per-second value. When max is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when no max-rate is executed. In order for the parent policer to be effective, a kilobits-per-second value should be specified.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

max-rate

Syntax **max-rate** *pir-rate*
max-rate percent *percent-rate*
no max-rate

Context **[Tree]** (config>port>ethernet>egr-scheduler-override max-rate)
[Tree] (config>port>sonet-sdh>path>egr-scheduler-override max-rate)
[Tree] (config>port>tdm>ds1>channel-group>egr-scheduler-override max-rate)

Full Context configure port ethernet egress-scheduler-override max-rate
configure port sonet-sdh path egress-scheduler-override max-rate
configure port tdm ds1 channel-group egress-scheduler-override max-rate
configure port tdm ds3 egress-scheduler-override max-rate
configure port tdm e1 channel-group egress-scheduler-override max-rate
configure port tdm e3 egress-scheduler-override max-rate

Description This command overrides the **max-rate** parameter found in the port-scheduler-policy associated with the port. When a max-rate is defined at the port or channel level, the port scheduler policies max-rate parameter is ignored.

The egress-scheduler-override **max-rate** command supports a parameter that allows the override command to restore the default of not having a rate limit on the port scheduler. This is helpful when the port scheduler policy has an explicit maximum rate defined and it is desirable to remove this limit at the port instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the maximum rate override from the egress port or channels port scheduler context. Once removed, the max-rate parameter from the port scheduler policy associated with the port or channel will be used by the local scheduler context.

Parameters *pir-rate* — Specifies the explicit maximum frame based bandwidth limit, in kilobits per second. This value overrides the QoS scheduler policy rate.

Values **For Ethernet:** 1 to 6400000000, **max**
For SONET-SDH and TDM: 1 to 3200000000, **max**

percent-rate — Specifies the percent rate.

Values 0.01 to 100.00

When the override is defined, modifications to the policer-control-policy max-rate parameter have no effect on the SAP's parent policer until the override is removed using the **no max-rate** command within the SAP.

The **no** form of this command returns the policer-control-policy's parent policer maximum rate to **max**.

Parameters *rate* **| max** — Specifies the rate override in kilobits per second or use the maximum override value.

Values 1 to 6400000000, max

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

max-rate

Syntax **max-rate** *rate*
no max-rate

Context [Tree] (config>qos>plcr-ctrl-plcy>root max-rate)

Full Context configure qos policer-control-policy root max-rate

Description The **max-rate** command defines the parent policer's PIR leaky bucket's decrement rate. A parent policer is created for each time the policer-control-policy is applied to either a SAP or subscriber instance for the 7450 ESS and 7750 SR, or multiservice site instance for the 7950 XRS. Packets that are not discarded by the child policers associated with the SAP or subscriber or multiservice site instances are evaluated against the parent policer's PIR leaky bucket.

For each packet, the bucket is first decremented by the correct amount based on the decrement rate to derive the current bucket depth. The current depth is then compared to one of two discard thresholds associated with the packet. The first discard threshold (discard-unfair) is applied if the FIR (Fair Information Rate) leaky bucket in the packet's child policer is in the confirming state. The second discard threshold (discard-all) is applied if the child policer's FIR leaky bucket is in the exceed state. Only one of the two thresholds is applied per packet. If the current depth of the parent policer PIR bucket is less than the threshold value, the parent PIR bucket is in the conform state for that particular packet. If the depth is equal to or greater than the applied threshold, the bucket is in the violate state for the packet.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the result is “conform,” the bucket depth is increased by the size of the packet (plus or minus the per-packet-offset setting in the child policer) and the packet is not discarded by the parent policer. If the result is “violate,” the bucket depth is not increased and the packet is discarded by the parent policer. When the parent policer discards a packet, any bucket depth increases (PIR, CIR and FIR) in the parent policer caused by the packet are canceled. This prevents packets that are discarded by the parent policer from consuming the child policers PIR, CIR, and FIR bandwidth.

The **policer-control-policy root max-rate** setting may be overridden on each SAP or sub-profile where the policy is applied.

The **no** form of this command returns the policer-control-policy’s parent policer maximum rate to **max**.

Parameters *rate* — The kilobits-per-second value must be defined as an integer that represents the number of kilobytes that the parent policer will be decremented per second. The actual decrement is performed per packet, based on the time that has elapsed since the last packet associated with the parent policer.

Values 1 to 6400000000, **max**

max — When **max** is specified, the parent policer does not enforce a maximum rate on the aggregate throughput of the child policers. This is the default setting when the **policer-control-policy** is first created and is the value that the parent policer returns to when no max-rate is executed. In order for the parent policer to be effective, a kilobits-per-second value should be specified.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

max-rate

Syntax **max-rate** *rate*
no max-rate

Context **[Tree]** (config>qos>hs-scheduler-policy max-rate)

Full Context configure qos hs-scheduler-policy max-rate

Description This command defines an explicit maximum frame-based bandwidth limit for the HS scheduler policy scheduler context. If a maximum rate is defined that is smaller than the port rate, the port is rate-limited to the configured megabits per second value. This command can be executed at any time for any non-default existing HS scheduler policy.

The **no** form of the command removes an explicit rate value from the HS scheduler policy. After the explicit rate value is removed, all instances of the scheduler policy on HSQ egress ports are allowed to run at the available line rate unless the instance has a max rate override in place.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *rate* — Specifies the explicit maximum frame-based bandwidth limit, in megabits per second. This parameter is required when executing this command.

Values 1 to 100000, max

Platforms 7750 SR-7/12/12e

max-rate

Syntax **max-rate** *pir-rate*
max-rate percent *percent-rate*
no max-rate

Context **[Tree]** (config>qos>port-scheduler-policy max-rate)

Full Context configure qos port-scheduler-policy max-rate

Description This command defines an explicit maximum frame-based bandwidth limit for the port scheduler policies scheduler context. By default, when a scheduler policy is associated with a port or channel, the instance of the scheduler on the port automatically limits the bandwidth to the lesser of port or channel line rate and a possible egress-rate value (for Ethernet ports). If a max-rate is defined that is smaller than the port or channel rate, the expressed kilobits per second value is used instead. The max-rate command is another way to sub-rate the port or channel. This command can be used on channels only on the 7450 ESS and 7750 SR.

The **max-rate** command may be executed at any time for an existing port-scheduler-policy. When a new max-rate is given for a policy, the system evaluates all instances of the policy to see if the configured rate is smaller than the available port or channel bandwidth. If the rate is smaller and the maximum rate is not currently overridden on the scheduler instance, the scheduler instance is updated with the new maximum rate value.

The max-rate value defined in the policy may be overridden on each scheduler instance. If the maximum rate is explicitly defined as an override on a port or channel, the policies max-rate value has no effect.

The **no** form of this command removes an explicit rate value from the port scheduler policy. When removed, all instances of the scheduler policy on egress ports or channel are allowed to run at the available line rate unless the instance has a max-rate override in place.

Parameters *pir-rate* — Specifies the PIR rate, in kilobits per second.

Values 1 to 6400000000, **max**

percent *percent-rate* — Specifies the percent rate.

Values 0.01 to 100.00

The **no** form of this command removes the value from the configuration.

Default no max-retries-not-estab

Parameters *max-retries* — Specifies the maximum number of retries for non-established tunnels.

Default no max-retries-not-estab

Values 2 to 7

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.124 max-routes

max-routes

Syntax **max-routes** *routes*
no max-routes

Context [Tree] (config>aaa>route-downloader max-routes)

Full Context configure aaa route-downloader max-routes

Description This command determines the upper limits for total number of routes to be received and accepted by the system. The total number is inclusive of both IPv4 and IPv6 addresses and no differentiation is needed across protocols. It includes the sum of both. Once this limit is reached, the download process stops sending new access-requests until the next download-interval expires.

The **no** form of this command reverts to the default value.

Default max-routes 200000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *routes* — Specifies the maximum number of the routes imported.

Values 1 to 200000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description This command configures the per-client maximum number of sessions.

The **no** form of the command reverts to the default value.

Default max-sessions 256

Parameters *sessions* — Specifies the per-client maximum number of sessions.

Values 1 to 65536

Default 256

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

17.129 max-sessions-per-cid

max-sessions-per-cid

Syntax **max-sessions-per-cid** *sessions* [**allow-sessions-without-cid**]
no max-sessions-per-cid

Context **[Tree]** (config>subscr-mgmt>ppp-policy max-sessions-per-cid)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt ppp-policy max-sessions-per-cid

Description This command configures the maximum number of PPPoE sessions with the same Agent Circuit ID that can be active on the same SAP or MSAP. The limit is enforced in the discovery phase, prior to PAP or CHAP authentication and is based on the Agent Circuit ID sub-option that is present in the vendor-specific PPPoE access loop identification tag added in PADI and PADR messages by a PPPoE intermediate agent.

When the optional **allow-sessions-without-cid** keyword is specified, PPPoE sessions without an Agent Circuit ID can be established. The configured sessions limit does not apply to these sessions.

By default, there is no limit for the number of PPPoE sessions with the same Agent Circuit ID that are active on the same SAP or MSAP. Sessions without Agent Circuit ID can be established.

The **no** form of this command reverts to the default value.

Default no max-sessions-per-cid

Parameters *sessions* — Specifies the maximum number of sessions with the same circuit ID that can be active on the same SAP or MSAP.

Values 1 to 8190

allow-sessions-without-cid — Specifies to enable support for PPPoE sessions without a circuit ID while a **max-sessions-per-cid** limit is configured on a SAP or MSAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.130 max-sessions-per-mac

max-sessions-per-mac

Syntax **max-sessions-per-mac** *sessions* [**allow-same-circuit-id-for-dhcp**]
no max-sessions-per-mac

Context **[Tree]** (config>subscr-mgmt>ppp-policy max-sessions-per-mac)

Full Context configure subscriber-mgmt ppp-policy max-sessions-per-mac

Description This command sets the maximum PPP sessions that can be opened for a given MAC address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To enable IPv4 address allocation using the internal DHCPv4 client for multiple PPPoE sessions on a single SAP and having the same MAC address and circuit-ID, the optional CLI parameter **allow-same-circuit-id-for-dhcp** should be added. The SR OS local DHCP server detects the additional vendor-specific options inserted by the internal DHCPv4 client and use an extended unique key for lease allocation.

The **no** form of this command reverts to the default value.

Parameters *sessions* — Specifies the maximum PPP sessions that can be opened for the given MAC address.

Values 1 to 8191

allow-same-circuit-id-for-dhcp — Enables support for IPv4 address allocation using the internal DHCPv4 client for multiple PPPoE sessions on a single SAP that have the same MAC address and circuit ID.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.131 max-setup-time

max-setup-time

Syntax **max-setup-time** [[*up-interval*] | **infinite**]
no max-setup-time

Context **[Tree]** (config>lag>bfd>family max-setup-time)

Full Context configure lag bfd family max-setup-time

Description This command specifies the maximum amount of time the router will forward traffic over a link that has transitioned from Standby to Active, before the micro-BFD session must be fully established (Up state).

The **no** form of this command returns the timer value to the default (0) which indicates that forwarding will not start until the BFD session is established.

Default max-setup-time infinite

Parameters *up-interval* — Specifies the amount of time, in milliseconds.

Values -1 to 60000

infinite — Specifies no end time to forward traffic.

Platforms All

17.134 max-sr-labels

max-sr-labels

Syntax **max-sr-labels** *label-stack-size* [**additional-frr-labels** *labels*]
no max-sr-labels

Context [Tree] (config>router>mpls>lsp max-sr-labels)
[Tree] (config>router>mpls>lsp-template max-sr-labels)

Full Context configure router mpls lsp max-sr-labels
configure router mpls lsp-template max-sr-labels

Description This command configures the maximum number of labels which the ingress LER can push for a given SR-TE LSP.

This command is used to allow room to insert additional transport, service, and other labels when packets are forwarded in a given context.

The **max-sr-labels** *label-stack-size* value should reflect the desired maximum label stack of the primary path of the SR-TE LSP.

The value in **additional-frr-labels** *labels* should reflect additional labels inserted by remote LFA for the backup next-hop of the SR-TE LSP.

The sum of both label values represents the worst case transport of SR label stack size for this SR-TE LSP and is populated by MPLS in the TTM such that services and shortcut applications can check it to decide if a service can be bound or a route can be resolved to this SR-TE LSP.

The maximum label stack supported by the router is always signaled by PCC in the PCEP Open object as part of the as SR-PCE-CAPABILITY TLV. It is referred to as the Maximum Stack Depth (MSD).

In addition, the per-LSP value for the max-sr-labels option, if configured, is signaled by PCC to PCE in the Segment-ID (SID) Depth value in a METRIC object for both a PCE computed LSP and a PCE controlled LSP. PCE will compute and provide the full explicit path with TE-links specified. If there is no path with the number of hops lower than the MSD value, or the Segment-ID (SID) Depth value if signaled, a reply with no path will be returned to PCC.

For a PCC controlled LSP, if the label stack returned by the TE-DB's hop-to-label translation exceeds the per LSP maximum SR label stack size, the LSP is brought down.

The **no** form of this command reverts to the default value.

Default max-sr-labels 6 additional-frr-labels 1

Parameters *label-stack-size* — Specifies the label stack size.

Values 1 to 11

additional-frr-labels *labels* — Specifies the addition FRR labels.

Values 0 to 3

[Tree] (config>router>mpls>lsp-template>egr-stats max-stats)

Full Context configure router mpls ingress-statistics p2mp-template-lsp max-stats
configure router mpls ingress-statistics p2p-template-lsp max-stats
configure router mpls lsp egr-stats max-stats
configure router mpls lsp-template egr-stats max-stats

Description This command enables accounting and statistical data collection. When applying accounting policies the data, by default, is collected in the appropriate records and written to the designated billing file.

The config>router>mpls>ingr-stats>p2mp-template-lsp>max-stats command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

When the **no max-stats** command is issued the statistics are still accumulated by the forwarding engine. However, the CPU will not obtain the results and write them to the billing file. If a subsequent **max-stats** command is issued then the counters written to the billing file include all the traffic while the **no max-stats** command was in effect.

17.145 max-tx-delay

max-tx-delay

Syntax **max-tx-delay** *deci-seconds*
no max-tx-delay

Context **[Tree]** (config>mcast-mgmt>mcast-rprt-dest max-tx-delay)

Full Context configure mcast-management mcast-reporting-dest max-tx-delay

Description This command specifies the time interval before the packet starts transmitting towards the destination. When an IGMP event is encoded and ready to be transported, a buffer for the packet is allocated (if not already existent). The events are written into this buffer. Along with the initial buffer creation, a timer is started. The trigger for the transmission of the packet is either the TX buffer being filled up to 1400 B, or the timer expiry, whichever comes first.

The **no** form of this command reverts to the default.

Parameters *deci-seconds* — Specifies the maximum delay after which any cached reports are flushed to the reporting destination.

Values 0 to 100

Platforms All

max-tx-delay

Syntax **max-tx-delay** *deciseconds*
no max-tx-delay

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy max-tx-delay)

Full Context configure service nat syslog syslog-export-policy max-tx-delay

Description This command enables aggregation of flow log messages within a syslog frame. It introduces a delay during which logs are collected in each BB-ISA so they can be sent in a single syslog message to conserve system resources and network bandwidth.

When aggregation is enabled, generation of a syslog frame carrying multiple flow logs is triggered by one of the two events (whichever occurs first):

- Expiry of the max-tx-delay timer
- Exceeding MTU size

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command reverts to the default.

Default max-tx-delay 3

Parameters *deciseconds* — Specifies the maximum time a syslog message is delayed in the system's output buffer.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.146 max-ve-id

max-ve-id

Syntax **max-ve-id** *value*
no max-ve-id

Context **[Tree]** (config>service>vpls>bgp-vpls max-ve-id)

Full Context configure service vpls bgp-vpls max-ve-id

Description This command configures the allowed range for the VE-id value: locally configured and received in a NLRI. Configuration of a VE-id higher than the value specified in this command is not allowed.

Also upon reception of a higher VE-id in an NLRI imported in this VPLS instance (RT is the configured import RT) the following action must be taken:

- a trap must be generated informing the operator of the mismatch.
- NLRI must be dropped
- no service labels are to be installed for this VE-id
- no new NLRI must be generated if a new offset is required for VE-id.

The **no** form of this command sets the max-ve-id to un-configured. The BGP VPLS status should be administratively down for “no max-ve-id” to be used.

The max-ve-id value can be changed without shutting down bgp-vpls if the newly provisioned value does not conflict with the already configured local VE-ID. If the value of the local-VE-ID is higher than the new max-ve-id value the command is rejected. The operator needs to decrease first the VE-ID before running the command.

The actions taken for other max-ve-id values are as follows:

- max-ve-id value higher than all VE-IDs (local and received) is allowed and there are no effects.
- max-ve-id higher than the local VE-ID but smaller than the remote VE-IDs:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Provisioning is allowed
- A warning message will be generated stating that “Higher VE-ID values were received in the BGP VPLS context. Related pseudowires will be removed.”
- The pseudowires associated with the higher VE-IDs will be removed locally.
- This is a situation that should be corrected by the operator as the pseudowire may be down just at the local PE, consuming unnecessarily core bandwidth. The higher VE-IDs should be removed or lowered.

If the max-ve-id has increased a BGP route refresh is sent to the VPLS community to get the routes which might have been rejected earlier due to max-ve-id check. A max-ve-id value needs to be provisioned for BGP VPLS to be in “no shutdown” state.

Default no max-ve-id

Parameters *value* — Specifies the allowed range of [1-value] for the VE-id. The configured value must be bigger than the existing VE-ids

Values 1 to 65535

Platforms All

17.147 max-wait-to-advertise

max-wait-to-advertise

Syntax **max-wait-to-advertise** *seconds*
no max-wait-to-advertise

Context **[Tree]** (config>service>vprn>bgp>convergence>family max-wait-to-advertise)

Full Context configure service vprn bgp convergence family max-wait-to-advertise

Description This command configures the maximum amount of time that BGP waits until it starts advertising IPv4-unicast or IPv6-unicast routes to its BGP peers. For IPv4-unicast routes, *seconds* is measured from the time when the first peer that supports the IPv4-unicast address family comes up. For IPv6-unicast routes *seconds* is measured from the time when the first peer that negotiates the IPv6-unicast address family comes up.

The time limit configured by this command should allow sufficient time for all important peers to re-establish their sessions with the restarting router and advertise their complete set of IPv4-unicast or IPv6-unicast routes (followed by the applicable End of RIB marker).

The **no** form of this command implements the default value, which is three times the value of the **min-wait-to-advertise** time limit.

Default no max-wait-to-advertise

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the maximum amount of time, in seconds, that BGP waits until IPv4-unicast or IPv6-unicast routes are advertised to peers.

Values 0 to 3600

Platforms All

max-wait-to-advertise

Syntax **max-wait-to-advertise** *seconds*
no max-wait-to-advertise

Context **[Tree]** (config>router>bgp>convergence>family max-wait-to-advertise)

Full Context configure router bgp convergence family max-wait-to-advertise

Description This command configures the maximum amount of time that BGP waits until it starts advertising IPv4-unicast or IPv6-unicast routes to its BGP peers. For IPv4-unicast routes, the time limit value is measured from the time when the first peer that supports the IPv4-unicast address family comes up. For IPv6-unicast routes the time limit value is measured from the time when the first peer that negotiates the IPv6-unicast address family comes up.

The time limit configured by this command should allow sufficient time for all important peers to re-establish their sessions with the restarting router and advertise their complete set of IPv4-unicast or IPv6-unicast routes (followed by the applicable End of RIB marker).

The **no** form of this command implements the default value, which is three times the value of the **min-wait-to-advertise** time-limit.

Default no max-wait-to-advertise

Parameters *seconds* — Specifies the maximum amount of time, in seconds, that BGP waits until IPv4-unicast or IPv6-unicast routes are advertised to peers.

Values 0 to 3600

configure service vprn dhcp6 local-dhcp-server failover maximum-client-lead-time
configure service vprn dhcp6 local-dhcp-server pool failover maximum-client-lead-time

Description The **maximum-client-lead-time** (MCLT) is the maximum time that a DHCP server can extend client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environment, the initial lease time for all DHCP clients is by default restricted to MCLT. Consecutive DHCP renews can extend the lease time beyond the MCLT.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The MCLT is a safeguard against IP address/prefix duplication in cases of a lease synchronization failure when local-remote failover model is deployed.

Once the intercommunication link failure between the redundant DHCP servers is detected, the DHCP IP address range configured as remote will not be allowed to start delegating new leases until the MCLT + partner-down-delay intervals expire. This is to ensure that the new lease that was delegated from the local IP address-range/prefix on one node but was never synchronized due to the intercommunication link failure, will expire before the same IP address/prefix is allocated from the remote IP address-range/prefix on the other node.

However, the already existing (and synchronized) lease times can be renewed from the remote IP address range at any time, regardless of the state of the intercommunication link (operational or failed).

Lease synchronization failure can be caused either by a node failure, or a failure of the link over which the DHCP leases are synchronized (intercommunication link). Synchronization failure detection can take up to 3 seconds.

During the failure, the DHCP lease time for the new clients is restricted to MCLT while for the existing clients the lease time will over time (by consecutive DHCP renews) be gradually reduced to the MCLT.

The **no** form of this command reverts to the default.

Default maximum-client-lead-time min 10

Parameters *maximum-client-lead-time* — Specifies the maximum client lead time.

Values

hrs *hours*	1 to 23
min *minutes*	1 to 59
sec *seconds*	1 to 59

configure service vprn dhcp local-dhcp-server pool subnet maximum-declined

Description This command configures the maximum number of declined addresses allowed.

The **no** form of the reverts to the default.

Default maximum-declined 64

Parameters *maximum-declined* — Specifies the maximum number of declined addresses allowed.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.151 maximum-ipv6-routes

maximum-ipv6-routes

Syntax **maximum-ipv6-routes** *number* [**log-only**] [**threshold** *percentage*]
no maximum-ipv6-routes

Context **[Tree]** (config>service>vprn maximum-ipv6-routes)

Full Context configure service vprn maximum-ipv6-routes

Description This command specifies the maximum number of remote IPv6 routes that can be held within a VPN routing/ forwarding (VRF) context. The **local**, **host**, **static** and **aggregate** routes are not counted.

The VPRN service ID must be in a shutdown state in order to modify maximum-routes command parameters.

If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then the offending RIP peer (if applicable) is brought down (but the VPRN instance remains up). BGP peering will remain up but the exceeding BGP routes will not be added to the VRF.

The maximum route threshold can dynamically change to increase the number of supported routes even when the maximum has already been reached. Protocols will resubmit their routes which were initially rejected.

The **no** form of this command disables any limit on the number of routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default 0 or disabled — The threshold will not be raised.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *number* — An integer that specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only — Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

threshold *percentage* — The percentage at which a warning log message and SNMP trap should be set. There are two warnings, the first is a mid-level warning at the threshold value set and the second is a high-level warning at level between the maximum number of routes and the mid-level rate ([mid+max] / 2).

Values 0 to 100

The **no** form of this command reverts to the default values.

Default maximum-p2mp-spmsi 10

Parameters *range* — Specifies the maximum number of RSVP P2MP or LDP P2MP S-PMSI tunnels for the GTM.

Values 1 to 4000

Default 10

Platforms All

17.153 maximum-paths

maximum-paths

Syntax **maximum-paths** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no maximum-paths

Context [Tree] (config>service>vprn>bgp>multi-path maximum-paths)

Full Context configure service vprn bgp multi-path maximum-paths

Description This command sets ECMP multi-path parameters that apply to all address families for that BGP multi-path. For some address families it is possible to override these settings on a per address family basis.

When multi-path is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multi-path, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64).
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGP learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command disables BGP multi-path.

Default no maximum-paths

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

egp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path-as — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

maximum-paths

Syntax **maximum-paths** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no maximum-paths

Context **[Tree]** (config>router>bgp>multi-path maximum-paths)

Full Context configure router bgp multi-path maximum-paths

Description This command sets ECMP multipath parameters that apply to all address families for that BGP multipath. For some address families it is possible to override these settings on a per address family basis.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command disables BGP multipath.

Default no maximum-paths

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

17.154 maximum-recovery-time

maximum-recovery-time

Syntax **maximum-recovery-time** *interval*
no maximum-recovery-time

Context **[Tree]** (config>router>ldp>graceful-restart maximum-recovery-time)

Full Context configure router ldp graceful-restart maximum-recovery-time

Description This command configures the local maximum recovery time.

The **no** form of this command returns the default value.

Default no maximum-recovery-time (which equals a value of 120 seconds)

Parameters *interval* — Specifies the length of time in seconds.

Values 15 to 1800

Platforms All

17.155 maximum-routes

maximum-routes

Syntax **maximum-routes** *number* [**log-only**] [**threshold** *percentage*]
no maximum-routes

Context **[Tree]** (config>service>vprn maximum-routes)

Full Context configure service vprn maximum-routes

Description This command specifies the maximum number of remote routes that can be held within a VPN routing/ forwarding (VRF) context. The **local**, **host**, **static** and **aggregate** routes are not counted.

The VPRN service ID must be in a shutdown state in order to modify maximum-routes command parameters.

If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then the offending RIP peer (if applicable) is brought down (but the VPRN instance remains up). BGP peering will remain up but the exceeding BGP routes will not be added to the VRF.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The maximum route threshold can dynamically change to increase the number of supported routes even when the maximum has already been reached. Protocols will resubmit their routes which were initially rejected.

The **no** form of this command disables any limit on the number of routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default 0 or disabled — The threshold will not be raised.

Parameters *number* — An integer that specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only — Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

threshold *percentage* — The percentage at which a warning log message and SNMP trap should be set. There are two warnings, the first is a mid-level warning at the threshold value set and the second is a high-level warning at level between the maximum number of routes and the mid-level rate ([mid+max] / 2).

Values 0 to 100

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about MBB events.

Platforms All

17.158 mbb-prefer-current-hops

mbb-prefer-current-hops

Syntax [**no**] **mbb-prefer-current-hops**

Context **[Tree]** (config>router>mpls mbb-prefer-current-hops)

Full Context configure router mpls mbb-prefer-current-hops

Description This command implements a new option in the CSPF path computation during a Make-Before-Break (MBB) procedure of an RSVP LSP.

When MPLS performs an MBB for the primary or secondary path of a P2P LSP, or the S2L path of a P2MP LSP, and the new **mbb-prefer-current-hops** option is enabled in MPLS context, CSPF will select a path, among equal-cost candidate paths, with the most overlapping links with the current path. Normally, CSPF selects the path randomly.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The procedures of the new MBB CSPF path selection apply to LSP without the least-fill option enabled. If the least-fill rule results in a different path, the LSP path will be moved though. Users can still favor stability over least-fill condition by applying a larger value to the parameter **least-fill-min-thd** under the MPLS context such that a path will only be moved when the difference of the least-available bandwidth becomes significant enough between the most used links in the equal cost paths. If that difference is not significant enough, CSPF will select the path with the most overlapping links instead of selecting a path randomly.

The procedures when the new **mbb-prefer-current-hops** option is enabled apply to all MBB types. Thus, it applies to the auto-bandwidth MBB, the configuration change MBB, the soft preemption MBB, the TE graceful shutdown MBB, the delayed retry MBB (for SRLG secondary LSP path), the path change MBB, the timer resignal MBB, and the manual resignal MBB.

During the FRR global revertive MBB, CSPF selects a random link among the ones available between the PLR node and the Merge Point node, including the failed link if it has restored in the meantime. These links cannot be checked for overlap with the current path.

The TE graceful shutdown MBB will still avoid the link or node that is in maintenance and the soft preemption MBB will still avoid the link that is overbooked.

For an inter-area LSP, this feature applies to the subset of the path from the ingress LER to the exit ABR.

The procedures of this feature are not applied to a zero bandwidth CSPP LSP, including an auto-bandwidth CSPF LSP while its operational bandwidth is zero, and to a non-CSPF LSP.

configure mcast-management bandwidth-policy t2-paths secondary-paths queue-parameters mbs

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the override for the default Maximum Buffer Size (MBS) for each individual path's queue. The queues MBS threshold defines the point at which all packets destined for the queue are discarded based on queue depth. The defined threshold also provides context for the queues drop-tail parameter.

The mbs *percent-of-pool* parameter is defined as a percentage of the total pool size. The system allows the sum of all MBS values to equal more than 100% allowing for oversubscription of the pool.

For the primary-path and secondary-path queues, the mbs percent is applied to a single queue for each path.

The **no** form of this command is used to restore the path queues default MBS value.

Parameters *percent-of-pool* — Specifies the percent of buffers from the total buffer pool space for the number of buffers, expressed as a decimal integer. If 10 MB is the total buffers in the buffer pool, a value of 10 would limit the maximum queue size to 1MB (10%) of buffer space for the forwarding class queue. If the total size is increased to 20MB, the existing value of 10 would automatically increase the maximum size of the queue to 2MB.

Values 0 to 100

Default

Primary:	7
Secondary:	40

mbs

Syntax **mbs** *size* [**bytes** | **kilobytes**]
no mbs

Context **[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>queue mbs)

Full Context configure subscriber-mgmt sla-profile egress qos queue mbs

Description This command configures the maximum size for the queue.

The sum of the MBS for all queues on an egress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS size to the size as configured in the QoS policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *size* — This required parameter specifies that the MBS is expressed as an integer representing the required size in either bytes or kilobytes. The default is **kilobytes**. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly to define the size. By specifying the keyword **default** sets the MBS to its default value.

Values 0 to 1073741824, **default**

bytes — Specifies that the value given for *size* is interpreted as the queue's MBS value in bytes.

kilobytes — Specifies that the value given for *size* is interpreted as the queue's MBS value in kilobytes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mbs

Syntax **mbs** *size* [**bytes** | **kilobytes**]
no mbs

Context **[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>queue mbs)

Full Context configure subscriber-mgmt sla-profile ingress qos queue mbs

Description The Maximum Burst Size (MBS) command configures the explicit definition of the maximum number of buffers allowed for a specific queue.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the number of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The sap-ingress context for mbs provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packet's RED slope does not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS size to the size as configured in the QoS policy.

configure service ies interface sap ingress queue-override queue mbs
configure service vprn sap egress queue-override queue mbs
configure service vprn sap ingress queue-override queue mbs

Description This command overrides specific attributes of the specified queue's MBS parameters. The MBS is a mechanism to override the default maximum size for the queue.

The sum of the MBS for all queues on an egress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer is available when needed or that the packets RED slope is not forced the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

If the CBS value is larger than the MBS value, an error will occur, preventing the MBS change.

The **no** form of this command returns the MBS size assigned to the queue.

Default mbs default

Parameters *size* — This required parameter specifies that the MBS is expressed as an integer representing the required size in either bytes or kilobytes. The default is **kilobytes**. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly to define the size. By specifying the keyword **default** sets the MBS to its default value.

Values 0 to 1073741824, default

bytes — Specifies that the value given for *size* is interpreted as the queue's MBS value in bytes.

kilobytes — Specifies that the value given for *size* is interpreted as the queue's MBS value in kb/s.

no mbs

Context [Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr mbs)
[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr mbs)

Full Context configure card fp ingress access queue-group policer-override policer mbs
configure card fp ingress network queue-group policer-override policer mbs

Description This command configures the policer's PIR leaky bucket's violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low priority violate threshold. For ingress, trusted in-profile packets and untrusted high priority packets use the policer's high priority violate threshold while trusted out-of-profile and untrusted low priority packets use the policer's low priority violate threshold.

The PIR bucket's violate threshold represent the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by **high-prio-only** is available for the higher priority traffic.

The policer's mbs size defined in the QoS policy may be overridden on an sla-profile or SAP where the policy is applied.

The **no** form of this command reverts the policer to its default MBS size. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Full Context configure port ethernet access egress queue-group queue-overrides queue mbs
configure port ethernet access ingress queue-group queue-overrides queue mbs
configure port ethernet network egress queue-group queue-overrides queue mbs

Description The Maximum Burst Size (MBS) command specifies the default maximum buffer size for the template queue. The value is given in kilobytes.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The **queue-group** or network egress QoS context for mbs provides a mechanism for overriding the default maximum size for the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packets RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

This command applies to egress queue group queues as the queue-delay is only supported on egress queues. This command **the queue-delay** command are mutually exclusive.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the MBS size assigned to the queue to the value.

Default mbs default

Parameters *size* — The *size* parameter is required when specifying **mbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 1073741824

bytes — When **byte** is defined, the value given for size is interpreted as the queue's MBS value given in bytes.

kilobytes — When **kilobytes** is defined, the value is interpreted as the queue's MBS value given in kilobytes.

default — Specifying the keyword **default** sets the MBS to its default value.

Description
This command overrides specific attributes of the specified queue's MBS parameters. A queue uses its MBS value to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the number of buffers allowed by the MBS, all packets are discarded until packets have been drained from the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope associated with a packet. A queue that has not exceeded its MBS is not guaranteed to have buffer available when needed or that the packet's RED slope will not force the discard of the packet. Setting correct CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

The **no** form of this command returns the MBS assigned to the queue to the default value.

Default
mbs default

Parameters
size — The size parameter is an integer expression of the maximum number of kilobytes or bytes of buffering allowed for the queue. A value of 0 causes the queue to discard all packets.

Values 0 to 1073741824, default

bytes — Indicates that the *size* parameter value is expressed in bytes.

kilobytes — Indicates that the *size* parameter is expressed in kilobytes.

[Tree] (config>service>vprn>if>sap>ingress>queue-override>queue mbs)

Full Context configure service vprn interface sap egress queue-override queue mbs
configure service vprn interface sap ingress queue-override queue mbs

Description This command can be used to override specific attributes of the specified queue's MBS parameters. The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. Once the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard to queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

If the CBS value is larger than the MBS value, an error will occur, preventing the MBS change.

The **no** form of this command returns the MBS size assigned to the queue to the value.

Default mbs default

Parameters *size* — The size parameter is required when specifying **mbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **bytes** and **kilobytes** keywords are mutually exclusive and are used to explicitly define whether the size represents bytes or kilobytes.

Values 0 to 1073741824

no mbs

Context **[Tree]** (config>qos>sap-ingress>dyn-policer mbs)
[Tree] (config>qos>sap-egress>dyn-policer mbs)
[Tree] (config>qos>sap-ingress>policer mbs)
[Tree] (config>qos>sap-egress>policer mbs)

Full Context configure qos sap-egress dynamic-policer mbs
configure qos sap-egress policer mbs
configure qos sap-ingress dynamic-policer mbs
configure qos sap-ingress policer mbs

Description This command is used to configure the policer's PIR leaky bucket's high-priority violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low-priority violate threshold. For ingress, trusted in-profile packets and untrusted high-priority packets use the policer's high-priority violate threshold while trusted out-of-profile and untrusted low-priority packets use the policer's low-priority violate threshold. At egress, inplus-profile, and in-profile packets use the policer's high-priority violate threshold and out-of-profile packets use the policer's low-priority violate threshold. Exceed-profile packets are discarded unless **enable-exceed-pir** is configured, in which case they are forwarded.

The PIR bucket's violate threshold represents the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low-priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by **high-prio-only** is available for the higher priority traffic.

The policer's MBS size defined in the QoS policy may be overridden on an SLA profile or SAP where the policy is applied.

The **no** form of this command returns the queue to its default MBS size. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

mbs

Syntax **mbs** *percent*
no mbs

Context **[Tree]** (config>qos>network-queue>queue mbs)

Full Context configure qos network-queue queue mbs

Description This command specifies the relative amount of buffer pool space for the maximum buffers for a specific ingress network FP forwarding class queue or egress network port forwarding class queue. The value is entered as a percentage.

The MBS value is used by a queue to determine whether it has exhausted its total allowed buffers while enqueuing packets. When the queue has exceeded its maximum amount of buffers, all packets are discarded until the queue transmits a packet. A queue that has not exceeded its MBS is not guaranteed to have a buffer available when needed or that the packet's RED slope will not force the discard of the packet. In order to safeguard against queue starvation (when a queue does not receive its fair share of buffers), set proper CBS parameters and control CBS oversubscription. Another safeguard is to properly set the RED slope parameters for the needs of the network queues.

The MBS can sometimes be smaller than the CBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

The **no** form of this command returns the MBS for the queue to the default for the forwarding class.

Special Cases **Forwarding Class Queue on Egress Network Port or Channel —** For network egress, each forwarding class is supported by an egress queue on a per network port basis. These forwarding class-based queues are automatically created when a port or channel is placed in network mode. The configuration parameters for each queue come from the applied egress policy on the network port or channel. Forwarding class queue on egress channel applies only to the 7450 ESS and 7750 SR.

The **mbs** value is used to calculate the queue's MBS size based on the total amount buffer space allocated for the buffer pool on the egress network port or channel. This buffer pool size will dynamically fluctuate based on the port or channels egress pool size setting.

The total MBS settings for all network egress queues on the port or channel based on the total percentages can exceed 100 percent. Some over-subscription can be desirable to allow exceptionally busy forwarding classes more access to buffer space. The proper use of CBS settings will ensure that oversubscribing MBS settings will not starve other queues of buffers when needed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Forwarding Class Queue on Ingress FP — For network ingress, each forwarding class is supported by an ingress queue per FP. These forwarding class queues are automatically created when a single port or channel is placed in the network mode on the FP and are removed when all network ports or channels are removed from the FP (defined as access). The configuration parameters for each queue come from the applied ingress policy under the network context of the FP.

The **mbs** value is used to calculate the queue's MBS size based on the total amount buffer space allocated for the network ingress buffer pool on the FP. This buffer pool will dynamically fluctuate based on the sum of all ingress pool sizes for all network ports and channels on the FP.

The total MBS settings for all network egress queues on the port or channel based on the total percentages can exceed 100 percent. Some over-subscription can be desirable to allow exceptionally busy forwarding classes more access to buffer space. The proper use of CBS settings will ensure that oversubscribing MBS settings will not starve other queues of buffers when needed.

Parameters *percent* — The percent of buffers from the total buffer pool space for the maximum number of buffers, expressed as a decimal integer. If 10 Mbytes is the total buffer space in the buffer pool, a value of 10 would limit the maximum queue size to 1 Mbyte (10%) of buffer space for the forwarding class queue. If the total size is increased to 20 Mbytes, the existing value of 10 would automatically increase the maximum size of the queue to 2 Mbytes.

Values 0 to 100

Platforms All

mbs

Syntax **mbs** {*size* [**bytes** | **kilobytes**] | **default**}
no mbs

Context **[Tree]** (config>qos>qgrps>egr>qgrp>policer mbs)
[Tree] (config>qos>qgrps>ing>qgrp>policer mbs)

Full Context configure qos queue-group-templates egress queue-group policer mbs
configure qos queue-group-templates ingress queue-group policer mbs

Description This command specifies the default maximum buffer size for the template queue in bytes or kilobytes.

The MBS value is used by a queue to determine whether it has exhausted all of its buffers while enqueuing packets. When the queue has exceeded the amount of buffers allowed by MBS, all packets are discarded until packets have been drained from the queue.

The **port>ethernet>access>ingress>queue-group** and **port>ethernet>access>egress>queue-group** contexts for **mbs** provides a mechanism for overriding the default maximum size for the queue.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The sum of the MBS for all queues on an ingress access port can oversubscribe the total amount of buffering available. When congestion occurs and buffers become scarce, access to buffers is controlled by the RED slope that a packet is associated with. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed or that the packet's RED slope will not force the discard of the packet. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard against queue starvation (when a queue does not receive its fair share of buffers). Another is properly setting the RED slope parameters for the needs of services on this port or channel.

When configured on an egress queue group queue, this command and the **queue-delay** command are mutually exclusive. In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured. If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

For policers, this command is used to configure the policer's PIR leaky bucket's high-priority violate threshold. The **high-prio-only** command is applied to the MBS value to derive the bucket's low-priority violate threshold.

At ingress, trusted in-profile packets and untrusted high-priority packets use the policer's high-priority violate threshold while trusted out-of-profile and untrusted low-priority packets use the policer's low-priority violate threshold.

At egress, inplus-profile and in-profile packets use the policer's high-priority violate threshold and out-of-profile packets use the policer's low-priority violate threshold. Exceed-profile packets are discarded unless **enable-exceed-pir** is configured, in which case they are forwarded.

The PIR bucket's violate threshold represents the maximum burst tolerance allowed by the policer. If the policer's offered rate is equal to or less than the policer's defined rate, the PIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the offered rate increases beyond the metering rate, the amount of data allowed above the rate is capped by the threshold. The low-priority violate threshold provides a smaller burst size for the lower priority traffic associated with the policer. Since all lower priority traffic is discarded at the lower burst tolerance size, the remaining burst tolerance defined by high-prio-only is available for the higher priority traffic.

The policer's mbs size defined in the QoS policy may be overridden on an SLA profile or SAP where the policy is applied.

The **no** form of this command returns the MBS size to its default value. By default, the MBS is 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Default default

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *size* — For queues, the size parameter is an integer expression of the maximum number of bytes or kilobytes of buffering allowed for the queue. For a value of 100 kbytes, enter the value 100. A value of 0 causes the queue to discard all packets. For policers, the size parameter is an integer expression of the maximum number of bytes for the policer's MBS. The queue MBS maximum value used is constrained by the pool size in which the queue exists and by the shared pool space in the corresponding megapool.

Values 0 to 2683435456

Default value: 16 Mbytes when PIR equals max or is greater than or equal to the FP capacity (this overrides an explicitly configured MBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max PIR capped to 3968 kbytes, with a minimum of 256 bytes.

Context **[Tree]** (config>qos>shared-queue>queue mbs)

Full Context configure qos shared-queue queue mbs

Description This command specifies the relative amount of the buffer pool space for the maximum buffers for a specific ingress shared queue.

The MBS value is used by a queue to determine whether it has exhausted its total allowed buffers while enqueuing packets. When the queue has exceeded its maximum amount of buffers, all packets are discarded until the queue transmits a packet. A queue that has not exceeded its MBS size is not guaranteed that a buffer will be available when needed. Setting proper CBS parameters and controlling CBS oversubscription is one major safeguard against queue starvation (when a queue does not receive its fair share of buffers).

The MBS size can sometimes be smaller than the CBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

Default The queue MBS defaults are listed in Table 96.

Full Context configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds priority mbs-contribution
configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds priority mbs-contribution

Description The **mbs-contribution** command is used to configure the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP or subscriber context. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP or subscriber sub-profile where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues once all the lower priority packets have been prevented from consuming bucket depth, the burst tolerance for the priority level is consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated to the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the number of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child’s FIR rate does not modify the number of packets forwarded by the parent policer for the child’s priority level. It simply modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst tolerance before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level’s discard-unfair and discard-all threshold to allow the parent policer to absorb some of the FIR burst before reaching the priority’s discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer’s PIR bucket while the individual fair bursts making up the aggregate are based on each child’s FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic numbers of higher priority traffic can be ignored when sizing a lower priority’s fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level’s fair burst size is set to 30 kbytes (mbs-contribution 30 kbytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child’s PIR MBS is set to 10 kbytes, which makes each child’s FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available,
- Based on weights, the children's FIR rates are set as follows:

	FIR Rate	**FIR MBS**
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes
Child 3	1 Mb/s	10 kbytes

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s,
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s,
- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer is responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's mbs and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, you should consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The number of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used which causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber sla-profile or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The **no mbs-contribution** command returns the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer is recalculated.

Parameters *size* [**bytes** | **kilobytes**] — The size parameter is required when executing the **mbs-contribution** command. It is expressed as an integer and specifies the priority's specific portion of accumulative MBS for the priority level in bytes or kilobytes which is selected by the trailing **bytes** or **kilobytes** keywords. If both **bytes** and **kilobytes** are missing, **kilobytes** is assumed. Setting this value has no effect on parent policer instances where the priority level's **mbs-contribution** value has been overridden.

Values 0 to 16777216

bytes | **kilobytes**: — The **bytes** keyword is optional and is mutually exclusive with the **kilobytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in bytes.

The **kilobytes** keyword is optional and is mutually exclusive with the **bytes** keyword. Size is interpreted as specifying the size of min-thresh-separation in kilobytes.

Default **kilobytes**

fixed — This optional fixed keyword is used to force the inclusion of the defined **mbs-contribution** value in the parent policer's discard threshold calculations. If the **mbs-contribution** command is executed without the **fixed** keyword, the fixed calculation behavior for the priority level is removed.

Full Context configure card fp ingress network queue-group policer-control-override priority-mbs-thresholds priority mbs-contribution
configure card fp ingress access queue-group policer-control-override priority-mbs-thresholds priority mbs-contribution

Description This command configures the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP or subscriber context. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP or subscriber sub-profile where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues once all the lower priority packets have been prevented from consuming bucket depth, the burst tolerance for the priority level will be consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated to the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the amount of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child's FIR rate does not modify the amount of packets forwarded by the parent policer for the child's priority level. It simply modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

tolerance before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level's discard-unfair and discard-all threshold to allow the parent policer to absorb some amount of FIR burst before reaching the priority's discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer's PIR bucket while the individual fair bursts making up the aggregate are based on each child's FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic amounts of higher priority traffic can be ignored when sizing a lower priority's fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level's fair burst size is set to 30 kbytes (mbs-contribution 30 kilobytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child's PIR MBS is set to 10 kbytes, which makes each child's FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available,
- Based on weights, the children's FIR rates are set as follows:

	FIR Rate	**FIR MBS**
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes
Child 3	1 Mb/s	10 kbytes

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s,
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s,
- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer will be responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's MBS and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, you should consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The amount of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used which causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber SLA profile or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The **no** form of this command reverts to the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer are recalculated.

Default no mbs-contribution

mbs-contribution

Syntax **mbs-contribution** *size* [**bytes** | **kilobytes**]

Context **[Tree]** (config>service>vprn>if>sap>egress>policer-ctrl-over>mbs-thrshlds>priority mbs-contribution)
[Tree] (config>service>vprn>if>sap>ingress>policer-ctrl-over>mbs-thrshlds>priority mbs-contribution)

Full Context configure service vprn interface sap egress policer-control-override priority-mbs-thresholds priority mbs-contribution
configure service vprn interface sap ingress policer-control-override priority-mbs-thresholds priority mbs-contribution

Description The mbs-contribution override command within the SAP ingress and egress contexts is used to override a parent policer's priority level's mbs-contribution parameter that is defined within the policer-control-policy applied to the SAP. This override allow the priority level's burst tolerance to be tuned based on the needs of the SAP's child policers attached to the priority level.

When the override is defined, modifications to the policer-control-policy priority level's mbs-contribution parameter have no effect on the SAP's parent policer priority level until the override is removed using the no mbs-contribution command within the SAP.

The **no** form of this command removes the override and allows the mbs-contribution setting from the policer-control-policy to control the parent policer's priority level's burst tolerance.

Default no mbs-contribution

Parameters *size* — This parameter is required when specifying MBS contribution override and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 16777216 or default

Default kilobytes

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Description The **mbs-contribution** command is used to configure the policy-based burst tolerance for a parent policer instance created when the policy is applied to a SAP, or a subscriber context for the 7450 ESS and 7750 SR, or a 7950 XRS multiservice site. The system uses the parent policer's **min-thresh-separation** value, the priority level's **mbs-contribution** value, and the number of child policers currently attached to the priority level to derive the priority level's shared-portion and fair-portion of burst tolerance within the local priority level. The shared-portion and fair-portions for each priority level are then used by the system to calculate each priority level's discard-unfair threshold and discard-all threshold. The mbs-contribution is the minimum separation between two adjacent active discard-all thresholds.

The value for a priority level's **mbs-contribution** within the policer-control-policy may be overridden on the SAP, or subscriber sub-profile (applies to the 7450 ESS and 7750 SR) or multiservice site (for 7950 XRS) where the policy is applied in order to allow fine tuning of the discard-unfair and discard-all thresholds relevant to the needs of the local child policers on the object.

Accumulative Nature of Burst Tolerance for a Parent Policer Priority Level

When defining **mbs-contribution**, the specified size may only be a portion of the burst tolerance associated with the priority level. The packets associated with the priority level share the burst tolerance of lower within the parent policer. As the parent policer PIR bucket depth increases during congestion, the lower priority packets eventually experience discard based on each priority's discard-unfair and discard-all thresholds. Assuming congestion continues when all the lower priority packets have been prevented from consuming bucket depth, the burst tolerance for the priority level will be consumed by its own packets and any packets associated with higher priorities.

The Effect of Fair and Unfair Child Policer Traffic at a Parent Policer Priority Level

The system continually monitors the offered rate of each child policer on each parent policer priority level and detects when the policer is in a congested state (the aggregate offered load is greater than the decrement rate defined on the parent policer). As previously stated, the result of congestion is that the parent policer's bucket depth will increase until it eventually hovers around either a discard-unfair or discard-all threshold belonging to one of the priority levels. This threshold is the point where enough packets are being discarded that the increment rate and decrement rate begin to even out. If only a single child policer is associated with the priority level, the discard-unfair threshold is not used since fairness is only applicable when multiple child policers are competing at the same priority level.

When multiple child policers are sharing the congested priority level, the system uses the offered rates and the parenting parameters of each child to determine the fair rate per child when the parent policer is unable to meet the bandwidth needs of each child. The fair rate represents the amount of bandwidth that each child at the priority level should receive relative to the other children at the same level according to the policer control policy instance managing the child policers. This fair rate is applied as the decrement rate for each child's FIR bucket. Changing a child's FIR rate does not modify the number of packets forwarded by the parent policer for the child's priority level. It just modifies the forwarded ratio between the children on that priority level. Since each child FIR bucket has some level of burst tolerance

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

before marking its packets as unfair, the current parent policer bucket depth may at times rise above the discard-unfair threshold. The mbs-contribution value provides a means to define how much separation is provided between the priority level's discard-unfair and discard-all threshold to allow the parent policer to absorb some amount of FIR burst before reaching the priority's discard-all threshold.

This level of fair aggregate burst tolerance is based on the decrement rate of the parent policer's PIR bucket while the individual fair bursts making up the aggregate are based on each child's FIR decrement rate. The aggregate fair rate of the priority level is managed by the system with consideration of the current rate of traffic in higher priority levels. In essence, the system ensures that for each iteration of the child FIR rate calculation, the sum of the child FIR decrement rates plus the sum of the higher priority traffic increment rates equals the parent policers decrement rate. This means that dynamic amounts of higher priority traffic can be ignored when sizing a lower priority's fair aggregate burst tolerance. Consider the following:

- The parent policer decrement rate is set to 20 Mb/s (max-rate 20,000).
- A priority level's fair burst size is set to 30 kbytes (mbs-contribution 30 kbytes).
- Higher priority traffic is currently taking 12 Mb/s.
- The priority level has three child policers attached.
- Each child's PIR MBS is set to 10 kbytes, which makes each child's FIR MBS 10 kbytes.
- The children want 10 Mb/s, but only 8 Mb/s is available
- Based on weights, the children's FIR rates are set as follows:

	FIR Rate	**FIR MBS**
Child 1	4 Mb/s	10 kbytes
Child 2	3 Mb/s	10 kbytes
Child 3	1 Mb/s	10 kbytes

The 12 Mb/s of the higher priority traffic and the 8 Mb/s of fair traffic equal the 20 Mb/s decrement rate of the parent policer.

It is clear that the higher priority traffic is consuming 12 Mb/s of the parent policer's decrement rate, leaving 8 Mb/s of decrement rate for the lower priority's fair traffic.

- The burst tolerance of child 1 is based on 10 kbytes above 4 Mb/s.
- The burst tolerance of child 2 is based on 10 kbytes above 3 Mb/s.
- The burst tolerance of child 3 is based on 10 kbytes above 1 Mb/s.

If all three children burst simultaneously (unlikely), they will consume 30 kbytes above 8 Mb/s. This is the same as the remaining decrement rate after the higher priority traffic.

Parent Policer Total Burst Tolerance and Downstream Buffering

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The highest in-use priority level's discard-all threshold is the total burst tolerance of the parent policer. In some cases, the parent policer represents downstream bandwidth capacity and the max-rate of the parent policer is set to prevent overrunning the downstream bandwidth. The burst tolerance of the parent policer defines how much more traffic may be sent beyond the downstream scheduling capacity. In the worst-case scenario, when the downstream buffering is insufficient to handle the total possible burst from the parent policer, downstream discards based on lack of buffering may occur. However, in all likelihood, this is not the case.

In most cases, lower priority traffic in the policer will be responsible for the greater part of congestion above the parent policer rate. Since this traffic is discarded with a lower threshold, this lowers the effective burst tolerance even while the highest priority traffic is present.

Configuring a Priority Level's MBS Contribution Value

In the most conservative case, a priority level's **mbs-contribution** value may be set to be greater than the sum of child policer's mbs and one max-size-frame per child policer. This ensures that even in the absolute worst case where all the lower priority levels are simultaneously bursting to the maximum capacity of each child, enough burst tolerance for the priority's children will exist if they also burst to their maximum capacity.

Since simply adding up all the child policer's PIR MBS values may result in large overall burst tolerances that are not ever likely to be needed, consider some level of burst oversubscription when configuring the **mbs-contribution** value for each priority level. The amount of oversubscription should be determined based on the needs of each priority level.

Using the Fixed Keyword to Create Deterministic Parent Policer Discard Thresholds

In the default behavior, the system ignores the **mbs-contribution** values for a priority level on a subscriber for 7450 ESS and 7750 SR, or a multiservice site for 7950 XRS, or SAP parent policer when a child policer is not currently associated with the level. This prevents additional burst tolerance from being added to higher priority traffic within the parent policer.

This does cause fluctuations in the defined threshold values when child policers are added or removed from a parent policer instance. If this behavior is undesirable, the fixed keyword may be used that causes the **mbs-contribution** value to always be included in the calculation of parent policer's discard thresholds. The defined **mbs-contribution** value may be overridden on a subscriber sla-profile for the 7450 ESS and 7750 SR, or on a multiservice site for the 7950 XRS, or on a SAP instance, but the fixed nature of the contribution cannot be overridden.

If the defined **mbs-contribution** value for the priority level is zero, the priority level will have no effect on the parent policer's defined discard thresholds. A packet associated with the priority level will use the next lower priority level's discard-unfair and discard-all thresholds.

The **no** form of this command returns the policy's priority level's MBS contribution to the default value. When changed, the thresholds for the priority level and all higher priority levels for all instances of the parent policer will be recalculated.

Use subject to Terms available at: www.nokia.com

Parameters *size* — The size parameter is required when executing the **mbs-contribution** command. It is expressed as an integer and specifies the priority's specific portion amount of accumulative MBS for the priority level. Setting this value has no effect on parent policer instances where the priority level's **mbs-contribution** value has been overridden.

Values 0 to 4194304 or **default** (applies to the 7450 ESS)
0 to 16777216 or **default** (applies to the 7750 SR and 7950 XRS)

Default 8

bytes | kilobytes: — This parameter indicates whether the size is expressed in bytes or kilobytes.

Default **kilobytes**

fixed — The optional fixed keyword is used to force the inclusion of the defined **mbs-contribution** value in the parent policer's discard threshold calculations. If the **mbs-contribution** command is executed without the **fixed** keyword, the fixed calculation behavior for the priority level is removed.

mc-ecmp-balance-hold

Syntax **mc-ecmp-balance-hold** *minutes*
no mc-ecmp-balance-hold

Context **[Tree]** (config>router>pim mc-ecmp-balance-hold)

Full Context configure router pim mc-ecmp-balance-hold

Description This command defines a hold period that applies after an interface has been added to the ECMP link. It is also used periodically to rebalance if channels have been removed from the ECMP link.

If the ECMP interface has not changed in the hold period and if no multicast streams have been removed, then no action is taken when the timer triggers.

This parameter should be used to avoid excessive changes to the multicast distribution.

A rebalance will not occur to multicast streams that have a priority greater than the configured **ecmp-opt-threshold**.

The **no** form of this command removes the minutes value from the configuration.

Parameters *minutes* — Specifies the hold time, in minutes, that applies after an interface has been added to the ECMP link.

Values 2 to 600

17.165 mc-ecmp-hashing-enabled

mc-ecmp-hashing-enabled

Syntax **mc-ecmp-hashing-enabled** [**rebalance**]
no mc-ecmp-hashing-enabled

Context **[Tree]** (config>service>vprn>pim mc-ecmp-hashing-enabled)

Full Context configure service vprn pim mc-ecmp-hashing-enabled

Description This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to be distributed over the multiple ECMP paths based on a hash of S and G (and possibly next-hop IP address). When a link in the ECMP set is removed, the multicast flows that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing multicast flows using the other ECMP links stay on those links until they are pruned.

Hash-based multicast balancing is supported for both IPv4 and IPv6.

This command cannot be used together with the **mc-ecmp-balance** command. Using this command and the **lag-usage-optimization** command on mixed port speed LAGs is not recommended, because some groups may be forwarded incorrectly.

The **no** form of this command disables the hash-based multicast balancing of traffic over ECMP links.

The **no** form of this command means that the use of multiple ECMP paths if enabled at the **config>router** or **config>service>vprn** context is controlled by the existing implementation and CLI commands **mc-ecmp-balance**.

Default no mc-ecmp-hashing-enabled

Parameters **rebalance** — Specifies to rebalance flows to newly added links immediately, instead of waiting until they are pruned.

Platforms All

mc-ecmp-hashing-enabled

Syntax [**no**] **mc-ecmp-hashing-enabled** [**rebalance**]

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mc-fr-profile-egress

Syntax **mc-fr-profile-egress** *src-mc-fr-prof dst-mc-fr-prof* [**overwrite**]

Context **[Tree]** (config>qos>copy mc-fr-profile-egress)

Full Context configure qos copy mc-fr-profile-egress

Description This command copies an existing **mc-fr-profile-egress** profile ID to another multi-class frame-relay egress profile ID. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination profile ID exists.

Parameters *src-mc-fr-prof* — Specifies the existing source **mc-fr-profile-egress** profile ID from which the **copy** command attempts to copy.

Values 1 to 65535

src-mc-fr-prof — Specifies the destination **mc-fr-profile-egress** profile ID to which the copy command attempts to copy.

Values 1 to 65535

overwrite — Use this parameter when the **mc-fr-profile-egress** *dst-mc-fr-prof* already exists. If it does, everything in the existing destination **mc-fr-profile-egress** *dst-mc-fr-prof* is completely overwritten with the contents of the **mc-fr-profile-egress** *src-mc-fr-prof*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI use {overwrite}; destination mc-fr-egress-profile
"4" exists.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

configure mcast-management multicast-info-policy video-policy video-interface pip mc-handover
configure mcast-management multicast-info-policy video-policy video-interface sd mc-handover

Description This command sets the rate at which the Fast Channel Change (FCC) server will send unicast data to the FCC client during the handover to the multicast stream.

The **no** form of the command returns the parameter to the default value.

Default mc-handover 25

Parameters *percentage* — Specifies the percentage of nominal bandwidth.

Values

HD:	0 to 100
SD and PIP:	0 to 600

Default 25

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

17.172 mc-ipsec

mc-ipsec

Syntax [**no**] **mc-ipsec**

Context **[Tree]** (config>redundancy>multi-chassis>peer mc-ipsec)

Full Context configure redundancy multi-chassis peer mc-ipsec

Description Commands in this context configure multi-chassis peer parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.173 mc-ipsec-non-forwarding

mc-ipsec-non-forwarding

Syntax [**no**] **mc-ipsec-non-forwarding tunnel-grp-id**

Context **[Tree]** (config>vrrp>policy>priority-event mc-ipsec-non-forwarding)

Full Context configure vrrp policy priority-event mc-ipsec-non-forwarding

Description This command configures an instance of a multi-chassis IPsec tunnel-group Priority Event used to override the base priority value of a VRRP virtual router instance depending on the operational state of the event.

Parameters *tunnel-grp-id* — Identifies the multi-chassis IPsec tunnel group whose non-forwarding state is monitored by this priority control event.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.174 mc-lag

mc-lag

Syntax [**no**] **mc-lag**

Context **[Tree]** (config>redundancy>multi-chassis>peer mc-lag)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure redundancy multi-chassis peer mc-lag

Description Commands in this context configure multi-chassis LAG operations and related parameters.

The **no** form of this command administratively disables multi-chassis LAG. MC-LAG can be issued only when mc-lag is shutdown.

Default no mc-lag

Platforms All

mc-lag

Syntax **mc-lag**

Context **[Tree]** (config>eth-cfm>redundancy mc-lag)

Full Context configure eth-cfm redundancy mc-lag

Description Commands in this context configure the MC-LAG specific ETH-CFM redundancy parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.175 mc-maximum-routes

mc-maximum-routes

Syntax **mc-maximum-routes** *number* [**log-only**] [**threshold** *threshold*]

Context **[Tree]** (config>service>vprn mc-maximum-routes)

Full Context configure service vprn mc-maximum-routes

Description This command specifies the maximum number of multicast routes that can be held in the form of this command in a VPN routing or forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then no new joins are processed.

The **no** form of this command disables the limit of multicast routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default no mc-maximum-routes

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *number* — Specifies the maximum number of routes to be held in a VRF context.

Values 1 to 2147483647

log-only — Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes.

threshold — Specifies the percentage at which a warning log message and SNMP trap should be sent.

Values 0 to 100

Default 10

Platforms All

mc-maximum-routes

Syntax **mc-maximum-routes** *number* [**log-only**] [**threshold** *threshold*]
no mc-maximum-routes

Context **[Tree]** (config>router mc-maximum-routes)

Full Context configure router mc-maximum-routes

Description This command specifies the maximum number of multicast routes that can be held within a VPN routing/forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a VRF, then no new joins will be processed.

The **no** form of this command disables the limit of multicast routes within a VRF context. Issue the **no** form of this command only when the VPRN instance is shutdown.

Default no mc-maximum-routes

Parameters *number* — Specifies the maximum number of routes to be held in a VRF context

Values 1 to 2147483647

log-only — Specifies that if the maximum limit is reached, only log the event. **log-only** does not disable the learning of new routes

threshold — The percentage at which a warning log message and SNMP trap should be sent.

17.178 mcast-capacity

mcast-capacity

Syntax **mcast-capacity** *primary-percentage* **secondary** *secondary-percentage*
no mcast-capacity

Context **[Tree]** (config>mcast-mgmt>chassis-level>plane-capacity mcast-capacity)

Full Context configure mcast-management chassis-level per-mcast-plane-capacity mcast-capacity

Description This command configures the primary and secondary multicast plane capacities used when the full complement of possible switch fabrics in the system is not up (at least one possible switch fabric is not provisioned or is down). The rates are defined as a percentage of the total multicast plane capacity which is configured using the **total-capacity** command.

The **no** form of this command reverts to the default values.

Default mcast-capacity 87.50 secondary 87.50

Parameters *primary-percentage* — Specifies the percentage of the total multicast plane capacity to be used for primary multicast planes.

secondary-percentage — Specifies the percentage of the total multicast plane capacity to be used for secondary multicast planes.

Values 0.01 to 100

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

17.179 mcast-ipv4

mcast-ipv4

Syntax [**no**] **mcast-ipv4**

Context **[Tree]** (config>cflowd>collector>export-filter>family mcast-ipv4)

Full Context configure cflowd collector export-filter family mcast-ipv4

Description This command filters multicast IPv4 flow data from being sent to the associated collector.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the filter, allowing multicast IPv4 flow data to be sent to the associated collector.

Default no mcast-ipv4

Platforms All

17.180 mcast-ipv6

mcast-ipv6

Syntax [**no**] **mcast-ipv6**

Context **[Tree]** (config>cflowd>collector>export-filter>family mcast-ipv6)

Full Context configure cflowd collector export-filter family mcast-ipv6

Description This command filters multicast IPv6 flow data from being sent to the associated collector.

The **no** form of this command removes the filter, allowing multicast IPv6 flow data to be sent to the associated collector.

Default no mcast-ipv6

Platforms All

17.181 mcast-ipv6-snooping-scope

mcast-ipv6-snooping-scope

Syntax **mcast-ipv6-snooping-scope** {**mac-based** | **sg-based**}
no mcast-ipv6-snooping-scope

Context **[Tree]** (config>service>vpls mcast-ipv6-snooping-scope)

Full Context configure service vpls mcast-ipv6-snooping-scope

Description This command specifies the forwarding scope used for IPv6 multicast traffic when PIM snooping for IPv6 is enabled.

By default, the scope is **mac-based**; IPv6 snooped multicast traffic is forwarded is based on the low-order 32 bits of the destination IPv6 address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the scope is configured as **sg-based**, the IPv6 snooped multicast traffic is forwarded based on both its full source (if specified in the join) and destination IPv6 address. SG-based forwarding is only supported on FP3- (or higher) based line cards.

PIM snooping for IPv6 must be disabled to change the forwarding mode within a VPLS service between **mac-based** and **sg-based**.

Default mcast-ipv6-snooping-scope mac-based

Parameters **mac-based** — Enables forwarding for PIM-snooped IPv6 multicast traffic based on the low-order 32 bits of its destination IPv6 address.

sg-based — Enables forwarding for PIM-snooped IPv6 multicast traffic based on its full source (if specified in the join) and destination IPv6 address.

Platforms All

17.182 mcast-management

mcast-management

Syntax **mcast-management**

Context **[Tree]** (config mcast-management)

Full Context configure mcast-management

Description Commands in this context configure multicast management parameters. The **mcast-management** CLI node contains the **bandwidth-policy** and **multicast-info-policy** definitions. The bandwidth-policy is used to manage the ingress multicast paths into the switch fabric. The multicast-info-policy defines how each multicast channel is handled by the system. The policy may be used by the ingress multicast bandwidth manager, the ECMP path manager and the egress multicast CAC manager.

The **mcast-management** node always exists and contains the default bandwidth-policy and the default multicast-info-policy. Enter the mcast-management node when editing, deleting or creating a bandwidth policy or multicast info policy. The default bandwidth policy and multicast-info-policy cannot be edited or deleted.

A chassis-level node within multicast-management is used to control the switch fabric multicast planes replication limits. The switch fabric multicast planes are the individual multicast spatial replication contexts available in the system.

Platforms All

Use subject to Terms available at: www.nokia.com

17.183 mcast-path-management

mcast-path-management

Syntax **mcast-path-management**

Context **[Tree]** (config>card>fp>ingress mcast-path-management)

Full Context configure card fp ingress mcast-path-management

Description This CLI node contains the forwarding plane settings for ingress multicast path management. Enter the node to configure the bandwidth-policy and the administrative state of ingress multicast path management.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

17.184 mcast-pool

mcast-pool

Syntax **mcast-pool percent-of-total** *percent-of-buffers* **resv-cbs** *percent-of-pool* **slope-policy** *policy-name*
no mcast-pool

Context **[Tree]** (config>mcast-mgmt>bw-plcy mcast-pool)

Full Context configure mcast-management bandwidth-policy mcast-pool

Description This command configures the ingress multicast path management buffer pool. The pool is used by the primary and secondary path queues through which all ingress managed multicast traffic must flow. The parameters may be used to configure the size of the pool relative to the total ingress buffer space, the amount of reserved CBS buffers within the pool and the slope policy used to manage early congestion detection functions in the shared portion of the pool.

Care should be taken when managing the buffer pool space as changes to the systems buffer pool behavior can have negative effects on multicast and unicast forwarding.

Sizing the Pool

The percent-of-total command defines how much of the total ingress buffer pool space for the MDA is dedicated for multicast channels managed by the bandwidth policy. Since multicast typically has a higher scheduling priority through the switch fabric, the buffer pool does not need to be large. By default, the system reserves 10% of the buffers on the ingress side of the MDA once multicast path management is enabled.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Reserved CBS Portion of the Pool

The multicast pool is divided into two portions; reserved and shared. The reserved portion is used by the multicast path queues until they cross there individual CBS thresholds. Since the CBS thresholds are configured as percentages and the percentages can oversubscribe the reserved portion of the pool, it is possible for some of the queues CBS buffer allocation to be met by the shared portion of the pool. By default, 50% of the pool is defined as reserved. This may be changed using the resv-cbs percentage parameter.

Shared Portion WRED Slopes

The shared portion of the buffer pool is used by queues that have crossed over their CBS thresholds. Since the total MBS values for the multicast path queues may oversubscribe the pool size, a buffer congestion control mechanism is supported within the pool in the form of two WRED slopes. The **slope-policy** parameter defines how the slopes are configured and whether they are activated. Each packet entering a path queue is defined as high or low priority within the queue based on the channel's preference value relative to the **cong-priority-threshold** command. When getting a shared buffer of a high priority packet, the high WRED slope is used. Low priority packets use the low WRED slope.

The **no** form of this command returns the managed multicast path pool to its default settings.

Parameters *percent-of-buffers* — Specifies the percentage of ingress buffers that is allocated to the multicast pool.

Values 1 to 50

Default 10

percent-of-pool — Specifies the percentage of the pool that is reserved for multicast path queues within their CBS threshold.

Values 1 to 100

Default 50

slope-policy-name — Specifies the WRED slopes within the multicast pool. Once a slope policy is associated with a buffer pool, it cannot be deleted.

Default default

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

17.185 mcast-reporting

mcast-reporting

Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt igmp-policy mcast-reporting

Description Commands in this context configure mcast reporting.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.186 mcast-reporting-dest

mcast-reporting-dest

Syntax **mcast-reporting-dest** *dest-name* [**create**]
no mcast-reporting-dest *dest-name*

Context **[Tree]** (config>mcast-management mcast-reporting-dest)

Full Context configure mcast-management mcast-reporting-dest

Description This command creates a multicast reporting destination hierarchy in CLI under which parameters defining this destination can be specified. The destination refers to an external node that collects and analyze IGMP events.

The multicast reporting destination is associated with a name that each subscriber can reference to send the IGMP related events.

It can be also referenced in the host tracking policy in case that IGMP events are related to the host tracking feature.

The **no** form of this command removes the destination name from the configuration.

Parameters *dest-name* — Specifies the multicast reporting destination name.

Platforms All

mcast-reporting-dest

Syntax [**no**] **mcast-reporting-dest** [*dest-name*]

Context **[Tree]** (debug>mcast-mgmt mcast-reporting-dest)

Full Context debug mcast-management mcast-reporting-dest

Description This command debugs multicast path management reporting destinations and applies only to the 7750 SR.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mcast-reporting-dest

Syntax **mcast-reporting-dest** *dest-name*
no mcast-reporting-dest

Context **[Tree]** (config>subscr-mgmt>igmp-policy>mcast-reporting mcast-reporting-dest)

Full Context configure subscriber-mgmt igmp-policy mcast-reporting mcast-reporting-dest

Description This command references the multicast reporting destination to which IGMP-related events are exported. The multicast-reporting-destination is referenced within the IGMP policy for the subscriber.

The **no** form of this command reverts to the default value.

Parameters *dest-name* — Specifies the name of the multicast reporting destination, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.187 mcast-tunneling

mcast-tunneling

Syntax [**no**] **mcast-tunneling**

Context **[Tree]** (config>router>ldp>targ-session>peer mcast-tunneling)
[Tree] (config>router>ldp>targ-session>peer-template mcast-tunneling)

Full Context configure router ldp targeted-session peer mcast-tunneling
configure router ldp targeted-session peer-template mcast-tunneling

Description At the downstream router, the FEC is resolved and the result of the resolution is a Label Mapping advertisement to the upstream peer.

At the upstream router, if the RSVP LSP does not exist to the peer address, the upstream router does not use the T-LDP session for FEC resolution.

The **no** form of this command reverts to the default value.

Default no mcast-tunneling

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.188 mcast-upstream-asbr-frr

mcast-upstream-asbr-frr

Syntax [**no**] **mcast-upstream-asbr-frr**

Context **[Tree]** (config>router>ldp mcast-upstream-asbr-frr)

Full Context configure router ldp mcast-upstream-asbr-frr

Description This command enables ASBR MoFRR.

When ASBR MoFRR is enabled, the local leaf will perform MoFRR for multiple ASBRs; for example, if there are two ASBRs, the local leaf will select one ASBR as the primary and another ASBR as the backup.

The **no** form of the command disables ASBR MoFRR.

If the **mcast-upstream-frr** command is enabled, disabling ASBR MoFRR will only allow IGP MoFRR in the local AS; for example, a single ASBR will be selected and two separate, disjointed paths will be selected as the primary and backup LSPs from the local leaf to ASBR.

If the **mcast-upstream-frr** command is disabled, disabling ASBR MoFRR will disable MoFRR entirely.

Default no mcast-upstream-asbr-frr

Platforms All

17.189 mcast-upstream-frr

mcast-upstream-frr

Syntax [**no**] **mcast-upstream-frr**

Context **[Tree]** (config>router>ldp mcast-upstream-frr)

Full Context configure router ldp mcast-upstream-frr

Description This command enables the mLDP fast upstream switchover feature.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When this command is enabled and LDP is resolving a mLDP FEC received from a downstream LSR, it checks if an ECMP next-hop or a LFA next-hop exist to the root LSR node. If LDP finds one, it programs a primary ILM on the interface corresponding to the primary next-hop and a backup ILM on the interface corresponding to the ECMP or LFA next-hop. LDP then sends the corresponding labels to both upstream LSR nodes. In normal operation, the primary ILM accepts packets while the backup ILM drops them. If the interface or the upstream LSR of the primary ILM goes down causing the LDP session to go down, the backup ILM will then start accepting packets.

In order to make use of the ECMP next-hop, the user must configure the **ecmp** value in the system to at least 2 using the following command:

config>router>ecmp

In order to make use of the LFA next-hop, the user must enable LFA using the following commands:

config>router>isis>loopfree-alternates

config>router>ospf>loopfree-alternates

Enabling IP FRR or LDP FRR features is not strictly required since LDP only needs to know where the alternate next-hop to the root LSR is to be able to send the Label Mapping message to program the backup ILM at the initial signaling of the tree. Thus enabling the LFA option is sufficient. If however, unicast IP and LDP prefixes need to be protected, then these features and the mLDP fast upstream switchover can be enabled concurrently.

The mLDP FRR fast switchover relies on the fast detection of loss of **LDP session** to the upstream peer to which the primary ILM label had been advertised. We strongly recommended to perform the following:

- Enable BFD on all LDP interfaces to upstream LSR nodes. When BFD detects the loss of the last adjacency to the upstream LSR, it will bring down immediately the LDP session which will cause the IOM to activate the backup ILM.
- If there is a concurrent TLDP adjacency to the same upstream LSR node, enable BFD on the T-LDP peer in addition to enabling it on the interface.
- Enable the **ldp-sync-timer** option on all interfaces to the upstream LSR nodes. If an LDP session to the upstream LSR to which the primary ILM is resolved goes down for any other reason than a failure of the interface or of the upstream LSR, routing and LDP will go out of sync. This means the backup ILM will remain activated until the next time SPF is rerun by IGP. By enabling IGP-LDP synchronization feature, the advertised link metric will be changed to max value as soon as the LDP session goes down. This in turn will trigger an SPF and LDP will likely download a new set of primary and backup ILMs.

The **no** form of this command disables the fast upstream switchover for mLDP FECs.

Default no mcast-upstream-frr

17.190 mcast-vpn-ipv4

mcast-vpn-ipv4

Syntax **mcast-vpn-ipv4 send** *send-limit* **receive** [**none**]
mcast-vpn-ipv4 send *send-limit*
no mcast-vpn-ipv4

Context **[Tree]** (config>router>bgp>add-paths mcast-vpn-ipv4)
[Tree] (config>router>bgp>group>add-paths mcast-vpn-ipv4)
[Tree] (config>router>bgp>group>neighbor>add-paths mcast-vpn-ipv4)

Full Context configure router bgp add-paths mcast-vpn-ipv4
configure router bgp group add-paths mcast-vpn-ipv4
configure router bgp group neighbor add-paths mcast-vpn-ipv4

Description This command configures the add-paths capability for multicast IPv4 VPN routes. By default, add-paths is not enabled for multicast IPv4 VPN routes.

The maximum number of multicast paths per IPv4 VPN prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast IPv4 VPN routes, causing sessions established using add-paths for multicast IPv4 VPN to go down and come back up without the add-paths capability.

Default no mcast-vpn-ipv4

Parameters *send-limit* — Specifies the maximum number of paths per multicast IPv4 VPN prefix that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast IPv4 VPN AFI/SAFI.

Values 1 to 16, none

receive — Specifies that the router negotiates to receive multiple multicast routes per IPv4 VPN prefix.

none — Specifies that the router does not negotiate to receive multiple multicast routes per IPv4 VPN prefix.

Description This command configures the add-paths capability for multicast IPv6 VPN routes. By default, add-paths is not enabled for multicast IPv6 VPN routes.

The maximum number of multicast paths per IPv6 VPN prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast IPv6 VPN routes, causing sessions established using add-paths for multicast IPv6 VPN to go down and come back up without the add-paths capability.

Default no mcast-vpn-ipv6

Parameters *send-limit* — Specifies the maximum number of paths per multicast IPv6 VPN prefix that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast IPv6 VPN AFI/SAFI.

Values 1 to 16, none

receive — Specifies that the router negotiates to receive multiple multicast routes per IPv6 VPN prefix.

none — Specifies that the router does not negotiate to receive multiple multicast routes per IPv6 VPN prefix.

17.192 mcc-mnc-prefix

mcc-mnc-prefix

Syntax **mcc-mnc-prefix** *imsi-prefix-string*
no mcc-mnc-prefix

Context **[Tree]** (config>app-assure>group>gtp>gtp-fltr>imsi-apn-fltr>entry mcc-mnc-prefix)

Full Context configure application-assurance group gtp gtp-filter imsi-apn-filter entry mcc-mnc-prefix

Description This command configures a matching condition for the IMSI (MCC-MNC) prefix.

Parameters *imsi-prefix-string* — Specifies a string of 1 to 6 decimal digits representing the IMSI prefix to be matched against the IMSI IE of the packet, or the special value **ANY_IMSI** to indicate that an IMSI IE must be present as a matching condition regardless of the IMSI IE value.

If no MCC-MNC prefix is specified, the entry will match GTP packets that have an IMSI IE containing any value.

Values 0 to 999999, **ANY_IMSI**

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.193 mcr-default-gtw

mcr-default-gtw

Syntax **mcr-default-gtw**

Context **[Tree]** (config>service>vpls mcr-default-gtw)

Full Context configure service vpls mcr-default-gtw

Description Commands in this context configure the default gateway information when using Dual Homing in L2-TPSDA. The IP and MAC address of the default gateway used for subscribers on an L2 MC-Ring are configured in this context. After a ring heals or fails, the system sends out a gratuitous ARP on an active ring SAP in order to attract traffic from subscribers on the ring with connectivity to that SAP.

17.194 mcs

mcs

Syntax **mcs** [**detail**]
no mcs

Context **[Tree]** (debug>service>id>pim-snooping mcs)

Full Context debug service id pim-snooping mcs

Description This command enables or disables debugging for PIM snooping multi-chassis synchronization.

Parameters **detail** — Provides detailed debugging information

Platforms All

mcs

Syntax **mcs** [*ip-int-name*]
no mcs

Context **[Tree]** (debug>router>igmp mcs)

Full Context debug router igmp mcs

Description This command enables debugging for IGMP multicast servers (MCS).

The **no** form of the command disables the IGMP interface debugging for the specifies interface name.

Parameters *ip-int-name* — Debugs the information associated with the specified IP interface name.

Values IP interface address

Platforms All

17.195 mcs-interval

mcs-interval

Syntax **mcs-interval** *minutes*
mcs-interval use-update-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no mcs-interval

Context [Tree] (config>subscr-mgmt>acct-plcy mcs-interval)

Full Context configure subscriber-mgmt radius-accounting-policy mcs-interval

Description This command specifies the interval at which the active BNG in a dual-homed deployment synchronizes subscriber accounting data using MCS to the standby BNG. The MCS interval is a statically configured value or is equal to the configured RADIUS accounting update-interval.

The **no** form of the command reverts to the default value.

Default no mcs-interval

Parameters *minutes* — Specifies the interval, in minutes, at which accounting data of the subscriber is synchronized.

Values 5 to 60

use-update-interval — Synchronizes subscriber accounting data at the same time as the RADIUS interim-update. For this, the configured update-interval in the RADIUS accounting policy is used, ignoring RADIUS overrides.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.196 mcs-peer

mcs-peer

Syntax **mcs-peer** *ip-address* **sync-tag** [*sync-tag*]
no mcs-peer

Context [Tree] (config>python>py-pol>cache mcs-peer)

Full Context configure python python-policy cache mcs-peer

Description This command specifies the MCS peer's address and sync-tag for syncing the cached entries of the python-policy. The sync-tag must be match on both chassis.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IPv4 address of the MCS peer.

sync-tag — Specifies the tag for sync, up to 32 characters.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mcs-peer

Syntax **mcs-peer** *ip-address* **sync-tag** *name*
no mcs-peer

Context **[Tree]** (config>aaa>diam-peer-plcy>proxy mcs-peer)

Full Context configure aaa diameter-peer-policy proxy mcs-peer

Description This command configures the IP address and the synchronization tag for the multi-chassis synchronization (MCS) peer.

This command is applicable only to legacy implementations of Diameter base in SR OS.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the MCS peer.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

name — Specifies the sync tag name, up to 32 characters. The name must match on both nodes for the pair of redundant diameter proxies.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.197 md

md

Syntax **md** *file-url*

Context **[Tree]** (file md)

Full Context file md

Description This command creates a new directory in a file system.

Directories can only be created one level at a time.

Parameters *file-url* — Specifies the directory name to be created.

Values

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each

17.198 md-auto-id

md-auto-id

Syntax **md-auto-id**

Context **[Tree]** (config>eth-cfm md-auto-id)

Full Context configure eth-cfm md-auto-id

Description This command automatically assigns numerical index values for ma-index and md-index in model-driven management interfaces.

Classic management interfaces use a numerical index as the primary key for ETH-CFM domains and associations. In model-driven interfaces, domains and associations use string names as keys. The domain and association can optionally be created without having to explicitly select and specify a numerical index in model-driven interfaces. In this case, SR OS assigns an index using the configured index range.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

md-auto-id

Syntax **md-auto-id**

Context **[Tree]** (config>qos md-auto-id)

Full Context configure qos md-auto-id

Description This command automatically assigns numerical ID values for QoS policies in model-driven (MD) management interfaces.

Classic management interfaces use a numerical policy ID as the primary key for sap-ingress, sap-egress, and network QoS policies. In model-driven interfaces, SAP and network policies use string names as keys. The SAP and network policies can optionally be created in MD interfaces without having to explicitly select and specify a numerical policy ID. In this case, SR OS assigns an ID using the configured ID range.

Platforms All

md-auto-id

Syntax **md-auto-id**

Context **[Tree]** (config>filter md-auto-id)

Full Context configure filter md-auto-id

Description This command automatically assigns numerical ID values for filter policies in model-driven management interfaces.

Classic management interfaces use a numerical filter ID as the primary key for IP filters, IPv6 filters, and MAC filters. In model-driven interfaces, IP, IPv6, and MAC filters use string names as keys. The filters can optionally be created in MD interfaces without having to explicitly select and specify a numerical filter ID. In this case, SR OS assigns an ID using the configured ID range.

Platforms All

md-auto-id

Syntax **md-auto-id**

Context **[Tree]** (config>service md-auto-id)

Full Context configure service md-auto-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command automatically assigns numerical ID values for services, customers, and PW templates in model-driven (MD) management interfaces.

Classic management interfaces use a numerical service ID, customer ID, and PW template ID as the primary key for services, customers, and PW templates. In model-driven interfaces, services, customers, and PW templates use string names as keys. The services, customers, and PW templates can optionally be created in MD interfaces without having to explicitly select and specify a numerical ID. In this case, SR OS assigns an ID using the configured ID range.

17.200 md-cli-session

md-cli-session

Syntax **md-cli-session** {**permit** | **deny**}

Context **[Tree]** (config>system>security>profile>grpc>rpc-authorization md-cli-session)

Full Context configure system security profile grpc rpc-authorization md-cli-session

Description This command configures the use of the MdCli Session RPC for the user profile.

The **no** form of this command reverts to the default value.

Default md-cli-session permit

Parameters **deny** — Specifies that the use of MdCli Session RPC is denied.

permit — Specifies that the use of MdCli Session RPC is permitted.

Platforms All

17.201 md-index-range

md-index-range

Syntax **md-index-range start** *md-index* **end** *md-index*
no md-index-range

Context **[Tree]** (config>eth-cfm>md-auto-id md-index-range)

Full Context configure eth-cfm md-auto-id md-index-range

Description This command specifies the range of indexes used by SR OS to automatically assign an index to ETH-CFM domains that are created in model-driven interfaces without an index explicitly specified by the user or client.

A domain created with an explicitly-specified index cannot use an index in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **md-auto-id** command for further details.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **start** *md-index* — Specifies the lower value of the index range. The value must be less than or equal to the **end** value.

Values 1 to 4294967295

end *md-index* — Specifies the upper value of the index range. The value must be greater than or equal to the **start** value.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.202 md-interfaces

md-interfaces

Syntax [**no**] **md-interfaces**

Context **[Tree]** (config>system>security>management-interface>output-authorization md-interfaces)

Full Context configure system security management-interface output-authorization md-interfaces

Description This command controls output authorization of commands or RPCs for model-driven interfaces that display configuration or state.

When enabled, output authorization is performed for the following commands:

- MD-CLI **info** and **compare** commands
- NETCONF <get> and <get-config> RPCs
- gNMI Get RPC

When disabled, output authorization is not performed, which may significantly decrease the system response time by reducing command authorization requests, especially when remote AAA servers are used. Input to edit configuration is always authorized based on the AAA configuration.

By default, authorization checks are performed for configuration and state output.

The **no** form of this command disables authorization checks, allowing the output to be displayed immediately.

Default md-interfaces

17.203 mda

mda

Syntax [**no**] **mda** *mda-id*

Context **[Tree]** (config>isa>wlan-gw-group mda)

Full Context configure isa wlan-gw-group mda

Description This command enables an ISA for WLAN-GW functionality.

The **no** form of this command removes the ISA from the WLAN-GW configuration.

Parameters *mda-id* — Indicates the IOM and MDA slot in format *slot*/*mda*.

Values slot — 1 to 10
mda — 1 to 2

Platforms 7750 SR, 7750 SR-e, 7750 SR-s

mda

Syntax [**no**] **mda** *mda-slot*

Context **[Tree]** (config>card mda)

Full Context configure card mda

Description This mandatory command enables access to a card's MDA CLI context to configure MDAs.

Parameters *mda-slot* — Specifies the MDA slot number to be configured. Slots are numbered 1 and 2. On vertically oriented slots, the top MDA slot is number 1, and the bottom MDA slot is number 2. On horizontally oriented slots, the left MDA is number 1, and the right MDA slot is number 2.

Values 1, 2

Platforms All

mda

Syntax [**no**] **mda** *mda-slot*

Context **[Tree]** (config>card>xiom mda)

Full Context configure card xiom mda

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Configures an MDA-s in one of the slots of an XIOM.

Parameters *mda-slot* — Specifies the MDA-s slot number.

Values 1 or 2

Platforms 7750 SR-s

mda

Syntax [**no**] **mda** *mda-id*

Context **[Tree]** (config>service>vpls>mesh-sdp>egress>mfib-allowed-mda-destinations mda)
[Tree] (config>service>vpls>spoke-sdp>egress>mfib-allowed-mda-destinations mda)

Full Context configure service vpls mesh-sdp egress mfib-allowed-mda-destinations mda
configure service vpls spoke-sdp egress mfib-allowed-mda-destinations mda

Description This command specifies an MFIB-allowed MDA destination for an SDP binding configured in the system.

Parameters *mda-id* — Specifies an MFIB-allowed MDA destination

Values

slot/mda	slot: 1 to 10
	mda: 1, 2
slot/xiom/mda	slot: 1 to 10
	xiom: “x1” or “x2”
	mda: 1, 2

Platforms All

mda

Syntax [**no**] **mda** *mda-id*

Context **[Tree]** (config>isa>tunnel-grp mda)

Full Context configure isa tunnel-group mda

Description This command specifies the MDA ID of the MS-ISA as the member of tunnel-group with multi-active enabled. Up to 16 MDA could be configured under the same tunnel-group.

Parameters *mda-id* — Specifies the id of MS-ISA.

Values iom-slot-id/mda-slot-id

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mda

Syntax **mda** *mda-id* [**drain**]
no mda *mda-id*

Context **[Tree]** (config>isa>lns-group mda)

Full Context configure isa lns-group mda

Description This command configures an ISA LNS group MDA.

The **no** form of the command removes the MDA ID from the LNS group configuration.

Parameters *mda-id* — Specifies the MDA identifier.

Values

mda-id:	*slot*/*mda*
	slot: 1 to 10
	mda: 1, 2

drain — Prevents new L2TP sessions being associated with the ISA. If an ISA is removed from the lns-group or if the lns-group be shutdown all associated L2TP sessions will be immediately terminated (and L2TP CDN messages sent to the L2TP peer). View show commands to determine which ISA is terminating which session (**show router l2tp session**).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mda

Syntax [**no**] **mda** *mda-id*

Context **[Tree]** (config>isa>nat-group mda)

Full Context configure isa nat-group mda

Description This command configures an ISA NAT group MDA.

Parameters *mda-id* — Specifies the MDA ID in the *slot/mda* format.

Values slot: 1 to 10
mda: 1 to 16

Note: Available parameter values may differ by platform.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mda

Syntax [**no**] **mda** *mda-id*

Context **[Tree]** (config>service>pw-template>egress>mfib-mda mda)

Full Context configure service pw-template egress mfib-allowed-mda-destinations mda

Description This command specifies an MFIB-allowed media adapter destination for an SDP binding configured in the system.

Parameters *mda-id* — Specifies an MFIB-allowed media adapters destination.

Values 1, 2

Platforms All

17.204 mda-type

mda-type

Syntax **mda-type** *mda-type* [**level** *mda-level*]
no mda-type

Context **[Tree]** (config>card>mda mda-type)

Full Context configure card mda mda-type

Description This mandatory command provisions a specific MDA type to the device configuration for the slot. The MDA can be preprovisioned but an MDA must be provisioned before ports can be configured. Ports can be configured once the MDA is properly provisioned.

A maximum of two MDAs can be provisioned on an IOM or XCM. To modify an MDA slot, shut down all port associations.

XMAs are provisioned using MDA commands. A medium severity alarm is generated if an MDA is inserted that does not match the MDA type configured for the slot. This alarm is cleared when the correct MDA is inserted or the configuration is modified. A high severity alarm is raised when an administratively enabled MDA is removed from the chassis. This alarm is cleared if the either the correct MDA type is inserted or the configuration is modified. A low severity trap is issued if an MDA is removed that is administratively disabled.

An MDA can only be provisioned in a slot if the MDA type is allowed in the MDA slot. An error message is generated when an MDA is provisioned in a slot where it is not allowed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Some MDA hardware can support two different firmware loads. One load includes the base Ethernet functionality, including 10G WAN mode, but does not include 1588 port-based timestamping. The second load includes the base Ethernet functionality and 1588 port-based timestamping, but does not include 10G WAN mode. These are identified as two MDA types that are the same, except for a “-ptp” suffix to indicate the second loadset; for example, *x40-10gb-sfp* and *x40-10gb-sfp-ptp*. A hard reset of the MDA occurs when switching between the two provisioned types.

A medium severity alarm is generated if an MDA is inserted that does not match the MDA type configured for the slot. This alarm is cleared when the correct MDA is inserted or the configuration is modified.

A high severity alarm is raised when an administratively enabled MDA is removed from the chassis. This alarm is cleared if the either the correct MDA type is inserted or the configuration is modified. A low severity trap is issued if an MDA is removed that is administratively disabled.

An alarm is raised if partial or complete MDA failure is detected. The alarm is cleared when the error condition ceases.

All parameters in the MDA context remain and if non-default values are required then their configuration remains as it is on all existing MDAs.

New generations of XMAs include variants controlled through hardware and software licensing. For these XMAs, the license level must be provisioned in addition to the MDA type. An XMA cannot become operational unless the provisioned license level matches the license level of the XMA installed into the slot. The set of license levels varies by MDA type.

The provisioned level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if configuration that would not be permitted with the new target license level exists.

If the license level is not specified, the level is set to the highest license level for that XMA.

The **no** form of this command deletes the MDA from the configuration. The MDA must be administratively shut down before it can be deleted from the configuration.

Parameters *mda-type* — Specifies the type of MDA selected for the slot position. Values for this attribute vary by platform and release. The release notes include a listing of all supported mda-types and their CLI strings. In addition, the command can be queried to check which mda-types are relevant for the active platform type. Some examples include me6-10gb-spf+ and x4-100g-cfp2.

mda-level — Specifies the MDA level. Possible values vary by MDA type.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mda-type

Syntax **mda-type** *mda-type*
no mda-type

Context **[Tree]** (config>card>xiom>mda mda-type)

Full Context configure card xiom mda mda-type

Description This command adds an MDA-s to the device configuration for the slot. The MDA-s type can be preprovisioned, which means that the MDA-s does not have to be installed in the chassis.

An MDA-s must be provisioned before a connector or a port can be configured.

An MDA-s can only be provisioned in a slot that is vacant. No other MDA-s can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An MDA-s can only be provisioned in a slot if the MDA-s type is allowed in the slot. An error message is generated if an attempt is made to provision an MDA-s type that is not allowed.

If an MDA-s is inserted that does not match the configured MDA-s type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct MDA-s type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled MDA-s is removed from the chassis. The alarm is cleared when the correct MDA-s type is installed or the configuration is modified. A log event is issued when a MDA-s is removed that is administratively disabled.

The **no** form of this command removes the MDA-s from the configuration.

Parameters *mda-type* — Specifies the type of MDA-s to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported mda-types and their CLI strings. In addition, the command can be queried to check which mda-types are relevant for the active platform type.

Platforms 7750 SR-s

17.205 mdl

mdl

Syntax **mdl** {**eic** | **lic** | **fic** | **unit** | **pfi** | **port** | **gen**} *mdl-string*
no mdl [**eic** | **lic** | **fic** | **unit** | **pfi** | **port** | **gen**]

Context **[Tree]** (config>port>tdm>ds3 mdl)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port tdm ds3 mdl

Description This command configures the maintenance data link (MDL) message for a DS-3/E-3.

This command is only applicable if the DS-3/E-3 is using C-bit framing (see the **config>port>tdm>ds3 framing** command).

The **no** form of this command removes the MDL string association and stops the transmission of any IDs.

Default no mdl

Parameters *mdl-string* — Specifies an MDL message up to 38 characters long on a DS-3.

eic — Specifies the equipment ID code up to 10 characters long.

lic — Specifies the equipment ID code up to 11 characters long.

fic — Specifies the ID code up to 10 characters long.

unit — Specifies the unit ID code up to 6 characters long.

pfi — Specifies the facility ID code up to 38 characters long.

port — Specifies the port ID code up to 38 characters long.

gen — Specifies the generator number to send in the MDL test signal message up to 38 characters long.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

17.206 mdl-transmit

mdl-transmit

Syntax **mdl-transmit** {**path** | **idle-signal** | **test-signal**}
no mdl-transmit [**path** | **idle-signal** | **test-signal**]

Context **[Tree]** (config>port>tdm>ds3 mdl-transmit)

Full Context configure port tdm ds3 mdl-transmit

Description This command enables the transmission of an MDL message on a DS-3/E-3 over channelized interface.

The **no** form of this command disables transmission of the specified message or all messages.

Default no mdl-transmit

Parameters **path** — Specifies the MDL path message.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

idle-signal — Specifies the MDL idle signal message.

test-signal — Specifies the MDL test signal message.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

17.207 mdt-pim

mdt-pim

Syntax **mdt-pim mode** {**asm** | **ssm**} **group-address** *group-ip-address*
no mdt-pim

Context **[Tree]** (config>service>vprn>mvpn>pt>selective>multistream-spmsi mdt-pim)

Full Context configure service vprn mvpn provider-tunnel selective multistream-spmsi mdt-pim

Description This command creates a multi-stream MDT that could match many (C-S,C-G)s into a single data MDT.

Parameters *group-ip-address* — Specifies the group address of this data MDT, that is the provider group address.

Platforms All

17.208 mdt-type

mdt-type

Syntax **mdt-type** {**sender-receiver** | **sender-only** | **receiver-only**}
no mdt-type

Context **[Tree]** (config>service>vprn>mvpn mdt-type)

Full Context configure service vprn mvpn mdt-type

Description This command allows restricting MVPN instance per PE node to a specific role. By default, MVPN instance on a given PE node assumes the role of being a sender as well as receiver. This creates a mesh of MDT/PMSI across all PE nodes from this PE.

This command provides an option to configure either a sender-only or receiver-only mode per PE node. Restricting the role of a PE node prevents creating full mesh of MDT/PMSI across all PE nodes that are participating in MVPN instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

auto-rp-discovery cannot be enabled together with **mdt-type sender-only** or **mdt-type receiver-only**, or **wildcard-spmsi** configurations.

The **no** version of this command restores the default (sender-receiver).

Default mdt-type sender-receiver

Parameters **sender-receiver** — MVPN has both sender and receivers connected to PE node.

sender-only — MVPN has only senders connected to PE node.

receiver-only — MVPN has only receivers connected to PE node.

no meas-interval {**5-mins** | **15-mins** | **1-hour** | **1-day**}

Context **[Tree]** (config>oam-pm>session meas-interval)

Full Context configure oam-pm session meas-interval

Description This command establishes the parameters of the individual measurement intervals utilized by the session. Multiple measurement intervals may be specified within the session. A maximum of three different measurement intervals may be configured under each session.

The **no** form of this command deletes the specified measurement interval.

Parameters **meas-interval** — Specifies the duration of the measurement interval.

Values 5-mins, 15-mins, 1-hour, 1-day

create — Creates the measurement interval.

Platforms All

17.210 measurement-template

measurement-template

Syntax **measurement-template** *template-name* [**create**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no measurement-template *template-name*

Context **[Tree]** (config>test-oam>link-meas measurement-template)

Full Context configure test-oam link-measurement measurement-template

Description This command configures a measurement template identifier that can be assigned to the IP interface by name.

Configuration modifications can be made to the measurement template without disabling the template and while IP interfaces are actively referencing the **measurement-template**. Refer to the *7250 IXR OAM and Diagnostics Guide* for more information about which modifications will cause the test on associated IP interfaces to “Terminate” and restart.

The **no** form of this command removes the template name. A measurement template can be removed if no interfaces are referencing the template.

Parameters *template-name* — Specifies the measurement template name, up to 64 characters.

create — Keyword used to create the measurement template. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

measurement-template

Syntax **measurement-template** [*64 chars max*]
no measurement-template

Context **[Tree]** (config>router>if>if-attr>delay>dyn measurement-template)

Full Context configure router interface if-attribute delay dynamic measurement-template

Description This command specifies the measurement template name used on the interface. The **measurement-template** associated with the interface can be changed without disabling the test protocol used to carry the test packet. Changing or removing the **measurement-template** associated with the IP interface stops the test and removes all test results for the IP interface.

The **no** form of this command removes the **measurement-template**, which stops the test and removes all test results for the interface.

Default no measurement-template

Parameters *64 chars max* — Specifies the measurement template name, up to 64 characters

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.211 med-out

med-out

Syntax **med-out** {*number* | **igp-cost**}
no med-out

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy med-out)

Full Context configure subscriber-mgmt bgp-peering-policy med-out

Description This command enables advertising the Multi-Exit Discriminator (MED) and assigns the value used for the path attribute for the MED advertised to BGP peers if the MED is not already set.

The specified value can be overridden by any value set with a route policy.

The **no** form of this command used at the global level reverts to default where the MED is not advertised.

Parameters *number* — Specifies the MED path attribute value, expressed as a decimal integer.

Values 0 to 4294967295

igp-cost — Specifies that the MED is set to the IGP cost of the given IP prefix.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

med-out

Syntax **med-out** {*number* | **igp-cost**}
no med-out

Context **[Tree]** (config>service>vprn>bgp med-out)
[Tree] (config>service>vprn>bgp>group med-out)
[Tree] (config>service>vprn>bgp>group>neighbor med-out)

Full Context configure service vprn bgp group med-out
configure service vprn bgp group neighbor med-out
configure service vprn bgp med-out

Description This command enables advertising the Multi-Exit Discriminator (MED) and assigns the value used for the path attribute for the MED advertised to BGP peers if the MED is not already set.

The specified value can be overridden by any value set via a route policy.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command used at the global level reverts to default where the MED is not advertised.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no med-out

Parameters *number* — Specifies the MED path attribute value, expressed as a decimal integer.

Values 0 to 4294967295

igp-cost — Specifies the MED is set to the IGP cost of the given IP prefix.

Platforms All

med-out

Syntax **med-out** {*number* | **igp-cost**}
no med-out

Context **[Tree]** (config>router>bgp med-out)

17.212 medium-duration-flow-count

medium-duration-flow-count

Syntax [**no**] **medium-duration-flow-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-sub-cntr medium-duration-flow-count)

Full Context configure log accounting-policy custom-record aa-specific aa-sub-counters medium-duration-flow-count

Description This command includes the medium duration flow count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the medium duration flow count.

Default no medium-duration-flow-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.213 member

member

Syntax [**no**] **member** *port-id*

Context **[Tree]** (config>interface-group-handler member)

Full Context configure interface-group-handler member

Description This command binds the specified port with the associate Interface Group Handler. Up to eight **member** commands can be issued to add multiple ports to the associated IGH. The **member** must be a port or channel on a SONET or POS MDA. It must be a physical port or channel in network mode, and not bound to any router interfaces. A port or channel cannot be a member of more than one IGH at the same time. MLPPP bundles and their members cannot be IGH members.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the specified port ID from the associated IGH.

Parameters *port-id* — Identifies the port to be associated with the interface group handler.

Platforms All

member

Syntax [**no**] **member** *port-id*

Context **[Tree]** (config>port>multilink-bundle member)

Full Context configure port multilink-bundle member

Description This command binds a channel group to a multilink bundle. For IMA and MLFR groups, this command binds a channel group filling up the entire DS-1 or E-1. For MLPPP groups, fractional (n x ds0) DS1 or E1 links are also allowed. However, fractional DS1 links and fractional E1 links may not be combined in the same multilink bundle. If a channel with a different number of timeslots than the primary-link member is added to the bundle, a warning will be provided.

The **no** form of this command removes the specified channel group from the multilink bundle.

Parameters *port-id* — Specifies the physical port ID in the following format:

port-id	*slot*/*mda*/*port*.*channel*		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

Platforms 7450 ESS, 7750 SR-7/12/12e

member

Syntax **member** *port-id*
no member

Context **[Tree]** (config>eth-tunnel>path member)

Full Context configure eth-tunnel path member

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command associates a port with the path defined under the Ethernet tunnel. If the operator wants to replace an existing member port or control tag, the whole path needs to be shutdown first. The alternate path will be activated as a result keeping traffic interruption to a minimum. Then the whole path must be deleted, the alternate path precedence modified to primary before re-creating the new path.

The following port-level configuration needs to be the same across the two member ports of an Ethernet tunnel:

- port>ethernet>access>{ingress|egress}>queue-group
- port>ethernet>egress-scheduler-policy
- port>access>egress>pool
- port>ethernet>dot1q-etype
- port>ethernet>qinq-etype
- port>ethernet>pbb-etype
- port>ethernet>mtu

The Ethernet tunnel will inherit the configuration from the first member port for these parameters. Additional member port that is added must have the same configuration.

The operator is allowed to update these port parameters only if the port is the sole member of an Ethernet tunnel. This means that in the example below, the operator needs to remove port 1/1/4 and port 1/1/5 before being allowed to modify 1/1/1 for the above parameters.

```
eth-tunnel 1
  path 1
    member 1/1/1
  path 2
    member 1/1/4
eth-tunnel 2
  path 1
    member 1/1/1
  path 2
    member 1/1/5
```

The **no** form of this command is used just to indicate that a member is not configured. The procedure described above, based on the **no path** command must be used to un-configure/change the member port assigned to the path.

Default no member

Parameters *port-id* — Specifies the port-id associated with the path in the format x/y/z where x represents the IOM, y the MDA and z the port numbers.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

member

Syntax **member** *encap-value* [**create**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no member *encap-value*

Context **[Tree]** (config>connection-profile member)

Full Context configure connection-profile member

Description This command allows the adding of discrete VPI/VCI values to an ATM connection profile for assignment to an ATM SAP of an Apipe VLL of vc-type atm-cell.

Up to a maximum of 16 discrete VPI/VCI values can be configured in a connection profile. The user can modify the content of a profile which triggers a re-evaluation of all the ATM SAPs which are currently using the profile.

The **no** form of this command deletes the member from the configuration.

Parameters *encap-value* — Specifies the VPI and VCI values of this connection profile member.

Values vpi: NNI: 0 to 4095
UNI: 0 to 255
vci: 1, 2, 5 to 65535

Platforms 7450 ESS, 7750 SR-7/12/12e

member

Syntax [**no**] **member** *encap-id* [**to** *encap-id*]

Context **[Tree]** (config>service>vpls>sap>egress>encap-defined-qos>encap-group member)

Full Context configure service vpls sap egress encap-defined-qos encap-group member

Description This command adds or removes a member ISID or a range of contiguous ISID members to an encap-group. The user can add or remove members to the encap-group one at a time or as a range of contiguous values using the member command. However, when the **qos-per-member** option is enabled, members must be added or removed one at a time.

The **no** form of this command removes the single or range of ISID values from the encap-group.

Parameters *encap-id* — The value of the single encap-id or the start encap-id of the range. ISID is the only encap-id supported.

to *encap-id* — The value of the end encap-id of the range. ISID is the only encap-id supported.

Platforms All

member

Syntax [**no**] **member** *interface-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vprn>isis>link-group>level member)

Full Context configure service vprn isis link-group level member

Description This command adds or removes a links to the associated link-group. The interface name should already exist before it is added to a link-group.

The **no** form of this command removes the specified interface from the associated link-group.

Parameters *interface-name* — Specifies the name of the interface to be added or removed from the associated link-group.

Platforms All

member

Syntax [**no**] **member** *member-id*

Context [Tree] (config>gmpls-tun-grp member)

Full Context configure gmpls-tun-grp member

Description This command configures a member of a GMPLS tunnel group. A member of a GMPLS tunnel group is a GMPLS LSP. All members of a tunnel group must have the same bandwidth. Up to 16 members may be configured for each GMPLS tunnel group.

The **no** form of this command removes the member.

Default no member

Parameters *member-id* — Specifies the identifier of the GMPLS tunnel group member.

Values 1 to 16

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

member

Syntax **member** *user-profile-name* [*user-profile-name*]
no member *user-profile-name*

Context [Tree] (config>system>security>user>console member)

Full Context configure system security user console member

Description This command is used to associate the user with a local command authorization profile.

A user can be associated with up to eight profiles.

The **no** form of this command removes the association between the user and the profile.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default member default

Parameters *user-profile-name* — Specifies up to eight user profile names, up to 32 characters.

Platforms All

member

Syntax [**no**] **member** *interface-name*

Context **[Tree]** (config>router>isis>link-group>level member)

Full Context configure router isis link-group level member

Description This command adds or removes a link to the associated link-group. The interface name should already exist before it is added to a link-group.

The **no** form of this command removes the specified interface from the associated link-group.

Parameters *interface-name* — Specifies the name of the interface to be added or removed from the associated link-group.

Platforms All

17.214 member-threshold

member-threshold

Syntax [**no**] **member-threshold** *threshold*

Context **[Tree]** (config>gmpls-tun-grp member-threshold)

Full Context configure gmpls-tun-grp member-threshold

Description The **member-threshold** is the number of member GMPLS LSPs that must be operationally up before the GMPLS tunnel group is considered operationally up. If that number is not reached, then the GMPLS tunnel group is taken operationally down.

A member of a GMPLS tunnel group may be treated as down for one of the following reasons. These reason codes are recorded in the tmnxGmplsTunGrpMemberTable in the MIB:

- adminDn — The member or the related tunnel group is admin down.
- wpLspDn — The associated GMPLS LSP working path is down.
- wpPortDn — The data-bearer port associated with the GMPLS LSP working path is down.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- wpPortNoRsrc — The data bearer port associated with the LSP working path has no resource to support the services over the GMPLS tunnel group logical port.
- ppLspDn — The associated GMPLS LSP protect path is down.
- ppPortDn — The data-bearer port associated with the GMPLS LSP protect path is down.
- ppPortNoRsrc — The data bearer port associated with the GMPLS LSP protect path has no resource to support the services over the GMPLS tunnel group logical port.

The **no** form of this command resets the member threshold to 0.

Default member-threshold 0

Parameters *threshold* — Specifies the minimum number of GMPLS LSPs that must be operationally up before the GMPLS tunnel group is considered operationally up.

Values 0 to 15

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.215 members

members

Syntax [**no**] **members** *comm-id* [*comm-id*]

Context **[Tree]** (config>router>policy-options>community members)

Full Context configure router policy-options community members

Description This command adds members to a route policy community list to use in route policy entries.

The **no** version of this command deletes route policy community members.

Parameters *comm-id* — Specifies a BGP community value, up to 72 characters. A community ID can be specified in different forms.

Values [*as-num:comm-val* | *reg-ex* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *reg-ex* — A regular expression string. Allowed values are any string up to 72 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (such as “#”, “$”, or spaces), the entire string must be enclosed within double quotes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- *ext-comm* — The extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*reg-ex1*&*reg-ex2*
  - {*target* | *origin*}:*ip-address*:*reg-ex2*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*
  - **flowspec-set**:*ext-asnum*:*group-id*
  - **flowspec-set-trans**:*ext-asnum*:*group-id*
  - **ipv6-redirect**: *ipv6-addr*
  - **color**:*co-bits*:*color-value*

  where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - *reg-ex1*, *reg-ex2* — A regular expression string. Allowed values are any string up to 63 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.
  - **bandwidth** — bandwidth
  - *val-in-mbps* — 0 to 16777215
  - **ext:4300** — origin verification
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - **ext** — extended
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFFFF
  - **flowspec-set —** FlowSpec set
  - **flowspec-set-trans —** FlowSpec set transitive
  - *ipv6-addr* — x:x:x:x:x:x:x:x (eight 16-bit pieces)
  - *group-id* — 0 to 16383
  - *co-bits* — 00, 01, 10 or 11
  - *color-value* — 0 to 4294967295
- *well-known-comm* — **null**, **no-export**, **no-export-subconfed**, **no-advertise**, **llgr-stale**, **no-llgr**, **blackhole**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- *large-comm* — large community, defined as one of the following:
  - *ext-asnum*:*ext-comm-val*:*ext-comm-val*
  - *reg-ex3*&*reg-ex3*&*reg-ex3*

  where:
  - *reg-ex3* — A regular expression string. Allowed values are any string up to 68 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Use subject to Terms available at: www.nokia.com

Context [Tree] (config>li>x-interfaces>x3>alarms memory-alarm)

Full Context configure li x-interfaces x3 alarms memory-alarm

Description This command configures the thresholds for raising the memory alarm. The low threshold value must be configured with a smaller value than the high threshold.

The **no** form of this command reverts to the default values.

Parameters *high-percentage* — Specifies the high threshold value, as a percentage.

Values 1 to 100

Default 100

low-percentage — Specifies the low threshold value, as a percentage.

Values 0 to 99

Default 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.218 memory-use-alarm

memory-use-alarm

Syntax **memory-use-alarm rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]
no memory-use-alarm

Context [Tree] (config>system>thresholds memory-use-alarm)

Full Context configure system thresholds memory-use-alarm

Description The memory thresholds are based on monitoring the TIMETRA-SYSTEM-MIB sgiMemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm. The absolute sample type method is used.

The **no** form of this command removes the configured memory threshold warning.

Parameters **rising-threshold** *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

seconds — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

The threshold value represents units in bytes.

Values 1 to 2147483647

rmon-event-type — Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an OS logger entry. The RMON-MIB log table entries can be viewed using the CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Syntax **memory-use-warn rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]
no memory-use-warn

Context **[Tree]** (config>system>thresholds memory-use-warn)

Full Context configure system thresholds memory-use-warn

Description The memory thresholds are based on monitoring MemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm.

The absolute sample type method is used.

The **no** form of this command removes the configured compact flash threshold warning.

Parameters **rising-threshold** *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units in bytes.

Values -2147483648 to 2147483647

Default 0

seconds — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type — Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence.

This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

startup-alarm *alarm-type* — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Default either

Values rising, falling, either

Configuration example

```
memory-use-warn rising-threshold 500000 falling-threshold 400000 interval 800 rmon-
event-type log start-alarm falling
```

17.220 mep

mep

Syntax [**no**] **mep** *mep-id* **domain** *md-index* **association** *ma-index*

Context **[Tree]** (config>eth-tunnel>path>eth-cfm mep)

Full Context configure eth-tunnel path eth-cfm mep

Description This command provisions an 802.1ag maintenance endpoint (MEP).

The **no** form of this command reverts to the default values.

Parameters *mep-id* — Specifies the maintenance association end point identifier.

Values 1 to 8191

md-index — Specifies the maintenance domain (MD) index value.

Values 1 to 4294967295

ma-index — Specifies the MA index value.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep

Syntax [**no**] **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**vlan** *vlan-id*]

Context **[Tree]** (config>port>ethernet>eth-cfm mep)
[Tree] (config>lag>eth-cfm mep)
[Tree] (config>router>if>eth-cfm mep)

Full Context configure lag eth-cfm mep
configure port ethernet eth-cfm mep
configure router interface eth-cfm mep

Description This command provisions the maintenance endpoint (MEP).

The **no** form of this command reverts to the default values.

Parameters *mep-id* — Specifies the maintenance association end point identifier.

Values 1 to 8191

md-index — Specifies the maintenance domain (MD) index value.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ma-index — Specifies the MA index value.

Values 1 to 4294967295

vlan-id — Specific to tunnel facility MEPs which means this option is only applicable to the lag>eth-cfm> context. Used to specify the outer vlan id of the tunnel.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep

Syntax **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**direction** {**up** | **down**}] [**primary-vlan-enable**]
no mep *mep-id* **domain** *md-index* **association** *ma-index*

[Tree] (config>service>epipe>spoke-sdp>eth-cfm mep)
[Tree] (config>service>ipipe>sap>eth-cfm mep)

Full Context configure service epipe sap eth-cfm mep
configure service epipe spoke-sdp eth-cfm mep
configure service ipipe sap eth-cfm mep

Description This command provisions the maintenance endpoint (MEP).

The **no** form of this command reverts to the default values.

Parameters *mep-id* — Specifies the maintenance endpoint identifier.

Values 1 to 8191

md-index — Specifies the maintenance domain (MD) index value.

Values 1 to 4294967295

ma-index — Specifies the maintenance association (MA) index value.

Values 1 to 4294967295

direction {up | **down}** — Indicates the direction in which the MEP faces on the bridge port. The UP direction is not supported for all Fpipe services. For example, Ipipe does not support the direction of UP for MEPs.

up — Sends ETH-CFM messages toward the MAC relay entity.

down — Sends ETH-CFM messages away from the MAC relay entity.

primary-vlan-enable — Provides a method for linking the MEP with the primary VLAN configured under the bridge-identifier for the MA. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

mep

Syntax **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**direction** {**up** | **down**}] [**primary-vlan-enable**]
no mep *mep-id* **domain** *md-index* **association** *ma-index*

Context **[Tree]** (config>service>vpls>mesh-sdp>eth-cfm mep)
[Tree] (config>service>vpls>spoke-sdp>eth-cfm mep)
[Tree] (config>service>vpls>eth-cfm mep)
[Tree] (config>service>vpls>sap>eth-cfm mep)

Full Context configure service vpls eth-cfm mep
configure service vpls mesh-sdp eth-cfm mep
configure service vpls sap eth-cfm mep
configure service vpls spoke-sdp eth-cfm mep

Description This command configures the ETH-CFM maintenance endpoint (MEP). A MEP created at the VPLS service level **vpls>eth-cfm** creates a virtual MEP.

The **no** version of the command will remove the MEP.

Parameters *mep-id* — Specifies the MEP identifier.

Values 1 to 8191

md-index — Specifies the maintenance domain (MD) index value.

Values 1 to 4294967295

ma-index — Specifies the maintenance association (MA) index value.

Values 1 to 4294967295

direction up | down — Indicates the direction in which the MEP faces on the bridge port. Direction is not supported when a MEP is created directly under the vpls>eth-cfm construct (vMEP).

down — Sends ETH-CFM messages away from the MAC relay entity

up — Sends ETH-CFM messages toward the MAC relay entity

primary-vlan-enable — Provides a method for linking the MEP with the primary VLAN configured under the bridge-identifier for the MA. MEPs cannot be changed from or to primary VLAN functions. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

mep

Syntax [**no**] **mep**

Context **[Tree]** (config>router>mpls>lsp>working-tp-path mep)
[Tree] (config>router>mpls>lsp>protect-tp-path mep)

Full Context configure router mpls lsp protect-tp-path mep
configure router mpls lsp working-tp-path mep

Description This command creates or edits an MPLS-TP maintenance entity group (MEG) endpoint (MEP) on and MPLS-TP path. MEPs represent the termination point for OAM flowing on the path, as well as linear protection for the LSP. Only one MEP can be configured at each end of the path.

The following commands are applicable to a MEP on an MPLS-TP working or protect path: oam-template, bfd-enable, and shutdown. In addition, a protection-template may be configured on a protect path.

The **no** form of this command removes a MEP from an MPLS-TP path.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.221 mesh-group

mesh-group

Syntax **mesh-group** {**value** | **blocked**}
no mesh-group

Context **[Tree]** (config>service>vprn>isis>if mesh-group)

Full Context configure service vprn isis interface mesh-group

Description This command assigns an interface to a mesh group. Mesh groups limit the amount of flooding that occurs when a new or changed LSP is advertised throughout an area.

All routers in a mesh group should be fully meshed. When LSPs need to be flooded, only a single copy is received rather than a copy per neighbor.

To create a mesh group, configure the same mesh group value for each interface that is part of the mesh group. All routers must have the same mesh group value configured for all interfaces that are part of the mesh group.

To prevent an interface from flooding LSPs, the optional **blocked** parameter can be specified. Configure mesh groups carefully. It is easy to create isolated islands that do not receive updates as (other) links fail.

The **no** form of this command removes the interface from the mesh group.

Default no mesh-group — The interface does not belong to a mesh group.

Parameters *value* — Specifies a unique decimal integer value distinguishes this mesh group from other mesh groups on this or any other router that is part of this mesh group.

Values 1 to 2000000000

blocked — Prevents an interface from flooding LSPs.

Platforms All

17.222 mesh-sdp

mesh-sdp

Syntax **mesh-sdp** *sdp-id*[*:vc-id*] [**vc-type** {**ether** | **vlan**}] [**create**]
mesh-sdp *sdp-id*[*:vc-id*] [**vc-type** {**ether** | **vlan**}] [**create**] **leaf-ac**
mesh-sdp *sdp-id*[*:vc-id*] [**vc-type** {**ether** | **vlan**}] [**create**] **root-leaf-tag**
no mesh-sdp *sdp-id*[*:vc-id*]

Context **[Tree]** (config>service>vpls mesh-sdp)

Full Context configure service vpls mesh-sdp

Description This command binds a VPLS service to an existing Service Distribution Point (SDP).

Mesh SDPs bound to a service are logically treated like a single bridge “port” for flooded traffic where flooded traffic received on any mesh SDP on the service is replicated to other “ports” (spoke SDPs and SAPs) and not transmitted on any mesh SDPs.

Note: This command creates a binding between a service and an SDP. The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The SDP must already be defined in the **config>service>sdp** context in order to associate the SDP with an Epipe or VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end router devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default No *sdp-id* is bound to a service.

Special Cases **VPLS —** Several SDPs can be bound to a VPLS. Each SDP must be destined to a different router. If two *sdp-id* bindings terminate on the same router, an error occurs and the second SDP binding is rejected.

Parameters *sdp-id* — Specifies an SDP identifier.

Values 1 to 17407

vc-id — Specifies a virtual circuit identifier. This value is used to validate the VC ID portion of each mesh SDP binding defined in the service. The default value of this object is equal to the service ID. Any value may be used for the *vc-id* when there is no existing mesh SDP within the service; if a mesh SDP exists then all other mesh SDPs in the service must be configured with the same *vc-id*.

Values 1 to 4294967295

vc-type — Specifies to override the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

ether — Defines the VC type as Ethernet. The **vlan** keyword is mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

vlan — Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for mesh SDP bindings.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

root-leaf-tag — Specifies a tagging mesh SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that uses a default VID 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac — Specifies an access (AC) mesh SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP type is a root AC if *leaf-ac* or *root-leaf-tag* is not specified at SDP binding creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

create — Keyword used to create the mesh SDP. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Full Context configure service vprn ospf area interface message-digest-key
configure service vprn ospf area sham-link message-digest-key
configure service vprn ospf area virtual-link message-digest-key

Description This command configures a message digest key when MD5 authentication is enabled on the interface, virtual-link or sham-link. Multiple message digest keys can be configured.

This command is not valid in the OSPF3 context.

The **no** form of this command removes the message digest key identified by the *key-id*.

Default No message digest keys are defined.

Parameters **keyid** — The *keyid* is expressed as a decimal integer.

Values 1 to 255

md5 *key* — The MD5 key. The *key* can be any alphanumeric string up to 16 characters in length.

md5 *hash-key* — The MD5 hash key. The key can be any combination of ASCII characters up to 32 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

Platforms All

message-digest-key

Syntax **message-digest-key** *key-id* **md5** [*key* | *hash-key* | *hash2-key*] [**hash** | **hash2** | **custom**]

message-interval

Syntax **message-interval** {[*seconds*] [**milliseconds** *milliseconds*]}
no message-interval

Context **[Tree]** (config>service>ies>if>ipv6>vrrp message-interval)

Full Context configure service ies interface ipv6 vrrp message-interval

Description This command sets the advertisement timer and indirectly sets the master down timer on the virtual router instance. The message-interval setting must be the same for all virtual routers participating as a virtual router. Any VRRP advertisement message received with an Advertisement Interval field different than the virtual router instance configured message-interval value will be silently discarded.

The message-interval command is available in both non-owner and owner **vrrp** *virtual-router-id* nodal contexts. If the message-interval command is not executed, the default message interval of 1 second will be used.

The **no** form of this command restores the default message interval value of 1 second to the virtual router instance.

Default message-interval 1

Parameters *seconds* — The number of seconds that will transpire before the advertisement timer expires.

Values 1 to 255

Default 1

milliseconds *milliseconds* — Specifies the time interval, in milliseconds, between sending advertisement messages.

Values 100 to 900

Platforms All

no message-interval

Context **[Tree]** (config>router>if>vrrp message-interval)
[Tree] (config>router>if>ipv6>vrrp message-interval)

Full Context configure router interface ipv6 vrrp message-interval
configure router interface vrrp message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages and to derive the master down timer as backup.

For an owner virtual router instance, the administrative advertisement timer directly sets the operational advertisement timer and indirectly sets the master down timer for the virtual router instance.

Non-owner virtual router instances usage of the **message-interval** setting is dependent on the state of the virtual router (master or backup) and the state of the **master-int-inherit** parameter.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- When a non-owner is operating as master for the virtual router, the configured **message-interval** is used as the operational advertisement timer similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the configured **message-interval** value is used to match the incoming VRRP advertisement message advertisement interval field. If the locally configured message interval does not match the advertisement interval field, the VRRP advertisement is discarded.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured **message-interval** is ignored. The master down timer is indirectly derived from the incoming VRRP advertisement message advertisement interval field value.

VRRP advertisements messages that are fragmented, or contain IP options (IPv4), or contain extension headers (IPv6) require a longer message interval to be configured.

The in-use value of the message interval is used to derive the master down timer to be used when the virtual router is operating in backup mode based on the following formula:

(3x (in-use message interval) + skew time)

The skew time portion is used to slow down virtual routers with relatively low priority values when competing in the master election process.

The command is available in both non-owner and owner **vrrp** nodal contexts.

By default, a **message-interval** of 1 second is used.

The **no** form of the command reverts to the default value.

Default message-interval 1 — Advertisement timer set to 1 second.

Parameters *seconds* — The number of seconds that will transpire before the advertisement timer expires expressed as a decimal integer.

Values IPv4: 1 to 255 IPv6: 1 to 40

milliseconds — Specifies the time interval, in milliseconds, between sending advertisement messages.

Values 100 to 900 IPv6: 10 to 990

Platforms All

17.230 message-length

message-length

Syntax **message-length** *message-length*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no message-length

Context [Tree] (config>service>sdp>keep-alive message-length)

Full Context configure service sdp keep-alive message-length

Description This command configures the SDP monitoring keepalive request message length transmitted.

The **no** form of this command reverts the **message-length** *octets* value to the default setting.

Default no message-length — The message length should be equal to the SDP's operating path MTU as configured in the **config>service>sdp path-mtu** command. If the default size is overridden, the actual size used will be the smaller of the operational SDP ID Path MTU and the size specified.

Parameters *message-length* — Specifies the size of the keepalive request messages in octets, expressed as a decimal integer. The **size** keyword overrides the default keepalive message size.

Values 40 to 9198

Platforms All

17.231 message-path

message-path

Syntax **message-path** *sap-id*
no message-path

Context [Tree] (config>service>ies>sub-if>grp-if>srrp message-path)
[Tree] (config>service>vprn>sub-if>grp-if>srrp message-path)

Full Context configure service ies subscriber-interface group-interface srrp message-path
configure service vprn subscriber-interface group-interface srrp message-path

Description This command defines a specific SAP for SRRP in-band messaging. A message-path SAP must be defined prior to activating the SRRP instance. The defined SAP must exist on the SRRP instances group IP interface for the command to succeed and cannot currently be associated with any dynamic or static subscriber hosts. Once a group IP interface SAP has been defined as the transmission path for SRRP Advertisement messages, it cannot be administratively shutdown, will not support static or dynamic subscriber hosts and cannot be removed from the group IP interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The SRRP instance message-path command may be executed at any time on the SRRP instance. Changing the message SAP fails if a dynamic or static subscriber host is associated with the new SAP. Once successfully changed, the SRRP instance immediately disables anti-spoof on the SAP and starts sending SRRP Advertisement messages, if the SRRP instance is activated.

Changing the current SRRP message SAP on an active pair of routers should be done in the following manner:

1. Shutdown the backup SRRP instance.
2. Change the message SAP on the shutdown node.
3. Change the message SAP on the active master node.
4. Re-activate the shutdown SRRP instance.

Shutting down the backup SRRP instance prevents the SRRP instances from becoming master due to temporarily using differing message path SAPs.

If an MCS peering is operational between the redundant nodes and the SRRP instance has been associated with the peering, the designated message path SAP is sent from each member.

The **no** form of this command can only be executed when the SRRP instance is shutdown. Executing no message-path allows the existing SAP to be used for subscriber management functions. A new message-path SAP must be defined prior to activating the SRRP instance.

Parameters *sap-id* — Specifies the physical port identifier portion of the SAP definition.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure service vpls sap spb level metric
configure service vpls spoke-sdp spb level metric

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This configures metric for this SPB interface SAP/spoke-sdp. This command is valid only for interfaces on control B-VPLS.

Parameters *value* — The configuration metric value.

Values 1 to 16777215

Default 1000

Platforms All

metric

Syntax **metric** *metric-value*
no metric [*metric-value*]

Context **[Tree]** (config>service>vprn>static-route-entry>black-hole metric)
[Tree] (config>service>vprn>static-route-entry>next-hop metric)
[Tree] (config>service>vprn>static-route-entry>grt metric)
[Tree] (config>service>vprn>static-route-entry>indirect metric)
[Tree] (config>service>vprn>static-route-entry>ipsec-tunnel metric)

Full Context configure service vprn static-route-entry black-hole metric
configure service vprn static-route-entry grt metric
configure service vprn static-route-entry indirect metric
configure service vprn static-route-entry ipsec-tunnel metric
configure service vprn static-route-entry next-hop metric

Description This command specifies the cost metric for the static route, expressed as a decimal integer. This value is used when importing the static route into other protocols such as OSPF. When the metric is configured as 0 then the metric configured in OSPF, default-import-metric, applies. When modifying the metric of an existing static route, the preference will not change unless specified. This value is also used to determine which static route to install in the forwarding table.

If there are multiple static routes with the same preference but different metrics then the lower cost (metric) route will be installed.

The **no** form of this command returns the metric to the default value

Default metric 1

Parameters *metric-value* — Specifies the cost metric value.

Values 0 to 65535

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>service>vprn>isis>if>level metric)

Full Context configure service vprn isis interface level metric

Description This command configures the metric used for the level on the interface.

In order to calculate the lowest cost to reach a given destination, each configured level on each interface must have a cost. The costs for each level on an interface may be different.

If the metric is not configured, the default of 10 is used unless reference bandwidth is configured.

The **no** form of this command reverts to the default value.

Default no metric

Parameters *metric* — The metric assigned for this level on this interface.

Values 1 to 16777215

Default 10

Platforms All

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>service>vprn>ospf>area>if metric)
[Tree] (config>service>vprn>ospf3>area>if metric)
[Tree] (config>service>vprn>ospf>area>sham-link metric)

Full Context configure service vprn ospf area interface metric
configure service vprn ospf area sham-link metric
configure service vprn ospf3 area interface metric

Description This command configures an explicit route cost metric for the OSPF interface that overrides the metrics calculated based on the speed of the underlying link.

The **no** form of this command deletes the manually configured interface metric, so the interface uses the computed metric based on the **reference-bandwidth** command setting and the speed of the underlying link.

Default no metric

configure router mpls lsp-template metric
configure router mpls static-lsp metric

Description This command allows the user to override the LSP operational metric with a constant administrative value that will not change regardless of the actual path the LSP is using over its lifetime.

The LSP operational metric will match the metric the active path of this LSP is using at any given time. For a CSPF LSP, this metric represents the cumulative IGP metric of all the links the active path is using. If CSPF for this LSP is configured to use the TE metric, the LSP operational metric is set to the maximum value. For a non-CSPF LSP, the operational metric is the shortest IGP cost to the destination of the LSP.

The LSP operational metric is used by some applications to select an LSP among a set of LSPs that are destined to the same egress router. The LSP with the lowest operational metric will be selected. If more than one LSP with the same lowest LSP metric exists, the LSP with the lowest tunnel index will be selected. The configuration of a constant metric by the user will make sure the LSP always maintains its preference in this selection regardless of the path it is using at any given time. Applications that use the LSP operational metric include LDP-over-RSVP, VPRN auto-bind, and IGP, BGP and static route shortcuts.

The **no** form of this command disables the administrative LSP metric and reverts to the default setting in which the metric value will represent the LSP metric returned by MPLS. The same behavior is obtained if the user entered a metric of value zero (0).

Default no metric. The LSP operational metric defaults to the metric returned by MPLS.

Parameters *metric* — Specifies the integer value which specifies the value of the LSP administrative metric. A value of zero command reverts to the default setting and disables the administrative LSP metric.

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy metric)

Full Context configure router mpls forwarding-policies forwarding-policy metric

Description This command configures the metric of an MPLS forwarding policy.

The *metric* parameter is supported with the endpoint policy only and is inherited by the routes which resolve their next hop to this policy.

The **no** form of this command removes the *metric* parameter from the MPLS forwarding policy.

Parameters *metric* — Specifies the metric value.

Values 1 to 16777215

Platforms All

metric

Syntax **metric** *metric*
no metric [*metric*]

Context **[Tree]** (config>router>static-route-entry>black-hole metric)
[Tree] (config>router>static-route-entry>indirect metric)
[Tree] (config>router>static-route-entry>next-hop metric)

Full Context configure router static-route-entry black-hole metric
configure router static-route-entry indirect metric
configure router static-route-entry next-hop metric

Description This command specifies the cost metric for the static route, expressed as a decimal integer. This value is used when importing the static route into other protocols such as OSPF. When the metric is configured as 0 then the metric configured in OSPF, default-import-metric, applies. When modifying the metric of an existing static route, the preference will not change unless specified. This value is also used to determine which static route to install in the forwarding table.

If there are multiple static routes with the same preference but different metrics then the lower cost (metric) route will be installed.

The **no** form of this command returns the metric to the default value

Default metric 1

Use subject to Terms available at: www.nokia.com

Parameters *metric* — Specifies the cost metric value.

Values 0 to 65535

Platforms All

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>service>sdp metric)

Full Context configure service sdp metric

Description This command specifies the metric to be used within the tunnel table manager for decision making purposes. When multiple SDPs going to the same destination exist, this value is used as a tie-breaker by tunnel table manager users such as MP-BGP to select the route with the lower value.

Parameters *metric* — Specifies the SDP metric.

Values 0 to 65535

Platforms All

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>router>isis>if>level metric)

Full Context configure router isis interface level metric

Description This command configures the metric used for the level on the interface.

In order to calculate the lowest cost to reach a given destination, each configured level on each interface must have a cost. The costs for each level on an interface may be different.

If the metric is not configured, the default of 10 is used unless reference bandwidth is configured.

The **no** form of this command reverts to the default value.

Default metric 10

Parameters *metric* — Specifies the metric assigned for this level on this interface.

Values 1 to 16777215

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

metric

Syntax **metric** *metric*
no metric

Context **[Tree]** (config>router>ospf>area>interface metric)
[Tree] (config>router>ospf3>area>interface metric)

Full Context configure router ospf area interface metric
configure router ospf3 area interface metric

Description This command configures an explicit route cost metric for the OSPF interface that overrides the metrics calculated based on the speed of the underlying link.

The **no** form of this command deletes the manually configured interface metric, so the interface uses the computed metric based on the **reference-bandwidth** command setting and the speed of the underlying link.

Default no metric

Parameters *metric* — Specifies the metric to be applied to the interface expressed as a decimal integer.

Values 1 to 65535

Platforms All

metric

Syntax **metric** *metric* [**equal** | **or-higher** | **or-lower**]
no metric

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from metric)

Full Context configure router policy-options policy-statement entry from metric

Description This command matches BGP routes based on local preference (the value in the MULTI_EXIT_DISC attribute).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

A non-BGP route does not match a policy entry if it contains the **metric** command. In addition, a BGP route without a MED attribute also does not match a policy entry if it contains a **metric** command.

Default no metric

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *metric* — Specifies the MED value.

Values 0 to 4294967295, or a parameter name delimited by starting and ending at-sign (@) characters

equal — Specifies that matched routes should have the same MED as the value specified.

or-higher — Specifies that matched routes should have the same or a greater MED as the value specified.

or-lower — Specifies that matched routes should have the same or a lower MED as the value specified.

Platforms All

metric

Syntax **metric** {**add** | **subtract**} *metric*
metric set [**igp** | *metric-value*]
no metric

Context **[Tree]** (config>router>policy-options>policy-statement>default-action metric)
[Tree] (config>router>policy-options>policy-statement>entry>action metric)

Full Context configure router policy-options policy-statement default-action metric
configure router policy-options policy-statement entry action metric

Description In a BGP import or export policy, this command assigns a MED value to routes matched by the policy statement entry. The MED value may be set to a fixed value (overriding the received value), set to the routing table cost of the route used to resolve the next hop of the BGP route, or modified by adding or subtracting a fixed value offset.

The **no** form of this command removes the MED attribute from the matched routes.

Default no metric

Parameters **add** — Specifies that an integer is added to any existing metric. If the result of the addition results in a number greater than 4294967295, the value 4294967295 is used.

subtract — Specified *integer* is subtracted from any existing metric. If the result of the subtraction results in a number less than 0, the value of 0 is used.

set — Specifies that *integer* replaces any existing metric.

igp — Sets the MED value to the routing table cost of the route used to resolve the next hop of the BGP route.

metric — Specifies the metric modifier expressed as a decimal integer.

Values 0 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

param-name —Specifies the metric parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”

Platforms All

metric

Syntax **metric** *metric*

17.245 mfib-allowed-mda-destinations

mfib-allowed-mda-destinations

Syntax **mfib-allowed-mda-destinations**

Context **[Tree]** (config>service>vpls>mesh-sdp>egress mfib-allowed-mda-destinations)
[Tree] (config>service>vpls>spoke-sdp>egress mfib-allowed-mda-destinations)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls mesh-sdp egress mfib-allowed-mda-destinations
configure service vpls spoke-sdp egress mfib-allowed-mda-destinations

Description Commands in this context configure MFIB-allowed MDA destinations.

The allowed-mda-destinations node and the corresponding **mda** command are used on spoke and mesh SDP bindings to provide a list of MDA destinations in the chassis that are allowed as destinations for multicast streams represented by [*,g] and [s,g] multicast flooding records on the VPLS service. The MDA list only applies to IP multicast forwarding when IGMP snooping is enabled on the VPLS service. The MDA list has no effect on normal VPLS flooding such as broadcast, L2 multicast, unknown destinations or non-snooped IP multicast.

At the IGMP snooping level, a spoke or mesh SDP binding is included in the flooding domain for an IP multicast stream when it has either been defined as a multicast router port, received a IGMP query through the binding or has been associated with the multicast stream through an IGMP request by a host over the binding. Due to the dynamic nature of the way that a spoke or mesh SDP binding is associated with one or more egress network IP interfaces, the system treats the binding as appearing on all network ports. This causes all possible network destinations in the switch fabric to be included in the multicast streams flooding domain. The MDA destination list provides a simple mechanism that narrows the IP multicast switch fabric destinations for the spoke or mesh SDP binding.

If no MDAs are defined within the allowed-mda-destinations node, the system operates normally and will forward IP multicast flooded packets associated with the spoke or mesh SDP binding to all switch fabric taps containing network IP interfaces.

The MDA inclusion list should include all MDAs that the SDP binding may attempt to forward through. A simple way to ensure that an MDA that is not included in the list is not being used by the binding is to define the SDP the binding is associated with as MPLS and use an RSVP-TE LSP with a strict egress hop. The MDA associated with the IP interface defined as the strict egress hop should be present in the inclusion list. If the inclusion list does not currently contain the MDA that the binding is forwarding through, the multicast packets will not reach the destination represented by the binding.

By default, the MDA inclusion list is empty.

If an MDA is removed from the list, the MDA is automatically removed from the flooding domain of any snooped IP multicast streams associated with a destination on the MDA unless the MDA was the last MDA on the inclusion list. Once the inclusion list is empty, all MDAs are eligible for snooped IP multicast flooding for streams associated with the SDP binding.

mfib-allowed-mda-destinations

Syntax **mfib-allowed-mda-destinations**

Context **[Tree]** (config>service>pw-template>egress mfib-allowed-mda-destinations)

Full Context configure service pw-template egress mfib-allowed-mda-destinations

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure MFIB-allowed XMA or MDA destinations.

The allowed-mda-destinations node and the corresponding **mda** command are used on spoke and mesh SDP bindings to provide a list of XMA or MDA destinations in the chassis that are allowed as destinations for multicast streams represented by [*,g] and [s,g] multicast flooding records on the VPLS service. The XMA or MDA list only applies to IP multicast forwarding when IGMP snooping is enabled on the VPLS service. The XMA or MDA list has no effect on normal VPLS flooding such as broadcast, Layer 2 multicast, unknown destinations or non-snooped IP multicast.

At the IGMP snooping level, a spoke or mesh SDP binding is included in the flooding domain for an IP multicast stream when it has either been defined as a multicast router port, received a IGMP query through the binding or has been associated with the multicast stream through an IGMP request by a host over the binding. Due to the dynamic nature of the way that a spoke or mesh SDP binding is associated with one or more egress network IP interfaces, the system treats the binding as appearing on all network ports. This causes all possible network destinations in the switch fabric to be included in the multicast streams flooding domain. The XMA or MDA destination list provides a simple mechanism that narrows the IP multicast switch fabric destinations for the spoke or mesh SDP binding.

If no XMAs or MDAs are defined within the allowed-mda-destinations node, the system operates normally and will forward IP multicast flooded packets associated with the spoke or mesh SDP binding to all switch fabric taps containing network IP interfaces.

The XMA or MDA inclusion list should include all XMAs or MDAs that the SDP binding may attempt to forward through. A simple way to ensure that an XMA or MDA that is not included in the list is not being used by the binding is to define the SDP the binding is associated with as MPLS and use an RSVP-TE LSP with a strict egress hop. The XMA or MDA associated with the IP interface defined as the strict egress hop should be present in the inclusion list.

If the inclusion list does not currently contain the XMA or MDA that the binding is forwarding through, the multicast packets will not reach the destination represented by the binding. By default, the XMA or MDA inclusion list is empty.

If an XMA or MDA is removed from the list, the XMA or MDA is automatically removed from the flooding domain of any snooped IP multicast streams associated with a destination on the XMA or MDA unless the XMA or MDA was the last XMA or MDA on the inclusion list. Once the inclusion list is empty, all XMAs or MDAs are eligible for snooped IP multicast flooding for streams associated with the SDP binding.

17.246 mfib-ping

mfib-ping

Syntax **mfib-ping service** *service-id* **source** *src-ip* **destination** *mcast-address* [**size** *size*] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**timeout** *timeout*] [**interval** *interval*]

Context **[Tree]** (oam mfib-ping)

Full Context oam mfib-ping

Description This command determines the list of SAPs which egress a certain IP multicast stream (identified by source unicast and destination multicast IP addresses) within a VPLS service. An MFIB ping packet is always sent via the data plane.

An MFIB ping is forwarded across the VPLS following the MFIB. If an entry for the specified source unicast and destination multicast IP addresses exist in the MFIB for that VPLS, then the packet is forwarded along those paths, provided they are active. A response is generated only when there is an egress SAP binding for the specified IP multicast stream.

An MFIB ping reply can be sent using the data plane or the control plane. The **return-control** option configures the reply to be sent using the control plane. If **return-control** is not specified, the reply is sent using the data plane.

Special Cases **MFIB 224.0.0.X pings —** MFIB ping requests directed to a destination address in the special 224.0.0.X range are flooded throughout the service flooding domain and receives a response from all operational SAPs. Note that SAPs that are operationally down do not reply.

Parameters *service-id* — Specifies the service ID of the VPLS to diagnose or manage.

Values 1 to 2147483647, *service-name*, up to 64 characters

src-ip — Specifies the source IP address for the OAM request.

Values ipv4-address - a.b.c.dipv6-address - xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx
xx [0..FF]H

mcast-address — Specifies the destination multicast address for the OAM request.

Values ipv4-address - a.b.c.dipv6-address - xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx
xx [0..FF]H

size — Specifies the multicast OAM request packet size, in octets, expressed as a decimal integer. The request payload is padded to the specified size with a 6-byte PAD header and a byte payload of 0xAA as necessary.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the octet size specified is less than the minimum packet, the minimum sized packet necessary to send the request is used.

Values 1 to 9786

Default No OAM packet padding

vc-label-ttl — Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

Values 1 to 255

Default 255

send-count — Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent.

The message interval value must be expired before the next message request is sent.

Values 1 to 100

Default 1

return-control — Specifies that the OAM reply must be sent using the control plane instead of the data plane.

timeout — Specifies the value used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the next message request.

Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 100

Default 5

interval — Specifies the value used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

Output The following output displays multicast FIB connectivity test information

17.248 mfib-table-low-wmark

mfib-table-low-wmark

Syntax [**no**] **mfib-table-low-wmark** *low-water-mark*

Context **[Tree]** (config>service>vpls mfib-table-low-wmark)

Full Context configure service vpls mfib-table-low-wmark

Description This command specifies the multicast FIB low watermark. When the percentage filling level of the multicast FIB drops below the configured value, the corresponding trap is cleared and a log entry is added.

The **no** form of this command reverts to the default.

Default mfib-table-low-wmark

Parameters *low-water-mark* — Specifies the multicast FIB low watermark as a percentage.

Values 1 to 100

Default 90

Platforms All

17.249 mfib-table-size

mfib-table-size

Syntax **mfib-table-size** *size*
no mfib-table-size

Context **[Tree]** (config>service>vpls mfib-table-size)

Full Context configure service vpls mfib-table-size

Description This command specifies the maximum number of (s,g) entries in the multicast forwarding database (MFIB) for this VPLS instance.

The *mfib-table-size* parameter specifies the maximum number of multicast database entries for both learned and static multicast addresses for the VPLS instance. When a table-size limit is set on the mfib of a service which is lower than the current number of dynamic entries present in the mfib then the number of entries remains above the limit.

The **no** form of this command removes the configured maximum MFIB table size.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no mfib-table-size

Parameters *size* — Specifies the maximum number of (s,g) entries allowed in the Multicast FIB

Values 1 to 40959

Platforms All

17.250 mgmt-ethernet

mgmt-ethernet

Syntax **mgmt-ethernet** [**revert** *seconds*]
no mgmt-ethernet

Context **[Tree]** (config>redundancy mgmt-ethernet)

Full Context configure redundancy mgmt-ethernet

Description If the management Ethernet port on the active CPM goes down, this command allows the active CPM to be configured to use the management Ethernet port of the standby CPM.

The **revert** option allows the administrator to control when to revert back to the management Ethernet port of the primary CPM once it comes up again.

The **no** form of the command disables redundancy, so that connectivity to the active CPM is lost if its Ethernet port goes down.

This feature is not supported on the 7750 SR-a, 7750 SR-e, 7750 SR-1s, 7750 SR-2s, and the VSR platforms.

Default no mgmt-ethernet

Parameters *seconds* — Specifies the duration to wait (in seconds) before reverting back to the primary CPM's management Ethernet port.

Values 1 to 300

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.251 mh-mode

mh-mode

Syntax **mh-mode** {**access** | **network**}

Context **[Tree]** (config>service>vpls>bgp-evpn>vxlan mh-mode)

Full Context configure service vpls bgp-evpn vxlan mh-mode

Description This command configures multihoming mode.

Default mh-mode access

Parameters **access** — When configured in this mode, the BGP-EVPN instance does not participate in multihoming procedures, such as processing DF election for the service or enabling local bias forwarding mode.

network — When configured in this mode, the BGP-EVPN instance participates in multihoming procedures, such as processing DF election for the service or enable local bias forwarding mode.

In services with two VXLAN instances, only one of the two instances can be configured as **network**.

Platforms All

mh-mode

Syntax **mh-mode** {**access** | **network**}

Context **[Tree]** (config>service>vpls>bgp-evpn>mpls mh-mode)

Full Context configure service vpls bgp-evpn mpls mh-mode

Description This command configures each BGP-EVPN instance in a multi-instance EVPN VPLS service, to behave as network or access.

You can only configure one network instance for the service. If the service has a provider tunnel enabled, it requires a network instance.

Default mh-mode network

Parameters **access** — Specifies that the BGP-EVPN instance does not participate in multihoming procedures, such as DF election processing or local bias forwarding.

network — Specifies that the BGP-EVPN instance participates in multihoming procedures, such as DF election processing or local bias forwarding.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.252 mhf-creation

mhf-creation

Syntax **mhf-creation** {**default** | **none** | **explicit** | **static**}
no mhf-creation

Context **[Tree]** (cfg>eth-cfm>domain>assoc>bridge mhf-creation)

Full Context configure eth-cfm domain association bridge-identifier mhf-creation

Description This command defines the MIP method of creation. MIP creation mode and other factors are part of the MIP creation authority (**association** or **default-domain**) logic. The MIP creation algorithm may result in multiple potential MIPs. Only the lowest-level valid MIP is installed. The **static** creation mode is the exception to the single MIP installation rule.

Under the association context, the **level** *level* parameter is not supported as part of this command. The level is derived from the level configuration of the domain.

The **no** form of this command is only available under the **association** context, and reverts the current mode of creation to the default **none**. In order to transition to and from the **static** mode of operation, the active **mhf-creation** mode must be **none**.

Default mhf-creation none

Parameters **default** — Specifies MHFs (MIPs) can be created for this SAP or spoke SDP without the requirement for a MEP at some lower MA level. If a lower-level MEP exists, the creation method will behave as **explicit**.

none — Specifies that no MHFs (MIPs) can be created for this SAP or spoke SDP.

explicit — Specifies that MHFs (MIPs) can be created for this SAP or spoke SDP only if a MEP is created at some lower MD Level. There must be at least one lower MD Level MEP provisioned on the same SAP or spoke SDP.

static — Specifies the exact level of the MHF (MIP) that will be created for this SAP. Multiple MHFs (MIPs) are allowed as long as the MD Level hierarchy is properly configured for the particular Primary VLAN. Ingress MHFs (MIPs) with primary VLAN are not supported on SDP Bindings.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mhf-creation

Syntax **mhf-creation** {**none** | **default** | **explicit** | **static**} **level** *level*
no mhf-creation

Context **[Tree]** (config>eth-cfm>default-domain>bridge-identifier mhf-creation)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure eth-cfm default-domain bridge-identifier mhf-creation

Description This command defines the MIP method of creation. MIP creation mode and other factors are part of the MIP creation authority (**association** or **default-domain**) logic. The MIP creation algorithm may result in multiple potential MIPs. Only the lowest-level valid MIP is installed. The **static** creation mode is the exception to the single MIP installation rule.

Under the association context, the **level** *level* parameter is not supported as part of this command. The level is derived from the level configuration of the domain.

The **no** form of this command is only available under the **association** context, and reverts the current mode of creation to the default **none**. In order to transition to and from the **static** mode of operation, the active **mhf-creation** mode must be **none**.

Default mhf-creation defer (config>eth-cfm>default-domain>bridge-identifier)

Parameters **none** — Specifies that no MHFs (MIPs) can be created for this SAP or spoke SDP.

default — Specifies MHFs (MIPs) can be created for this SAP or spoke SDP without the requirement for a MEP at some lower MA level. If a lower-level MEP exists, the creation method will behave as **explicit**.

explicit — Specifies that MHFs (MIPs) can be created for this SAP or spoke SDP only if a MEP is created at some lower MD Level. There must be at least one lower MD Level MEP provisioned on the same SAP or spoke SDP.

defer — Defers the MIP creation process to the system-wide read-only values. This parameter is only configurable under the **default-domain** context.

level — Specifies the requested level of the MIP. This is used by the MIP creation algorithm to determine its validity in comparison to other ETH-CFM MIPs in the same service. If *level* is configured as “defer”, the level value will be inherited from the global read-only system values, and “-1” will be stored as a MIB value in the table.

Values 0 to 7, **defer**

Default defer

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.253 micro-loop-avoidance

micro-loop-avoidance

Syntax **micro-loop-avoidance** [**fib-delay** *fib-delay*]
no micro-loop-avoidance

Context **[Tree]** (config>router>isis>segment-routing micro-loop-avoidance)

Full Context configure router isis segment-routing micro-loop-avoidance

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables, in the IGP instance, the micro-loop avoidance feature to prevent micro-loops from using Segment Routing (SR) loop-free tunnels for packets that are forwarded over SR IS-IS node SIDs.

When enabled, the behavior of the feature is triggered by the receipt of a single event on a on a P2P link or broadcast link with two neighbors:

- link addition or restoration
- link removal or failure
- link metric change

IGP then performs the following procedures.

1. IGP runs the main SPF and LFA SPFs.
2. For a node or a prefix in which the SPF resulted in no change to its next hop(s) and metric(s), then IGP takes no action.
3. For a node or a prefix in which SPF resulted in a change to its next hop(s) or metric(s), IGP marks the route as eligible for micro-loop avoidance.
   a. Activate, for each node SID that uses a micro-loop avoidance eligible route with ECMP next hops, the common set of next hops between the previous and new SPF.
   b. Compute and activate, for each node SID which uses a micro-loop avoidance eligible route, with a single next hop loop-free SR tunnel that is applicable to the specific link event.

      This tunnel acts the micro-loop avoidance primary path for the route and uses the same outgoing interface as the new computed primary next hop.
   c. Program the TI-LFA, base LFA, or remote LFA backup path that protects the new primary next hop for the node SID.
4. Start the **fib-delay** timer to delay programming of new main and LFA SPF results into the FIB.
5. After the expiry of the **fib-delay** timer, program the new primary next hop(s) for node SIDs routes that were marked eligible for micro-loop avoidance procedures.

The **no** form of this command disables the micro-loop avoidance feature.

Default no micro-loop-avoidance

Parameters *fib-delay* — Specifies the delay, in 100s of milliseconds, before the system programs the new next hops for the SR tunnel.

Values 1 to 300

Default 15

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

micro-loop-avoidance

Syntax **[no] micro-loop-avoidance**

Context **[Tree]** (config>router>isis>flex-algos>flex-algo micro-loop-avoidance)

Full Context configure router isis flexible-algorithms flex-algo micro-loop-avoidance

Description This command enables flexible algorithms-aware micro-loop avoidance. When enabled, the micro-loop configuration parameters are inherited from the base SPF.

The **no** form of this command disables the micro-loop avoidance for flexible algorithms.

Default no micro-loop-avoidance

Platforms All

17.254 mid-pool

mid-pool

Syntax [**no**] **mid-pool** *mid-pool-id*

Context **[Tree]** (config>qos>hs-pool-policy>mid-tier mid-pool)

Full Context configure qos hs-pool-policy mid-tier mid-pool

Description Commands in this context configure mid-pool tier parameters for an HS pool policy. Parameters allow for allocating the percentage of the root pool size, defining a mid-tier pool's root-pool parent, specifying the port bandwidth oversubscription factor, or specifying a slope policy for the specific mid-tier pool.

The **no** form of the command reverts the parent root pool association to root-pool 1, reverts to the default allocation-percentage value, the default **port-bw-oversub-factor**, and default slope-policy to the specified mid-pool.

Parameters *mid-pool-id* — Specifies the mid pool ID. This is a required parameter when this command is executed and specifies which mid-pool context is being entered.

Values 1 to 16

Platforms 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

17.255 mid-tier

mid-tier

Syntax **mid-tier**

Context **[Tree]** (config>qos>hs-pool-policy mid-tier)

Full Context configure qos hs-pool-policy mid-tier

Description Commands in this context configure HS pool policy parameters. Within the **mid-tier** context, mid-pools can be associated with a root pool, sized as a percentage of the root pool, have an HS slope policy applied, or be configured with a port bandwidth oversubscription factor parameter used to influence the port-class pool sizes associated with the mid-tier pool.

Platforms 7750 SR-7/12/12e

17.256 migrant

migrant

Syntax [**no**] **migrant**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state migrant)

Full Context configure subscriber-mgmt wlan-gw tunnel-query ue-state migrant

Description This command enables matching on tunnels with migrant UEs.

The **no** form of this command disables matching on migrant UEs, unless UE state matching is disabled altogether.

Default no migrant

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.257 millisecond-event-timestamp

millisecond-event-timestamp

Syntax **[no] millisecond-event-timestamp**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>aaa>isa-radius-plcy>acct-include-attributes millisecond-event-timestamp)

Full Context configure aaa isa-radius-policy acct-include-attributes millisecond-event-timestamp

Description This command enables the router to include the Alc-Millisecond-Event-Timestamp attribute in the accounting message. This attribute specifies the time the accounting event was logged, in milliseconds since Jan 1, 1970 00:00:00 UTC.

The **no** form of this command disables the router from including the Alc-Millisecond-Event-Timestamp attribute in the accounting message.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.258 min-advertisement

min-advertisement

configure service vprn subscriber-interface group-interface arp-host min-auth-interval
configure subscriber-mgmt msap-policy vpls-only-sap-parameters arp-host min-auth-interval

Description This command configures the minimum authentication interval.

The **no** form of this command reverts to the default.

Default min-auth-interval 15

Parameters *min-auth-interval* — Specifies the minimum authentication interval, in minutes.

Values 1 to 6000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

min-auth-interval

Syntax **min-auth-interval** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no min-auth-interval

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-sol min-auth-interval)
[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol min-auth-interval)

Full Context configure service ies subscriber-interface group-interface ipv6 router-solicit min-auth-interval

Description This command specify the minimum interval between two consecutive authentication attempts from the same host.

The **no** form of this command reverts to the default.

Parameters *days* — Specifies the number of days that a user must wait for the next authentication attempt.

hours — Specifies the number of hours that a user must wait for the next authentication attempt.

minutes — Specifies the number of minutes that a user must wait for the next authentication attempt.

seconds — Specifies the number of seconds that a user must wait for the next authentication attempt.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

min-auth-interval

Syntax **min-auth-interval** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
min-auth-interval infinite
no min-auth-interval

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipoe-session min-auth-interval)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session min-auth-interval)

Full Context configure service ies subscriber-interface group-interface ipoe-session min-auth-interval
configure service vprn subscriber-interface group-interface ipoe-session min-auth-interval

Description Re-authentication for IPoE sessions enable dynamic policy changes.

This command configures the maximum frequency of re-authentications by specifying a minimum interval between two non-forced authentications for the same IPoE session.

A forced authentication is by default triggered by a circuit-id, interface-id or remote-id change (see the **force-auth** [**config>service>ies>sub-if>grp-if>ipoe-session force-auth**, **config>service>vprn>sub-if>grp-if>ipoe-session force-auth**] command).

Re-authentications are, by default, disabled and can be enabled by configuring a **min-auth-interval**.

Setting the **min-auth-interval** to zero seconds always re-authenticates on each trigger packet.

The **no** form of this command reverts to the default behavior.

Default min-auth-interval infinite

Parameters *days* — Specifies the min number of days between two non-forced authentications for IPoE sessions.

Values 0 to 365

hours — Specifies the min number of hours between two non-forced authentications for IPoE sessions.

Values 0 to 23

minutes — Specifies the min number of minutes between two non-forced authentications for IPoE sessions.

Values 0 to 59

seconds — Specifies the min number of seconds between two non-forced authentications for IPoE sessions.

Values 0 to 59

infinite — Specifies that non-forced re-authentications for IPoE sessions is not performed.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

17.261 min-bandwidth

min-bandwidth

Syntax **min-bandwidth** *bandwidth-in-mbps*
no min-bandwidth

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth min-bandwidth)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth min-bandwidth)

Full Context configure router mpls lsp auto-bandwidth min-bandwidth
configure router mpls lsp-template auto-bandwidth min-bandwidth

Description This command configures the minimum bandwidth that auto-bandwidth allocation is allowed to request for an LSP.

The LSP minimum applies whether the bandwidth adjustment is triggered by normal adjust-timer expiry or manual request.

The **no** form of this command reverts to the default value.

Default min-bandwidth 0

Parameters *bandwidth-in-mbps* — Specifies the minimum bandwidth in Mb/s.

Values 0 to 6400000

Platforms All

17.262 min-delay

min-delay

Syntax **min-delay** [*delay*]
no min-delay

Context **[Tree]** (config>log>event-handling>handler>action-list>entry min-delay)

Full Context configure log event-handling handler action-list entry min-delay

Description This command specifies the minimum delay in seconds between subsequent executions of the action specified in this entry. This is useful, for example, to ensure that a script does not get triggered to execute too often.

Default no min-delay

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *delay* — Specifies the unit in seconds.

Values 1 to 604800

Platforms All

17.263 min-first-fragment-size-rx

min-first-fragment-size-rx

Syntax **min-first-fragment-size-rx** *mtu-bytes*
no min-first-fragment-size-rx

Context **[Tree]** (config>router>nat>inside>dslite>address min-first-fragment-size-rx)
[Tree] (config>service>vprn>nat>inside>dslite>address min-first-fragment-size-rx)

Full Context configure router nat inside dual-stack-lite address min-first-fragment-size-rx
configure service vprn nat inside dual-stack-lite address min-first-fragment-size-rx

Description This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.

The **no** form of the command reverts to the default value.

Default min-first-fragment-size-rx 1280

Parameters *mtu-bytes* — Specifies the minimum MTU size for the first fragment in the upstream direction

Values 512 to 1280

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.264 min-frame-length

min-frame-length

Syntax **min-frame-length** *byte-length*

Context **[Tree]** (config>port>ethernet min-frame-length)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port ethernet min-frame-length

Description This command configures the minimum transmitted frame length.

Parameters *byte-length* — Specifies the number of bytes for the minimum frame length.

Values 64, 68

Default 64

Platforms All

17.265 min-lease-time

min-lease-time

Syntax **min-lease-time** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

min-num-ue

Syntax **min-num-ue** *minimum*
no min-num-ue

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query min-num-ue)

Full Context configure subscriber-mgmt wlan-gw tunnel-query min-num-ue

Description This command enables matching only on tunnels that have at least the specified number of UEs connected.

The **no** form of this command disables matching on a minimum number of UEs.

Default no min-num-ue

Parameters *minimum* — Specifies the minimum number of UEs.

Values 1 to 4294967295

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.267 min-route-advertisement

min-route-advertisement

Syntax **min-route-advertisement** *seconds*
no min-route-advertisement

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy min-route-advertisement)

Full Context configure subscriber-mgmt bgp-peering-policy min-route-advertisement

Description This command configures the minimum interval, in seconds, at which a prefix can be advertised to a peer.

The **no** form of this command reverts to default values.

Default min-route-advertisement 30

Parameters *seconds* — Specifies the minimum route advertising interval, in seconds, expressed as a decimal integer.

Values 1 to 255

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router bgp group neighbor min-route-advertisement
configure router bgp min-route-advertisement

Description This command configures the minimum interval, in seconds, between successive updates of a prefix towards a peer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group), or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command used at the global level reverts to default.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

The **rapid-update** command can be used to override the peer-level **min-route-advertisement** time and applies the minimum setting (0 seconds) to routes belonging to address families specified by the **rapid-update** command; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **rapid-update** and **rapid-withdrawal** commands may result in the routes being sent before the peer-level MRAI timer expires.

Default min-route-advertisement 30

Parameters *seconds* — Specifies the minimum route advertising interval, in seconds, expressed as a decimal integer.

Values 1 to 255

Platforms All

Description The **min-thresh-separation** command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified min-thresh-separation value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level is zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level is equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level is zero.
- When a parent policer instance's priority level has one child policer associated, the fair-portion is equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion is equal to the maximum of the following:
  - **min-thresh-separation** value
  - The priority level's **mbs-contribution** value less **min-thresh-separation** value

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead the following rules is used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion is set to zero
- If the **mbs-contribution** value is not set to zero:
  - The shared-portion is set to the current **min-thresh-separation** value
  - The fair-portion is set to the maximum of the following:

min-thresh-separation value

mbs-contribution value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that is handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

Note: A priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

The **no** form of this command returns the policy's **min-thresh-separation** value to the default value.

Parameters *size* — The size parameter is required when executing the **min-thresh-separation** command. It is expressed as an integer and specifies the shared portion in bytes or kilobytes that is selected by the trailing bytes or kilobytes keywords. If both bytes and kilobytes are missing, kilobytes is the assumed value. Setting this value has no effect on parent policer instances where the **min-thresh-separation** value has been overridden.

Values 0 to 16777216

[**bytes** | **kilobytes**] — The **bytes** keyword is optional and is mutually exclusive with the **kilobytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in bytes.

The **kilobytes** keyword is optional and is mutually exclusive with the **bytes** keyword. When specified, size is interpreted as specifying the size of **min-thresh-separation** in kilobytes.

Description This command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified min-thresh-separation value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level will be zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level will be equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level will be zero.
- When a parent policer instance's priority level has one child policer associated, the fair-portion will be equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion will be equal to the maximum of the following:
  - **min-thresh-separation** value
  - The priority level's **mbs-contribution** value less **min-thresh-separation** value

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead the following rules will be used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion will be set to zero
- If the **mbs-contribution** value is not set to zero:
  - The shared-portion will be set to the current **min-thresh-separation** value
  - The fair-portion will be set to the maximum of the following:
    - **min-thresh-separation** value
    - **mbs-contribution** value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated except for parent policer instances that currently have a min-thresh-separation override.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that will be handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

One thing to note is that a priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

Description
This command, within the SAP ingress and egress contexts, is used to override the root arbiter's parent policer min-thresh-separation parameter that is defined within the policer-control-policy applied to the SAP.

When the override is defined, modifications to the policer-control-policy min-thresh-separation parameter have no effect on the SAP's parent policer until the override is removed using the no min-thresh-separation command within the SAP.

The no form of this command removes the override and allows the min-thresh-separation setting from the policer-control-policy to control the root arbiter's parent policer's minimum discard threshold separation size.

Default
no min-thresh-separation

Parameters
size — The minimum discard threshold separation override value.

Values 1 to 16777216 | default

bytes — Signifies that *size* is expressed in bytes. The bytes and kilobytes keywords are mutually exclusive and optional. The default is kilobytes.

kilobytes — Signifies that *size* is expressed in kilobytes. The bytes and kilobytes keywords are mutually exclusive and optional. The default is kilobytes.

min-thresh-separation

Syntax **min-thresh-separation** *size* [**bytes** | **kilobytes**]
no min-thresh-separation

Context **[Tree]** (config>qos>plcr-ctrl-plcy>root>priority-mbs-thresholds min-thresh-separation)

Full Context configure qos policer-control-policy root priority-mbs-thresholds min-thresh-separation

Description The **min-thresh-separation** command defines the minimum required separation between each in-use discard threshold maintained for each parent policer context associated with the policer-control-policy. The min-thresh-separation value may be overridden on each SAP or sub-profile to which the policy is applied.

The system uses the default or specified **min-thresh-separation** value in order to determine the minimum separation required between each of the of the parent policer discard thresholds. The system enforces the minimum separation based on the following behavior in two ways. The first is determining the size of the shared-portion for each priority level (when the **mbs-contribution** command's optional fixed keyword is not specified):

- When a parent policer instance's priority level has less than two child policers associated, the shared-portion for the level will be zero.
- When a parent policer instance's priority level has two or more child policers associated, the shared-portion for the level will be equal to the current value of **min-thresh-separation**.

The second function the system uses the **min-thresh-separation** value for is determining the value per priority level for the fair-portion:

- When a parent policer instance's priority level has no child policers associated, the fair-portion for the level will be zero.
- When a parent policer instance's priority level has one child policer associated, the fair-portion will be equal to the maximum of the min-thresh-separation value and the priority level's mbs-contribution value.
- When a parent policer instance's priority level has two or more child policers associated, the fair-portion will be equal to the maximum of the following:
  - **min-thresh-separation** value
  - **mbs-contribution** value less **min-thresh-separation** value

When the **mbs-contribution** command's optional fixed keyword is defined for a priority level within the policy, the system will treat the defined **mbs-contribution** value as an explicit definition of the priority level's MBS. While the system will continue to track child policer associations with the parent policer priority levels, the association counters will have no effect. Instead, the following rules will be used to determine a fixed priority level's shared-portion and fair-portion:

- If a fixed priority level's **mbs-contribution** value is set to zero, both the shared-portion and fair-portion will be set to zero
- If the **mbs-contribution** value is not set to zero:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- The shared-portion will be set to the current **min-thresh-separation** value
- The fair-portion will be set to the maximum of the following:
  min-thresh-separation value
  mbs-contribution value less **min-thresh-separation value**

Each time the **min-thresh-separation** value is modified, the thresholds for all instances of the parent policer created through association with this **policer-control-policy** are reevaluated.

Determining the Correct Value for the Minimum Threshold Separation Value

The minimum value for **min-thresh-separation** should be set equal to the maximum size packet that will be handled by the parent policer. This ensures that when a lower priority packet is incrementing the bucket, the size of the increment will not cause the bucket's depth to equal or exceed a higher priority threshold. It also ensures that an unfair packet within a priority level cannot cause the PIR bucket to increment to the discard-all threshold within the priority.

When evaluating maximum packet size, each child policer's per-packet-offset setting should be taken into consideration. If the maximum size packet is 1518 bytes and a per-packet-offset parameter is configured to add 20 bytes per packet, min-thresh-separation should be set to 1538 due to the fact that the parent policer will increment its PIR bucket using the extra 20 bytes.

In most circumstances, a value larger than the maximum packet size is not necessary. Management of priority level aggregate burst tolerance is intended to be implemented using the priority level **mbs-contribution** command. Setting a value larger than the maximum packet size will not adversely affect the policer performance, but it may increase the aggregate burst tolerance for each priority level.

Note: A priority level's shared-portion of the parent policer's PIR bucket depth is only necessary to provide some separation between a lower priority's discard-all threshold and this priority's discard-unfair threshold. It is expected that the burst tolerance for the unfair packets is relatively minimal since the child policers feeding the parent policer priority level all have some amount of fair burst before entering into an FIR exceed or unfair state. The fair burst amount for a priority level is defined using the mbs-contribution command.

The **no** form of this command returns the policy's **min-thresh-separation** value to the default value.

Parameters *size* — The *size* parameter is required when executing the **min-thresh-separation** command. It is expressed as an integer. Setting this value has no effect on parent policer instances where the **min-thresh-separation** value has been overridden.

Values 0 to 4194304 or **default** (applies to the 7450 ESS)
0 to 16777216 or **default** (applies to the 7750 SR or 7950 XRS)

17.270 min-wait-to-advertise

min-wait-to-advertise

Syntax **min-wait-to-advertise** *seconds*
no min-wait-to-advertise

Context **[Tree]** (config>service>vprn>bgp>convergence min-wait-to-advertise)

Full Context configure service vprn bgp convergence min-wait-to-advertise

Description This command configures the minimum amount of time that BGP waits, after the first session establishment following a restart of the BGP instance, until it can start advertising IPv4-unicast and IPv6-unicast routes to its BGP peers, to allow time for re-convergence.

The time limit configured by this command should allow sufficient time for all important peers to re-establish their sessions with the restarting router.

The **no** form of this command implements the default time limit of 0 seconds, which disables all forms of delayed route advertisement. In other words, it causes IPv4-unicast and IPv6-unicast routes to be re-advertised as soon as possible after BGP instance restart.

Default no min-wait-to-advertise

Parameters *seconds* — Specifies the minimum amount of time, in seconds, that BGP waits until IPv4-unicast and IPv6-unicast routes can be advertised to peers.

Values 0 to 3600

Platforms All

17.271 minimum

minimum

Syntax **minimum** [**percent** [*percent*]] [**number** [*number*]]
no minimum

Context **[Tree]** (config>service>vprn>dhcp6>server>pool>prefix>thresholds>minimum-free minimum)
[Tree] (config>router>dhcp6>server>pool>prefix>thresholds>minimum-free minimum)

Full Context configure router dhcp6 local-dhcp-server pool prefix thresholds minimum-free minimum
configure service vprn dhcp6 local-dhcp-server pool prefix thresholds minimum-free minimum

Description This command configures a percentage-based or number-based threshold which represents the minimal available percentage or number of the prefix with a configured length in the provisioned prefix. The system sends out a warning if the actual percentage or number is lower than the configured threshold.

For example:

```
prefix 2001:0:0:ffe0::/50 pd wan-host create
   thresholds
       minimum-free prefix-length 64
           minimum number 3
```

With the above configuration, the system sends a warning when the number of available /64 in prefix 2001:0:0:ffe0::/50 is less than 3.

The **no** form of this command removes the command parameters from the configuration.

[Tree] (config>service>vprn>dhcp>server>pool minimum-free)

Full Context configure router dhcp local-dhcp-server pool minimum-free
configure service vprn dhcp local-dhcp-server pool minimum-free

Description This command specifies the desired minimum number of free addresses in this pool.

The **no** form of this command reverts to the default.

Default minimum-free 1

Parameters *minimum-free* — Specifies the minimum number of free addresses.

Values 0 to 255

percent — Specifies that the value indicates a percentage.

event-when-depleted — This parameter enables a system-generate event when all available addresses in the pool/subnet of local DHCP server are depleted.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Syntax **minimum-free** *minimum-free* [**percent**] [**event-when-depleted**]
no minimum-free

[Tree] (config>service>vprn>dhcp>server>pool>subnet minimum-free)

Full Context configure router dhcp local-dhcp-server pool subnet minimum-free
configure service vprn dhcp local-dhcp-server pool subnet minimum-free

Description This command configures the minimum number of free addresses in this subnet. If the actual number of free addresses in this subnet falls below this configured minimum, a notification is generated.

The **no** form of the reverts to the default.

Default minimum-free 1

Parameters *minimum-free* — Specifies the minimum number of free addresses in this subnet.

Values 0 to 255

percent — Specifies that the value indicates a percentage.

event-when-depleted — Enables a system-generate event when all available addresses in the pool or subnet of local DHCP server are depleted.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Syntax [**no**] **minimum-free prefix-length** [*prefix-length*]

Context [Tree] (config>service>vprn>dhcp6>server>pool>thresholds minimum-free)
[Tree] (config>router>dhcp6>server>pool>thresholds minimum-free)

Full Context configure router dhcp6 local-dhcp-server pool thresholds minimum-free
configure service vprn dhcp6 local-dhcp-server pool thresholds minimum-free

Description This command creates a threshold for a given prefix length on the pool level. Up to 128 thresholds could be created. For example, with **minimum-free prefix-length 64**, then the usage of /64 prefix in the pool is counted.

There are two types of thresholds that could be defined at the pool level:

- Depleted — The system sends out a warning when the prefix with the configured length is no long available in the pool.
- Minimum free — A percentage-based threshold which represents the minimal available percentage of prefix with the configured length in the pool. The system will send out warning if the actual percentage is lower than the configured percentage.

Configuring this command also enables the system stats collection for **configure prefix length**, which could be displayed with the **show router** *router-id* **dhcp6 local-dhcp-server** *dhcp6-server-name* **pool-threshold-stats** command.

The **no** form of this command removes the prefix-length from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *prefix-length* — Specifies the IPv6 prefix length.

Values 1 to 128

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.276 minimum-isa-generation

minimum-isa-generation

Syntax **minimum-isa-generation** *min-isa-generation*

Context **[Tree]** (config>isa>aa-grp minimum-isa-generation)

Full Context configure isa application-assurance-group minimum-isa-generation

Description This command configures the scale parameters for the ISA group. When *min-isa-generation* is configured as 1, the group and per-ISA limits are the MS-ISA scale.

If there is a mix of ISA 1s and 2s, the *min-isa-generation* must be left as 1.

When min-isa-gen is configured as 2, the per-isa resource limits shown in the **show isa application-assurance-group 1 load-balance** output will increase to show ISA2 limits.

Default minimum-isa-generation 1

Parameters *min-isa-generation* — Specifies the minimum ISA Generation allowed in this group.

Values 1 – ISA (ISA1)
2 – ISA2

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

17.277 minimum-length

minimum-length

Syntax **minimum-length** *length*
no minimum-length

Context **[Tree]** (config>system>security>password>complexity-rules minimum-length)

Full Context configure system security password complexity-rules minimum-length

© 2022 Nokia.

Description This command sets the minimum number of links that must be active for the bundle to be active.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the number of active links drops below the configured minimum then the multilink bundle will transition to an operationally down state.

The **no** form of this command removes the minimum link limit.

Default minimum-links 1

Parameters *minimum-link* — Specifies the minimum link limit, expressed as an integer.

Values 1 to 8

Platforms 7450 ESS, 7750 SR-7/12/12e

17.280 minute

minute

Syntax **minute** {*minute-number* [*..minute-number*] | **all**}
no minute

Context **[Tree]** (config>system>cron>sched minute)

Full Context configure system cron schedule minute

Description This command specifies the minute to schedule a command. Multiple minutes of the hour can be specified. When multiple minutes are configured, each of them will cause the schedule to occur. If a minute is configured, but no **hour** or day is configured, the event will not execute. If a minute is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

The **no** form of this command removes the specified minute from the configuration.

Default no minute

Parameters *minute-number* — Specifies the minute to schedule a command.

Values 0 to 59 (maximum 60 minute-numbers)

all — Specifies all minutes.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service epipe sap eth-cfm mip
configure service epipe spoke-sdp eth-cfm mip
configure service vpls mesh-sdp eth-cfm mip
configure service vpls sap eth-cfm mip
configure service vpls spoke-sdp eth-cfm mip

Description This command configures Maintenance Intermediate Points (MIPs). The creation rules of the MIP are dependent on the **mhf-creation** configuration for the MA.

The MIP can be created with a primary VLAN using the **primary-vlan-enable** *vlan-id* parameter matching the VLAN configured under the applicable association. Optional VLANs can be added the to the locally-generated CFM frames for egress processing using the **cfm-vlan-tag** option.

The **no** form of this command removes the MIP creation request.

Default no mip

Parameters *qtag1* — Specifies the outer VLAN ID.

Values 1 to 4094

qtag2 — Specifies the inner VLAN ID and can only be specified if *qtag1* is configured.

Values 1 to 4094

mac — Provides a method for manually configuring the MIP MAC address.

mac-address — Specifies the MAC address of the MIP.

Values 6-byte mac-address in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx of the MIP. The MAC address must be unicast. Using the all-zeros address is equivalent to the **no** form of this command.

default-mac — Specifies to change the MAC address back to the default MAC without having to delete and reconfigure the MIP.

primary-vlan-enable — Provides a method for linking the MIP with the primary VLAN configured under the bridge-identifier for the MA. This is only allowed if the mhf-creation method is static. MIPs cannot be changed from or to primary VLAN functions without first being deleted. This must be configured as part of the creation step and can only be changed by deleting the MIP and re-creating it. Primary VLANs are only supported under Layer 2 Epipe and VPLS services.

vlan-id — Specifies the VLAN ID. This parameter must match the VLAN ID under the bridge-identifier for the MA that is appropriate for this service.

Values 0 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mip

Syntax **mip primary-vlan-enable** [**vlan** *vlan-id*]
no mip

Context **[Tree]** (config>service>template>vpls-sap-template>eth-cfm mip)

Full Context configure service template vpls-sap-template eth-cfm mip

Description This command allows Maintenance Intermediate Points (MIPs). The creation rules of the MIP are dependent on the mhf-creation configuration for the MA. This MIP option is only available for default and static mhf-creation methods.

Parameters **primary-vlan-enable** — Provides a method for linking the MIP with the primary VLAN configured under the bridge-identifier for the MA. This is only allowed if the mhf-creation method is static. MIPs cannot be changed from or to primary VLAN functions without first being deleted. This must be configured as part of the creation step and can only be changed by deleting the MEP and re-creating it. Primary VLANs are only supported under Ethernet SAPs.

vlan — A required parameter when including primary-vlan-enable. Provides a method for associating the VLAN under the bride-identifier under the MA with the MIP.

vlan-id — Must match the vlan-id under the bridge-identifier for the MA that is appropriate for this service.

Values 0 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mip

Syntax [**no**] **mip**

Context **[Tree]** (config>router>mpls>mpls-tp>transit-path>forward-path mip)
[Tree] (config>router>mpls>mpls-tp>transit-path>reverse-path mip)

Full Context configure router mpls mpls-tp transit-path forward-path mip
configure router mpls mpls-tp transit-path reverse-path mip

Description This command creates a context for maintenance entity group intermediate point (MIP) parameters for the forward path and the reverse path of an MPLS-TP LSP at an LSR.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mip

Syntax [**no**] **mip domain** *md-index* **association** *ma-index*

Context **[Tree]** (debug>eth-cfm mip)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug eth-cfm mip

Description This command specifies the MIP from which to debug the CFM PDUs.

The **no** form of this command removes the MIP parameters.

Parameters *md-index* — Specifies the maintenance domain (MD) index value of the launch point.

Values 1 to 4294967295

ma-index — Specifies the maintenance association (MA) index value of the launch point.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.283 mip-ltr-priority

mip-ltr-priority

Syntax **mip-ltr-priority** *priority*

Context **[Tree]** (cfg>eth-cfm>domain>assoc>bridge mip-ltr-priority)

Full Context configure eth-cfm domain association bridge-identifier mip-ltr-priority

Description This command allows the operator to set the priority of the Linktrace Response Message (ETH-LTR) from a MIP for this association.

Default 7

Parameters *priority* — Specifies the priority of the Linktrace Response Message (ETH-LTR) from a MIP.

Values 0 to 7

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mip-ltr-priority

Syntax **mip-ltr-priority** *priority*

Context **[Tree]** (config>eth-cfm>default-domain>bridge-identifier mip-ltr-priority)

Full Context configure eth-cfm default-domain bridge-identifier mip-ltr-priority

Description This command allows the operator to set the priority of the Linktrace Response Message (ETH-LTR) from a MIP for this association.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default defer

Parameters *priority* — Specifies the priority of the Linktrace Response Message (ETH-LTR) from a MIP. The “defer” value is only supported under the default-domain context and causes **mip-ltr-priority** to inherit values from the global read-only-system values.

Values 0 to 7, **defer**

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.285 mirror-dest

mirror-dest

Syntax **mirror-dest** *service-id* [**create**] [**type** *mirror-type*] [**name** *name*]
no mirror-dest *service-id*

Context **[Tree]** (config>mirror mirror-dest)

Full Context configure mirror mirror-dest

Description This command creates a context to set up a service that is intended for packet mirroring. It is configured as a service to allow mirrored packets to be directed locally (within the same router) or remotely, over the core of the network and have a far-end decode mirror encapsulation.

The mirror destination service is comprised of destination parameters that define where the mirrored packets are to be sent. It also specifies whether the defined *service-id* will receive mirrored packets from far-end router over the network core.

The mirror destination service IDs are persistent between boots of the router and are included in the configuration saves. The local sources of mirrored packets for the service ID are defined within the **debug mirror mirror-source** command that references the same *service-id*. Up to 255 mirror destination service IDs can be created within a single system.

The **mirror-dest** command creates or edits a service ID for mirroring purposes. If the *service-id* does not exist within the context of all defined services, the mirror destination service is created and the context of the CLI is changed to that service ID. If the *service-id* exists within the context of defined mirror destination services, the CLI context is changed for editing parameters on that service ID. If the *service-id* exists within the context of another service type, an error message is returned and CLI context is not changed from the current context.

LI source configuration is saved using the **li>save** command.

The **no** form of this command removes a mirror destination from the system. The mirror source or **li-source** associations with the mirror destination *service-id* do not need to be removed or shutdown first. The mirror destination *service-id* must be shutdown before the service ID can be removed. When the service ID is removed, all **mirror-source** or **li-source** commands that have the service ID defined will also be removed from the system.

Parameters *service-id* — The service identification identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If particular a service ID already exists for a service, then the same value cannot be used to create a mirror destination service ID with the same value. For example:

If an Epipe service ID **11** exists, then a mirror destination service ID **11** cannot be created. If a VPLS service ID **12** exists, then a mirror destination service ID **12** cannot be created.

If an IES service ID **13** exists, then a mirror destination service ID **13** cannot be created.

Values

service-id:	1 to 2147483647
svc-name:	64 characters maximum

create — Keyword used to create a mirror destination service.

mirror-type — The type describes the encapsulation supported by the mirror service.

Values The following values apply to the 7750 SR:

ether, frame-relay, ppp, ip-only, atm-sdu, satop-e1, satop-e3, satop-t1, cesopsn, cesopsn-cas

Values The following values apply to the 7950 XRS:

ether, ip-only

Values The following values apply to the 7450 ESS:

ether, frame-relay, ppp

name — Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Service names may not begin with an integer (0 to 9).

Context [Tree] (config>li mirror-dest-template)

Full Context configure li mirror-dest-template

Description This command creates a template used by RADIUS-triggered mirror destinations. RADIUS provides the IP destination (and other optional attributes) for the mirror destination and the mirror template provides the remaining mirror destination attributes for mirroring packets remotely over the core of an IP network.

The system supports up to eight mirror destination templates and allows a mirror destination to be swapped in real time. Only new LI sources will use the new attribute of the mirror destination template. Existing LI sources remain unchanged and continue to use the attribute of the previous mirror destination template.

The **no** form of this command removes a mirror destination template from the system.

Parameters *name* — Specifies the template name, up to 32 characters.

mirror-type — Specifies the type of encapsulation supported by the mirror service.

Values ether, frame-relay, ppp, ip-only, atm-sdu, satop-e1, satop-t1, cesopsn, cesopsn-cas

create — Keyword required to create a template.

mirror-dest-template

Syntax **mirror-dest-template** *template-name*
no mirror-dest-template

Context **[Tree]** (config>li>radius mirror-dest-template)

Full Context configure li radius mirror-dest-template

Description This command enables or disables the use of a RADIUS triggered mirror destination template to be used by new LI sources.

Parameters *template-name* — Specifies the template name, up to 32 characters. The template must already exist.

Platforms All

17.288 mirror-source

mirror-source

Syntax **mirror-source** [**all-inclusive**] *mirror-service-id*
no mirror-source

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action mirror-source)

Full Context configure application-assurance group policy app-qos-policy entry action mirror-source

Description This command configures an application-based policy mirroring service that uses this AA ISA group's AQP entry as a mirror source. When configured, AQP entry becomes a mirror source for IP packets seen by the AA (the mirrored packet is an IP packet analyzed by AA and does not include encapsulations present on the incoming interfaces).

Default no mirror-source

Parameters **all-inclusive** — Specifies that all packets during identification phase that could match a given AQP rule are mirrored in addition to packets after an application identification completes that match the AQP rule. This ensures all packets of a given flow are mirrored at a cost of sending unidentified packets that once the application is identified will no longer match this AQP entry.

mirror-service-id — Specifies the mirror source service ID to use for flows that match this policy.

Values 1 to 2147483647

© 2022 Nokia.

svc-name: 64 characters maximum

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mirror-source

Syntax [**no**] **mirror-source** *service-id*

Context **[Tree]** (debug>app-assure>group>traffic-capture>match mirror-source)

Full Context debug app-assure group traffic-capture match mirror-source

Description This command configures debugging on a mirror source.

mirror-source

Syntax [**no**] **mirror-source** *service-id*

Context **[Tree]** (config>mirror mirror-source)

Full Context configure mirror mirror-source

Description This command configures mirror source parameters for a mirrored service.

The **mirror-source** command is used to enable mirroring of packets specified by the association of the **mirror-source** to sources of packets defined within the context of the *mirror-dest-service-id*. The mirror destination service must already exist within the system.

A mirrored packet cannot be mirrored to multiple destinations. If a packet matches multiple mirror source entries (for example, a SAP on one **mirror-source** and a port on another **mirror-source**), then the packet is mirrored to a single *mirror-dest-service-id* based on the following precedence:

1. Filter entry
2. Subscriber (applies to the 7750 SR and 7450 ESS)
3. SAP
4. Physical port

The precedence is structured so the most specific match criteria has precedence over a less specific match. For example, if a **mirror-source** defines a port and a SAP on that port, then a packet arriving on the SAP will be mirrored using the SAP mirror (and not mirrored using the Port mirror) because the SAP is more specific than the port.

The **no** form of this command deletes all related source commands within the context of the **mirror-source** *service-id*. The command does not remove the service ID from the system.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — Specifies the service identification identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

Values

service-id:	1 to 2147483647
svc-name:	64 characters maximum

Platforms All

mirror-source

Syntax [**no**] **mirror-source** *service-id*

Context **[Tree]** (debug mirror-source)

Full Context debug mirror-source

Description This command configures mirror source parameters for a mirrored service.

The **mirror-source** command is used to enable mirroring of packets specified by the association of the **mirror-source** to sources of packets defined within the context of the *mirror-dest-service-id*. The mirror destination service must already exist within the system.

A mirrored packet cannot be mirrored to multiple destinations. If a packet matches multiple mirror source entries (for example, a SAP on one **mirror-source** and a port on another **mirror-source**), then the packet is mirrored to a single *mirror-dest-service-id* based on the following precedence:

1. Filter entry
2. Subscriber (applies to the 7750 SR and 7450 ESS)
3. SAP
4. Physical port

The precedence is structured so the most specific match criteria has precedence over a less specific match. For example, if a **mirror-source** defines a port and a SAP on that port, then a packet arriving on the SAP will be mirrored using the SAP mirror (and not mirrored using the Port mirror) because the SAP is more specific than the port.

The **mirror-source** configuration is not saved when a configuration is saved. A **mirror-source** manually configured within an ASCII configuration file will not be preserved if that file is overwritten by a **save** command. Define the **mirror-source** within a file associated with a **config exec** command to make a **mirror-source** persistent between system reboots.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, all mirror destination service IDs have a **mirror-source** associated with them. The **mirror-source** is not technically created with this command. Instead the service ID provides a contextual node for storing the current mirroring sources for the associated mirror destination service ID. The **mirror-source** is created for the mirror service when the operator enters the **debug>mirror-source** *svcId* for the first time. If the operator enters **li>li-source** *svcId* for the first time, an LI source is created for the mirror service. The **mirror-source** is also automatically removed when the mirror destination service ID is deleted from the system.

The **no** form of this command deletes all related source commands within the context of the **mirror-source** *service-id*. The command does not remove the service ID from the system.

Parameters *service-id* — Specifies the mirror destination service ID for which match criteria will be defined. The *service-id* must already exist within the system.

Values *service-id*: 1 to 2147483647
svc-name: 64 characters maximum

Description This command configures a TCA for the counter capturing drops due to the GTP filter missing mandatory IE check. A missing-mandatory-ie drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a missing-mandatory-ie TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.292 mixed-lsp-mode

mixed-lsp-mode

Syntax [**no**] **mixed-lsp-mode**

Context **[Tree]** (config>service>sdp mixed-lsp-mode)

Full Context configure service sdp mixed-lsp-mode

Description This command enables the use by an SDP of the mixed-LSP mode of operation. This command indicates to the service manager that it must allow a primary LSP type and a backup LSP type in the same SDP configuration. For example, the **lsp** and **ldp** commands are allowed concurrently in the SDP configuration. The user can configure one or two types of LSPs under the same SDP. Without this command, these commands are mutually exclusive.

The user can configure an RSVP LSP as a primary LSP type with an LDP LSP as a backup type. The user can also configure a BGP RFC 3107 BGP LSP as a backup LSP type.

If the user configures an LDP LSP as a primary LSP type, then the backup LSP type must be an RFC 3107 BGP labeled route.

At any given time, the service manager programs only one type of LSP in the linecard that will activate it to forward service packets according to the following priority order:

- RSVP LSP type. Up to 16 RSVP LSPs can be entered by the user and programmed by the service manager in ingress linecard to load balance service packets. This is the highest priority LSP type.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- LDP LSP type. One LDP FEC programmed by the service manager but the ingress card can use up to 16 LDP ECMP paths for the FEC to load balance service packets when ECMP is enabled on the node.
- BGP LSP type. One RFC 3107-labeled BGP prefix programmed by the service manager. The ingress card can use more than one next-hop for the prefix.

In the case of the RSVP/LDP SDP, the service manager will program the NHLFE(s) for the active LSP type preferring the RSVP LSP type over the LDP LSP type. If no RSVP LSP is configured or all configured RSVP LSPs go down, the service manager will re-program the card with the LDP LSP if available. If not, the SDP goes operationally down.

When a higher priority type LSP becomes available, the service manager reverts back to this LSP at the expiry of the sdp-revert-time timer or the failure of the currently active LSP, whichever comes first. The service manager then re-programs the card accordingly. If the infinite value is configured, then the SDP reverts to the highest priority type LSP only if the currently active LSP failed.

Note: LDP uses a tunnel down damp timer which is set to three seconds by default. When the LDP LSP fails, the SDP will revert to the RSVP LSP type after the expiry of this timer. For an immediate switchover, this timer must be set to zero. Use the **config>router>ldp>tunnel-down-damp-time** command.

If the user changes the value of the sdp-revert-time timer, it will take effect only at the next use of the timer. Any timer which is outstanding at the time of the change will be restarted with the new value.

If class based forwarding is enabled for this SDP, the forwarding of the packets over the RSVP LSPs will be based on the FC of the packet as in current implementation. When the SDP activates the LDP LSP type, then packets are forwarded over the LDP ECMP paths using the regular hash routine.

In the case of the LDP/BGP SDP, the service manager will prefer the LDP LSP type over the BGP LSP type. The service manager will re-program the card with the BGP LSP if available otherwise it brings down the SDP operationally.

Also note the following difference in behavior of the LDP/BGP SDP compared to that of an RSVP/LDP SDP. For a given /32 prefix, only a single route will exist in the routing table: the IGP route or the BGP route. Thus, either the LDP FEC or the BGP label route is active at any given time. The impact of this is that the tunnel table needs to be re-programmed each time a route is deactivated and the other is activated. Furthermore, the SDP revert-time cannot be used since there is no situation where both LSP types are active for the same /32 prefix.

The **no** form of this command disables the mixed-LSP mode of operation. The user first has to remove one of the LSP types from the SDP configuration or the command will fail.

Default no mixed-lsp-mode

7450 ESS, 7750 SR-7/12/12e

- configure port multilink-bundle mlppp

17.302 mlppp-profile-egress

mlppp-profile-egress

Syntax **mlppp-profile-egress** *profile-id* [**create**]
no mlppp-profile-egress *profile-id*

Context **[Tree]** (config>qos mlppp-profile-egress)

Full Context configure qos mlppp-profile-egress

Description This command creates a profile for the user to configure the egress QoS parameters of a multiclass MLPPP bundle.

A maximum of 128 egress QoS profiles can be created on the system.

The **no** form of this command deletes the profile.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *profile-id* — Specifies an ingress mlppp-profile ID.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mlppp-profile-egress

Syntax **mlppp-profile-egress** *src-mlppp-prof dst-mlppp-prof* [**overwrite**]

Context **[Tree]** (config>qos>copy mlppp-profile-egress)

Full Context configure qos copy mlppp-profile-egress

Description This command copies an existing ingress **mlppp-profile-egress** profile ID to another egress **mlppp-profile-egress** profile ID. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination profile ID exists.

Parameters *src-mlppp-prof* — Specifies the existing source egress **mlppp-profile-egress** profile ID from which the **copy** command attempts to copy.

Values 1 to 65535

dst-mlppp-prof — Specifies the destination egress **mlppp-profile-egress** profile ID to which the copy command attempts to copy.

Values 1 to 65535

overwrite — Use this parameter when the **mlppp-profile-egress** *dst-mlppp-prof* already exists. If it does, everything in the existing destination **mlppp-profile-egress** *dst-mlppp-prof* is completely overwritten with the contents of the **mlppp-profile-egress** *src-mlppp-prof*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI use {overwrite}; destination mlppp-egress-profile
"1010" exists
```

If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.303 mlppp-profile-ingress

mlppp-profile-ingress

Syntax [**no**] **mlppp-profile-ingress** *profile-id* [**create**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>qos mlppp-profile-ingress)

Full Context configure qos mlppp-profile-ingress

Description This command creates a profile for the user to configure the ingress QoS parameters of a multiclass MLPPP bundle.

A maximum of 128 ingress QoS profiles can be created on the system.

The **no** form of this command deletes the profile.

Parameters *profile-id* — Specifies a specific multi-class ingress profile.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mlppp-profile-ingress

Syntax **mlppp-profile-ingress** *src-mlppp-prof dst-mlppp-prof* [**overwrite**]

Context [Tree] (config>qos>copy mlppp-profile-ingress)

Full Context configure qos copy mlppp-profile-ingress

Description This command copies an existing ingress **mlppp-profile-ingress** profile ID to another ingress **mlppp-profile-ingress** profile ID. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination profile ID exists.

Parameters *src-mlppp-prof* — Specifies the existing source MLPPP profile ID from which the **copy** command attempts to copy.

Values 1 to 65535

dst-mlppp-prof — Specifies the destination MLPPP profile ID to which the copy command attempts to copy.

Values 1 to 65535

overwrite — Use this parameter when the **mlppp-profile-ingress** *dst-mlppp-prof* already exists. If it does, everything in the existing destination **mlppp-profile-ingress** *dst-mlppp-prof* is completely overwritten with the contents of the **mlppp-profile-ingress** *src-mlppp-prof*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI use {overwrite}; destination mlppp-ingress-profile
"100" exists
```

If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mode

Syntax **mode** *mode*

Context **[Tree]** (config>card>mda>atm mode)

Full Context configure card mda atm mode

Description This command configures the ATM MDA into a mode with the increased VC scale (16k VCs, as opposed to 8K VCs). ESM is supported only in 16K VCs mode. In 16K VCs mode, there is only one queue allocated to each VC in the ATM MDA. In 8K VCs mode, there are two queues allocated per VC.

The 16K VC mode is supported only on the 4-port oc-3/12c/STM-1/4c ATM MDA.

Changing the ATM MDA mode requires a reset of the MDA. A warning is issued asking for the confirmation before the command is executed.

Default mode max8k-vc

Parameters *mode* — Specifies the VC scale.

Values max8k-vc, max16k-vc

Platforms All

mode

Syntax **mode** {**strict** | **loose** | **strict-no-ecmp**}
no mode

configure service vprn network-interface urpf-check mode
configure service vprn subscriber-interface group-interface urpf-check mode

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the mode of unicast RPF check.

The **no** form of this command reverts to the default (strict) mode.

Default mode strict

Parameters **strict** — When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

loose — In **loose** mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when **urpf-check** is enabled.

strict-no-ecmp — When a packet is received on an interface in this mode and the SA matches an ECMP route the packet is dropped by uRPF.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface urpf-check mode
- configure service ies subscriber-interface group-interface ipv6 urpf-check mode

All

- configure service ies interface ipv6 urpf-check mode
- configure service vprn network-interface urpf-check mode
- configure service vprn interface ipv6 urpf-check mode
- configure service vprn interface urpf-check mode
- configure service ies interface urpf-check mode

mode

Syntax **mode** {**strict** | **loose** | **strict-no-ecmp**}
no mode

Context **[Tree]** (config>subscr-mgmt>git>ipv4>urpf-check mode)

Full Context configure subscriber-mgmt group-interface-template ipv4 urpf-check mode

Description This command configures the mode of Unicast RPF (uRPF) check.

The **no** form of this command reverts to the default.

Default mode strict

Parameters **strict** — Specifies that the uRPF checks whether the incoming packet has a source IP address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source IP address prefix.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

loose — Specifies that the uRPF checks whether the incoming packet has a source IP address with a corresponding prefix in the routing table. However, the **loose** mode does not check whether the interface expects to receive a packet with a specific source IP address prefix. This object is valid only when the **urpf-check** command is enabled.

strict-no-ecmp — Specifies that when a packet is received on an interface in this mode and the SA matches an ECMP route, the packet is dropped by uRPF.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mode

Syntax **mode** {**none** | **basic** | **advanced**}

Context **[Tree]** (config>system>power-management mode)

Full Context configure system power-management mode

Description This command sets the power mode. This command is supported in the 7750 SR-S OS and 7950 XRS only.

Default mode basic

Parameters **none** — Specifies that there is no management of power to modules. In this mode, no gradual shutdown of active XCMs and XMAs is enforced. No spare capacity is reserved and any APEQ failure may result in brownouts or card failures.

basic — Specifies that the node will bring up as many provisioned modules (in order of priority) as possible using the N+1 algorithm. In **basic** mode the system shuts down IO cards when power capacity drops below the Power Safety Level.

advanced — Specifies that the operator can maintain a spare APEQ as long as possible to make it immune to the possibility of power brown-outs. In **advanced** mode, the system starts shutting down IO cards when the power capacity drops below the Power Safety Level + Max rated APEQ.

Platforms 7750 SR-s, 7950 XRS

mode

Syntax **mode** {**automatic** | **manual**}

Context **[Tree]** (config>port>dwdm>coherent mode)

Full Context configure port dwdm coherent mode

Description This command configures the mode used to compensate for chromatic dispersion.

Parameters **automatic** — Sets to automatic mode.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

manual — Sets to manual mode.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mode

Syntax **mode** {**none** | **uni-n**}

Context **[Tree]** (config>port>ethernet>elmi mode)

Full Context configure port ethernet elmi mode

Description This command configures the Ethernet LMI mode.

Parameters **none** — Specifies that the E LMI mode is set to none.

uni-n — Specifies that the E LMI mode is set to UNI-N.

Platforms All

mode

Syntax **mode** {**access** | **network** | **hybrid**}
no mode

Context **[Tree]** (config>lag mode)
[Tree] (config>port>ethernet mode)
[Tree] (config>port>sonet-sdh>path mode)
[Tree] (config>port>tdm>ds1>channel-group mode)
[Tree] (config>port>tdm>ds3 mode)
[Tree] (config>port>tdm>e1>channel-group mode)
[Tree] (config>port>tdm>e3 mode)

Full Context configure lag mode
configure port ethernet mode
configure port sonet-sdh path mode
configure port tdm ds1 channel-group mode
configure port tdm ds3 mode
configure port tdm e1 channel-group mode
configure port tdm e3 mode

Description This command configures an Ethernet port, TDM channel, or SONET/SDH path (sub-port) for **access, network or hybrid** mode operation.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

An **access** port or channel is used for customer facing traffic on which services are configured. A Service Access Point (SAP) can only be configured on an access port or channel. When a port is configured for access mode, the appropriate **encap-type** must be specified to distinguish the services on the port or SONET path. Once an Ethernet port, a TDM channel or a SONET path has been configured for access mode, multiple services can be configured on the Ethernet port, a TDM channel or SONET path.

A network port or channel participates in the service provider transport or infrastructure network when a network mode is selected. When the network option is configured, the encap-type cannot be configured for the port/channel.

When network mode is selected on a SONET/SDH path, the appropriate control protocols are activated when the need arises. For example, configuring an IP interface on the SONET path activates IPCP while the removal of the IP interface causes the IPCP to be removed. The same applies for MPLS, MPLSCP, and OSICP. When configuring a SONET/SDH port, the mode command must be entered in the channel context or an error message is generated.

A hybrid Ethernet port allows the combination of network and access modes of operation on a per-VLAN basis and must be configured as either dot1q or QinQ encapsulation.

When the hybrid port is configured to the dot1q encapsulation, the user configures a SAP inside a service simply by providing the SAP ID which must include the port-id value of the hybrid mode port and an unused VLAN tag value. The format is <*port-id*>:*qtag1*. A SAP of format <*port-id*>:* also supported.

The user configures a network IP interface under **config>router>if>port** by providing the port name which consists of the port-id of the hybrid mode port and an unused VLAN tag value. The format is <*port-id*>:*qtag1*. The user must explicitly enter a valid value for qtag1. The <*port-id*>:* value is not supported on a network IP interface. The 4096 VLAN tag space on the port is shared among VLAN SAPs and VLAN network IP interfaces.

When the hybrid port is configured to QinQ encapsulation, the user configures a SAP inside a service simply by providing the SAP ID which must include the port-id value of the hybrid mode port and the outer and inner VLAN tag values. The format is <port-id>:qtag1.qtag2. A SAP of format <*port-id*>: *qtag1*.* is also supported. The outer VLAN tag value must not have been used to create an IP network interface on this port. In addition, the qtag1.qtag2 value combination must not have been used by another SAP on this port.

The user configures a network IP interface under **config>router>if>port** by providing the port name which consists of the port-id of the hybrid mode port and a VLAN tag value. The format is <*port-id*>:*qtag1*.*. An outer VLAN tag qtag2 of * creates an IP network interface. In addition, the qtag1.qtag2 value combination must not have been used on another SAP or IP network interface on this port.

The **no** form of this command restores the default.

Default mode network — For Ethernet ports

mode access — For TDM channel or SONET paths

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Special Cases **SONET/SDH Path —** When network mode is selected, the appropriate control protocols are activated when the need arises. For example, configuring an IP interface on the SONET path activates IPCP while the removal of the IP interface causes the IPCP to be removed. The same applies for MPLS, MPLSCP, and OSICP. When configuring a SONET/SDH port, the **mode** command must be entered in the channel context or an error message is generated.

Parameters **access** — Configures the Ethernet port, TDM channel or SONET path as service access.

network — Configures the Ethernet port, TDM channel or SONET path for transport network use.

hybrid — Configures the Ethernet port for hybrid use.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path mode

- configure port tdm e1 channel-group mode
- configure port tdm e3 mode
- configure port tdm ds1 channel-group mode
- configure port tdm ds3 mode

All

- configure port ethernet mode
- configure lag mode

mode

Syntax **mode** {**active** | **passive**}

Context **[Tree]** (config>port>ethernet>efm-oam mode)

Full Context configure port ethernet efm-oam mode

Description This command configures the mode of OAM operation for this Ethernet port. These two modes differ in that active mode causes the port to continually send out efm-oam info PDUs while passive mode waits for the peer to initiate the negotiation process. A passive mode port cannot initiate monitoring activities (such as loopback) with the peer.

Default mode active

Parameters **active** — Provides capability to initiate negotiation and monitoring activities.

passive — Relies on peer to initiate negotiation and monitoring activities.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mode

Syntax **mode** {**dce** | **dte** | **bidir**}

Context **[Tree]** (config>port>ml-bundle>mlfr>frame-relay mode)

Full Context configure port multilink-bundle mlfr frame-relay mode

Description This command configures the DCE/DTE mode of the Frame Relay interface.

Parameters **dce** — Enables the DCE mode.

dte — Enables the DTE mode.

bidir — Enables the bidirectional mode for LMI types ANSI and ITU.

Platforms 7450 ESS, 7750 SR-7/12/12e

mode

Syntax **mode** {**dce** | **dte** | **bidir**}

[Tree] (config>port>tdm>ds3>frame-relay mode)
[Tree] (config>port>tdm>e1>channel-group>frame-relay mode)
[Tree] (config>port>tdm>e3>frame-relay mode)

Full Context configure port multilink-bundle mlfr frame-relay mode
configure port sonet-sdh path frame-relay mode
configure port tdm ds1 channel-group frame-relay mode
configure port tdm ds3 frame-relay mode
configure port tdm e1 channel-group frame-relay mode
configure port tdm e3 frame-relay mode

Description This command sets the Frame Relay interface into the DCE, DTE, or Bidirectional mode of LMI operation. The DTE mode causes the router to send status inquiries over the interface. The DCE mode causes the router to respond to status inquiries. In bidirectional mode, the router performs both DTE and DCE operation over the FR interface. The bidirectional mode applies to the ANSI and ITU LMI types only.

This feature is used when two routers are connected back-to-back, running frame relay encapsulation.

Default mode dte

Parameters **dce** — Enables the DCE mode.

dte — Enables the DTE mode.

bidir — Enables the bidirectional mode for LMI types ANSI and ITU.

mode

Syntax **mode** {**manual** | **auto** | **off**}

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg>service-carving mode)

Full Context configure service system bgp-evpn ethernet-segment service-carving mode

Description This command configures the service-carving mode. This determines how the DF is elected for a specified Ethernet-Segment and service.

Default mode auto

Parameters **auto** — This mode is the service-carving algorithm defined in RFC 7432. The DF for the service is calculated based on the modulo function of the service (identified by either the evi or the isid) and the number of PEs.

manual — In this mode the DF is elected based on the manual configuration added in the **service-carving>manual** context.

off — In this mode all the services elect the same DF PE (assuming the same PEs are active for all the configured services). The PE with the lowest IP is elected as DF for the Ethernet-Segment.

Platforms All

mode

Syntax **mode** *mode*

Context **[Tree]** (config>service>vpls>pim-snooping mode)

Full Context configure service vpls pim-snooping mode

Description This command sets the PIM snooping mode to proxy or plain snooping.

no mode

Context **[Tree]** (config>service>vpls>stp mode)
[Tree] (config>service>template>vpls-template>stp mode)

Full Context configure service template vpls-template stp mode
configure service vpls stp mode

Description This command specifies the version of Spanning Tree Protocol the bridge is currently running.

See section Spanning Tree Operating Modes for more information about these modes.

The **no** form of this command returns the STP variant to the default.

Default mode rstp

Parameters **rstp** — Corresponds to the Rapid Spanning Tree Protocol specified in IEEE 802.1D/D4-2003

dot1w — Corresponds to the mode where the Rapid Spanning Tree is backward compatible with IEEE 802.1w

compdot1w — Corresponds to the Rapid Spanning Tree Protocol in conformance with IEEE 802.1w

mstp — Sets MSTP as the STP mode of operation. Corresponds to the Multiple Spanning Tree Protocol specified in 802.1Q REV/D5.0-09/200

pmstp — The PMSTP mode is only supported in VPLS services where the M-VPLS flag is configured

Context **[Tree]** (config>service>vprn>msdp>group mode)

Full Context configure service vprn msdp group mode

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers.

Multicast Source Discovery Protocol (MSDP) peers can be configured grouped in a full-mesh topology that prevents excessive flooding of source-active messages to neighboring peers.

In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, then unpredictable results may occur.

Default mode standard

Parameters **mesh-group** — Specifies that source-active message received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These source-active messages are only flooded to non-mesh group peers or members of other mesh groups.

standard — Specifies a non-meshed mode.

Platforms All

mode

Syntax **mode** {**auto** | **napt** | **one-to-one**}
no mode

Context **[Tree]** (config>service>vprn>nat>outside>pool mode)

Full Context configure service vprn nat outside pool mode

Description This command configures the mode of operation of this NAT address pool.

The mode value is only relevant while the value of pool type is equal to largeScale; while the value of pool type is equal to l2Aware, the mode of operation is always NAPT.

Default mode auto

Parameters **napt** — Specifies NAPT (Network Address Port Translation)

auto — The system selects the actual mode based upon other configuration parameters; the actual mode can be NAPT or 1:1 NAT (also known as 'Basic NAT').

one-to-one — Indicates 1:1 NAT (also known as 'Basic NAT')

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Full Context debug service id dhcp mode

Description This command configures the DHCP tracing mode.

The **no** form of the command disables debugging.

Parameters **dropped-only** — Only displays dropped packets.

ingr-and-dropped — Only displays ingress packet and dropped packets.

egr-ingr-and-dropped — Displays ingress, egress and dropped packets.

Platforms All

mode

Syntax **mode** *mode*

Context [Tree] (config>gmpls-tun-grp mode)

Full Context configure gmpls-tun-grp mode

Description This command sets the operating mode of the GMPLS tunnel group.

In **load-sharing** mode, traffic is load-shared across the member GMPLS LSPs of the tunnel group. The same hashing algorithm is used as for LAG (see the "LAG and ECMP hashing" chapter of the 7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide). If load-sharing is configured, then all of the GMPLS LSPs must terminate on the same far-end node. All of the ports used by GMPLS LSPs must be equivalent in that they must have the same named QoS policy, bandwidth, and so on Once more than one gLSP is associated with a tunnel group, the QoS policy / scheduler policy cannot be changed for any of the ports. All GMPLS LSPs must be unprotected end-to-end. Segment protection is allowed for GMPLS LSPs associated in a load sharing mode tunnel group.

In **active-standby** mode, only one member gLSP can be associated with the tunnel group.

The **no** form of this command removes the member.

Default mode load-sharing

Parameters *mode* — Specifies the operating mode of the GMPLS tunnel group.

Values **active-standby** — Sets the operating mode to active-standby.**load-sharing** — Sets the operating mode to load-sharing.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

mode

Syntax **mode** *mode*

Context **[Tree]** (config>app-assure>group>gtp mode)

Full Context configure application-assurance group gtp mode

Description This command is used to either untunnel GTP-U traffic received on UDP port number 2152, or apply GTP filtering/firewall rules as specified under this GTP CLI context.

Default mode filtering

Parameters *mode* — Specifies the operational mode of the command.

Values **filtering** — AA applies GTP filtering rules to GTP-U traffic, without further analysis of IP traffic tunneled within GTP.

untunneling — AA untunnels GTP traffic and provides analytical reporting of the applications running within the GTP tunnels. The rest of the commands under GTP CLI context (such as GTP-filter and event-log) are not applicable in this mode.

For AA to untunnel GTP traffic, the operator must configure “gtp” under the partition by using the **config**>**app-assure**>**group**>**gtp** command.

The following caveats apply:

- Only GTP-U traffic with TID <> 0 is untunneled.
- Any UDP but non-GTP traffic that uses port 2152 will be identified as UDP traffic.
- Only GTP-U packets with message type: G-PDU (0xFF) is untunneled. Other GTP-U packets with different message types are reported as GTP Protocol.
- Only GTP-u packets with non-fragmented outer IP and no IPv4 options or IPv6 extension headers are untunneled. Otherwise, no inner GTP tunnel classification is performed and the traffic is identified and reported as GTP protocol.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mode

Syntax **mode** {**auto** | **napt** | **one-to-one**}
no mode

Context **[Tree]** (config>router>nat>outside>pool mode)

Full Context configure router nat outside pool mode

Description This command specifies the mode of operation of this NAT address pool.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command reverts to the default.

Default auto

Parameters **{auto | napt | one-to-one}** — Specifies the mode of operation of this NAT pool.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mode

Syntax **mode** {**mesh-group** | **standard**}

Context **[Tree]** (config>router>msdp>group mode)

Full Context configure router msdp group mode

Description This command configures groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers.

Multicast Source Discovery Protocol (MSDP) peers can be configured grouped in a full-mesh topology that prevents excessive flooding of source-active messages to neighboring peers.

In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, then unpredictable results may occur.

Default mode standard

Parameters **mesh-group** — Specifies that source-active message received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These source-active messages are only flooded to non-mesh group peers or members of other mesh groups.

standard — Specifies a non-meshed mode.

Platforms All

mode

Syntax **mode** {**strict** | **loose** | **strict-no-ecmp**}

Context **[Tree]** (config>router>if>urpf-check mode)
[Tree] (config>router>if>ipv6>urpf-check mode)

Full Context configure router interface ipv6 urpf-check mode
configure router interface urpf-check mode

Description This command specifies the mode of unicast RPF check.

The **no** form of this command reverts to the default (strict) mode.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default mode strict

Parameters **strict** — When specified, uRPF checks whether incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

loose — In **loose** mode, uRPF checks whether incoming packet has source address with a corresponding prefix in the routing table. However, the loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. This object is valid only when **urpf-check** is enabled.

strict-no-ecmp — When a packet is received on an interface in this mode and the SA matches an ECMP route the packet is dropped by uRPF.

Platforms All

mode

Syntax **mode** {**ecmp-protected** | **linear**}
no mode

Context **[Tree]** (config>router>segment-routing>maintenance-policy mode)

Full Context configure router segment-routing maintenance-policy mode

Description This command specifies the data path programming and protection mechanism for SR policy candidate paths to which the maintenance policy is applied.

In both the **linear** mode and **ecmp-protected** modes, if two or more candidate paths of the same {headend, color, endpoint} and also have the same mode, then the best preference path is treated as the primary while the next best preference path is the standby. If a third path is present in the linear mode, then this is treated as a tertiary and also programmed in the IOM.

If the currently active path goes unavailable due to S-BFD, the system failovers to the next best preference available candidate path. If S-BFD is down on all segment lists of all programmed candidate paths of an SR Policy, then the SR Policy is marked as down in TTM.

If the default mode is specified, the router only programs the segment lists of the best preference paths in the IOM.

The **no** form of this command removes the configured mode.

Default no mode

Parameters **ecmp-protected** — Specifies only the top two routes (paths) are programmed in the IOM. Up to 32 segment lists can be programmed for each path.

linear — Specifies the top three routes are programmed in the IOM. Only one segment list is allowed per path.

mode

Syntax **mode** {**target-defined** | **on-change** | **sample**}

Context **[Tree]** (config>system>telemetry>persistent-subscriptions>subscription mode)

Full Context configure system telemetry persistent-subscriptions subscription mode

Description This command configures the subscription path mode for telemetry notifications that are sent for the persistent subscription.

Default mode target-defined

Parameters **target-defined** — Keyword specifying that target defined mode is used.

on-change — Keyword specifying that on change mode is used.

sample — Keyword specifying that sample mode is used.

Platforms All

17.312 mode-annexb

mode-annexb

Syntax [**no**] **mode-annexb**

Context **[Tree]** (config>port>aps mode-annexb)

Full Context configure port aps mode-annexb

Description This command configures the APS group for 1+1 Optimized operation as described in Annex B of ITU.T G.841. Note that Annex B operates in non-revertive bi-directional switching mode only as defined in G.841.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

17.313 modify-buffer-allocation-rate

modify-buffer-allocation-rate

Syntax **modify-buffer-allocation-rate**

Context **[Tree]** (config>port modify-buffer-allocation-rate)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port modify-buffer-allocation-rate

Description Commands in this context configure ingress and egress percentage of rate parameters. This command only applies to physical ports (for example, it will not work on APS or similar logical ports). The percentage of rate commands are used to define a percentage value that affects the amount of buffers used by ingress and egress port managed buffer space. Enter the modify-buffer-allocation-rate context when editing the port's percentage of rate commands.

Platforms All

17.314 module

module

Syntax **module** *cpm-slot*

Context **[Tree]** (config>system>bluetooth module)

Full Context configure system bluetooth module

Description Commands in this context define Bluetooth parameters for the specific CPM slot.

Parameters *cpm-slot* — Specifies the CPM slot.

Values {A | B | C | D}

Platforms 7750 SR-1, 7750 SR-s

17.315 mofrr

mofrr

Syntax [**no**] **mofrr**

Context **[Tree]** (debug>router>pim mofrr)

Full Context debug router pim mofrr

Description This command enables debugging for PIM multicast fast failover (MoFRR).

The **no** form of this command disables MoFRR debugging.

17.316 mon-hw-agg-shaper-sch

mon-hw-agg-shaper-sch

Syntax [**no**] **mon-hw-agg-shaper-sch**

Context **[Tree]** (config>port>ethernet>access>egress>vport mon-hw-agg-shaper-sch)

Full Context configure port ethernet access egress vport mon-hw-agg-shaper-sch

Description This command enables congestion monitoring of the hardware aggregate shaper scheduler on the specified vport.

The **no** form of this command disables congestion monitoring.

Default no mon-hw-agg-shaper-sch

Platforms 7750 SR-1, 7750 SR-s

17.317 mon-port-sch

mon-port-sch

Syntax [**no**] **mon-port-sch**

Context **[Tree]** (config>port>ethernet mon-port-sch)
[Tree] (config>port>ethernet>access>egress>vport mon-port-sch)
[Tree] (config>port>sonet-sdh>path>access>egress>vport mon-port-sch)

Full Context configure port ethernet access egress vport mon-port-sch
configure port ethernet mon-port-sch
configure port sonet-sdh path access egress vport mon-port-sch

Description This command enables congestion monitoring on an Egress Port Scheduler (EPS) that is applied to a physical port or to a Vport.

Congestion monitoring must be further configured under the port-scheduler CLI hierarchy. Once the congestion monitoring is in effect, the offered rate (incoming traffic) is compared to the configured port-scheduler congestion threshold. The results of these measurements are stored as the number of samples representing the number of times the offered rates exceeded the configured congestion threshold since the last clearing of the stats. Therefore, the results represent the number of times that the port-scheduler that is applied to a port/Vport was congested since the last reset of the stats (via a **clear** command).

The **no** form of this command disables congestion monitoring.

17.318 monitor

monitor

Syntax **monitor** *ip-prefix/length*
no monitor

Context **[Tree]** (config>service>ies>sub-if>wlan-gw>redundancy monitor)

Full Context configure service ies subscriber-interface wlan-gw redundancy monitor

Description This command specifies an IPv4 route (prefix/length) per subscriber-interface to be monitored in the FDB to determine liveness of the subscriber-interface (and consequently all associated group-interfaces of type **wlangw**) on a peer WLAN-GW. This route is the one that is advertised in routing by the peer WLAN-GW when the subscriber-interface and WLAN-GW group are operationally up.

Parameters *ip-prefix/length* — Specifies the IP prefix and length.

Values ip-prefix:a.b.c.d
ip-prefix-length: 0 to 32

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

monitor

Syntax **monitor** *ip-prefix/length*
no monitor

Context **[Tree]** (config>service>vprn>nat>outside>pool>redundancy monitor)
[Tree] (config>router>nat>outside>pool>redundancy monitor)

Full Context configure router nat outside pool redundancy monitor
configure service vprn nat outside pool redundancy monitor

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the monitoring route based on which the NAT multi-chassis switchover is triggered. Monitoring route of a NAT pool on the local node must match the export route of a corresponding NAT pool on the peering node. Presence of the monitoring route in the routing table is an indication that the peering NAT pool is active (since it is advertising its export route). The disappearance of the monitoring route from the routing table is an indication that the peering pool has failed and consequently the nodal switchover is triggered, the local pool becomes active and its export route is consequently advertised. The export route can be advertised only from:

- The active lead pool.
- Active pool for which fate-sharing is disabled.

Default no monitor

Parameters *ip-prefix/length* — Specifies the IP prefix and length.

Syntax:

ip-prefix/length:	ip-prefix	a.b.c.d
	ip-prefix-length	0 to 32

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

monitor

Syntax [**no**] **monitor**

Context **[Tree]** (config>router>bgp monitor)
[Tree] (config>router>bgp>group monitor)
[Tree] (config>router>bgp>group>neighbor monitor)
[Tree] (config>service>vprn>bgp>group monitor)
[Tree] (config>service>vprn>bgp>group>neighbor monitor)

Full Context configure router bgp group monitor
configure router bgp group neighbor monitor
configure router bgp monitor
configure service vprn bgp group monitor
configure service vprn bgp group neighbor monitor

Description Commands in this context configure monitor parameters.

The **no** form of this command disables BGP BMP monitoring.

Use subject to Terms available at: www.nokia.com

17.319 monitor-agg-egress-queue-stats

monitor-agg-egress-queue-stats

Syntax [**no**] **monitor-agg-egress-queue-stats**

Context **[Tree]** (config>port monitor-agg-egress-queue-stats)

Full Context configure port monitor-agg-egress-queue-stats

Description This command enables the monitoring of aggregate egress queue statistics on the port. All queues on the port are monitored, including SAP egress, network egress, subscriber egress, and egress queue group queues, as well as system queues that can be used, for example, to send port-related protocol packets (LACP, EFM, and so on). The aggregate in-profile, out-of-profile, and total statistics are provided for both forwarded and dropped packets and octets.

Monitoring of aggregate statistics is supported on **PXC** sub-ports but not on a **PXC** physical port. It is also not supported on satellite ports.

The **no** form of this command disables aggregate egress queue statistics monitoring on the specified port.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.320 monitor-bandwidth

monitor-bandwidth

Syntax [**no**] **monitor-bandwidth**

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth monitor-bandwidth)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth monitor-bandwidth)

Full Context configure router mpls lsp auto-bandwidth monitor-bandwidth
configure router mpls lsp-template auto-bandwidth monitor-bandwidth

Description This command enables the collection and display of auto-bandwidth measurements, but prevents any automatic bandwidth adjustments from taking place.

The **no** form of this command disables the collection and display of auto-bandwidth measurements.

17.321 monitor-oper-group

monitor-oper-group

Syntax **monitor-oper-group** *name* **priority-step** *step*
no monitor-oper-group

Context **[Tree]** (config>service>ies>sub-if>grp-if>srrp monitor-oper-group)
[Tree] (config>service>vprn>sub-if>grp-if>srrp monitor-oper-group)

Full Context configure service ies subscriber-interface group-interface srrp monitor-oper-group
configure service vprn subscriber-interface group-interface srrp monitor-oper-group

Description This command will configure the association between the SRRP instance in a Fate Sharing Group and the operational-group that contains messaging SAPs. A state transition of a messaging SAP within an operational-group will trigger calculation of the priority for all SRRP instances that are associated with that operational-group.

The **no** form of this command reverts to the default.

Parameters *name* — Specifies the name of the operational-group, up to 32 characters, that is tracking operational state of SRRP messaging SAPs

priority-step — Specifies the priority step for which the priority of an SRRP instance is changed. If a messaging SAP within an operational-group transition to a non-UP state, the priority is decreased by the step value. If the messaging SAP within the operational-group transition into the UP state, the priority of the SRRP instance is increased by the step value.

Values 1 to 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group

Syntax **monitor-oper-group** *name*
no monitor-oper-group

Context **[Tree]** (config>lag monitor-oper-group)

Full Context configure lag monitor-oper-group

Description This command, supported on access LAG only, specifies the operational group to monitor. The state of the operational group affects the state of this LAG. When the operational group is inactive, the state of the LAG goes down and the LAG uses the configured **lag**>**standby-signaling** mechanism (**lacp** or **power-off**) to signal the CE that the LAG is not available.

Default no monitor-oper-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *name* — Specifies the name of the **oper-group**, up to 32 characters.

Platforms All

monitor-oper-group

Syntax **monitor-oper-group** *name*
no monitor-oper-group

Context **[Tree]** (config>service>vpls>site monitor-oper-group)
[Tree] (config>service>vpls>spoke-sdp monitor-oper-group)
[Tree] (config>service>vpls>sap monitor-oper-group)
[Tree] (config>service>vpls>bgp>pw-template-binding monitor-oper-group)

Full Context configure service vpls bgp pw-template-binding monitor-oper-group
configure service vpls sap monitor-oper-group
configure service vpls site monitor-oper-group
configure service vpls spoke-sdp monitor-oper-group

Description This command specifies the operational group to be monitored by the object under which it is configured. The **oper-group** *name* must be already configured under the **config>service** context before its name is referenced in this command.

The **no** form of this command removes the association.

Default no monitor-oper-group

Parameters *group-name* — Specifies a character string of maximum 32 ASCII characters identifying the group instance.

Platforms All

monitor-oper-group

Syntax **monitor-oper-group** *group-name*
no monitor-oper-group

Context **[Tree]** (config>service>epipe>spoke-sdp monitor-oper-group)
[Tree] (config>service>epipe>sap monitor-oper-group)

Full Context configure service epipe sap monitor-oper-group
configure service epipe spoke-sdp monitor-oper-group

Description This command specifies the operational group to be monitored by the object under which it is configured. The **oper-group** *name* must be already configured under the **config>service** context before its name is referenced in this command.

The **no** form of this command removes the association.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *group-name* — Specifies an oper group name.

Platforms All

monitor-oper-group

Syntax **monitor-oper-group** *group-name*
no monitor-oper-group

Context **[Tree]** (config>service>epipe>pw-port monitor-oper-group)

Full Context configure service epipe pw-port monitor-oper-group

Description This command configures the monitoring operational group name, up to 32 characters in length, associated with this PW-port entry.

Parameters *group-name* — Specifies an operational group to monitor.

Platforms All

monitor-oper-group

Syntax **monitor-oper-group** *name*
no monitor-oper-group

Context **[Tree]** (config>service>ies>if monitor-oper-group)

Full Context configure service ies interface monitor-oper-group

Description This command specifies the operational group to be monitored by the object under which it is configured. The oper-group name must be already configured under the config>service context before its name is referenced in this command.

The **no** form of this command removes the association from the configuration.

Default no monitor-oper-group

Parameters *name* — Specifies a character string of maximum 32 ASCII characters identifying the group instance.

Platforms All

monitor-oper-group

no monitor-oper-group [**family** {**ipv4** | **ipv6**}]

Context **[Tree]** (config>service>vprn>pim>if monitor-oper-group)

Full Context configure service vprn pim interface monitor-oper-group

Description This command configures PIM to monitor the state of an operational group to provide a redundancy mechanism. PIM monitors the operational group and changes its DR priority to the specified value when the status of the operational group is up. This enables the router to become the PIM DR only when the operational group is up. If the operational group status changes to down, PIM changes its DR priority to the default or the value configured with **priority** under **config**>**service**>**vprn**>**pim**>**if**. The **oper-group** *group-name* must already be configured under the **config**>**service** context before its name is referenced in this command. Two operational groups are supported per PIM interface.

The **no** form of this command removes the operational group from the configuration.

Parameters *group-name* — Specifies the operational group identifier up to 32 characters in length.

family — Specifies the address family.

ipv4 — Specifies the IPv4 designated router priority.

ipv6 — Specifies the IPv6 designated router priority.

add — Specifies that the value is to be added to the existing priority to become the designated router.

subtract — Specifies that the value is to be subtracted from the existing priority to become the designated router.

set — Specifies the priority to become the designated router.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

value — Specifies the priority modifier expressed as a decimal integer.

Values 1 to 4294967295

no monitor-oper-group *name*

Context **[Tree]** (config>isa>nat-group>inter-chassis-redundancy monitor-oper-group)

Full Context configure isa nat-group inter-chassis-redundancy monitor-oper-group

Description This command enables monitoring of the objects, such as SAPs, BFD sessions, or VRRP sessions for the purpose of adjusting the overall health of the node in a redundant inter-chassis NAT system. A state change of the objects in the oper-group influences the health of a NAT node in a redundant configuration.

The **no** form of this command reverts to the default.

Default no monitor-oper-group

Parameters *name* — Specifies the name of the operational group that is being monitored, up to 32 characters.

drop — A state change of an object in the oper-group influences the overall health of the system in the context of NAT inter-chassis redundancy. For example, a transition into a non-operational (down) state of an object within the monitored oper-group triggers a decrease of the overall health of the node for the amount specified by the health-drop value.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group

no monitor-oper-group *name*

Context **[Tree]** (config>service>ies>subscriber-mgmt>up-resiliency monitor-oper-group)
[Tree] (config>service>vprn>subscriber-mgmt>up-resiliency monitor-oper-group)

Full Context configure service ies subscriber-mgmt up-resiliency monitor-oper-group
configure service vprn subscriber-mgmt up-resiliency monitor-oper-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines parameters to derive the service health based on monitored operational groups. The BNG UPF sends the health value to the BNG CPF. The BNG CPF uses the value to determine the need for a BNG UPF status change (active or standby).

The **no** form of the command removes the configuration.

Parameters *name* — Specifies the operational group name, up to 32 characters.

drop — Specifies how the failure of an operational group member affects the health value. The base health value is 255; the value decreases with the defined *drop* per member failure to a minimum of 0.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group

Syntax **monitor-oper-group** *name* **health-drop** *drop*
no monitor-oper-group *name*

Context **[Tree]** (config>service>vpls>sap>pfcp>up-resiliency monitor-oper-group)

Full Context configure service vpls sap pfcp up-resiliency monitor-oper-group

Description This command defines parameters to derive the service health based on monitored operational groups. The BNG UPF sends the health value to the BNG CPF. The BNG CPF uses the value to determine the need for a BNG UPF status change (active or standby).

If the configured groups are not the same for all capture SAPs sharing the same underlying port or LAG, the configuration of a Layer 2 access ID alias is required, or else the system chooses arbitrarily one set of configured groups.

The **no** form of the command removes the configuration.

Parameters *name* — Specifies the operational group name, up to 32 characters.

drop — Specifies how the failure of an operational group member affects the health value. The base health value is 255; the value decreases with the defined *drop* per member failure to a minimum of 0.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

no monitor-oper-group [**family** {**ipv4** | **ipv6**}]

Context [Tree] (config>router>pim>if monitor-oper-group)

Full Context configure router pim interface monitor-oper-group

Description This command configures PIM to monitor the state of an operational group to provide a redundancy mechanism. PIM monitors the operational group and changes its DR priority to the specified value when the status of the operational group is up. This enables the router to become the PIM DR only when the operational group is up. If the operational group status changes to down, PIM changes its DR priority to the default or the value configured with **priority** under **config**>**router**>**pim**>**if**. The **oper-group** *group-name* must already be configured under the **config**>**service** context before its name is referenced in this command. Two operational groups are supported per PIM interface.

The **no** form of this command removes the operational group from the configuration.

Parameters *group-name* — Specifies the operational group identifier, up to 32 characters.

family — Specifies the address family.

ipv4 — Specifies the IPv4 designated router priority.

ipv6 — Specifies the IPv6 designated router priority.

add — Specifies that the value is to be added to the existing priority to become the designated router.

subtract — Specifies that the value is to be subtracted from the existing priority to become the designated router.

set — Specifies the priority to become the designated router.

value — Specifies the priority modifier expressed as a decimal integer.

monitor-oper-group

Syntax **monitor-oper-group** *group name*
no monitor-oper-group

Context [Tree] (config>service>sdp>binding>pw-port monitor-oper-group)

Full Context configure service sdp binding pw-port monitor-oper-group

Description This command specifies the operational group to be monitored by the object under which it is configured. The oper-group name must be already configured under the config>service context before its name is referenced in this command.

The **no** form of the command removes the association from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no monitor-oper-group

Parameters *name* — Specifies a character string of maximum 32 ASCII characters identifying the group instance.

Platforms All

17.322 monitor-port

monitor-port

Syntax **monitor-port** *port-id* **health-drop** *drop*
no monitor-port *port-id*

Context **[Tree]** (config>isa>nat-group>inter-chassis-redundancy monitor-port)

Full Context configure isa nat-group inter-chassis-redundancy monitor-port

Description This command enables monitoring of the ports to adjust the overall health of the node in a redundant inter-chassis NAT system. A state change of a monitored port influences the health of a NAT node in a redundant configuration.

The **no** form of this command reverts to the default.

Default no monitor-port

Parameters *port-id* — Specifies the port being monitored.

Values slot/mda/port

drop — A state change of an object in the oper-group influences the overall health of the system in the context of NAT inter-chassis redundancy. For example, a transition into a non-operational (down) state of an object within the monitored oper-group triggers a decrease of the overall health of the node for the amount specified by the health-drop value.

Values 1 to 255

17.323 monitor-ptsf-unusable

monitor-ptsf-unusable

Syntax **monitor-ptsf-unusable**

Context **[Tree]** (config>system>ptp>ptsf monitor-ptsf-unusable)

Full Context configure system ptp ptsf monitor-ptsf-unusable

Description Commands in this context configure the monitoring of neighbor clocks for the Packet Timing Signal Fail (PTSF) unusable state (condition) when the profile is set to g8275dot1-2014.

When enabled, the local clock monitors the noise level of PTP event messages exchanged between external neighbor PTP ports and the local clock. If there is too much noise and the expectation is these event message would not allow the clock to meet its output performance requirements, that neighbor port is considered unusable. This relates to declaring the PTSF-unusable state as defined in the profile.

Once a neighbor port is declared unusable, its Announce messages are excluded from the BMCA and the port cannot be selected as the parent clock.

The unusable condition can be cleared using the following command:

clear system ptp port *port-id* **neighbor** *mac-address* **ptsf-unusable**

When disabled, PTP clears the PTSF-unusable state from all neighbor PTP ports.

Deleting or disabling the local PTP port clears the PTSF-unusable state from all neighbor PTP ports that are accessed through the local PTP port.

Disabling the **monitor-ptsf-unusable** function of the PTP clock clears the PTSF-unusable state from all neighbor PTP ports.

In addition, if no PTP messages have been received from a neighbor for 15 minutes, the neighbor information is purged, which also clears the PTSF-unusable state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn interface sap egress queue-override queue monitor-queue-depth

Description
This command configures queue depth monitoring for the specified queue.

The **no** form of this command disables queue depth monitoring for the specified queue.

Parameters
fast-polling — Keyword used to specify that fast queue polling is enabled. Fast queue polling is only supported on FP3- and FP4-based hardware.

percentage — Specifies a percentage, up to two decimal places, of the queue MBS. When the depth of the queue exceeds this percentage, a violation is registered.

Values 00.01 to 99.99

17.325 monitor-threshold

monitor-threshold

Syntax **monitor-threshold** *percent*
no monitor-threshold

Context **[Tree]** (config>qos>port-scheduler-policy monitor-threshold)
[Tree] (config>qos>port-scheduler-policy>group monitor-threshold)

Full Context configure qos port-scheduler-policy group monitor-threshold
configure qos port-scheduler-policy monitor-threshold

Description This command defines the congestion monitoring threshold for the desired monitoring entity under the port-scheduler for per aggregate port-scheduler rate, per individual level, and per group that is aggregating multiple levels.

The congestion threshold is specified in percentages of the configured PIR rate for the entity for which congestion monitoring is desired. For example, if the configured PIR rate for level 1 is 100,000 kb/s, and the monitoring threshold is set to 90%, then an event where the offered rate is >90,000 kb/s will be recorded. This event is shown as part of the cumulative count of congestion threshold exceeds since the last clearing of the counters.

The **no** form of this command removes the congestion monitoring threshold.

Default no monitor-threshold

Parameters *percent* — Specifies the percent of the configured rate. If the offered rate exceeds the configured threshold, a counter monitoring the threshold will be increased.

Values 0 to 100

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

monitor-threshold

Syntax **monitor-threshold** *percent*
no monitor-threshold

Context **[Tree]** (config>qos>hw-agg-shap-sched-plcy monitor-threshold)

Full Context configure qos hw-agg-shaper-scheduler-policy monitor-threshold

Description This command configures the egress scheduler monitor threshold for the hardware aggregate shaper scheduler policy. The value is expressed as a percentage of the scheduler rate, which is considered as a limit for determining congestion.

The **no** form of this command removes the congestion monitoring threshold.

Default no monitor-threshold

Parameters *percent* — Specifies the percent of the configured rate.

Values 0 to 100

Platforms 7750 SR-1, 7750 SR-s

17.326 month

month

Syntax **month** {*month-number* [*..month-number*] | *month-name* [*..month-name*] | **all**}
no month

Context **[Tree]** (config>system>cron>sched month)

Full Context configure system cron schedule month

Description This command specifies the month when the event should be executed. Multiple months can be specified. When multiple months are configured, each of them will cause the schedule to trigger. If a month is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

The **no** form of this command removes the specified month from the configuration.

Default no month

Parameters **month-number** — Specifies a month number.

Values 1 to 12 (maximum 12 month-numbers)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

month-name — Specifies a month by name.

Values january, february, march, april, may, june, july, august, september, october, november, december (maximum 12 month names)

all — Specifies all months.

17.328 more-fragments

more-fragments

Syntax **more-fragments** *more-fragments*
no more-fragments

Context **[Tree]** (config>test-oam>build-packet>header>ipv4 more-fragments)
[Tree] (debug>oam>build-packet>packet>field-override>header>ipv4 more-fragments)

Full Context configure test-oam build-packet header ipv4 more-fragments
debug oam build-packet packet field-override header ipv4 more-fragments

Description This command defines if the MF flag should be set in the associated IPv4 header.

The **no** form of this command reverts to the default value.

Default more-fragments 0

Parameters *more-fragments* — Specifies an MF flag for an IPv4 packet header to be launched by the OAM **find-egress** tool. A value of 1 means there are more fragments to be sent.

Values 0, 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.329 motd

motd

Syntax **motd** {**url** *url-prefix*: *source-url* | **text** *motd-text-string*}
no motd

Context **[Tree]** (config>system>login-control motd)

Full Context configure system login-control motd

Description This command creates the message of the day displayed after a successful console login. Only one message can be configured.

The **no** form of this command removes the message.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no motd

Parameters **url** *url-prefix*: *source-url* — When the message of the day is present as a text file, provide both url-prefix and the source-url of the file containing the message of the day. The URL prefix can be local or remote.

text *motd-text-string* — Specifies the text of the message of the day. The *motd-text-string* must be enclosed in double quotes. Multiple text strings are not appended to one another.

Some special characters can be used to format the message text. The \n character can be used to create multi-line messages. A \n in the message moves to the beginning of the next line by sending ASCII/UTF-8 chars 0xA (LF) and 0xD (CR) to the client terminal. An \r in the message sends the ASCII/UTF-8 char 0xD (CR) to the client terminal.

Platforms All

17.330 move

move

Syntax **move** *old-file-url new-file-url* [**force**] [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

Context **[Tree]** (file move)

Full Context file move

Description This command moves a local file, system file, or a directory. If the target already exists, the command fails and an error message displays.

The following prompt appears if the destination file already exists:

“Overwrite destination file (y/n)?”

Parameters *old-file-url* — Specifies the file or directory to be moved.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

new-file-url — Specifies the new destination to place the old-file-url.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp://}*login*:*pswd*@*remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

force — Forces an immediate move of the specified file(s).

The **file move force** command moves the specified file(s) without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile — Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**>**client-tls-profile** to use.

proxy-url — Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect — Specifies to automatically refuse any HTTP redirects without prompting the user.

17.331 move-frequency

move-frequency

Syntax **move-frequency** *frequency*
no move-frequency

Context **[Tree]** (config>service>vpls>mac-move move-frequency)
[Tree] (config>service>template>vpls-template>mac-move move-frequency)

Full Context configure service template vpls-template mac-move move-frequency
configure service vpls mac-move move-frequency

Description This command indicates the maximum rate at which MACs can be re-learned in the VPLS service, before the SAP where the moving MAC was last seen is automatically disabled in order to protect the system against undetected loops or duplicate MACs.

The **no** form of this command reverts to the default value.

Default move-frequency 2 (when mac-move is enabled). For example, 10 relearns in a 5 second period.

Parameters *frequency* — Specifies the rate, in 5-second intervals for the maximum number of relearns

Values 1 to 10

Platforms All

17.332 mp-bgp-keep

mp-bgp-keep

Syntax [**no**] **mp-bgp-keep**

Context **[Tree]** (config>router>bgp mp-bgp-keep)

Full Context configure router bgp mp-bgp-keep

Description As a result of enabling this command, route refresh messages are no longer needed, or issued when VPN route policy changes are made; RIB-IN will retain all MP-BGP routes.

The **no** form of this command is used to disable this feature.

Default no mp-bgp-keep

Platforms All

17.333 mp-mbb-time

mp-mbb-time

Syntax **mp-mbb-time** *interval*
no interval

Context **[Tree]** (config>router>ldp mp-mbb-time)

Full Context configure router ldp mp-mbb-time

Description This command configures the maximum time a P2MP transit/bud node must wait before switching over to the new path if the new node does not send MBB TLV to inform of the availability of data plane.

The **no** form of this command reverts to the default value.

Default no mp-mbb-time (which equals a value of 3 seconds)

Parameters *interval* — Specifies the MP MBB time, in seconds.

Values 1 to 10

Platforms All

17.334 mpls

mpls

Syntax **mpls** [**bgp** *bgp*] [**endpoint** *endpoint-name*]
no mpls [**bgp** *bgp*]

Context **[Tree]** (config>service>epipe>bgp-evpn mpls)
[Tree] (config>service>vpls>bgp-evpn mpls)
[Tree] (config>service>vprn>bgp-evpn mpls)

Full Context configure service epipe bgp-evpn mpls
configure service vpls bgp-evpn mpls
configure service vprn bgp-evpn mpls

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure the BGP EVPN MPLS parameters. In VPLS, either instance BGP 1 or BGP 2 can be configured, but not both simultaneously in the same service. Epipe and VPRN services only support instance 1. If the **bgp** *bgp* parameter is not specified, the instance is set to 1.

The **endpoint** option is only supported for Epipe services. When configured, the same endpoint name can be configured for the **bgp-evpn>mpls** context and an additional spoke SDP. An EVPN MPLS destination always has higher preference than a spoke SDP.

The **no** form of this command removes the MPLS instance from the service.

Parameters *bgp* — Indicates the BGP instance identifier.

Values 1, 2

endpoint-name — Specifies the endpoint name for Epipe services, up to 32 characters.

Platforms All

mpls

Syntax **mpls**

Context **[Tree]** (config>service>vprn>bgp-ipvpn mpls)

Full Context configure service vprn bgp-ipvpn mpls

Description Commands in this context configure the BGP IPVPN parameters.

Platforms All

mpls

Syntax [**no**] **mpls**

Context **[Tree]** (config>router mpls)

Full Context configure router mpls

Description Commands in this context configure MPLS parameters. MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The **no** form of this command deletes this MPLS protocol instance and removes all configuration parameters for this MPLS instance.

You must remove all SDP bindings and use the **shutdown** command to administratively disable the MPLS instance before deleting it.

Platforms All

17.335 mpls-dm

mpls-dm

Syntax **mpls-dm**

Context **[Tree]** (config>test-oam mpls-dm)

Full Context configure test-oam mpls-dm

Description Commands in this context configure global MPLS delay measurement parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.336 mpls-echo-request-downstream-map

mpls-echo-request-downstream-map

Syntax **mpls-echo-request-downstream-map** {**dsmap** | **ddmap**}

Context **[Tree]** (config>test-oam mpls-echo-request-downstream-map)

Full Context configure test-oam mpls-echo-request-downstream-map

Description This command specifies which format of the downstream mapping TLV to use in all LSP trace packets and LDP tree trace packets originated on this node. The Downstream Mapping (DSMAP) TLV is the original format in RFC 4379 (obsoleted by RFC 8029) and is the default value. The new Downstream Detailed Mapping (DDMAP) TLV is the new enhanced format specified in RFC 6424 and RFC 8029.

This command applies to LSP trace of an RSVP P2P LSP, a MPLS-TP LSP, or LDP unicast FEC, and to LDP tree trace of a unicast LDP FEC. It does not apply to LSP trace of an RSVP P2MP LSP which always uses the DDMAP TLV.

The global DSMAP/DDMAP setting impacts the behavior of both OAM LSP trace packets and SAA test packets of type **lsp-trace** and is used by the sender node when one of the following events occurs:

1. An SAA test of type **lsp-trace** is created (not modified) and no value is specified for the per-test **downstream-map-tlv** {**dsmap** | **ddmap** | **none**} option. In this case, the SAA test **downstream-map-tlv** value defaults to the global **mpls-echo-request-downstream-map** value.

2. An OAM test of type **lsp-trace** test is executed and no value is specified for the per-test **downstream-map-tlv** {**dsmap** | **ddmap** | **none**} option. In this case, the OAM test **downstream-map-tlv** value defaults to the global **mpls-echo-request-downstream-map** value.

A consequence of the rules above is that a change to the value of **mpls-echo-request-downstream-map** option does not affect the value inserted in the downstream mapping TLV of existing tests.

Following are the details of the processing of the new DDMAP TLV:

1. When either the DSMAP TLV or the DDMAP TLV is received in an echo request message, the responder node includes the same type of TLV in the echo reply message with the proper downstream interface information and label stack information.
2. If an echo request message without a Downstream Mapping TLV (DSMAP or DDMAP) expires at a node which is not the egress for the target FEC stack, the responder node always includes the DSMAP TLV in the echo reply message. This can occur in the following cases:
   a. The user issues a LSP trace from a sender node with a **min-ttl** value higher than 1 and a **max-ttl** value lower than the number of hops to reach the egress of the target FEC stack. This is the sender node behavior when the global configuration or the per-test setting of the DSMAP/DDMAP is set to DSMAP.
   b. The user issues a LSP ping from a sender node with a **ttl** value lower than the number of hops to reach the egress of the target FEC stack. This is the sender node behavior when the global configuration of the DSMAP/DDMAP is set to DSMAP.
   c. The behavior in (a) is changed when the global configuration or the per-test setting of the Downstream Mapping TLV is set to DDMAP. The sender node includes in this case the DDMAP TLV with the Downstream IP address field set to the all-routers multicast address as per Section 3.4 of RFC 8029. The responder node then bypasses the interface and label stack validation and replies with a DDMAP TLV with the correct downstream information for the target FEC stack.
3. A sender node never includes the DSMAP or DDMAP TLV in an lsp-ping message.

In addition to performing the same features as the DSMAP TLV, the new DDMAP TLV addresses the following scenarios:

1. Full validation of an LDP FEC stitched to a BGP IPv4 label route. In this case, the LSP trace message is inserted from the LDP LSP segment or from the stitching point.
2. Full validation of a BGP IPv4 label route stitched to an LDP FEC. This includes the case of explicit configuration of the LDP-BGP stitching in which the BGP label route is active in Route Table Manager (RTM) and the case of a BGP IPv4 label route resolved to the LDP FEC due to the IGP route of the same prefix active in RTM. In this case, the LSP trace message is inserted from the BGP LSP segment or from the stitching point.
3. Full validation of an LDP FEC which is stitched to a BGP LSP and stitched back into an LDP FEC. In this case, the LSP trace message is inserted from the LDP segments or the or from the stitching points.
4. Full validation of an LDP FEC tunneled over an RSVP LSP using LSP trace.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To properly check a target FEC which is stitched to another FEC (stitching FEC) of the same or a different type, or which is tunneled over another FEC (tunneling FEC), it is necessary for the responding nodes to provide details about the FEC manipulation back to the sender node. This is achieved via the use of the new FEC stack change sub-TLV in the Downstream Detailed Mapping TLV (DDMAP) defined in RFC 6424.

When the user configures the use of the DDMAP TLV on a trace for an LSP that does not undergo stitching or tunneling operation in the network, the procedures at the sender and responder nodes are the same as in the case of the DSMAP TLV.

This feature however introduces changes to the target FEC stack validation procedures at the sender and responder nodes in the case of LSP stitching and LSP hierarchy. These changes pertain to the processing of the new FEC stack change sub-TLV in the new DDMAP TLV and the new return code of value `15 Label switched with FEC change`.

The **no** form of this command reverts to the default behavior of using the DSMAP TLV in a LSP trace packet and LDP tree trace packet.

Default mpls-echo-request-downstream-map dsmap

Parameters **dsmap** — Specifies that the DSMAP TLV should be used in all LSP trace packets and LDP tree trace packets originating on the node.

ddmap — Specifies that the DDMAP TLV should be used in all LSP trace packets and LDP tree trace packets originating on the node.

Output The following output is an example of mpls-echo-request-downstream-map information.

Sample Output for LDP-over-RSVP

17.340 mpls-time-stamp-format

mpls-time-stamp-format

Syntax **mpls-time-stamp-format** {**rfc4379** | **unix**}

Context **[Tree]** (config>test-oam mpls-time-stamp-format)

Full Context configure test-oam mpls-time-stamp-format

Description This command configures the format of the timestamp used by for lsp-ping, lsp-trace, p2mp-lsp-ping and p2mp-lsp-trace, vccv-ping, vccv-trace, and lsp-trace.

If **rfc4379** is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Changing this system-wide setting does not affect tests that are currently in progress, but SAAs starts to use the new timestamp when they are restarted. When an SR OS receives an echo request, it replies with the locally configured timestamp format, and does not try to match the timestamp format of the incoming echo request message.

Default mpls-time-stamp-format unix

Parameters **rfc4379** — Specifies the RFC 4379 (obsoleted by RFC 8029) time stamp format. The timestamp's **seconds** field holds the integral number of seconds since 1-Jan-1900 00:00:00 UTC. The timestamp's **microseconds** field contains a microseconds value in the range 0 to 999999. This setting is used to inter-operate with network elements which are fully compliant with RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*, (such as an SR OS system with the same setting, or any other RFC 4379 compliant router).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

unix — Specifies the Unix time stamp format. The time stamps **seconds** field holds a Unix time, the integral number of seconds since 1-Jan-1970 00:00:00 UTC. The time stamps **microseconds** field contains a microseconds value in the range 0 to 999999. This setting is used to inter-operate with network elements which send and expect a 1970-based timestamp in MPLS Echo Request/Reply PDUs (such as an SR OS system with the same setting, or an SR OS system running software earlier than R8.0 R4).

Platforms All

17.341 mpls-tp

mpls-tp

Syntax [**no**] **mpls-tp**

Context **[Tree]** (config>router>mpls mpls-tp)

Full Context configure router mpls mpls-tp

Description Generic MPLS-TP parameters and MPLS-TP transit paths are configured under this context. If a user configures **no mpls**, normally the entire mpls configuration is deleted. However, in the case of mpls-tp, a check is made that there is no other mpls-tp configuration (e.g., services or LSPs using mpls-tp on the node). The mpls-tp context cannot be deleted if MPLS-TP LSPs or SDPs exist on the system.

A **shutdown** of mpls-tp will bring down all MPLS-TP LSPs on the system.

Default no mpls-tp

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.342 mpls-tp-mep

mpls-tp-mep

Syntax [**no**] **mpls-tp-mep**

Context **[Tree]** (config>router>mpls>interface mpls-tp-mep)

Full Context configure router mpls interface mpls-tp-mep

Description Commands in this context configure a section layer MEP for MPLS-TP on an MPLS interface.

17.345 mrinfo

mrinfo

Syntax **mrinfo** {*ip-address* | *dns-name*} [**router** *router-instance* | **service-name** *service-name*]

Context **[Tree]** (global mrinfo)

Full Context global mrinfo

Description This command is used to print relevant multicast information from the target multicast router. Information displayed includes adjacency information, protocol, metrics, thresholds, and flags from the target multicast route.

Parameters *ip-address* — Specifies the IP address of the multicast-capable target router.

Values ipv4 unicast address (a.b.c.d)

dns-name — Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

router-instance — Specifies the router name or service ID for the router instance.

Values *router-name*: Base
vprn-service-id: 1 to 2147483647

Default Base

service-name — Specifies the service name, up to 64 characters.

Output The following output displays mrinfo information. The output fields are described in the following table.

Output Sample

```
A:dut-f# mrinfo 10.1.1.2

10.1.1.2  [version 3.0,prune,genid,mtrace]:
  10.1.1.2 -> 10.1.1.1 [1/0/pim]
  10.1.1.3 -> 0.0.0.0 [1/0/pim/down/disabled]
  10.1.1.4 -> 0.0.0.0 [1/0/pim/querier/leaf]
  239.200.200.3 -> 239.200.200.5 [1/0/tunnel/pim]...
```

Table 97 **Mrinfo Output Fields**

Label	Description
General flags	
version	Indicates software version on queried router
prune	Indicates that router understands pruning

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 97 **Mrinfo Output Fields**

Label	Description
genid	Indicates that router sends generation IDs
mtrace	Indicates that the router handles mtrace requests
Neighbors flags	
1	Metric
0	Threshold (multicast time-to-live)
pim	PIM enabled on interface
down	Operational status of interface
disabled	Administrative status of interface
leaf	No downstream neighbors on interface
querier	Interface is IGMP querier
tunnel	Neighbor reached via tunnel

17.346 mrouter-dest

mrouter-dest

Syntax [**no**] **mrouter-dest** *mac-name*

Context **[Tree]** (config>service>vpls>pbb>bvpls>igmp-snooping mrouter-dest)
[Tree] (config>service>vpls>pbb>bvpls>mld-snooping mrouter-dest)

Full Context configure service vpls pbb backbone-vpls igmp-snooping mrouter-dest
configure service vpls pbb backbone-vpls mld-snooping mrouter-dest

Description This command configures the destination B-MAC address name to be used in the related backbone VPLS to reach a specific IGMP or MLD snooping MRouter. The name is associated at system level with the MAC address, using the command **config>service>pbb mac-name**.

Parameters *mac-name* — Specifies the MAC name.

Values 32 chars max

17.347 mrouter-port

mrouter-port

Syntax [**no**] **mrouter-port**

Context **[Tree]** (config>service>vpls>bind>igmp-snooping mrouter-port)
[Tree] (config>service>vpls>bind>mld-snooping mrouter-port)
[Tree] (config>service>vpls>mesh-sdp>igmp-snooping mrouter-port)
[Tree] (config>service>vpls>sap>igmp-snooping mrouter-port)
[Tree] (config>service>vpls>spoke-sdp>igmp-snooping mrouter-port)
[Tree] (config>service>vpls>spoke-sdp>mld-snooping mrouter-port)

Full Context configure service vpls allow-ip-int-bind igmp-snooping mrouter-port
configure service vpls allow-ip-int-bind mld-snooping mrouter-port
configure service vpls mesh-sdp igmp-snooping mrouter-port
configure service vpls sap igmp-snooping mrouter-port
configure service vpls spoke-sdp igmp-snooping mrouter-port
configure service vpls spoke-sdp mld-snooping mrouter-port

Description This command specifies whether a multicast router is attached behind this SAP, SDP, or routed VPLS IP interface.

Configuring these objects as an mrouter-port will have a double effect. Firstly, all multicast traffic received on another SAP, SDP, or routed VPLS IP interface will be copied to this SAP, SDP, or routed VPLS IP interface. Secondly, IGMP/MLD reports generated by the system as a result of a router joining or leaving a multicast group, will be sent to this SAP, SDP, or routed VPLS IP interface.

If two multicast routers exist in the network, one of them will become the active querier. While the other multicast router (non-querier) stops sending IGMP queries, it should still receive reports to keep its multicast trees up-to-date. To support this, the mrouter-port should be enabled on all SAPs, SDPs, or routed VPLS IP interfaces connecting to a multicast router.

Note: The IGMP version to be used for the reports (v1, v2, or v3) can only be determined after an initial query has been received. Until such time, no reports are sent on the SAP, spoke-SDP, or routed VPLS IP interface, even if **mrouter-port** is enabled.

If the **send-queries** command is enabled on this SAP or spoke-SDP, the **mrouter-port** parameter cannot be set.

When PIM-snooping is enabled within a VPLS service, all IP multicast traffic and PIM messages will be sent to any SAP or SDP binding configured with an IGMP-snooping mrouter port. This occurs even without IGMP-snooping enabled, but is not supported in a BGP-VPLS or M-VPLS service.

The **no** form of this command reverts to the default.

mrouter-port

Syntax [**no**] **mrouter-port**

Context **[Tree]** (config>service>vpls>vxlan>igmp-snooping mrouter-port)

Full Context configure service vpls vxlan igmp-snooping mrouter-port

Description This command enables all VXLAN binds to be mrouter ports, indicating that a multicast router is attached behind each VXLAN binding. Configuring these objects as an **mrouter-port** has two effects. Firstly, all multicast traffic received on another object is copied to each VXLAN binding. Secondly, IGMP reports generated by the system as a result of a router joining or leaving a multicast group is sent to all VXLAN bindings. When PIM snooping for IPv4 is enabled within a VPLS service, all IP multicast traffic and PIM for IPv4 messages are sent to all VXLAN bindings configured with an **igmp-snooping mrouter-port**. This occurs even without **igmp-snooping** enabled.

configure service vpls pbb backbone-vpls sdp igmp-snooping mrouter-port
configure service vpls pbb backbone-vpls sdp mld-snooping mrouter-port

Description This command specifies whether a multicast router is attached behind this SAP or spoke-SDP.

Configuring a SAP or spoke-SDP as an mrouter-port will have a double effect. Firstly, all multicast traffic received on another SAP or spoke-SDP will be copied to this SAP or spoke-SDP. Secondly, IGMP or MLD reports generated by the system as a result of someone joining or leaving a multicast group, will be sent to this SAP or SDP.

If two multicast routers exist in the local area network, one of them will become the active querier. The other multicast router (non-querier) stops sending IGMP or MLD queries, but it should still receive reports to keep its multicast trees up to date. To support this, the mrouter-port should be enabled on all SAPs or spoke-SDPs connecting to a multicast router.

The IGMP version to be used for the reports (v1, v2 or v3) or MLD version (v1 or v2) can only be determined after an initial query has been received. Until such time no reports are sent on the SAP, even if mrouter-port is enabled.

If the **send-queries** command is enabled on this SAP or spoke-SDP, the **mrouter-port** parameter cannot be set.

Context **[Tree]** (config>service>mrp mrp-policy)

Full Context configure service mrp mrp-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure an MRP policy. The mrp-policy specifies either a forward or a drop action for the Group B-MAC attributes associated with the ISIDs specified in the match criteria. The mrp-policy can be applied to multiple BVPLS services as long as the scope of the policy is template.

Any changes made to the existing policy, using any of the sub-commands, will be applied immediately to all services where this policy is applied. For this reason, when many changes are required on a mrp-policy, Nokia recommends that the policy be copied to a work area. That work-in-progress policy can be modified until complete and then written over the original mrp-policy. Use the **config mrp-policy copy** command to maintain policies in this manner.

The **no** form of this command deletes the mrp-policy. An MRP policy cannot be deleted until it is removed from all the SAPs or SDPs where it is applied.

Default no mrp-policy

Parameters *policy-name* — Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

create — This keyword is required when first creating the configuration context. When the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms All

Full Context configure service vpls mesh-sdp mrp mrp-policy
configure service vpls sap mrp mrp-policy
configure service vpls spoke-sdp mrp mrp-policy

Description This command instructs MMRP to use the mrp-policy specified in the command to control which Group B-MAC attributes will be declared and registered on the egress SAP/Mesh-SDP/Spoke-SDP. The Group B-MACs will be derived from the ISIDs using the procedure used in the PBB solution. The Group MAC is standard OUI with the last 24 bits being the ISID value. If the policy-name refers to a non-existing mrp-policy the command should return error. Changes to a mrp-policy are allowed and applied to the SAP/SDPs under which the policy is referenced.

Default no mrp-policy

no mss-adjust-group

Context **[Tree]** (config>router mss-adjust-group)
[Tree] (config>service>vprn mss-adjust-group)

Full Context configure router mss-adjust-group
configure service vprn mss-adjust-group

Description This command associates the MSS adjust group consisting of multiple ISAs with the routing context in which the application requiring TCP MSS adjust resides.

Parameters *bb-group-id* — Specifies the group used for TCP MSS adjust

segment-size — Specifies the value to put into the TCP Maximum Segment Size (MSS) option if it is not already present, or if the present value is higher

Values 160 to 10240

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.362 mst-instance

mst-instance

Syntax **mst-instance** *mst-inst-number*

Context **[Tree]** (config>service>vpls>sap>stp mst-instance)

Full Context configure service vpls sap stp mst-instance

Description Commands in this context configure MSTI related parameters at SAP level. This context can be open only for existing mst-instances defined at the service level (see **config**>**service**>**vpls**>**stp mst-instance**).

Parameters *mst-inst-number* — Specifies an existing Multiple Spanning Tree Instance number

Values 1 to 4094

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mst-instance

Syntax **mst-instance** *mst-inst-number* [**create**]
no mst-instance [*mst-inst-number*]

Context **[Tree]** (config>service>vpls>stp mst-instance)

Full Context configure service vpls stp mst-instance

Description This command creates the context to configure MST instance (MSTI) related parameters. Up to 16 instances will be supported by MSTP. The instance 0 is mandatory by protocol and therefore, it cannot be created by the CLI. The software will maintain this instance automatically.

Parameters *mst-inst-number* — Specifies the Multiple Spanning Tree instance

Values 1 to 4094

Platforms All

17.363 mst-max-hops

mst-max-hops

Syntax **mst-max-hops** *hops-count*
no mst-max-hops

Context **[Tree]** (config>service>vpls>stp mst-max-hops)

Full Context configure service vpls stp mst-max-hops

Description This command specifies the number of hops in the region before BPDU is discarded and the information held for the port is aged out. The root bridge of the instance sends a BPDU (or M-record) with remaining-hop-count set to configured <*max-hops*>. When a bridge receives the BPDU (or M-record), it decrements the received remaining-hop-count by 1 and propagates it in BPDU (or M-record) it generates.

The **no** form of this command sets the *hops-count* to its default value.

Default mst-max-hops 20

Parameters *hops-count* — Specifies the maximum number of hops

Values 1 to 40

Platforms All

17.364 mst-name

mst-name

Syntax **mst-name** *region-name*
no mst-name

Context **[Tree]** (config>service>vpls>stp mst-name)

Full Context configure service vpls stp mst-name

Description This command defines an MST region name. Two bridges are considered as a part of the same MST region as soon as their configuration of the MST region name, the MST-revision and VLAN-to-instance assignment is identical.

The **no** form of this command removes *region-name* from the configuration.

Default no mst-name

Parameters *region-name* — Specifies an MST-region name up to 32 characters in length

Platforms All

17.365 mst-path-cost

mst-path-cost

Syntax **mst-path-cost** *inst-path-cost*
no mst-path-cost

Context **[Tree]** (config>service>vpls>sap>stp>mst-instance mst-path-cost)

Full Context configure service vpls sap stp mst-instance mst-path-cost

Description This commands specifies path-cost within a specified instance, expressing probability that a specified port will be put into the forwarding state in case a loop occurs (the highest value expresses lowest priority).

The **no** form of this command sets port-priority to its default value.

Default The path-cost is proportional to link speed.

Parameters *inst-path-cost* — Specifies the contribution of this port to the MSTI path cost of paths toward the spanning tree regional root which include this port

Values 1 to 200000000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

17.366 mst-port-priority

mst-port-priority

Syntax **mst-port-priority** *stp-priority*
no mst-port-priority

Context **[Tree]** (config>service>vpls>sap>stp>mst-instance mst-port-priority)

Full Context configure service vpls sap stp mst-instance mst-port-priority

Description This commands specifies the port priority within a specified instance, expressing probability that a specified port will be put into the forwarding state if a loop occurs.

The **no** form of this command sets port-priority to its default value.

Default mst-port-priority 128

Parameters *stp-priority* — Specifies the value of the port priority field.

Platforms All

17.367 mst-priority

mst-priority

Syntax **mst-priority** *bridge-priority*
no mst-priority

Context **[Tree]** (config>service>vpls>stp>mst-instance mst-priority)

Full Context configure service vpls stp mst-instance mst-priority

Description This command specifies the bridge priority for this specific Multiple Spanning Tree Instance for this service. The *bridge-priority* value reflects likelihood that the switch will be chosen as the regional root switch (65535 represents the least likely). It is used as the highest 4 bits of the Bridge ID included in the MSTP BPDUs generated by this bridge.

The priority can only take on values that are multiples of 4096 (4k). If a value is specified that is not a multiple of 4K, then the value will be replaced by the closest multiple of 4K, which is lower than the value entered.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command sets the bridge-priority to its default value.

Default mst-priority 32768 — All instances created by the **config>service>vpls>stp>mst-instance vlan-range** command and not having explicit definition of bridge-priority will inherit default value

Parameters *bridge-priority* — Specifies the priority of this specific Multiple Spanning Tree Instance for this service

Values 0 to 65535

Platforms All

17.368 mst-revision

mst-revision

Syntax **mst-revision** *revision-number*
no mst-revision

Context **[Tree]** (config>service>vpls>stp mst-revision)

Full Context configure service vpls stp mst-revision

Description This command defines the MST configuration revision number. Two bridges are considered as a part of the same MST region as soon as their configuration of MST-region name, MST-revision and VLAN-to-instance assignment is identical.

The **no** form of this command returns MST configuration revision to its default value.

Default mst-revision 0

Parameters *revision-number* — Specifies the MSTP region revision number to define the MSTP region

Values 0 to 65535

Platforms All

17.369 mstat

mstat

Syntax **mstat source** [*ip-address* | *dns-name*] **group** {*ip-address* | *dns-name*} [**destination**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-address | *dns-name*] [**hop** *hop*] [**router** *router-instance* | **service-name** *service-name*] [**wait-time** *wait-time*]

Context [Tree] (global mstat)

Full Context global mstat

Description This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information.

Parameters **source** *ip-address* — Specifies the ip-address of the multicast capable target router.

Values ipv4 address (a.b.c.d)

dns-name — Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

group *ip-address* — Specifies the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This will suffice if packet loss statistics for a particular multicast group are not needed.

destination *ip-address* — Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is also returned to the address specified as the receiver.

hop — Specifies the maximum number of hops that will be traced from the receiver back toward the source.

Values 1 to 255

Default 32 hops (infinity for the DVMRP routing protocol)

router-instance — Specifies the router name or service ID used to identify the router instance.

Values

router-name:	Base
service-id:	1 to 2147483647

Default Base

service-name — Specifies the service name up to 64 characters in length.

wait-time — Specifies the number of seconds to wait for the response.

Values 1 to 60

Output The following output is an example of mstat information. The output fields are described in the following table.

Table 98 **Mstat Output Fields**

Label	Description
hop	The number of hops from the source to the listed router
router name	The number of the router for this hop or “?” when not reverse DNS translated
address	The address of the router for this hop
protocol	The protocol used
ttl	The forward TTL threshold. TTL that a packet is required to have before it is forwarded over the outgoing interface.
forwarding code	Forwarding information/error code for this hop

For each interface between two nodes a line is printed, following the same layout as other routers with an implementation derived from mrouted. Consider the following:

- The forwarding information/error code is only displayed when different from “No Error”.
- “?” means there is no reverse DNS translation.
- There is no “Overall Mcast Pkt Rate” available in the PE for the VPRN case.

17.370 mstat2

mstat2

Syntax **mstat2 source** [*ip-address* | *dns-name* | *starg*] **group** {*ip-address* | *dns-name*} [**destination** *ip-address* | *dns-name*] [**hop** *hop*] [**router** *router-instance* | **service-name** *vprn-service-name*] [**wait-time** *seconds*]

Context **[Tree]** (global mstat2)

Full Context global mstat2

Description This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information.

Parameters **source** *ip-address* — Specifies the ip-address of the multicast capable target router.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

dns-name — Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

starg — Specifies a static (*,G) entry. This command can only be enabled if no existing source addresses for this source is specified.

group *ip-address* — Specifies the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This will suffice if packet loss statistics for a particular multicast group are not needed.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

destination *ip-address* — Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is also returned to the address specified as the receiver.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

hop — Specifies the maximum number of hops that are traced from the receiver back toward the source.

Values 1 to 255

Default 32

router-instance — Specifies the router name or service ID used to identify the router instance.

Values

router-name:	Base
service-id:	1 to 2147483647

Default Base

vprn-service-name — Specifies the service name, up to 64 characters.

seconds — Specifies the number of seconds to wait for the response.

Values 1 to 60

Default 3

Output

Table 99 **Mstat2 Output Fields**

Label	Description
hop	Number of hops from the source to the listed router.

17.372 mtrace

mtrace

Syntax **mtrace source** [*ip-address* | *dns-name*] **group** {*ip-address* | *dns-name*} [**destination** *ip-address* | *dns-name*] [**hop** *hop*] [**router** *router-instance* | **service-name** *service-name*] [**wait-time** *wait-time*]

Context **[Tree]** (global mtrace)

Full Context global mtrace

Description This command traces a multicast path from a source to a receiver.

Parameters **source** *ip-address* — Specifies the ip-address of the multicast capable target router.

Values ipv4 address (a.b.c.d)

dns-name — Specifies the DNS name (if DNS name resolution is configured). 63 characters maximum.

group *ip-address* — Specifies the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) will be used. This will suffice if packet loss statistics for a particular multicast group are not needed.

destination *ip-address* — Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response will also be returned to the address specified as the receiver.

hop — Specifies the maximum number of hops that will be traced from the receiver back toward the source.

Values 1 to 255

Default 32 hops (infinity for the DVMRP routing protocol)

router-instance — Specifies the router name or service ID used the identify the router instance.

Values

router-name:	“Base”
service-id:	1 to 2147483647

Default Base

service-name — Specifies the service name up, to 64 characters.

Context **[Tree]** (global mtrace2)

Full Context global mtrace2

Description This command traces a multicast path from a source to a receiver.

Parameters **source** *ip-address* — Specifies the IP address of the multicast capable target router.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

dns-name — Specifies the DNS name (if DNS name resolution is configured), up to 63 characters.

starg — Specifies a static (*,G) entry. This command can only be enabled if no existing source addresses for this source is specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

group *ip-address* — Specifies the multicast address or DNS name of the group that resolves to the multicast group address that is used. If the group is not specified, address 224.2.0.1 (the MBone audio) is used. This suffices if packet loss statistics for a particular multicast group are not needed.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

destination *ip-address* — Specifies either the IP address or the DNS name of the unicast destination. If this parameter is omitted, the IP address of the system where the command is entered is used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response is returned to the address specified as the receiver.

Values ipv4-prefix:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

hop-count — Specifies the maximum number of hops that are traced from the receiver back toward the source.

Values 1 to 255

Default 32 hops (infinity for the DVMRP routing protocol)

router-instance — Specifies the router name or service ID used the identify the router instance.

Values

router-name:	“Base”
service-id:	1 to 2147483647

Default Base

service-name — Specifies the service name, up to 64 characters.

wait-time — Specifies the number of seconds to wait for the response.

Values 1 to 60

configure service vprn subscriber-interface group-interface ipv6 mtu
configure service vprn subscriber-interface group-interface ipv6 router-advertisements mtu
configure service vprn subscriber-interface ipv6 router-advertisements mtu
configure subscriber-mgmt router-advertisement-policy mtu

Description This command specifies the value to be placed in link MTU options sent by the router on this interface.

The **no** form of this command reverts to the default.

Default no mtu — The MTU option is not sent in the router advertisement messages.

Parameters *bytes* — Specifies the advertised MTU value in bytes for this interface.

Values 1280 to 9800 (for **config**>**router**>**router-advert**>**if** and **config**>**service**>**vprn**>**router-advert**>**if** contexts only)
1280 to 9212 (for subscriber management context, ies and vprn service subscriber-interface contexts)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt router-advertisement-policy mtu
- configure service ies subscriber-interface ipv6 router-advertisements mtu
- configure service vprn subscriber-interface ipv6 router-advertisements mtu
- configure service vprn subscriber-interface group-interface ipv6 router-advertisements mtu

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines which Maximum Transmission Unit (MTU) is applied, by default, for packets egressing the PPP link. If a lower MRU is sent during PPP link establishment, the MRU value is used.

The **no** form of this command reverts to the default.

Default mtu 1492

Parameters *mtu-bytes* — Specifies the MTU value in octets.

Values 512 to 9154

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mtu

Syntax **mtu** *mtu-bytes*
no mtu

Context **[Tree]** (config>port>ethernet mtu)
[Tree] (config>port>sonet-sdh>path mtu)
[Tree] (config>port>tdm>ds1>channel-group mtu)
[Tree] (config>port>tdm>ds3 mtu)
[Tree] (config>port>tdm>e1>channel-group mtu)
[Tree] (config>port>tdm>e3 mtu)

Full Context configure port ethernet mtu
configure port sonet-sdh path mtu
configure port tdm ds1 channel-group mtu
configure port tdm ds3 mtu
configure port tdm e1 channel-group mtu
configure port tdm e3 mtu

Description This command configures the maximum payload MTU size for an Ethernet port, PPP-enabled port or sub-port and Frame Relay-enabled port or subport. The Ethernet port level MTU parameter indirectly defines the largest physical packet the port can transmit or the far-end Ethernet port can receive. Packets that cannot be fragmented at egress and exceed the MTU are discarded.

The value specified for the MTU includes the destination MAC address, source MAC address, the Ethertype or Length field and the complete Ethernet payload. The MTU value does not include the preamble, start of frame delimiter or the trailing CRC.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

PoS channels use the MTU to define the largest PPP payload a PoS frame may contain. A significant difference between SONET/SDH PoS channel and Ethernet physical MTU values the overhead considered part of the framing method and the overhead considered to be part of the application using the frame. In Ethernet, the preamble, start of frame delimiter and the CRC are considered part of the framing overhead and not part of the frame payload. For a PoS channel, the HDLC framing overhead is not included in the physical MTU; only the PPP and PPP payload are included. If the port mode or encapsulation type is changed, the MTU assumes the default values of the new mode or encapsulation type.

The **no** form of this command restores the default values.

Default The default MTU value depends on the (sub-)port type, mode and encapsulation and are listed in Table 102:

Table 102 **Default MTU Values**

Type	Mode	Encap Type	Default (Bytes)
10/100, Gig, or 10GigE	Access	null	1514
10/100, Gig, or 10GigE	Access	dot1q	1518
10/100, Gig, or 10GigE	Access	q-in-q	1522
SONET/SDH or TDM	Access	mpls	1506
SONET/SDH or TDM	Access	bcp-null	1518
SONET/SDH or TDM	Access	bcp-dot1q	1522
SONET/SDH or TDM	Access	ipcp	1502
SONET/SDH or TDM	Access	frame-relay	1578
ATM, SONET/SDH or TDM	Access	atm	1524
10/100 or 100FX Ethernet	Network	null	1514
10/100 or 100FX Ethernet	Network	dot1q	1518
SONET/SDH	Network	ppp-auto	1524

Parameters *mtu-bytes* — Sets the maximum allowable size of the MTU, expressed as an integer.

Values

512 to 9212	config>port>ethernet
512 to 9800	config>port>ethernet (for FP4-based connector ports)
512 to 9208	config>port>sonet-sdh>path
512 to 9208	config>port>tdm>ds1>channel-group
512 to 9208	config>port>tdm>ds3

mtu

Syntax **mtu** *mtu-bytes*
no mtu

Context **[Tree]** (config>service>vprn>ospf>area>if mtu)
[Tree] (config>service>vprn>ospf3>area>if mtu)

Full Context configure service vprn ospf area interface mtu
configure service vprn ospf3 area interface mtu

Description This command configures the OSPF packet size used on this interface. If this parameter is not configured, OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

config>port>ethernet, **config>port>sonet-sdh>path**, **config>port>tdm>t3-e3**, **config>port>tdm>t1-e1>channel-group**

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned contexts is used.

To determine the actual packet size, add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

The **no** form of this command reverts to default value derived from the MTU configured in the **config>port** context.

Default no mtu

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mtu-bytes* — Specifies the MTU to be used by OSPF for this logical interface, in bytes.

Values 512 to 9786

Platforms All

mtu

Syntax **mtu** *value*
no mtu

Context **[Tree]** (config>service>vprn>nat>outside mtu)

Full Context configure service vprn nat outside mtu

Description This command configures the Maximum Transmission Unit (MTU) for downstream traffic flowing through this router (as outside NAT router). The system fragments IP datagrams exceeding the MTU.

The **no** form of the command reverts to the default.

Default no mtu

Parameters *value* — Specifies the MTU for downstream traffic.

Values 512 to 9000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu

Syntax **mtu** *mtu-size*
no mtu

Context **[Tree]** (config>router>nat>outside mtu)

Full Context configure router nat outside mtu

Description This command configures the MTU for downstream traffic flowing through this router (as outside NAT router). The system fragments IP datagrams exceeding the MTU.

Default no mtu

Parameters *mtu-size* — Specifies the MTU for downstream traffic.

Values 512 to 9000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mtu

Syntax **mtu** *mtu*
no mtu

Context **[Tree]** (config>service>ipfix>export-policy>collector mtu)

Full Context configure service ipfix ipfix-export-policy collector mtu

Description This command sets the MTU size of the UDP packet containing IPFIX records destined for the collector node. Multiple records will be stuffed into a single IP packet until stuffing an additional data record would exceed MTU or the internal timer of 250 ms expires.

Default mtu 1500

Parameters *mtu* — Specifies the Maximum Transmission Unit range.

Values 512 to 9212

Platforms All

mtu

Syntax **mtu** *mtu-size*

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy mtu)

Full Context configure service nat syslog syslog-export-policy mtu

Description The command defines the MTU, the maximum size of the IP frame that can be transmitted. The size of the frame includes the syslog message and the IP header. This is an IP-MTU value.

When aggregation is enabled (the **max-tx-delay** command), generation of a syslog frame carrying multiple flow logs is triggered by one of the two events (whichever occurs first):

- Expiry of the max-tx-delay timer
- Exceeding MTU size

Default mtu 1500

Parameters *mtu-size* — Specifies the MTU size in bytes.

Values 512 to 9000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu

Syntax **mtu** *mtu-size*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no mtu

Context [Tree] (config>service>nat>map-domain mtu)

Full Context configure service nat map-domain mtu

Description This command configures the IPv6 MTU in a MAP domain. The configured MTU applies to traffic in the downstream direction, towards the CE. The configured MTU value must be lower than the MTU of the outgoing port for the traffic, which includes L2 overhead.

Default mtu 8686

Parameters *mtu-size* — Specifies the IPMTU size of the translated IPv6 packet.

Values 160 to 8686

Platforms VSR

mtu

Syntax **mtu** *bytes*
no mtu

Context [Tree] (config>router>ospf>area>interface mtu)
[Tree] (config>router>ospf3>area>interface mtu)

Full Context configure router ospf area interface mtu
configure router ospf3 area interface mtu

Description This command configures the OSPF packet size used on this interface. If this parameter is not configured OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

- **config>port>ethernet**
- **config>port>sonet-sdh>path**
- **config>port>tdm>t3-e3**
- **config>port>tdm>t1-e1>channel-group**

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned context is used.

To determine the actual packet size, add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

The **no** form of this command reverts to the default derived from the MTU configured in the **config>port** context.

Default no mtu

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *bytes* — Specifies the MTU to be used by OSPF for this logical interface in bytes.

Values 512 to 9786 in the **config**>**router**>**ospf**>**area**>**interface** context.
1280 to 9786 in the **config**>**router**>**ospf3**>**area**>**interface** context.

Platforms All

mtu

Syntax **mtu** *mtu-size*
no mtu

Context **[Tree]** (config>fwd-path-ext>fpe>srv6>interface-b mtu)

Full Context configure fwd-path-ext fpe srv6 interface-b mtu

Description This command configures the Maximum Transfer Unit (MTU) of interface-b of the SRv6 originating FPE.

The MTU is used to check if an IPv4 service packet should be fragmented and if an IPv6 service packet should be dropped when tunneled over SRv6.

The minimum value is the IPv6 minimum MTU value. The maximum value is set to the FP4 maximum Ethernet port MTU of 9800 minus 14 bytes for Null Ethernet encapsulation.

The **no** form of this command reverts to the default value.

Default mtu 9786

Parameters *mtu-size* — Specifies the MTU size, in bytes.

Values 1280 to 9786

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

17.375 mtu-over-head

mtu-over-head

Syntax **mtu-over-head** *mtu-value*
no mtu-over-head

Context **[Tree]** (config>service>vprn>pim mtu-over-head)

Full Context configure service vprn pim mtu-over-head

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This commands subtracts the specified value from the MVPN MTU to allow a BIER header to be added without exceeding the network MTU.

Default no mtu-over-head

Parameters *mtu-value* — Specifies the value subtracted from the MVPN MTU.

Values 44, 76, 140, 268, 536

Platforms All

17.376 multi-access

multi-access

Syntax [**no**] **multi-access**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>access multi-access)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>vrgw>lanext>access multi-access)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext access multi-access
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range vrgw lanext access multi-access

Description This command enables access from multiple APs into a per-tenant BD and the associated vRGW (BRG) instance.

The **no** form of this command disables access from multiple APs and limits access from a single AP into per tenant bridge domain (BD) and the associated vRGW (BRG) instance.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.377 multi-active

multi-active

Syntax [**no**] **multi-active**

Context **[Tree]** (config>isa>tunnel-grp multi-active)

Full Context configure isa tunnel-group multi-active

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables configuring multiple active MS-ISA in the tunnel-group. IPsec traffic will be load balanced to configured active MS-ISAs.

Operational notes:

- A shutdown of group and removal of all existing configured tunnels of the tunnel-group are needed before provisioning command “multi-active”.
- If the tunnel-group is admin-up with “multi-active” configured then the configuration of “primary” and “backup” are not allowed.
- The active-mda-number must be =< total number of ISA configured.
  - If active-mda-number is less than total number of ISA configured then the delta number of ISA will become backup ISA.

Default no multi-active

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

17.378 multi-chassis

multi-chassis

Syntax **multi-chassis**

Context **[Tree]** (config>redundancy multi-chassis)

Full Context configure redundancy multi-chassis

Description Commands in this context configure multi-chassis parameters.

Platforms All

multi-chassis-redundancy

Syntax **multi-chassis-redundancy** *seconds*
no multi-chassis-redundancy

Context **[Tree]** (config>python>py-pol>cache>minimum-lifetimes multi-chassis-redundancy)

Full Context configure python python-policy cache minimum-lifetimes multi-chassis-redundancy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the minimum lifetime for a cache entry to be synchronized with the MCS peer.

The **no** form of this command reverts to the default.

Parameters *seconds* — Specifies the multi-chassis redundancy time in second.

Values 1 to 600

Platforms All

17.380 multi-chassis-shunt-id

multi-chassis-shunt-id

Syntax **multi-chassis-shunt-id** *id*
no multi-chassis-shunt-id

Context **[Tree]** (config>service>ies>subscriber-mgmt multi-chassis-shunt-id)
[Tree] (config>service>vprn>subscriber-mgmt multi-chassis-shunt-id)

Full Context configure service ies subscriber-mgmt multi-chassis-shunt-id
configure service vprn subscriber-mgmt multi-chassis-shunt-id

Description This command configures the shunt ID that is used to shunt downstream traffic from a standby node to an active node. Because this ID identifies the traffic service on the standby node, the same ID must be configured per service on each node.This configuration is required for BNG CUPS inter-UPF resiliency shunting, not for non-BNG CUPS shunting. However, when configured, it is also used for shunting non-BNG CUPS sessions in the same service.

The **no** form of the command removes the configuration.

Parameters *id* — Specifies the shunt ID.

Values 1 to 8191

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.381 multi-homed-prefix

multi-homed-prefix

Syntax [**no**] **multi-homed-prefix**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>ospf>lfa multi-homed-prefix)

Full Context configure router ospf loopfree-alternates multi-homed-prefix

Description This command enables multi-homed prefix LFA for both OSPF routes (IP FRR) and SR-OSPF node SID tunnels.

This feature makes use of the multi-homed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multi-homed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes.

The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to **all**. The user must enable the **ip-fast-reroute** leaf to have these backup paths programmed into the FIB in data path.

The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as the computing node S and which are advertised by multiple routers (anycast prefix) in both algorithm 0 and flexible-algorithm numbers.

The **no** form of this command disables multi-homed prefix LFA.

Default no multi-homed-prefix

Platforms All

17.382 multi-homing

multi-homing

Syntax **multi-homing single-active** [**no-esi-label**]
multi-homing all-active
no multi-homing

Context [Tree] (config>service>system>bgp-evpn>eth-seg multi-homing)

Full Context configure service system bgp-evpn ethernet-segment multi-homing

Description This command configures the multi-homing mode for the Ethernet-Segment as **single-active** or all-active multi-homing, as defined in RFC7432.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, the use of **esi-label** is enabled for **all-active** and **single-active** as defined in RFC7432 (for **single-active multi-homing,** the esi-label is used to avoid transient loops).

When **single-active no-esi-label** is specified, the system will not allocate a label for the esi and hence advertise esi label 0 to peers. Even if the esi is configured to not send the esi-label, upon reception of an esi-label from a peer, the PE will always send traffic to that peer using the received esi-label.

Default no multi-homing

Parameters **single-active** — Configures single-active mode for the Ethernet-Segment.

all-active — Configures the system to not send an esi-label for **single-active** mode.

no-esi-label — Configures single-active mode for the Ethernet-Segment.

Platforms All

17.383 multi-instance

multi-instance

Syntax [**no**] **multi-instance**

Context **[Tree]** (config>router>ospf multi-instance)

Full Context configure router ospf multi-instance

Description This command enables OSPF multi-instance RFC 6549, *OSPFv2 Multi-Instance Extensions,* support in the BASE router. This support is enabled per instance and allows flexibility when migrating a particular instance from classic OSPFv2 to a multi-instance OSPFv2.

The **no** form of the command reverts to the default.

Default no multi-instance

Platforms All

Use subject to Terms available at: www.nokia.com

Context [Tree] (config>fwd-path-ext>fpe multi-path-list)

Full Context configure fwd-path-ext fpe multi-path-list

Description This command enables the context to configure a multipath FPE list instance, which can contain multiple PXC ports or LAGs of PXC ports.

Platforms All

17.386 multi-service-site

multi-service-site

Syntax [**no**] **multi-service-site** *customer-site-name*

Context [Tree] (config>service>ies>if>sap multi-service-site)
[Tree] (config>service>ies>sub-if>grp-if>sap multi-service-site)
[Tree] (config>service>vprn>sub-if>grp-if>sap multi-service-site)

Full Context configure service ies interface sap multi-service-site
configure service ies subscriber-interface group-interface sap multi-service-site
configure service vprn subscriber-interface group-interface sap multi-service-site

Description This command creates a new customer site or edits an existing customer site with the *customer-site-name* parameter. A customer site is an anchor point to create an ingress and egress virtual scheduler hierarchy. When a site is created, it must be assigned to a chassis slot or port. When scheduler policies are defined for ingress and egress, the scheduler names contained in each policy are created according to the parameters defined in the policy. Multi-service customer sites exist for the sole purpose of creating a virtual scheduler hierarchy and making it available to queues on multiple Service Access Points (SAPs).

The scheduler policy association with the customer site normally prevents the scheduler policy from being deleted until after the scheduler policy is removed from the customer site. The multi-service-site object generates a log message indicating that the association was deleted due to scheduler policy removal.

When the multi-service customer site is created, an ingress and egress scheduler policy association does not exist. This does not prevent the site from being assigned to a chassis slot or prevent service SAP assignment. After the site has been created, the ingress and egress scheduler policy associations can be assigned or removed at any time.

The **no** form of this command removes the value from the configuration.

Default n/a — Each customer site must be explicitly created.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *customer-site-name* — Each customer site must have a unique name within the context of the customer. If *customer-site-name* already exists for the customer ID, the CLI context changes to that site name for the purpose of editing the site scheduler policies or assignment. Any modifications made to an existing site affects all SAPs associated with the site. Changing a scheduler policy association may cause new schedulers to be created and existing policers and queues on the SAPs to no longer be orphaned. Existing schedulers on the site may cease to exist, causing policers and queues relying on that scheduler to be orphaned.

If the *customer-site-name* does not exist, it is assumed that an attempt is being made to create a site of that name in the customer ID context. The success of the command execution depends on the following:

The maximum number of customer sites defined for the chassis slot has not been met.

The *customer-site-name* is valid.

The **create** keyword is included in the command line syntax (if the system requires it).

When the maximum number of customer sites has been exceeded a configuration error occurs, the command will not execute and the CLI context will not change.

If the *customer-site-name* is invalid, a syntax error occurs, the command will not execute and the CLI context will not change.

Values Valid names consist of any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

configure service vprn interface sap multi-service-site

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command associates the SAP with a *customer-site-name*. If the specified *customer-site-name* does not exist in the context of the service customer ID an error occurs and the command is not executed. If *customer-site-name* exists, the current and future defined queues on the SAP (ingress and egress) attempts to use the scheduler hierarchies created within *customer-site-name* as parent schedulers.

This command is mutually exclusive with the SAP ingress and egress scheduler policy commands. If a scheduler policy has been applied to either the ingress or egress nodes on the SAP, the **multi-service-site** command fails without executing. The locally applied scheduler policies must be removed prior to executing the **multi-service-site** command.

The **no** form of this command removes the SAP from any multi-service customer site the SAP belongs to. Removing the site can cause existing or future policers and queues to enter an orphaned state.

Parameters *customer-site-name* — Specifies an existing customer site name, up to 32 characters. If the *customer-site-name* exists and local scheduler policies have not been applied to the SAP, the current and future policers queues defined on the SAP looks for their parent schedulers within the scheduler hierarchies defined in the customer-site-name.

Platforms All

multi-service-site

Syntax **multi-service-site** *customer-site-name*
no multi-service-site *customer-site-name*

Context **[Tree]** (config>service>vprn>if>sap multi-service-site)

Full Context configure service vprn interface sap multi-service-site

Description This command creates a new customer site or edits an existing customer site with the *customer-site-name* parameter. A customer site is an anchor point to create an ingress and egress virtual scheduler hierarchy. When a site is created, it must be assigned to a chassis slot or port on the 7750 SR. When scheduler policies are defined for ingress and egress, the scheduler names contained in each policy are created according to the parameters defined in the policy. Multi-service customer sites exist for the sole purpose of creating a virtual scheduler hierarchy and making it available to queues on multiple Service Access Points (SAPs).

The scheduler policy association with the customer site normally prevents the scheduler policy from being deleted until after the scheduler policy is removed from the customer site. The multi-service-site object will generate a log message indicating that the association was deleted due to scheduler policy removal.

When the multi-service customer site is created, an ingress and egress scheduler policy association does not exist. This does not prevent the site from being assigned to a chassis slot or prevent service SAP assignment. After the site has been created, the ingress and egress scheduler policy associations can be assigned or removed at any time.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *customer-site-name* — Each customer site must have a unique name within the context of the customer. If *customer-site-name* already exists for the customer ID, the CLI context changes to that site name for the purpose of editing the site scheduler policies or assignment. Any modifications made to an existing site will affect all SAPs associated with the site. Changing a scheduler policy association may cause new schedulers to be created and existing policers and queues on the SAPs to no longer be orphaned. Existing schedulers on the site may cease to exist, causing policers and queues relying on that scheduler to be orphaned.

If the *customer-site-name* does not exist, it is assumed that an attempt is being made to create a site of that name in the customer ID context. The success of the command execution depends on the following:

- The maximum number of customer sites defined for the chassis slot has not been met.
- The *customer-site-name* is valid.
- The **create** keyword is included in the command line syntax (if the system requires it).

When the maximum number of customer sites has been exceeded a configuration error occurs; the command will not execute and the CLI context will not change.

If the *customer-site-name* is invalid, a syntax error occurs; the command will not execute and the CLI context will not change.

Values Valid names consist of any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

Context **[Tree]** (config>mcast-management multicast-info-policy)

Full Context configure mcast-management multicast-info-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a multicast information policy. Multicast information policies are used to manage parameters associated with Layer 2 and Layer 3 multicast records. Multiple features use the configured information within the policy. The multicast ingress path manager uses the policy to decide the inactive and active state behavior for each multicast record using the ingress paths to the switch fabric. The system's multicast ECMP join decisions are influenced by the channel information contained within the policy.

Multicast Bundles:

A multicast information policy consists of one or multiple named bundles. Multicast streams are mapped to a bundle based on matching the destination address of the multicast stream to configured channel ranges defined within the bundles. Each policy has a bundle named 'default' that is used when a destination address does not fall within any of the configured channel ranges.

Each bundle has a set of default parameters used as the starting point for multicast channels matching the bundle. The default parameters may be overridden by optional exception parameters defined under each channel range. Further optional parameter overrides are possible under explicit source address contexts within each channel range.

Default Multicast Information Policy

A multicast information policy always exists with the name 'default' and cannot be edited or deleted. The following parameters are contained in the default multicast information policy:

Policy Description:	Default policy, cannot be edited or deleted.
Bundle:	default
Bundle Description:	Default Bundle, cannot be edited or deleted.
Congestion-Priority-Threshold:	4
ECMP-Optimization-Limit-Threshold:	7
Bundle Defaults:	
Administrative Bandwidth:	0 (undefined)
Preference:	0
CAC-Type:	Optional
Bandwidth Activity:	Dynamic with no black-hole rate
Explicit Ingress SF Path:	None (undefined)
Configured Channel Ranges:	None

The default multicast information policy is applied to all VPLS and VPRN services and all routing contexts until an explicitly defined multicast information policy has been mapped.

Explicit Multicast Information Policy Associations

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Each VPLS service and each routing context (including VPRN routing contexts) supports an explicit association with an pre-existing multicast information policy. The policy may need to be unique per service or routing context since that each context has its own multicast address space. The same multicast channels may be and most likely be used for completely different multicast streams and applications in each forwarding context.

Interaction with Ingress Multicast Path Management

When ingress multicast path management is enabled on an MDA, the system automatically creates a bandwidth manager context that manages the multicast path bandwidth into the switch fabric used by the ingress ports on the MDA. As routing or snooping protocols generate Layer 2 or Layer 3 multicast FIB records that are populated on the MDA's forwarding plane, they are processed though the multicast information policy that is associated with the service or routing context associated with the record. The policy returns the following information for the record to be used by the ingress bandwidth manager:

- The records administrative bandwidth (0 if undefined)
- Preference level (0 to 7 with 7 being highest)
- Bandwidth activity monitoring setting (use admin bw or dynamic monitoring) If admin bw is indicated, also returns active and inactive thresholds
- Initial switch fabric multicast path (primary or secondary)
- Explicit switch fabric multicast path (primary, secondary, or none)

Interaction with Multicast ECMP Optimization

The multicast information policy is used by the multicast ECMP optimization function to derive each channels administrative bandwidth. The ECMP function tallies all bandwidth information for channels joined and attempts to equalize the load between the various paths to the sender. The multicast information policy returns the following information to the ECMP path manager:

- Administrative bandwidth (0 if undefined)
- Preference (0 to 7 with 7 the highest preference value)

Default multicast-info-policy "default"

Parameters *policy-name* — Identifies the name of the policy to be either created or edited. Each multicast information policy must be uniquely named within the system. Names of up to 32 ASCII characters are supported with the normal character restrictions.

create — The create keyword is required if creating a new multicast information policy when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the multicast information policy name already exists.

Platforms All

multicast-info-policy

Syntax **multicast-info-policy** *policy-name*
no multicast-info-policy

Context **[Tree]** (config>service>ies multicast-info-policy)
[Tree] (config>service>vpls multicast-info-policy)
[Tree] (config>service>vprn multicast-info-policy)
[Tree] (config>router multicast-info-policy)

Full Context configure router multicast-info-policy
configure service ies multicast-info-policy
configure service vpls multicast-info-policy
configure service vprn multicast-info-policy

Description This command overrides the default multicast information policy on a service or routing context. When the policy association is changed, all multicast channels in the service or routing context must be reevaluated.

If a multicast information policy is not explicitly associated with the service or routing context, the default multicast information policy is used when ingress multicast path management is enabled.

While a multicast information policy is associated with a service or routing context, the policy cannot be deleted from the system.

The **no** form of the command removes an explicit multicast information policy from the service or routing context and restores the default multicast information policy.

Parameters *policy-name* — Specifies the policy name, up to 32 characters. The *policy-name* parameter is required and specifies an existing multicast information policy that should be associated with the service or routing context.

Platforms All

17.395 multicast-leave-sync-propagation

multicast-leave-sync-propagation

Syntax **multicast-leave-sync-propagation** *time*

Context **[Tree]** (config>service>system>bgp-evpn multicast-leave-sync-propagation)

Full Context configure service system bgp-evpn multicast-leave-sync-propagation

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the additional amount of time that the system waits before removing a multicast state that was synchronized in an Ethernet Segment via Multicast Join or Leave Synch routes. This value represents a delta corresponding to the time it takes for a BGP advertisement to propagate to ES peers.

The node triggering the route computes the maximum response time as the product of the locally configured values, Last Member Query Count and Last Member Query Interval (this value is taken from the **config**>**service**>**vpls**>**sap**>**igmp-snooping**>**last-member-query-interval** or **config**>**service**>**vpls**>**spoke-sdp**>**igmp-snooping**>**last-member-query-interval** commands depending on the Ethernet Segment being used), and adds the delta value to the Maximum Response Time. Increasing the Maximum Response Time by this value can help minimize the churn of removing and recreating the state on the node.

The maximum response time value should be configured consistently in all ES peers. For example, in a scenario where a maximum response time of five seconds is advertised by PE-A and there is a delay of four seconds in the BGP propagation to PE-B, the timer could already expire on PE-A while PE-B is still in LMQ time and can still receive joins (which would recreate state in A after a join synch route from B). To minimize this situation, adding an extra delta timer on PE-A, reduces the potential churn of PE-A removing and recreating the state.

Default multicast-leave-sync-propagation 5

Parameters *time* — Specifies the multicast leave sync propagation delay time, in seconds.

Values 0 to 300

Default 5

Platforms All

17.396 multicast-lsp

multicast-lsp

Syntax **multicast-lsp** *lsp-name*
no multicast-lsp

Context **[Tree]** (config>service>sdp>class-forwarding multicast-lsp)

Full Context configure service sdp class-forwarding multicast-lsp

Description This command specifies the RSVP or static LSP in this SDP to use to forward VPLS multicast and broadcast packets. The LSP name must exist and must have been associated with this SDP using the command **config**>**service**>**sdp**>**lsp**. In the absence of an explicit configuration by the user, the default LSP is used.

Default no multicast-lsp — traffic mapped to default-lsp *name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *lsp-name* — Specifies the RSVP or static LSP to use.

Platforms All

17.397 multicast-network-domain

multicast-network-domain

Syntax **multicast-network-domain** *multicast-network-domain*
no multicast-network-domain

Context **[Tree]** (config>service>ies>if multicast-network-domain)

Full Context configure service ies interface multicast-network-domain

Description This command is used to enable efficient multicast replication over a spoke SDP. Multicast traffic is copied to only a subset of network interfaces that may be used as egress for a spoke SDP. A network domain is defined by associating multiple interfaces to a logical group that may participate in multicast replication for a spoke SDP.

The **no** form of command disables efficient multicast replication to a network domain for a spoke SDP and traffic is replicated to all forwarding complexes.

Default no multicast-network-domain

Platforms All

17.398 multicast-policer

multicast-policer

Syntax **multicast-policer** *policer-id* [**fp-redirect-group**]
no multicast-policer

Context **[Tree]** (config>qos>sap-ingress>fc multicast-policer)

Full Context configure qos sap-ingress fc multicast-policer

Description Within a **sap-ingress** QoS policy forwarding class context, the **multicast-policer** command is used to map packets that match the forwarding class and are considered multicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

instance forwarding records. Two basic types of services support multicast packets: routed services (IES and VPRN) and L2 multipoint services (VPLS, I-VPLS, and B-VPLS). For the routed service types, a multicast packet is destined to an IPv4 or IPv6 multicast address. For the L2 multipoint services, a multicast packet is a packet destined to a multicast MAC address (multicast bit set in the destination MAC address but not the ff:ff:ff:ff:ff:ff broadcast address). The VPLS services also support two other multipoint forwarding types (broadcast and unknown), which are considered separate from the multicast forwarding type.

If ingress forwarding logic has resolved a packet to the multicast forwarding type within the forwarding class, it will be mapped to either an ingress multipoint queue (using the **multicast** *queue-id* or **multicast** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**multicast-policer** *policer-id*). The **multicast** and **multicast-policer** commands within the forwarding class context are mutually exclusive. By default, the multicast forwarding type is mapped to the SAP ingress default multipoint queue. If the **multicast-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the multicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **multicast-policer** command is ignored for instances of the policer applied to SAPs subscribers or multiservice site where broadcast packets are not supported.

When the multicast forwarding type within a forwarding class is mapped to a policer, the multicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the multicast forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs subscribers or multiservice site associated with the QoS policy, and the **no multicast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no multicast-policer** command will fail and the multicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no multicast-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters *policer-id* — When the forwarding class **multicast-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

fp-redirect-group — Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

17.399 multicast-queue

multicast-queue

Syntax **multicast-queue** *queue-id* [**group** *queue-group-name*]
no multicast-queue

Context **[Tree]** (config>qos>sap-ingress>fc multicast-queue)

Full Context configure qos sap-ingress fc multicast-queue

Description This command overrides the default multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic on a SAP using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Parameters *queue-id* — The *queue-id* parameter specified must be an existing, multipoint queue defined in the config>qos>sap-ingress context.

Values Any valid multipoint queue-ID in the policy including 2 through 32.

Default 11

group *queue-group-name* — This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

multicast-queue

Syntax **multicast-queue** *queue-id*
no multicast-queue

Context **[Tree]** (config>qos>network-queue>fc multicast-queue)

Full Context configure qos network-queue fc multicast-queue

Description This command overrides the default multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type, unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Resource Utilization

When a multipoint queue is created and at least one forwarding class is mapped to the queue using the **multipoint-queue** command, a single ingress multipoint hardware queue is created per instance of the applied network-queue policy, using the queue-policy command at the ingress network FP level. Multipoint queues are not created at egress and the multipoint queues defined in the network-queue policy are ignored when the policy is applied to an egress port.

Parameters *queue-id* — Specifies any valid multipoint queue-ID in the policy. The *queue-id* parameter specified must be an existing, multipoint queue defined in the **config>qos>network-queue>queue** context.

Values 1 to 16

Default 11

Platforms All

multicast-queue

Context **[Tree]** (config>qos>shared-queue>fc multicast-queue)

Full Context configure qos shared-queue fc multicast-queue

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the multicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all multicast traffic on a SAP using this policy is forwarded using the *queue-id*.

The multicast forwarding type includes the **unknown** unicast forwarding type and the **broadcast** forwarding type unless each is explicitly defined to a different multipoint queue. When the unknown and broadcast forwarding types are left as default, they will track the defined queue for the multicast forwarding type.

The **no** form of this command sets the multicast forwarding type *queue-id* back to the default queue for the forwarding class. If the **broadcast** and **unknown** forwarding types were not explicitly defined to a multipoint queue, they will also be set back to the default multipoint queue (queue 11).

Parameters *queue-id* — The *queue-id* parameter specified must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

17.400 multicast-redirection

multicast-redirection

Syntax **multicast-redirection** [**fwd-service** *service-id*] *ip-int-name*
no multicast-redirection

Context **[Tree]** (config>router>policy-options>policy-statement>entry>action multicast-redirection)

Full Context configure router policy-options policy-statement entry action multicast-redirection

Description This command configures the interface where to redirect IGMP multicast traffic to.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

multicast-redirection

Syntax **multicast-redirection** [**fwd-service** *service-id*] *ip-int-name*
no multicast-redirection

Context **[Tree]** (config>router>policy-options>policy-statement>default-action multicast-redirection)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router policy-options policy-statement default-action multicast-redirection

Description This command enables a redirection under a filtering policy. The filtering policy in this case becomes a redirection policy and it is defined under the **router>policy-option** hierarchy.

After the redirection policy is applied to the subscriber, all IGMP messages will be processed per subscriber host before they get redirected to the referenced interface (and possibly service). However, multicast traffic will not be replicated directly per subscriber host but instead it will be forwarded on the interface that is referenced in the redirection policy. The redirected interface must have IGMP enabled.

Currently all traffic is redirected and there is no ability to selectively redirect multicast traffic based on match conditions (such as, multicast-groups, source IP address of IGMP messages). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast redirection is not supported between the VPRN services and the Global Routing Context. Multicast redirection is supported in the wholesale/retail VPRN context.

Note: Redirecting from a VPRN instance to the GRT is not supported. Redirecting from a VPRN to a different VPRN is supported and redirecting from an IES to another IES is also supported.

Default no multicast-redirection

Parameters **fwd-service** *service-id* — Specifies the service to which traffic should be redirected. This option is applied only in the VPRN context. It is possible to redirect the multicast group into another service instance routing interface.

ip-int-name — specifies the alternate interface to which IGMP messages are redirected.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.401 multicast-senders

multicast-senders

Syntax **multicast-senders** {**auto** | **always** | **never**}
no multicast-senders

Context **[Tree]** (config>service>vprn>pim>if multicast-senders)

Full Context configure service vprn pim interface multicast-senders

Description This command configures the way subnet matching is done for incoming data packets on this interface. An IP multicast sender is an user entity to be authenticated in a receiving host.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **auto** — Subnet matching is automatically performed for incoming data packets on this interface.

always — Subnet matching is always performed for incoming data packets on this interface.

never — Subnet matching is never performed for incoming data packets on this interface.

Platforms All

multicast-senders

Syntax **multicast-senders** {**auto** | **always** | **never**}
no multicast-senders

Context **[Tree]** (config>router>pim>interface multicast-senders)

Full Context configure router pim interface multicast-senders

Description This command configures how traffic from directly-attached multicast sources should be treated on broadcast interfaces. It can also be used to treat all traffic received on an interface as traffic coming from a directly-attached multicast source. This is particularly useful if a multicast source is connected to a point-to-point or unnumbered interface.

The **no** form of this command reverts to the default value.

Default multicast-senders auto

Parameters **auto** — Specifies that, on broadcast interfaces, the forwarding plane performs subnet-match check on multicast packets received on the interface to determine if the packet is from a directly-attached source. On unnumbered/point-to-point interfaces, all traffic is implicitly treated as coming from a remote source.

always — Treats all traffic received on the interface as coming from a directly-attached multicast source.

never — Specifies that, on broadcast interfaces, traffic from directly-attached multicast sources will not be forwarded; however, traffic from a remote source will still be forwarded if there is a multicast state for it. On unnumbered/point-to-point interfaces, it means that all traffic received on that interface must not be forwarded.

Platforms All

17.402 multicast-service

multicast-service

Syntax **multicast-service** *service-id*
no multicast-service

Context **[Tree]** (config>service>ies>video-interface multicast-service)
[Tree] (config>service>vpls>video-interface multicast-service)
[Tree] (config>service>vprn>video-interface multicast-service)

Full Context configure service ies video-interface multicast-service
configure service vpls video-interface multicast-service
configure service vprn video-interface multicast-service

Description This command adds a multicast service association to the video interface. This parameter is not required on the video interface when the service carries both unicast and multicast traffic.

When multicast and unicast are carried in separate service instances, the operator can set this parameter on the unicast video interface to form an association with the multicast service when replies need to be sent in the multicast service instance.

When multicast and unicast are carried in separate services when a downstream device (such as a DSLAM) can perform a service cross connect between the services and performs multicast replication.

The **no** form of the command removes the multicast service association.

Default none

Parameters *service-id* — The service ID of the associated multicast service.

Values

service-id:	1 to 2147483647
svc-name:	64 characters maximum

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

17.403 multicast6-fast-failover

multicast6-fast-failover

Syntax [**no**] **multicast6-fast-failover**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>pim multicast6-fast-failover)

Full Context configure router pim multicast6-fast-failover

Description This command enables Multicast-Only Fast Reroute (MoFRR) functionality for IPv6 PIM-SSM interfaces in the global routing table instance.

The **no** form of this command disables MoFRR for IPv6 PIM-SSM interfaces.

Default no multicast6-fast-failover

Platforms All

17.404 multicastclient

multicastclient

Syntax **multicastclient** [**authenticate**]
no multicastclient

Context [Tree] (config>system>time>ntp multicastclient)

Full Context configure system time ntp multicastclient

Description This command configures the node to receive multicast NTP messages on the CPM MGMT port. If **multicastclient** is not configured, received NTP multicast traffic will be ignored. Use the **show** command to view the state of the configuration.

The **no** construct of this message removes the multicast client for the specified interface from the configuration.

Parameters **authenticate** — Specifies to make authentication a requirement (optional). If authentication is required, the authentication key-id received must have been configured in the **authentication-key** command, and that key-id type and key value must also match.

Platforms All

17.405 multiclass

multiclass

Syntax **multiclass** *count*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no multiclass

Context **[Tree]** (config>port>ml-bundle>mlpp multiclass)

Full Context configure port multilink-bundle mlppp multiclass

Description This command enables multi-class MLPPP as defined by RFC 2686*, The Multi-Class Extension to Multi-Link PPP*, on a MLPPP bundle (including MLPPP bundle protection groups) with 2, 3 or 4 classes. For multiclass MLPPP bundles with a non-zero count, the class index takes valid values from 0 to one less than the maximum number of classes inclusive. For example a 4-class MLPPP bundle has 4 classes with indexes 0, 1, 2, and 3. A bundle must be shutdown with no links for this value to be changed.

Entries are created and deleted by the system depending on the number of classes being used by a given MLPPP bundle.

The **no** form of this command disables multi-class MLPPP.

Default multiclass 4

Parameters *count* — Specifies the number of classes in a MLPPP bundle.

Values 2 to 4

Platforms 7450 ESS, 7750 SR-7/12/12e

17.406 multihop

multihop

Syntax **multihop** *ttl-value*
no multihop

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy multihop)

Full Context configure subscriber-mgmt bgp-peering-policy multihop

Description This command configures the time to live (TTL) value entered in the IP header of packets sent to an EBGP peer multiple hops away.

This parameter is meaningful only when configuring EBGP peers. It is ignored if set for an IBGP peer.

The **no** form of this command is used to convey to the BGP instance that the EBGP peers are directly connected.

The **no** form of this command reverts to default values.

Default multihop 1 (EBGP peers are directly connected)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

multihop 64 (IBGP)

Parameters *ttl-value* — Specifies the TTL value, expressed as a decimal integer.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

17.408 multipath-eligible

multipath-eligible

Syntax [**no**] **multipath-eligible**

Context **[Tree]** (config>service>vprn>bgp>group multipath-eligible)
[Tree] (config>service>vprn>bgp>neighbor multipath-eligible)

Full Context configure service vprn bgp group multipath-eligible
configure service vprn bgp neighbor multipath-eligible

Description This command specifies that a BGP neighbor or the set of BGP neighbors in a peer group should be part of a selective multipath set. Selective multipaths are only supported by the ipv4, label-ipv4, ipv6, and label-ipv6 address families.

If no candidate multipath route for an IP prefix came from a multipath-eligible peer, multipaths are selected without further constraints.

If the best route for an IP prefix is received from a neighbor marked as multipath-eligible, other routes for the same prefix are not eligible to be used as multipaths unless they also came from peers marked as multipath-eligible.

If the best route for an IP prefix did not come from a multipath-eligible peer but there is at least one candidate multipath route for the same prefix from a multipath-eligible peer, multipath is not used.

The **no** form of this command marks a neighbor or group as non-multipath eligible. The effect of this depends on whether other neighbors and groups are marked as multipath eligible.

Default no multipath-eligible

Platforms All

multipath-eligible

Context **[Tree]** (config>test-oam>link-meas>template>asw multiplier)

Full Context configure test-oam link-measurement measurement-template aggregate-sample-window multiplier

Description This command configures the number of sample windows in an aggregate sample window.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default multiplier 12

Parameters *sample-window-durations* — Specifies the number of sample windows

Values 1 to 12

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier

Syntax **multiplier** *interval-durations*

Context **[Tree]** (config>test-oam>link-meas>template>sw multiplier)

Full Context configure test-oam link-measurement measurement-template sample-window multiplier

Description This command configures the number of probe results that should be in the sample window. For example, a multiplier of 10 and an interval of 5 results in 50 probes being transmitted from an individual sample window. Consequently, 50 probe results are expected within the 50 second duration that the sample window is “In-progress”.

Default multiplier 10

Parameters *interval-durations* — Specifies the number of intervals in a sample window.

Values 1 to 900

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

17.411 multipliers

Syntax **multipliers sample-multiplier** *num1* **adjust-multiplier** *num2*
no multipliers

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth multipliers)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth multipliers)

Full Context configure router mpls lsp auto-bandwidth multipliers
configure router mpls lsp-template auto-bandwidth multipliers

Description This command configures the sample-multiplier and adjust-multiplier applicable to one particular LSP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The sample-multiplier configures the number of collection intervals between measurements of the number of bytes that have been transmitted on the LSP. The byte counts include the layer 2 encapsulation of MPLS packets and represent traffic of all forwarding classes and priorities (in-profile vs, out-of-profile) belonging to the LSP. The router calculates the average data rate in each sample interval. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms.

The adjust-multiplier is the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust-count.

The adjust-multiplier is not allowed to be set to a value less than the sample-multiplier. It is recommended that the adjust-multiplier be a multiple of the sample-multiplier.

The **no** form of this command instructs the system to take the value from the **auto-bandwidth-multipliers** command.

Default no multipliers

Parameters *number1* — Specifies the number of collection intervals in a sample interval.

Values 1 to 511

number2 — Specifies the number of collection intervals in an adjust interval.

Values 1 to 16383

Platforms All

17.412 multistream-spmsi

multistream-spmsi

Syntax **multistream-spmsi** *index* [**create**]
no multistream-spmsi *index*

Context **[Tree]** (config>service>vprn>mvpn>pt>selective multistream-spmsi)

Full Context configure service vprn mvpn provider-tunnel selective multistream-spmsi

Description This command creates a multi-stream S-PMSI policy. Having multiple multi-stream S-PMSIs per MVPN creates a link list, in which the first match (lowest index) will be chosen for a multicast stream. The number of configured multi-stream S-PMSIs cannot exceed the configured maximum S-PMSI for a given MVPN.

Parameters *index* — Specifies the index number.

Values 1 to 1024

Full Context configure router bgp add-paths mvpn-ipv4
configure router bgp group add-paths mvpn-ipv4
configure router bgp group neighbor add-paths mvpn-ipv4

Description This command configures the add-paths capability for multicast VPN IPv4 routes. By default, add-paths is not enabled for multicast VPN IPv4 routes.

The maximum number of paths per multicast VPN IPv4 NRLI to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast VPN IPv4 routes, causing sessions established using add-paths for multicast VPN IPv4 to go down and come back up without the add-paths capability.

Default no mvpn-ipv4

Parameters *send-limit* — Specifies the maximum number of paths per multicast VPN IPv4 NRLI that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast VPN IPv4 AFI/SAFI.

Default 1 to 16, none

receive — Specifies that the router negotiates to receive multiple routes per multicast VPN IPv4 NRLI.

none — Specifies that the router does not negotiate to receive multiple routes per multicast VPN IPv4 NRLI.

Full Context configure router bgp add-paths mvpn-ipv6
configure router bgp group add-paths mvpn-ipv6
configure router bgp group neighbor add-paths mvpn-ipv6

Description This command configures the add-paths capability for multicast VPN IPv6 routes. By default, add-paths is not enabled for multicast VPN IPv6 routes.

The maximum number of paths per multicast VPN IPv6 NRLI to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple multicast VPN paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default. The **none** option disables the receive capability.

The **no** form of this command disables add-paths support for multicast VPN IPv6 routes, causing sessions established using add-paths for multicast VPN IPv6 to go down and come back up without the add-paths capability.

Default no mvpn-ipv6

Parameters *send-limit* — Specifies the maximum number of paths per multicast VPN IPv6 NRLI that are allowed to be advertised to add-paths peers. The actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to multicast VPN IPv6 AFI/SAFI.

receive — Specifies that the router negotiates to receive multiple routes per multicast VPN IPv6 NRLI.

none — Specifies that the router does not negotiate to receive multiple routes per multicast VPN IPv6 NRLI.

mvpn-no-export

Syntax [**no**] **mvpn-no-export**

Context **[Tree]** (config>router>ldp>import-pmsi-routes mvpn-no-export)

Full Context configure router ldp import-pmsi-routes mvpn-no-export

Description This command specifies that the SR OS is to cache intra-as MVPN PMSI AD routes for option B.

The **no** form of this command disables caching of intra-as MVPN PMSI AD routes. The default is disabled, however when an upgrade from a software load that does not supports this command is performed, this command will be enabled after the upgrade.

This command is enabled if the user is using an older config file.

Default no mvpn-no-export

17.417 mvpn-rtcache

mvpn-rtcache

Syntax **mvpn-rtcache** [**group** *grp-ip-address*] [**peer** *ip-address*]
no mvpn-rtcache

Context **[Tree]** (debug>router>pim mvpn-rtcache)

Full Context debug router pim mvpn-rtcache

Description This command enables debugging for the PIM MVPN route cache.

The **no** form of this command disables debugging for the PIM MVPN route cache.

Parameters *grp-ip-address* — Debugs information associated with the specified group.

Values multicast group address (ipv4, ipv6) or zero

peer-ip-address — Debugs information associated with the specified peer.

Values peer address (ipv4, ipv6)

Full Context configure service vpls mrp mvrp
configure service vpls sap mrp mvrp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This object consolidates the MVRP attributes. MVRP is only supported initially in the management VPLS so the object is not supported under BVPLS, IVPLS or regular VPLS not marked with the m-vpls tag.

Platforms All

17.422 mvrp-control

mvrp-control

Syntax [**no**] **mvrp-control**

Context **[Tree]** (config>service>vpls>vpls-group mvrp-control)

Full Context configure service vpls vpls-group mvrp-control

Description This command enables MVRP control in the VPLS instances instantiated using the templates for the specified vpls-group. That means the flooding FDB will be created empty and will be populated with endpoints whenever MVRP receives a declaration and a registration on a specific endpoint. Also the VLAN ID associated by the control VPLS with the instantiated VPLS will be declared on service activation by MVRP on all virtual MVRP ports in the control VPLS. Service activation takes place when at least one other SAP is provisioned and brought up under the data VPLS. This is usually a customer facing SAP or a SAP leading outside of the MVRP controlled domain.

The **no** form of this command disallows MVRP control over this VPLS. The VPLS will be created with a regular FDB and will become as a result active upon creation time. Command change is allowed only when the related vpls-group is in shutdown state.

Default no mvrp-control

configure port tdm ds3 frame-relay n391dte
configure port tdm e1 channel-group frame-relay n391dte
configure port tdm e3 frame-relay n391dte

Description This command sets the DTE full status polling interval for the Frame Relay Local Management Interface (LMI). The number specifies the frequency at which inquiries expect a full status report.

The **no** form of this command returns the **n391dte** counter to the default value.

Default n391dte 6

Parameters *intervals* — The number of exchanges to be done before requesting a full-status report. A value of 1 specifies to receive full-status messages only.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure port tdm ds3 frame-relay n392dce
configure port tdm e1 channel-group frame-relay n392dce
configure port tdm e3 frame-relay n392dce

Description This command sets the DCE error threshold for the Frame Relay Local Management Interface (LMI).

The threshold specifies the number of errors needed to bring down a link.

The **no** form of this command returns the **n392dce** counter to the default value.

Default n392dce 3

Parameters *threshold* — Specifies the number of errors that will place the channel in an operationally down state.

Values 1 to 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.7 nak-non-matching-subnet

nak-non-matching-subnet

Syntax [**no**] **nak-non-matching-subnet**

Context **[Tree]** (config>router>dhcp>server>pool nak-non-matching-subnet)
[Tree] (config>service>vprn>dhcp>server>pool nak-non-matching-subnet)

Full Context configure router dhcp local-dhcp-server pool nak-non-matching-subnet
configure service vprn dhcp local-dhcp-server pool nak-non-matching-subnet

Description When this command is enabled, if the local DHCPv4 server receives a DHCP request with option 50 (client requested a previously allocated message as described in section 3.2 of RFC 2131, *Dynamic Host Configuration Protocol*) and the address allocation algorithm uses a pool that does not have option 50, the system returns a DHCP NAK. Otherwise, the system drops the DHCP packet.

The **no** form of this command reverts to the default.

Default no nak-non-matching-subnet

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.8 name

name

Syntax **name** *header-name*

Context **[Tree]** (config>app-assure>group>http-enrich>field name)

Full Context configure application-assurance group http-enrich field name

Description This command configures an HTTP enrichment template field header name.

The **no** form of this command removes the http enrichment template field header name from the configuration.

Parameters *header-name* — Specifies the name of the http enrichment policy that is inserted before the actual field name (e.g. x-subId = subscriberID).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context **[Tree]** (config>system name)

Full Context configure system name

Description This command creates a system name string for the device.

For example, system-name parameter ALA-1 for the **name** command configures the device name as ALA-1.

```
ABC>config>system# name "ALA-1"
ALA-1>config>system#
```

Only one system name can be configured. If multiple system names are configured, the last one encountered overwrites the previous entry.

The **no** form of the command reverts to the default value.

Default no name

Parameters *system-name* — Specifies the system name as a character string. The string may be up to 64 characters. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

name

Syntax **name** *name-string* **value** *value-string*
name *name-string* **address** *ip-address*
name *name-string* **number** *value-number*
no name *name-string*

Context **[Tree]** (config>router>policy-options>global-variables name)
[Tree] (config>router>policy-options>policy-statement>entry>from>policy-variables name)

Full Context configure router policy-options global-variables name
configure router policy-options policy-statement entry from policy-variables name

Description This command allows operators to configure routing policies that are often reused across BGP peers of a common type (transit, peer, customer, and so on). Using global variables allows an operator to have a single variable that is consistent across all peers of a type, while retaining the flexibility to reference different policy functions (prefixes, prefix-lists, community lists, and so on) with unique names.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Depending on the parameter referenced, the correct type should be specified as follows:

- value-string: **as-path, as-path-group, community, prefix-list, damping**
- ip-address: **next-hop**
- value-number: **aigp-metric, as-path-prepend, local-preference, metric, origin, origin-validation, preference, tag, type**

The **no** form of this command removes the global variable.

Parameters *name-string* — Specifies the name of the global variable, with the variable delimited by at-signs (@) at the beginning and the end of the name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

value-string — The value of the policy variable. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

value-number — Specifies the numerical value of the policy variable.

Values 0 to 4294967295

ip-address — Specifies the IP address of the policy variable.

Values ipv4-address:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms All

18.9 named-pool-policy

named-pool-policy

Syntax **named-pool-policy** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy named-pool-policy)

Full Context configure qos copy named-pool-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command copies an existing **named-pool-policy** to another **named-pool-policy**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination policy exists.

Parameters *src-name* — Specifies the existing source **named-pool-policy**, up to 32 characters, from which the **copy** command attempts to copy.

dst-name — Specifies the destination **named-pool-policy** *dst-name*, up to 32 characters, to which the copy command attempts to copy.

overwrite — Use this parameter when the **named-pool-policy** *dst-name* already exists. If it does, everything in the existing destination **named-pool-policy** *dst-name* is completely overwritten with the contents of the **named-pool-policy** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI use {overwrite}; destination named-pool-policy
"test" exists.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

18.10 nas-identifier

nas-identifier

Syntax [**no**] **nas-identifier**

Context **[Tree]** (config>aaa>l2tp-acct-plcy>include-radius-attribute nas-identifier)

Full Context configure aaa l2tp-accounting-policy include-radius-attribute nas-identifier

Description This command enables the generation of the nas-identifier RADIUS attribute.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nas-identifier

Syntax [**no**] **nas-identifier**

Context **[Tree]** (config>subscr-mgmt>auth-policy>include-radius-attribute nas-identifier)

Full Context configure aaa isa-radius-policy acct-include-attributes nas-ip-address
configure aaa isa-radius-policy auth-include-attributes nas-ip-address

Description This command enables the generation of the NAS-IP-Address RADIUS attribute.

Default no nas-ip-address

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.13 nas-ip-address-origin

nas-ip-address-origin

Syntax **nas-ip-address-origin** {**isa-ip** | **system-ip**}
no nas-ip-address-origin

Context [Tree] (config>aaa>isa-radius-plcy nas-ip-address-origin)

Full Context configure aaa isa-radius-policy nas-ip-address-origin

Description This command specifies the RADIUS NAS-IP-Address attribute.

The **no** form of the command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default nas-ip-address-origin system-ip

Parameters **system-ip** — Specifies that the value of the object TIMETRA-VRTR-MIB::vRiaIpAddress.1.1.1 is used.

isa-ip — Specifies that a value in the range specified by tmnxRadIsaPlcySrvSrcAddrStart and tmnxRadIsaPlcySrvSrcAddrEnd is used that corresponds to the ISA card that transmits the Access-Request packet or the Accounting-Request packet.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.14 nas-port

nas-port

Syntax [**no**] **nas-port** *binary-spec*

Context **[Tree]** (config>aaa>l2tp-acct-plcy>include-radius-attribute nas-port)

Full Context configure aaa l2tp-accounting-policy include-radius-attribute nas-port

Description This command enables the generation of the nas-port RADIUS attribute. Enter decimal representation of a 32-bit string that indicates the port information. This 32-bit string can be compiled based on different information from the port (data types). Using number-of-bits data-type syntax indicates the number of bits from the 32 bits that are used for the specific data type. These data types can be combined up to 32 bits. In between the different data types 0s and 1s as bits can be added.

The **no** form of this command disables the **nas-port** configuration.

Parameters *binary-spec* — Specifies the NAS port attribute.

Values		
binary-spec	<bit-specification> <binary-spec>	
bit-specification	0 | 1 | <bit-origin>	
bit-origin	*<number-of-bits><origin>	
number-of-bits	1 to 32	
origin	s | m | p | o | i | v | c	
	s	slot number
	m	MDA number
	p	port number, lag-id, pw-id or pxc-id
	o	outer VLAN ID
	i	inner VLAN ID
	v	ATM VPI

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

	c	ATM VCI or PXC subport (subport a = 0, subport b = 1)

Output The following output shows an example.

Sample

```
*12o*12i00*2s*2m*2p => oooo oooo oooo iiii iiii iiii 00ss mmpp
If outer vlan = 0 & inner vlan = 1 & slot = 3 & mda = 1 & port = 1
=>  0000 0000 0000 0000 0000 0001 0011 0101 => nas-port = 309
```

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nas-port

Syntax **nas-port** *binary-spec*
no nas-port

Context **[Tree]** (config>subscr-mgmt>auth-policy>include-radius-attribute nas-port)
[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute nas-port)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute nas-port
configure subscriber-mgmt authentication-policy include-radius-attribute nas-port

Description This command enables the generation of the **nas-port** RADIUS attribute. You enter decimal representation of a 32-bit string that indicates your port information. This 32-bit string can be compiled based on different information from the port (data types). By using syntax number-of-bits data-type you indicate how many bits from the 32 bits are used for the specific data type. These data types can be combined up to 32 bits. In between the different data types 0's and/or 1's as bits can be added.

The **no** form of this command disables the **nas-port** configuration.

Parameters *binary-spec* — Specifies the NAS port attribute.

Values		
binary-spec	<bit-specification> <binary-spec>	
bit-specification	0 | 1 | <bit-origin>	
bit-origin	*<number-of-bits><origin>	
number-of-bits	1 to 32	
origin	s | m | p | o | i | v | c	
	s	slot number

Syntax [**no**] **nat**

Context **[Tree]** (config>service>vprn nat)
[Tree] (config>router nat)

Full Context configure router nat
configure service vprn nat

Description This command enables a NAT instance for the specified router or service.

The **no** form of this command disables the NAT instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax **nat**

Context **[Tree]** (config>li>li-source nat)

Full Context configure li li-source nat

Description Commands in this context configure LI NAT parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax **nat**

Context **[Tree]** (config>subscriber-mgmt>pfcp-association nat)

Full Context configure subscriber-mgmt pfcp-association nat

Description Commands in this context configure NAT groups for BNG CUPS PFCP association (see the **nat-group** command in the **config**>**subscriber-mgmt**>**pfcp-association**>**nat** context).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax **nat** [**nat-policy** *nat-policy-name*]

Context **[Tree]** (config>filter>ip-filter>entry>action nat)

Full Context configure filter ip-filter entry action nat

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables NAT traffic diversion based on IPv4 filters (LSN44) or IPv6 filters (DS-Lite, NAT64). The filter contains a matching condition based on any combination of the 5 tuple. Traffic is diverted to NAT based on such defined matching condition. Filter fields outside of the 5 tuples are not valid and it will be ignored in filter based traffic diversion to NAT.

The pool selection for the outside IP address and port along with other mapping characteristics can be specified by the means on the NAT policy.

Parameters *nat-type* — Specifies the NAT type.

nat-policy-name — Specifies the NAT policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax **nat nat-type** *nat-type* [**nat-policy** *nat-policy-name*]

Context **[Tree]** (config>filter>ipv6-filter>entry>action nat)

Full Context configure filter ipv6-filter entry action nat

Description This command enables NAT traffic diversion based on IPv4 filters (LSN44) or IPv6 filters (DS-Lite, NAT64). The filter contains a matching condition based on any combination of the 5 tuple. Traffic is diverted to NAT based on such defined matching condition. Filter fields outside of the 5 tuples are not valid and it will be ignored in filter based traffic diversion to NAT.

The pool selection for the outside IP address and port along with other mapping characteristics can be specified by the means on the NAT policy.

Parameters *nat-type* — Specifies the NAT type.

nat-policy-name — Specifies the NAT policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax **nat**

Context **[Tree]** (admin nat)

Full Context admin nat

Description This command performs NAT operations.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.19 nat-access-mode

nat-access-mode

Syntax **nat-access-mode** *access-mode*

Context **[Tree]** (config>subscr-mgmt>sub-profile nat-access-mode)

Full Context configure subscriber-mgmt sub-profile nat-access-mode

Description This command configures the NAT access mode.

Access mode in L2-Aware NAT environment is a reflection of supported home set up (bridged or routed) in relation to the configured anti-spoof setting.

This configuration option is only applicable to L2-Aware NAT subscribers. It determines which home model is supported with L2-Aware NAT:

- Bridged RG with mac-ip anti-spoof
- Bridged RG with nh-mac anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

Default nat-access-mode auto

Parameters *access-mode* — Specifies the NAT access mode.

Values auto — The supported combinations are:

- Bridged RG with mac-ip anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

bridged — The supported combinations are:

- Bridged RG with mac-ip anti-spoof
- Bridged RG with nh-mac anti-spoof
- Routed RG with NAT and mac-ip anti-spoof
- Routed RG with NAT and nh-mac anti-spoof
- Routed RG without NAT and nh-mac anti-spoof

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.20 nat-allow-bypass

nat-allow-bypass

Syntax [**no**] **nat-allow-bypass**

Context **[Tree]** (config>subscr-mgmt>sub-prof nat-allow-bypass)

Full Context configure subscriber-mgmt sub-profile nat-allow-bypass

Description This command enables L2-Aware NAT host for selective bypass. L2-aware NAT subscribers eligible for NAT bypass must be explicitly enabled with this command. Once enabled, the ip-filter configuration applied in sub-profile determines whether the traffic is bypassed.

The **no** form of this command causes traffic received from subscribers associated with this profile to not bypass the Layer-2-Aware NAT.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.21 nat-classifier

nat-classifier

Syntax **nat-classifier** *nat-classifier-name*
no nat-classifier

Context **[Tree]** (config>service>nat>nat-policy>dnat nat-classifier)

Full Context configure service nat nat-policy dnat nat-classifier

Description This command when configured within the nat-policy, references a nat-classifier and consequently activates DNAT functionality. Unless this command is provisioned, the destination IP address translation will not take place. The **nat-classifier** identifies the traffic (in a filter-like fashion) that is subjected to DNAT.

The **no** form of this command removes the *nat-classifier-name* from the configuration.

Default none

Parameters *nat-classifier-name* — Specifies the name, up to 32 characters, of the NAT classifier.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat-classifier

Syntax **nat-classifier** *nat-classifier-name* [**create**]
no nat-classifier

Context **[Tree]** (config>service>nat nat-classifier)

Full Context configure service nat nat-classifier

Description This command creates a nat-classifier. Traffic can be identified in nat-classifier based on the protocol type and destination ports. Once the traffic is identified, an action associated with identified traffic, such as destination NAT (DNAT), can be taken.

The **no** form of the command removes the *nat-classifier-name* from the configuration.

Default none

Parameters *nat-classifier-name* — Specifies the name, up to 32 characters, of the referenced NAT classifier.

create — Keyword used to create the NAT classifier.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.22 nat-group

nat-group

Syntax **nat-group** *nat-group-id* [**create**]
no nat-group nat-group-id

Context **[Tree]** (config>router>isa-svc-chain nat-group)

Full Context configure router isa-service-chaining nat-group

Description This command allows service chaining to be enabled for subscribers whose NAT flows are established on the set of ISAs in the specified NAT group.

The **no** form of this command removes the NAT group from the configuration.

Parameters *nat-group-id* — Specifies the NAT group identifier.

Values 1 to 4

create — Keyword used to create the NAT group instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat-group

Syntax **nat-group** *nat-group-id* **sync-tag** *tag*
no nat-group *nat-group-id*

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync>nat nat-group)

Full Context configure redundancy multi-chassis peer sync nat nat-group

Description This command enables MCS for NAT. NAT group health information is exchanged between the pair of redundant NAT nodes. The system elects one of the nodes as the active node for the NAT group, while the other node becomes a standby node.

The **no** form of this command disables multi-chassis synchronization for a NAT group.

Default no nat-group

Parameters *nat-group-id* — Specifies the NAT group that is synchronized.

Values 1 to 4

tag — Specifies the synchronization tag that must be the same on both nodes of the NAT group. It is mandatory and must match its counterpart on the peering node for the NAT group that is being synchronized, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group

Syntax **nat-group** *nat-group-id* [**create**]
no nat-group *nat-group-id*

Context **[Tree]** (config>isa nat-group)

Full Context configure isa nat-group

Description This command configures an ISA NAT group.

The **no** form of the command removes the ID from the configuration.

Default none

Parameters *nat-group-id* — Specifies the ISA NAT group ID.

Values 1 to 4

create — Keyword used to create the NAT group.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat-group

Syntax **nat-group** *nat-group-id*
no nat-group

Context **[Tree]** (config>subscriber-mgmt>pfcp-association>nat nat-group)

Full Context configure subscriber-mgmt pfcp-association nat nat-group

Description This command configures a NAT group participating in NAT on BNG CUPS. ISAs in the NAT group are enabled for operation in BNG CUPS, but are not limited to BNG CUPS deployment. They can be used simultaneously with other versions of NAT in BNG, outside of the CUPS functionality.

The **no** version of this command deletes the NAT group.

Parameters *nat-group-id* — Specifies the NAT group ID.

Values 1 to 4

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.23 nat-import

nat-import

Syntax **nat-import** *policy-name* [*policy-name*]
no nat-import

Context **[Tree]** (config>router>nat>inside nat-import)
[Tree] (config>service>vprn>nat>inside nat-import)

Full Context configure router nat inside nat-import
configure service vprn nat inside nat-import

Description This command references an import-policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT.

A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context.

All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with **action-type accept** in the route policy.

Parameters *policy-name* — Specifies up to five NAT import policy names, up to 64 characters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-import

Syntax **nat-import all** [**inside-router** *router-instance*]
nat-import route *ipv4-address* [**inside-router** *router-instance*]
no nat-import all [**inside-router** *router-instance*]
no nat-import route *ipv4-address* [**inside-router** *router-instance*]

Context **[Tree]** (debug>nat nat-import)

Full Context debug nat nat-import

Description This command enables debugging for routes dynamically imported into NAT from BGP.

The events related to dynamic routes in NAT can be filtered by a specific route and inside routing context.

Only events related to dynamic imports are dispayed. Events related to static route configurations are not shown.

Typical debug output displays the following information:

- `18 2021/06/15 09:29:54.436 UTC MINOR: DEBUG #2001 vprn550 NAT_IMPORT`
  This entry represents the debug event, the inside service in which the event occurred, and the process related to the event. For this particular log, the event ID is 2001 which occurred in the inside service vprn 550 and was related to a dynamic route importing into NAT.
- `dest-prefix 10.10.10.0/24 nat-policy ls-outPolicy service 500 : start import : ACCEPT by policy-statement evaluation`
  This entry represents the description of the event. The destination prefix 10.10.10.0/24 is associated with **nat-policy** *ls-outPolicy* and was successfully imported from the outside vprn 500 (into the inside vprn 550 identified by the first entry).

The **no** form of the command disables debugging of the specified parameters.

Parameters **all** — Specifies to debug all routes dynamically imported into NAT from BGP.

router-instance — Specifies filtering based on specific inside routing context.

ipv4-address — Specifies filtering based on the specific route.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.24 nat-outside

nat-outside

Syntax **nat-outside** *nat-group-id* [**create**]
no nat-outside *nat-group-id*

Context **[Tree]** (config>service>epipe nat-outside)

Full Context configure service epipe nat-outside

Description This command binds an Epipe to a NAT context running on an ISA-BB, allowing the Epipe to act as the outside service for the NAT or firewall. When **nat-outside** is enabled, one end of the Epipe is implicitly tied to ISA BB forwarding, leaving one remaining SAP, spoke, or similar available to be configured.

The **no** version of this command removes the Epipe binding to a NAT context.

Parameters *nat-group-id* — The NAT group ID where the PPPoE client is applied.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.25 nat-policy

nat-policy

Syntax **nat-policy** *policy-name*
no nat-policy

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range nat-policy)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range nat-policy)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range nat-policy
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range nat-policy

Description This command specifies the NAT policy for WLAN-GW ISA subscribers.

The **no** form of this command reverts to the default.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat-policy

Syntax **nat-policy** *nat-policy-name*
no nat-policy

Context **[Tree]** (config>router>nat>inside nat-policy)
[Tree] (config>router>policy-options>policy-statement>entry>action nat-policy)
[Tree] (config>service>vprn>nat>inside nat-policy)

Full Context configure router nat inside nat-policy
configure router policy-options policy-statement entry action nat-policy
configure service vprn nat inside nat-policy

Description This command configures the NAT policy that is used for large-scale NAT in this service. If a **nat-policy** is not configured, then the default **nat-policy** is used.

The **no** form of the command removes the policy name from the configuration.

Parameters *nat-policy-name* — Specifies the NAT policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy

Syntax **nat-policy** *nat-policy-name*
no nat-policy

Context **[Tree]** (config>router>policy-options>policy-statement>default-action nat-policy)

Full Context configure router policy-options policy-statement default-action nat-policy

Description This command assigns a NAT policy to the matched routes that do not have a more specific nat-policy configured under action.

A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route must be associated with a NAT policy that maps traffic destined to it into a NAT pool and outside routing context. If the NAT policy is not specified within the route policy, the imported NAT route, by default, is associated with the default NAT policy defined in the NAT inside routing context.

All BGP-VPN routes that are destined to be imported into NAT inside routing context must have action-type set to **accept** , regardless of whether the NAT policy is configured in the action.

The **no** form of the command removes the policy name from the configuration.

Parameters *nat-policy-name* — Specifies the NAT policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat-policy

Syntax **nat-policy** *nat-policy-name* [**create**]
no nat-policy *nat-policy-name*

Context **[Tree]** (config>service>nat nat-policy)

Full Context configure service nat nat-policy

Description This command configures a NAT policy.

Parameters *nat-policy-name* — Specifies the NAT policy name, up to 32 characters.

create — Keyword used to create the NAT policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy

Syntax **nat-policy** *policy-name*
no nat-policy

Context **[Tree]** (config>subscr-mgmt>sub-profile nat-policy)

Full Context configure subscriber-mgmt sub-profile nat-policy

Description This command configures the NAT policy to be used for subscribers associated with this subscriber profile.

Parameters *policy-name* — Specifies the policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.26 nat-policy-name

nat-policy-name

Syntax [**no**] **nat-policy-name**

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy>include nat-policy-name)

Full Context configure service nat syslog syslog-export-policy include nat-policy-name

Description This command includes the NAT policy name in the flow log.

The **no** form of the command disables the feature.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.27 nat-port-forwarding

nat-port-forwarding

Syntax **nat-port-forwarding**

Context **[Tree]** (config>system>persistence nat-port-forwarding)

Full Context configure system persistence nat-port-forwarding

Description This command configures NAT port forwarding persistence parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.28 nat-port-range

nat-port-range

Syntax [**no**] **nat-port-range**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute nat-port-range)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute nat-port-range

Description This command enables the generation of the of **nat-port-range** attribute.

The **no** form of this command disables the generation of the **nat-port-range** attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.29 nat-prefix-list

nat-prefix-list

Syntax **nat-prefix-list** *name*
no nat-prefix-list *name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>subscr-mgmt>sub-prof nat-prefix-list)

Full Context configure subscriber-mgmt sub-profile nat-prefix-list

Description This command specifies the nat-prefix-list referenced within the subscriber-profile is used to associate L2-aware subscriber traffic with additional nat-policies based on the destination IPv4 address of the traffic.

The **no** form of the command removes the prefix list name from the configuration.

Default none

Parameters *name* — Specifies the nat prefix list name. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-prefix-list

Syntax **nat-prefix-list** *name* [**create**] [**application** *application-choice*]
no nat-prefix-list *name*

Context [Tree] (config>service>nat nat-prefix-list)

Full Context configure service nat nat-prefix-list

Description This command is used to create configuration context for:

- IP prefixes that are used select multiple nat-policies per subscriber in L2-aware NAT.
- Inside IP prefixes in DNAT-only scenario. The inside IP prefixes are then setup as downstream routes used to steer the return (downstream) traffic to the proper MS-ISA.

The **no** form of the command removes the prefix list name from the configuration.

Default none

Parameters *name* — Specifies the nat prefix list name. Allowed values are any string up to 32 characters long composed of printable,7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

application *application-choice* — Specifies how this NAT prefix list is to be applied.

Values **l2-aware-dest-to-policy**: Specifies that the nat-prefix-list can be applied only within the sub-profile for l2-aware subscribers. It will contain mapping between the destination prefix and a nat-policy.
dnat-only-subscribers: Specifies that the nat-prefix-list can be applied only to dnat-only-subscribers. It will contain the source-prefix that needs to be install in outside routing context so that the return traffic from the outside can be directed to proper MS-ISA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.30 nat-subscriber-string

nat-subscriber-string

Syntax [**no**] **nat-subscriber-string**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes nat-subscriber-string)

Full Context configure aaa isa-radius-policy acct-include-attributes nat-subscriber-string

Description This command enables the inclusion of the NAT subscriber string attributes.

The **no** form of the command excludes NAT subscriber string attributes.

Default no nat-subscriber-string

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.31 nat-traversal

nat-traversal

Syntax **nat-traversal** [**force**] [**keep-alive-interval** *keep-alive-interval*] [**force-keep-alive**]
no nat-traversal

Context **[Tree]** (config>ipsec>ike-policy nat-traversal)

Full Context configure ipsec ike-policy nat-traversal

Description This command specifies whether NAT-T (Network Address Translation Traversal) is enabled, disabled or in forced mode.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts the parameters to the default.

Default no nat-traversal

Parameters **force** — Forces to enable NAT-T

keep-alive-interval *keep-alive-interval* — Specifies the keep-alive interval in seconds.

Values 120 to 600

force-keep-alive — When specified, the keep-alive does not expire.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.32 nat64

nat64

Syntax [**no**] **nat64**

Context **[Tree]** (config>service>vprn>inside nat64)

Full Context configure service vprn inside nat64

Description Commands in this context configure NAT64.

The **no** form of the command disables NAT64.

nat64

Syntax [**no**] **nat64**

Context **[Tree]** (config>service>vprn>nat>inside nat64)
[Tree] (config>router>nat>inside nat64)

Full Context configure router nat inside nat64
configure service vprn nat inside nat64

Description Commands in this context configure NAT64 parameters.

The **no** form of the command disables NAT64.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.33 nat64-lsn-sub

nat64-lsn-sub

Syntax [**no**] **nat64-lsn-sub router** *router-instance* **ip** *ipv6-prefix*

Context **[Tree]** (config>li>li-source>nat nat64-lsn-sub)

Full Context configure li li-source nat nat64-lsn-sub

Description This command configures a NAT64 LSN subscriber source.

Parameters *router-instance* — Specifies the routing instance into which to inject the mirrored packets.

ipv6-prefix — Specifies the IPv6 address.

Values

ipv6-prefix:	<prefix>/<length>
prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x to [0 to FFFF]H
	d t o[0t o 255]D
<length>	[0 to 128]

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.34 national-bits

national-bits

Syntax **national-bits** *sa4 sa5 sa6 sa7 sa8*
no national-bits

Context **[Tree]** (config>port>tdm>e1 national-bits)

Full Context configure port tdm e1 national-bits

Description This command configures the national use bits.

Parameters *sa-bits* — Disables or enables SA bits.

Values 0, 1

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.35 nbr

nbr

Syntax **nbr** [**detail**]
no nbr

Context **[Tree]** (debug>router>rsvp>event nbr)

Full Context debug router rsvp event nbr

Description This command debugs neighbor events.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about neighbor events.

Platforms All

18.36 ncp-renegotiation

ncp-renegotiation

Syntax **ncp-renegotiation** {**ignore** | **terminate-session**}
no ncp-renegotiation

Context **[Tree]** (config>subscr-mgmt>ppp-policy ncp-renegotiation)

Full Context configure subscriber-mgmt ppp-policy ncp-renegotiation

Description This command configures the NCP renegotiation.

The **no** form of the command reverts to the default value.

Default ncp-renegotiation terminate-session

Parameters **ignore** — Specifies that BNG ignore subsequent renegotiation messages after successful IPCP negotiation.

terminate-session — Specifies that the PPP session be terminated.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.37 nd

nd

Syntax **nd**

Context **[Tree]** (config>service>ies>sub-if>grp-if>ipv6 nd)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6 nd)

Full Context configure service ies subscriber-interface group-interface ipv6 nd
configure service vprn subscriber-interface group-interface ipv6 nd

Description Commands in this context configure neighbor discovery (ND) parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nd

Syntax **nd**

Context **[Tree]** (config>service>ies>if>vpls>evpn nd)
[Tree] (config>service>vprn>if>vpls>evpn nd)

Full Context configure service ies interface vpls evpn nd
configure service vprn interface vpls evpn nd

Description Commands in this context configure ND host route parameters.

Platforms All

18.38 nd-host-route

nd-host-route

Syntax **nd-host-route**

Context **[Tree]** (config>service>vprn>if>ipv6 nd-host-route)

Full Context configure service vprn interface ipv6 nd-host-route

Description Commands in this context populate ND host route entries.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.39 nd-learn-unsolicited

nd-learn-unsolicited

Syntax **nd-learn-unsolicited** {**global** | **link-local** | **both**}
no nd-learn-unsolicited

Context **[Tree]** (config>service>ies>if>ipv6 nd-learn-unsolicited)

Full Context configure service ies interface ipv6 nd-learn-unsolicited

Description This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement messages with or without the solicited flag set. The command can be enabled for global addresses, link-local addresses, or for both.

The **no** form of this command makes the router use standard RFC 4861 behavior, as described below, for learning of neighbor entries.

- If an unsolicited NA, regardless of the S flag, is received from a neighbor that is not yet in the ND cache, the NA is ignored.
- If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the stale state.

Parameters **global** — Learns global neighbor entries out of received unsolicited Neighbor Advertisement messages.

link-local — Learns link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

both — Learns both global and link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

Platforms All

nd-learn-unsolicited

Syntax **nd-learn-unsolicited** {**global** | **link-local** | **both**}
no nd-learn-unsolicited

Context **[Tree]** (config>service>vprn>if>ipv6 nd-learn-unsolicited)

Full Context configure service vprn interface ipv6 nd-learn-unsolicited

Description This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement messages, with or without the solicited flag set. The command can be enabled for global addresses, link-local addresses, or for both.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command makes the router follow standard RFC 4861 behavior for learning of neighbor entries.

- If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the ND cache, the NA is ignored in line with RFC 4861.
- If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state. This is the standard RFC behavior.

Parameters **global** — Learns global neighbor entries out of received unsolicited Neighbor Advertisement messages.

link-local — Learns link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

both — Learns both global and link local neighbor entries out of received unsolicited Neighbor Advertisement messages.

Platforms All

18.40 nd-populate-host-route

nd-populate-host-route

Syntax [**no**] **nd-populate-host-route**

Context **[Tree]** (config>service>ies>interface>ipv6 nd-populate-host-route)

Full Context configure service ies interface ipv6 nd-populate-host-route

Description This command enables the addition or deletion of host routes in the route-table derived from neighbor entries in the neighbor cache. To enable this command, the interface must be shut down. The command triggers the population of host routes in the route table out of their corresponding static, dynamic, or EVPN types in the neighbor table. Neighbor entries installed by subscriber management, local interfaces, and others, do not create host-routes.

Only reachable entries are added to the route table (entries are created from solicited NA messages). Entries created as stale — from Neighbor Solicitation (NS), unsolicited Neighbor Advertisements (NA), Router Solicitation (RS), Router Advertisement (RA), and Redirect messages — are not added to the route table because the neighbor is not confirmed as two-way.

- RA, RS, NS, and Redirect messages with a link layer address are added as STALE cache entries. Unsolicited NAs are added as STALE if **nd-learn-unsolicited** is configured.
- To speed up the addition of host routes to the route table for neighbors created as STALE, the following procedure is used:
  - If **nd-populate-host-route** is configured, the router sends an NS (unicast Neighbor Unreachability Detection (NUD) message) to the neighbor created as STALE. Only one NUD message is sent.
  - If **nd-populate-host-route** is not configured, no confirmation message is sent and regular procedures apply.
- When the solicited NA for the neighbor is received, the entry becomes reachable and is then added to the route-table.

The **no** form of this command disables the creation of host routes from the neighbor cache.

18.41 nd-proactive-refresh

nd-proactive-refresh

Syntax **nd-proactive-refresh** {**global** | **link-local** | **both**}
no nd-proactive-refresh

Context **[Tree]** (config>service>ies>if>ipv6 nd-proactive-refresh)

Full Context configure service ies interface ipv6 nd-proactive-refresh

Description This command enables a proactive refresh of the neighbor entries. When enabled, at the stale timer expiration, the router sends a NUD message to the host (regardless of the existence of traffic to the IP address on the IOM), so the entry can be refreshed or removed.

This behavior is different from ARP, where the refresh is sent 30 seconds prior to the entry's age out time. The refresh can be optionally enabled for global addresses, link-local addresses, or both.

The **no** form of this command disables the proactive behavior and the router only refreshes an entry if there is traffic that needs to be sent to the IP address.

Parameters **global** — Refreshes global neighbor entries.

link-local — Refreshes link local neighbor entries.

both — Refreshes both global and link local neighbor entries.

Platforms All

nd-proactive-refresh

Syntax **nd-proactive-refresh** {**global** | **link-local** | **both**}

18.42 nd-route-tag

nd-route-tag

Syntax **nd-route-tag** *tag*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no nd-route-tag

Context [Tree] (config>service>ies>if>ipv6 nd-route-tag)

Full Context configure service ies interface ipv6 nd-route-tag

Description This command adds a route tag to the ARP-ND host routes generated out of the neighbor entries in the interface. As any other route tag, it can be used to match ARP-ND routes in BGP export policies.

The **no** form of this command removes the route tag for the ARP-ND host routes.

Parameters *tag* — Specifies the route tag to be added when the proxy ND entries are advertised to EVPN.

Values 1 to 255

18.43 neid

neid

Syntax **neid** *hex-string*
no neid

Context [Tree] (config>system>ned>profile neid)

Full Context configure system network-element-discovery profile neid

Description This command configures the NEID for this profile.

The **no** form of this command deletes the NEID for this profile.

Parameters *hex-string* — A hexadecimal string that consists of a subnet ID and basic ID. The first 8 high-order bits indicate the subnet ID and range from 0x1 to 0xFE. The 16 low-order bits indicate the basic ID and ranges from 0x0001 to 0xFFFE. The NEID cannot be configured as 0x90006 to 0x9FF06 or 0x9bff0.

Values 0x10001 to 0xFEFFFE

neighbor

Syntax **neighbor** *ip-address* [**create**]
no neighbor *ip-address*

Context **[Tree]** (config>service>vpls>gsmp>group neighbor)
[Tree] (config>service>vprn>gsmp>group neighbor)

Full Context configure service vpls gsmp group neighbor
configure service vprn gsmp group neighbor

Description Commands in this context configure a GSMP ANCP neighbor parameters.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IP address of the GSMP ANCP neighbor.

create — Keyword used to create the neighbor instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms All

neighbor

Syntax [**no**] **neighbor** *ip-address* [**create**]

Context **[Tree]** (config>service>vprn>gsmp>group neighbor)

Full Context configure service vprn gsmp group neighbor

Description This command adds a neighbor in the GSMP group.

The **no** form of this command removes the neighbor from the GSMP group.

Parameters *ip-address* — Specifies the IP address in dotted decimal notation.

create — This keyword is mandatory when creating a GSMP group name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms All

neighbor

Syntax [**no**] **neighbor** *ip-int-name*

Context **[Tree]** (config>router>rip>group neighbor)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>router>ripng>group neighbor)
[Tree] (config>service>vprn>rip>group neighbor)

Full Context configure router rip group neighbor
configure router ripng group neighbor
configure service vprn rip group neighbor

Description This command creates a context for configuring a RIP neighbor interface. By default, group interfaces are not activated with RIP, unless explicitly configured. The BNG only learns RIP routes from IPv4 host on the group interface. The RIP neighbor group interface defaults to **none**. The send operation is unchangeable for group-interface.

The **no** form of this command deletes the RIP interface configuration for this group interface. The shutdown command in the **config>router>rip>group group-name>neighbor** context can be used to disable an interface without removing the configuration for the interface.

Default no neighbor

Parameters *ip-int-name* — Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

Platforms All

neighbor

Syntax **neighbor** *ipv6-address mac-address*
no neighbor *ipv6-address*

Context [Tree] (config>service>ies>if>ipv6 neighbor)

Full Context configure service ies interface ipv6 neighbor

Description This command configures IPv6-to-MAC address mapping on the IES interface.

Parameters *ipv6-address* — The IPv6 address of the interface for which to display information.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mac-address — Specifies the 48-bit MAC address for the IPv6-to-MAC address mapping in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms All

neighbor

Syntax **neighbor** *ip-address*
no neighbor

Context **[Tree]** (config>port>aps neighbor)

Full Context configure port aps neighbor

Description This command specifies the neighbor's IP address only on a multi-chassis APS where the working and protect circuits are configured on different routers. When the value the neighbor IP address is set to 0.0.0.0, this implies that the APS group is configured as a single-chassis APS group.

The route to the neighbor must not traverse the multi-chassis APS member (working or protect) circuits. It is recommended that the neighbor IP address configured is on a shared network between the routers that own the working and protect circuits.

By default no neighbor address is configured and both the working and protect circuits should be configured on the same router (i.e., single-chassis APS). APS is assumed to be configured wholly on a single chassis.

Parameters *ip-address* — Specifies the neighbor's IP address only on a multi-chassis APS where the working and protect circuits are configured on different routers. The node should be connected with a direct interface to ensure optimum fail-over time.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x:-[0 to FFFF]H
	d: [0 to 255]D

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

neighbor

Syntax [**no**] **neighbor** *ip-address*

Context **[Tree]** (config>router>bgp>group neighbor)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router bgp group neighbor

Description This command creates a BGP peer/neighbor instance within the context of the BGP group.

This command can be issued repeatedly to create multiple peers and their associated configuration.

The **no** form of this command is used to remove the specified neighbor and the entire configuration associated with the neighbor. The neighbor must be administratively **shutdown** before attempting to delete it. If the neighbor is not shutdown, the command will not result in any action except a warning message on the console indicating that neighbor is still administratively up.

Default no neighbor

Parameters *ip-address* — Specifies the IP address of the BGP peer router in dotted decimal notation.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: 32 characters maximum, mandatory for link local addresses

Platforms All

neighbor

[Tree] (config>service>vprn>ospf3>area>if neighbor)

Full Context configure service vprn ospf area interface neighbor
configure service vprn ospf3 area interface neighbor

Description This command configures an OSPF non-broadcast multi-access (NBMA) neighbor. The OSPF interface must be configured as an NBMA interface with the **interface-type non-broadcast** command. An NBMA network has no broadcast or multicast capabilities, so the router cannot discover its neighbors dynamically. All neighbors must be configured statically with the **neighbor** command.

In addition to configuring the OSPF NBMA neighbor's IP address, the neighbor's MAC address may need to be configured with the **config>service>vprn>interface>static-arp** command for OSPFv2 neighbors using its IPv4 address, and the **config>service>vprn>interface>ipv6>neighbor** command for OSPFv3 neighbors using its IPv6 link-local address.

The **no** form of this command removes the **neighbor** configuration.

Default No OSPF NBMA neighbors are configured.

Parameters *ip-address* — Specifies the OSPFv2 neighbor's IPv4 address or the OSPFv3 neighbor's IPv6 link-local address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x [-interface]
	x:x:x:x:x:x:d.d.d.d [-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface —32 characters max, for link local addresses.

Platforms All

neighbor

Syntax **neighbor** *ipv6-address mac-address*
no neighbor *ipv6-address*

Context **[Tree]** (config>router>if>ipv6 neighbor)

Full Context configure router interface ipv6 neighbor

Description This command configures an IPv6-to-MAC address mapping on the interface. Use this command if a directly attached IPv6 node does not support ICMPv6 neighbor discovery, or for some reason, a static address must be used. This command can only be used on Ethernet media.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The *ipv6-address* must be on the subnet that was configured from the IPv6 **address** command or a link-local address.

Parameters *ipv6-address* — The IPv6 address assigned to a router interface.

Values		
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

mac-address — Specifies the MAC address for the neighbor in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

Platforms All

neighbor

Syntax **neighbor** [*ip-int-name*]
no neighbor

Context **[Tree]** (debug>router>ip neighbor)

neighbor

Syntax [**no**] **neighbor** *ipv4-address*
[**no**] **neighbor** *ipv6-address*

Context **[Tree]** (config>router>ospf>area>interface neighbor)
[Tree] (config>router>ospf3>area>interface neighbor)

Full Context configure router ospf area interface neighbor
configure router ospf3 area interface neighbor

Description This command configures an OSPF non-broadcast multi-access (NBMA) neighbor. The OSPF interface must be configured as an NBMA interface with the **interface-type non-broadcast** command. An NBMA network has no broadcast or multicast capabilities, so the router cannot discover its neighbors dynamically. All neighbors must be configured statically with the **neighbor** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In addition to configuring the OSPF NBMA neighbor's IP address, the neighbor's MAC address may need to be configured with the **config>router>interface>static-arp** command for OSPFv2 neighbors using its IPv4 address, and the **config>router>interface>ipv6>neighbor** command for OSPFv3 neighbors using its IPv6 link-local address.

The **no** form of this command removes the **neighbor** configuration.

Default no neighbor

Parameters *ipv4-address* — Specifies the OSPFv2 neighbor's IPv4 address.

Values ipv4-address — a.b.c.d

ipv6-address — Specifies the OSPFv3 neighbor's IPv6 link-local address.

Values

ipv6-address:	x:x:x:x:x:x:x:x [-interface]
	x:x:x:x:x:x:d.d.d.d [-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface — 32 characters maximum for link local addresses.

Syntax **neighbor** {*ip-address* | **prefix-list** *name*}
no neighbor

Context **[Tree]** (config>router>policy-options>policy-statement>entry>to neighbor)
[Tree] (config>router>policy-options>policy-statement>entry>from neighbor)

Full Context configure router policy-options policy-statement entry from neighbor
configure router policy-options policy-statement entry to neighbor

Description This command specifies the neighbor address as found in the source address of the actual join and prune message as a filter criterion. If no neighbor is specified, any neighbor is considered a match.

The **no** form of the of the command removes the neighbor IP match criterion from the configuration.

Default no neighbor

Parameters *ip-address* — Specifies the neighbor IP address in dotted decimal notation.

Values ipv4-address:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: 32 characters maximum, mandatory for link local addresses

prefix-list *name* — Specifies the prefix-list name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The *name* specified must already be defined.

Full Context configure service ies subscriber-interface group-interface ipv6 nd neighbor-limit
configure service vprn subscriber-interface group-interface ipv6 nd neighbor-limit

Description This command configures the maximum number of neighbors learned for a single host by doing neighbor discovery.

The **no** form of this command reverts to the default.

Default neighbor-limit 1

Parameters *value* — Specifies the maximum number of neighbors learned.

Values 1 to 8

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

neighbor-limit

Syntax **neighbor-limit** *limit* [**log-only**] [**threshold** *percent*]
no neighbor-limit

Context [Tree] (config>service>ies>if>ipv6 neighbor-limit)

Full Context configure service ies interface ipv6 neighbor-limit

Description This command configures the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface.

When the number of dynamic neighbor entries reaches the configured percentage of this limit, an SNMP trap is sent. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations is dropped. Entries that have already been learned is refreshed.

The **no** form of this command removes the **neighbor-limit**.

Default no neighbor-limit

Parameters **log-only** — Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, entries above the limit is learned.

percent — The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

limit — The number of entries that can be learned on an IP interface expressed as a decimal integer. If the limit is set to 0, dynamic neighbor learning is disabled and no dynamic neighbor entries are learned.

Values 0 to 102400

Context [Tree] (config>router>if>ipv6 neighbor-limit)

Full Context configure router interface ipv6 neighbor-limit

Description This command configures the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface.

When the number of dynamic neighbor entries reaches the configured percentage of this limit, an SNMP trap is sent. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations will be dropped. Entries that have already been learned will be refreshed.

The **no** form of this command removes the neighbor-limit.

Default no neighbor-limit

Parameters *limit* — The number of entries that can be learned on an IP interface expressed as a decimal integer. If the limit is set to 0, dynamic neighbor learning is disabled and no dynamic neighbor entries are learned.

Values 0 to 102400

log-only — Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, entries above the limit will be learned.

percent — The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

18.49 neighbor-trust

neighbor-trust

Syntax **neighbor-trust** [**vpn-ipv4**] [**vpn-ipv6**]
no neighbor-trust

Context **[Tree]** (config>router>bgp neighbor-trust)

Full Context configure router bgp neighbor-trust

Description This command enables a label security feature for prefixes of a VPN family at an inter-AS boundary.

This label security feature allows the configuration of a router, acting in a PE and/or in an ASBR role, to accept packets of VPRN prefixes only from direct EBGP neighbors to which it advertised a VPRN label.

The untrusted state identifies the participating interfaces. The router supports a maximum of 15 network interfaces that can participate in this feature.

At a high level, BGP tracks each direct EBGP neighbor over an untrusted interface and to which it sent a VPRN prefix label. For each of those VPRN prefixes, BGP programs a bit map in the ILM record that indicates, on per-untrusted interface basis, whether the matching received packets must be forwarded or dropped.

The **no** form of this command disables the inter-AS security feature for the VPN family.

Parameters **vpn-ipv4** — Enables the inter-AS label security for VPN IPv4 family.

vpn-ipv6 — Enables the inter-AS label security for VPN IPv6 family.

configure service vprn dhcp local-dhcp-server pool options netbios-name-server
configure subscriber-mgmt local-user-db ipoe host options netbios-name-server
configure subscriber-mgmt local-user-db ppp host options netbios-name-server

Description This command configures up to four Network Basic Input/Output System (NetBIOS) name server IP addresses for a DHCP client.

The **no** form of this command removes the IP address from the netbios-name-server configuration.

Parameters *ip-address* — Specifies up to four NetBIOS name server IP addresses. The address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.52 netbios-node-type

netbios-node-type

[Tree] (config>service>vprn>dhcp>server>pool>options netbios-node-type)

Full Context configure router dhcp local-dhcp-server pool options netbios-node-type
configure service vprn dhcp local-dhcp-server pool options netbios-node-type
configure subscriber-mgmt local-user-db ipoe host options netbios-node-type

Description This command configures the Network Basic Input/Output System (NetBIOS) node type.

The **no** form of this command removes the NetBIOS node type parameters from the configuration.

Parameters *netbios-node-type* — Specifies the netbios node type.

Values B — Broadcast node uses broadcasting to query nodes on the network for the owner of a NetBIOS name.

P — Peer-to-peer node uses directed calls to communicate with a known NetBIOS name server for the IP address of a NetBIOS machine name.

M — Mixed node uses broadcast queries to find a node, and if that fails, queries a known P-node name server for the address.

H — Hybrid node is the opposite of the M-node action so that a directed query is executed first, and if that fails, a broadcast is attempted.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.54 netconf-stream

netconf-stream

Syntax **netconf-stream** *stream-name*
no netconf-stream

Context [Tree] (config>li>log>log-id netconf-stream)

Full Context configure li log log-id netconf-stream

Description This command is used to associate a NETCONF stream name with a Lawful Intercept log ID. The NETCONF stream name must be unique in the Lawful Intercept context of the SR OS device. For the same Lawful Intercept log ID, the **to netconf** command must be configured for a subscription to that NETCONF stream name to be accepted. If the NETCONF stream is changed, active subscriptions to the changed stream name are terminated by SR OS.

The **no** form of this command removes a NETCONF stream name from a Lawful Intercept log ID. Active subscriptions to the removed stream name are terminated by SR OS.

Parameters *stream-name* — Specifies a NETCONF stream name, up to 32 characters.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

netconf-stream

Syntax **netconf-stream** *stream-name*
no netconf-steam

Context **[Tree]** (config>log>log-id netconf-stream)

Full Context configure log log-id netconf-stream

Description This command is used to associate a NETCONF stream name with a log ID. The NETCONF stream name must be unique per SR OS device. For the same log ID, **to netconf** must be configured for a subscription to that NETCONF stream name to be accepted. A **netconf-stream** cannot be set to “NETCONF” as “NETCONF” is reserved for log-id 101. If a **netconf-stream** is changed, active subscriptions to the changed stream name are terminated by SR OS.

The **no** form of this command removes a NETCONF stream name from a log ID. Active subscriptions to the removed stream name are terminated by SR OS.

Parameters *stream-name* — Specifies a NETCONF stream name, up to 32 characters.

network

Syntax **network** *network-policy-id* [**create**] [**name** *name*]
no network *network-policy-id*

Context **[Tree]** (config>qos network)

Full Context configure qos network

Description This command creates or edits a QoS network policy. The network policy defines the treatment that IP or MPLS packets receive as they ingress and egress the network port.

The QoS network policy consists of an ingress and egress component. The ingress component of the policy defines how DiffServ code points and MPLS EXP bits are mapped to internal forwarding class and profile state. The forwarding class and profile state define the Per Hop Behavior (PHB) or the QoS treatment through the router. The mapping on each network interface defaults to the mappings defined in the default network QoS policy until an explicit policy is defined for the network interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The egress component of the network QoS policy defines the queuing parameters associated with each forwarding class. Each of the forwarding classes defined within the system automatically creates a queue on each network interface. This queue gets all the parameters defined within the default network QoS policy 1 until an explicit policy is defined for the network interface access uplink port. If the egressing packet originated on an ingress SAP, or the remarking parameter is defined for the egress interface, the egress QoS policy also defines the IP DSCP, dot1p/DE, or MPLS EXP bit marking based on the forwarding class and the profile state.

Network **policy-id 1** exists as the default policy that is applied to all network interfaces by default. The network **policy-id 1** cannot be modified or deleted. It defines the default DSCP-to-FC mapping and MPLS EXP-to-FC mapping for the ingress. For the egress, it defines six forwarding classes that represent individual queues and the packet marking criteria.

Network **policy-id 1** exists as the default policy that is applied to all network ports by default. This default policy cannot be modified or deleted. It defines the default DSCP-to-FC mapping and default unicast meters for ingress IP traffic. For the egress, it defines the forwarding class to dot1p and DSCP values and the packet marking criteria.

If a new network policy is created (for instance, policy-id 3), only the default action and egress forwarding class parameters are identical to the default policy. A new network policy does not contain the default DSCP-to-FC and MPLS-EXP-to-FC mapping for network QoS policy of type **ip-interface** or the DSCP-to-FC mapping (for network QoS policy of type **port**). The default network policy can be copied (use the copy command) to create a new network policy that includes the default ingress DSCP-to-FC and MPLS EXP-to-FC mapping (as appropriate). Parameters can be modified, or the **no** form of this command can be used to remove an object from the configuration.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all network interfaces where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area policy-id. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the config qos copy command to maintain policies in this manner.

The **no** form of this command deletes the network policy. A policy cannot be deleted until it is removed from all entities where it is applied. The default network **policy** *policy-id* 1 cannot be deleted.

Default network 1 — System Default Network Policy 1

Parameters *network-policy-id* — The policy-id uniquely identifies the policy on the router.

Values 1 to 65535

Default 1

create — Required parameter when creating a QoS network policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

name *name* — A name that is saved as part of the configuration data. If a name is not specified at creation time, then SR OS assigns a string version of the network policy identifier as the name.

Values A string up to 64 characters

Platforms All

network

Syntax **network** *src-pol dst-pol* [**overwrite**]

Context **[Tree]** (config>qos>copy network)

Full Context configure qos copy network

Description This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is used to create new policies using existing policies and also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters *src-pol dst-pol* — Indicates that the source and destination policies are network policy IDs. Specify the source policy that the copy command will copy and specify the destination policy to which the command will duplicate the policy to a new or different policy ID.

Values 1 to 65535

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, the following error occurs if the destination policy ID exists.

```
SR>config>qos# copy network 1 427
MINOR: CLI Destination "427" exists use {overwrite}.
SR>config>qos# copy network 1 427 overwrite
```

Context [Tree] (config>app-assure>group>policy>app-filter>entry network-address)

Full Context configure application-assurance group policy app-filter entry network-address

Description This command configures the network address to use in application definition. The network address will match the destination IP address in a from-sub flow or the source IP address in a to-sub flow.

The **no** form of this command restores the default (removes the network address from application criteria defined by this entry).

Default no network-address

Parameters **eq** — Specifies a comparison operator indicating that the value configured and the value in the flow are equal.

neq — Specifies a comparison operator indicating that the value configured differs from the value in the flow.

ip-address — Specifies a valid unicast address.

Values

ipv4-address	a.b.c.d[/mask]
	mask - [1..32]
ipv6-address	x:x:x:x:x:x:x:x/prefix-length
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
	prefix-length [1..128]

ip-prefix-list-name — Specifies the name of an IP prefix list, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.57 network-domain

network-domain

Syntax [**no**] **network-domain** *network-domain-name*

Context [Tree] (config>router>network-domains network-domain)

Full Context configure router network-domains network-domain

Description This command creates network-domains that can be associated with individual interfaces and SDPs.

Use subject to Terms available at: www.nokia.com

Default network-domain “default”

Parameters *network-domain-name* — Specifies the network domain name, up to 32 characters.

Platforms All

network-domain

Syntax [**no**] **network-domain** *network-domain-name*

Context **[Tree]** (config>router>if network-domain)

Full Context configure router interface network-domain

Description This command assigns a given interface to a given network-domain. The network-domain is then taken into account during sap-ingress queue allocation for VPLS SAP.

The network-domain association can only be done in a base-routing context. Associating a network domain with an loop-back or system interface will be rejected. Associating a network-domain with an interface that has no physical port specified will be accepted, but will have no effect as long as a corresponding port, or LAG, is defined.

Single interfaces can be associated with multiple network-domains.

Default network-domain “default”

Platforms All

network-domain

Syntax **network-domain** *network-domain-name*
no network-domain

Context **[Tree]** (config>service>sdp network-domain)

Full Context configure service sdp network-domain

Description This command assigns a given SDP to a given network-domain. The network-domain is then taken into account during sap-ingress queue allocation for VPLS SAP.

The network-domain association can only be done in a base-routing context. Associating a network domain with an loop-back or system interface will be rejected. Associating a network-domain with an interface that has no physical port specified will be accepted, but will have no effect as long as a corresponding port, or LAG, is undefined.

A single SDP can only be associated with a single network-domain.

Default network-domain "default"

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command associates the VXLAN instance with the virtual Ethernet Segment. The association of the virtual ES is based on the VXLAN instance and range of services where the VXLAN instance is configured.

The **no** form of this command removes the VXLAN instance from the Ethernet Segment association.

Parameters *instance* — Specifies the VXLAN instance that is to be associated with the virtual ES.

Values 1

Platforms All

18.61 network-interface

network-interface

Syntax **network-interface** *interface-name* [**create**]
no network-interface *interface-name*

Context **[Tree]** (config>service>vprn network-interface)

Full Context configure service vprn network-interface

Description This command configures a network interface in a VPRN that acts as a CSC interface to a CSC-CE in a Carrier Supporting Carrier IP VPN deployment model.

Parameters *interface-name* — Specifies the name of the interface to be added.

create — Keyword used to create the network interface.

Platforms All

18.62 network-ip

network-ip

Syntax **network-ip** *ip-address*[*/mask*]
no network-ip

Context **[Tree]** (config>app-assure>group>transit-prefix-policy>entry>match network-ip)

Full Context configure application-assurance group transit-prefix-policy entry match network-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures an entry for an address of prefix transit aa-sub and is used when the site is a remote site on the same opposite side of the system as the parent SAP. The network IP addresses represents the dest-IP in the from-SAP direction and src-IP in the to-SAP direction.

The **no** form of this command removes the network IP address/mask from the match criteria.

Parameters *ip-address[/mask]* — specifies the network address prefix and length associated with this transit prefix policy entry.

Values

ip-address[/mask]: ipv4-address - a.b.c.d[/mask]
mask - [1..32]
ipv6-address - x:x:x:x:x:x:x:x/prefix-length
x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D
prefix-length [1..128]

18.63 network-queue

network-queue

Syntax **network-queue** *policy-name* [**create**]
no network-queue *policy-name*

Context **[Tree]** (config>qos network-queue)

Full Context configure qos network-queue

Description This command creates a context to configure a network queue policy. Network queue policies define the ingress network queuing at the FP network node level and on the Ethernet port and SONET/SDH path level to define network egress queuing.

Default network-queue “default”

Parameters *policy-name* — The name of the network queue policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

create — Required keyword when creating a network queue policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

network-queue

Syntax **network-queue** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy network-queue)

Full Context configure qos copy network-queue

Description This command copies or overwrites existing network queue QoS policies to another network queue policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters **network-queue** — Indicates that the source policy ID and the destination policy ID are network-queue policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, the following message is generated indicating that the destination policy ID exists.

```
SR7>config>qos# copy network-queue nq1 nq2
MINOR: CLI Destination "nq2" exists - use {overwrite}.
SR7>config>qos# copy network-queue nq1 nq2 overwrite
```

Platforms All

18.64 network-rtt-threshold

network-rtt-threshold

Syntax **network-rtt-threshold** *network-rtt-threshold*
no network-rtt-threshold

Context **[Tree]** (config>app-assure>group>tcp-optimizer network-rtt-threshold)

Full Context configure application-assurance group tcp-optimizer network-rtt-threshold

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the threshold of the Route Trip Time (RTT) delay of the network side (between AA and the content provider) above which TCP Optimization (TCPO) is performed. This enables the operator to disable optimization for content that is served from a location close to the TCP optimizer.

Default no network-rtt-threshold

Parameters *network-rtt-threshold* — Specifies the network side RTT delay threshold, inmilliseconds.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.65 network-type

network-type

Syntax **network-type** {**sdh** | **sonet**}

Context **[Tree]** (config>system>ptp network-type)

Full Context configure system ptp network-type

Description This command configures the codeset to be used for the encoding of QL values into PTP clockClass values when the profile is configured for G.8265.1. The codeset is defined in Table 1/G.8265.1. This setting only applies to the range of values observed in the clockClass values transmitted out of the node in Announce messages. The router will support the reception of any valid value in Table 1/G.8265.1

Default network-type sdh

Parameters **sdh** — Specifies the values used on a G.781 Option 1 compliant network.

sonet — Specifies the values used on a G.781 Option 2 compliant network.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.66 new-password-at-login

new-password-at-login

Syntax [**no**] **new-password-at-login**

Context **[Tree]** (config>system>security>user>console new-password-at-login)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system security user console new-password-at-login

Description This command forces the user to change a password at the next console login. The new password applies to FTP but the change can be enforced only by the console, SSH, or Telnet login.

The **no** form of this command does not force the user to change passwords.

Default no new-password-at-login

Platforms All

18.67 new-qinq-untagged-sap

new-qinq-untagged-sap

Syntax [**no**] **new-qinq-untagged-sap**

Context **[Tree]** (config>system>ethernet new-qinq-untagged-sap)

Full Context configure system ethernet new-qinq-untagged-sap

Description This command controls the behavior of QinQ SAP y.0 (for example, 1/1/1:3000.0). If the flag is not enabled (no new-qinq-untagged-sap), the y.0 SAP works the same as the y.* SAP (for example, 1/1/1:3000.*); all frames tagged with outer VLAN y and no inner VLANs or inner VLAN x where inner VLAN x is not specified in a SAP y.x configured on the same port (for example, 1/1/1:3000.10).

If the flag is enabled, then the following new behavior immediately applies to all existing and future y.0 SAPs: the y.0 SAP maps all the ingress frames tagged with outer tag VLAN-id of y (qinq-etype) and no inner tag or with inner tag of VLAN-id of zero (0). When the flag is disabled, there is no disruption for existing usage of this SAP type.

Default no new-qinq-untagged-sap.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, VSR

18.68 new-session-id

new-session-id

Syntax [**no**] **new-session-id**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>subscr-mgmt>diam-appl-plcy>gy>efh new-session-id)

Full Context configure subscriber-mgmt diameter-application-policy gy extended-failure-handling new-session-id

Description This command determines the Diameter session ID when Extended Failure Handling (EFH) is active and an attempt is made to establish a new Diameter Gy session with the Online Charging Server (OCS). An attempt to establish a new Diameter Gy session is made when the allocated interim credit is used or the validity time expires for a rating group of a Diameter Gy session. The first attempt always uses a new Diameter session ID. This command controls the behavior for each subsequent attempt. The behavior is as follows:

- no new-session-id (default) — The same Diameter session ID is used for each subsequent attempt.
- new-session-id — A new Diameter session ID is used for each attempt.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.69 newline

newline

Syntax [**no**] **newline**

Context [Tree] (config>system>management-interface>cli>md-cli>environment>prompt newline)

Full Context configure system management-interface cli md-cli environment prompt newline

Description This command displays a new line before the first prompt line.

The **no** form of this command suppresses the new line before the first prompt line.

Default newline

Platforms All

18.70 next

next

Syntax [**no**] **next**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>nat>pcp-server-policy>option next)

Full Context configure service nat pcp-server-policy option next

Description This command enables support for the **next** option.

The **no** form of this command reverts to the default.

Default no next

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.71 next-attempt

next-attempt

Syntax **next-attempt** {**same-preference-level** | **next-preference-level**}
no next-attempt

Context [Tree] (config>router>l2tp next-attempt)
[Tree] (config>service>vprn>l2tp next-attempt)

Full Context configure router l2tp next-attempt
configure service vprn l2tp next-attempt

Description This command enables tunnel selection algorithm based on the tunnel preference level.

The **no** form of this command reverts to the default.

Default next-attempt next-preference-level

Parameters **same-preference-level** — If the **tunnel-spec** selection algorithm evaluates into a tunnel that is currently unavailable (for example, a tunnel in a denylist) then the next elected tunnel, if available, is chosen within the same preference-level as the last attempted tunnel. Only when all tunnels within the same preference level are exhausted, the tunnel selection algorithm moves to the next preference level.

In case that a new session setup request is received while all tunnels on the same preference level are denylisted, the L2TP session tries to be established on denylisted tunnels before the tunnel selection moves to the next preference level.

next-preference-level — If the **tunnel-spec** selection algorithm evaluates into a tunnel that is currently unavailable (for example tunnel in a denylist) then the selection algorithm tries to select the tunnel from the next preference level, even though the tunnels on the same preference level might be available for selection.

Default next-preference-level

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.72 next-header

next-header

Syntax **next-header** *next-header*
no next-header

Context **[Tree]** (config>system>security>mgmt-access-filter>ipv6-filter>entry next-header)

Full Context configure system security management-access-filter ipv6-filter entry next-header

Description This command specifies the next header to match. The protocol type such as TCP, UDP or OSPF is identified by its respective protocol number. Well-known protocol numbers include ICMP(1), TCP(6), UDP(17). IPv6 Extension headers are identified by the next header IPv6 numbers as per RFC2460. This command only applies to the 7750 SR and 7950 XRS.

Parameters *next-header* — Specifies for IPv4 MAF the IP protocol field, and for IPv6 the next header type to be used in the match criteria for this Management Access Filter Entry.

Values

next-header:	0 to 255, protocol numbers accepted in DHB
keywords:	none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, drp, igmp, igp, ip, ipv6, ipv6-icmp, ipv6-no-nxt, isis, iso-ip, l2tp, spf-igp, pim, pnni, ptp, rdp, rsvp, stp, tcp, udp, vrrp

Platforms All

18.73 next-hop

next-hop

Syntax **next-hop** {*ip-address* | *ip-int-name* | *ipv6 address*}

Context **[Tree]** (config>service>vprn>static-route-entry next-hop)

Full Context configure service vprn static-route-entry next-hop

Description This command specifies the directly connected next hop IP address or interface used to reach the destination. If the next hop is over an unnumbered interface or a point-to-point interface, the *ip-int-name* of the unnumbered or point-to-point interface (on this node) can be configured.

If the next hop is over an unnumbered interface in the 7450 ESS router, the *ip-int-name* of the unnumbered interface (on this node) can be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The configured *ip-address* can be either on the network side or the access side on this node. The address must be associated with a network directly connected to a network configured on this node.

Default no next-hop

Parameters *ip-int-name, ipv4-address, ipv6-address* — the IP-INT, IPv4, and IPv6 addresses

Values The following values apply to the 7750 SR and 7950 XRS:

ip-int-name	32 characters max
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface] x:x:x:x:x:x:d.d.d.d[-interface] x: [0 to FFFF]H d: [0 to 255]D interface: 32 characters maximum, mandatory for link local addresses

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

Platforms All

next-hop

Syntax **next-hop** *ip-address*
no next-hop

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy>nh-grp>bkup next-hop)
[Tree] (config>router>mpls>fwd-policies>fwd-policy>nh-grp>pri next-hop)

Full Context configure router mpls forwarding-policies forwarding-policy next-hop-group backup-next-hop next-hop
configure router mpls forwarding-policies forwarding-policy next-hop-group primary-next-hop next-hop

Description This command configures the address of primary or backup next hop of an NHG entry in a forwarding policy.

The **no** form of this command removes the address of primary or backup next hop of an NHG entry in a forwarding policy.

Parameters *ip-address* — Specifies the destination IPv4 or IPv6 address.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2022 Nokia.

next-hop

Syntax **next-hop** {*ip-int-name* | *ip-address* | *ipv6-address*}

Context **[Tree]** (config>router>static-route-entry next-hop)

Full Context configure router static-route-entry next-hop

Description This command specifies the directly connected next hop IP address or interface used to reach the destination. If the next hop is over a point-to-point unnumbered interface, the **ip-int-name** of the unnumbered point-to-point interface (on this node) can be configured.

If the next hop is over an unnumbered interface in the 7450 ESS router, the *ip-int-name* of the unnumbered interface (on this node) can be configured.

The configured *ip-address* can be either on the network side or the access side on this node. The address must be associated with a network directly connected to a network configured on this node.

Default no next-hop

Parameters *ip-int-name* | *ip-address* | *ipv6-address* — Specifies the interface or IPv4/IPv6 address of the next hop.

Values The following values apply to the 7750 SR, 7450 ESS, and 7950 XRS:

ip-int-name	32 characters max
ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface] x:x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

next-hop

Syntax [**no**] **next-hop** *ip-address*

Context **[Tree]** (config>vrrp>policy>priority-event>route-unknown next-hop)

Full Context configure vrrp policy priority-event route-unknown next-hop

Description This command enables an allowed next hop IP address to match the IP route prefix for a route-unknown priority control event.

If the next-hop IP address does not match one of the defined *ip-address*, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **next-hop** command is optional. If no **next-hop** *ip-address* commands are configured, the comparison between the RTM prefix return and the **route-unknown** IP route prefix are not included in the next hop information.

When more than one next hop IP addresses are eligible for matching, a **next-hop** command must be executed for each IP address. Defining the same IP address multiple times has no effect after the first instance.

The **no** form of the command removes the *ip-address* from the list of acceptable next hops when looking up the **route-unknown** prefix. If this *ip-address* is the last next hop defined on the **route-unknown** event, the returned next hop information is ignored when testing the match criteria. If the *ip-address* does not exist, the **no next-hop** command returns a warning error, but continues to execute if part of an **exec** script.

Default no next-hop — No next hop IP address for the route unknown priority control event is defined.

Parameters *ip-address* — The IP address for an acceptable next hop IP address for a returned route prefix from the RTM when looking up the **route-unknown** route prefix.

Values The following values apply to the 7450 ESS:
ipv4-address: a.b.c.d

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x[-interface]	
	x:	[0..FFFF]H
	interface:	32 chars maximum, mandatory for link local addresses

The link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

Platforms All

Use subject to Terms available at: www.nokia.com

next-hop

Syntax **next-hop** *ip-address*
next-hop prefix-list *name*
no next-hop

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from next-hop)

Full Context configure router policy-options policy-statement entry from next-hop

Description This command enables BGP routes to be matched based on the BGP next-hop address. The match condition is evaluated against the IPv4 or IPv6 address in the NEXT_HOP or MP_REACH_NLRI attribute.

When the next-hop match is applied to VPN-IP routes, the Route Distinguisher (RD) is ignored.

A non-BGP route does not match a policy entry if it contains the **next-hop** command.

Default no next-hop

Parameters *ip-address* — An IPv4 or IPv6 address.

Values a.b.c.d or x:x:x:x:x:x:x:x or x:x:x:x:x:x:d.d.d.d

name — Specifies the name of a prefix-list (up to 32 characters).

prefix-list — Specifies that the BGP next hop should be matched against a prefix-list instead of an individual IP address.

Platforms All

next-hop

Syntax **next-hop** {*ip-address* | **peer-address**}
no next-hop

Context **[Tree]** (config>router>policy-options>policy-statement>default-action next-hop)
[Tree] (config>router>policy-options>policy-statement>entry>action next-hop)

Full Context configure router policy-options policy-statement default-action next-hop
configure router policy-options policy-statement entry action next-hop

Description This command assigns the specified next hop IP address to routes matching the policy statement entry.

If a next-hop IP address is not specified, the next-hop attribute is not changed.

The **no** form of this command disables assigning a next hop address in the route policy entry.

Default no next-hop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the next hop IP address in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
param-name:	The next-hop parameter variable name.
	Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

peer-address — Set the next-hop IP address to the peer’s IP address.

Full Context configure router mpls forwarding-policies forwarding-policy next-hop-group

Description This command configures an NHG entry in an MPLS forwarding policy.

Each NHG can have primary and backup next hops of the same type.

The **no** form of this command removes the NHG from the MPLS forwarding policy.

Parameters *index* — Specifies the index value.

Values 1 to 32

direct — Specifies the direct resolution type.

indirect — Specifies the indirect resolution type.

Platforms All

18.76 next-hop-id

next-hop-id

Syntax [**no**] **next-hop-id** *next-hop-id-index*

18.79 next-hop-self

next-hop-self

Syntax [**no**] **next-hop-self**

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy next-hop-self)

Full Context configure subscriber-mgmt bgp-peering-policy next-hop-self

Description This command configures the neighbor to always set the NEXTHOP path attribute to its own physical interface when advertising to a peer.

The **no** form of this command disables the command.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

next-hop-self

Syntax [**no**] **next-hop-self**

Context **[Tree]** (config>service>vprn>bgp>group next-hop-self)
[Tree] (config>service>vprn>bgp>group>neighbor next-hop-self)

Full Context configure service vprn bgp group neighbor next-hop-self
configure service vprn bgp group next-hop-self

Description This command configures the group or neighbor to always set the NEXTHOP path attribute to its own physical interface when advertising to a peer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This is primarily used to avoid third-party route advertisements when connected to a multi-access network.

The **no** form of this command used at the group level allows third-party route advertisements in a multi-access network.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no next-hop-self — Third-party route advertisements are allowed.

Platforms All

next-hop-self

Syntax [**no**] **next-hop-self**

Context **[Tree]** (config>router>bgp>group next-hop-self)
[Tree] (config>router>bgp>group>neighbor next-hop-self)

Full Context configure router bgp group neighbor next-hop-self
configure router bgp group next-hop-self

Description This command enables BGP to advertise routes to members of a group or to a specific neighbor using a local address of the BGP instance as the BGP next-hop address. Note that **next-hop-self** is set without exception, regardless of the route source (EBGP or IBGP) or its family. When used with VPN-IPv4 and VPN-IPv6 routes the **enable-rr-vpn-forwarding** command should also be configured.

The **no** form of this command uses protocol standard behavior to decide whether or not to set **next-hop-self** in advertised routes.

Default no next-hop-self

Platforms All

next-hop-self

Syntax [**no**] **next-hop-self**

Full Context configure router policy-options policy-statement default-action next-hop-self
configure router policy-options policy-statement entry action next-hop-self

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures BGP to advertise routes that match a policy entry (or that match no other policy entry and, therefore, to which the default action applies) using a local address of the BGP instance as the BGP next-hop address. The command applies to IPv4, IPv6, label-IPv4, and label-IPv6 routes. It also applies to VPN-IPv4 and VPN-IPv6 routes, but only when used in conjunction with the **enable-rr-vpn-forwarding** command.

This command affects how routes are advertised to IBGP peers, regardless of whether or not they were learned from an IBGP or EBGP peer

The **no** form of this command uses protocol standard behavior to decide whether or not to set **next-hop-self** in advertised routes.

Default no next-hop-self

Platforms All

18.80 next-hop-unchanged

next-hop-unchanged

Syntax **next-hop-unchanged** [**label-ipv4**] [**label-ipv6**] [**vpn-ipv4**] [**vpn-ipv6**] [**evpn**]
no next-hop-unchanged

Context **[Tree]** (config>router>bgp>group next-hop-unchanged)
[Tree] (config>router>bgp>group>neighbor next-hop-unchanged)

Full Context configure router bgp group neighbor next-hop-unchanged
configure router bgp group next-hop-unchanged

Description This command enables unchanged BGP next-hops when sending BGP routes to peers in this group or neighbor.

The **no** form of this command disables unchanged BGP next-hops.

Default no next-hop-unchanged

Parameters **evpn** — Specifies BGP next hops are unchanged for the evpn address family.

label-ipv4 — Specifies BGP next hops are unchanged for the label-ipv4 address family.

label-ipv6 — Specifies BGP next hops are unchanged for the label-ipv6 address family.

vpn-ipv4 — Specifies BGP next hops are unchanged for the vpn-ipv4 address family.

vpn-ipv6 — Specifies BGP next hops are unchanged for the vpn-ipv6 address family.

18.81 nh-type

nh-type

Syntax **nh-type** {**ip** | **tunnel**}
no nh-type

Context **[Tree]** (config>router>route-next-hop-policy>template nh-type)

Full Context configure router route-next-hop-policy template nh-type

Description This command configures the next-hop type constraint into the route next-hop policy template.

The user can select if tunnel backup next-hop or IP backup next-hop is preferred. The default in SR OS implementation is to prefer IP next-hop over tunnel next-hop. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the next-hop type preference specified in the template.

The **no** form deletes the next-hop type constraint from the route next-hop policy template.

Default nh-type ip

Parameters **{ip | tunnel}** — Specifies the two possible values for the next-hop type.

Default ip

Platforms All

18.82 nmda

nmda

Syntax **nmda**

nmda-support

Syntax [**no**] **nmda-support**

Context **[Tree]** (config>system>management-interface>yang-modules>nmda nmda-support)

Full Context configure system management-interface yang-modules nmda nmda-support

Description This command enables the advertisement of NMDA support over NETCONF through the use of YANG library 1.1.

The **no** form of this command disables NMDA advertisement over NETCONF and YANG library 1.0 is used.

Default no nmda-support

Platforms All

18.84 no-match-action

no-match-action

Syntax **no-match-action** *action*
no no-match-action

Context **[Tree]** (config>open-flow>of-switch>flowtable no-match-action)

Full Context configure open-flow of-switch flowtable no-match-action

Description This command configures the action for the flow table when a packet does not match any entry for the controller.

The **no** form of this command restores the default action.

Default no-match-action fall-through

Parameters *action* — Specifies the action for the flow table.

Values drop - Specifies that packets that do not match entries in the flow table as programmed by the OpenFlow switch will be dropped.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

fall-through - Specifies that packets that do not match entries in the flow table as programmed by the OpenFlow switch will be forwarded using regular processing by the router. Fall-through applies if an error occurs that prevents a flow table from being installed in a filter policy.

packet-in - Specifies that packets that do not match entries in the flow table as programmed by the OpenFlow switch will be extracted and sent to the controller in a flow-controlled manner. If this action is used, an auxiliary channel should be enabled for packet-in processing using the **aux-channel-enable** command.

Platforms All

18.85 node

node

Syntax **node** *origin-host-string* [**destination-realm** *destination-realm-string*]
no diameter-node

Context **[Tree]** (config>aaa>diam node)

Full Context configure aaa diameter node

Description This command creates a Diameter client node in the SR OS. Multiple Diameter client nodes with their own peer definitions are simultaneously supported in SR OS.

Each such node is defined by a unique DiameterIdentity (the origin host and realm names).

The **no** form of this command removes the origin host string from the configuration.

Parameters *origin-host-string* — Specifies the origin host name, up to 80 characters, is a mandatory parameter that translates to an Origin-Host AVP that is carried in all Diameter messages. The origin host and origin realm form a Diameter Identity that must be unique within the Diameter network in which they participate.

destination-realm-string — Specifies the destination realm name, up to 80 characters, is an optional parameter that translates to an Origin-Realm AVP that is carried in all Diameter messages. The destination host and destination realm form a Diameter Identity that must be unique within the Diameter network in which they participate

If the realm name is not configured, it will be extracted from the host parameter as follows:

- it is set to the string after the first dot (.) in the configured origin-host-string
- it is set to the configured origin-host-string if a dot (.) is not present in the string

create — Keyword used to create the Diameter client node. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

node

Syntax [**no**] **node** *host-name*

Context **[Tree]** (debug>diameter node)

Full Context debug diameter node

Description This command debugs the Diameter node. Node-level debugging can report on all message exchange between the peers. Although this level can report messages that contain session id (app level messages), this level is session unaware. It deals strictly with getting the messages in and out of the system (connection level messages which are not routable, and application level messages which are routable).

Parameters *host-name* — Specifies the host name, up to 80 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.86 node-id

node-id

Syntax **node-id fqdn** *domain-name*
node-id use-ip-address

Context **[Tree]** (config>subscr-mgmt>pfcp-association node-id)

Full Context configure subscriber-mgmt pfcp-association node-id

Description This command configures the FQDN as sent in PFCP messages. This command can be configured to use the linked interface source IP address, or a pre-configured.

Default node-id use-ip-address

Parameters *domain-name* — Specifies the FQDN, up to 255 characters.

use-ip-address — Specifies to use the IP address of the interface configured for this association.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

node-id

Syntax **node-id** *node-id*
no node-id

Context **[Tree]** (config>router>mpls>mpls-tp node-id)

Full Context configure router mpls mpls-tp node-id

Description This command configures the MPLS-TP Node ID for the node. This is used as the 'from' Node ID used by MPLS-TP LSPs originating at this node. The default value of the node-id is the system interface IPv4 address. The Node ID may be entered in 4-octet IPv4 address format, <a.b.c.d>, or as an unsigned 32 bit integer. The Node ID is not treated as a routable IP address from the perspective of IP routing, and is not advertised in any IP routing protocols.

The MPLS-TP context cannot be administratively enabled unless at least a system interface IPv4 address is configured because MPLS requires that this value is configured.

Default no node-id

Parameters *node-id* — Specifies the MPLS-TP node ID for the node.

Values a.b.c.d or 1 to 4294967295

Default System interface IPv4 address

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

node-id

Syntax **node-id** *mac-address*
no node-id

Context **[Tree]** (config>eth-ring node-id)

Full Context configure eth-ring node-id

Description This optional command configures the MAC address of the RPL control. The default is to use the chassis MAC for the ring control. This command overrides the chassis MAC address with a different MAC address.

The **no** form of the command removes the RPL link.

Default no node-id

Parameters *mac-address* — xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.87 node-id-in-rro

node-id-in-rro

Syntax [**no**] **node-id-in-rro** [**include** | **exclude**]

Context **[Tree]** (config>router>rsvp node-id-in-rro)

Full Context configure router rsvp node-id-in-rro

Description This command enables the option to include node-id sub-object in RRO. Node-ID sub-object propagation is required to provide fast reroute protection for LSP that spans across multiple area domains.

If this option is disabled, then node-id is not included in RRO object.

Default node-id-in-rro exclude

Platforms All

18.88 node-protect

node-protect

Syntax [**no**] **node-protect**

Context **[Tree]** (config>router>mpls>lsp>fast-reroute node-protect)
[Tree] (config>router>mpls>lsp-template>fast-reroute node-protect)

Full Context configure router mpls lsp fast-reroute node-protect
configure router mpls lsp-template fast-reroute node-protect

Description This command enables or disables node and link protection on the specified LSP. Node protection ensures that traffic from an LSP traversing a neighboring router will reach its destination even if the neighboring router fails.

Default node-protect (for a provisioned LSP)

no node-protect (for a P2P LSP template)

Platforms All

Use subject to Terms available at: www.nokia.com

node-protect

Syntax **node-protect** [**max-pq-nodes** *value*]
no node-protect

Context **[Tree]** (config>router>isis>loopfree-alternates>remote-lfa node-protect)

Full Context configure router isis loopfree-alternates remote-lfa node-protect

Description This command enables node-protect in which the router prefers a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node.

The **no** form of this command disables node-protect.

Default no node-protect

Parameters *value* — Specifies the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

Values 1 to 32

Default 16

Platforms All

node-protect

Syntax [**no**] **node-protect**

Context **[Tree]** (config>router>isis>loopfree-alternates>ti-lfa node-protect)

Full Context configure router isis loopfree-alternates ti-lfa node-protect

Description This command enables node-protect in which the router prefers a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node.

The **no** form of this command disables node-protect.

Default no node-protect

Full Context configure router isis segment-routing egress-statistics node-sid
configure router isis segment-routing ingress-statistics node-sid
configure router ospf segment-routing egress-statistics node-sid
configure router ospf segment-routing ingress-statistics node-sid
configure router ospf3 segment-routing egress-statistics node-sid
configure router ospf3 segment-routing ingress-statistics node-sid

Description This command enables the allocation of statistic indices to each node SID (received by means of IGP advertisement). All NHLFEs associated to a given SID share the same index. If a statistics index is not available at allocation time, the allocation fails, then the system re-tries the allocation. The system generates a log on the first fail and a log on the final successful allocation.

The **no** form of this command disables the allocation of statistic indices to each node SID, releases the statistic indices, and clears the associated counters.

Default no node-sid

Platforms All

node-sid

Syntax **node-sid index** *index-value* [**clear-n-flag**]
node-sid label *label-value* [**clear-n-flag**]
no node-sid

Context **[Tree]** (config>router>ospf>area>interface node-sid)
[Tree] (config>router>ospf3>area>interface node-sid)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router ospf area interface node-sid
configure router ospf3 area interface node-sid

Description This command assigns a node SID index or label value to the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary.

This command fails if the network interface is not of type loopback or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index, and therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations, which may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS will resolve to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Parameters *index-value* — Specifies the node SID index value.

Values 0 to 4294967295

label-value — Specifies the node SID label value.

Values 0 to 4294967295

clear-n-flag — Clears the node SID flag.

Default no clear-n-flag

18.92 non-dr-attract-traffic

non-dr-attract-traffic

Syntax [**no**] **non-dr-attract-traffic**

Context **[Tree]** (config>service>vprn>pim non-dr-attract-traffic)

Full Context configure service vprn pim non-dr-attract-traffic

Description This command specifies whether the router should ignore the designated router state and attract traffic even when it is not the designated router.

An operator can configure an interface (router or IES or VPRN interfaces) to IGMP and PIM. The interface IGMP state will be synchronized to the backup node if it is associated with the redundant peer port. The interface can be configured to use PIM which will cause multicast streams to be sent to the elected DR only. The DR will also be the router sending traffic to the DSLAM. Since it may be required to attract traffic to both routers a flag non-dr-attract-traffic can be used in the PIM context to have the router ignore the DR state and attract traffic when not DR. While using this flag, the router may not send the stream down to the DSLAM while not DR.

When enabled, the designated router state is ignored. When disabled, **no non-dr-attract-traffic**, the designated router value is honored.

Default no non-dr-attract-traffic

Platforms All

non-dr-attract-traffic

Syntax **non-dr-attract-traffic** [**from-evpn**] [**from-pim-mvpn**]
no non-dr-attract-traffic

Context **[Tree]** (config>service>vpls>bind>evpn-mcast-gateway non-dr-attract-traffic)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vpls allow-ip-int-bind evpn-mcast-gateway non-dr-attract-traffic

Description This command triggers the required procedures so that multicast traffic can be attracted to the router when it is not elected as DR.

The **no** form of this command disables the attraction of non-DR traffic.

Default non-dr-attract-traffic from-pim-mvpn

Parameters **from-evpn** — Specifies that non-DR traffic generates a wildcard SMET route to attract the MCAST traffic from the OISM domain. No Layer 3 IFF or PIM/C-MCAST route is triggered from received SMET routes on the non-DR.

from-pim-mvpn — Specifies that non-DR traffic does not generate a wildcard SMET route but it does create an IIF or generate PIM/C-MCAST join upon receiving an SMET route. Local joins on a non-SBD service generate PIM/C-MCAST routes or SMETs despite this.

Platforms All

non-dr-attract-traffic

Syntax [**no**] **non-dr-attract-traffic**

Context **[Tree]** (config>router>pim non-dr-attract-traffic)

Full Context configure router pim non-dr-attract-traffic

Description This command specifies whether the router should ignore the designated router state and attract traffic even when it is not the designated router.

An operator can configure an interface (router or IES or VPRN interfaces) to IGMP and PIM. The interface state will be synchronized to the backup node if it is associated with the redundant peer port. The interface can be configured to use PIM which will cause multicast streams to be sent to the elected DR only. The DR will also be the router sending traffic to the DSLAM. Since it may be required to attract traffic to both routers a flag non-dr-attract-traffic can be used in the PIM context to have the router ignore the DR state and attract traffic when not DR. 18.93 non-multi-chassis-tunnel-id-range

non-multi-chassis-tunnel-id-range

Syntax **non-multi-chassis-tunnel-id-range start** *l2tp-tunnel-id* **end** *l2tp-tunnel-id*
non-multi-chassis-tunnel-id-range default
no non-multi-chassis-tunnel-id-range

Context **[Tree]** (config>system>l2tp non-multi-chassis-tunnel-id-range)

Full Context configure system l2tp non-multi-chassis-tunnel-id-range

Description This command sets the tunnel-id range that is used to allocate a new tunnel-id for a tunnel for which no multi-chassis redundancy is configured.

The **no** form of this command is a double negation and means all tunnel-IDs are configured for multi-chassis redundancy.

Default Sets the tunnel-id range to the full tunnel-id range available on this system meaning that by default no tunnel-ID has multi-chassis redundancy.

non-multi-chassis-tunnel-id-range default or non-multi-chassis-tunnel-id-range start 1 end <maximum *tunnel-id*>

The default for **start** *l2tp-tunnel-id* is 1. No tunnel-ids are available for which no multi-chassis redundancy is configured when set to 0.

The default for **end** *l2tp-tunnel-id* is the maximum tunnel-id allowed on this system. The **end** *l2tp-tunnel-id* must be set to 0 when the **start** *l2tp-tunnel-id* is set to 0 and vice versa.

Parameters **start** *l2tp-tunnel-id* — Specifies the start of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

Values 0 to 16383

end *l2tp-tunnel-id* — Specifies the end of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

Values 1 to 16383

18.94 non-sub-traffic

non-sub-traffic

Syntax **non-sub-traffic sub-profile** *sub-profile-name* **sla-profile** *sla-profile-name* [**subscriber** *sub-ident-string*] [**app-profile** *app-profile-name*]
no non-sub-traffic

Context **[Tree]** (config>service>ies>sub-if>grp-if>sap>sub-sla-mgmt>single-sub non-sub-traffic)
[Tree] (config>service>vpls>sap>sub-sla-mgmt>single-sub non-sub-traffic)
[Tree] (config>service>vprn>sub-if>grp-if>sap>sub-sla-mgmt>single-sub non-sub-traffic)
[Tree] (config>subscr-mgmt>msap-policy>sub-sla-mgmt>single-sub non-sub-traffic)

Full Context configure service ies subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters non-sub-traffic
configure service vpls sap sub-sla-mgmt single-sub-parameters non-sub-traffic
configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters non-sub-traffic
configure subscriber-mgmt msap-policy sub-sla-mgmt single-sub-parameters non-sub-traffic

Description This command configures traffic profiles for non-IP traffic such as PPPoE packets on a VPLS SAP. It is used in conjunction with the **profiled-traffic-only** command to forward non-IP traffic through the single subscriber SAP without the need for SAP queues.

The **no** form of this command removes any configured profile.

Parameters *sub-profile-name* — Specifies an existing subscriber profile name to be associated with the non-sub-traffic L2 host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

sla-profile-name — Specifies an existing SLA profile name to be associated with the non-sub-traffic L2 host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

sub-ident-string — Specifies the subscriber ID to be associated with the non-sub-traffic L2 host. The *sub-ident-string* should match the dynamic subscriber associated with the SAP. If no *sub-ident-string* is configured and no dynamic subscriber is yet associated, then the system will use a default subscriber ID that is overridden when a dynamic subscriber is created on the SAP.

app-profile-name — Specifies an existing app profile name to be associated with the non-sub-traffic L2 host. The application profile is configured in the **config>app-assure>group>policy>app-prof** context.

configure service vprn l2tp group l2tpv3 nonce-length

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vprn l2tp l2tpv3 nonce-length

Description This command configures the length for the local L2TPv3 nonce (random number) value used in the Nonce AVP.

The **no** form of this command removes the nonce length from the configuration.

Default no nonce-length

Parameters *length* — Specifies the length of the Nonce AVP value.

Values 16 to 64

default — When specified within the **config>service>vprn>l2tp>group>l2tpv3** context, this is referencing to the **nonce-length** configuration within the **config>service>vprn>l2tp>l2tpv3** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.97 normal-state

normal-state

Syntax **normal-state** {**open** | **closed**}

Context **[Tree]** (config>system>alarm-contact-input normal-state)

Full Context configure system alarm-contact-input normal-state

Description This command configures the normal state of the alarm contact input circuit. When the system detects a transition from the normal state, an alarm is generated. The alarm is cleared when the system detects a transition back to the normal state.

Note: Configure the normal state as **closed** if an external power source is used to power the alarm contact inputs.

Default normal-state open

Parameters **open** — Specifies that the normal state of the alarm contact input circuit is open. When the system detects a transition to the closed state, an alarm is generated. The alarm is cleared when the system detects a transition back to the open state.

closed — Specifies that the normal state of the alarm contact input circuit is closed. When the system detects a transition to the open state, an alarm is generated. The alarm is cleared when the system detects a transition back to the closed state.

Platforms 7750 SR-a

18.98 notification

notification

Syntax [**no**] **notification**

Context **[Tree]** (config>port>ethernet>lldp>dstmac notification)

Full Context configure port ethernet lldp dest-mac notification

Description This command enables LLDP notifications.

The **no** form of this command disables LLDP notifications.

Default no notification

Platforms All

notification

Syntax **notification** [**neighbor** *ip-address* | **group** *name*]
no notification

Context **[Tree]** (debug>router>bgp notification)

Full Context debug router bgp notification

Description This command decodes and logs all sent and received notification messages in the debug log.

The **no** form of this command disables the debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

18.99 notification-bundling

notification-bundling

Syntax **notification-bundling**

Context **[Tree]** (config>system>telemetry notification-bundling)

Full Context configure system telemetry notification-bundling

Description Commands in this context configure SubscribeResponse notification bundling.

Platforms All

18.100 notification-interval

notification-interval

Syntax **notification-interval** *time*
no notification-interval

Context **[Tree]** (config>system>lldp notification-interval)

Full Context configure system lldp notification-interval

Description This command configures the minimum time between change notifications.

The **no** form of this command reverts to the default value.

Default no notification-interval

Parameters *time* — Specifies the minimum time, in seconds, between change notifications.

Values 5 to 3600

Default 5

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

18.101 notify

notify

Syntax **notify** [**detail**]
no notify

Context **[Tree]** (debug>router>gmpls>packet notify)

Full Context debug router gmpls packet notify

Description This command enables debugging for GMPLS Notify packets.

The **no** form of the command disables debugging for GMPLS Notify packets.

Parameters **detail** — Keyword to produce debug output in greater detail.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.102 notify-dest-change

notify-dest-change

Syntax [**no**] **notify-dest-change**

Context **[Tree]** (config>filter>redirect-policy notify-dest-change)

Full Context configure filter redirect-policy notify-dest-change

Description This command instructs the system to send notifications (Log, SNMP, …) when the active destination of a redirect policy changes. No notification is sent when there are no more active destinations (as this is covered by a specific other notification). Notifications can be controlled (using the **config>log>event-control** command) using application ID *2017* and event-name *tFilterRPActiveDstChangeEvent*.

The **no** form of the command disables notification generation.

Default no notify-dest-change

18.103 nssa

nssa

Syntax [**no**] **nssa**

Context **[Tree]** (config>service>vprn>ospf>area nssa)
[Tree] (config>service>vprn>ospf3>area nssa)

Full Context configure service vprn ospf area nssa
configure service vprn ospf3 area nssa

Description This command creates the context to configure an OSPF Not So Stubby Area (NSSA) and adds/removes the NSSA designation from the area.

NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF domain.

Existing virtual links of a non-stub or NSSA area are removed when the designation is changed to NSSA or stub.

An area can be designated as stub or NSSA but never both at the same time.

By default, an area is not configured as an NSSA area.

The **no** form of this command removes the NSSA designation and configuration context from the area.

Default no nssa — The OSPF area is not an NSSA.

Platforms All

nssa

Syntax [**no**] **nssa**

Context **[Tree]** (config>router>ospf>area nssa)
[Tree] (config>router>ospf3>area nssa)

Full Context configure router ospf area nssa
configure router ospf3 area nssa

Description This command creates the context to configure an OSPF or OSPF3 Not So Stubby Area (NSSA) and adds/removes the NSSA designation from the area.

Full Context configure router wpp portals portal ntf-logout-retry-count
configure service vprn wpp portals portal ntf-logout-retry-count

Description This command configures the number of retransmissions of an NTF_LOGOUT message.

The **no** form of this command reverts to the default.

Default ntf-logout-retry-count 5

Parameters *value* — Specifies the number of retransmissions of an NTF_LOGOUT message.

Values 0 to 5

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.106 ntp

ntp

Syntax [**no**] **ntp**

Context **[Tree]** (config>service>vprn ntp)

Full Context configure service vprn ntp

Description Commands in this context configure Network Time Protocol (NTP) and its operation. It also enables NTP server mode within the VPRN routing instance so that the router will respond to NTP requests from external clients received inside the VPRN.

The **no** form of this command stops the execution of NTP and removes its configuration.

ntp

Syntax [**no**] **ntp**

Context **[Tree]** (config>system>time ntp)

Full Context configure system time ntp

Description Commands in this context configure Network Time Protocol (NTP) and its operation. This protocol defines a method to accurately distribute and maintain time for network elements. Furthermore, this capability allows for the synchronization of clocks between the various network elements. Use the no form of the command to stop the execution of NTP and remove its configuration.

Default ntp

Platforms All

ntp

Syntax **ntp** [**router** *router-instance*] [**interface** *ip-int-name*]

Context **[Tree]** (debug>system ntp)

Full Context debug system ntp

Description This command enables and configures debugging for NTP.

The **no** form of the command disables debugging for NTP.

Parameters *router-instance* — Specifies the router name or CPM router instance.

Values *router-name* | *vprn-svc-id*
router-name – “Base”, “management”
vprn-svc-id – 1 to 2147483647

Default Base

ip-int-name — Specifies the name of the IP interface. The name can be up to 32 characters and must begin with a letter. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

18.109 number

number

Syntax **number** {**eq** | **neq** | **lt** | **lte** | **gt** | **gte**} *event-id*
no number

Context **[Tree]** (config>service>vprn>log>filter>entry>match number)

Full Context configure service vprn log filter entry match number

Description This command adds an SR OS application event number as a match criterion.

SR OS event numbers uniquely identify a specific logging event within an application.

Only one **number** command can be entered per event filter entry. The latest **number** command overwrites the previous command.

The **no** form of this command removes the event number as a match criterion.

Default no event-number — No event ID match criterion is specified.

Parameters **eq | neq | lt | lte | gt | gte** — Specifies the type of match. Valid operators are listed below.

Values

Operator	Note
eq	equal to
neq	not equal to
lt	less than
lte	less than or equal to
gt	greater than
gte	greater than or equal to

event-id — Specifies the event ID, expressed as a decimal integer.

Context **[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac>mc-constraints number-down)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac mc-constraints number-down

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the number of ports down along with level for multicast CAC policy on an MSAP.

The **no** form of this command reverts to the default.

Parameters *number-lag-port-down* — Specifies the number of port in a LAG group that are down. If the number of ports available in the LAG is reduced by the number of ports configured in this command here then bandwidth allowed for bundle and/or interface is as per the levels configured in this context.

Values 1 to 64 (for 64-link LAG)
1 to 32 (for other LAGs)

level-id — Specifies the amount of bandwidth available within a given bundle for MC traffic for a specified level.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *level-id* — Specifies the bandwidth for a given level. Level 1 has the highest priority. Level 8 has the lowest priority.

Values 1 to 8

Platforms All

number-down

Syntax [**no**] **number-down** *number-of-lag-ports-down*

Context **[Tree]** (config>vrrp>policy>priority-event>lag-port-down number-down)

Full Context configure vrrp policy priority-event lag-port-down number-down

Description This command creates a context to configure an event set threshold within a lag-port-down priority control event.

The **number-down** command defines a sub-node within the **lag-port-down** event and is uniquely identified with the *number-of-lag-ports-down* parameter. Each **number-down** node within the same **lag-port-down** event node must have a unique *number-of-lag-ports-down* value. Each **number-down** node has its own **priority** command that takes effect whenever that node represents the current threshold.

The total number of sub-nodes (uniquely identified by the *number-of-lag-ports-down* parameter) allowed in a single **lag-port-down** event is equal to the total number of possible physical ports allowed in a LAG.

A **number-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold. When the number of ports down equals a given threshold, that is the active threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default no number-down — No threshold for the LAG priority event is created.

Parameters *number-of-lag-ports-down* — The number of LAG ports down to create a set event threshold. This is the active threshold when the number of down ports in the LAG equals or exceeds *number-of-lag-ports-down*, but does not equal or exceed the next highest configured *number-of-lag-ports-down*.

Values 1 to 64 (applies to 64-link LAG) 1 to 32 (applies to other LAGs)

Platforms All

Use subject to Terms available at: www.nokia.com

18.111 number-paths

number-paths

Syntax **number-paths** *number-of-paths* [**redundant-sfm** *number-of-paths*]

Context **[Tree]** (config>mcast-mgmt>bw-plcy>t2-paths>secondary-paths number-paths)

Full Context configure mcast-management bandwidth-policy t2-paths secondary-paths number-paths

Description This command is used to explicitly provision the number of secondary paths (and imply the number of primary paths) supported by the TChip based forwarding plane the bandwidth policy is managing. The default (and minimum) number of secondary paths is 1 and the maximum configurable is 15. The number of primary paths is total number of available paths minus the number of secondary paths.

Secondary paths are used by:

- Expedited VPLS, IES and VPRN service ingress multipoint queues
- Expedited network ingress multipoint queues
- Managed multicast explicit path primary channels (using the primary paths managed multipoint queue)
- All managed multicast dynamic path channels when the primary paths or multicast planes are not at their limit (using the primary paths managed multipoint queue)
- Highest preference managed multicast dynamic path channels when the primary paths or multicast planes are at their limit (using the primary paths managed multipoint queue)

Secondary paths are used by:

- Best-Effort VPLS, IES and VPRN service ingress multipoint queues
- Best-Effort network ingress multipoint queues
- Managed multicast explicit path secondary channels (using the secondary paths managed multipoint queue)
- Lower preference managed multicast dynamic path channels when the primary paths or multicast planes are at their limit (using the secondary paths managed multipoint queue)

The number of secondary paths should be increased from the default value of 1 when a single secondary path is enough for explicit secondary path managed traffic or the amount of best-effort multipoint non-managed queue traffic.

The **no** form of this command restores the default number of secondary paths.

Default number-paths 1 redundant-sfm 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *number-of-paths* — Specifies the number of secondary paths when only one switch fabric is active, while the dual-sfm parameter specifies the same value when two switch fabrics are active.

Values 1 to 15

Default 1

18.112 number-retries

number-retries

Syntax **number-retries** *number-retries*
no number-retries

19.2 oam-pm

oam-pm

Syntax **oam-pm session** *session-name* {**dm** | **dmm** | **lmm** | **slm** | **twamp-light**} {**start** | **stop**}

Context **[Tree]** (oam oam-pm)

Full Context oam oam-pm

Description This command allows the operator to start and stop on-demand OAM-PM sessions.

Parameters *session-name* — Identifies the session name, up to 32 characters, that the test is associated with.

dm — Specifies the MPLS delay measurement test that is affected by the command.

dmm — Specifies the DMM test that is affected by the command.

lmm — Specifies the LMM test that is affected by the command.

slm — Specifies the SLM test that is affected by the command.

twamp-light — Specifies the TWAMP-light test that is affected by the command.

start — Manually starts the test.

stop — Manually stops the test.

Platforms All

oam-pm

Syntax **oam-pm**

Context **[Tree]** (config oam-pm)

Full Context configure oam-pm

Description This is the top level context that contains the configuration parameters that defines storage parameters (including binning structures), availability/resiliency and the individual proactive, and on-demand tests used to gather the performance/statistical information.

Platforms All

19.3 oam-template

oam-template

Syntax [**no**] **oam-template** *name*

Context **[Tree]** (config>router>mpls>mpls-tp oam-template)

Full Context configure router mpls mpls-tp oam-template

Description This command creates or edits an OAM template Generally applicable proactive OAM parameters are configured using templates. The top-level template is the OAM template.

Generic MPLS-TP OAM and fault management parameters are configured in the OAM Template.

Proactive CC/CV uses BFD and parameters such as Tx/Rx timer intervals, multiplier and other session/fault management parameters specific to BFD are configured using a BFD Template, which is referenced from the OAM template.

Default no oam-template

Parameters *name* — Specifies a text string name for the template of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes. Named OAM templates are referenced from the MPLS-TP path MEP configuration.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

oam-template

Syntax **oam-template** *name*
no oam-template

Context **[Tree]** (config>router>mpls>lsp>working-tp-path>mep oam-template)
[Tree] (config>router>mpls>lsp>protect-tp-path>mep oam-template)

Full Context configure router mpls lsp protect-tp-path mep oam-template
configure router mpls lsp working-tp-path mep oam-template

Description This command applies an OAM template to an MPLS-TP working or protect path. It contains configuration parameters for proactive OAM mechanisms that can be enabled on the path; for example, BFD. Configuration of an OAM template is optional.

The **no** form of this command removes the OAM template from the path.

Default no oam-template

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *name* — Specifies a text string name for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.4 ocsp

ocsp

Syntax [**no**] **ocsp**

Context **[Tree]** (debug>certificate ocsp)

Full Context debug certificate ocsp

Description This command enables debug output of the OCSP protocol for a CA profile.

The **no** form of this command disables the debug output.

Platforms All

ocsp

Syntax **ocsp**

Context **[Tree]** (config>system>security>pki>ca-profile ocsp)

Full Context configure system security pki ca-profile ocsp

Description Commands in this context configure OCSP parameters.

Platforms All

19.5 octet-counters

octet-counters

Syntax [**no**] **octet-counters**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes octet-counters)

Full Context configure aaa isa-radius-policy acct-include-attributes octet-counters

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the inclusion of the octet-counters attributes.

The **no** form of the command excludes octet-counters attributes.

Default no octet-counters

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.6 octets-admitted-count

octets-admitted-count

Syntax [**no**] **octets-admitted-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr octets-admitted-count)
[Tree] (config>log>acct-policy>cr>aa>aa-to-sub-cntr octets-admitted-count)

Full Context configure log accounting-policy custom-record aa-specific from-aa-sub-counters octets-admitted-count
configure log accounting-policy custom-record aa-specific to-aa-sub-counters octets-admitted-count

Description This command includes the admitted octet count in the AA subscriber's custom record and only applies to the 7750 SR.

The **no** form of this command excludes the admitted octet count.

Default no octets-admitted-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.7 octets-denied-count

octets-denied-count

Syntax [**no**] **octets-denied-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr octets-denied-count)
[Tree] (config>log>acct-policy>cr>aa>aa-to-sub-cntr octets-denied-count)

Full Context configure log accounting-policy custom-record aa-specific from-aa-sub-counters octets-denied-count

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure log accounting-policy custom-record aa-specific to-aa-sub-counters octets-denied-count

Description This command includes the denied octet count in the AA subscriber's custom record and only applies to the 7750 SR.

The **no** form of this command excludes the denied octet count.

Default no octets-denied-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.8 of-controller

of-controller

Syntax [**no**] **of-controller** *ip-address:port*

Context **[Tree]** (config>open-flow>of-switch of-controller)

Full Context configure open-flow of-switch of-controller

Description This command configures the OpenFlow controller for this OpenFlow switch and creates a context for the configuration of additional OpenFlow control channel parameters. Up to two controllers can be configured per OpenFlow switch instance.

The **no** form of this command deletes the controller for this OpenFlow switch instance.

Parameters *ip-address:port* — Specifies the IP address and TCP port for the OpenFlow channel to the controller.

Values

ipv4-address	a.b.c.d:port
ipv6-address	[x:x:x:x:x:x:x:x]:port (eight 16-bit pieces)
	x: [0..FFFF]H
port	1 to 65535

Platforms All

Use subject to Terms available at: www.nokia.com

19.9 of-switch

of-switch

Syntax **of-switch** *ofs-name* [**ofs-id** *ofs-id*]
no of-switch *ofs-name*

Context **[Tree]** (config>open-flow of-switch)

Full Context configure open-flow of-switch

Description This command creates an OpenFlow switch instance.

The **no** form of the command deletes the OpenFlow switch instance from the context.

Default no of-switch

Parameters *ofs-name* — specifies the name of the OpenFlow switch instance, a string up to 32 characters.

ofs-id — Specifies the ID of the switch. This is used together with the chassis MAC address to generate the Datapath ID of the OpenFlow switch instance. If it is not configured, an automatically generated Datapath ID is assigned to the switch according to the order in which the OFS instance came up relative to other OFS instances on the node. The configuration should be saved after configuring the OFS ID. If the user originally configures the OFS without an OFS ID, and subsequently adds an OFS ID without saving the new configuration, the OFS may not get the same Datapath ID (which is allocated on a first-come, first-served basis in the absence of an OFS ID).

Values 1 to 8

Platforms All

19.10 offer-selection

offer-selection

Syntax **offer-selection**

Context **[Tree]** (config>service>ies>sub-if>grp-if>dhcp offer-selection)
[Tree] (config>service>vprn>sub-if>dhcp offer-selection)
[Tree] (config>service>vprn>sub-if>grp-if>dhcp offer-selection)

Full Context configure service ies subscriber-interface group-interface dhcp offer-selection
configure service vprn subscriber-interface dhcp offer-selection

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vprn subscriber-interface group-interface dhcp offer-selection

Description Commands in this context configure a discover delay to influence the offer selection of DHCPv4 clients.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.11 offer-time

offer-time

Syntax **offer-time** [**min** *minutes*] [**sec** *seconds*]
no offer-time

Context **[Tree]** (config>router>dhcp>server>pool offer-time)
[Tree] (config>service>vprn>dhcp>server>pool offer-time)

Full Context configure router dhcp local-dhcp-server pool offer-time
configure service vprn dhcp local-dhcp-server pool offer-time

Description This command configures the time interval during which a DHCP offer is valid.

The **no** form of this command reverts to the default.

Default offer-time min 1

Parameters *time* — Specifies the offer time.

Values

min *minutes*	0 to 10
sec *seconds*	0 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.12 offered-measurement

offered-measurement

Syntax **offered-measurement**

Context **[Tree]** (config>qos>adv-config-policy>child-control offered-measurement)

Full Context configure qos adv-config-policy child-control offered-measurement

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command modifies the offered rate measurement used to determine the bandwidth the queue or policer is requesting from its parent virtual scheduling context.

This command modifies the parameters that control the child requested bandwidth for all policers and queues associated with the policy.

Platforms All

19.13 offset

offset

Syntax **offset** *offset*

Context **[Tree]** (config>system>time>dst-zone offset)

Full Context configure system time dst-zone offset

Description This command specifies the number of minutes that will be added to the time when summer time takes effect. The same number of minutes will be subtracted from the time when the summer time ends.

Default offset 60

Parameters *offset* — Specifies the number of minutes added to the time at the beginning of summer time and subtracted at the end of summer time, expressed as an integer.

Values 0 to 60

Default 60

Platforms All

19.14 on-cac-failure

on-cac-failure

Syntax [**no**] **on-cac-failure**

Context **[Tree]** (config>router>rsvp>te-threshold-update on-cac-failure)

Full Context configure router rsvp te-threshold-update on-cac-failure

Description This command is used to enable a CAC failure-triggered IGP update.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command should reset on-cac-failure to the default value and disable the CAC failure-triggered IGP update.

Default no on-cac-failure

Platforms All

19.15 on-error

on-error

Syntax [**no**] **on-error**

Context **[Tree]** (debug>diameter>node on-error)

Full Context debug diameter node on-error

Description This command debugs Diameter node errors. Only errors raised before the peer is determined. For example, there is no route for this message in the realm routing table, and therefore the peer cannot be determined.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

on-error

Syntax [**no**] **on-error**

Context **[Tree]** (debug>dia>node>peer on-error)

Full Context debug dia node peer on-error

Description This command reports only peer error conditions.

on-error

Syntax [**no**] **on-error**

Context **[Tree]** (debug>diam>application on-error)
[Tree] (debug>diam>application>policy on-error)

Full Context debug diameter application on-error
debug diameter application policy on-error

Description This command debugs Diameter application errors and reports only peer error conditions, for example, an unknown session-id.

© 2022 Nokia.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.16 on-failure

on-failure

Syntax **on-failure** [**failover** {**enabled** | **disabled**}] [**handling** {**continue** | **retry-and-terminate** | **terminate**}]
no on-failure

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy on-failure)

Full Context configure subscriber-mgmt diameter-application-policy on-failure

Description This command is applicable only to the R16.0R4 or later implementation of Diameter base in the SR OS.

This command configures session failure handling. The behavior of a Diameter application (Gx, Gy, or NASREQ) that fails to receive a response (an answer message CCA) to a transmitted request message (CCR) for a session, can be controlled by the Diameter server through two AVPs carried in CCA messages that are defined in RFC 4006, *Diameter Credit-Control Application*:

- CC-Session-Failover AVP
  - FAILOVER_NOT_SUPPORTED
  - FAILOVER_SUPPORTED
- Credit-Control-Failure-Handling AVP
  - TERMINATE
  - CONTINUE
  - RETRY_AND_TERMINATE

If those AVPs are not provided by the Diameter server, the local configuration provided by this command takes effect. This command defines the following:

- Retransmission behavior of the application in case that the response to a transmitted request message is not received. The Diameter base notifies the application after the lifetime of the transmitted request message expires (tx timeout) or the route to the destination-realm is unavailable. Depending on the configuration option, the application can then retransmit the message, or suppress retransmission.
- Handling behavior defines whether the session is terminated or continues to exist in absence of the response from the Diameter server.

Default on-failure failover enabled handling terminate

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **failover enabled** — Specifies that application session is allowed to retransmit the request message (CCR).

failover disabled — Specifies that the application session is not allowed to retransmit the request message (CCR).

handling continue — Specifies that the sessions continues to exist if the response to a transmitted CCR message is not received. Whether the transmitted message is re-transmitted depends on the failover configuration. In case of session initiation procedure in the Gx case (CCR-I timeout), the subscriber host is nonetheless instantiated with the default parameters, assuming that they are provided. If the default parameter is not provided, the subscriber host initiation fails.

handling retry-and-terminate — Specifies that the message is re-transmitted in case that the failover is enabled. If the response to the retransmitted request message is not received (re-transmission times out), the application session is terminated.

handling terminate — Specifies that the session is terminated if the response to the original request message is not received. No re-transmissions is attempted, regardless of whether or not the failover is enabled.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

on-failure

Syntax **on-failure** [**failover** {**enabled** | **disabled**}] [**handling** {**continue** | **retry-and-terminate** | **terminate**}]
no on-failure

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy on-failure)

Full Context configure subscriber-mgmt diameter-application-policy on-failure

Description This command is applicable to both legacy (pre-Release 16.0.R4) and new (Release 16.0.R4 and later) implementations of Diameter base in the SR OS.

- Legacy Diameter base description:

  This command configures session failure handling. The behavior of the application's session in case of a peer failure can be controlled by the Diameter server through two AVPs carried in CCA messages that are defined in RFC 4006, *Diameter Credit-Control Application*:

  - CC-Session-Failover AVP
    - FAILOVER_NOT_SUPPORTED
    - FAILOVER_SUPPORTED
  - Credit-Control-Failure-Handling AVP
    - TERMINATE
    - CONTINUE
    - RETRY_AND_TERMINATE

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If those AVPs are not provided by the Diameter server, the local configuration provided by this command will take effect. This command defines the following:

- The peer-failover behavior to a secondary peer if the primary peer is unresponsive. From the application point of view, the primary peer is considered unresponsive if the request message that was sent to it, times out. The time out of the message is determined by the tx-timer command.

  The peer-failover action based on the request message timeout is defined per session. In other words, a request message timeout for one session cannot cause the failover for some other session.

  The maximum number of transmissions per session is hard-coded to 2 and the same message is never re-transmitted to the same TCP socket (a TCP socket is defined as a current peering connection defined by the TCP source/destination IP addresses/ports; closing and then reopening a connection to the same peer will result in creation of a new TCP socket). Once the original message for the session times out on the primary peer, the message is re-transmitted to the secondary peer, provided that the secondary peer is available and the failover is enabled with the corresponding handling mechanism. In case that the secondary peer is unavailable, the original message is not be re-transmitted to the same primary peer again.

  Once the reply from a peer is received, the session is tied to that peer until the next timeout. In other words, the session always sticks to the peer from which it received the last response.
- The handling behavior if the response from the peer is not received or the peers are not available at all (all peering connections are closed). If the response to a session initiation message is not received, the fate of the session will depend on the configuration (the session can be terminated or continue to exist with default parameters).

• New Diameter base description:

This command configures session failure handling. The behavior of a Diameter application (Gx, Gy, or NASREQ) that fails to receive a response (an answer message CCA) to a transmitted request message (CCR) for a session, can be controlled by the Diameter server through two AVPs carried in CCA messages that are defined in RFC 4006, *Diameter Credit-Control Application*:

- CC-Session-Failover AVP
  - FAILOVER_NOT_SUPPORTED
  - FAILOVER_SUPPORTED
- Credit-Control-Failure-Handling AVP
  - TERMINATE
  - CONTINUE
  - RETRY_AND_TERMINATE

If those AVPs are not provided by the Diameter server, the local configuration provided by this command takes effect. This command defines the following:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Retransmission behavior of the application in case that the response to a transmitted request message is not received. The Diameter base notifies the application after the lifetime of the transmitted request message expires (tx timeout) or the route to the destination-realm is unavailable. Depending on the configuration option, the application can then retransmit the message, or suppress retransmission.
- Handling behavior defines whether the session is terminated or continues to exist in absence of the response from the Diameter server.

Default on-failure failover enabled handling terminate

Parameters **failover enabled** — Specifies that application session is allowed to switch to the secondary peer (for legacy Diameter base). For new Diameter base, this keyword specifies that application session is allowed to retransmit the request message (CCR).

failover disabled — Specifies that the application session is not allowed to switch to the secondary peer (for legacy Diameter base). For new Diameter base, this keyword specifies that the application session is not allowed to retransmit the request message (CCR).

handling continue — Specifies that the sessions continue to exist if the response to a transmitted CCR message is not received. Whether the transmitted message is re-transmitted depends on the failover configuration. In case of session initiation procedure in the Gx case (CCR-I timeout), the subscriber host is nonetheless instantiated with the default parameters, assuming that they are provided. If the default parameter are not provided, the subscriber host initiation fails.

handling retry-and-terminate — Specifies that the message is re-transmitted if the peer-failover is enabled and the secondary peer is available. Once the retransmitted request message is timed out, the application session is terminated (for legacy Diameter base). For new Diameter base, this keyword specifies that the message is re-transmitted if the failover is enabled. If the response to the retransmitted request message is not received (re-transmission times out), the application session is terminated.

handling terminate — Specifies that the session is terminated if the response to the original request message is not received. No re-transmissions is attempted, regardless if the failover is enabled.

19.19 one-time-http-redirection

one-time-http-redirection

Syntax **one-time-http-redirection ip-filter** *filter-id*
one-time-http-redirection

Context **[Tree]** (config>subscr-mgmt>sla-prof one-time-http-redirection)

Full Context configure subscriber-mgmt sla-profile one-time-http-redirection

Description This command specify the one-time http redirection filter id. This filter will apply to the host when host is created, and is replaced by the sla-profile ingress filter (configured in the **config>subscr-mgmt>sla-prof>ingress** context) after first HTTP request from host has been redirected.

Note: The system does not check if the configured filter include http-redirection entry. If the filter does not include the http-redirection then it will not be replaced in future.

If 7750 SR receives filter insertion via CoA or access-accept when one-time redirection filter is still active then the received filter entries will only be applied to the sla-profile ingress filter. And after 1st http redirection, the original sla-profile ingress filter + received filter will replace the redirection filter.

The **no** form of this command reverts to the default.

Parameters *filter-id* — Specifies the ID of filter that is used for HTTP redirection.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

one-time-http-redirection

Syntax **one-time-http-redirection**

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt one-time-redirect
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt one-time-redirect

Description This command enables one-time http-redirect to specify redirect URL for traffic matching the specified destination port.

The **no** form of this command reverts to the default.

Parameters **url** *rdr-url-string* — Specifies the HTTP web address that is sent to the user's browser.

port *port-num* — Specifies the destination port number as a decimal hex or binary.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.21 one-way-delay-test

one-way-delay-test

Syntax **one-way-delay-test** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*]

Context **[Tree]** (oam>eth-cfm one-way-delay-test)

Full Context oam eth-cfm one-way-delay-test

Description This command issues an ETH-CFM one-way delay test.

Parameters *mac-address* — Specifies a unicast destination MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

remote-mepid *mep-id* — Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id* — Specifies the local MEP ID.

Values 1 to 8191

md-index — Specifies the MD index.

Values 1 to 4294967295

ma-index — Specifies the MA index.

Values 1 to 4294967295

priority — Specifies the priority.

Values 0 to 7

Default 7

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.22 one-way-delay-threshold

one-way-delay-threshold

Syntax **one-way-delay-threshold** *seconds*

Context **[Tree]** (config>eth-tunnel>path>eth-cfm>mep one-way-delay-threshold)
[Tree] (config>lag>eth-cfm>mep one-way-delay-threshold)
[Tree] (config>port>ethernet>eth-cfm>mep one-way-delay-threshold)

Full Context configure eth-tunnel path eth-cfm mep one-way-delay-threshold
configure lag eth-cfm mep one-way-delay-threshold
configure port ethernet eth-cfm mep one-way-delay-threshold

Description This command enables one way delay threshold time limit.

Default one-way-delay-threshold 3

Parameters *seconds* — Specifies the value, in seconds, for the threshold.

Values 0 to 600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

one-way-delay-threshold

Syntax **one-way-delay-threshold** *seconds*

Context **[Tree]** (config>eth-ring>path>eth-cfm>mep one-way-delay-threshold)

Full Context configure eth-ring path eth-cfm mep one-way-delay-threshold

Description This command configures a one way delay threshold time limit.

Default one-way-delay-threshold 3

Parameters *seconds* — Specifies the value, in seconds, for the threshold.

Values 0 to 600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.23 opaque-data

opaque-data

Syntax **opaque-data** *hex-string*
no opaque-data

Context **[Tree]** (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action>insert-nsh>meta-data opaque-data)

Full Context configure subscriber-mgmt isa-service-chaining vas-filter entry action insert-nsh meta-data opaque-data

Description This command specifies 16-byte opaque data HEX string to be inserted in NSH meta-data (with MD-Type set to 1). The opaque data can also be provided (overridden) by AAA server. AAA server has precedence over static configuration. The **opaque-data** and **insert-subscriber-id** commands are mutually exclusive.

The **no** form of this command removes the HEX string from the configuration.

Parameters *hex-string* — Specifies the HEX string up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

19.24 opcode

opcode

Syntax [**no**] **opcode**

Context **[Tree]** (config>service>nat>pcp-server-policy opcode)

Full Context configure service nat pcp-server-policy opcode

Description This command specifies the PCP opcodes supported by the PCP servers using this PCP policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.25 open

open

Syntax **open** [**neighbor** *ip-address* | **group** *name*]
no open

Context **[Tree]** (debug>router>bgp open)

Full Context debug router bgp open

Description This command decodes and logs all sent and received open messages in the debug log.

The **no** form of this command disables debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Use subject to Terms available at: www.nokia.com

19.28 oper-group

oper-group

Syntax **oper-group** *name*
no oper-group

Context **[Tree]** (config>service>epipe oper-group)

Full Context configure service epipe oper-group

Description This command associates an operational group to the status of the Epipe. When this oper-group is used in Epipes with static VXLAN or BGP-EVPN, the oper-group behaves as follows:

- The Epipe (and the oper-group) goes down if a SAP or spoke SDP go oper-down due to admin shutdown, service shutdown, or non-DF status as a result of EVPN multi-homing single-active election.
- The Epipe (and oper-group) will go down if the Epipe's EVPN destination is removed (due to an EVPN AD per-EVI route withdrawal, for instance).
- The Epipe (and oper-group) will not go down if a static VXLAN destination exists and the egress VTEP is not in the global route-table.

The operational group must be monitored in a different service and not in the service where it is defined.

The **no** version of this command removes the oper-group association.

Parameters *name* — Specifies the name of the **oper-group**, up to 32 characters.

Platforms All

oper-group

Syntax **oper-group** *name*
no oper-group

Context **[Tree]** (config>service>epipe>bgp-evpn>mpls oper-group)

Full Context configure service epipe bgp-evpn mpls oper-group
configure service epipe bgp-evpn segment-routing-v6 oper-group
configure service system bgp-evpn ethernet-segment oper-group
configure service vpls bgp-evpn mpls oper-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vpls bgp-evpn vxlan oper-group

Description This command adds the BGP EVPN MPLS, SRv6, or VXLAN instance or Ethernet Segment (ES) as a member of the operational group.

When configured on an ES, the state of the operational group depends on the state of the SAPs contained in the ES. The operational group transitions to up if at least one SAP in the ES is up. The operational group goes down when all the associated SAPs are operationally down. The ES operational group should be monitored on the LAG associated to the ES, along with single-active multi-homing, so that the NDF state can be signaled to the CE by LAG standby signaling.

When configured on a BGP EVPN instance, the operational group is up when it is either empty (meaning that the operational group has no members) or at least an EVPN destination is created under the EVPN instance added as member. When configured, no other SAP, SDP binding, or BGP EVPN instance can be added to the same operational group within the same or a different service.

The operational group is down when the following apply:

- on a BGP EVPN instance
- the service is disabled
- the BGP EVPN MPLS, VXLAN or SRv6 instance are disabled
- all the EVPN destinations in the instance are removed

Default no oper-group

Parameters *name* — Specifies the name of the operational group, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service epipe bgp-evpn segment-routing-v6 oper-group

All

- configure service vpls bgp-evpn mpls oper-group
- configure service epipe bgp-evpn mpls oper-group
- configure service vpls bgp-evpn vxlan oper-group
- configure service system bgp-evpn ethernet-segment oper-group

oper-group

Syntax **oper-group** *name*
no oper-group

Context **[Tree]** (config>service>epipe>vxlan>egr-vtep oper-group)

Full Context configure service epipe vxlan egr-vtep oper-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command associates an operational group to the VXLAN static egress VTEP. If the egress VTEP IP disappears from the routing table, the oper-group status will become operationally down.

The operational group must be monitored in a different service and not in the service where it is defined.

The **no** version of this command removes the oper-group association.

Parameters *name* — Specifies the name of the **oper-group**, up to a maximum of 32 characters.

Platforms All

oper-group

Syntax **oper-group** *group-name*
no oper-group

Context **[Tree]** (config>service>epipe>sap oper-group)

Full Context configure service epipe sap oper-group

Description This command configures the operational group identifier.

The no form of this command removes the group name from the configuration.

Parameters *group-name* — Specifies the Operational-Group identifier up to 32 characters in length.

Platforms All

oper-group

Syntax **oper-group** *group-name*
no oper-group

Context **[Tree]** (config>service>vpls>sap oper-group)
[Tree] (config>service>vpls>spoke-sdp oper-group)
[Tree] (config>service>vpls>bgp>pw-template-binding oper-group)

Full Context configure service vpls bgp pw-template-binding oper-group
configure service vpls sap oper-group
configure service vpls spoke-sdp oper-group

Description This command associates the context to which it is configured to the operational group specified in the *group-name*. The **oper-group** *oper-name* must be already configured under **config>service** context before its name is referenced in this command.

The **no** form of this command removes the association.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no oper-group

Parameters *group-name* — Specifies a character string of maximum 32 ASCII characters identifying the group instance

Platforms All

oper-group

Syntax **oper-group** *group-name*
no oper-group

Context **[Tree]** (config>service>ies>if>vrrp oper-group)

Full Context configure service ies interface vrrp oper-group

Description This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up and is down for all other VRRP states.

The **no** form of this command removes the association.

Default no oper-group

Parameters *group-name* — Specifies the operational group identifier up to 32 characters in length.

Platforms All

oper-group

Syntax **oper-group** *group-name*
no oper-group

Context **[Tree]** (config>service>vprn>if>vrrp oper-group)
[Tree] (config>service>vprn>if>ipv6>vrrp oper-group)

Full Context configure service vprn interface ipv6 vrrp oper-group
configure service vprn interface vrrp oper-group

Description This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up and is down for all other VRRP states.

The **no** form of this command removes the association.

Default no oper-group — No operational group is configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *group-name* — Specifies the operational group identifier, up to 32 characters in length.

Platforms All

oper-group

Syntax **oper-group** *group-name*
no oper-group

Context **[Tree]** (config>router>if>vrrp oper-group)
[Tree] (config>router>if>ipv6>vrrp oper-group)

Full Context configure router interface ipv6 vrrp oper-group
configure router interface vrrp oper-group

Description This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up; the operational group is down for all other VRRP states.

The **no** form of the command removes the association.

Default no oper-group — No operational group is configured.

Parameters *group-name* — Specifies the operational group identifier, up to 32 characters.

Platforms All

oper-group

Syntax **oper-group** *group-name* [**create**]
no oper-group *group-name*

Context **[Tree]** (config>service oper-group)

Full Context configure service oper-group

Description This command creates a system-wide group (operational group) name which can be used to associate a number of service objects (for example, SAPs or pseudowires). The status of the group is derived from the status of its members. The status of the group can then be used to influence the status of non-member objects. For example, when a group status is marked as down, the object(s) that monitor the group change their status accordingly.

The **no** form of the command removes the group. All the object associations need to be removed before the no form of the command can be executed.

Default no oper-group

Parameters *group-name* — Specifies the operational group identifier up to 32 characters in length.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

create — This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms All

19.29 oper-members

oper-members

Syntax **oper-members** *oper-members*
no oper-members

Context **[Tree]** (config>service>vprn>isis>link-group>level oper-members)

Full Context configure service vprn isis link-group level oper-members

Description This command sets the threshold for the minimum number of operational links for the associated link-group. If the number of operational links drops below this threshold, the configured offsets are applied. For example, oper-members=3. The metric of the member interfaces is increased when the number of interfaces is lower than 3.

The **no** form of this command reverts the oper-members limit to 1.

Default no oper-members

Parameters *oper-members* — Specifies the number of operational members.

Values 0 to 8

Platforms All

oper-members

Syntax **oper-members** [*value*]
no oper-members

Context **[Tree]** (config>router>isis>link-group>level oper-members)

Full Context configure router isis link-group level oper-members

Description This command sets the threshold for the minimum number of operational links for the associated link-group. If the number of operational links drops below this threshold, the configured offsets are applied. For example, oper-members=3. The metric of the member interfaces is increased when the number of interfaces is lower than 3.

The **no** form of this command reverts the **oper-members** limit to 1.

no option *option-number*

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>to-client-options>ipv4 option)

Full Context configure subscriber-mgmt local-user-db ipoe host to-client-options ipv4 option

Description This command configures DHCPv4 options via LUDB that are passed in all DHCP messages to the client. The options are blindly appended to any options already present in the DHCP message. In other words, there is no intelligent merging of the options where overlapping options from different sources are further evaluated to determine whether only one option or multiple options should be returned to the client.

Multiple DHCP options can be configured at the same time although each option requires its own option statement. Those options are equivalent to RADIUS VSAs **Alc-ToCLient-Dhcp4-Options**.

DHCPv4 options can be provided via DHCPv4 server in the relay case. In addition, DHCPv4 options provided via LUDB or RADIUS can be supplied and consequently appended to the already existing options. If DHCPv4 options are provided simultaneously via LUDB and RADIUS, the RADIUS as a source of DHCPv4 option is blocked and the options supplied via LUDB are passed to the client. This is valid for the relay and proxy case.

Any DHCP option may be encoded in the option statement. An example of the option statement for DHCPv4 default-gateway is given below:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

option 3 192.168.1.254

DHCPv4 options may be fixed length or variable length. They are appended at the end of DHCPv4 messages. All options begin with a tag octet, which uniquely identifies the option. Fixed-length options without data consist of only a tag octet. Only options 0 and 255 are fixed length. All other options are variable-length.

The **no** form of the removes the option from the configuration.

Parameters *option-number* — Specifies up to four option numbers. This can be a well-known or an anonymous option.

Values 1 to 254

ipv4-address — Specifies an IPv4 address as an option.

Values a.b.c.d

hex-string — Specifies options coded as hex characters.

Values 0x0..0xFFFFFFFF, up to 254 hex nibbles

ascii-string — Specifies options coded as an ASCII string, up to 27 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

option

Syntax **option** *option-number* **address** [*ip-address*]
option *option-number* **hex** *hex-string*
option *option-number* **string** *ascii-string*
option *option-number* **domain** *domain-name*
no option *option-number*

Context **[Tree]** (ipoe>host>to-server-options>ipv6 option)

Full Context configure subscriber-mgmt local-user-db ipoe host to-server-options ipv6 option

Description This command specifies the DHCPv6 options to send to the server.

The **no** form of this command removes the option parameters from the configuration.

Parameters *option-number* — Specifies the option number and the identification string that is inserted in the DHCP client message to the server.

Values 1 to 65535

ip-address — Specifies the IPv6 address.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

Syntax **option** *option-number* **address** [*ip-address*]
option *option-number* **hex** *hex-string*
option *option-number* **string** *ascii-string*
option *option-number* **domain** *domain-name*
no option *option-number*

Context **[Tree]** (ipoe>host>to-client-options>ipv6 option)
[Tree] (ppp>host>to-client-options>ipv6 option)

Full Context configure subscriber-mgmt local-user-db ipoe host to-client-options ipv6 option
configure subscriber-mgmt local-user-db ppp host to-client-options ipv6 option

Description This command specifies the DHCPv6 options to send to the client.

The **no** form of this command removes the option parameters from the configuration.

Parameters *option-number* — Specifies the option number and the identification string that is inserted in the DHCP client message to the client.

Values 1 to 65535

ip-address — Specifies the IPv6 address. Up to four addresses can be specified.

Values

ipv6-address:	x:x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d	
	x: [0 to FFFF]H	
	d: [0 to 255]D	

hex-string — Specifies the hex value of the option.

Values 0x0 to 0xFFFFFFFF, up to 254 hex nibbles

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match option-present)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match option-present
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match option-present

Description This command configures the option-present match condition.

The **no** form of this command reverts to the default.

Parameters **true** — Enables checking for the presence of IP options in the IP header.

false — Disables checking for the presence of IP options in the IP header.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

option-present

Syntax **option-present** {**true** | **false**}
no option-present

Context **[Tree]** (config>filter>ip-filter>entry>match option-present)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure filter ip-filter entry match option-present

Description This command configures matching packets that contain any IP options in the IP header as an IP filter match criterion.

The **no** form of the command removes the checking of IP options in the IP header as a match criterion.

Default no option-present

Parameters **true** — Specifies matching on all IP packets that contain any IP options in the IP header. A match will occur for all packets that have any IP option present. An option field of zero is considered as no option present.

false — Specifies matching on IP packets that do not have any IP option present in the IP header. (an option field of zero). An option field of zero is considered as no option present.

Platforms All

option-present

Syntax **option-present** {**true** | **false**}
no option-present

Context **[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match option-present)

Full Context configure system security cpm-filter ip-filter entry match option-present

Description This command configures matching packets that contain the option field or have an option field of zero in the IP header as an IP filter match criterion.

The **no** form of this command removes the checking of the option field in the IP header as a match criterion.

Default no option-present

Parameters **true** — Specifies matching on all IP packets that contain the option field in the header. A match will occur for all packets that have the option field present. An option field of zero is considered as no option present.

false — Specifies matching on IP packets that do not have any option field present in the IP header (an option field of zero). An option field of zero is considered as no option present.

19.38 option60

option60

Syntax **option60 hex** *hex-string*
option60 string *ascii-string*
no option60

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident option60)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification option60

Description This command specifies the Vendor-Identifying Vendor Option to match. Option 60 is encoded as Type-Length-Value (TLV). The *hex-string* portion of Option 60 in the received DHCP request is used for matching. Only the first 32 bytes can be defined here. If Option 60 from the message is longer, those bytes are ignored.

Note: This command is only used when **option60** is configured as one of the **match-list** parameters.

The **no** form of this command removes **option60** from the configuration.

Parameters *hex-string* — Specifies the hexadecimal format for this option.

Values 0x0 to 0xFFFFFFFF(maximum 64 hex nibbles)

ascii-string — Specifies the string format for this option, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.41 origin

origin

Syntax **origin** {**igp** | **egp** | **incomplete** | **any** | **aaa** | **dynamic** | **static** | **bonding** | **pfcp**}
no origin

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from origin)

Full Context configure router policy-options policy-statement entry from origin

Description This command configures the match criteria for the origin attribute of the route. The origin attribute is applicable to BGP routes and to the following subscriber-management routes.

- Host routes (for example, IPv4 /32 address, or IPv6 SLAAC prefix) carry the origin attribute with the **aaa**, **dynamic**, or **static** options, depending on the address assignment method. For CUPS hosts, the **pfcp** option is used for the origin attribute. Host routes can also be distinguished using the **sub-mgmt** option for the **protocol** command.
- Dynamically provisioned prefixes or loopback addresses carry the origin attribute with the **aaa** or **pfcp** options, depending on the protocol that provides the prefix and address. Dynamic routes can also be distinguished using the **direct** option for the **protocol** command.
- Statically configured prefixes under the subscriber interface do not have an origin attribute.These routes can be distinguished using the **direct** option for the **protocol** command.
- Framed routes for non-CUPS hosts do not have an origin attribute. Framed routes for CUPS hosts use the **pfcp** option for the origin attribute. Alternatively, framed routes can be distinguished using the **managed** option for the **protocol** command.

These values that are specific to subscriber-management routes are never carried in BGP updates as part of the BGP origin attribute and are not visible within the BGP process.

Default no origin

Parameters **igp** — Specifies path-matching information that originates within the local AS.

egp — Specifies path-matching information that originates in another AS.

incomplete — Configures path-matching information learned by another method.

any — Specifies to ignore this criteria.

aaa — Specifies to use the subscriber-host address that originates from AAA.

Values IPv4 — subscriber-management /32 host routes that originate from the RADIUS framed-ip-address VSA other than 255.255.255.254. The 255.255.255.254 returned by the RADIUS indicates that the BNG (NAS) should assign an IP address from its own pool.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

IPv6 — subscriber-management routes that originate through framed-ipv6-prefix (SLAAC), delegated-ipv6-prefix (IA_PD) or alc-ipv6-address (IA_NA) RADIUS attributes. It is also applicable to VSA Alc-IPv6-Sub-If-Prefix, where the subscriber interface prefix can originate from RADIUS. This is valid for IPoE and PPPoE type hosts.

dynamic — Specifies to use the subscriber host address that originates from DHCP, DHCPv6, or the local address server.

Values IPv4 — subscriber-management /32 host routes that originate from the DHCP server (local or remote) or RADIUS framed-ip-address=255.255.255.254 (RFC 2865).

IPv6 — subscriber-management routes that are assigned via local DHCPv6 server pools whose name is obtained through the Alc-Delegated-IPv6-Pool (PD pool) and Framed-IPv6-Pool (NA pool) RADIUS attributes, or the local address server whose name is obtained through the Alc-SLAAC-IPv6-Pool (SLAAC pool) RADIUS attribute. This is valid for IPoE and PPPoE type hosts.

For IPoEv6 only, the pool name can also be obtained from ipv6-delegated-prefix-pool (PD pool) and ipv6-wan-address-pool (NA pool) from the LUDB.

static — Specifies to use the subscriber-host address that originates from the local user database.

Values IPv4 — subscriber-management /32 host routes that originate from the LUDB and also covers the RADIUS fallback category (RADIUS falls back to system defaults or to the LUDB).

IPv6 — subscriber-management routes that originate from the LUDB from ipv6-address (IA_NA) or ipv6-prefix (IA_PD), or ipv6-slaac-prefix (SLAAC).

bonding — Specifies to use bonding.

pfcp — Specifies to use routes learned using the PFCP protocol.

Platforms All

origin

Syntax **origin** {**igp** | **egp** | **incomplete** | *param-name*}
no origin

Context **[Tree]** (config>router>policy-options>policy-statement>default-action origin)
[Tree] (config>router>policy-options>policy-statement>entry>action origin)

Full Context configure router policy-options policy-statement default-action origin
configure router policy-options policy-statement entry action origin

Description This command sets the BGP origin assigned to routes exported into BGP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the routes are exported into protocols other than BGP, this option is ignored.

The **no** form of this command disables setting the BGP origin for the route policy entry.

Default no origin

Parameters **igp** — Sets the path information as originating within the local AS.

egp — Sets the path information as originating in another AS.

incomplete — Sets the path information as learned by some other means.

param-name — The origin parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

19.43 origin-invalid-unusable

origin-invalid-unusable

Syntax [**no**] **origin-invalid-unusable**

Context **[Tree]** (config>service>vprn>bgp>best-path-selection origin-invalid-unusable)

Full Context configure service vprn bgp best-path-selection origin-invalid-unusable

Description When this command is configured, all VPRN BGP routes that have an origin validation state of “Invalid” are considered unusable by the best path selection algorithm, meaning they are not used for forwarding, not advertised to BGP peers, and not eligible for export as a VPN-IP route.

With the default value, VPRN BGP routes with an origin validation state of “Invalid” are usable if they are selected.

Default no origin-invalid-unusable

Platforms All

origin-invalid-unusable

Syntax [**no**] **origin-invalid-unusable**

Context **[Tree]** (config>router>bgp>best-path-selection origin-invalid-unusable)

Full Context configure router bgp best-path-selection origin-invalid-unusable

Description When **origin-invalid-unusable** is configured, all routes that have an RPKI origin validation state of ‘Invalid’ are considered unusable by the best path selection algorithm, meaning they are not used for forwarding and not advertised to BGP peers.

With the default of **no origin-invalid-unusable**, routes with an RPKI origin validation state of ‘Invalid’ are compared to other ‘usable’ routes for the same prefix according to the BGP decision process.

Default no origin-invalid-unusable

no origin-validation-state

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from origin-validation-state)

Full Context configure router policy-options policy-statement entry from origin-validation-state

Description This command is used to match BGP routes on the basis of origin validation state:

- Valid (0)
- Not-Found (1)
- Invalid (2)

Default no origin-validation-state

Parameters **valid** — Marks the route as having an origin validation state of valid.

notFound — Marks the route as having an origin validation state of Not Found.

invalid — Marks the route as having an origin validation state of invalid.

Platforms All

origin-validation-state

Syntax **origin-validation-state** {*state* | *param-name*}
no origin-validation-state

Context **[Tree]** (config>router>policy-options>policy-statement>default-action origin-validation-state)
[Tree] (config>router>policy-options>policy-statement>entry>action origin-validation-state)

Full Context configure router policy-options policy-statement default-action origin-validation-state
configure router policy-options policy-statement entry action origin-validation-state

Description This command is used to mark BGP IPv4 and IPv6 routes matching the **default-action** or a specific entry of a route policy with one of the 3 following origin validation states:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Valid (0)
- Not-Found (1)
- Invalid (2)

Default no origin-validation-state

Parameters *state* — Specifies the default operational origin validation state for this policy statement.

Values valid — Marks the route as having an origin validation state of valid.

notFound — Marks the route as having an origin validation state of Not Found.

invalid — Marks the route as having an origin validation state of invalid.

param-name — Specifies the origin parameter variable name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

19.47 originate-default-route

originate-default-route

Syntax **originate-default-route** [**type-nssa**] [**adjacency-check**]
no originate-default-route

Context **[Tree]** (config>service>vprn>ospf>area>nssa originate-default-route)
[Tree] (config>service>vprn>ospf3>area>nssa originate-default-route)

Full Context configure service vprn ospf area nssa originate-default-route
configure service vprn ospf3 area nssa originate-default-route

Description This command specifies whether when configuring an NSSA with no summaries, the Area Border Router (ABR) injects a type-7 LSA default route into the NSSA area. The default behavior is to inject a type-3 LSA default route, but some older implementations expect a type-7 LSA default route.

When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the NSSA area. Some older implementations expect a type 7 LSA default route.

The **no** form of this command disables origination of a default route.

Default no originate-default-route — A default route is not originated.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **type-nssa** — Specifies that a type 7 LSA should be used for the default route.

Configure this parameter to inject a type 7 LSA default route into an NSSA configured with no summaries, instead of a type 3 LSA.

To revert to a type 3 LSA, execute the **originate-default-route** command without the **type-nssa** parameter.

Default type 3 LSA default route

adjacency-check — Specifies whether adjacency checks are performed before originating a default route. If this parameter is configured, then no area 0 adjacency is required for the ABR to advertise the default route.

Default Adjacency checks are performed, and an area 0 adjacency is required for the ABR to advertise the default route

Platforms All

originate-default-route

Syntax **originate-default-route** [**type-7**] [**no-adjacency-check**]
originate-default-route [**type-nssa**] [**no-adjacency-check**]
no originate-default-route

Context **[Tree]** (config>router>ospf>area>nssa originate-default-route)
[Tree] (config>router>ospf3>area>nssa originate-default-route)

Full Context configure router ospf area nssa originate-default-route
configure router ospf3 area nssa originate-default-route

Description This command enables the generation of a default route and its LSA type (3 or 7) into a Not So Stubby Area (NSSA) by an NSSA Area Border Router (ABR).

When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the NSSA area. Some older implementations expect a type 7 LSA default route.

The **no** form of this command disables origination of a default route.

Default no originate-default-route

Parameters **type-7** — Specifies a type 7 LSA should be used for the default route in the **config**>**router**>**ospf**>**area**>**nssa** context.

Configure this parameter to inject a type-7 LSA default route instead the type 3 LSA into the NSSA configured with no summaries.

To revert to a type 3 LSA, enter **originate-default-route** without the **type-7** parameter.

Default Type 3 LSA default route.

type-nssa — Specifies an NSSA-LSA type should be used for the default route in the **config**>**router**>**ospf3**>**area**>**nssa** context.

Use subject to Terms available at: www.nokia.com

no-adjacency-check — Specifies whether or not adjacency checks are performed before originating a default route. If this parameter is configured, then no area 0 adjacency is required for the ABR to advertise the default route.

Default Adjacency checks are performed, and an area 0 adjacency is required for the ABR to advertise the default route.

Platforms All

19.48 originated-qos-marking

originated-qos-marking

Syntax [**no**] **originated-qos-marking** *dscp-name*

Context **[Tree]** (config>system>telemetry>persistent-subscriptions>subscription originated-qos-marking)

Full Context configure system telemetry persistent-subscriptions subscription originated-qos-marking

Description This command configures the QoS marking used for packets carrying telemetry notifications.

The **no** form of this command removes the QoS marking.

Parameters *dscp-name* — Specifies the QoS marking name.

The *dscp-name* parameter is a 6-bit value. It must be one of the predefined DSCP names in the system.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, e f, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

19.50 orphan-override

orphan-override

Syntax **orphan-override** [**level** *priority-level*] [**weight** *weight*] [**cir-level** *cir-level*] [**cir-weight** *cir-weight*]
no orphan-override

Context **[Tree]** (config>qos>port-scheduler-policy orphan-override)

Full Context configure qos port-scheduler-policy orphan-override

Description This command overrides the default orphan behavior for port schedulers created using the port scheduler policy. The default orphan behavior is to give all orphan queues and schedulers bandwidth after all other properly parented queues and schedulers. Orphans by default do not receive any within-CIR bandwidth and receive above-CIR bandwidth after priority levels 8 through 1 have been allocated. The orphan-override command accepts the same parameters as the port-parent command in the SAP egress and network queue policy contexts. The defined parameters are used as a default port-parent association for any queue or scheduler on the port that the port scheduler policy is applied.

Orphan queues and schedulers are identified as:

- Any queue or scheduler that does not have a port-parent or parent command applied
- Any queue that has a parent command applied, but the specified scheduler name does not exist on the queue's SAP, MSS, or SLA Profile instance.

A queue or scheduler may be properly parented to an upper level scheduler, but that scheduler may be orphaned. In this case, the queue or scheduler receives bandwidth from its parent scheduler based on the parent schedulers ability to receive bandwidth as an orphan.

Within-CIR Priority Level Parameters

The within-CIR parameters define which port priority level the orphan queues and schedulers should be associated with when receiving bandwidth for the queue or schedulers within-CIR offered load. The within-CIR offered load is the amount of bandwidth the queue or schedulers could use that is equal to or less than its defined or summed CIR value. The summed value is only valid on schedulers and is the sum of the within-CIR offered loads of the children attached to the scheduler. The parameters that control within-CIR bandwidth allocation for orphans are the orphan-override commands cir-level and cir-weight keywords. The cir-level keyword defines the port priority level that the scheduler or queue uses to receive bandwidth for its within-CIR offered load. The cir-weight is used when multiple queues or schedulers exist at the same port priority level for within-CIR bandwidth. The weight value defines the relative ratio that is used to distribute bandwidth at the priority level when more within-CIR offered load exists than the port priority level has bandwidth.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A cir-weight equal to zero (the default value) has special meaning and informs the system that the orphan queues and schedulers do not receive bandwidth from the within-CIR distribution. Instead, all bandwidth for the orphan queues and schedulers must be allocated from the port scheduler's above-CIR pass.

Above-CIR Priority Level Parameters

The above-CIR parameters define which port priority level the orphan queues and schedulers should be associated with when receiving bandwidth for the queue or schedulers above-CIR offered load. The above-CIR offered load is the amount of bandwidth the queue or schedulers could use that is equal to or less than its defined PIR value (based on the queue or schedulers rate command) less any bandwidth that was given to the queue or scheduler during the above-CIR scheduler pass. The parameters that control above-CIR bandwidth allocation for orphans are the orphan-override commands level and weight keywords. The **level** keyword defines the port priority level that the scheduler or queue uses to receive bandwidth for its above-CIR offered load. The weight is used when multiple queues or schedulers exist at the same port priority level for above-CIR bandwidth. The weight value defines the relative ratio that is used to distribute bandwidth at the priority level when more above-CIR offered load exists than the port priority level has bandwidth.

The **no** form of this command removes the orphan override port parent association for the orphan queues and schedulers on port schedulers created with the port scheduler policy. Any orphan queues and schedulers on a port associated with the port scheduler policy will revert to default orphan behavior.

Parameters **level** *priority-level* — Defines the port priority the orphan queues and schedulers will use to receive bandwidth for their above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

weight *weight* — Defines the weight the orphan queues and schedulers will use in the above-CIR port priority level (defined by the level parameter).

Values 1 to 100

Default 1

cir-level *cir-level* — Defines the port priority the orphan queues and schedulers will use to receive bandwidth for their within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the orphan queues and schedulers do not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 1 to 8 (8 is the highest level)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

cir-weight *cir-weight* — Defines the weight the orphan queues and schedulers will use in the within-CIR port priority level (defined by the cir-level parameter). When the cir-weight parameter is set to a value of 0 (the default value), the orphan queues and schedulers do not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 1 to 100 (100 is the highest weight)

Platforms All

19.51 ospf

ospf

Syntax **ospf** [*router-id*]
no ospf

Context **[Tree]** (config>service>vprn ospf)

Full Context configure service vprn ospf

Description This command enables access to the context to enable an OSPF protocol instance.

OSPF instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command deletes the OSPF protocol instance removing all associated configuration parameters.

Default no ospf

Parameters *router-id* — Specifies the OSPF router ID to be used with the associated OSPF instance. The *router-id* must be given a dot decimal notation format.

Values a.b.c.d

Platforms All

ospf

Syntax **ospf** *ospf-instance* [*router-id*]
[**no**] **ospf** *ospf-instance*

Context **[Tree]** (config>router ospf)

Full Context configure router ospf

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates an OSPF routing instance and then enters the associated context to configure the associated protocol parameters.

Additionally, the router ID can be specified as another parameter of the OSPF command. This parameter is required for all non-base OSPF instances.

The default value for the base instance is inherited from the configuration in the **config**>**router** context. When that is not configured, the following apply:

1. the system uses the system interface address (which is also the loopback address)
2. if a system interface address is not configured, it uses the last 32 bits of the chassis MAC address

This is a required command when configuring multiple instances and the instance being configured is not the base instance. When configuring multiple instances of OSPF, there is a risk of loops because networks are advertised by multiple domains configured with multiple interconnections to one another. To prevent this from happening, all routers in a domain should be configured with the same domain ID. Each domain (OSPF-instance) should be assigned a specific bit value in the 32-bit tag mask.

The default value for non-base instances is 0.0.0.0 and is invalid; in this case, the instance of OSPF will not start. When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

Issue the shutdown and no shutdown commands for the instance for the new router ID to be used, or reboot the entire router.

OSPF instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command to reverts to the default value.

Default no ospf

Parameters *ospf-instance* — Specifies a unique integer that identifies a specific instance of a version of the OSPF protocol running in the router instance specified by the router ID.

Values 1 to 31

router-id — Specifies the OSPF router ID to be used with the associated OSPF instance. This IP address must be given a dot decimal notation format.

19.55 otu

otu

Syntax [**no**] **otu**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>port otu)

Full Context configure port otu

Description This command specifies whether or not to enable OTU encapsulation. The port must be shut down before OTU is enabled. This command is valid only for ports on assemblies that support this encapsulation mode. Refer to the appropriate Installation Guide for ports assembly to determine if OTU encapsulation is supported.

Note that OTU cannot be disabled on OTU3 encapsulated OC768 or 40-Gigabit Ethernet.by the **no otu** command. Therefore, the default depends on the port type. The default for OTU3 encapsulated OC768 or 40-Gigabit Ethernet is **otu**.

The **no** form of this command disables OTU (clear channel 10GE-LAN/WAN or OC192).

Default no otu

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.56 otu2-lan-data-rate

otu2-lan-data-rate

Syntax **otu2-lan-data-rate** {**11.049** | **11.096**}

Context [Tree] (config>port>otu otu2-lan-data-rate)

Full Context configure port otu otu2-lan-data-rate

Description This command specifies the data rate to use when configured for an OTU encapsulated 10GE-LAN signal. The port must be shut down before changing the 10GE LAN OTU2 data rate.

Default otu2-lan-data-rate 11.049

Parameters **11.049** — Configures the port to transmit and receive an 11.049 Gb/s synchronous OTU encapsulated 10GE-LAN signal (No fixed stuffing bytes in the OTU2 frame).

11.096 — Configures the port to transmit and receive an 11.096 Gb/s synchronous OTU encapsulated 10GE-LAN signal (with fixed stuffing bytes in the OTU2 frame).

no out-label

Context **[Tree]** (config>router>mpls>lsp>working-tp-path out-label)
[Tree] (config>router>mpls>lsp>protect-tp-path out-label)

Full Context configure router mpls lsp protect-tp-path out-label
configure router mpls lsp working-tp-path out-label

Description This command configures the outgoing label value to use for an MPLS-TP working or protect path. The out-link is the outgoing interface on the node that this path will use, and must be specified. If the out-link refers to a numbered IP interface, the user may optionally configure the **next-hop** parameter and the system will determine the interface to use to reach the configured next-hop, but will check that the user-entered value for the *out-link* corresponds to the link returned by the system. If they do not correspond, then the path will not come up.

Default no out-label

Parameters *out-label* — Specifies the out label.

Values 32 to 16415

if-name — Specifies the interface name.

ip-address — Specifies the IPv4 address in a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.67 out-profile-rate

out-profile-rate

Syntax **out-profile-rate** *packet-rate-limit* [**log-event**]
no out-profile-rate

Context **[Tree]** (config>sys>security>cpu-protection>policy out-profile-rate)

Full Context configure system security cpu-protection policy out-profile-rate

Description This command applies a packet arrival rate limit for the entire SAP/interface, above which packets will be market as discard eligible, in other words, out-profile/low-priority/yellow. The rate defined is a global rate limit for the interface regardless of the number of traffic flows. It is a per-SAP/interface rate.

The **no** form of this command sets out-profile-rate parameter back to the default value.

Default out-profile-rate 3000 for cpu-protection-policy-id 1-253

out-profile-rate 6000 for cpu-protection-policy-id 254 (default access interface policy)

out-profile-rate 3000 for cpu-protection-policy-id 255 (default network interface policy)

Parameters *packet-rate-limit* — Specifies a packet arrival rate limit in packets per second.

Values 1 to 65535, **max** (max indicates no limit)

log-events — Issues a tmnxCpmProtViolSapOutProf, tmnxCpmProtViolIfOutProf, or tmnxCpmProtViolSdpBindOutProf log event and tracks violating interfaces when the out-profile-rate is exceeded. Supported on CPM3 and above only.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

19.68 out-remark

out-remark

Syntax **out-remark** {**dscp** *dscp-name* | **prec** *ip-prec-value*}
no out-remark

Context **[Tree]** (config>qos>sap-ingress>fc out-remark)

Full Context configure qos sap-ingress fc out-remark

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used in a SAP ingress QoS policy to define an explicit out-of-profile remark action for a forwarding class or subclass. While the SAP ingress QoS policy may be applied to any SAP, the remarking functions are only enforced when the SAP is associated with an IP or subscriber interface (in an IES or VPRN). When the policy is applied to a Layer 2 SAP (for example, Epipe or VPLS), the remarking definitions are silently ignored.

In the case where the policy is applied to a Layer 3 SAP, the out-of-profile remarking definition will be applied to packets that have been classified to the forwarding class or subclass. It is possible for a packet to match a classification command that maps the packet to a particular forwarding class or subclass, only to have a more explicit (higher priority match) override the association. Only the highest priority match forwarding class or subclass association will drive the out-of-profile marking.

The out-remark command is only applicable to ingress IP routed packets that are considered out-of-profile. The profile of a SAP ingress packet is affected by either the explicit in-profile/out-of-profile definitions or the ingress policing function applied to the packet. Table 104 describes the effect of the out-remark command on received SAP ingress packets. Within the out-of-profile IP packet's ToS field, either the six DSCP bits or the three precedence bits are remarked.

Table 104 **Out-remark Command Effect**

SAP Ingress Packet State	out-remark Command Effect
Non-Routed, Policed In-Profile	No Effect (non-routed packet)
Non-Routed, Policed Out-of-Profile	No Effect (non-routed packet)
Non-Routed, Explicit In-Profile	No Effect (non-routed packet)
Non-Routed, Explicit Out-of-Profile	No Effect (non-routed packet)
IP Routed, Policed In-Profile	No Effect (in-profile packet)
IP Routed, Policed Out-of-Profile	out-remark value applied to IP header ToS field
IP Routed, Explicit In-Profile	No Effect (in-of-profile packet)
IP Routed, Explicit Out-of-Profile	out-remark value applied to IP header ToS field

A packet that is explicitly remarked at ingress will not be affected by any egress remarking decision. Explicit ingress remarking has highest priority.

An explicit dscp name or precedence value must be specified for out-of-profile remarking to be applied.

The **no** form of this command disables ingress remarking of out-of-profile packets classified to the forwarding class or subclass.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no out-remark

Parameters **dscp** *dscp-name* — Specifies that the matching packet's DSCP bits should be overridden with the value represented by *dscp-name*.

The *dscp-name* parameter is a 6-bit value. It must be one of the predefined DSCP names defined on the system.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, e f, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

prec *ip-prec-value* — Specifies that the matching packet's precedence bits should be overridden with the value represented by *ip-prec-value*.

The value specified by *ip-prec-value* is used to overwrite the precedence bits within a matching routed packets IP header ToS field.

Values 0 to 7

Platforms All

19.69 outband

outband

Syntax **outband** *service-id*
no outband

Context **[Tree]** (config>system>security>vprn-aaa-server outband)

Full Context configure system security vprn-aaa-server outband

Description This command configures TACACS+ and RADIUS servers in a VPRN to be used for AAA by that VPRN and by sessions on the console or out-of-band (OOB) Ethernet ports.

The **no** form of this command disables the use of servers in out-of-band management.

Default no outband

Parameters *service-id* — Specifies the VPRN server for AAA to use for OOB sessions.

Values *service-id*: 1 to 2147483648
svc-name: 64 characters maximum

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

19.70 outbound-max-sessions

outbound-max-sessions

Description This command enables debugging for all BGP outbound route filtering (ORF) packets. ORF is used to inform a neighbor of targets (using target-list) that it is willing to receive.

Platforms All

19.72 outer-tag

outer-tag

Syntax **outer-tag** *value* [*vid-mask*]
no outer-tag

Context **[Tree]** (config>qos>sap-ingress>mac-criteria>entry>match outer-tag)

Full Context configure qos sap-ingress mac-criteria entry match outer-tag

Description This command configures the matching of the first tag that is carried transparently through the service. Service delimiting tags are stripped from the frame and the outer tag on ingress is the first tag after any service delimiting tags. The outer tag is the first tag before any service delimiting tags on egress. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

On dot1Q SAPs, the outer tag is the only tag that can be matched. On dot1Q SAPs with exact match (sap 2/1/1:50), the outer tag will be populated with the next tag that is carried transparently through the service or 0 if there is no additional VLAN tags on the frame.

On QinQ SAPs that strip a single service delimiting tag, the outer tag will contain the next tag (which is still the first tag carried transparently through the service.) On SAPs with two service delimiting tags (two tags stripped), the **outer-tag** will contain 0 even if there are more than two tags on the frame.

The optional *vid_mask* is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value & vid-mask) = = (tag & vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS, the VID type cannot be specified on the default QoS policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The default vid-mask is set to 4095 for exact match.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

outer-tag

Syntax **outer-tag** *value* [*vid-mask*]
no outer-tag

Context **[Tree]** (config>filter>mac-filter>entry>match outer-tag)

Full Context configure filter mac-filter entry match outer-tag

Description This command configures the matching of the first tag that is carried transparently through the service. Service delimiting tags are stripped from the frame and outer tag on ingress is the first tag after any service delimiting tags. Outer tag is the first tag before any service delimiting tags on egress. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

On dot1Q SAPs outer-tag is the only tag that can be matched. On dot1Q SAPs with exact match (sap 2/1/1:50) the outer-tag will be populated with the next tag that is carried transparently through the service or 0 if there is no additional VLAN tags on the frame.

On QinQ SAPs that strip a single service delimiting tag, outer-tag will contain the next tag (which is still the first tag carried transparently through the service.) On SAPs with two service delimiting tags (two tags stripped) outer-tag will contain 0 even if there are more than 2 tags on the frame.

The optional *vid-mask* is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value & vid-mask) = = (tag & vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS the VID type cannot be specified on the default QoS policy.

The default vid-mask is set to 4095 for exact match.

19.73 output

output

Syntax **output**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>sync-if-timing>bits output)

Full Context configure system sync-if-timing bits output

Description This command provides a context to configure and enable or disable the external BITS timing reference output to the central clock of the router. On redundant systems, there are two possible BITS-out interfaces, one for each CPM or CCM.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

19.74 output-authorization

output-authorization

Syntax **output-authorization**

Context [Tree] (config>system>security>management-interface output-authorization)

Full Context configure system security management-interface output-authorization

Description This command configures the authorization of the configuration and state output in model-driven interfaces and telemetry. When enabled, commands that display configuration or state output authorize every element in the output. If a remote AAA server is configured, this can cause delays in displaying output while it is authorized. If a large amount of output is displayed, for example, when displaying the system configuration, the remote AAA server receives a large number of authorization requests.

Input to edit the configuration is not affected by this command, and is always authorized.

19.78 overall

overall

Syntax **overall** *max-nr-of-hosts*
no overall

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits overall)
[Tree] (config>subscr-mgmt>sub-profile>host-limits overall)

Full Context configure subscriber-mgmt sla-profile host-limits overall
configure subscriber-mgmt sub-profile host-limits overall

Description This command configures the maximum number of subscriber hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of subscriber hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of subscriber hosts.

Values 1 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

overall

Syntax **overall** *max-nr-of-sessions*
no overall

Context **[Tree]** (config>subscr-mgmt>sla-profile>session-limits overall)
[Tree] (config>subscr-mgmt>sub-profile>session-limits overall)

Full Context configure subscriber-mgmt sla-profile session-limits overall
configure subscriber-mgmt sub-profile session-limits overall

Description This command configures the maximum number of subscriber sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of subscriber sessions limit.

Parameters *max-nr-of-sessions* — Specifies the maximum number of subscriber sessions.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.79 overall-rate

overall-rate

Syntax **overall-rate** *packet-rate-limit*
no overall-rate

Context **[Tree]** (config>sys>security>cpu-protection>policy overall-rate)

Full Context configure system security cpu-protection policy overall-rate

Description This command applies a maximum packet arrival rate limit (applied per SAP/interface) for the entire SAP/interface, above which packets will be discarded immediately. The rate defined is a global rate limit for the interface regardless of how many traffic flows are present on the SAP/interface. It is a per-SAP/interface rate.

The **no** form of this command sets overall-rate parameter back to the default value.

Default overall max for cpu-protection-policy-id 1 to 253

overall 6000 for cpu-protection-policy-id 254 (default access interface policy)

overall max for cpu-protection-policy-id 255 (default network interface policy)

Parameters *packet-rate-limit* — Specifies a packet arrival rate limit in packets per second.

Values 1 to 65535, **max** (the max indicates no limit)

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

19.80 overflow

overflow

Syntax **overflow** *percent*
no overflow

Context **[Tree]** (config>cflowd overflow)

Full Context configure cflowd overflow

Description This command specifies the percentage of the flow cache entries removed when the maximum number of entries is exceeded. The entries removed are the entries that have not been updated for the longest amount of time.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command resets the number of entries cleared from the flow cache on overflow to the default value.

Default overflow 1

Parameters *percent* — Specifies the percentage of the flow cache entries removed when the maximum number of entries is exceeded.

Values 1 to 50 percent

Platforms All

19.81 overflow-limit

overflow-limit

Syntax **overflow-limit** *number* **threshold** *percent* [**bw** *bandwidth-in-mbps*]
no overflow-limit

Context **[Tree]** (config>router>mpls>lsp>auto-bandwidth overflow-limit)
[Tree] (config>router>mpls>lsp-template>auto-bandwidth overflow-limit)

Full Context configure router mpls lsp auto-bandwidth overflow-limit
configure router mpls lsp-template auto-bandwidth overflow-limit

Description This command configures overflow-triggered auto-bandwidth adjustment. It sets the threshold at which bandwidth adjustment is initiated due to the configured number of overflow samples having been reached, regardless of how much time remains until the adjust interval ends.

A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the thresholds configured as part of this command.

If overflow-triggered auto-bandwidth adjustment is successful the overflow count, maximum average data rate and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails then the overflow count is reset but the maximum average data rate and adjust count maintain current values.

The **no** form of this command disables overflow-triggered automatic bandwidth adjustment.

Default no overflow-limit

Parameters *number* — Specifies the number of overflow samples that triggers an overflow auto-bandwidth adjustment attempt.

Values 1 to 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

percent — Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth, for counting an overflow sample.

Values 1 to 100

bandwidth-in-mbps — Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) relative to the current bandwidth, for counting an overflow sample.

Values 1 to 6400000

Platforms All

19.82 overload

overload

Syntax **overload** [**timeout** *seconds*]
no overload

Context **[Tree]** (config>service>vpls>spb overload)

Full Context configure service vpls spb overload

Description This command administratively sets the SPB to operate in the overload state for a specific time period, in seconds, or indefinitely. During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by SPB and is not used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The overload command can be useful in circumstances where SPB is overloaded or used prior to executing a shutdown command to divert traffic around the switch.

The **no** form of this command causes the router to exit the overload state.

Default no overload

Parameters *seconds* — The time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default Infinity (overload state maintained indefinitely)

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

overload

Syntax **overload** [**timeout** *seconds*] [**max-metric**]
no overload

Context **[Tree]** (config>service>vprn>isis overload)

Full Context configure service vprn isis overload

Description This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.

During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and will not be used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The **overload** command can be useful in circumstances where the router is overloaded or used prior to executing a **shutdown** command to divert traffic around the router.

The **max-metric** parameter can be set to advertise transit links with the maximum metric of 0xffffffe (wide metrics) or 0x3f (regular metrics), instead of setting the overload bit when placing the router in overload.

The **no** form of this command causes the router to exit the overload state.

Default no overload

Parameters *seconds* — Specifies the time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default infinity (overload state maintained indefinitely)

max-metric — Set the maximum metric instead of overload.

Platforms All

overload

Syntax **overload** [**timeout** *seconds*]
no overload

Context **[Tree]** (config>service>vprn>ospf overload)
[Tree] (config>service>vprn>ospf3 overload)

Full Context configure service vprn ospf overload
configure service vprn ospf3 overload

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined to directly attached interfaces continue to reach the router.

To put the IGP in an overload state, enter a **timeout** value. The IGP will enter the overload state until the **timeout** timer expires or a **no overload** command is executed.

If the **overload** command is performed during the execution of an **overload-on-boot** command, the **overload** command takes precedence. This could occur as a result of a saved configuration file in which both parameters are saved. When the file is saved by the system, the **overload-on-boot** command is saved after the **overload** command.

Use the **no** form of this command to return to the default. When the **no overload** command is executed, the overload state is terminated, regardless the reason the protocol entered overload state.

Default no overload

Parameters **timeout** *seconds* — Specifies the number of seconds to reset overloading.

Values 60 to1800

Default 60

Platforms All

overload

Syntax **overload** [**timeout** *seconds*] [**max-metric**]
no overload

Context **[Tree]** (config>router>isis overload)

Full Context configure router isis overload

Description This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.

During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and will not be used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The overload command is cleared from the configuration after a reboot if **overload-on-boot** is configured with or without a timeout value. To keep the IS-IS router in the overload state indefinitely after rebooting, configure **overload-on-boot** with no timeout value or configure the **overload** command with **no overload-on-boot** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **overload** command can be useful in circumstances where the router is overloaded or used prior to executing a **shutdown** command to divert traffic around the router.

The **max-metric** parameter can be set to advertise transit links with the maximum metric of 0xfffffffe (wide metrics) or 0x3f (regular metrics), instead of setting the overload bit when placing the router in overload.

The **no** form of this command causes the router to exit the overload state.

Default no overload

Parameters *seconds* — Specifies the time, in seconds, that this router must operate in overload state.

Default infinity (overload state maintained indefinitely)

Values 60 to 1800

max-metric — Sets the maximum metric instead of overload.

Platforms All

overload

Syntax **overload** [**timeout** *seconds*]
no overload

Context **[Tree]** (config>router>ospf overload)
[Tree] (config>router>ospf3 overload)

Full Context configure router ospf overload
configure router ospf3 overload

Description This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined to directly attached interfaces continues to reach the router.

To put the IGP in an overload state enter a timeout value. The IGP will enter the overload state until the timeout timer expires or a **no overload** command is executed.

If the **overload** command is encountered during the execution of an **overload-on-boot** command then this command takes precedence. This could occur as a result of a saved configuration file where both parameters are saved. When the file is saved by the system the **overload-on-boot** command is saved after the **overload** command. **However**, when **overload-on-boot** is configured under OSPF with no timeout value configured, the router will remain in overload state indefinitely after a reboot.

The **no** form of this command reverts to the default. When the **no overload** command is executed, the overload state is terminated regardless of the reason the protocol entered overload state.

Default no overload

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *timeout seconds* — Specifies the number of seconds to reset overloading.

Values 1 to 1800 in the **config**>**router**>**ospf** context
60 to 1800 in the **config**>**router**>**ospf3** context

Context **[Tree]** (config>service>vpls>spb overload-on-boot)

Full Context configure service vpls spb overload-on-boot

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description When the router is in an overload state, SPB the B-VPLS is used only if there is no other SPB B-VPLS to reach the destination. This command configures the IGP upon bootup in the overload state until one of the following events occur:

- The timeout timer expires.
- A manual override of the current overload state is entered with the **no** form of the **config**>**service**>**vpls**>**spb overload** command.

The **no** form of this command does not affect the overload-on-boot function.

If no timeout is specified, SPB IS-IS goes into overload indefinitely after a reboot. After the reboot, the SPB IS-IS status displays a permanent overload state:

```
L1 LSDB Overload: Manual on boot (Indefinitely in overload)
```

This state can be cleared with the **config**>**service**>**vpls**>**spb**>**no overload** command.

When specifying a timeout value, SPB IS-IS goes into overload for the configured timeout after a reboot. After the reboot, SPB IS-IS status displays the remaining time the system stays in overload:

```
L1 LSDB Overload: Manual on boot (Overload Time Left: 17)
```

The overload state can be cleared before the timeout expires with the **no** form of the **config**>**service**>**vpls**>**spb overload** command.

The **no** form of this command removes the overload-on-boot functionality from the configuration.

Default no overload-on-boot

Parameters *seconds* — Specifies the time, in seconds, that this router must operate in overload state.

Values 60 to 1800

Default Infinity (overload state maintained indefinitely)

Platforms All

overload-on-boot

Syntax **overload-on-boot** [**timeout** *seconds*] [**max-metric**]
no overload-on-boot

Context **[Tree]** (config>service>vprn>isis overload-on-boot)

19.91 override

override

Syntax [**no**] **override**

Context **[Tree]** (config>service>vprn>pim>rp>static override)

Full Context configure service vprn pim rp static override

Description This command changes the precedence of static RP over dynamically learned Rendezvous Point (RP).

When enabled, the static group-to-RP mappings take precedence over the dynamically learned mappings.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no override

override

Syntax [**no**] **override**

Context **[Tree]** (config>router>pim>rp>static>address override)
[Tree] (config>router>pim>rp>ipv6>static>address override)

Full Context configure router pim rp ipv6 static address override
configure router pim rp static address override

Description This command changes the precedence of static RP over dynamically-learned Rendezvous Points (RPs).

When enabled, the static group-to-RP mappings take precedence over the dynamically learned mappings.

The **no** form of this command reverts to the default.

Default no override

Platforms All

19.92 override-bmi

override-bmi

Syntax **override-bmi** *value*
no override-bmi

Context **[Tree]** (config>router>isis>segm-rtng>msd override-bmi)

Full Context configure router isis segment-routing maximum-sid-depth override-bmi

Description This command provides the ability to override the announced MSD node Base MPLS Imposition (BMI). The MSD-BMI value announced by a router can be used by recipients to understand the number of MPLS labels that can be imposed inclusive of all service, transport, or special labels.

When **override-bmi** is not configured, the router announces the node maximum supported BMI assuming the most simple services and Layer 2 encapsulation.

The **no** form of this command reverts to the default.

Default no override-bmi

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *values* — Specifies the override BMI.

Values 0 to 12

Platforms All

override-bmi

Syntax **override-bmi** *value*
no override-bmi

Context **[Tree]** (config>router>ospf>segm-rtng>msd override-bmi)

Full Context configure router ospf segment-routing maximum-sid-depth override-bmi

Description This command provides the ability to override the announced MSD node Base MPLS Imposition (BMI). The MSD-BMI value announced by a router can be used by recipients to understand the number of MPLS labels that can be imposed inclusive of all service, transport, or special labels.

When **override-bmi** is not configured, the router announces the node maximum supported BMI assuming the most simple services and Layer 2 encapsulation.

The **no** form of this command reverts to the default.

Default no override-bmi

Parameters *values* — Specifies the override BMI. The upper limit depends on the FP chipset used.

Values 0 to 12

Platforms All

19.93 override-erld

override-erld

Syntax **override-erld** *value*
no override-erld

Context **[Tree]** (config>router>isis>segm-rtng>msd override-erld)

Full Context configure router isis segment-routing maximum-sid-depth override-erld

Description This command provides the ability to override the announced MSD node Entropy Readable Label Depth (ERLD). It is useful for ingress LSRs to know each intermediate LSR's capability of reading the maximum label stack depth and performing EL-based load balancing.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When **override-erld** is not configured, then the router announces the node maximum supported ERLD assuming the most simple Layer 2 encapsulation.

The **no** form of this command reverts to the default.

Default no override-erld

Parameters *values* — Specifies the override ERLD.

Values 0 to 15

Platforms All

override-erld

Syntax **override-erld** *value*
no override-erld

Context **[Tree]** (config>router>ospf>segm-rtng>msd override-erld)

Full Context configure router ospf segment-routing maximum-sid-depth override-erld

Description This command provides the ability to override the announced MSD node Entropy Readable Label Depth (ERLD). It is useful for ingress LSRs to know each intermediate LSR's capability of reading the maximum label stack depth and performing EL-based load balancing.

When **override-erld** is not configured, then the router announces the node maximum supported ERLD assuming the most simple Layer 2 encapsulation.

Default no override-erld

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service ies subscriber-interface group-interface ipv6 dhcp6 override-slaac
configure service ies subscriber-interface ipv6 dhcp6 override-slaac
configure service vprn subscriber-interface group-interface ipv6 dhcp6 override-slaac
configure service vprn subscriber-interface ipv6 dhcp6 override-slaac

Description This command allows a DHCP IA_NA address to override and replace a host existing SLAAC address. When this feature is enabled, a subscriber SLAAC address is removed once the DHCP IA_NA address assignment is completed. If used with conjunction with the **allow-multiple-wan-address** command, the DHCP IA_NA address will also override the SLAAC address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

19.95 override-tunnel-elc

override-tunnel-elc

Syntax [**no**] **override-tunnel-elc**

Context **[Tree]** (config>router>bgp override-tunnel-elc)

Full Context configure router bgp override-tunnel-elc

Description This command enables or disables entropy label capability (ELC) on BGP tunnels.

When this command is enabled, the system assumes that all far ends for BGP tunnels are entropy-label-capable, regardless of any received capability signaling. This ensures that the entropy label will be inserted on BGP tunnels in the absence of capability signaling support by the far end.

This is a system-wide configuration, since efficient entropy label operation requires that all LSRs in a network support entropy labels. This command should be used with care, particularly in inter-AS use cases, since entropy label capability may differ between domains.

Default no override-tunnel-elc

Platforms All

override-tunnel-elc

Syntax [**no**] **override-tunnel-elc**

Context **[Tree]** (config>router>isis>entropy-label override-tunnel-elc)
[Tree] (config>router>ospf>entropy-label override-tunnel-elc)

Full Context configure router isis entropy-label override-tunnel-elc

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure router ospf entropy-label override-tunnel-elc

Description This command configures the ability to override any received entropy label capability advertisement. When enabled, the system assumes that all nodes for an IGP domain are capable of receiving and processing the entropy label on segment routed tunnels. This command can only be configured if **entropy-label** is enabled via the **config**>**router**>**isis**>**segment-routing**>**entropy-label** or **config**>**router**>**ospf**>**segment-routing**>**entropy-labe**l command.

The **no** form of this command disables the override. The system assumes entropy label capability for other nodes in the IGP instance if capability advertisements are received.

Default no override-tunnel-elc

Platforms All

override-tunnel-elc

Syntax [**no**] **override-tunnel-elc**

Context **[Tree]** (config>router>mpls>lsp override-tunnel-elc)
[Tree] (config>router>mpls>lsp-template override-tunnel-elc)

Full Context configure router mpls lsp override-tunnel-elc
configure router mpls lsp-template override-tunnel-elc

Description This command allows the system to override any received entropy label capability advertisement.

This command is enabled under the LSP context or in LSP templates of type **pce-init-p2p-srte** and **on-demand-p2p-srte**, the system assumes that all nodes along the path of the SR-TE LSP are capable of receiving and processing the entropy label. This includes SR-TE LSPs that have a PCE-computed path, PCE-initiated SR-TE LSPs, and on-demand SR-TE LSPs.

The **no** form of this command disables the override.

Default no override-tunnel-elc

Platforms All

19.96 own-auth-method

own-auth-method

Syntax **own-auth-method** {**psk** | **cert** | **eap-only**}

Use subject to Terms available at: www.nokia.com

no own-auth-method

Context [Tree] (config>ipsec>ike-policy own-auth-method)

Full Context configure ipsec ike-policy own-auth-method

Description This command configures the authentication method used with this IKE policy on its own side.

Default no own-auth-method

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

19.97 owner

owner

Syntax **owner** {**bgp-ad** | **bgp-vpls** | **bgp-evpn-mpls**}
no owner

Context [Tree] (config>service>vpls>provider-tunnel>inclusive owner)

Full Context configure service vpls provider-tunnel inclusive owner

Description This command selects the owner protocol of the inclusive PMSI tunnel in the service. Only one of the protocols will support the provider tunnel.

The **bgp-vpls** and **bgp-evpn-mpls** parameters cannot be configured together in the same service. Although **bgp-ad** and **bgp-evpn** can coexist in the same service, **bgp-ad** cannot be configured as the owner of the provider-tunnel. In addition, the following applies to this configuration:

- The owner must be explicitly set before the provider-tunnel can be **no shutdown**.
- If the owner is **bgp-ad**, then BGP-EVPN MPLS and BGP-EVPN VXLAN will fail to **no shutdown**.
- The provider-tunnel must be shutdown to change the owner; on the fly change is not allowed.

Default no owner

Parameters **bgp-ad** — Specifies that bgp-ad is the owner of the provider-tunnel.

bgp-vpls — Specifies that bgp-vpls is the owner of the provider-tunnel.

bgp-evpn-mpls — Specifies that BGP-EVPN MPLS is the owner of the provider-tunnel.

20 p Commands

20.1 p2mp

p2mp

Syntax **p2mp** {**enable** | **disable**}

Context **[Tree]** (config>router>ldp>session-params>peer>fec-type-capability p2mp)

Full Context configure router ldp session-parameters peer fec-type-capability p2mp

Description This command enables or disables P2MP FEC capability for the session.

Platforms All

20.2 p2mp-candidate-path

p2mp-candidate-path

Syntax [**no**] **p2mp-candidate-path** *candidate-path-name*

Context **[Tree]** (config>router>p2mp-sr-tree>p2mp-policy p2mp-candidate-path)

Full Context configure router p2mp-sr-tree p2mp-policy p2mp-candidate-path

Description This command configures a candidate path in the P2MP policy entry for the P2MP SR tree.

A P2MP SR policy can contain multiple candidate paths, which are redundant trees. Each candidate path represents a P2MP SR tree with its own traffic engineering constraints. Each candidate path has its own preference; the candidate path with the highest preference is the active P2MP SR tunnel.

The **no** form of this command removes the specified candidate path from the P2MP SR policy.

Parameters *candidate-path-name* — Specifies the name of the candidate path, up to 32 characters.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.3 p2mp-id

p2mp-id

Syntax **p2mp-id** *id*

Context **[Tree]** (config>router>mpls>lsp p2mp-id)

Full Context configure router mpls lsp p2mp-id

Description This command configures the identifier of an RSVP P2MP LSP. An RSVP P2MP LSP is fully identified by the combination of: <P2MP ID, tunnel ID, extended tunnel ID> part of the P2MP session object, and <tunnel sender address, LSP ID> fields in the p2mp sender_template object.

The **p2mp-id** is a 32-bit identifier used in the session object that remains constant over the life of the P2MP tunnel. It is unique within the scope of the ingress LER.

The **no** form restores the default value of this parameter.

This command is not supported on the 7450 ESS.

Default 0

Parameters *id* — Specifies a P2MP identifier.

Values 0 to 65535

Platforms All

20.4 p2mp-ipv4

p2mp-ipv4

Syntax **p2mp** {**enable** | **disable**}

Context **[Tree]** (config>router>ldp>if-params>if>ipv4>fec-type-capability p2mp-ipv4)
[Tree] (config>router>ldp>if-params>if>ipv6>fec-type-capability p2mp-ipv4)
[Tree] (config>router>ldp>session-params>peer>fec-cap p2mp-ipv4)

Full Context configure router ldp interface-parameters interface ipv4 fec-type-capability p2mp-ipv4
configure router ldp interface-parameters interface ipv6 fec-type-capability p2mp-ipv4
configure router ldp session-parameters peer fec-type-capability p2mp-ipv4

Description This command enables or disables IPv4 P2MP FEC capability on the interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **config>router>ldp>if-params>if>ipv6>fec-type-capability>p2mp-ipv4** command is not supported on the 7450 ESS.

Platforms All

20.5 p2mp-ipv6

p2mp-ipv6

Context **[Tree]** (config>router>ldp>if-params>if>ipv4>fec-type-capability p2mp-ipv6)
[Tree] (config>router>ldp>if-params>if>ipv6>fec-type-capability p2mp-ipv6)
[Tree] (config>router>ldp>session-params>peer>fec-cap p2mp-ipv6)

Full Context configure router ldp interface-parameters interface ipv4 fec-type-capability p2mp-ipv6
configure router ldp interface-parameters interface ipv6 fec-type-capability p2mp-ipv6
configure router ldp session-parameters peer fec-type-capability p2mp-ipv6-address

Description This command enables or disables IPv6 P2MP FEC capability on the interface.

This command is not supported on the 7450 ESS.

Platforms All

20.6 p2mp-ldp-tree-join

p2mp-ldp-tree-join

Syntax **p2mp-ldp-tree-join**
p2mp-ldp-tree-join ipv4
p2mp-ldp-tree-join ipv6
p2mp-ldp-tree-join ipv4 ipv6
no p2mp-ldp-tree-join [**ipv4**] [**ipv6**]

Context **[Tree]** (config>service>vprn>pim>if p2mp-ldp-tree-join)

Full Context configure service vprn pim interface p2mp-ldp-tree-join

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the option to join P2MP LDP tree towards the multicast source for the VPRN service. If p2mp-ldp-tree-join is enabled, a PIM multicast join received on an interface is processed to join P2MP LDP LSP using the in-band signaled P2MP tree for the same multicast flow. LDP P2MP tree is setup towards the multicast source. Route to source of the multicast node is looked up from the RTM. The next-hop address for the route to source is set as the root of LDP P2MP tree.

The **no** form of command disables joining P2MP LDP tree for IPv4 or IPv6 or both (if both or none is specified).

Default no p2mp-ldp-tree-join

Parameters *ipv4* — Enables dynamic mLDP in-band signaling for IPv4 PIM joins. IPv4 multicast must be enabled; see **ipv4-multicast-disable**. For backward compatibility **p2mp-ldp-tree-join** is equivalent to **p2mp-ldp-tree-join ipv4**.

ipv6 — Enables dynamic mLDP in-band signaling for IPv6 PIM joins. IPv6 multicast must be enabled; see **ipv6-multicast-disable**.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

p2mp-ldp-tree-join

Syntax [**no**] **p2mp-ldp-tree-join** [**ipv4**] [**ipv6**]

Context **[Tree]** (config>router>pim>interface p2mp-ldp-tree-join)

Full Context configure router pim interface p2mp-ldp-tree-join

Description This command configures the option to join the P2MP LDP tree towards the multicast source. If **p2mp-ldp-tree-join** is enabled, a PIM multicast join received on an interface is processed to join the P2MP LDP LSP, using the in-band signaled P2MP tree for the same multicast flow. LDP P2MP tree is set up towards the multicast source. The route to the multicast node source is looked up from the RTM. The next-hop address for the route to source is set as the root of LDP P2MP tree.

The **no** form of this command disables joining the P2MP LDP tree for IPv4 or IPv6 or for both (if both or none is specified).

Default no p2mp-ldp-tree-join

Parameters *ipv4* — Enables dynamic MLDP in-band signaling for IPv4 PIM joins. IPv4 multicast must be enabled. For backward compatibility **p2mp-ldp-tree-join** is equivalent to **p2mp-ldp-tree-join ipv4**.

ipv6 — Enables dynamic MLDP in-band signaling for IPv6 PIM joins. IPv6 multicast must be enabled.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.7 p2mp-lsp-ping

p2mp-lsp-ping

Syntax **p2mp-lsp-ping** *lsp-name* [**p2mp-instance** *instance-name* [**s2l-dest-address** *ipv4-address* [*ipv4-address*]]] [**ttl** *label-ttl*]
p2mp-lsp-ping ldp *p2mp-identifier* [**vpn-recursive-fec**] [**sender-addr** *ipv4-address*] [**leaf-addr** *ipv4-address* [*ipv4-address*]]
p2mp-lsp-ping ldp-ssm source *ip-address* **group** *ip-address* [{**router** *router-instance* | **service-name** *service-name*}] [**sender-addr** *ipv4-address*] [**leaf-addr** *ipv4-address* [*ipv4-address*]]
NOTE: Options common to all **p2mp-lsp-ping** cases**:** [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**timeout** *timeout*] [**detail**]

Context **[Tree]** (oam p2mp-lsp-ping)

Full Context oam p2mp-lsp-ping

Description This command performs an in-band connectivity test for an RSVP P2MP LSP. The echo request message is sent on the active P2MP instance and is replicated in the data path over all branches of the P2MP LSP instance. By default, all egress LER nodes that are leaves of the P2MP LSP instance replies to the echo request message.

LDP P2MP generic-identifier along with source IP address of the head-end node can be used to uniquely identify LDP P2MP LSP in a 7750 SR or 7950 XRS network. LDP **p2mp-identifier** is a mandatory parameter to test LSP ping. LDP P2MP identifier specified to configure a tunnel-interface on head-end node must be used as **p2mp-identifier** to test an LSP.

To reduce the scope of the echo reply messages, explicitly enter a list of addresses for the egress LER nodes that are required to reply. A maximum of five addresses can be specified in a single run of the **p2mp-lsp-ping** command. An LER node can parse the list of egress LER addresses and, if its address is included, it replies with an echo reply message.

The output of the command without the **detail** option provides a high-level summary of received error codes and success codes. The output of the command with the **detail** option shows a line for each replying node, as in the output of the LSP ping for a P2P LSP.

The display is delayed until all responses are received or the timer configured in the *timeout* parameter expires. No other CLI commands can be entered while waiting for the display. Entering A ^C aborts the ping operation. Note that **p2mp-lsp-ping** is not supported in a VPLS/B-VPLS PMSI context.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *lsp-name* — Specifies the name, up to 64 characters, that identifies an P2MP LSP to ping.

instance-name — Specifies the name, up to 32 characters, of the specific instance of the P2MP LSP to send the echo request.

s2l-dest-addr *ipv4-address* — Specifies up to five egress LER system addresses that are required to reply to the LSP ping echo request message.

label-ttl — Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 255

Default 255

p2mp-identifier — Specifies the identifier for an LDP P2MP LSP to ping (applies to the 7750 SR and 7950 XRS only).

Values 1 to 4294967295

vpn-recursive-fec — Adds a VPN recursive FEC element to the launched packet (useful for pinging a VPN BGP inter-AS Option B leaf). This parameter issues an OAM **p2mp-lsp-ping** with RFC 6512 VPN recursive opaque FEC type 8.

Refer to the “OAM” subsection of the LDP chapter in the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide* for more information.

sender-addr *ipv4-address* — Specifies any local IP sender address for mLDP (applies to the 7750 SR and 7950 XRS only).

leaf-addr *ipv4-address* — Specifies up to five egress LER system addresses that are required to reply to LSP ping echo request message (applies to the 7750 SR and 7950 XRS only).

Values ipv4-address: a.b.c.d

ldp-ssm — Specifies a specific multicast stream to be tested when using dynamic multicast in mLDP. The source and group addresses correspond to the <S,G> being advertised by this mLDP FEC.

Values

source	*ipv4-address*	*a.b.c.d*|
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0t o 255]D
group	*mcast-address*	
	mcast-v6-address	
router	*router-name*	Base | management
		Default - Base
	service-id	[1 to 2147483647]
	service-name	up to 64 characters
sender-addr	*ipv4-address*	*a.b.c.d*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

leaf-addr *ipv4-address* *a.b.c.d*

fc-name — Specifies the **fc** and **profile** parameters used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified fc and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, the **fc** and **profile** parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in an egress network queue. The egress network queue is selected according to the **fc** and **profile** parameter values determined by the classification of the echo request packet that is being replied to at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 105 summarizes this behavior.

Table 105 **p2mp-lsp-ping Request Packet and Behavior**

Request Packet	Behavior
CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by the user in the OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 105 **p2mp-lsp-ping Request Packet and Behavior**

Request Packet	Behavior
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile of the LSP ping echo request message.

Default out

octets — Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request payload is padded with zeros to the specified size. Note that an OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

timeout — Specifies the time, in seconds, that is used to override the default *timeout* value and is the amount of time that the router waits for an echo reply message from all leaves of the P2MP LSP after sending the message request message. Upon the expiration of the message time out, the requesting router no longer waits for reply messages. Any echo reply message received after the request times out is silently discarded.

Values 1 to 120

Default 10

detail — Displays P2MP LSP detailed information.

20.8 p2mp-lsp-trace

p2mp-lsp-trace

Syntax **p2mp-lsp-trace** *lsp-name* **p2mp-instance** *instance-name* **s2l-dest-address** *ip-address* [**fc** *fc-name* [**profile** {**in** | **out**}]] [**size** *octets*] [**max-fail** *no-response-count*] [**probe-count** *probes-per-hop*] [**min-ttl** *min-label-ttl*] [**max-ttl** *max-label-ttl*] [**timeout** *timeout*] [**interval** *interval*] [**detail**]

Context **[Tree]** (oam p2mp-lsp-trace)

Full Context oam p2mp-lsp-trace

Description This command discovers and displays the hop-by-hop path for a source-to-leaf (S2L) sub-LSP of an RSVP P2MP LSP.

The LSP trace capability allows the user to trace the path of a single S2L path of a P2MP LSP. Its operation is like **p2mp-lsp-ping**, but the sender of the echo reply request message includes the downstream mapping TLV to request the downstream branch information from a branch LSR or bud LSR. The branch LSR or bud LSR also includes the downstream mapping TLV to report the information about the downstream branches of the P2MP LSP. An egress LER does not include this TLV in the echo response message.

The parameter probe-count operates in the same way as in LSP Trace on a P2P LSP. It represents the maximum number of probes sent per TTL value before stops waiting for echo reply messages. If a response is received from the traced node before reaching maximum number of probes, then no more probes are sent for the same TTL. The sender of the echo request then increments the TTL and uses the information it received in the downstream mapping TLV to start sending probes to the node downstream of the last node which replied. This continues until the egress LER for the traced S2L path replies.

Like **p2mp-lsp-ping**, an LSP trace probe reports on all egress LER nodes that eventually receive the echo request message, but only the traced egress LER node replies to the last probe.

Any branch LSR node or bud LSR node in the P2MP LSP tree may receive a copy of the echo request message with the TTL in the outer label expiring at this node. However, only a branch LSR or bud LSR that has a downstream branch over which the traced egress LER is reachable responds.

When a branch LSR or bud LSR responds, it sets the global return code in the echo response message to RC=14 - “See DDMAP TLV for Return Code and Return Sub-Code” and the return code in the DDMAP TLV corresponding to the outgoing interface of the branch used by the traced S2L path to RC=8 - “Label switched at stack-depth <RSC>”. Note that **p2mp-lsp-trace** is not supported in a VPLS/B-VPLS PMSI context.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters *lsp-name* — Specifies the name that identifies an P2MP LSP, up to 64 characters, to ping.

instance-name — Specifies the name, up to 32 characters, of the specific instance of the P2MP LSP to send the echo request.

ip-address — Specifies the egress LER system address of the S2L sub-LSP path which is being traced.

Values a.b.c.d

fc-name — Specifies the **fc** and **profile** parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, the **fc** and **profile** parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in an egress network queue. The egress network queue is selected according to the **fc** and **profile** parameter values determined by the classification of the echo request packet that is being replied to at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 106 summarizes this behavior.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 106 **p2mp-lsp-trace Request Packet and Behavior**

Request Packet	Behavior
CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet{tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile of the LSP trace echo request message.

Default out

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

octets — Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request payload is padded with zeros to the specified size. Note that an OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

no-response-count — Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

Values 1 to 10

Default 5

probes-per-hop — Specifies the number of LSP trace echo request messages to send per TTL value.

Values 1 to 10

Default 1

min-label-ttl — Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

max-label-ttl — Specifies the maximum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 30

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for an echo reply message from all leaves of the P2MP LSP after sending the message request message. Upon the expiration of the message time out, the requesting router no longer waits for reply messages. Any echo reply message received after the request times out is silently discarded.

Values 1 to 60

Default 3

interval — Specifies the time, in seconds, used to override the default echo request message send interval and defines the minimum amount of time that must expire before the next echo request message is sent.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of an echo reply message corresponding to the outstanding message request.

Values 1 to 10

Default 1

Output The following is an example of p2mp-lsp-trace information.

Sample Output

```
*A:Dut-C# oam p2mp-lsp-trace "p2mp_1" p2mp-instance "1" s2l-dest-address 10.20.1.

20.9 p2mp-merge-point-abort-timer

p2mp-merge-point-abort-timer

Syntax **p2mp-merge-point-abort-timer** *seconds*
no p2mp-merge-point-abort-timer

Context **[Tree]** (config>router>rsvp p2mp-merge-point-abort-timer)

Full Context configure router rsvp p2mp-merge-point-abort-timer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies a configurable timer to abort Merge-Point (MP) node procedures for an S2L of a P2MP LSP instance. When a value higher than zero is configured for this timer, it will enter into effect anytime this node activates Merge-Point procedures for one or more P2MP LSP S2L paths. As soon an ingress interface goes operationally down, the Merge-Point node starts the abort timer. Upon expiry of the timer, MPLS will clean up all P2MP LSP S2L paths which ILM is on the failed interface and which have not already received a Path refresh over the bypass LSP.

The **no** form of this command disables the timer.

Default no p2mp-merge-point-abort-timer

Parameters *seconds* — Specifies the length of the abort timer in seconds

Values 1 to 65535

Platforms All

20.10 p2mp-policy

p2mp-policy

Syntax [**no**] **p2mp-policy** *policy-name*

Context **[Tree]** (config>router>p2mp-sr-tree p2mp-policy)

Full Context configure router p2mp-sr-tree p2mp-policy

Description This command creates a P2MP policy entry for the P2MP SR tree.

The **no** form of this command deletes the specified policy entry.

Parameters *policy-name* — Specifies the policy name, up to 32 characters.

Platforms All

p2mp-policy

The **no** form of this command disables the P2MP policy.

Platforms All

20.11 p2mp-resignal-timer

p2mp-resignal-timer

Syntax **p2mp-resignal-timer** *minutes*
no p2mp-resignal-timer

Context **[Tree]** (config>router>mpls p2mp-resignal-timer)

Full Context configure router mpls p2mp-resignal-timer

Description This command configures the re-signal timer for a P2MP LSP instance. MPLS will request CSPF to re-compute the whole set of S2L paths of a given active P2MP instance each time the P2MP re-signal timer expires. The P2MP re-signal timer is configured separately from the P2P LSP parameter. MPLS performs a global MBB and moves each S2L sub-LSP in the instance into its new path using a new P2MP LSP ID if the global MBB is successful, regardless of the cost of the new S2L path.

This command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **no** form of this command disables the timer-based re-signaling of P2MP LSPs on this system.

Parameters *minutes* — Specifies the time MPLS waits before attempting to re-signal the P2MP LSP instance.

Values 60 to 10080

20.15 p2mp-template-lsp

p2mp-template-lsp

Syntax [**no**] **p2mp-template-lsp rsvp-session-name** *SessionNameString* **sender** *sender-address*

Context **[Tree]** (config>router>mpls>ingress-stats p2mp-template-lsp)

Full Context configure router mpls ingress-statistics p2mp-template-lsp

Description This command configures an ingress statistics context matching on the RSVP session name for a RSVP P2MP LSP at the egress LER.

This command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

When the ingress LER signals the path of the S2L sub-LSP, it includes the name of the LSP and that of the path in the Session Name field of the Session Attribute object in the Path message. The encoding is as follows:

Session Name: <lsp-name::path-name>, where lsp-name component is encoded as follows:

- P2MP LSP through the user configuration for L3 multicast in global routing instance: “LspNameFromConfig”
- P2MP LSP as I-PMSI or S-PMSI in L3 mVPN: templateName-SvcId-mTTmIndex
- P2MP LSP as I-PMSI in VPLS/B-VPLS: templateName-SvcId-mTTmIndex

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The ingress statistics CLI configuration allows the user to match either on the exact name of the P2MP LSP as configured at the ingress LER or on a context that matches on the template name and the service-id as configured at the ingress LER.

When the matching is performed on a context, the user must enter the RSVP session name string in the format “templateName-svcId” to include the LSP template name as well as the mVPN VPLS/B-VPLS service ID as configured at the ingress LER. In this case, one or more P2MP LSP instances signaled by the same ingress LER could be associated with the ingress statistics configuration and the user is provided with CLI parameter max-stats to limit the maximum number of stat indices that can be assigned to this context. If the context matches more than this value, the additional request for stat indices from this context will be rejected. A background tasks monitors the ingress statistics templates which have one or more matching LSP instances with unassigned stat index and assigns one to them as they are freed.

Note the following rules when configuring an ingress statistics context based on template matching:

- max-stats, once allocated, can be increased but not decreased unless the entire ingress statistics context matching a template name is deleted.
- In order to delete ingress statistics context matching a template name, a shutdown is required.
- An accounting policy cannot be configured or de-configured until the ingress statistics context matching a template name is shut down.
- After deleting an accounting policy from an ingress statistics context matching a template name, the policy is not removed from the log until a “no shut” is performed on the ingress statistics context.

If there are no stat indices available at the time the session of the P2MP LSP matching a template context is signaled and the session state installed by the egress LER, no stats are allocated to the session.

Furthermore, the assignment of stat indices to the LSP names that match the context will also be not deterministic. The latter is due to the fact that a stat index is assigned and released following the dynamics of the LSP creation or deletion by the ingress LER. For example, a multicast stream crosses the rate threshold and is moved to a newly signaled S-PMSI dedicated to this stream. Later on, the same steam crosses the threshold downwards and is moved back to the shared I-PMSI and the P2MP LSP corresponding to the S-PMSI is deleted by the ingress LER.

The **no** form deletes the ingress statistics context matching on the RSVP session name.

Parameters **rsvp-session-name** *SessionNameString* — Specifies the name of the RSVP P2MP session in the format of “templateName-svcId”. This field can hold up to 64 characters.

sender *sender-address* — Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

20.18 p2p-template-lsp

p2p-template-lsp

Syntax [**no**] **p2p-template-lsp rsvp-session-name** *SessionNameString* **sender** *sender-address*

Context **[Tree]** (config>router>mpls>ingress-stats p2p-template-lsp)

Full Context configure router mpls ingress-statistics p2p-template-lsp

Description This command configures an ingress statistics context matching on the RSVP session name for a RSVP P2P auto-LSP at the egress LER.

When the ingress LER signals the path of a template based **one-hop-p2p** or **mesh-p2p auto-lsp**, it includes the name of the LSP and that of the path in the Session Name field of the Session Attribute object in the Path message. The encoding is as follows:

Session Name: *lsp-name::path-name*, where *lsp-name* component is encoded as follows:

P2MP LSP through the user configuration for Layer 3 multicast in global routing instance: “LspNameFromConfig”

- P2MP LSP as I-PMSI or S-PMSI in L3 mVPN: templateName-SvcId-mTTmIndex
- P2MP LSP as I-PMSI in VPLS/B-VPLS: templateName-SvcId-mTTmIndex.

The ingress statistics CLI configuration allows the user to match either on the exact name of the P2P auto-LSP or on a context that matches on the template name and the destination of the LSP at the ingress LER.

When the matching is performed on a context, the user must enter the RSVP session name string in the format “templateName-svcId” to include the LSP template name as well as the mVPN VPLS/B-VPLS service ID as configured at the ingress LER. In this case, one or more P2MP LSP instances signaled by the same ingress LER could be associated with the ingress statistics configuration. In this case, the user is provided with CLI parameter max-stats to limit the maximum number of stat indices which can be assigned to this context. If the context matches more than this value, the additional request for stat indices from this context will be rejected.

Note the following rules when configuring an ingress statistics context based on template matching:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- **max-stats**, once allocated, can be increased but not decreased unless the entire ingress statistics context matching a template name is deleted.
- In order to delete ingress statistics context matching a template name, a shutdown is required.
- An accounting policy cannot be configured or de-configured until the ingress statistics context matching a template name is shut down.
- After deleting an accounting policy from an ingress statistics context matching a template name, the policy is not removed from the log until a **no shut** is performed on the ingress statistics context.

If there are no stat indices available at the time the session of the P2P LSP matching a template context is signaled and the session state installed by the egress LER, no stats are allocated to the session.

Furthermore, the assignment of stat indices to the LSP names that match the context will also be not deterministic. The latter is due to the fact that a stat index is assigned and released following the dynamics of the LSP creation or deletion by the ingress LER. For example, a multicast stream crosses the rate threshold and is moved to a newly signaled S-PMSI dedicated to this stream. Later on, the same steam crosses the threshold downwards and is moved back to the shared I-PMSI and the P2MP LSP corresponding to the S-PMSI is deleted by the ingress LER.

The **no** form deletes the ingress statistics context matching on the RSVP session name.

Parameters **rsvp-session-name** *SessionNameString* — Specifies the name of the RSVP P2MP session in the format of “templateName-svcId”. This field can hold up to 64 characters.

sender *sender-address* — Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

packet

Syntax **packet jitter-buffer** *milliseconds* [**payload-size** *bytes*]
packet payload-size *bytes*
no packet

Context **[Tree]** (config>service>cpipe>sap>cem packet)
[Tree] (config>service>epipe>sap>cem packet)

Full Context configure service cpipe sap cem packet
configure service epipe sap cem packet

Description This command specifies the jitter buffer size, in milliseconds, and payload size, in bytes.

Default The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots as shown in Table 107.

Table 107 **Packet CEM SAP Endpoint Types**

Endpoint Type	Timeslots	Default Jitter Buffer (in ms)
unstructuredE1	—	5

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 107 **Packet CEM SAP Endpoint Types**

Endpoint Type	Timeslots	Default Jitter Buffer (in ms)
unstructuredT1	—	5
nxDS0 (E1/T1)	—	32
	N = 1	16
	N = 2 to 4	8
	N = 5 to 15	5
nxDS0WithCas (E1)	N	8
nxDS0WithCas (T1)	N	12

Parameters *milliseconds* — Specifies the jitter buffer size in milliseconds (ms).

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffers is not allowed. Setting the jitter butter value to 0 sets it back to the default value.

Values 1 to 250

payload-size *bytes* — Specifies the payload size (in bytes) of packets transmitted to the packet service network (PSN) by the CEM SAP. This determines the size of the data that will be transmitted over the service. If the size of the data received is not consistent with the payload size then the packet is considered malformed.

Values 0 | 16 to 2048

Default The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots as shown in Table 108.

Table 108 **CEM SAP Endpoint Types**

Endpoint Type	Timeslots	Default Payload Size (in bytes)
unstructuredE1	—	256
unstructuredT1	—	192
nxDS0 (E1/T1)	N = 1	64
	N = 2 to 4	N x 32
	N = 5 to 15	N x 16
	N >= 16	N x 8
nxDS0WithCas (E1)	N	N x 16
nxDS0WithCas (T1)	N	N x 24

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For all endpoint types except for nxDS0WithCas, the valid payload size range is from the default to 2048 bytes.

For nxDS0WithCas, the payload size divide by the number of timeslots must be an integer factor of the number of frames per trunk multi-frame (for example, 16 for E1 trunk and 24 for T1 trunk).

For 1xDS0, the payload size must be a multiple of 2.

For NxDS0, where N > 1, the payload size must be a multiple of the number of timeslots.

For unstructuredE1 and unstructuredT1, the payload size must be a multiple of 32 bytes.

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffer is not allowed.

Setting the payload size to 0 sets it back to the default value.

Context **[Tree]** (debug>router>igmp packet)

Full Context debug router igmp packet

Description This command enables/disables debugging for IGMP packets.

Parameters **query** — Specifies to log the IGMP group- and source-specific queries transmitted and received on this interface.

v1-report — Specifies to debug IGMP V1 reports transmitted and received on this interface.

v2-report — Specifies to debug IGMP V2 reports transmitted and received on this interface.

v3-report — Specifies to debug IGMP V3 reports transmitted and received on this interface.

v2-leave — Specifies to debug the IGMP Leaves transmitted and received on this interface.

ip-int-name — Debugs the information associated with the specified IP interface name.

Values IP interface address

ip-address — Debugs the information associated with the specified IP address.

Full Context debug router pim packet

Description This command enables debugging for PIM packets.

The **no** form of this command disables debugging for PIM packets.

Parameters **hello** | **register** | **register-stop** | **jp** | **bsr** | **assert** | **crp | mdt-tlv | auto-rp-announcement | auto-rp-mapping | graft | graft-ack** — Specifies PIM packet types.

ip-int-name — Debugs the information associated with the specified IP interface name, up to 32 characters.

mt-int-name — Debugs the information associated with the specified VPRN ID and group address.

Values *vprn-id*-mt-*grp-ip-address*

int-ip-address — Debugs the information associated with the specified IP address.

ipv4 — Specifies to display IPv4 packets.

ipv6 — Specifies to display IPv6 packets.

mpls-if-name — Debugs the information associated with the specified MPLS interface.

Values mpls-if-*index*

receive — Specifies to display received packets.

send — Specifies to display sent packets.

family — Debugs database packet information.

Values ipv4, ipv6

Platforms All

packet

Syntax **packet jitter-buffer** *milliseconds* [**payload-size** *bytes*]
packet payload-size *bytes*
no packet

Context **[Tree]** (config>mirror>mirror-dest>sap>cem packet)

Full Context configure mirror mirror-dest sap cem packet

Description This command specifies the jitter buffer size, in milliseconds, and payload size, in bytes.

Default The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots:

Endpoint Type	Timeslots	Default Jitter Buffer (in ms)
unstructuredE1	n/a	5

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Endpoint Type	Timeslots	Default Jitter Buffer (in ms)
unstructuredT1	n/a	5
unstructuredE3	n/a	5
unstructuredT3	n/a	5
nxDS0 (E1/T1)	N = 1	32
	N = 2 to 4	16
	N = 5 to 15	8
	N >= 16	5
nxDS0WithCas (E1)	N	8
nxDS0WithCas (T1)	N	12

Parameters *milliseconds* — Specifies the jitter buffer size in milliseconds (ms).

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffers is not allowed.

Setting the jitter butter value to 0 sets it back to the default value.

Values 1 — 250

bytes — Specifies the payload size (in bytes) of packets transmitted to the packet service network (PSN) by the CEM SAP. This determines the size of the data that will be transmitted over the service. If the size of the data received is not consistent with the payload size then the packet is considered malformed.

Default The default value depends on the CEM SAP endpoint type, and if applicable, the number of timeslots:

Endpoint Type	Timeslots	Default Payload Size (in bytes)
unstructuredE1	n/a	256
unstructuredT1	n/a	192
unstructuredE3	n/a	1024
unstructuredT3	n/a	1024
nxDS0 (E1/T1)	N = 1	64
	N = 2 to 4	N x 32
	N = 5 to 15	N x 16
	N >= 16	N x 8
nxDS0WithCas (E1)	N	N x 16
nxDS0WithCas (T1)	N	N x 24

For all endpoint types except for nxDS0WithCas, the valid payload size range is from the default to 2048 bytes.

For nxDS0WithCas, the payload size divide by the number of timeslots must be an integer factor of the number of frames per trunk multiframe (for example, 16 for E1 trunk and 24 for T1 trunk).

For 1xDS0, the payload size must be a multiple of 2.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For NxDS0, where N > 1, the payload size must be a multiple of the number of timeslots.

For unstructuredE1, unstructuredT1, unstructuredE3 and unstructuredT3, the payload size must be a multiple of 32 bytes.

Configuring the payload size and jitter buffer to values that result in less than 2 packet buffers or greater than 32 packet buffer is not allowed.

Setting the payload size to 0 sets it back to the default value.

Values 16 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

packet

Syntax **packet** *packet-number* [**create**]
no packet *packet-number*

Context **[Tree]** (debug>oam>build-packet packet)

Full Context debug oam build-packet packet

Description This command configures a packet to be launched by the OAM **find-egress** tool.

The **no** form of this command removes the packet number value.

Parameters *packet-number* — Specifies a packet to be launched by the OAM **find-egress** tool.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

packet

Syntax **packet all**
packet cfm-opcode *opcode* [*opcode*]
no packet

Context **[Tree]** (debug>eth-cfm>mep packet)
[Tree] (debug>eth-cfm>mip packet)

Full Context debug eth-cfm mep packet
debug eth-cfm mip packet

Description This command defines the ETH-CFM opcodes of interest to be debugged.

The **no** form of this command stops packet debugging and the collection of PDUs.

Parameters **all** — Specifies that debugging is enabled for all ETH-CFM packets.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

opcode — Specifies a standard numerical reference or common three-letter acronym (TLA) that identifies the CFM PDU type. Up to five opcodes can be specified, and a combination of both numbers and TLAs can be used.

MEPs support all opcodes.

MIPs support 2 (LBR), 3 (LBM), 4 (LTR), and 5 (LTM).

Unknown or unsupported opcodes in TLA form are rejected. The applicable numerical opcode can be used instead. When numerical references are used, they are converted to a known TLA or left in numerical form if the TLA is unknown.

Re-entering the **packet** command overwrites the previous opcode entries for the MEP or MIP.

Values MEP: 1 to 255 | common TLA
MIP: 2 to 5 | common TLA

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context **[Tree]** (debug>subscr-mgmt>pfcp packet)

Full Context debug subscriber-mgmt pfcp packet

Description This command debugs PFCP packets that are received or sent. The **no** form of this command disables any PFCP packet debugging.

Parameters **high-detail** — Specifies to provide a full packet dump; without this parameter only basic packet information is provided.

dropped-only — Specifies to only debug dropped packets.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.20 packet-byte-offset

packet-byte-offset

Syntax **packet-byte-offset** {**add** *bytes* | **subtract** *bytes*}
no packet-byte-offset

Context **[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>policer packet-byte-offset)
[Tree] (config>subscr-mgmt>sla-prof>egress>qos>policer packet-byte-offset)

Full Context configure subscriber-mgmt sla-profile egress qos policer packet-byte-offset
configure subscriber-mgmt sla-profile ingress qos policer packet-byte-offset

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to modify the size of each packet handled by the policer by adding or subtracting a number of bytes. The actual packet size is not modified; only the size used to determine the bucket depth impact is changed. The **packet-byte-offset** command is meant to be an arbitrary mechanism the can be used to either add downstream frame encapsulation or remove portions of packet headers. Both the policing metering and profiling throughput is affected by the offset as well as the stats associated with the policer.

When child policers are adding to or subtracting from the size of each packet, the parent policer's **min-thresh-separation** value should also need to be modified by the same amount.

The policer's **packet-byte-offset** defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. Packet byte offset settings are not included in the applied rate when (queue) frame based accounting is configured and the policer is managed by HQoS, however the offsets are applied to the statistics.

The **no** form of this command removes the per packet size modifications from the policer.

Parameters **add** *bytes* — Specifies the packet byte offset. The **add** keyword is mutually exclusive to the **subtract** keyword. Either **add** or **subtract** must be specified. When **add** is defined the corresponding bytes parameter specifies the number of bytes that is added to the size each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 0 to 31

subtract *bytes* — Specifies the packet byte offset. The **subtract** keyword is mutually exclusive to the **add** keyword. Either **add** or **subtract** must be specified. When b is defined the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet.

Note: The minimum resulting packet size used by the system is 1 byte.

Values ingress 1 to 32
egress: 1 to 64

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service ipipe sap ingress policer-override policer packet-byte-offset

Description

This command, within the SAP ingress and egress policer-overrides contexts, is used to override the sap-ingress and sap-egress QoS policy configured packet-byte-offset parameter for the specified policer-id. Packet byte offset settings are not included in the applied rate when (queue) frame based accounting is configured; however, the offsets are applied to the statistics.

The **no** packet-byte-offset command is used to restore the policer's packet-byte-offset setting to the policy defined value.

Default

no packet-byte-offset

Parameters

add-bytes — Specifies the number of bytes that are added to the size each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 1 to 31

sub-bytes — Specifies the number of bytes that are subtracted from the size of each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet.

Values 1 to 64

configure service vpls sap ingress policer-override policer packet-byte-offset

Description This command, within the SAP ingress and egress policer-overrides contexts, is used to override the sap-ingress and sap-egress QoS policy configured packet-byte-offset parameter for the specified policer-id. Packet byte offset settings are not included in the applied rate when (queue) frame based accounting is configured, however the offsets are applied to the statistics.

The **no** form of this command restores the policer's packet-byte-offset setting to the policy defined value.

Default no packet-byte-offset

Parameters *add-bytes* — The add keyword is mutually exclusive to the subtract keyword. Either add or subtract must be specified. When add is defined the corresponding bytes parameter specifies the number of bytes that is added to the size each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 0 to 31

sub-bytes — The subtract keyword is mutually exclusive to the add keyword. Either add or subtract must be specified. When subtract is defined the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet.

Values 1 to 64

packet-byte-offset

Syntax **packet-byte-offset** {**add** *add-bytes* | **subtract** *sub-bytes*}
no packet-byte-offset

Context [Tree] (config>service>ies>if>sap>egress>policer-override>plcr packet-byte-offset)
[Tree] (config>service>ies>if>sap>ingress>policer-override>plcr packet-byte-offset)

Full Context configure service ies interface sap egress policer-override policer packet-byte-offset
configure service ies interface sap ingress policer-override policer packet-byte-offset

Description This command, within the SAP ingress and egress policer-overrides contexts, is used to override the sap-ingress and sap-egress QoS policy configured packet-byte-offset parameter for the specified policer-id. Packet byte offset settings are not included in the applied rate when (queue) frame based accounting is configured, however the offsets are applied to the statistics.

The **no** form of this command restores the policer's packet-byte-offset setting to the policy defined value.

Default no packet-byte-offset

Parameters **add** *add-bytes* — The **add** keyword is mutually exclusive to the **subtract** keyword. Either **add** or **subtract** must be specified. When **add** is defined, the corresponding bytes parameter specifies the number of bytes that is added to the size each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 0 to 31

subtract *sub-bytes* — The **subtract** keyword is mutually exclusive to the **add** keyword. Either **add** or **subtract** must be specified. When **subtract** is defined, the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the policer for rate metering, profiling and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet.

configure qos sap-ingress policer packet-byte-offset

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to modify the size of each packet handled by the policer by adding or subtracting a number of bytes. The actual packet size is not modified; only the size used to determine the bucket depth impact is changed. The **packet-byte-offset** command is meant to be an arbitrary mechanism that can be used to either add downstream frame encapsulation or remove portions of packet headers. Both the policing metering and profiling throughput is affected by the offset as well as the stats associated with the policer.

When child policers are adding to or subtracting from the size of each packet, the parent policer's **min-thresh-separation** value should also need to be modified by the same amount.

The policer's **packet-byte-offset** defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. Packet byte offset settings are not included in the applied rate when (queue) frame-based accounting is configured and the policer is managed by HQoS; however, the offsets are applied to the statistics.

The **no** form of this command is used to remove per packet size modifications from the policer.

Parameters **add** *add-bytes* — The **add** keyword is mutually exclusive to the **subtract** keyword. Either **add** or **subtract** must be specified. When **add** is defined, the corresponding bytes parameter specifies the number of bytes that is added to the size of each packet associated with the policer for rate metering, profiling, and accounting purposes. From the policer's perspective, the maximum packet size is increased by the amount being added to the size of each packet.

Values 0 to 31

subtract *sub-bytes* — The **subtract** keyword is mutually exclusive to the **add** keyword. Either **add** or **subtract** must be specified. When **subtract** is defined, the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the policer for rate metering, profiling, and accounting purposes. From the policer's perspective, the maximum packet size is reduced by the amount being subtracted from the size of each packet. The minimum resulting packet size used by the system is 1 byte.

no packet-byte-offset

Context **[Tree]** (config>qos>sap-ingress>queue packet-byte-offset)

Full Context configure qos sap-ingress queue packet-byte-offset

Description This command modifies the size of each packet handled by the queue by adding or subtracting the specified number of bytes. The actual packet size is not modified, only the size used to determine the ingress scheduling and profiling is changed. The **packet-byte-offset** command is an arbitrary mechanism that can be used to either add downstream frame encapsulation or remove portions of packet headers. Both the scheduling and profiling throughput is affected by the offset as well as the statistics (accounting) associated with the queue. The **packet-byte-offset** does not apply to drop statistics, received valid statistics, or the offered managed and unmanaged statistics used by Ingress Multicast Path Management.

The **no** form of this command removes per-packet size modifications from the queue.

Parameters *add-bytes* — Specifies the number of bytes added to the size of each packet associated with the queue for scheduling, profiling, and accounting purposes. From the queue's perspective, the packet size is increased by the amount specified.

Values 0 to 30, in increments of 2

sub-bytes — Specifies the number of bytes subtracted from the size of each packet associated with the queue for scheduling, profiling, and accounting purposes. From the queue's perspective, the packet size is reduced by the amount specified. The minimum resulting packet size used by the system is 1 byte.

Values 0 to 64, in increments of 2

When a packet-byte-offset value is applied to a queue instance, it adjusts the immediate packet size. This means that the queue rates, i.e., operational PIR and CIR, and queue bucket updates use the adjusted packet size. In addition, the queue statistics will also reflect the adjusted packet size. Scheduler policy rates, which are data rates, will use the adjusted packet size.

The port scheduler max-rate and the priority level rates and weights, if a Weighted Scheduler Group is used, are always on-the-wire rates and thus use the actual frame size. The same applies for the agg-rate-limit on a SAP, a subscriber, or a multiservice Site (MSS) when the queue is port-parented.

When the user enables frame-based-accounting in a scheduler policy or queue-frame-based-accounting with agg-rate-limit in a port scheduler policy, the queue rate will be capped to a user-configured on-the-wire rate and the packet-byte-offset is not included. However, the offsets are applied to the statistics.

The **no** form of this command is used to remove per packet size modifications from the queue.

Parameters *add-bytes* — The **add** keyword is mutually exclusive to the **subtract** keyword. Either parameter must be specified. When **add** is defined, the corresponding bytes parameter specifies the number of bytes that is added to the size of each packet associated with the queue for scheduling and accounting purposes.

Values 0 to 32

sub-bytes — The **subtract** keyword is mutually exclusive to the **add** keyword. Either parameter must be specified. When subtract is defined, the corresponding bytes parameter specifies the number of bytes that is subtracted from the size of each packet associated with the queue for scheduling and accounting purposes. The minimum resulting packet size used by the system is 1 byte.

packet-sanity

Syntax **packet-sanity direction** *direction* [**create**]
no packet-sanity direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>sctp-filter packet-sanity)

Full Context configure application-assurance group statistics threshold-crossing-alert sctp-filter packet-sanity

Description This command configures a TCA for the counter capturing packet sanity hits for the specified SCTP filter. A packet sanity TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.26 packet-size

packet-size

Syntax **packet-size** *bytes*
no packet-size

Context **[Tree]** (config>system>snmp packet-size)

Full Context configure system snmp packet-size

Description This command configures the maximum SNMP packet size generated by this node.

The **no** form of this command restores the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default packet-size 1500

Parameters *bytes* — Specifies the SNMP packet size in bytes.

Values 484 to 9216

Platforms All

20.27 packet-too-big

packet-too-big

Syntax **packet-too-big** [*number seconds*]
no packet-too-big

Context **[Tree]** (config>service>ies>if>ipv6>icmp6 packet-too-big)

Full Context configure service ies interface ipv6 icmp6 packet-too-big

Description This command specifies whether packet-too-big ICMP messages should be sent. When enabled, ICMPv6 packet-too-big messages are generated by this interface.

The **no** form of this command disables the sending of ICMPv6 packet-too-big messages.

Default packet-too-big 100 10

Parameters *number* — Specifies the number of ICMP messages that are too large to send in the time frame specified by the *seconds* parameter.

Values 10 to 1000

Default 100

seconds — Specifies the time frame, in seconds, that is used to limit the number of "packet-too-big" ICMP messages issued.

Values 1 to 60

Default 10

Platforms All

packet-too-big

Syntax **packet-too-big** [*number seconds*]
no packet-too-big

Full Context configure service vprn interface ipv6 icmp6 packet-too-big

Description This command configures the rate for Internet Control Message Protocol version 6 (ICMPv6) packet-too-big messages.

Parameters *number* — Specifies the number of packet-too-big messages to send in the time frame specified by the *seconds* parameter.

Values 10 to 1000

Default 100

seconds — Specifies the time frame, in seconds, that is used to limit the number of packet-too-big messages issued.

Values 1 to 60

Default 10

Platforms All

packet-too-big

Syntax **packet-too-big**
packet-too-big number [**10..1000**] **seconds** [**1..60**]
no packet-too-big

Context **[Tree]** (config>service>vprn>if>sap>ip-tunnel>icmp6-gen packet-too-big)

Full Context configure service vprn interface sap ip-tunnel icmp6-generation packet-too-big

Description This command enables the system to send ICMPv6 PTB (Packet Too Big) messages on the private side and optionally specifies the rate.

With this command configured, the system sends PTB back if it received an IPv6 packet on the private side that is bigger than 1280 bytes and also exceeds the private MTU of the tunnel.

The **ip-mtu** command (under **ipsec-tunnel** or **tunnel-template**) specifies the private MTU for the ipsec-tunnel or dynamic tunnel.

The **no** form of this command reverts **interval** and **message-count** values to their default values.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

packet-too-big

packets

Syntax **packets** [**neighbor** *ip-address* | **group** *name*]
no packets

Context **[Tree]** (debug>router>bgp packets)

Full Context debug router bgp packets

Description This command decodes and logs all sent and received BGP packets in the debug log.

The **no** form of this command disables debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms All

packets

Syntax **packets** [**station** *station-name*]
no packets

Context **[Tree]** (debug>router>bmp packets)

Full Context debug router bmp packets

Description This command enables debugging for all BMP packets.

The **no** form of the command disables debugging for all BMP packets.

Parameters *station-name* — Specifies the station name of the BMP monitoring station, up to 32 characters.

Platforms All

Use subject to Terms available at: www.nokia.com

packets

Syntax [**no**] **packets** [**neighbor** *ip-int-name* | *ip-addr*]

Context **[Tree]** (debug>router>rip packets)

Full Context debug router rip packets

Description This command enables debugging for RIP packets.

Parameters *ip-int-name* **|** *ip-address* — Debugs the RIP packets sent on the neighbor IP address or interface.

Platforms All

packets

Syntax [**no**] **packets** [**neighbor** *ip-int-name* | *ipv6-address*]

Context **[Tree]** (debug>router>ripng packets)

Full Context debug router ripng packets

Description This command enables debugging for RIPng packets.

Parameters *ip-int-name* | *ipv6-address* — Debugs the RIPng packets sent on the neighbor IP address or interface.

Platforms All

20.31 packets-admitted-count

packets-admitted-count

Syntax [**no**] **packets-admitted-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr packets-admitted-count)
[Tree] (config>log>acct-policy>cr>aa>aa-to-sub-cntr packets-admitted-count)

Full Context configure log accounting-policy custom-record aa-specific from-aa-sub-counters packets-admitted-count
configure log accounting-policy custom-record aa-specific to-aa-sub-counters packets-admitted-count

Description This command includes the admitted packet count in the AA subscriber's custom record and only applies to the 7750 SR.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command excludes the admitted packet count.

Default no packets-admitted-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.32 packets-denied-count

packets-denied-count

Syntax [**no**] **packets-denied-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr packets-denied-count)
[Tree] (config>log>acct-policy>cr>aa>aa-to-sub-cntr packets-denied-count)

Full Context configure log accounting-policy custom-record aa-specific from-aa-sub-counters packets-denied-count
configure log accounting-policy custom-record aa-specific to-aa-sub-counters packets-denied-count

Description This command includes the denied packet count in the AA subscriber's custom record and only applies to the 7750 SR.

The **no** form of this command excludes the denied packet count.

Default no packets-denied-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.33 pad-size

pad-size

Syntax **pad-size** *octets*
no pad-size

Context **[Tree]** (config>oam-pm>session>ip>twamp-light pad-size)

Full Context configure oam-pm session ip twamp-light pad-size

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the amount by which the TWAMP Light packet is padded. TWAMP session controller packets are 27 bytes smaller than TWAMP session reflector packets. If symmetrical packet sizes in the forward and backward direction are required, the pad size must be configured to a minimum of 27 bytes.

The **no** form of this command removes all padding.

Default pad-size 0

Parameters *octets* — Specifies the value, in octets, to pad the TWAMP Light packet.

Values 0 to 2000

Default 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.34 pad-tlv-size

pad-tlv-size

Syntax **pad-tlv-size** *octets*
no pad-tlv-size

Context **[Tree]** (config>oam-pm>session>mpls>dm pad-tlv-size)

Full Context configure oam-pm session mpls dm pad-tlv-size

Description This command allows the operator to add an optional Pad TLV to PDU and increase the frame on the wire by the specified amount. Note that this command only configures the size of the padding added to the PDU, and does not configure the total size of the frame on the wire. Since the bit count for the length is a maximum of 255 (8bits) the maximum pad per pad-tlv is between 0, 2 and 257 (type 1B, Length 1B, Length 255). Only a single pad-tlv can be added.

The **no** form of this command removes the optional TLV.

Parameters *octets* — Specifies the overall length of the pad-tlv.

Values 0, 2 to 257

Default 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.35 padding-size

padding-size

Syntax **padding-size** *padding-size*
no padding-size

Context **[Tree]** (config>service>vprn>static-route-entry>indirect>cpe-check padding-size)
[Tree] (config>service>vprn>static-route-entry>next-hop>cpe-check padding-size)

Full Context configure service vprn static-route-entry indirect cpe-check padding-size
configure service vprn static-route-entry next-hop cpe-check padding-size

Description This optional parameter specifies the amount of padding to add to the ICMP packet in bytes. The parameter is only applicable when the **cpe-check** option is used with the associated static route.

Default padding-size 56

Parameters *padding-size* — An integer value.

Values 0 to 16384 bytes

Platforms All

padding-size

Syntax **padding-size** *padding-size*
no padding-size

Context **[Tree]** (config>router>static-route-entry>indirect>cpe-check padding-size)
[Tree] (config>router>static-route-entry>next-hop>cpe-check padding-size)

Full Context configure router static-route-entry indirect cpe-check padding-size
configure router static-route-entry next-hop cpe-check padding-size

Description This command specifies the amount of padding to add to the ICMP packet in bytes. The parameter is only applicable when the **cpe-check** option is used with the associated static route.

Default padding-size 56

Parameters *padding-size* — Specifies the integer value.

Values 0 to 16384 bytes

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

padding-size

Syntax **padding-size** *size*
no padding-size

Context **[Tree]** (config>vrrp>priority-event>host-unreachable padding-size)

Full Context configure vrrp priority-event host-unreachable padding-size

Description This command allows the operator to increase the size of IP packet by padding the PDU.

The **no** form of the command reverts to the default.

Default padding-size 0

Parameters *size* — Specifies amount of increase to the ICMP PDU.

Values 0 to 16384

20.36 padi-auth-policy

padi-auth-policy

Syntax **padi-auth-policy** *policy-name*
no padi-auth-policy

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host padi-auth-policy)

Full Context configure subscriber-mgmt local-user-db ppp host padi-auth-policy

Description This command configures the PADI authentication policy of this host.

Parameters *policy-name* — Specifies the authentication policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.37 pado-ac-name

pado-ac-name

Syntax **pado-ac-name** *name*
no pado-ac-name

Context **[Tree]** (config>subscr-mgmt>ppp-policy pado-ac-name)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt ppp-policy pado-ac-name

Description This command configures the Access Concentrator name that is used in the PPPoE PADO message.

By default, the system name or if not configured, the chassis Serial Number is used.

Parameters *name* — Specifies the string up to 128 characters to be used as AC name in the PPPoE PADO message.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.38 pado-delay

pado-delay

Syntax **pado-delay** *deci-seconds*
no pado-delay

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host pado-delay)

Full Context configure subscriber-mgmt local-user-db ppp host pado-delay

Description This command configures the delay timeout before sending a PPPoE Active Discovery Offer (PADO).

Parameters *deci-seconds* — Specifies the delay timeout before sending a PADO.

Values 1 to 30

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pado-delay

Syntax **pado-delay** *deci-seconds*
no pado-delay

Context **[Tree]** (config>subscr-mgmt>ppp-policy pado-delay)

Full Context configure subscriber-mgmt ppp-policy pado-delay

Description This command configures the delay timeout before sending a PPP Active Discovery Offer (PADO) packet.

Parameters *deci-seconds* — Specifies the delay timeout before sending a PADO.

Values 1 to 30

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.39 pairing-button

pairing-button

Syntax **pairing-button** *admin-state*

Context **[Tree]** (config>system>bluetooth pairing-button)

Full Context configure system bluetooth pairing-button

Description This command is used to allow or block the function of the pairing button. This can be used to block the accidental triggering of a pairing operation while there is already a paired device.

The actual behavior of the Bluetooth pairing is dependent on both this command and the **power** command.

If normal operation is to use the pairing button on the router and on the external device to initiate the Bluetooth connection, then set:

config>system>bluetooth>power enabled-manual

config>system>bluetooth>pairing-button enable

If normal operation is to only require the pairing to be initiated by the external device, then set:

config>system>bluetooth>power enabled-automatic

config>system>bluetooth>pairing-button disable

If normal operation is to not allow the local operator to connect without permission from the central management location, then set:

config>system>bluetooth>power enabled-manual

config>system>bluetooth>pairing-button disable

Then when a connection is desired, the central management station must change the configuration to one of the two options shown above for the time the local operator is connecting. The central management station can change the setting back to block local access after the operations is complete.

Default pairing-button disable

Parameters *admin-state* — Specifies the administrative state.

Values enable — pairing button can trigger a pairing operation

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

disable — pairing button does not trigger a pairing operation

Platforms 7750 SR-1, 7750 SR-s

20.40 parallel

parallel

Syntax **parallel** [**no-advertise**]
no parallel

Context **[Tree]** (config>router>ospf>segm-rtng>adjacency-set parallel)
[Tree] (config>router>isis>segm-rtng>adjacency-set parallel)

Full Context configure router isis segment-routing adjacency-set parallel
configure router ospf segment-routing adjacency-set parallel

Description This command indicates that all members of the adjacency set must terminate on the same neighboring node. The system raises a trap if a user attempts to add an adjacency terminating on a neighboring node that differs from the existing members of the adjacency set. In addition, the system stops advertising the adjacency set in IS-IS or OSPF and locally deprograms it.

By default, parallel adjacency sets are advertised in the IGP. The **no-advertise** option prevents an adjacency set from being advertised in the IGP. It is only allowed in CLI and SNMP if the **parallel** command is configured.

The **no** form of this command indicates that the adjacency set can include adjacencies to different next hop nodes.

Default parallel

20.42 parent

parent

Syntax **parent** [**weight** *weight*] [**cir-weight** *cir-weight*]
no parent

Context **[Tree]** (config>port>ethernet>access>egr>qgrp>qover>q parent)

Full Context configure port ethernet access egress queue-group queue-overrides queue parent

Description This command, when used in the *queue-overrides* context for a queue group queue, defines an optional **weight** and **cir-weight** for the queue treatment by the parent scheduler that further governs the available bandwidth given the queue aside from the queue PIR setting. When multiple schedulers and/or queues share a child status with the parent scheduler, the weight or level parameters define how this queue contends with the other children for the parent bandwidth.

Parameters *weight* — Specifies the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler-name. Any queues or schedulers defined as weighted receive no parental bandwidth until all strict queues and schedulers on the parent have reached their maximum bandwidth or are idle. In this manner, weighted children are considered to be the lowest priority.

Values 0 to 100

Default 1

cir-weight — Specifies the weight the queue uses at the within-cir port priority level. The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-cir pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Platforms All

configure port ethernet access ingress queue-group scheduler-override scheduler parent

Description This command can be used to override the scheduler's parent weight and CIR weight. The weights apply to the associated level/cir-level configured in the applied scheduler policy. The scheduler name must exist in the applied scheduler policy.

The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy - this allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the queue group overrides. If the parent scheduler does not exist, causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of this command returns the scheduler's parent weight and cir-weight to the value configured in the applied scheduler policy.

Default no parent

Parameters *weight* — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total distributes the available bandwidth at that level. A weight is considered to be active when the queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

cir-weight — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same cir-level defined by the cir-level parameter in the applied scheduler policy. Within the strict cir-level, all cir-weight values from active children at that level are summed and the ratio of each active child's cir-weight to the total distributes the available bandwidth at that level. A cir-weight is considered to be active when the policer, queue, or scheduler that the cir-weight pertains to has not reached the CIR and still has packets to transmit.

A 0 (zero) cir-weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

configure service ipipe sap egress queue-override queue parent
configure service ipipe sap ingress queue-override queue parent

Description

This command defines an optional parent scheduler that further governs the available bandwidth given the queue aside from the queue's PIR setting. When multiple schedulers and/or queues share a child status with the parent scheduler, the **weight** or **level** parameters define how this queue contends with the other children for the parent's bandwidth.

Checks are not performed to see if a *scheduler-name* exists when the parent command is defined on the queue. Scheduler names are configured in the **config>qos>scheduler-policy>tier** *level* context. Multiple schedulers can exist with the *scheduler-name* and the association pertains to a scheduler that should exist on the egress SAP as the policy is applied and the queue created. When the queue is created on the egress SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly or indirectly applied (through a multi-service customer site) to the egress SAP. If the *scheduler-name* does not exist, the queue is placed in the orphaned operational state. The queue will accept packets but will not be bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The orphaned state must generate a log entry and a trap message. The SAP which the queue belongs to must also depict an orphan queue status. The orphaned state of the queue is automatically cleared when the *scheduler-name* becomes available on the egress SAP.

The parent scheduler can be made unavailable due to the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the queue enters the orphaned state and automatically returns to normal operation when the parent scheduler is available again.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. Once a parent association has been removed, the former child queue attempts to operate based on its configured rate parameter. Removing the parent association on the queue within the policy takes effect immediately on all queues using the SAP egress QoS policy.

Parameters

weight — These optional keywords are mutually exclusive to the **level** keyword. Specifies the relative weight of this queue in comparison to other child schedulers, policers, and queues while vying for bandwidth on the parent *scheduler-name*. Any policers, queues, or schedulers defined as weighted receive no parental bandwidth until all policers, queues, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

All **weight** values from all weighted active policers, queues, and schedulers with a common parent scheduler are added together. Then, each individual active weight is divided by the total, deriving the percentage of remaining bandwidth provided to the policer, queue, or scheduler. A weight is considered to be active when the pertaining policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

cir-weight — Specifies the weight the queue or scheduler will use at the within-cir port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the policer, queue, or scheduler does not receive bandwidth during the port schedulers within-cir pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

configure service epipe sap egress scheduler-override scheduler parent
configure service epipe sap ingress scheduler-override scheduler parent
configure service fpipe sap egress scheduler-override scheduler parent
configure service fpipe sap ingress scheduler-override scheduler parent
configure service ipipe sap egress scheduler-override scheduler parent
configure service ipipe sap ingress scheduler-override scheduler parent

Description This command can be used to override the scheduler's parent weight and cir-weight information. The weights apply to the associated level/cir-level configured in the applied scheduler policy. The scheduler name must exist in the scheduler policy applied to the ingress or egress of the SAP or multi-service site.

The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy – this allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the SAP/MSS overrides. If the parent scheduler does not exist causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of this command returns the scheduler's parent weight and cir-weight to the value configured in the applied scheduler policy.

Default no parent

Parameters *weight* — Specifies the relative weight of this scheduler in comparison to other child schedulers, policers, and queues at the same strict **level** defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the policer, queue, or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

cir-weight — Specifies the relative weight of this scheduler in comparison to other child schedulers, policers, and queues at the same *cir-level* defined by the **cir-level** parameter in the applied scheduler policy. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that level. A **cir-weight** is considered to be active when the policer, queue, or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit.

A 0 (zero) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

no parent

Context [Tree] (config>service>vpls>sap>egress>queue-override>queue parent)
[Tree] (config>service>vpls>sap>ingress>queue-override>queue parent)

Full Context configure service vpls sap egress queue-override queue parent
configure service vpls sap ingress queue-override queue parent

Description This command defines an optional parent scheduler that further governs the available bandwidth given the queue aside from the queue's PIR setting. When multiple schedulers and/or queues share a child status with the parent scheduler, the **weight** or **level** parameters define how this queue contends with the other children for the parent's bandwidth.

Checks are not performed to see if a *scheduler-name* exists when the parent command is defined on the queue. Scheduler names are configured in the **config>qos>scheduler-policy>tier** *level* context. Multiple schedulers can exist with the *scheduler-name* and the association pertains to a scheduler that should exist on the egress SAP as the policy is applied and the queue created. When the queue is created on the egress SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly or indirectly applied (through a multi-service customer site) to the egress SAP. If the *scheduler-name* does not exist, the queue is placed in the orphaned operational state. The queue will accept packets but will not be bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The orphaned state must generate a log entry and a trap message. The SAP which the queue belongs to must also depict an orphan queue status. The orphaned state of the queue is automatically cleared when the *scheduler-name* becomes available on the egress SAP.

The parent scheduler can be made unavailable due to the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the queue enters the orphaned state mentioned above and automatically return to normal operation when the parent scheduler is available again.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. Once a parent association has been removed, the former child queue attempts to operate based on its configured rate parameter. Removing the parent association on the queue within the policy takes effect immediately on all queues using the SAP egress QoS policy.

Parameters *weight* — These optional keywords are mutually exclusive to the **level** keyword. The weight defines the relative weight of this queue in comparison to other child schedulers, policers, and queues while vying for bandwidth on the parent *scheduler-name*. Any policers, queues, or schedulers defined as weighted receive no parental bandwidth until all policers, queues, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

All **weight** values from all weighted active policers, queues, and schedulers with a common parent scheduler are added together. Then, each individual active weight is divided by the total, deriving the percentage of remaining bandwidth provided to the policer, queue, or scheduler. A weight is considered to be active when the pertaining policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

cir-weight — Specifies the weight the queue or scheduler will use at the within-cir port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the policer, queue, or scheduler does not receive bandwidth during the port schedulers within-cir pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Platforms All

parent

Syntax **parent** {**root** | *arbiter-name*} [**level** *priority-level*] [**weight** *weight-within-level*]
no parent

Context **[Tree]** (config>qos>plcr-ctrl-plcy>tier>arbiter parent)

Full Context configure qos policer-control-policy tier arbiter parent

Description This command is used to define from where the tiered arbiter receives bandwidth. Both tier 1 and tier 2 arbiters default to parenting to the root arbiter. Tier 2 arbiters may be modified to parent to a tier 1 arbiter. The tier 1 arbiter parent cannot be changed.

The **no** form of this command is used to return the tiered arbiter to the default parenting behavior.

Default parent root level 1 weight 1

Parameters **root** — In tier 1, *arbiter-name* is not allowed and only **root** is accepted. When **root** is specified, the arbiter will receive all bandwidth directly from the root arbiter. This is the default parent for tiered arbiters.

arbiter-name — In tier 1, *arbiter-name* is not allowed and only **root** is accepted. The specified *arbiter-name* must exist within the policer-control-policy at tier 1 or the parent command will fail. When a tiered arbiter is acting as a parent for another tiered arbiter, the parent arbiter cannot be removed from the policy. The child arbiter will receive all bandwidth directly from its parent arbiter (that receives bandwidth from the root arbiter).

priority-level — Each child arbiter attaches to its parent on one of the parent's eight strict levels. Level 1 is the lowest and 8 is the highest. The level attribute is used to define which level the child arbiter uses on its parent. The parent distributes its available bandwidth based on strict priority starting with priority level 8 and proceeding towards level 1.

Values 1 to 8

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

weight-within-level — The **weight** attribute is used to define how multiple children at the same parent strict level compete when insufficient bandwidth exists on the parent for that level. Each child's weight is divided by the sum of the active children's weights and the result is multiplied by the available bandwidth. If a child cannot receive its entire weighted fair share of bandwidth due to a defined child rate limit, the remainder of its bandwidth is distributed between the other children based on their weights.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

parent

Syntax **parent** *arbiter-name* [**weight** *weight-within-level*] [**level** *level*]
no parent

Context **[Tree]** (config>qos>sap-ingress>dyn-policer parent)
[Tree] (config>qos>sap-egress>dyn-policer parent)
[Tree] (config>qos>sap-ingress>policer parent)
[Tree] (config>qos>sap-egress>policer parent)

Full Context configure qos sap-egress dynamic-policer parent
configure qos sap-egress policer parent
configure qos sap-ingress dynamic-policer parent
configure qos sap-ingress policer parent

Description This command is used to create a child-to-parent mapping between each instance of the policer and either the **root** arbiter or a specific tiered **arbiter** on the object where the policy is applied. Defining a parent association for the policer causes the policer to compete for the parent policer's available bandwidth with other child policers mapped to the policer control hierarchy.

Policer control hierarchies may be created on SAPs or on a subscriber or multiservice site context. To create a policer control hierarchy on an ingress or egress SAP context, a **policer-control-policy** must be applied to the SAP. When applied, the system will create a parent policer that is bandwidth limited by the policy's **max-rate** value under the root arbiter. The root arbiter in the policy also provides the information used to determine the various priority-level discard-unfair and discard-all thresholds. Besides the root arbiter, the policy may also contain user-defined tiered arbiters that provide arbitrary bandwidth control for subsets of child policers that are either directly or indirectly parented by the arbiter.

When the QoS policy containing the policer with a **parent** mapping to an arbiter name exists on the SAP, the system will scan the available arbiters on the SAP. If an arbiter exists with the appropriate name, the policer to arbiter association is created. If the specified arbiter does not exist either because a **policer-control-policy** is not currently applied to the SAP or the arbiter name does not exist within the applied policy, the policer is placed in an orphan state. Orphan policers operate as if they are not parented and are not subject to any bandwidth

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

constraints other than their own PIR. When a policer enters the orphan state, it is flagged as operationally degraded due to the fact that it is not operating as intended and a trap is generated. Whenever a **policer-control-policy** is added to the SAP or the existing policy is modified, the SAP's policer's parenting configurations must be reevaluated. If an orphan policer becomes parented, the degraded flag is cleared, and a resulting trap is generated.

For subscribers, the policer control hierarchy is created through the **policer-control-policy** applied to the **sub-profile** used by the subscriber. A unique policer control hierarchy is created for each subscriber associated with the **sub-profile**. The QoS policy containing the policer with the parenting command comes into play through the subscriber **sla-profile**, which references the QoS policy. The combining of the **sub-profile** and the **sla-profile** at the subscriber level provides the system with the proper information to create the policer control hierarchy instance for the subscriber. This functionality is available only for the 7450 ESS and 7750 SR.

Executing the **parent** command will fail if:

- The policer’s stat-mode in the QoS policy is set to no-stats
- A stat-mode no-stats override exists on an instance of the policer on a SAP or subscriber or multiservice site context

A policer with a **parent** command applied cannot be configured with **stat-mode no-stats** in either the QoS policy or as an override on an instance of the policer.

When a policer is successfully parented to an arbiter, the **parent** commands **level** and **weight** parameters are used to determine at what priority level and at which weight in the priority level that the child policer competes with other children (policers or other arbiters) for bandwidth.

The **no** form of this command is used to remove the parent association from all instances of the policer.

Parameters **{root |** *arbiter-name***}** — When the **parent** command is executed, either the keyword **root** or an *arbiter-name* must be specified.

root — Specifies that the policer is intended to become a child to the **root** arbiter where an instance of the policer is created. If the **root** arbiter does not exist, the policer will be placed in the orphan state.

Default **root**

arbiter-name — Specifies that the policer is intended to become a child to one of the tiered arbiters with the given arbiter-name where an instance of the policer is created. If the specified *arbiter-name* does not exist, the policer will be placed in the orphan state.

weight *weight-within-level* — The **weight** *weight-within-level* keyword and parameter are optional when executing the **parent** command. When **weight** is not specified, a default level of 1 is used in the parent arbiter’s priority level. When **weight** is specified, the *weight-within-level* parameter must be specified as an integer value from 1 through 100.

Syntax **parent** *scheduler-name* [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]
no parent

Context **[Tree]** (config>qos>sap-ingress>queue parent)
[Tree] (config>qos>sap-egress>queue parent)

Full Context configure qos sap-egress queue parent
configure qos sap-ingress queue parent

Description This command defines an optional parent scheduler that further governs the available bandwidth given the queue aside from the queue's PIR setting. When multiple schedulers, policers (at egress only), and/or queues share a child status with the parent scheduler, the **weight** or **level** parameters define how this queue contends with the other children for the parent's bandwidth.

Checks are not performed to see if a *scheduler-name* exists when the parent command is defined on the queue. Scheduler names are configured in the **config>qos>scheduler-policy>tier** *level* context. Multiple schedulers can exist with the *scheduler-name* and the association pertains to a scheduler that should exist on the egress SAP as the policy is applied and the queue created. When the queue is created on the egress SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly or indirectly applied (through a multiservice customer site) to the egress SAP. If the *scheduler-name* does not exist, the queue is placed in the orphaned operational state. The queue will accept packets but will not be bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP that the queue belongs to also depicts an orphan queue status. The orphaned state of the queue is automatically cleared when the *scheduler-name* becomes available on the egress SAP.

The parent scheduler can be made unavailable due to the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the queue enters the orphaned state and automatically returns to normal operation when the parent scheduler is available again.

When a parent scheduler is defined without specifying the weight parameter, the default is a weight of 1.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. When a parent association has been removed, the former child queue attempts to operate based on its configured rate parameter. Removing the parent association on the queue within the policy takes effect immediately on all queues using the SAP egress QoS policy.

Parameters *scheduler-name* — The defined *scheduler-name* conforms to the same input criteria as the schedulers defined within a scheduler policy. Scheduler names are configured in the config>qos>scheduler-policy>tier *level* context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the queue to use the defined *scheduler-name*, the scheduler exists on each egress SAP that the queue is eventually created on. For the duration where *scheduler-name* does not exist on the egress SAP, the queue operates in an orphaned state.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight — Specifies the relative weight of this queue in comparison to other child schedulers, policers, and queues, while vying for bandwidth on the parent *scheduler-name*. Any queues, policers, or schedulers defined as weighted receive no parental bandwidth until all policers, queues, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

All **weight** values from all weighted active queues, policers, and schedulers with a common parent scheduler are added together. Then, each individual active weight is divided by the total, deriving the percentage of remaining bandwidth provided to the queue, policer, or scheduler. A weight is considered to be active when the pertaining queue, policer, or scheduler has not reached its maximum rate and still has packets to transmit. All child queues, policers, and schedulers with a weight of 0 are considered to have the lowest priority level and are not serviced until all non-zero weighted queues, policers, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level — The optional **level** parameter defines the level of hierarchy when compared to other schedulers and queues competing for bandwidth on the parent *scheduler-name*. Queues or schedulers will not receive parental bandwidth until all queues, policers, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

Children of the parent scheduler with a lower strict priority will not receive bandwidth until all children with a higher strict priority have either reached their maximum bandwidth or are idle. Children with the same strict level are serviced in relation to their relative weights.

Values 1 to 8

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

cir-weight — Specifies the weight that the queue or scheduler uses at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Default 1

cir-level — Specifies the port priority that the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 8 (8 is the highest priority)

Default 0

Platforms All

parent

Syntax **parent** {**root** | *arbiter-name*} [**level** *level*] [**weight** *weight-within-level*]
no parent

Context **[Tree]** (config>qos>qgrps>egr>qgrp>policer parent)
[Tree] (config>qos>qgrps>ing>qgrp>policer parent)

Full Context configure qos queue-group-templates egress queue-group policer parent
configure qos queue-group-templates ingress queue-group policer parent

Description This command is used to create a child-to-parent mapping between each instance of the policer and either the **root** arbiter or a specific tiered **arbiter** on the object where the policy is applied. Defining a parent association for the policer causes the policer to compete for the parent policer's available bandwidth with other child policers mapped to the policer control hierarchy.

Policer control hierarchies may be created on SAPs or on a subscriber or multiservice site context. To create a policer control hierarchy on an ingress or egress SAP context, a **policer-control-policy** must be applied to the SAP. When applied, the system will create a parent policer that is bandwidth limited by the policy's **max-rate** value under the root arbiter. The root arbiter in the policy also provides the information used to determine the various priority level discard-unfair and discard-all thresholds. Besides the root arbiter, the policy may also contain user-defined tiered arbiters that provide arbitrary bandwidth control for subsets of child policers that are either directly or indirectly parented by the arbiter.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the QoS policy containing the policer with a **parent** mapping to an arbiter name exists on the SAP, the system will scan the available arbiters on the SAP. If an arbiter exists with the appropriate name, the policer to arbiter association is created. If the specified arbiter does not exist either because a **policer-control-policy** is not currently applied to the SAP or the arbiter name does not exist within the applied policy, the policer is placed in an orphan state. Orphan policers operate as if they are not parented and are not subject to any bandwidth constraints other than their own PIR. When a policer enters the orphan state, it is flagged as operationally degraded due to the fact that it is not operating as intended and a trap is generated. Whenever a **policer-control-policy** is added to the SAP or the existing policy is modified, the SAP's policer's parenting configurations must be reevaluated. If an orphan policer becomes parented, the degraded flag is cleared and a resulting trap is generated.

For subscribers, the policer control hierarchy is created through the **policer-control-policy** applied to the **sub-profile** used by the subscriber. A unique policer control hierarchy is created for each subscriber associated with the **sub-profile**. The QoS policy containing the policer with the parenting command comes into play through the subscriber **sla-profile** that references the QoS policy. The combining of the **sub-profile** and the **sla-profile** at the subscriber level provides the system with the proper information to create the policer control hierarchy instance for the subscriber. This functionality is available only for the 7450 ESS and 7750 SR.

Executing the **parent** command will fail if:

- The policer’s stat-mode in the QoS policy is set to no-stats
- A stat-mode no-stats override exists on an instance of the policer on a SAP or subscriber or multiservice site context

A policer with a **parent** command applied cannot be configured with **stat-mode no-stats** in either the QoS policy or as an override on an instance of the policer.

When a policer is successfully parented to an arbiter, the **parent** commands **level** and **weight** parameters are used to determine at what priority level and at which weight in the priority level that the child policer competes with other children (policers or other arbiters) for bandwidth.

The **no** form of this command is used to remove the parent association from all instances of the policer.

Parameters **{root |** *arbiter-name***}** — When the **parent** command is executed, either the keyword **root** or an *arbiter-name* must be specified.

Default **root**

root — The **root** keyword specifies that the policer is intended to become a child to the **root** arbiter where an instance of the policer is created. If the **root** arbiter does not exist, the policer will be placed in the orphan state.

arbiter-name — The *arbiter-name* parameter specifies that the policer is intended to become a child to one of the tiered arbiters with the given arbiter-name where an instance of the policer is created. If the specified arbiter-name does not exist, the policer will be placed in the orphan state.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

weight *weight-within-level* — The **weight** *weight-within-level* keyword and parameter are optional when executing the **parent** command. When **weight** is not specified, a default level of 1 is used in the parent arbiters priority level. When **weight** is specified, the *weight-within-level* parameter must be specified as an integer value from 1 through 100.

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

parent

Syntax **parent** *scheduler-name* [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]
no parent

Context **[Tree]** (config>qos>qgrps>egr>qgrp>queue parent)
[Tree] (config>qos>qgrps>ing>qgrp>queue parent)

Full Context configure qos queue-group-templates egress queue-group queue parent
configure qos queue-group-templates ingress queue-group queue parent

Description This command defines an optional parent scheduler that further governs the available bandwidth given the queue aside from the queue's PIR setting. When multiple schedulers, policers (at egress only), and/or queues share a child status with the parent scheduler, the **weight** or **level** parameters define how this queue contends with the other children for the parent's bandwidth.

Checks are not performed to see if a *scheduler-name* exists when the parent command is defined on the queue. Scheduler names are configured in the config>qos>scheduler-policy>tier *level* context. Multiple schedulers can exist with the *scheduler-name* and the association pertains to a scheduler that should exist on the egress SAP as the policy is applied and the queue created. When the queue is created on the egress SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly or indirectly applied (through a multiservice customer site) to the egress SAP. If the *scheduler-name* does not exist, the queue is placed in the orphaned operational state. The queue will accept packets but will not be bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP that the queue belongs to must also depict an orphan queue status. The orphaned state of the queue is automatically cleared when the *scheduler-name* becomes available on the egress SAP.

The parent scheduler can be made unavailable due to the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the queue enters the orphaned state and automatically returns to normal operation when the parent scheduler is available again.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. When a parent association has been removed, the former child queue attempts to operate based on its configured rate parameter. Removing the parent association on the queue within the policy takes effect immediately on all queues using the SAP egress QoS policy.

Parameters *scheduler-name* — The defined *scheduler-name* conforms to the same input criteria as the schedulers defined within a scheduler policy. Scheduler names are configured in the config>qos>scheduler-policy>tier *level* context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the queue to use the defined *scheduler-name*, the scheduler exists on each egress SAP the queue is eventually created on. For the duration where *scheduler-name* does not exist on the egress SAP, the queue operates in an orphaned state.

Values Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

weight *weight* — *weight* defines the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent *scheduler-name*. Any queues or schedulers defined as weighted receive no parental bandwidth until all policers, queues, and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

All **weight** values from all weighted active queues, policers, and schedulers with a common parent scheduler are added together. Then, each individual active weight is divided by the total, deriving the percentage of remaining bandwidth provided to the queue, policer, or scheduler. A weight is considered to be active when the pertaining queue or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority level and are not serviced until all non-zero weighted queues, policers, and schedulers at that level are operating at the maximum bandwidth or are idle.

Values 0 to 100

Default 1

level *level* — The optional **level** parameter defines the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent *scheduler-name*. Queues or schedulers will not receive parental bandwidth until all queues and schedulers with a higher (numerically larger) priority on the parent have reached their maximum bandwidth or are idle.

Children of the parent scheduler with a lower strict priority will not receive bandwidth until all children with a higher strict priority have either reached their maximum bandwidth or are idle. Children with the same strict level are serviced relative to their weights.

Values 1 to 8

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

cir-weight *cir-weight* — Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Default 1

cir-level *cir-level* — Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 8 (8 is the highest priority)

Default 0

Platforms All

parent

Syntax **parent** *scheduler-name* [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]
no parent

Context **[Tree]** (config>qos>scheduler-policy>tier>scheduler parent)

Full Context configure qos scheduler-policy tier scheduler parent

Description This command defines an optional parent scheduler that is higher up the policy hierarchy. Only schedulers in tier levels 2 and 3 can have a parental association. When multiple schedulers, policers (at egress only), and/or queues share a child status with the scheduler on the parent, the weight or strict parameters define how this scheduler contends with the other children for the parent's bandwidth. The parent scheduler can be removed or changed at any time and is immediately reflected on the schedulers created by association of this scheduler policy.

When a parent scheduler is defined without specifying weight or strict parameters, the default bandwidth access method is weight with a value of 1.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and returns without an error. When a parent association has been removed, the former child scheduler attempts to operate based on its configured rate parameter. Removing the parent association on the scheduler within the policy will take effect immediately on all schedulers with *scheduler-name* that have been created using the *scheduler-policy-name*.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *scheduler-name* — Specifies a scheduler name. The *scheduler-name* must already exist within the context of the scheduler policy in a tier that is higher (numerically lower).

Values Any valid *scheduler-name* existing on a higher tier within the scheduler policy.

weight *weight* — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level defined by the **level** parameter. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit.

A zero (0) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

Default 1

level *level* — Specifies the strict priority level of this scheduler in comparison to other child schedulers and queues vying for bandwidth on the parent scheduler-name during the above-CIR distribution phase of bandwidth allocation. During the above-CIR distribution phase, any queues or schedulers defined at a lower strict level receive no parental bandwidth until all queues and schedulers defined with a higher (numerically larger) strict level on the parent have reached their maximum bandwidth or have satisfied their offered load requirements.

When the similar **cir-level** parameter default (undefined) are retained for the child scheduler, bandwidth is only allocated to the scheduler during the above-CIR distribution phase.

Children of the parent scheduler with a lower strict priority level will not receive bandwidth until all children with a higher strict priority level have either reached their maximum bandwidth or are idle. Children with the same strict level are serviced in relation to their relative weights.

Values 1 to 8

Default 1

cir-weight *cir-weight* — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same **cir-level** defined by the **cir-level** parameter. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that level. A **cir-weight** is considered to be active when the queue or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit.

A zero (0) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

cir-level *cir-level* — Specifies the strict priority CIR level of this scheduler in comparison to other child schedulers and queues vying for bandwidth on the parent *scheduler-name* during the within-CIR distribution phase of bandwidth allocation. During the within-CIR distribution phase, any queues or schedulers defined at a lower strict CIR level receive no parental bandwidth until all queues and schedulers defined with a higher (numerically larger) strict CIR level on the parent have reached their CIR bandwidth or have satisfied their offered load requirements.

If the scheduler's **cir-level** parameter retains the default (undefined) state, bandwidth is only allocated to the scheduler during the above-CIR distribution phase.

Children with the same strict cir-level are serviced according to their cir-weight.

Values 0 to 8

Default 0

Platforms All

parent

Syntax **parent** [**weight** *weight*] [**cir-weight** *cir-weight*]
no parent

Context **[Tree]** (config>service>cust>multi-service-site>ingress>sched-override>scheduler parent)
[Tree] (config>service>cust>multi-service-site>egress>sched-override>scheduler parent)

Full Context configure service customer multi-service-site egress scheduler-override scheduler parent
configure service customer multi-service-site ingress scheduler-override scheduler parent

Description This command overrides the scheduler's parent weight and CIR weight information. The weights apply to the associated level or cir-level configured in the applied scheduler policy. The scheduler name must exist in the scheduler policy applied to the ingress or egress of the SAP or multi-service site.

The override weights are ignored if the scheduler does not have a **parent** command configured in the scheduler policy. This allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the SAP/MSS overrides. If the parent scheduler does not exist causing the configured scheduler to be fostered on an egress port scheduler, the override weights will be ignored and the default values used; this avoids having non-default weightings for fostered schedulers.

The **no** form of the command returns the scheduler's parent weight and CIR weight to the value configured in the applied scheduler policy.

Default no parent

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *weight* — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same strict **level** defined by the level parameter in the applied scheduler policy. Within the level, all weight values from active children at that level are summed and the ratio of each active child's weight to the total is used to distribute the available bandwidth at that level. A weight is considered to be active when the policer, queue or scheduler the weight pertains to has not reached its maximum rate and still has packets to transmit. A 0 (zero) weight value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict level.

Values 0 to 100

Default 1

cir-weight — Specifies the relative weight of this scheduler in comparison to other child schedulers and queues at the same *cir-level* defined by the **cir-level** parameter in the applied scheduler policy. Within the strict **cir-level**, all **cir-weight** values from active children at that level are summed and the ratio of each active child's **cir-weight** to the total is used to distribute the available bandwidth at that level. A **cir-weight** is considered to be active when the policer, queue or scheduler that the **cir-weight** pertains to has not reached the CIR and still has packets to transmit. A 0 (zero) **cir-weight** value signifies that the child scheduler will receive bandwidth only after bandwidth is distributed to all other non-zero weighted children in the strict cir-level.

Values 0 to 100

Default 0

20.43 parent-location

parent-location

Syntax **parent-location** {**default** | **sla**}
no parent-location

Context **[Tree]** (config>qos>sap-egress parent-location)

Full Context configure qos sap-egress parent-location

Description This command determines the expected location of the parent schedulers for queues configured with a parent command within the sap-egress policy. All parent schedulers must be configured within a scheduler-policy applied at the location corresponding to the parent-location parameter.

If a parent scheduler name does not exist at the specified location, the queue will not be parented and will be orphaned.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Default parent-location default

Parameters **default** — When the sap-egress policy is applied to an sla-profile for a subscriber, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the subscriber's sub-profile.

When the sap-egress policy is applied to a SAP, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the SAP or the multiservice site.

sla — When the sap-egress policy is applied to an sla-profile for a subscriber, the parent schedulers of the queues need to be configured in the scheduler-policy applied to the same sla-profile.

If this parameter is configured within a sap-egress policy that is applied to any object except of the egress of an sla-profile, the configured parent schedulers will not be found and so the queues will not be parented and will be orphaned. This parameter is not supported when **policers-hqos-manageable** is configured in the SAP egress QoS policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

parent-location

Syntax **parent-location** {**none** | **sub** | **vport**}
no parent-location

Context **[Tree]** (config>qos>scheduler-policy>tier parent-location)

Full Context configure qos scheduler-policy tier parent-location

Description This command determines the expected location of the parent schedulers for the tier 1 schedulers configured with a parent command within the scheduler-policy. The parent schedulers must be configured within a scheduler-policy applied at the location corresponding to the parent-location parameter.

If a parent scheduler name does not exist at the specified location, the schedulers will not be parented and will be orphaned.

The configuration of **parent-location** and **frame-based-accounting** in a scheduler policy is mutually exclusive in order to ensure consistency between the different scheduling levels.

The **no** form of this command reverts to the default.

Default parent-location none

Parameters **none** — This parameter indicates that the tier 1 schedulers do not have a parent scheduler and the configuration of the parent under a tier 1 scheduler is blocked. Conversely, this parameter is blocked when any tier 1 scheduler has a parent configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sub — When the scheduler-policy is applied to an sla-profile for a subscriber, the parent schedulers of the tier 1 schedulers need to be configured in the scheduler-policy applied to the subscriber's sub-profile.

If this parameter is configured within a scheduler-policy that is applied to any object except for the egress of an sla-profile, the configured parent schedulers will not be found and so the tier 1 schedulers will not be parented and will be orphaned.

vport — When the scheduler-policy is applied to an sla-profile, a sub-profile for a subscriber, or to the egress of a pseudowire SAP, the parent schedulers of the tier 1 schedulers need to be configured in the scheduler-policy applied to the Vport to which the subscriber will be assigned.

If this parameter is configured within a scheduler-policy that is applied to any object except for the egress of an sla-profile or sub-profile, or to the egress of a PW SAP, the configured parent schedulers will not be found and so the tier 1 schedulers will not be parented and will be orphaned.

Platforms All

20.44 parent-mid-pool

parent-mid-pool

Syntax **parent-mid-pool** *mid-pool-id*
no parent-mid-pool

Context **[Tree]** (config>qos>hs-port-pool-policy>alt-port-class-pools>class-pool parent-mid-pool)
[Tree] (config>qos>hs-port-pool-policy>std-port-class-pools>class-pool parent-mid-pool)

Full Context configure qos hs-port-pool-policy alt-port-class-pools class-pool parent-mid-pool
configure qos hs-port-pool-policy std-port-class-pools class-pool parent-mid-pool

Description This command creates the buffer allocation mapping between the associated class pool and the specified mid-pool. Use care when selecting a mid-pool in an active state (properly mapped to a root-pool with a non-zero allocation percentage). If a port-class pool is parented by an inactive mid-pool, the queues using the port-class pool are forced into an operational MBS setting of 0, causing all packet to be discarded. A port-class pool can be made inactive (no available buffers) by executing **parent-mid-pool none** in the port-class pool context.

The **no** form of the command reverts to the class-pool parenting value. For the standard port-class pools, this default is 1. For alternate port-class pools the default is none.

Default alt-port-class-pools: none

std-port-class-pools: 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mid-pool-id* — Specifies the mid-pool identifier in the HS pool policy. Either a valid mid-pool ID or **none** must be specified when executing the **parent-mid-pool** command. The *mid-pool-id* parameter defines the parent mid-pool to which the port-class is associated. The **none** keyword deactivates the port-class pool, causing the pool to have a zero size. A queue can still map to an inactive port-class pool although all packets are discarded by the queue.

Values 1 to 16, none

Platforms 7750 SR-7/12/12e

20.45 parent-root-pool

parent-root-pool

Syntax **parent-root-pool** *root-pool-id*
no parent-root-pool

Context **[Tree]** (config>qos>hs-pool-policy>mid-tier>mid-pool parent-root-pool)

Full Context configure qos hs-pool-policy mid-tier mid-pool parent-root-pool

Description This command creates a buffer allocation mapping between the associated **mid-pool** *mid-pool-id* and the specified **parent-root-pool** *root-pool-id*. The specified root pool ID must have a non-zero allocation-weight or the command fails. After a mid-pool is successfully associated with a root-pool, the parent root-pool's **allocation-weight** value cannot be set to zero.

When the *root-pool-id* is set to **none**, no buffers are assigned to the mid-tier pool.

The **no** form of the command reverts to the default.

Default parent-root-pool 1

Parameters *root-pool-id* — Specifies the parent root pool to which the mid-pool is associated. This parameter is required when executing the **parent-root-pool** command.

Values 1 to 16, none

Platforms 7750 SR-7/12/12e

Full Context configure router dhcp local-dhcp-server failover partner-down-delay
configure router dhcp local-dhcp-server pool failover partner-down-delay
configure router dhcp6 local-dhcp-server failover partner-down-delay
configure router dhcp6 local-dhcp-server pool failover partner-down-delay
configure service vprn dhcp local-dhcp-server failover partner-down-delay
configure service vprn dhcp local-dhcp-server pool failover partner-down-delay
configure service vprn dhcp6 local-dhcp-server failover partner-down-delay
configure service vprn dhcp6 local-dhcp-server pool failover partner-down-delay

Description This command configures the partner down delay time. Since the DHCP lease synchronization failure can be caused by the failure of the intercommunication link (and not necessary the entire node), there is a possibility the redundant DHCP servers become isolated in the network. In other words, they can serve DHCP clients but they cannot synchronize the lease. This can lead to duplicate assignment of IP addresses, since the servers have configured overlapping IP address ranges but they are not aware of each other's leases.

The purpose of the partner down delay is to prevent the IP lease duplication during the intercommunication link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and to avoid duplication of IP addresses or prefixes during the failure.

During the partner-down-delay time, the prefix designated as remote is eligible only for renewals of the existing DHCP leases that have been synchronized by the peering node. Only after the sum of the partner-down-delay and the maximum-client-lead-time will the prefix designated as remote be eligible for delegation of the new DHCP leases. When this occurs, we say that the remote IP address range has been taken over.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

It is possible to expedite the takeover of a remote IP address range so that the new IP leases can start being delegated from that range shortly after the intercommunication failure is detected. This can be achieved by configuring the partner-down-delay timer to 0 seconds, along with enabling the ignore-mclt-on-takeover CLI flag. Caution must be taken before enabling this functionality. It is safe to bypass safety timers (partner-down-delay + MCLT) only in cases where the operator is certain that the intercommunication between the nodes has failed due to the entire node failure and not due to the intercommunication (MCS) link failure. Failed intercommunication due to the nodal failure would ensure that only one node is present in the network for IP address delegation (as opposed to two isolated nodes with overlapping IP address ranges where address duplication can occur). For this reason, the operator must ensure that there are redundant paths between the nodes to ensure uninterrupted synchronization of DHCP leases.

In access-driven mode of operation, partner-down-delay has no effect.

The **no** form of this command reverts to the default.

Default partner-down-delay hrs 23 min 59 sec 59

Parameters *partner-down-delay* — Specifies the partner down delay time.

Values

hrs *hours*	1 to 23
min *minutes*	1 to 59
sec *seconds*	0 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.50 passive

passive

Syntax [**no**] **passive**

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy passive)

Full Context configure subscriber-mgmt bgp-peering-policy passive

Description This command enables the passive mode for the BGP neighbors.

The **no** form of this command disables the passive mode.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

passive

Syntax [**no**] **passive**

Context **[Tree]** (config>service>vprn>bgp>group passive)
[Tree] (config>service>vprn>bgp>group>neighbor passive)

Full Context configure service vprn bgp group neighbor passive
configure service vprn bgp group passive

Description This command enables passive mode for the BGP group or neighbor.

When in passive mode, BGP will not attempt to actively connect to the configured BGP peers but responds only when it receives a connect open request from the peer.

The **no** form of this command used at the group level disables passive mode where BGP actively attempts to connect to its peers.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no passive — BGP will actively try to connect to all the configured peers.

Platforms All

20.51 passive-mode

passive-mode

Syntax [**no**] **passive-mode**

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-ep passive-mode)

Full Context configure redundancy multi-chassis peer mc-endpoint passive-mode

Description This command configures the passive mode behavior for the MC-EP protocol. When in passive mode the MC-EP pair will be dormant until two of the pseudowires in a MC-EP will be signaled as active by the remote PEs, being assumed that the remote pair is configured with regular MC-EP. As soon as more than one pseudowire is active, dormant MC-EP pair will activate. It will use the regular exchange to select the best pseudowire between the active ones and it will block the Rx and Tx directions of the other pseudowires.

The **no** form of this command will disable the passive mode behavior.

Default no passive-mode

password

Syntax **password** {**ignore** | **chap** *password* | **pap** *password*} [**hash** | **hash2** | **custom**]
no password

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host password)

Full Context configure subscriber-mgmt local-user-db ppp host password

Description This command specifies a password type or configures password string for **pap** or **chap**. The pap and chap passwords are stored in a hashed format in the config files. The **hash|hash2** optional keywords are used for config execution.

This command will only be interpreted if the local user database is connected directly to the PPPoE node under the VPRN/IES group interface. It is not used if the local user database is accessed by a local DHCP server.

The **no** form of this command reverts to the default.

Parameters **ignore** — Specifies that the password be ignored, in which case authentication is always succeed, independent of the password used by the PPPoE client. The client must still perform authentication.

chap *password* — Specifies that the password, up to 64 characters, for Challenge-Handshake Authentication Protocol) (CHAP) is used. Only a password received with the CHAP protocol is accepted.

pap *password* — Specifies that the Password Authentication Protocol (PAP) is used, up to 64 characters. Only a password received with the PAP protocol is accepted, even though the CHAP protocol is proposed to the client first because it is unknown at the time of the offer which password type is allowed to the client.

hash | hash2 — Specifies hashing scheme.

custom — Specifies the custom encryption to management interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn l2tp group l2tpv3 password
configure service vprn l2tp group password
configure service vprn l2tp group tunnel password
configure service vprn l2tp l2tpv3 password
configure service vprn l2tp password

Description This command configures the password between L2TP LAC and LNS

The **no** form of this command removes the password.

Default no password

Parameters *password* — Configures the password used for challenge/response calculation and AVP hiding. The maximum length is up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the hash2 keyword is specified.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

Description This command configures the password for the X1 and X2 interfaces.

The **no** form of this command reverts to the default.

Parameters *hex-string* — Specifies the password. Must contain exactly 32 hex nibbles.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

password

Syntax **password**

Context **[Tree]** (global password)

Full Context global password

Description This command changes a user's CLI login password.

When a user logs in after the administrator forces a **new-password-at-login,** or the password has expired (**aging**), then this command is automatically invoked.

When invoked, the user is prompted to enter the old password, the new password, and then the new password again to verify the correct input.

If a user fails to create a new password after the administrator forces a **new-password-at-login** or after the password has expired, the user is not allowed to access the CLI.

A user cannot configure a non-conformant password for themselves using the global **password** command. A password value that does not conform to the minimum-length or other password complexity rules can be configured using the **config>system>security>user>password** command (for example, by an administrator), but a warning is provided in the CLI. This allows, for example, an administrator to configure a non-conformant password for a user.

password

Syntax **password** [*password*]

Context **[Tree]** (config>system>security>user password)

Full Context configure system security user password

Description This command configures the user password for console and FTP access.

The password is stored in an encrypted format in the configuration file when specified. Passwords should be encased in double quotes (" ") at the time of the password creation. The double quote character (") is not accepted inside a password. It is interpreted as the start or stop delimiter of a string.

The password can be entered as plain text or a hashed value. SR OS can distinguish between hashed passwords and plain text passwords and take the appropriate action to store the password correctly.

```
config>system>security>user# password testuser1
```

The password is hashed by default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For example:

```
config>system>security# user testuser1
config>system>security>user$ password xyzabcd1
config>system>security>user# exit

config>system>security# info
------------------------------------
...
            user "testuser1"
                password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
            exit
...
------------------------------------
config>system>security#
```

The **password** command allows you also to enter the password as a hashed value.

For example:

```
config>system>security# user testuser1
config>system>security>user$ password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
config>system>security>user# exit
config>system>security# info
------------------------------------
...
user "testuser1"
password "$2y$10$pFoehOg/tCbBMPDJ/kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
exit
...
------------------------------------
config>system>security#
```

Parameters *password* — This is the password for the user that must be entered by this user during the login procedure. The minimum length of the password is determined by the **minimum-length** command. The maximum length can be up to 20 chars if unhashed, 32 characters if hashed. The complexity requirements for the password is determined by the **complexity-rules** command and must be followed; otherwise, the password will not be accepted.

All password special characters (#, $, spaces, and so on) must be enclosed within double quotes.

For example: config>system>security>user# password “south#bay?”

The question mark character (?) cannot be directly inserted as input during a telnet connection because the character is bound to the **help** command during a normal Telnet/console connection.

To insert a # or ? characters, they must be entered inside a notepad or clipboard program and then cut and pasted into the Telnet session in the password field that is encased in the double quotes as delimiters for the password.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If a **password** is entered without any parameters, a password length of zero is implied: (carriage return).

Platforms All

password

Syntax **password** *password* [**hash** | **hash2** | **custom**]
no password

Context **[Tree]** (bof password)

Full Context bof password

Description This command configures the password to access the BOF interactive menu at startup.

If a password is configured, the BOF interactive menu is accessible only when the correct password is entered. If the correct password is not entered in 30 s, the node reboots.

The **no** form of this command removes the configured password.

Default no password

Parameters *password* — Specifies the password.

If the **hash**, **hash2**, or **custom** parameter is not configured, the password is entered in plaintext and the password length must be between 8 and 32 characters. A plaintext password cannot contain embedded nulls or end with “ hash”, “ hash2”, or “ custom”.

If the **hash**, **hash2**, or **custom** parameter is configured, the password is hashed and the password length must be between 1 and 64 characters.

hash — Keyword to specify that the password is entered in an encrypted form.

hash2 — Keyword to specify that the password is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the password cannot be transferred between nodes.

custom — Keyword to specify that the password uses custom encryption.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.54 password-history

password-history

Syntax **password-history** {**user** *user-name* | **all**}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (admin>clear password-history)

Full Context admin clear password-history

Description This command is used to clear old passwords used by a specific user, or for all users.

Parameters *user-name* — Clears the password history information about the specified user, up to 32 characters.

all — Clears the password history information for all users.

Platforms All

20.55 pat-repetition

pat-repetition

Syntax **pat-repetition** [**tnc** *tnc-milli-seconds* **qos** *qos-milli-seconds* **poa** *poa-milli-seconds*]
no pat-repetition

Context [Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pat-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pat-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms pat-repetition)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pat-repetition
configure mcast-management multicast-info-policy bundle channel video analyzer alarms pat-repetition
configure mcast-management multicast-info-policy bundle video analyzer alarms pat-repetition

Description This command configures the analyzer to check for the program association table (PAT). It is expected that the PAT arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PAT fails to arrive within the specified interval. As the delay increases between two consecutive PATs, the type of alarm raised becomes more critical, from TNC to POA.

Default no pat-repetition

Parameters *tnc-milli-seconds* — Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 100 to 800 in multiples of 100 only

Default 100

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

qos-milli-seconds — Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 200 to 900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 200

poa-milli-seconds — Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PATs is greater than or equal to this configured value.

Values 300 to 1000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 500

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

20.56 pat-syntax

pat-syntax

Syntax [**no**] **pat-syntax**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pat-syntax)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pat-syntax)

20.57 path

path

Syntax **path xc-a** *lag-id* **xc-b** *lag-id*
path pxc *pxc-id*
no path

Context **[Tree]** (config>fwd-path-ext>fpe path)

Full Context configure fwd-path-ext fpe path

Description This command references a PXC (pair of PXC sub-ports) and consequently create an association between the PXC and the application which is referenced under the same FPE object. Each application will utilize the PXC in the form of an internal cross-connect. The exact use and internal provisioning of this cross-connect depends on the application itself.

The **no** form of this command removes the reference and association from the configuration.

Default no path

Parameters **xc-a** *lag-id* — Specifies the LAG identifier associated with one side of the cross-connect. The operator has the freedom to associate **xc-a** with LAG ID containing either sub-ports.a or sub-ports.b. In other words, the system does not perform automatic check that will ensure a match between **xc-a** and the LAG ID containing sub-ports.a.

Values 1 to 800

xc-b *lag-id* — Specifies the LAG identifier associated with one side of the cross-connect. The operator has the freedom to associate **xc-a** with LAG ID containing either sub-ports.a or sub-ports.b.

Values 1 to 800

pxc-id — Specifies the PXC identifier, the PXC construct that contains a physical port in a loopback mode that provides the cross-connect capability. The system creates two paired sub-ports on top of this physical port and each of these two sub-ports forwards traffic in one direction over the loopback. One sub-port is associated with the transit side of the loopback, while the other sub-port is associated with the termination side (see PXC Configuration Guides for further explanation).

Values 1 to 64

Platforms All

path

Syntax **path** *path-id* **pxc** *pxc-id*
path *path-id* **xc-a** *lag-id* **xc-b** *lag-id*

Use subject to Terms available at: www.nokia.com

no path *path-id*

Context **[Tree]** (config>fwd-path-ext>fpe>multi-path-list path)

Full Context configure fwd-path-ext fpe multi-path-list path

Description This command configures a multipath FPE forwarding path. A single path in a multipath FPE can contain a single PXC port or LAG of PXC ports.

The PXC references a physical port in loopback mode that provides the cross-connect capability. The system creates two paired subports on top of the physical port, each of which forwards traffic in one direction over the loopback. One subport is associated with the transit side of the loopback, while the other is associated with the termination side.

The **no** form of the command removes the path.

Parameters *path-id* — Specifies a path ID for the forwarding path.

Values 1 to 64

pxc-id — Specifies a dedicated PXC ID for the forwarding path.

Values 1 to 64

xc-a *lag-id* — Specifies the LAG ID associated with one side (transit or termination) of the cross-connect. The operator can associate **xc-a** with the LAG containing either subports.a or subports.b. The system does not enforce a match between **xc-a** and the LAG ID containing subports.a.

Values lag-[1 to 800]

xc-b *lag-id* — Specifies the LAG ID associated with the other side of the cross-connect (not designated for **xc-a**). The operator can associate **xc-b** with the LAG containing either subports.a or subports.b. The system does not enforce a match between **xc-b** and the LAG ID containing subports.b.

Values lag-[1 to 800]

Platforms All

path

Syntax [**no**] **path** [*sonet-sdh-index*]

Context **[Tree]** (config>port>sonet-sdh path)

Full Context configure port sonet-sdh path

Description This command defines the SONET/SDH path.

The **no** form of this command removes the specified SONET/SDH path.

This command is supported on TDM satellite.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default full channel (or clear channel)

Parameters *sonet-sdh-index* — Specifies the components making up the specified SONET/SDH path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path. The *sonet-sdh-index* differs for SONET and SDH ports.

Values sts192 (for the 7950 XRS only)
sts1-*x.x* (for the 7450 ESS and 7750 SR), tu3, vt2, vt15

SONET		SDH	
OC-192	STS-48-index	STM-64	AUG-16-index
	STS-12-index		AUG-4-index
	STS-3-index		AUG-1-index
	STS-1-index		AU-3-index
OC-48	STS-12-index	STM-16	AUG-4-index
	STS-3-index		AUG-1-index
	STS-1-index		AU-3-index
OC-12	STS-3-index	STM-4	AUG-1-index
	STS-1-index		AU-3-index
OC-3	STS-1-index	STM-1	AU-3-index

In addition the support of virtual tributary circuits adds an additional level of complexity and several addition levels of indexes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path

Syntax [**no**] **path** *path-index*

Context **[Tree]** (config>eth-tunnel path)

Full Context configure eth-tunnel path

Description This command configures one of the two paths supported under the Ethernet tunnel.

The **no** form of this command removes the path from under the Ethernet tunnel. If this is the last path, the associated SAP need to be unconfigured before the path can be deleted.

Default no path

Parameters **path-index** — Specifies the identifier for the path.

Values 1 to 16

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path

Syntax **path** *name*
no path

Context **[Tree]** (config>service>epipe>spoke-sdp-fec path)

Full Context configure service epipe spoke-sdp-fec path

Description This command specifies the explicit path, containing a list of S-PE hops, that should be used for this spoke SDP. The path-name should correspond to the name of an explicit path configured in the **config>service>pw-routing** context.

If no path is configured, then each next-hop of the MS-PW used by the spoke SDP will be chosen locally at each T-PE and S-PE.

Default no path

Parameters *name* — The name of the explicit path to be used, as configured under the **config>service>pw-routing** context.

Platforms All

path

Syntax **path** *path-index* **tag** *qtag*[.*qtag*]
no path *path-index*

Context **[Tree]** (config>service>epipe>sap>eth-tunnel path)
[Tree] (config>service>ipipe>sap>eth-tunnel path)

Full Context configure service epipe sap eth-tunnel path
configure service ipipe sap eth-tunnel path

Description This command configures Ethernet tunnel SAP path parameters.

The **no** form of this command removes the values from the configuration.

Parameters *path-index* — Specifies the path index value.

Values 1 to 16

qtag[.*qtag*] — Specifies the qtag value.

Values 0 to 4094 | *

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path

Syntax **path** *path-index* **tag** *qtag*[.*qtag*]
no path *path-index*

Context **[Tree]** (config>service>vpls>sap>eth-tunnel path)

Full Context configure service vpls sap eth-tunnel path

Description This command configures Ethernet tunnel SAP path parameters.

The **no** form of this command removes the values from the configuration.

Parameters *path-index* — Specifies the path index value.

Values 1 to 16

tag *qtag*[.*qtag*] — Specifies the qtag value.

Values 0 to 4094, * (wildcard)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path

Syntax **path** *path-name*
no path *path-name*

Context **[Tree]** (config>router>gmpls path)

Full Context configure router gmpls path

Description This command creates the path to be used for a GMPLS LSP. A path can be used by multiple GMPLS LSPs. A path can specify some or all hops from ingress to egress and they can be either strict or loose.

Paths are created in a **no shutdown** state. A path must be shut down before making any changes (adding or deleting hops) to the path. When a path is shut down, any GMPLS LSP using the path becomes operationally down.

The **no** form of this command deletes the path and all its associated configuration information. All the GMPLS LSPs that are currently using this path will be affected. A path must be shut down and unbound from all GMPLS LSPs using the path before it can be deleted. The **no path** *path-name* command will not result in any action except a warning message on the console indicating that the path may be in use.

Parameters *path-name* — Specifies a unique case-sensitive name label for the LSP path.

Values 32 characters maximum alphanumeric string

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path

Syntax [**no**] **path**

Context **[Tree]** (debug>router>gmpls>event path)

Full Context debug router gmpls event path

Description This command enables and disables debugging for GMPLS Path events.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path

Syntax **path** [**detail**]
no path

Context **[Tree]** (debug>router>gmpls>packet path)

Full Context debug router gmpls packet path

Description This command enables debugging for GMPLS Path packets.

The **no** form of the command disables debugging for GMPLS Path packets.

Parameters **detail** — Keyword to produce debug output in greater detail.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path

Syntax [**no**] **path** *path-name*

Context **[Tree]** (config>router>mpls path)

Full Context configure router mpls path

Description This command creates the path to be used for an LSP. A path can be used by multiple LSPs. A path can specify some or all hops from ingress to egress and they can be either **strict** or **loose**. A path can also be empty (no *path-name* specified) in which case the LSP is set up based on IGP (best effort) calculated shortest path to the egress router. Paths are created in a **shutdown** state. A path must be shutdown before making any changes (adding or deleting hops) to the path. When a path is shutdown, any LSP using the path becomes operationally down.

To create a strict path from the ingress to the egress router, the ingress and the egress routers must be included in the path statement.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes the path and all its associated configuration information. All the LSPs that are currently using this path will be affected. Additionally all the services that are actively using these LSPs will be affected. A path must be **shutdown** and unbound from all LSPs using the path before it can be deleted. The **no path** *path-name* command will not result in any action except a warning message on the console indicating that the path may be in use.

Parameters *path-name* — Specifies a unique case-sensitive alphanumeric name label for the LSP path up to 32 characters in length.

Platforms All

path

Syntax **path** [**detail**]
no path

Context **[Tree]** (debug>router>rsvp>event path)

Full Context debug router rsvp event path

Description This command debugs path-related events.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about path-related events.

Platforms All

path

Syntax **path** [**detail**]
no path

Context **[Tree]** (debug>router>rsvp>packet path)

Full Context debug router rsvp packet path

Description This command enables debugging for RSVP path packets.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about path-related events.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path

Syntax **path** *name* [**create**]
no path *name*

Context **[Tree]** (config>service>pw-routing path)

Full Context configure service pw-routing path

Description This command configures an explicit path between this T-PE and a remote T-PE. For each path, one or more intermediate S-PE hops must be configured. A path can be used by multiple multi-segment pseudowires. Paths are used by a 7450 ESS, 7750 SR, or 7950 XRS T-PE to populate the list of Explicit Route TLVs included in the signaling of a dynamic MS-PW.

A path may specify all or only some of the hops along the route to reach a T-PE.

The **no** form of the command removes a specified explicit path from the configuration.

Parameters *path-name* — Specifies a locally-unique case-sensitive alphanumeric name label for the MS-PW path of up to 32 characters in length.

Platforms All

path

Syntax **path** {**a** | **b**} [{*port-id* | *lag-id*} **raps-tag** *qtag1*[.*qtag2*]]
no path {**a** | **b**}

Context **[Tree]** (config>eth-ring path)

Full Context configure eth-ring path

Description This command assigns the ring (major or sub-ring) path to a port and defines the Ring APS tag. Rings typically have two paths: a and b.

The **no** form of this command removes the path a or b.

Default no path

Parameters *port-id* — Specifies the port ID.

Values *slot*/*mda*/*port*

lag-id — Specifies the LAG ID.

Values **lag** — Keyword.
id — Specifies the LAG ID number.

raps-tag — Specifies the member encapsulation.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

qtag1 — Specifies the top or outer VLAN ID.

Values 1 to 4094

qtag2 — Specifies the bottom or inner VLAN ID.

Values 1 to 4094

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path

Syntax **path** *path-name* [**create**]
no path *name*

Context **[Tree]** (config>system>telemetry>sensor-groups>sensor-group path)

Full Context configure system telemetry sensor-groups sensor-group path

Description This command configures a sensor path for the specified sensor-group. Multiple sensor paths can be defined for a single sensor-group. The path is defined in the form of an XML Path (XPath) syntax that refers to single or multiple objects within the YANG model.

The **no** form of the command removes the specified explicit path from the configuration.

Parameters *path-name* — Specifies a sensor path, up to 512 characters.

create — Keyword used to create the sensor path.

Platforms All

20.58 path-b

path-b

Syntax [**no**] **path-b**

Context **[Tree]** (config>redundancy>mc>peer>mcr>ring path-b)

Full Context configure redundancy multi-chassis peer mc-ring ring path-b

Description This command specifies the set of upper-VLAN IDs associated with the SAPs that belong to path B with respect to load-sharing. All other SAPs belong to path A.

Default If not specified, the default is an empty set.

20.59 path-computation-method

path-computation-method

Syntax **path-computation-method** *path-computation-method*
no path-computation-method

Context **[Tree]** (config>router>mpls>lsp path-computation-method)
[Tree] (config>router>mpls>lsp-template path-computation-method)

Full Context configure router mpls lsp path-computation-method
configure router mpls lsp-template path-computation-method

Description This command configures the path computation method of a RSVP-TE or SR-TE LSP.

The user can select among the **hop-to-label** translation, the local CSPF or the PCE for a configured SR-TE LSP. For SR-TE LSP templates, the PCE option is supported with the SR-TE LSP template type **on-demand-p2p-srte** and not other template types.

The user can select among the IGP-based path, the local CSPF, or the PCE for a configured RSVP-TE LSP. The PCE option is not supported with the RSVP-TE LSP template.

By default, the IGP-based path is used for an RSVP-TE LSP and the **hop-to-label** path computation method is used for an SR-TE LSP.

The **no** form of this command returns to the default path computation method for the type of LSP.

Default no path-computation-method

Parameters *path-computation-method* — Specifies the path computation method for the LSP.

Values local-cspf — Selects the local router CSPF for path computation.
pce — Selects the PCE for path computation.

Platforms All

20.60 path-cost

path-cost

Syntax **path-cost** *sap-path-cost*
no path-cost [*sap-path-cost*]

Context **[Tree]** (config>service>vpls>sap>stp path-cost)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>template>vpls-sap-template>stp path-cost)
[Tree] (config>service>vpls>spoke-sdp>stp path-cost)

Full Context configure service template vpls-sap-template stp path-cost
configure service vpls sap stp path-cost
configure service vpls spoke-sdp stp path-cost

Description This command configures the Spanning Tree Protocol (STP) path cost for the SAP or spoke-SDP.

The path cost is used by STP to calculate the path cost to the root bridge. The path cost in BPDUs received on the root port is incremented with the configured path cost for that SAP or spoke-SDP. When BPDUs are sent out of other egress SAPs or spoke-SDPs, the newly calculated root path cost is used. These are the values used for CIST when running MSTP.

STP suggests that the path cost is defined as a function of the link bandwidth. Since SAPs and spoke-SDPs are controlled by complex queuing dynamics, in the 7450 ESS, 7750 SR, and 7950 XRS the STP path cost is a purely static configuration.

The **no** form of this command returns the path cost to the default value.

Parameters *path-cost* — The path cost for the SAP or spoke-SDP

Values 1 to 200000000 (1 is the lowest cost)

Default 10

Platforms All

Use subject to Terms available at: www.nokia.com

20.62 path-discovery

path-discovery

Syntax **path-discovery**

Context **[Tree]** (config>test-oam>ldp-treetrace path-discovery)

Full Context configure test-oam ldp-treetrace path-discovery

Description This command creates the context to configure the LDP ECMP OAM path discovery.

The ingress LER builds the ECMP tree for a given FEC (egress LER) by sending LSP Trace messages and including the LDP IPv4 Prefix FEC TLV as well as the downstream mapping TLV. It inserts an IP address range drawn from the 127/8 space. When received by the downstream LSR, it uses this range to determine which ECMP path is exercised by any IP address or a sub-range of addresses within that range based on its internal hash routine. When the MPLS Echo reply is received by the ingress LER, it records this information and proceeds with the next echo request message targeted for a node downstream of the first LSR node along one of the ECMP paths. The sub-range of IP addresses indicated in the initial reply is used since the objective is to have the LSR downstream of the ingress LER pass this message to its downstream node along the first ECMP path.

The user configures the frequency of running the tree discovery using the command **config>test-oam>ldp-treetrace>path-discovery>interval**.

The ingress LER gets the list of FECs from the LDP FEC database. New FECs are added to the discovery list at the next tree discovery and not when they are learned and added into the FEC database. The maximum number of FECs to be discovered with the tree building feature is limited to 500. The user can configure FECs to include or exclude using a policy profile by applying the command **config>test-oam>ldp-treetrace>path-discovery>policy-statement**.

Context **[Tree]** (config>router>mpls>mpls-tp>transit-path path-id)

Full Context configure router mpls mpls-tp transit-path path-id

Description This command configures path ID for an MPLS-TP transit path at an LSR. The path ID is equivalent to the MPLS-TP LSP ID and is used to generate the maintenance entity group intermediate point (MIP) identifier for the LSP at the LSR. A path-id must be configured for on-demand OAM to verify an LSP at the LSR.

The path-id must contain at least the following parameters: **lsp-num, src-node-id, src-global-id, src-tunnel-num, dest-node-id**.

The path-id must be unique on a node. It is recommended that his is also configured to be a globally unique value.

The **no** form of this command removes the path ID from the configuration.

Default no path-id

Parameters *lsp-num* — Specifies the LSP number.

Values 1 to 65535, or **working path**, or **protect-path**. A **working-path** is equivalent to an lsp-num of 1, and a **protect-path** is an lsp-num of 2.

src-global-id — Specifies the source global ID.

Values 0 to 4294967295

src-node-id — Specifies the source node ID.

Values a.b.c.d or 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

src-tunnel-num — Specifies the source tunnel number.

Values 1 to 61440

dest-global-id — Specifies the destination global ID. If the destination global ID is not entered, then it is set to the same value as the source global ID.

Values 0 to 4294967295

dest-node-id — Specifies the destination node ID.

Values a.b.c.d or 1 to 4294967295

dest-tunnel-num — Specifies the destination tunnel number. If the destination tunnel number is not entered, then it is set to the same value as the source tunnel number.

Values 1 to 61440

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.65 path-mtu

path-mtu

Syntax **path-mtu** [*bytes*]
no path-mtu *bytes*

Context **[Tree]** (config>service>sdp path-mtu)

Full Context configure service sdp path-mtu

Description This command configures the Maximum Transmission Unit (MTU) in bytes that the Service Distribution Point (SDP) can transmit to the far-end device router without packet dropping or IP fragmentation overriding the SDP-type default path-mtu.

The default SDP-type **path-mtu** can be overridden on a per SDP basis. Dynamic maintenance protocols on the SDP like RSVP may override this setting.

If the physical **mtu** on an egress interface or PoS channel indicates the next hop on an SDP path cannot support the current **path-mtu**, the operational **path-mtu** on that SDP will be modified to a value that can be transmitted without fragmentation.

The **no** form of this command removes any **path-mtu** defined on the SDP and the SDP will use the system default for the SDP type.

Default no path-mtu — Specifies the default path-mtu defined on the system for the type of SDP is used.

Parameters *bytes* — Specifies the bytes.

Values 576 to 9800

Use subject to Terms available at: www.nokia.com

Platforms All

20.66 path-mtu-discovery

path-mtu-discovery

Syntax [**no**] **path-mtu-discovery**

Context **[Tree]** (config>router>ldp>tcp-session-params>peer-transport path-mtu-discovery)

Full Context configure router ldp tcp-session-parameters peer-transport path-mtu-discovery

Description This command enables Path MTU discovery for the associated TCP connections. When enabled, the MTU for the associated TCP session is initially set to the egress interface MTU. The DF bit is also set so that if a router along the path of the TCP connection cannot handle a packet of a particular size without fragmenting, it sends back an ICMP message to set the path MTU for the given session to a lower value that can be forwarded without fragmenting.

If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR-ID value, the user must add each of the transport addresses to the path MTU discovery configuration as a separate peer. This means when the TCP connection is bootstrapped by a given Hello adjacency, the path MTU discovery can operate over that specific TCP connection by using its specific transport address.

Default no path-mtu-discovery

Platforms All

path-mtu-discovery

Syntax [**no**] **path-mtu-discovery**

Context **[Tree]** (config>router>bgp path-mtu-discovery)
[Tree] (config>router>bgp>group path-mtu-discovery)
[Tree] (config>router>bgp>group>neighbor path-mtu-discovery)

Full Context configure router bgp group neighbor path-mtu-discovery
configure router bgp group path-mtu-discovery
configure router bgp path-mtu-discovery

Description This command enables Path MTU Discovery (PMTUD) for the associated TCP connections.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When enabled, PMTUD is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint.

When PMTUD is disabled and there is no **tcp-mss** configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration), the router advertises a TCP MSS option of only 1024 bytes, limiting received TCP segments to that size.

The **no** form of this command disables PMTUD.

Default no path-mtu-discovery

Platforms All

20.67 path-preference

path-preference

Syntax **path-preference** *value*
no path-preference

Context **[Tree]** (config>router>mpls>lsp>secondary path-preference)

Full Context configure router mpls lsp secondary path-preference

Description This command enables the use of path preference among configured standby secondary paths per LSP. If all standby secondary paths have a default path-preference value then a non-standby secondary path will remain the active path while a standby secondary is available. A standby secondary path configured with the highest priority (for example, the lowest path-preference value) is made the active path when the primary is not in use. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the highest up-time. Path preference can only be configured on the standby secondary paths.

The **no** form of this command resets the path-preference to the default value.

Default path-preference 255

Parameters *value* — Specifies an alternate path for the LSP if the primary path is not available.

Values 1 to 255

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.68 path-probing

path-probing

Syntax **path-probing**

Context **[Tree]** (config>test-oam>ldp-treetrace path-probing)

Full Context configure test-oam ldp-treetrace path-probing

Description This command creates the context to configure the LDP tree trace path probing phase.

The periodic path exercising runs in the background to test the LDP ECMP paths discovered by the path discovery capability. The probe used is an LSP Ping message with an IP address drawn from the sub-range of 127/8 addresses indicated by the output of the tree discovery for this FEC.

The user configures the frequency of running the path probes using the **config>test-oam>ldp-treetrace>path-probing>interval** command. If an I/F is down on the ingress LER performing the LDP tree trace, then LSP Ping probes that normally go out this interface are not sent but the ingress LER node does not raise alarms.

The LSP Ping routine updates the content of the MPLS echo request message, specifically the IP address, as soon as the LDP ECMP path discovery phase has output the results of a new computation for the path in question.

Platforms All

20.69 path-profile

path-profile

Syntax **path-profile** *profile-id* [**path-group** *group-id*]
no path-profile *profile-id*

Context **[Tree]** (config>router>mpls>lsp path-profile)
[Tree] (config>router>mpls>lsp-template path-profile)

Full Context configure router mpls lsp path-profile
configure router mpls lsp-template path-profile

Description This command configures the PCE path profile and path group ID.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The PCE supports the computation of disjoint paths for two different LSPs originating and/or terminating on the same or different PE routers. To indicate this constraint to the PCE, the user must configure the PCE path profile ID and path group ID to which the PCE computed or PCE controlled LSP belongs to. These parameters are passed transparently by the PCC to the PCE and are thus opaque data to the router.

The association of the optional path-group ID is to allow the PCE to determine the profile ID that must be used with this path-group ID. One path-group ID is allowed per profile ID. The user can, however, enter the same path-group ID with multiple profile IDs by executing this command multiple times. A maximum of five **path-profile** [**path-group**] entries can be associated with the same LSP.

The **no** form of this command removes the path profile association with the LSP.

Parameters *profile-id* — Specifies the profile ID.

Values 1 to 4294967295

path-group *group-id* — Specifies the path group ID.

Values 0 to 4294967295

Platforms All

20.70 path-restoration-time

path-restoration-time

Syntax **path-restoration-time** *minutes*
no path-restoration-time

Context **[Tree]** (config>subscr-mgmt>pfcp-association path-restoration-time)

Full Context configure subscriber-mgmt pfcp-association path-restoration-time

Description This command configures the time sessions are kept after a PFCP path failure is detected. When the timer expires, or if it is not configured, all sessions associated with the path are removed. If the path recovers without a restart before the timer expires, the timer is canceled, and no sessions are removed.

The **no** form of this command removes the path restoration configuration.

Default no path-restoration-time

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *minutes* — Specifies the time, in minutes, that sessions are kept after a PFCP path failure. This timer should be configured to a value that is at least twice the sum of the **heartbeat interval** plus the total heartbeat timeout (heartbeat retries x heartbeat timeout = N1 x T1).

Values 5 to 1440

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.71 path-threshold

path-threshold

Syntax **path-threshold** *num-paths*
no path-threshold

Context **[Tree]** (config>eth-tunnel>lag-emulation path-threshold)

Full Context configure eth-tunnel lag-emulation path-threshold

Description This command configures the behavior for the eth-tunnel if the number of operational members is equal to or below a threshold level

Default no path-threshold

Parameters *num-paths* — Specifies the threshold for the Ethernet Tunnel group.

Values 0 to 15

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.72 path-type

path-type

Syntax **path-type** {**ibgp** | **ebgp**}
no path-type

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from path-type)

Full Context configure router policy-options policy-statement entry from path-type

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command matches BGP routes based on their path type (EBGP or IBGP). A route learned from an EBGP peer has path-type **ebgp**. A route learned from an IBGP or confed-EBGP peer has path-type **ibgp**.

A non-BGP route does not match a policy entry if it contains the **path-type** command.

Default no path-type

Parameters **ibgp** — Matches routes from internal BGP peers.

ebgp — Matches routes from external BGP peers.

Platforms All

20.73 patherr

patherr

Syntax **patherr** [**detail**]
no patherr

Context **[Tree]** (debug>router>gmpls>packet patherr)

Full Context debug router gmpls packet patherr

Description This command enables debugging for GMPLS PathErr packets.

The **no** form of the command disables debugging for GMPLS PathErr packets.

Parameters **detail** — Keyword to produce debug output in greater detail.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

patherr

Syntax **patherr** [**detail**]
no patherr

Context **[Tree]** (debug>router>rsvp>packet patherr)

Full Context debug router rsvp packet patherr

Description This command debugs path error packets.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about path error packets.

20.75 pattern

pattern

Syntax **pattern** *pad-value*
no pattern

Context **[Tree]** (config>oam-pm>session>ip pattern)

Full Context configure oam-pm session ip pattern

Description This command configures the pattern value to be repeated in the padding portion of the TWAMP Light packet.

The **no** form of this command uses an incrementing byte pattern beginning with 00 and ending with FF, wrapping back to 00.

Default pattern 0

Parameters *pad-value* — Specifies the specific pattern to use.

Values 0 to 65535

Default 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pattern

Syntax **pattern** *pad-value*
no pattern

Context **[Tree]** (config>oam-pm>session>mpls pattern)

Full Context configure oam-pm session mpls pattern

Description This command configures the pattern value to be repeated in the padding portion of pad-tlv length field of the dm PDU.

The **no** form of this command uses an incrementing byte pattern beginning with 00 and ending with FF, wrapping back to 00.

Parameters *pad-value* — Specifies a two octet pattern to be repeated to fill the padding field of each echo request packet launched for each test belonging to the specified session. For example, if 255 is specified, the padding field is filled with the octet values 00, FF, 00, FF, ... (hexadecimal).

Values 0 to 65535

Default 0

20.76 payload

payload

Syntax **payload** {**sts3** | **tug3** | **ds3** | **e3** | **vt2** | **vt15** | **ds1** | **e1**}

Context **[Tree]** (config>port>sonet-sdh>path payload)

Full Context configure port sonet-sdh path payload

Description This command specifies if the associated SONET/SDH path is an asynchronous circuit or a virtual tributary group (VT). This command is only applicable to channelized MDAs.

This command is supported on TDM satellite, however the sts3, ds3, and e3 parameters are not supported.

Parameters **sts3** — Configures STS3/STM1 payload as clear channel.

tu3 — Configures STS3/STM1 payload as Tributary Unit Group 3 (TUG3).

ds3 — Configures the port or channel as DS-3 STS1/VC3 payload as DS-3.

e3 — Configures the port or channel as E-3 STS1/VC3 payload as E-3.

vt2 — Configures the path STS1 payload as vt2 as a virtual tributary group. Only allowed on STS-1 nodes (SONET VT container).

vt15 — Configures the path as a virtual tributary group. Only allowed on STS-1 nodes (SONET VT container).

ds1 — Configures the port or channel as DS1.vt15 or vt2 payload as DS-1.

e1 — Configures VT2 payload as E-1.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.77 pbb

pbb

[Tree] (config>filter>ipv6-filter>entry pbr-down-action-override)
[Tree] (config>filter>mac-filter>entry pbr-down-action-override)

Full Context configure filter ip-filter entry pbr-down-action-override
configure filter ipv6-filter entry pbr-down-action-override
configure filter mac-filter entry pbr-down-action-override

Description This command allows overriding the default action that is applied for entries with PBR/PBF action defined, when the PBR/PBF target is down.

The **no** form of the command preserves default behavior when PBR/PBF target is down.

Default no pbr-down-action-override

Parameters *filter-action* — Specifies the packets matching the entry.

drop — Specifies that packets matching the entry will be dropped if PBR/PBF target is down.

forward — Specifies that packets matching the entry will be forwarded if PBR/PBF target is down.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

filter-default-action — Specifies that packets matching the entry will be processed as per **default-action** configuration for this filter if PBR/PBF target is down.

Context **[Tree]** (config>router>mpls>lsp pce-control)
[Tree] (config>router>mpls>lsp-template pce-control)

Full Context configure router mpls lsp pce-control
configure router mpls lsp-template pce-control

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables a PCE controlled LSP mode of operation. The **pce-control** option means the router delegates full control of the LSP to the PCE (PCE controlled). Enabling it means the PCE is acting in stateful-active mode for this LSP and the PCE will be able to reroute the path following a failure or re-optimize the path and update the router without a request from the router.

The user can delegate CSPF and non-CSPF LSPs, or LSPs that have the **path-computation-method pce** option enabled or disabled. The LSP maintains its latest active path computed by PCE or the router at the time it is delegated. The PCE only makes an update to the path at the next network event or reoptimization.

When configured to no, the PCE controlled mode of operation for the LSP has not effect.

Default no pce-control

Platforms All

20.83 pce-initiated-lsp

pce-initiated-lsp

Syntax [**no**] **pce-initiated-lsp**

Context **[Tree]** (config>router>mpls pce-initiated-lsp)

Description This command creates a context to configure support for PCE-initiated LSPs.

The **no** form of this command removes PCE-initiated LSP support. All PCE-initiated LSPs are deleted.

Platforms All

20.84 pce-report

pce-report

Syntax **pce-report rsvp-te** {**enable** | **disable**}
pce-report sr-te {**enable** | **disable**}

Context **[Tree]** (config>router>mpls pce-report)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router mpls pce-report

Description This command separately configures the reporting modes to a PCE for RSVP-TE or SR-TE LSPs. The PCC LSP database is synchronized with the PCE LSP database using the PCEP PCRpt (PCE Report) message for PCC-controlled, PCE-computed, and PCE-controlled LSPs.

The global MPLS level **pce-report** command can be used to enable or disable PCE reporting for all SR-TE LSPs or RSVP-TE LSPs during PCE LSP database synchronization. This configuration is inherited by all LSPs of the specified type. The PCC reports both CSPF and non-CSPF LSPs. The default value is disabled for both types of LSP. This default value is meant to control the introduction of the PCE into an existing network and to let the operator decide if all LSPs of a particular type need to be reported.

The LSP-level **pce-report** command overrides the global configuration for the reporting of LSPs to the PCE. The default value is to inherit the global MPLS level value. The **enable** or **disable** value allows for the override of the inherited value. The **inherit** value explicitly resets the LSP to inherit the global configuration for that LSP type.

If PCE reporting is disabled for the LSP, either due to inheritance or due to LSP-level configuration, then enabling the **pce-control** option for the LSP has no effect.

Default pce-report rsvp-te disable

pce-report sr-te disable

Parameters **rsvp-te** — Specifies the PCE reporting mode for all TE LSPs of RSVP-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of RSVP-TE type
disable — disables PCE reporting for all TE LSPs of RSVP-TE type

sr-te — Specifies the PCE reporting mode for all TE LSPs of SR-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of SR-TE type
disable — disables PCE reporting for all TE LSPs of SR-TE type

Platforms All

pce-report

Syntax **pce-report** {**enable** | **disable** | **inherit**}

Context **[Tree]** (config>router>mpls>lsp pce-report)
[Tree] (config>router>mpls>lsp-template pce-report)

Full Context configure router mpls lsp pce-report
configure router mpls lsp-template pce-report

Description This command separately configures the reporting modes to a PCE for RSVP-TE or SR-TE LSPs.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The PCC LSP database is synchronized with the PCE LSP database using the PCEP PCRpt (PCE Report) message for PCC-controlled, PCE-computed and PCE-controlled LSPs.

The global MPLS-level **pce-report** command can be used to enable or disable PCE reporting for all SR-TE LSPs or RSVP-TE LSPs during PCE LSP database synchronization. This configuration is inherited by all LSPs of the specified type. The PCC reports both CSPF and non-CSPF LSPs. The default value is disabled for both types of LSP. This default value is meant to control the introduction of the PCE into an existing network and to let the operator decide if all LSPs of a particular type need to be reported.

The LSP-level **pce-report** command overrides the global configuration for the reporting of LSP to the PCE. The default value is to inherit the global MPLS level value. The **enable** or **disable** value allows for the override of the inherited value. The **inherit** value explicitly resets the LSP to inherit the global configuration for that LSP type.

If PCE reporting is disabled for the LSP, either due to inheritance or due to LSP-level configuration, then enabling the **pce-control** option for the LSP has no effect.

Default pce-report inherit

Parameters **enable** — Enables PCE reporting.

disable — Disables PCE reporting.

inherit — Inherits the global configuration for PCE reporting.

Platforms All

20.85 pcep

pcep

Syntax [**no**] **pcep**

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pcp-server

Syntax **pcp-server** *name*

Context **[Tree]** (debug>router>pcp pcp-server)

Full Context debug router pcp pcp-server

Description This command enables debugging for the PCP servers.

Parameters *name* — Debugs the PCP server associated with the specified name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.89 pcp-server-policy

pcp-server-policy

Syntax **pcp-server-policy** *name* [**create**]
no pcp-server-policy *name*

Context **[Tree]** (config>service>nat pcp-server-policy)

Full Context configure service nat pcp-server-policy

Description This command configures a PCP server policy name.

The **no** form of the command removes the name from the configuration.

Parameters *name* — Specifies a PCP server policy name up to 32 characters.

create — Keyword used to create the PCP server policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pcp-server-policy

Syntax **pcp-server-policy** *name*
no pcp-server-policy

Context **[Tree]** (config>router>pcp-server>server pcp-server-policy)

Full Context configure router pcp-server server pcp-server-policy

Description This command configures the PCP server policy.

The **no** form of this command reverts to the default value.

Default no pcp-server-policy

Parameters *name* — Specifies the PCP server policy name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.90 pcr-repetition

pcr-repetition

Syntax **pcr-repetition** [**tnc** *tnc-milli-seconds* **qos** *qos-milli-seconds* **poa** *poa-milli-seconds*]
no pcr-repetition

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pcr-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pcr-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms pcr-repetition)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pcr-repetition
configure mcast-management multicast-info-policy bundle channel video analyzer alarms pcr-repetition
configure mcast-management multicast-info-policy bundle video analyzer alarms pcr-repetition

Description This command configures the analyzer to check for the program clock reference (PCR). It is expected that the PCR arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PCR fails to arrive within the specified interval. As the delay increases between two consecutive PCRs, the type of alarm raised becomes more critical, from TNC to POA.

Default no pcr-repetition

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *tnc-milli-seconds* — Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 100 to 800 in multiples of 100 only

Default 100

qos-milli-seconds — Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 200 to 900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 200

poa-milli-seconds — Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PCRs is greater than or equal to this configured value.

Values 300 to 1000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 500

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

20.91 pd-managed-route

pd-managed-route

Syntax **pd-managed-route** [**next-hop** {**ipv4** | **ipv6**}]
no pd-managed-route

Context **[Tree]** (config>service>vprn>sub-if>ipv6>dhcp6 pd-managed-route)
[Tree] (config>service>ies>sub-if>ipv6>dhcp6 pd-managed-route)

configure service vprn subscriber-interface group-interface ipv6 dhcp6 pd-managed-route
configure service vprn subscriber-interface ipv6 dhcp6 pd-managed-route

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables DHCP IA-PD (delegated prefix) to be modeled as managed (framed) route instead of as a subscriber-host. Antispoof filtering for the subscriber host associated with the IA-PD route must be set to **nh-mac**. The subscriber specific parameters (such as **sla-profile** or **sub-profile**) are ignored during the authentication phase because IA-PD is not modeled as a subscriber host. Other subscriber host-specific functions (for example, host overrides via CoA or host accounting) are not possible with a PD as the managed route.

By default, or when configured with the **next-hop ipv6** parameter, the next-hop for PD managed route is an IPv6 WAN sub-host (DHCP IA-NA or SLAAC) with the same mac address as the one in the DHCP lease state for the managed IA-PD. The DHCP IA-NA next-hop host will always override the SLAAC next-hop host if both are available. If the IPv6 next-hop is not present when the framed IA-PD is instantiated, the IA-PD is set up but the PD managed route will not be installed in the IPv6 route table and the DHCPv6 lease state for the IA-PD will have the managed route status (DHCP6 MRt Status) set to “noNextHop”.

When configured with the **next-hop ipv4** parameter the next-hop for PD managed route is a DHCPv4 sub-host that belongs to the same IPoE session or PPPoE session. For IPoE, **ipoe-session** must be enabled on the group-interface. If **ipoe-session** is disabled, an IPv4 next-hop will not be found. If the IPv4 next-hop is not found or not present at the time when the framed IA-PD is instantiated, the IA-PD is set up but the PD managed route is not installed in the IPv6 route table. In this case, the DHCPv6 lease state for the IA-PD will have the managed route status (DHCP6 MRt Status) set to noNextHop.

Note: IPv6 filters, QoS IPv6 criteria, and IPv6 multicast are not supported for DHCPv6 IA-PD as managed route pointing to an IPv4 subscriber host as next-hop.

The DHCP IA-PD modeled as a route is displayed differently than regular subscriber hosts in **show** commands related to subscriber host state. The PD managed route is always shown directly below the host it is using as the next hop. The forwarding status of the PD managed route is also shown, where (N) indicate that the PD managed route is not forwarding. In addition, DHCP IA-PD route is displayed as a managed route for the corresponding IPv6 subscriber host (DHCP IA-NA or SLAAC) or DHCPv4 subscriber host.

DHCP IA-PD information for managed IA-PD route is still maintained in the DHCPv6 lease state.

The **no** form of this command reverts to the default.

Parameters **next-hop** — Specifies the next-hop type for the DHCP IA-PD managed route

Values **ipv4** - The next-hop for PD managed route is a DHCPv4 sub-host that belongs to the same IPoE session (based on the IPoE session key which is **sap-mac** by default). IPoE session must be enabled on the group-interface.

ipv6 - The next-hop for PD managed route is an IPv6 WAN sub-host (DHCP IA-NA or SLAAC) with the same MAC address as the one in the DHCP lease state for the managed IA-PD. This is the default when no next-hop is specified.

20.92 pdn-connection-id

pdn-connection-id

Syntax [**no**] **pdn-connection-id**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp pdn-connection-id)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp pdn-connection-id

Description This command enables the inclusion of the PDN-Connection-Id AVP, which contains the APN as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.93 pdn-type

pdn-type

Syntax **pdn-type** {**ipv4** | **ipv6** | **ipv4v6**}
no pdn-type

Context **[Tree]** (config>router>gtp>uplink pdn-type)
[Tree] (config>service>vprn>gtp>uplink pdn-type)

Full Context configure router gtp uplink pdn-type
configure service vprn gtp uplink pdn-type

Description This command configures the PDP type to be signaled in GTP, determining which addresses are requested from the P-GW/GGSN and which hosts are set up afterwards. This can be overridden by RADIUS. If the **ipv4v6** keyword is used, the P-GW/GGSN can fall back to either IPv4 or IPv6.

The **no** form of this command reverts to the default configuration.

Default pdn-type ipv4

Parameters **ipv4** — Specifies the GTP connection requests an IPv4 address.

ipv6 — Specifies the GTP connection requests an IPv6 address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4v6 — Specifies the GTP connection requests both an IPv4 and an IPv6 address.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.94 pdp-context-type

pdp-context-type

Syntax [**no**] **pdp-context-type**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gy>avp pdp-context-type)

Full Context configure subscriber-mgmt diameter-application-policy gy include-avp pdp-context-type

Description This command includes the [3GPP-1247] PDP-Context-Type AVP in Diameter DCCA CCR-Initial messages.

The **no** form of this command removes the PDP-Context-Type AVP from the Diameter DCCA CCR-Initial messages.

Default pdp-context-type

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.95 pe-id-mac-flush-interop

pe-id-mac-flush-interop

Syntax [**no**] **pe-id-mac-flush-interop**

Context **[Tree]** (config>router>ldp>session-params>peer pe-id-mac-flush-interop)

Full Context configure router ldp session-parameters peer pe-id-mac-flush-interop

Description This command enables the addition of the PE-ID TLV in the LDP MAC withdrawal (mac-flush) message, under certain conditions, and modifies the mac-flush behavior for interoperability with other vendors that do not support the flush-all-from-me vendor-specific TLV. This flag can be enabled on a per LDP peer basis and allows the flush-all-from-me interoperability with other vendors. When the pe-id-mac-flush-interop flag is enabled for a given peer, the current mac-flush behavior is modified in terms of mac-flush generation, mac-flush propagation and behavior upon receiving a mac-flush.

The mac-flush generation will be changed depending on the type of event and according to the following rules:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Any all-from-me mac-flush event will trigger a mac-flush all-but-mine message (RFC 4762 compliant format) with the addition of a PE-ID TLV. The PE-ID TLV contains the IP address of the sending PE.
- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITHOUT the addition of the PE-ID TLV, as long as the source spoke SDP is not part of an end-point.
- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITH the addition of the PE-ID TLV, if the source spoke SDP is part of an end-point and the spoke-sdp goes from down/standby state to active state. In this case, the PE-ID TLV will contain the IP address of the PE to which the previous active spoke-sdp was connected to.

Any other case will follow the existing mac-flush procedures.

When the pe-id-mac-flush-interop flag is enabled for a given LDP peer, the mac-flush ingress processing is modified according to the following rules:

- Any received all-from-me mac-flush will follow the existing mac-flush all-from-me rules regardless of the existence of the PE-ID.
- Any received all-but-mine mac-flush will take into account the received PE-ID, that is all the mac addresses associated to the PE-ID will be flushed. If the PE-ID is not included, the mac addresses associated to the sending PE will be flushed.
- Any other case will follow the existing mac-flush procedures.

When a mac-flush message has to be propagated (for an ingress sdp-binding to an egress sdp-binding) and the pe-id-mac-flush-interop flag is enabled for the ingress and egress TLDP peers, the following behavior is observed:

- If the ingress and egress bindings are spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- If the ingress binding is an spoke SDP and the egress binding a mesh SDP, the PE will propagate the mac-flush message without modifying the PE-ID included in the PE-ID TLV.
- If the ingress binding is a mesh SDP and the egress binding an spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- When ingress and egress bindings are mesh-sdp, the mac-flush message is never propagated. This is the behavior regardless of the pe-id-mac-flush-interop flag configuration.

The PE-ID TLV is never added when generating a mac-flush message on a B-VPLS if the **send-bvpls-flush** command is enabled in the I-VPLS. In the same way, no PE-ID is added when propagating mac-flush from a B-VPLS to a I-VPLS when the **propagate-mac-flush-from-bvpls** command is enabled. Mac-flush messages for peers within the same I-VPLS or within the same B-VPLS domain follow the procedures described above.

Default no pe-id-mac-flush-interop

20.96 peak-rate

peak-rate

Syntax **peak-rate** *rate*
no peak-rate

Context **[Tree]** (config>router>policy-acct-template>policer peak-rate)

Full Context configure router policy-acct-template policer peak-rate

Description This command sets the peak rate (the fill or drain rate of the bucket).

Each policer has a peak information rate and a maximum burst size. The default **peak-rate** (when no value is configured or the configured value is max) is the line rate of the ingress port.

The **no** form of this command reverts to the default value.

Default peak-rate max

Parameters *rate* — Specifies the peak rate in Kb/s

Values 1 to 6400000000, max

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

20.97 peer

configure router dhcp6 server pool failover peer
configure service vprn dhcp server peer
configure service vprn dhcp server pool peer
configure service vprn dhcp6 server peer
configure service vprn dhcp6 server pool peer

Description This command creates a sync tag. DHCP leases can be synchronized per DHCP server or DHCP pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. MCS link is a logical link (IP, or MPLS).

MCS runs over TCP, port 45067 and it is using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5sec, MCS will send its own keepalive to the peer. If a reply is **not** received within three sec, MCS will declare its operation state as DOWN and the DB Sync state as out-of-sync. MCS will consequently notify its clients (DHCP Server being one of them) of this. It can take up to three seconds before the DHCP client realizes that the inter-chassis communication link has failed.

The inter-chassis communication link failure does not necessarily assume the same failed fate for the access links. The two redundant nodes can become isolated from each other in the network. This occurs when only the intercommunication (MCS) link fails. It is important that this MCS link be highly redundant.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the peer.

Values

ipv4-address:	a.b.c.d	
:	x:ipv6-addressx:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

tag *sync-tag* — Specifies a tag, up to 32 characters, that identifies the synchronizing DHCP servers or pools.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax [**no**] **peer router** *router-instance* **address** *ip-address* [**udp-port** *port*]

Context **[Tree]** (debug>gtp peer)

Full Context debug gtp peer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command restricts debugging to only data related to the specified GTP peer. This command can be repeated multiple times, where only data for any of the specified peers is debugged.

The **no** form of this command removes the restriction for the specified peer. When the last peer filter is removed, all data is debugged again, but may be restricted by other filters.

Parameters *router-instance* — Specifies the ID of the VRF where the peer is connected.

Values

router-instance:	*router-name* | *vprn-svc-id*
router-name:	"Base"
vprn-svc-id	1 to 2147483647

ip-address — Specifies the IP address of the peer.

Values a.b.c.d

port — Specifies the GTP-C port used by the peer.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer** *ip-address*
no peer

Context **[Tree]** (config>router>l2tp>group>tunnel peer)
[Tree] (config>service>vprn>l2tp>group>tunnel peer)

Full Context configure router l2tp group tunnel peer
configure service vprn l2tp group tunnel peer

Description This command configures the peer address.

The **no** form of this command removes the IP address from the tunnel configuration.

Default no peer

Parameters *ip-address* — Sets the LNS IP address for the tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer** *ip-address* [**udp-port** *port*] [**ip**]

Context **[Tree]** (debug>router>l2tp peer)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug router l2tp peer

Description This command enables and configures debugging for an L2TP peer.

Parameters *ip-address* — Specifies the IP address of the L2TP peer.

port — Specifies the UDP port for the L2TP peer. This parameter is only supported with L2TPv2 peers.

ip — Displays debugging information for peers using IP transport.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer** *name* [**create**]
no peer name

Context **[Tree]** (config>aaa>diam-peer-plcy peer)

Full Context configure aaa diameter-peer-policy peer

Description This command creates context for diameter peer configuration. Up to five Diameter peers can be configured inside a **diameter-peer-policy**. Only the two peers with the highest preference in the peer table are considered for use (the primary and secondary). Other peers can be the Open state and merely run keepalives (watchdog-request or answer messages). After the primary peer fails, the secondary peer is used as long as the last transaction on it has succeeded (stickiness). Another peer in the Open state becomes secondary. Load balancing between peers is not supported.

This command is applicable only to legacy implementations of Diameter base in the SR OS.

The **no** form of this command reverts to the default.

Parameters *name* — Specifies the peer name, up to of 32 characters.

create — Keyword used to create the peer. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer index** *index* [*destination-host-string*][**create**]
no peer index *index*

Context **[Tree]** (config>aaa>diam>node peer)

Full Context configure aaa diameter node peer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates context for diameter peer configuration within a Diameter client node in SR OS. Up to five Diameter peers can be configured within a given Diameter client node.

This command is not applicable to legacy Diameter base.

The **no** form of this command removes the peer index information from the configuration.

Parameters *index* — Specifies the index of a peer. Index is used to break a tie if a Diameter route for a given host or realm destination points to multiple diameter peers with the same preference. In such scenario, the peer with the lowest index will be selected as next-hop in traffic forwarding.

Values 1 to 5

destination-host-string — Identifies the peer by its name, up to 80 characters (of type DiameterIdentity). This peer name must match the one in Origin-Host AVP received in Capability Exchange Answer message. In case of a mismatch, the TCP connection will be terminated.

create — Keyword used to create the peer index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer** *ip-address* [**create**]
no peer *ip-address*

Context **[Tree]** (config>redundancy>multi-chassis peer)

Full Context configure redundancy multi-chassis peer

Description This command configures the IP address of the peer in a redundant multi-chassis setup, and enters the context for further, application-specific configuration options.

Parameters *ip-address* — Specifies a peer IP address. Multicast addresses are not allowed.

Values ipv4-address: a.b.c.d
ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

peer

Syntax [**no**] **peer** *destination-host*

Context **[Tree]** (debug>diameter>node peer)

Full Context debug diameter node peer

Description This command debugs Diameter node peers. At this level, the forwarding/routing phase is completed and the peer is known. All messages flowing between this node and the peer are reported. Although the messages displayed can contain session-ids, this debugging level is session unaware (the session states are not maintained at this level).

Parameters *destination-host* — Specifies the host name, up to 80 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer ip-address** *ip-address*
no peer

Context **[Tree]** (config>subscr-mgmt>pfcp-association peer)

Full Context configure subscriber-mgmt pfcp-association peer

Description This command configures PFCP peer IP address.

The **no** form of this command removes the PFCP IP address.

Default no peer

Parameters *ip-address* — Specifies the PFCP peer IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax **peer** *a.b.c.d* [**create**]

Context **[Tree]** (config>service>vprn>ptp peer)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn ptp peer

Description This command configures a remote PTP peer. It provides the context to configure parameters for the remote PTP peer.

Up to 20 remote PTP peers may be configured.

The **no** form of this command deletes the specified peer.

If the clock-type is ordinary slave or boundary, and PTP is no shutdown, the last peer cannot be deleted. This prevents the user from having PTP enabled without any peer configured and enabled.

Peers are created within the routing instance associated with the context of this command. All configured PTP peers must use the same routing instance.

Parameters *a.b.c.d* — Specifies the IP address of the remote peer.

Values ipv4-address a.b.c.d

create — Keyword used to create the peer.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax **peer** *ip-address* [**create**]
no peer *ip-address*

Context **[Tree]** (config>system>ptp peer)

Full Context configure system ptp peer

Description This command configures a remote PTP peer. It provides the context to configure parameters for the remote PTP peer.

Up to 20 remote PTP peers may be configured.

The **no** form of the command deletes the specified peer. The specific address being deleted must be included.

If the **clock-type** is **ordinary slave** or **boundary**, and PTP is no shutdown, the last peer cannot be deleted. This prevents the user from having PTP enabled without any peer configured and enabled.

Peers are created within the routing instance associated with the context of this command. All configured PTP peers must use the same routing instance.

Parameters *ip-address* — Specifies the IP address of the remote peer.

create — Creates the remote PTP peer.

Values ipv4 address: a.b.c.d.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax [**no**] **peer** *peer-address*

Context **[Tree]** (config>service>vprn>msdp peer)
[Tree] (config>service>vprn>msdp>group peer)

Full Context configure service vprn msdp group peer
configure service vprn msdp peer

Description This command configures peer parameters. Multicast Source Discovery Protocol (MSDP) must have at least one peer configured. A peer is defined by configuring a local-address that can be used by this node to set up a peering session and the address of a remote MSDP router, It is the address of this remote peer that is configured in this command and it identifies the remote MSDP router address.

After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. It may be required to have multiple peering sessions in which case multiple peer statements should be included in the configurations.

By default, the options applied to a peer are inherited from the global or group-level. To override these inherited options, include peer-specific options within the peer statement.

If the peer address provided is already a configured peer, then this command only provides the context to configure the parameters pertaining to this peer.

If the peer address provided is not already a configured peer, then the peer instance must be created and the context to configure the parameters pertaining to this peer should be provided. In this case, the $ prompt to indicate that a new entity (peer) is being created should be used.

The peer address provided will be validated and, if valid, will be used as the remote address for an MSDP peering session.

When the **no** form of this command is entered, the existing peering address will be removed from the configuration and the existing session will be terminated. Whenever a session is terminated, all source active information pertaining to and learned from that peer will be removed. Whenever a new peering session is created or a peering session is lost, an event message should be generated.

At least one peer must be configured for MSDP to function.

Parameters *peer-address* — The address configured in this statement must identify the remote MSDP router that the peering session must be established with.

Platforms All

Use subject to Terms available at: www.nokia.com

peer

Syntax **peer** *ipv4-address*
no peer

Context **[Tree]** (config>router>nat>inside>redundancy peer)
[Tree] (config>service>vprn>nat>inside>redundancy peer)

Full Context configure router nat inside redundancy peer
configure service vprn nat inside redundancy peer

Description This command is used in LSN44 multi-chassis redundancy in conjunction with filters. The configured peer address is an IPv4 address that is configured under an interface on the peering LSN44 node (active or standby). This IPv4 interface address is advertised via routing on the inside in order to attract traffic from the standby to the active LSN44 node.

If configured, the steering-route will be advertised only from the active LSN44 node. Consequently, upstream traffic for LSN44 will be attracted to the active LSN44 node. The nat action in the ipv4-filter on the active LSN44 node will forward traffic to the local MS-ISA where LSN44 function is performed. However, in that case that upstream traffic somehow arrives on the standby LSN44 node, the nat action in the IPv4-filter will forward traffic to the peer address (active LSN44 node).

The **no** form of the command removes the peer ipv4-address from the configuration.

Default none

Parameters *ipv4-address* — Specifies the IP address of the NAT redundancy peer.

Values ipv4-address:a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax [**no**] **peer** *peer-node-id*

Context **[Tree]** (config>router>lmp peer)

Full Context configure router lmp peer

Description This command creates a context to enable the specification of the LMP peer parameters. It also specifies the LMP peer node. For a GMPLS UNI, this is the UNI-N node at the far end of the IP control channel for the GMPLS UNI. If the peer loopback address is entered using the **peer-loopback-address** command, then this is used as the routable peer address; otherwise the *peer-node-id* is assumed to correspond to a routable peer loopback

Default no peer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *peer-node-id* — An identifier for the LMP peer node. This may be an IPv4-formatted address or a 32-bit unsigned integer.

Values a.b.c.d | 1 to 4294967295

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax **peer** *peer-node-id*
no peer

Context **[Tree]** (config>router>gmpls>lsp>working-path peer)
[Tree] (config>router>gmpls>lsp>protect-path peer)

Full Context configure router gmpls lsp protect-path peer
configure router gmpls lsp working-path peer

Description This command specifies a peer node to use for the first hop of the GMPLS LSP. If specified, this command forces the GMPLS LSP to use a specific UNI-N node on ingress to the optical network. This command is only applicable if 1toN end to end protection is used.

The **no** form of the command removes the list of SRLG groups to exclude.

Parameters *peer-node-id* — The node ID of the peer UNI-N. This may be an ipv4-formatted address or a 32-bit unsigned integer.

Values a.b.c.d | 1 – 4294967295

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax [**no**] **peer** *peer-node-id*

Context **[Tree]** (config>router>gmpls peer)

Full Context configure router gmpls peer

Description This command specifies parameters for the RSVP session to a neighboring GMPLS UNI-N node. The *peer-node-id* is the control plane identifier for the adjacent UNI-N node.

The **no** form of this command deletes the configuration.

Parameters *peer-node-id* — Specifies the control plane node ID of the neighboring GMPLS UNI-N node. This can be an ipv4 address or a 32-bit unsigned integer.

Values {a.b.c.d | 1 to 4294967295}

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

peer

Syntax [**no**] **peer**

Context **[Tree]** (debug>router>gmpls>event peer)

Full Context debug router gmpls event peer

Description This command enables and disables debugging for GMPLS NBR events.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax [**no**] **peer** *ip-address*

Context **[Tree]** (config>router>ldp>session-parameters peer)

Full Context configure router ldp session-parameters peer

Description This command configures parameters for an LDP peer.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the LDP peer in dotted decimal notation.

Platforms All

peer

Syntax [**no**] **peer** *ip-address*

Context **[Tree]** (config>router>ldp>targeted-session peer)

Full Context configure router ldp targeted-session peer

Description This command configures parameters for an LDP peer.no

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the LDP peer in dotted decimal notation.

Platforms All

peer

Syntax [**no**] **peer** *ip-address*

Context **[Tree]** (debug>router>ldp peer)

Full Context debug router ldp peer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Use this command for debugging an LDP peer.

Parameters **ip-address** — The IP address of the LDP peer.

Platforms All

peer

Syntax **peer** *ip-address* [**preference** *preference*]
no peer *ip-address*

Context **[Tree]** (config>router>pcep>pcc peer)

Full Context configure router pcep pcc peer

Description This command configures the IP address of a peer PCEP speaker. The address is used as the destination address in the PCEP session messages to a PCEP peer.

The **preference** parameter allows the PCC to select the preferred PCE when both have their PCEP sessions successfully established. A maximum of two PCEP peers is supported.

The PCE peer that is not in overload is always selected by the PCC as the active PCE. However, if neither of the PCEs are signaling the overload state, the PCE with the higher numerical preference value is selected, and in case of a tie, the PCE with the lower IP address is selected.

Note: The system does not support two or more simultaneously active PCEs.

The **no** form of the command removes the specified peer PCEP speaker.

Parameters *ip-address* — The IP address of the PCEP peer to be used as the destination address in the PCEP session.

preference — The preference value of the peer.

Values 0 to 100

Default 1

Platforms All

peer

Syntax **peer** *ip-address*
no peer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>aarp peer)

Full Context configure application-assurance aarp peer

Description This command defines the IP address of the peer router which must be a routable system IP address.

If no peer is configured and the AARP is **no shutdown**, it is configured as a single node AARP instance.

The **no** form of this command removes the IP address from the AARP instance.

Default no peer

Parameters *ip-address* — Specifies the IP address in the a.b.c.d format.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax [**no**] **peer** *peer-address*

Context [Tree] (config>router>msdp peer)
[Tree] (config>router>msdp>group peer)

Full Context configure router msdp group peer
configure router msdp peer

Description This command configures peer parameters. Multicast Source Discovery Protocol (MSDP) must have at least one peer configured. A peer is defined by configuring a local-address that can be used by this node to set up a peering session and the address of a remote MSDP router, It is the address of this remote peer that is configured in this command and it identifies the remote MSDP router address.

After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. It may be required to have multiple peering sessions in which case multiple peer statements should be included in the configurations.

By default, the options applied to a peer are inherited from the global or group-level. To override these inherited options, include peer-specific options within the peer statement.

If the peer address provided is already a configured peer, then this command only provides the context to configure the parameters pertaining to this peer.

If the peer address provided is not already a configured peer, then the peer instance must be created and the context to configure the parameters pertaining to this peer should be provided. In this case, the $ prompt to indicate that a new entity (peer) is being created should be used.

The peer address provided will be validated and, if valid, will be used as the remote address for an MSDP peering session.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the **no** form of this command is entered, the existing peering address will be removed from the configuration and the existing session will be terminated. Whenever a session is terminated, all source active information pertaining to and learned from that peer will be removed. Whenever a new peering session is created or a peering session is lost, an event message should be generated.

At least one peer must be configured for MSDP to function.

Parameters *peer-address* — Specifies the peer IP address. address configured in this statement must identify the remote MSDP router that the peering session must be established with.

Platforms All

peer

Syntax **peer** *lic-name*
no peer

Context **[Tree]** (config>li>x-interfaces>x1 peer)

Full Context configure li x-interfaces x1 peer

Description This command configures the LIC name for X1 interface communication, which is configured under **config**>**li**>**x-interfaces**>**lics**>**lic**.

The **no** form of this command reverts to the default.

Parameters *lic-name* — Specifies the LIC name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax **peer** *lic-name*
no peer

Context **[Tree]** (config>li>x-interfaces>x2 peer)

Full Context configure li x-interfaces x2 peer

Description This command configures the LIC name for X2 interface communication, which is configured under **config**>**li**>**x-interfaces**>**lics**>**lic**.

The **no** form of this command reverts to the default.

Parameters *lic-name* — Specifies the LIC name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

peer

Syntax [**no**] **peer** *lic-name*

Context **[Tree]** (config>li>x-interfaces>x3>peers peer)

Full Context configure li x-interfaces x3 peers peer

Description This command configures the LIC name for X3 interface communication, which is configured under **config**>**li**>**x-interfaces**>**lics**>**lic**.

The **no** form of this command removes the LIC name.

Parameters *lic-name* — Specifies the name for the LIC peer, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax [**no**] **peer** {*ip-address* | *ipv6-address*}

Context **[Tree]** (config>router>bfd>seamless-bfd peer)

Full Context configure router bfd seamless-bfd peer

Description This command specifies the context for the local mapping, used by an S-BFD initiator, between a discriminator for a far-end S-BFD reflector and its discriminator value.

The **no** form of this command removes the mapping for the peer.

Parameters *ip-address* — Specifies the IPv4 address of the peer.

Values a.b.c.d

ipv6-address — Specifies the IPv6 address of the peer.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Platforms All

peer

Syntax **peer** [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*} [**key-id** *key-id*] [**version** *version*] [**prefer**]
no peer [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>time>ntp peer)

Full Context configure system time ntp peer

Description This command configures symmetric active mode for an NTP peer. It is recommended to configure authentication and to only configure known time servers as peers. Peers may exist within a VPRN service.

Note: For symmetric peering to operate correctly with a peer accessible through a VPRN, local NTP server functionality must be enabled within the VPRN using the **config**>**service**>**vprn**>**ntp** command.

The **no** form of the command removes the configured peer.

Parameters *router-instance* — Specifies the routing context that contains the interface.

Values *router-name* —Base | Management
service-id — 1 to 2147483647

Default Base

service name — Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address — Configures the IPv4 address of the peer that requires a peering relationship to be set up.

Values a.b.c.d

Default None

ipv6-address — Configures the IPv6 address of the peer that requires a peering relationship to be set up.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Default None

key-id — Specifies the key ID. Successful authentication requires that both peers must have the same authentication key-id, type, and key value.

Specify the *key-id* that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP peer. If an NTP packet is received by these nodes, the authentication key-id, type, and key value must be valid, otherwise the packet will be rejected and an event or trap will be generated.

Values 1 to 255

Default None

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

version — Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode, in which case all versions are accepted.

Values 2 to 4

Default 4

prefer — When configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, then the new entry overrides the old entry.

Platforms All

20.98 peer-address-change-policy

peer-address-change-policy

Syntax **peer-address-change-policy** {**accept** | **ignore** | **reject**}

Context **[Tree]** (config>router>l2tp peer-address-change-policy)
[Tree] (config>service>vprn>l2tp peer-address-change-policy)

Full Context configure router l2tp peer-address-change-policy
configure service vprn l2tp peer-address-change-policy

Description This command specifies what to do in case the system receives a L2TP response from another address than the one the request was sent to.

Default peer-address-change-policy reject

Parameters **accept** — Specifies that this system accepts any source IP address change of received L2TP control messages related to a locally originated tunnel in the state waitReply and rejects any peer address change for other tunnels; in case the new peer IP address is accepted, it is learned and used as destination address in subsequent L2TP messages.

ignore — Specifies that this system ignores any source IP address change of received L2TP control messages, does not learn any new peer IP address, and does not change the destination address in subsequent L2TP messages.

reject — Specifies that this system rejects any source IP address change of received L2TP control messages and drops those messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.99 peer-as

peer-as

Syntax **peer-as** *as-number*
no peer-as

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy peer-as)

Full Context configure subscriber-mgmt bgp-peering-policy peer-as

Description This command configures the autonomous system number for the remote peer. The peer AS number must be configured for each configured peer.

The **no** form of this command removes the *as-number* from the configuration.

Parameters *as-number* — Specifies the AS number for the remote peer.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer-as

Syntax **peer-as** *as-number*

Context **[Tree]** (config>service>vprn>bgp>group peer-as)
[Tree] (config>service>vprn>bgp>group>neighbor peer-as)

Full Context configure service vprn bgp group neighbor peer-as
configure service vprn bgp group peer-as

Description This command configures the autonomous system number for the remote peer. The peer AS number must be configured for each configured peer.

For EBGP peers, the peer AS number configured must be different from the autonomous system number configured for this router under the global level since the peer will be in a different autonomous system than this router

For IBGP peers, the peer AS number must be the same as the autonomous system number of this router configured under the global level.

This is a required command for each configured peer. This may be configured under the group level for all neighbors in a particular group.

Default No AS numbers are defined.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *as-number* — The autonomous system number, expressed as a decimal integer.

Values 1 to 65535

Platforms All

peer-as

Syntax **peer-as** *as-number*

Context **[Tree]** (config>router>bgp>group peer-as)
[Tree] (config>router>bgp>group>neighbor peer-as)

Full Context configure router bgp group neighbor peer-as
configure router bgp group peer-as

Description This command configures the autonomous system number for the remote peer. The peer AS number must be configured for each configured peer.

For EBGP peers, the peer AS number configured must be different from the autonomous system number configured for this router under the global level since the peer will be in a different autonomous system than this router.

For IBGP peers, the peer AS number must be the same as the autonomous system number of this router configured under the global level.

This is required command for each configured peer. This may be configured under the group level for all neighbors in a particular group.

Parameters *as-number* — Specifies the autonomous system number expressed as a decimal integer.

Values 1 to 4294967295

Platforms All

20.100 peer-endpoint

peer-endpoint

Syntax **peer-endpoint sap** *sap-id* **encap-type** {**dot1q** | **null** | **qinq**}
peer-endpoint spoke-sdp *sdp-id:vc-id*
no peer-endpoint

Context **[Tree]** (config>app-assure>aarp peer-endpoint)

Full Context configure application-assurance aarp peer-endpoint

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the peer endpoint ID of the SAP or spoke-SDP parent-aa-sub of the AARP peer.

The **no** form of this command removes the peer endpoint from the AARP instance.

Default no peer-endpoint

Parameters *sap-id* — Specifies the physical port identifier portion of the SAP definition.

sdp-id:vc-id — Specifies the spoke SDP ID and VC ID.

Values 1 to 32767
1 to 4294967295

dot1q | **null** | **qinq** — Specifies the encapsulation type.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.101 peer-group

peer-group

Syntax **peer-group** *tunnel-group-id*
no peer-group

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-ipsec>tunnel-group peer-group)

Full Context configure redundancy multi-chassis peer mc-ipsec tunnel-group peer-group

Description This command specifies the corresponding tunnel-group ID on peer node. The peer tunnel-group ID does not necessary equals to local tunnel-group ID.

The **no** form of this command removes the tunnel-group ID from the configuration.

Parameters *tunnel-group-id* — Specifies the tunnel-group identifier.

Values 1 to 16

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.102 peer-interface-address

peer-interface-address

Syntax **peer-interface-address** *ip-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>lmp>peer>control-channel peer-interface-address)

Full Context configure router lmp peer control-channel peer-interface-address

Description This command configures the mandatory **peer-interface-address**. It is the destination address of the IPCC on the peer UNI-N used to reach the GMPLS Router ID of the UNI-N peer. It corresponds to the lmpCcRemoteIpAddr in RFC 4631.

Parameters *ip-address* — The interface address of the IPCC next-hop.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x to [0 to FFFF]H
d to [0 to 255]D

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.103 peer-ip-address

peer-ip-address

Syntax **peer-ip-address** *ip-address*
no peer-ip-address

Context [Tree] (config>service>ies>if>ipcp peer-ip-address)

Full Context configure service ies interface ipcp peer-ip-address

Description This command defines the remote IP address to be assigned to the far-end of the associated PPP or MLPPP link via IPCP extensions. This command is only applicable if the associated SAP or port is a PPP or MLPPP interface with an IPCP encapsulation.

The **no** form of this command reverts to the default value.

Default no peer-ip-address (0.0.0.0)

Parameters *ip-address* — Specifies a unicast IPv4 address to be signaled to the far-end of the associated PPP or MLPPP link by IPCP extensions.

Platforms All

peer-ip-address

Syntax **peer-ip-address** *ip-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no peer-ip-address

Context **[Tree]** (config>service>vprn>if>ipcp peer-ip-address)

Full Context configure service vprn interface ipcp peer-ip-address

Description This command defines the remote IP address to be assigned to the far-end of the associated PPP/MLPPP link via IPCP extensions.

This command is only applicable if the associated SAP/port is a PPP/MLPPP interface with an IPCP encapsulation.

The interface must be shut down to modify the IPCP configuration.

The **no** form of this command deletes the IPCP extension peer-ip-address configuration.

Default no peer-ip-address (0.0.0.0)

Parameters *ip-address* — Specifies a unicast IPv4 address to be signaled to the far-end of the associated PPP/MLPPP link by IPCP extensions.

Platforms All

20.104 peer-ip-prefix

peer-ip-prefix

Syntax **peer-ip-prefix** *ip-prefix/ip-prefix-length*
peer-ip-prefix ipv4-any
peer-ip-prefix ipv6-any
no peer-ip-prefix

Context **[Tree]** (config>ipsec>client-db>client>client-id peer-ip-prefix)

Full Context configure ipsec client-db client client-identification peer-ip-prefix

Description This command specifies match criteria that uses the peer's tunnel IP address as the input. Only one peer-ip-prefix criteria can be configured for a given client entry.

The **no** form of this command reverts to the default.

Default no peer-ip-prefix

Parameters *ip-prefix/ip-prefix-length* — Specifies an IPv4 or IPv6 prefix. It is considered a match if the peer's tunnel IP address is within the specified prefix.

ipv4-any — Matches any IPv4 address.

ipv6-any — Matches any IPv6 address.

© 2022 Nokia.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer-ip-prefix

Syntax [**no**] **peer-ip-prefix**

Context **[Tree]** (config>ipsec>client-db>match-list peer-ip-prefix)

Full Context configure ipsec client-db match-list peer-ip-prefix

Description This command enables the use of the peer's tunnel IP address as the match input.

The **no** form of this command disables the peer IP prefix matching process.

Default no peer-ip-prefix

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.105 peer-limit

peer-limit

Syntax **peer-limit** *limit*
no peer-limit

Context **[Tree]** (config>service>vprn>ptp peer-limit)

Full Context configure service vprn ptp peer-limit

Description This command specifies an upper limit to the number of discovered peers permitted within the routing instance. This command can ensure that a routing instance does not consume all the possible discovered peers and blocking discovered peers in other routing instances.

If it is desired to reserve a fixed number of discovered peers per router instance, then all router instances supporting PTP should have values specified with this command and the sum of all the peer-limit values must not exceed the maximum number of discovered peers supported by the system.

If the user attempts to specify a peer-limit, and there are already more discovered peers in the routing instance than the new limit being specified, the configuration is not accepted.

The **no** form of this command removes the limit from the configuration.

Default no limit

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *limit* — Specifies the maximum number of discovered peers allowed in the routing instance.

Values 0 to 50

Default 0 (The maximum number of discovered peers supported by the system).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer-limit

Syntax **peer-limit** *limit*
no peer-limit

Context **[Tree]** (config>system>ptp peer-limit)

Full Context configure system ptp peer-limit

Description This command specifies an upper limit to the number of discovered peers permitted within the routing instance. This can be used to ensure that a routing instance does not consume all the possible discovered peers and blocking discovered peers in other routing instances.

If it is desired to reserve a fixed number of discovered peers per router instance, then all router instances supporting PTP should have values specified with this command and the sum of all the peer-limit values must not exceed the maximum number of discovered peers supported by the system.

If the user attempts to specify a peer-limit, and there are already more discovered peers in the routing instance than the new limit being specified, the configuration will not be accepted.

Default no peer-limit

Parameters *limit* — Specifies the maximum number of discovered peers allowed in the routing instance.

Values 0 to 512

Default 1 (The maximum number of discovered peers supported by the system.)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.106 peer-loopback-address

peer-loopback-address

Syntax **peer-loopback-address** *ip-address*
no peer-loopback-address

Context **[Tree]** (config>router>lmp>peer peer-loopback-address)

Full Context configure router lmp peer peer-loopback-address

Description The IP address corresponding to the GMPLS loopback address configured on the LMP peer. If **peer-loopback-address** is entered, then this is used as the routable peer address, otherwise the *peer-node-id* is assumed to correspond to a routable peer loopback.

peer-loopback-address is an optional configurable field. If **peer-loopback-address** is not configured, the router will use **lmp-peer-node-id** (that is LmpNbrNodeId as per RFC 4631) as the dstIpAddr in the IP-header for the peer-specific messages (that is, Link summary msgs, RSVP msgs).

Note: The **peer-interface-address** is mandatory; it is the destination address of the IPCC on the peer UNI-N used to reach the GMPLS Router ID of the UNI-N peer. It corresponds to the lmpCcRemoteIpAddr in RFC 4631.

Default no peer-loopback-address

Parameters *ip-address* — The GMPLS control plane loopback address of the IPCC next-hop.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x to [0 to FFFF]H
d to [0 to 255]D

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer-template-map

Syntax **peer-template-map** *template-name* **policy** *peer-prefix-policy1* [*peer-prefix-policy2..up to 5*]
no peer-template-map peer-template *template-name*

Context **[Tree]** (config>router>ldp>targeted-session peer-template-map)

Full Context configure router ldp targeted-session peer-template-map

Description This command enables the automatic creation of a targeted Hello adjacency and LDP session to a discovered peer. The user configures a targeted session peer parameter template and binds it to a peer prefix policy.

Each application of a targeted session template to a given prefix in the prefix list will result in the establishment of a targeted Hello adjacency to an LDP peer using the template parameters as long as the prefix corresponds to a router-id for a node in the TE database. As a result of this, the user must enable the traffic-engineering option in ISIS or OSPF. The targeted Hello adjacency will either trigger a new LDP session or will be associated with an existing LDP session to that peer.

Up to 5 peer prefix policies can be associated with a single peer template at all times. Also, the user can associate multiple templates with the same or different peer prefix policies. Thus multiple templates can match with a given peer prefix. In all cases, the targeted session parameters applied to a given peer prefix are taken from the first created template by the user. This provides a more deterministic behavior regardless of the order in which the templates are associated with the prefix policies.

Each time the user executes the above command, with the same or different prefix policy associations, or the user changes a prefix policy associated with a targeted peer template, the system re-evaluates the prefix policy. The outcome of the re-evaluation will tell LDP if an existing targeted Hello adjacency needs to be torn down or if an existing targeted Hello adjacency needs to have its parameters updated on the fly.

If a /32 prefix is added to (removed from) or if a prefix range is expanded (shrunk) in a prefix list associated with a targeted peer template, the same prefix policy re-evaluation described above is performed.

The template comes up in the **no shutdown** state and as such it takes effect immediately. Once a template is in use, the user can change any of the parameters on the fly without shutting down the template. In this case, all targeted Hello adjacencies are updated.

The SR OS supports multiple ways of establishing a targeted Hello adjacency to a peer LSR:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- User configuration of the peer with the targeted session parameters inherited from the **config>router>ldp>targeted-session** in the top level context or explicitly configured for this peer in the **config>router>ldp>targ-session>peer** context and which overrides the top level parameters shared by all targeted peers. Let us refer to the top level configuration context as the global context. Some parameters only exist in the global context; their value will always be inherited by all targeted peers regardless of which event triggered it.
- User configuration of an SDP of any type to a peer with the signaling tldp option enabled (default configuration). In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129) PW template binding in a BGP-VPLS service. In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129 type II) PW template binding in a VLL service (dynamic multi-segment PW). In this case the target session parameter values are taken from the global context
- User configuration of a mapping of a targeted session peer parameter template to a prefix policy when the peer address exists in the TE database (this feature). In this case, the targeted session parameter values are taken from the template.

Since the above triggering events can occur simultaneously or in any arbitrary order, the LDP code implements a priority handling mechanism in order to decide which event overrides the active targeted session parameters. The overriding trigger will become the owner of the targeted adjacency to a given peer. The following is the priority order:

- Priority 1: manual configuration of session parameters
- Priority 2: mapping of targeted session template to prefix policy.
- Priority 3: auto-tx parameters
- Priority 4: auto-rx parameters
- Priority 5: manual configuration of SDP, PW template binding in BGP-AD VPLS and in FEC 129 VLL.

Any parameter value change to an active targeted Hello adjacency caused by any of the above triggering events is performed on the fly by having LDP immediately send a Hello message with the new parameters to the peer without waiting for the next scheduled time for the Hello message. This allows the peer to adjust its local state machine immediately and maintains both the Hello adjacency and the LDP session in UP state. The only exceptions are the following:

- The triggering event caused a change to the local-lsr-id parameter value. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session. A new Hello adjacency and LDP session will then get established to the peer using the new value of the local LSR ID.
- The triggering event caused the targeted peer shutdown option to be enabled. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Finally, the value of any LDP parameter which is specific to the LDP/TCP session to a peer is inherited from the **config>router>ldp>session-params>peer** context. This includes MD5 authentication, LDP prefix per-peer policies, label distribution mode (DU or DOD), and so on.

The **no** form of this command deletes the binding of the template to the peer prefix list and brings down all Hello adjacencies to the discovered LDP peers.

Platforms All

20.113 peer-to-peer

peer-to-peer

Syntax [**no**] **peer-to-peer**

Context **[Tree]** (debug>diameter>node>peer peer-to-peer)

Full Context debug diameter node peer peer-to-peer

Description This command reports only peer level message that are required for bringing up, maintaining and tearing down the peering connection (CER/A, DWR/A, and so on).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.114 peer-tracking-policy

peer-tracking-policy

Syntax **peer-tracking-policy** *policy-name*
no peer-tracking-policy

Context **[Tree]** (config>service>vprn>bgp peer-tracking-policy)

Full Context configure service vprn bgp peer-tracking-policy

Description This command specifies the name of a policy statement to use with the BGP peer-tracking function on the BGP sessions where this is enabled. The policy controls which IP routes in RTM are eligible to indicate reachability of IPv4 and IPv6 BGP neighbor addresses. If the longest matching route in RTM for a BGP neighbor address is an IP route that is rejected by the policy, or it is a BGP route accepted by the policy, or if there is no matching route, the neighbor is considered unreachable and BGP tears down the peering session and holds it in the idle state until a valid route is once again available and accepted by the policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The default peer-tracking policy (when the **no peer-tracking-policy** command is configured) is to use the longest matching active route in RTM that is not an LDP shortcut route or an aggregate route.

Note: When **peer-tracking** is configured, the peer-tracking policy should only permit one of **direct-interface** or **direct** routes to be advertised to a BGP peer. Advertising both routes will cause the best route to oscillate.

Default no peer-tracking-policy

Parameters *policy-name* — Specifies the route policy name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

Full Context configure router nat inside redundancy peer6
configure service vprn nat inside redundancy peer6

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used in NAT64 multi-chassis redundancy in conjunction with filters. The configured peer6 address is an IPv6 address configured under an interface on the peering NAT64 node (active or standby). This IPv6 interface address is advertised via routing on the inside in order to attract traffic from the standby to the active NAT64 node.

Under normal circumstances, the NAT64 prefix will be advertised only from the active NAT64 node. Consequently, upstream traffic for NAT64 will be attracted to the active NAT64 node. The nat action in the ipv6-filter on the active NAT64 node will forward traffic to the local MS-ISA where NAT64 function is performed. However, in that case that upstream traffic somehow arrives on the standby NAT64 node, the nat action in the IPv6-filter will forward traffic to the peer6 address (active NAT64 node).

The **no** form of the command removes the peer6 ip-address from the configuration.

Default none

Parameters *ipv6-address* — Specifies the IPv6 address of the NAT redundancy peer.

Values

ipv6-address:	ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H

20.125 per-host-replication

per-host-replication

Syntax **per-host-replication** [**uni-mac** | **mcast-mac**]
no per-host-replication

Context **[Tree]** (config>subscr-mgmt>igmp-policy per-host-replication)

Full Context configure subscriber-mgmt igmp-policy per-host-replication

Description This command enables per-host-replication in IPoE model. For PPPoX, per-host-replication is the only mode of operation. In the per-host-replication mode, multicast traffic is replicated per each host within the subscriber irrespective of the fact that some hosts may be subscribed to the same multicast stream. As a result, in case that multiple hosts within the subscriber are registered for the same multicast group, the multicast streams of that group is generated. The destination MAC address of multicast streams is changed to unicast so that each host receives its own copy of the stream. Multicast traffic in the per-host-replication mode can be classified via the existing QoS CLI structure. As such the multicast traffic will flow through the subscriber queues. HQoS Adjustment is not needed in this case.

The alternative behavior for multicast replication in IPoE environment is per-SAP- replication. In this model, only a single copy of the multicast stream is sent per SAP, irrespective of the number of hosts that are subscribed to the same multicast group. This behavior applies to 1:1 connectivity model as well as on 1:N connectivity model (SAP centric behavior as opposed to subscriber centric behavior).

In the per-SAP-replication model the destination MAC address is multicast (as opposed to unicast in the per-host-replication model). Multicast traffic is flowing via the SAP queue which is outside of the subscriber context. The consequence is that multicast traffic is not accounted in the subscriber HQoS. In addition, HQoS Adaptation is not supported in the per SAP replication model.

Default no per-host-replication — By default there is no per host replication and replication is done per SAP. This mode utilizes the SAP queues. With per-host-replication it will allow the use of the subscriber queues. Per-host-replication uses unicast MAC and multicast IP to deliver multicast content to end hosts. This is useful for multi host per SAP cases. To interoperate with end devices that do not support unicast MAC, there is an option to use per-host-replication with a multicast MAC. The traffic is the same as replication per SAP but the difference of using the subscriber queues.

Parameters **uni-mac** — Specifies that multicast traffic is sent with a unicast MAC and multicast IP.

mcast-mac — Specifies that multicast traffic is sent with a multicast MAC and IP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description This command enables CPM hardware queuing per peer. This means that when a peering session is established, the router will automatically allocate a separate CPM hardware queue for that peer.

The **no** form of this command disables CPM hardware queuing per peer.

Default per-peer-queuing

Platforms All

20.129 per-service-hashing

per-service-hashing

Syntax [**no**] **per-service-hashing**

Context **[Tree]** (config>service>epipe>load-balancing per-service-hashing)

Full Context configure service epipe load-balancing per-service-hashing

Description This command enables on a per service basis, consistent per-service hashing for Ethernet services over LAG, over Ethernet tunnel (eth-tunnel) using loadsharing protection-type or over CCAG. Specifically, it enables the new hashing procedures for Epipe, VPLS, regular or PBB services.

The following algorithm describes the hash-key used for hashing when the new option is enabled:

- If the packet is PBB encapsulated (contains an I-TAG ethertype) at the ingress side, use the ISID value from the I-TAG
- If the packet is not PBB encapsulated at the ingress side
  - For regular (non-PBB) VPLS and Epipe services, use the related service ID
  - If the packet is originated from an ingress IVPLS or PBB Epipe SAP
  - If there is an ISID configured use the related ISID value
  - If there is no ISID yet configured use the related service ID
  - For BVPLS transit traffic use the related flood list id
  - Transit traffic is the traffic going between BVPLS endpoints
  - An example of non-PBB transit traffic in BVPLS is the OAM traffic
  - The preceding rules apply regardless of traffic type
  - Unicast, BUM flooded without MMRP or with MMRP, IGMP snooped

per-service-hashing

Syntax [**no**] **per-service-hashing**

Context **[Tree]** (config>service>vpls>load-balancing per-service-hashing)
[Tree] (config>service>template>vpls-template>load-balancing per-service-hashing)

Full Context configure service template vpls-template load-balancing per-service-hashing
configure service vpls load-balancing per-service-hashing

Description This command enables on a per service basis, consistent per-service hashing for Ethernet services over LAG, over Ethernet tunnel (eth-tunnel) using loadsharing protection-type or over CCAG. Specifically, it enables the new hashing procedures for Epipe, VPLS, regular or PBB services.

The following algorithm describes the hash-key used for hashing when the new option is enabled:

- If the packet is PBB encapsulated (contains an I-TAG ethertype) at the ingress side, use the ISID value from the I-TAG
- If the packet is not PBB encapsulated at the ingress side
  - For regular (non-PBB) VPLS and Epipe services, use the related service ID
  - If the packet is originated from an ingress IVPLS or PBB Epipe SAP
- If there is an ISID configured use the related ISID value
- If there is no ISID yet configured use the related service ID
  - For BVPLS transit traffic use the related flood list id
- Transit traffic is the traffic going between BVPLS endpoints
- An example of non-PBB transit traffic in BVPLS is the OAM traffic
- The above rules apply regardless of traffic type
  - Unicast, BUM flooded without MMRP or with MMRP, IGMP snooped

The **no** form of this command implies the use of existing hashing options.

Default no per-service-hashing

20.130 per-source-rate

per-source-rate

Syntax **per-source-rate** *packet-rate-limit*
no per-source-rate

Context **[Tree]** (config>sys>security>cpu-protection>policy per-source-rate)

Full Context configure system security cpu-protection policy per-source-rate

Description This command configures a per-source packet arrival rate limit. Use this command to apply a packet arrival rate limit on a per source basis. A source is defined as a unique combination of SAP and MAC source address (mac-monitoring) or SAP and source IP address (ip-src-monitoring). The CPU will receive no more than the configured packet rate from each source (only certain protocols are rate limited for ip-src-monitoring as configured under **include-protocols** in the **cpu-protection** policy). The measurement is cleared each second.

This parameter is only applicable if the policy is assigned to an interface (some examples include saps, subscriber-interfaces, and spoke-sdps), and the **mac-monitor** or **ip-src-monitor** keyword is specified in the **cpu-protection** configuration of that interface.

The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In layer-3 aggregation scenarios, all packets from all subscribers behind the same aggregation router will arrive with the same source MAC address and as such the mac-monitoring functionality can not differentiate traffic from different subscribers.

Default per-source-rate max

Parameters *packet-rate-limit* — Specifies a per-source packet (per SAP/MAC source address or per SAP/IP source address) arrival rate limit in packets per second.

Values 1 to 65535, **max** (max indicates no limit)

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

20.131 per-spi-replication

per-spi-replication

Syntax [**no**] **per-spi-replication**

Context **[Tree]** (config>subscr-mgmt>igmp-policy per-spi-replication)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt igmp-policy per-spi-replication

Description This command enables per-SLA Profile Instance (SPI) replication. In this mode, a multicast stream is transmitted for the subscriber host SLA profile for each registered multicast group (channel). As a result, multiple copies of the same multicast stream are transmitted over the same SAP. The replication of the multicast packets depends on the number of SLA profile instances configured for the subscriber. For example, if the subscriber hosts use three SLA profiles, the (S,G) is replicated three times, but if the subscriber hosts use the same SLA profile, the (S,G) is only replicated once.

The **no** form of this command disables per-SPI replication.

Default no per-spi-replication

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.132 per-user

per-user

Syntax **per-user user-directory** *dir-url* **file-name** *file-name*
no per-user

Context **[Tree]** (config>system>login-control>login-scripts per-user)

Full Context configure system login-control login-scripts per-user

Description This command allows users to define their own login scripts that can be executed each time they first login to a CLI session. The command executes the script “*file-url* / *username* / *file-name*" when the user *username* logs into a CLI session (authenticated by any means including local user database, TACACS+, or RADIUS).

For example:

per-user user-directory "cf1:/local/users" file-name "login-script.txt"

would search for the following script when user “admin” logs in and authenticates via RADIUS:

cf1:/local/users/admin/login-script.txt

The per user login script is executed after any global script executes and before any login-exec script configured against a local user is executed. This allows users, for example, who are authenticated via TACACS+ or RADIUS to define their own login scripts.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables the execution of any per user login-scripts.

Default no per-user

Parameters *dir-url* — Specifies the path or directory name.

file-name — Specifies the name of the file (located in the *dir-url* directory) including the extension.

Description

The percent-rate command within the SAP ingress and egress QoS policy enables supports for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate or of its parent scheduler's rate.

When the rates are expressed as a port-limit, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QOS policy to be used on SAPs on different ports without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a local-limit, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QOS policy to be used on SAPs with different parent scheduler rates without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a percent-rate if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QOS policy.

When no percent-rate is defined within a SAP ingress or egress queue-override, the queue reverts to the defined shaping and CIR rates within the SAP ingress and egress QOS policy associated with the queue.

Use subject to Terms available at: www.nokia.com

Parameters *percent-of-line-rate* — The percent-of-line-rate parameter is used to express the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

pir-percent — Specifies the queue's PIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's CIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.00 to 100.00

Default 100.00

[Tree] (config>service>vpls>sap>ingress>queue-override>queue percent-rate)

Full Context configure service vpls sap egress queue-override queue percent-rate
configure service vpls sap ingress queue-override queue percent-rate

Description The **percent-rate** command supports a queue's shaping rate and CIR rate as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group queue-id will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10-Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the percent-rate command and the **rate** command is executed, the percent-rate values are deleted. In a similar fashion, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

An egress port queue group queue rate override may be expressed as either a percentage or an explicit rate independent on how the queue's template rate is expressed.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the queue to its default shaping **rate** and **cir** rate. When **no percent-rate** is defined within a port egress queue group queue override, the queue reverts to the defined shaping and CIR rates within the egress queue group template associated with the queue.

Parameters *pir-percent* — Specifies the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.00 to 100.00

In a similar fashion, the percent-rate command causes any rate command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at anytime.

An egress port queue group queue rate override may be expressed as either a percentage or an explicit rate independent on how the queue's template rate is expressed.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns the queue to its default shaping rate and cir rate. When **no percent-rate** is defined within a port egress queue group queue override, the queue reverts to the defined shaping and CIR rates within the egress queue group template associated with the queue.

Parameters *pir-percent* — Specifies the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.00 to 100.00

Default 100.00

no percent-rate

Context **[Tree]** (config>qos>plcr-ctrl-plcy>tier>arbiter percent-rate)

Full Context configure qos policer-control-policy tier arbiter percent-rate

Description This command configures the percent rate of this contexts policer policy.

The **no** form of this command removes the configuration.

Parameters *percentage* — Specifies the percentage.

Values 0.01 to 100.00

local-limit — Keyword used to specify the local limit.

reference-port-limit — Keyword used to specify the reference port limit.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

percent-rate

Syntax **percent-rate** *pir-percent* [**cir** *cir-percent*] [**local-limit** | **reference-port-limit**]
no percent-rate

Context **[Tree]** (config>qos>sap-ingress>policer percent-rate)
[Tree] (config>qos>sap-egress>policer percent-rate)

Full Context configure qos sap-egress policer percent-rate
configure qos sap-ingress policer percent-rate

Description The percent-rate command within the SAP ingress and egress QoS policies enables supports for a policer's PIR and CIR rate to be configured as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

This enables the same QoS policy to be used on SAPs on different FPs without needing to use SAP-based policer overrides to modify a policer's rate to get the same relative performance from the policer.

If the parent arbiter rate changes after the policer is created, the policer's PIR and CIR rates will be recalculated based on the defined percentage value.

The rate and percent-rate commands override one another. If the current rate for a policer is defined using the percent-rate command and the rate command is executed, the percent-rate values are deleted. In a similar fashion, the percent-rate command causes any rate command values to be deleted. A policer's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and CIR rate.

Use subject to Terms available at: www.nokia.com

Parameters *pir-percent* — Specifies the policer's PIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.01 to 100.00

Default 100.00

cir-percent — The **cir** keyword is optional and, when defined, the required cir-percent CIR parameter expresses the policer's CIR as a percentage of the immediate parent root policer/arbiter rate or the FP capacity.

Values Percentage ranging from 0.00 to 100.00

Default 100.00

local-limit — Keyword used to specify the local limit.

reference-port-limit — Keyword used to specify the reference port limit.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

percent-rate

Syntax **percent-rate** *pir-percent* [**cir** *cir-percent*] [**fir** *fir-percent*] [{**port-limit** | **local-limit** | **reference-port-limit**}]
percent-rate *pir-percent* **police** [{**port-limit** | **local-limit** | **reference-port-limit**}]
no percent-rate

Context **[Tree]** (config>qos>sap-ingress>queue percent-rate)

Full Context configure qos sap-ingress queue percent-rate

Description This command configures a queue's PIR and CIR as a percentage of the ingress port line rate or as a percentage of its parent scheduler rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR, CIR, and FIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR, CIR, and FIR will be recalculated based on the defined percentage value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form configured in the QoS policy (for example, a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a **rate** (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When no **percent-rate** is defined within a SAP ingress queue-override, the queue uses the defined shaping rate, CIR, and FIR within the SAP ingress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate, CIR, and FIR.

Parameters *pir-percent* — Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.00 to 100.00

Default 100.00

fir-percent — Specifies the queue's FIR as a percentage dependent on the use of the **port-limit** or **local-limit**. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0.00 to 100.00

Default 100.00

police — Keyword used to specify that traffic feeding into the physical queue instance above the specified PIR rate is dropped. When the **police** keyword is defined, only the PIR rate may be overridden. The **police** keyword is only applicable to SAP ingress.

port-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the port (including the ingress-rate setting) to which the queue is attached. The **port-limit** is the default.

local-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the queue's parent scheduler rate. If there is no parent scheduler rate, or its rate is **max**, the **port-limit** is used.

reference-port-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the reference port (including the ingress-rate setting) to which the queue is attached.

percent-rate

Syntax **percent-rate** *pir-percent* [**cir** *cir-percent*] [{**port-limit** | **local-limit** | **reference-port-limit**}]
no percent-rate

Context **[Tree]** (config>qos>sap-egress>queue percent-rate)

Full Context configure qos sap-egress queue percent-rate

Description This command configures a queue's PIR and CIR as a percentage of the egress port line rate or as a percentage of its parent scheduler rate or **agg-rate** rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate or **agg-rate** rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

When no **percent-rate** is defined within a SAP egress queue-override, the queue uses the defined shaping rate and CIR within the SAP egress QoS policy associated with the queue.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the queue to its default shaping rate and CIR.

Parameters *pir-percent* — Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit.**

Values 0.00 to 100.00

Default 100.00

port-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

Description This command configures a queue's PIR and CIR as a percentage of the ingress port line rate or as a percentage of its parent scheduler rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR, CIR, and FIR rates will be recalculated based on the defined percentage value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR, CIR, and FIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form configured in the QoS policy (for example, a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a **rate** (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When no **percent-rate** is defined within a SAP ingress queue-override, the queue uses the defined shaping rate, CIR, and FIR within the SAP ingress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate, CIR, and FIR.

Parameters *pir-percent* — Specifies the queue’s PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent — Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.00 to 100.00

Default 100.00

fir-percent — Specifies the queue's FIR as a percentage dependent on the use of the **port-limit** or **local-limit**. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0.00 to 100.00

Default 100.00

police — Keyword used to specify that traffic feeding into the physical queue instance above the specified PIR rate will be dropped. When the **police** keyword is defined, only the PIR rate may be overridden. The **police** keyword is only applicable to SAP ingress.

port-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the port (including the ingress-rate setting) to which the queue is attached. The **port-limit** is the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

local-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the queue's parent scheduler rate. If there is no parent scheduler rate, or its rate is **max**, the **port-limit** is used.

reference-port-limit — Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the reference port (including the ingress-rate setting) to which the queue is attached.

Platforms All

percent-rate

Syntax **percent-rate** *pir-percent* [**cir** *cir-percent*] [{**port-limit** | **local-limit** | **reference-port-limit**}]
no percent-rate

Context **[Tree]** (config>qos>qgrps>egr>queue-group>queue percent-rate)

Full Context configure qos queue-group-templates egress queue-group queue percent-rate

Description The **percent-rate** command within the egress queue group template enables support for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group *queue-id* will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the rate is performed under the **hs-wrr-group** within the egress queue group template.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and CIR rate.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *pir-percent* — Expresses the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

cir-percent — The **cir** keyword is optional and when defined, the required *pir-percent* parameter expresses the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may change dynamically due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

port-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit — Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

20.134 percent-reduction-from-mbs

percent-reduction-from-mbs

Syntax **percent-reduction-from-mbs** *percent*
no percent-reduction-from-mbs

Context **[Tree]** (config>mcast-mgmt>bw-plcy>t2>prim-path>queue>drop-tail>low percent-reduction-from-mbs)
[Tree] (config>mcast-mgmt>bw-plcy>t2>sec-path>queue>drop-tail>low percent-reduction-from-mbs)

Full Context configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters drop-tail low percent-reduction-from-mbs
configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters drop-tail low percent-reduction-from-mbs

Description This command overrides the default percentage value used to determine the low drop-tail value for the queue. By default, 10 percent of the queue depth is reserved for high congestion priority traffic. When specified, the **percent-reduction-from-mbs** percentage value is applied to the queues' MBS threshold. The resulting value is subtracted from the MBS to derive the low drop-tail threshold maintained by the queue. The low drop-tail threshold defines the point at which all low-congestion priority packets destined for the queue are discarded based on queue depth. Low- and high-congestion priority is derived from the multicast records preference value compared to the record's bundle priority threshold.

The **no** form of this command restores the default value.

Default percent-reduction-from-mbs 10

Parameters *percent* — Specifies the percent of queue depth reserved for high-congestion priority traffic.

Values 0 to 100, default

0 specifies that the MBS and low drop-tail thresholds be set to the same value resulting in high- and low-congestion priority packets being treated equally.

100 specifies that the low drop-tail threshold is set to 0, resulting in all low-congestion priority packets being discarded.

Values between 0 and 100 result in a corresponding differential between the MBS and the low drop-tail threshold values.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

configure service ies interface sap ingress queue-override queue drop-tail low percent-reduction-from-mbs
configure service vpls sap egress queue-override queue drop-tail low percent-reduction-from-mbs
configure service vpls sap ingress queue-override queue drop-tail low percent-reduction-from-mbs

Description This command overrides the low queue drop tail as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, then the low drop tail is at 420 kbytes and out-of-profile packets are not accepted into the queue if its depth is greater than this value, and discarded.

Parameters *percent* — Specifies the percentage reduction from the MBS for a queue drop tail.

Values 0 to 100, default

Platforms All

configure qos sap-egress queue drop-tail high percent-reduction-from-mbs
configure qos sap-egress queue drop-tail highplus percent-reduction-from-mbs
configure qos sap-egress queue drop-tail low percent-reduction-from-mbs

Description This command configures the egress SAP queue drop tails as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, then the low drop tail will be at 420 kbytes and out-of-profile packets will not be accepted into the queue if its depth is greater than this value and will be discarded.

The drop tails apply to packets with the following profile state:

- Exceed drop tail: exceed-profile
- High drop tail: in-profile
- Highplus drop tail: inplus-profile
- Low drop tail: out-of-profile

Default Exceed drop tail: 20%

Low drop tail: 10%

High drop tail: 0%

Highplus drop tail: 0%

Parameters *percent* — Specifies the percentage reduction from the MBS for a queue drop tail.

20.138 periodic-loopback

periodic-loopback

Syntax [**no**] **periodic-loopback**

Context **[Tree]** (config>service>ies>sub-if>grp-if>sap>atm>oam periodic-loopback)
[Tree] (config>service>vprn>if>sap>atm>oam periodic-loopback)
[Tree] (config>service>vprn>sub-if>grp-if>sap>atm periodic-loopback)

Full Context configure service ies subscriber-interface group-interface sap atm oam periodic-loopback
configure service vprn interface sap atm oam periodic-loopback
configure service vprn subscriber-interface group-interface sap atm periodic-loopback

Description This command enables periodic OAM loopbacks on this SAP. This command is only configurable on IES and VPRN SAPs. When enabled, an ATM OAM loopback cell is transmitted every period as configured in the **config>system>atm>oam>loopback-period** *period* context.

If a response is not received and consecutive retry-down retries also result in failure, the endpoint transitions to an alarm indication signal/loss of clock state. Then, an ATM OAM loopback cell is transmitted every period as configured in the loopback-period *period*. If a response is received for the periodic loopback and consecutive retry-up retries also each receive a response, the endpoint transitions back to the up state.

The **no** form of this command sets the value back to the default.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure service ies subscriber-interface group-interface sap atm oam periodic-loopback

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

- configure service vprn interface sap atm oam periodic-loopback

periodic-loopback

Syntax [**no**] **periodic-loopback**

Context **[Tree]** (config>service>ies>if>sap>atm>oam periodic-loopback)

Full Context configure service ies interface sap atm oam periodic-loopback

Description This command enables periodic OAM loopbacks on this SAP. This command is only configurable on IES and VPRN SAPs. When enabled, an ATM OAM loopback cell is transmitted every period as configured in the config>system>atm>oam>loopback-period *period* context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If a response is not received and consecutive retry-down retries also result in failure, the endpoint will transition to an alarm indication signal/loss of clock state. Then, an ATM OAM loopback cell will be transmitted every period as configured in the loopback-period *period*. If a response is received for the periodic loopback and consecutive retry-up retries also each receive a response, the endpoint will transition back to the up state.

The **no** form of this command sets the value back to the default.

Default no periodic-loopback

no periodic-update

Context **[Tree]** (config>aaa>isa-radius-plcy periodic-update)

Full Context configure aaa isa-radius-policy periodic-update

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables periodic RADIUS logging of currently allocated port blocks for a NAT subscriber (NAT binding).

Default no periodic-update (no Interim Update messages are sent)

Parameters **interval** *hours* — Specifies the interval at which RADIUS logging is refreshed. The log generation might delayed past the configured interval value if the message pacing (rate-limit) is enabled or when the number of un-acknowledged (pending) messages in SR OS has reached its upper limit. An increased number of pending Interim Update messages in SR OS is due to lack of adequate responsiveness of the RADIUS server.

Values 1 to 72

rate-limit *rate* — Specifies the pacing of the Interim Update messages related to refreshment of the currently allocated port blocks. By default, when this command is disabled, the messages are sent at a high rate determined by the processing capability of the SR OS. Such a high message rate can exceed the processing power of the logging server which can result in the loss of logging information. To overcome this, the Interim Update messages can be generated in a staggered manner at a configured interval that is accommodating toward the processing capabilities of the logging server.

Default 1 to 100000 messages per second

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.143 periodic-update-interval

periodic-update-interval

Syntax **periodic-update-interval** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

Context **[Tree]** (config>system>security>pki>ca-prof>auto-crl-update periodic-update-interval)

Full Context configure system security pki ca-profile auto-crl-update periodic-update-interval

Description This command specifies the interval for periodic updates. The minimal interval is 1 hour. The maximum interval is 366 days.

Default periodic-update-interval days 1

Parameters **days** *days* — Specifies the number of days for periodic updates.

Values 0 to 366

hours — Specifies the number of hours for periodic updates.

Values 0 to 23

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

minutes — Specifies the number of minutes for periodic updates.

Values 0 to 59

seconds — Specifies the number of seconds for periodic updates.

Values 0 to 59

20.144 persist

persist

Syntax **persist** {**on** | **off**}

Context **[Tree]** (bof persist)

Full Context bof persist

Description This command specifies whether the system will preserve system indexes when a **save** command is executed. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, and so on. This reduces resynchronizations of the Network Management System (NMS) with the affected network element.

In the event that persist is **on** and the reboot with the appropriate index file fails, SNMP is operationally shut down to prevent the management system from accessing and possibly synchronizing with a partially booted or incomplete network element. To enable SNMP access, enter the **config>system>snmp>no shutdown** command.

If **persist** is enabled and the **admin save** *url* command is executed with an FTP path used as the *url* parameter, two FTP sessions simultaneously open to the FTP server. The FTP server must be configured to allow multiple sessions from the same login, otherwise, the configuration and index files will not be saved correctly.

Note:

- Persistency files (.ndx) are saved on the same disk as the configuration files and the image files.
- When an operator sets the location for the persistency file, the system will check to ensure that the disk has enough free space. If this there is not enough free space, the persistency will not become active and a trap will be generated. Then, it is up to the operator to free adequate disk space. In the meantime, the system will perform a space availability check every 30 seconds. As soon as the space is available the persistency will become active on the next (30 second) check.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default persist off

Parameters **on** — Enables the system index saves between reboots.

off — Disables the system index saves between reboots.

Platforms All

20.145 persistence

persistence

Syntax **persistence** *seconds*
no persistence

Context **[Tree]** (config>python>py-pol>cache>minimum-lifetimes persistence)

Full Context configure python python-policy cache minimum-lifetimes persistence

Description This command configures the minimum lifetime for a cache entry to be made persistent.

The **no** form of this command reverts to the default.

Parameters *persistence* — The minimum lifetime, in seconds.

Values 1 to 600

Platforms All

persistence

Syntax [**no**] **persistence**

Context **[Tree]** (config>python>py-pol>cache persistence)

Full Context configure python python-policy cache persistence

Description This command enables persistency support for the cached entries of the python-policy.

Context **[Tree]** (config>service>vpls>sap pfcp)

Full Context configure service vpls sap pfcp

Description Commands in this context configure an active PFCP association for the VPLS capture SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pfcp

Syntax **pfcp**

Context **[Tree]** (debug>subscr-mgmt pfcp)

Full Context debug subscriber-mgmt pfcp

Description Commands in this context use debug commands associated with the PFCP protocol.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.149 pfcp-association

pfcp-association

Syntax **pfcp-association** *name* [**create**]
no pfcp-association *name*

Context **[Tree]** (config>subscr-mgmt pfcp-association)

Full Context configure subscriber-mgmt pfcp-association

Description This command creates a PFCP association towards a BNG CUPS CPF.

The **no** form of this command removes the association.

Parameters *name* — Specifies the name of the PFCP association, up to 32 characters.

create — Keyword used to create the PFCP association.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.150 pfcp-mappings

pfcp-mappings

Syntax **pfcp-mappings**

Context **[Tree]** (config>subscr-mgmt>sla-prof pfcp-mappings)

Full Context configure subscriber-mgmt sla-profile pfcp-mappings

Description Commands in this context configure the mapping of PFCP QoS IEs (such as QER GBR/MBR IEs), to local QoS overrides (such as queue and policer rates).

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.151 pfs

pfs

Syntax **pfs** [**dh-group** {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no pfs

Context [Tree] (config>ipsec>ike-policy pfs)

Full Context configure ipsec ike-policy pfs

Description This command enables perfect forward secrecy on the IPsec tunnel using this policy. PFS provides for a new Diffie-Hellman key exchange each time the SA key is renegotiated. After that SA expires, the key is forgotten and another key is generated (if the SA remains up). This means that an attacker who cracks part of the exchange can only read the part that used the key before the key changed. There is no advantage in cracking the other parts if they attacker has already cracked one.

The **no** form of this command disables PFS. If this it turned off during an active SA, when the SA expires and it is time to re-key the session, the original Diffie-Hellman primes will be used to generate the new keys.

Default no pfs

Parameters **dh-group {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}** — Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits
Group 2: 1024 bits
Group 5: 1536 bits
Group 14: 2048 bits
Group 15: 3072 bits
Group 19: P-256 ECC Curve, 256 bits
Group 20: P-384 ECC Curve, 384 bits
Group 21: P-512 ECC Curve, 512 bits

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.152 pfs-dh-group

pfs-dh-group

Syntax **pfs-dh-group** {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}
pfs-dh-group inherit
no pfs-dh-group

Context [Tree] (config>ipsec>ipsec-transform pfs-dh-group)

Full Context configure ipsec ipsec-transform pfs-dh-group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the Diffie-Hellman group to be used for Perfect Forward Secrecy (PFS) computation during CHILD_SA rekeying.

The **no** form of this command reverts to the default.

Default pfs-dh-group inherit

Parameters {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**} — Specifies the Diffie-Hellman group to achieve PFS.

inherit — Specifies that the value of the DH group used by the system is inherited from the IPsec gateway or IPsec tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.153 pgw

pgw

Syntax **pgw**

Context **[Tree]** (config>subscr-mgmt>gtp>peer-profile pgw)

Full Context configure subscriber-mgmt gtp peer-profile pgw

Description Commands in this context configure communication with a Packet Data Network Gateway.

Default none

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.154 phone

phone

Syntax [**no**] **phone** *phone-number*

Context **[Tree]** (config>service>cust phone)

Full Context configure service customer phone

Description This command adds telephone number information for a customer ID. The **no** form of this command removes the phone number value from the customer ID.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *string* — Specifies the customer phone number entered as an ASCII string up to 80 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Any printable, seven bit ASCII characters may be used within the string.

Platforms All

20.155 physical-access-id

physical-access-id

Syntax [**no**] **physical-access-id**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp physical-access-id)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp physical-access-id

Description This command includes the physical access ID.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.156 pid-pmt-unref

pid-pmt-unref

Syntax [**no**] **pat-syntax**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pid-pmt-unref)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pid-pmt-unref)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms pid-pmt-unref)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pid-pmt-unref
configure mcast-management multicast-info-policy bundle channel video analyzer alarms pid-pmt-unref
configure mcast-management multicast-info-policy bundle video analyzer alarms pid-pmt-unref

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the analyzer to check for unreferenced PIDs that have not been referred in the PMT.

Default no pid-pmt-unref

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

20.157 pim

pim

Syntax **pim** {**asm** | **ssm**} *grp-ip-address*
no pim

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive pim)

Full Context configure service vprn mvpn provider-tunnel inclusive pim

Description This command specifies the PIM mode to use, ASM or SSM, for PIM-based inclusive provider tunnels and the multicast group address to use. Also enables the context for specifying parameters for PIM peering on the inclusive provider tunnel.

Auto-discovery must be enabled in order for SSM to operate.

The **no** form of this command removes the pim context including the statements under the context.

Default no pim

Parameters **asm** — Specifies to use PIM ASM for inclusive provider tunnels.

ssm — Specifies to u PIM SSM for inclusive provider tunnels.

group-address — Specifies the multicast group address to use.

Platforms All

pim

Syntax [**no**] **pim**

Context **[Tree]** (config>service>vprn pim)

Full Context configure service vprn pim

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a Protocol Independent Multicast (PIM) instance in the VPRN service. When an PIM instance is created, the protocol is enabled. PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router supports PIM sparse mode (PIM-SM).

The **no** form of this command deletes the PIM protocol instance removing all associated configuration parameters.

Platforms All

pim

Syntax [**no**] **pim**

Context **[Tree]** (config>router pim)

Full Context configure router pim

Description This command enables a Protocol Independent Multicast (PIM) instance.

PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router OS supports PIM sparse mode (PIM-SM).

The **no** form of this command disables the PIM instance.

Default no pim

Platforms All

pim

Syntax **pim** [*grp-address*]
no pim

Context **[Tree]** (debug>router>msdp pim)

Full Context debug router msdp pim

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP) PIM.

The **no** form of the command disables MSDP PIM debugging.

Parameters *grp-address* — Debugs the IP multicast group address for which this entry contains information.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.158 pim-asm

pim-asm

Syntax **pim-asm** {*grp-ip-address/mask* | *grp-ip-address netmask*}
no pim-asm

Context **[Tree]** (config>service>vprn>mvpn>pt>selective pim-asm)

Full Context configure service vprn mvpn provider-tunnel selective pim-asm

Description This command specifies the range of PIM-ASM groups to use on the sender PE to setup ASM multicast tree for draft Rosen based Data MDT.

Parameters *grp-ip-address* — Specifies the multicast group address.

mask — Specifies the mask of the multicast-ip-address.

Values 4 to 32

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

Platforms All

20.159 pim-policy

pim-policy

Syntax **pim-policy** *pim-policy-name* [**create**]
no pim-policy *pim-policy-name*

Context **[Tree]** (config>subscr-mgmt pim-policy)

Full Context configure subscriber-mgmt pim-policy

Description This command creates a PIM policy or enters the context to configure a PIM policy.

The **no** form of this command deletes the specified PIM policy.

Parameters *pim-policy-name* — Specifies the PIM policy name, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

create — Specifies the keyword used to create the PIM policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pim-policy

Syntax **pim-policy** *policy-name*
no pim-policy *policy-name*

Context **[Tree]** (config>subscr-mgmt>sub-prof pim-policy)

Full Context configure subscriber-mgmt sub-profile pim-policy

Description This command adds an existing PIM policy to this subscriber profile.

The **no** form of this command removes the specified PIM policy from this subscriber profile.

Parameters *policy-name* — Specifies the name of the PIM policy name, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.160 pim-snooping

pim-snooping

Syntax **pim-snooping** [**saps**] [**spoke-sdps**]
no pim-snooping

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync pim-snooping)

Full Context configure redundancy multi-chassis peer sync pim-snooping

Description This command specifies whether PIM snooping for IPv4 information should be synchronized with a multi-chassis peer. Entering **pim-snooping** without any parameters results in the synchronization being applied only to SAPs.

Specifying the **spoke-sdps** parameter results in the synchronization being applied to manually configured spoke SDPs. Specifying both the **saps** and **spoke-sdps** parameters results in the synchronization being applied to both SAPs and manually configured spoke SDPs.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint. See PIM Snooping for IPv4 Synchronization for service support.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no pim-snooping

Parameters **saps** — Specifies that SAPs are to be synchronized with the multi-chassis peer according to the synchronization tags configured on the port. This is the default when no parameters are specified.

spoke-sdps — Specifies that spoke SDPs are to be synchronized with the multi-chassis peer according to the synchronization tags configured on spoke SDPs.

Platforms All

pim-snooping

Syntax **pim-snooping**

Context **[Tree]** (config>service>vpls pim-snooping)
[Tree] (config>service>vpls>spoke-sdp pim-snooping)
[Tree] (config>service>vpls>sap pim-snooping)

Full Context configure service vpls pim-snooping
configure service vpls sap pim-snooping
configure service vpls spoke-sdp pim-snooping

Description This command enables PIM snooping for the VPLS service. When enabled, it is enabled for all SAPs except default SAPs. A default SAP is a SAP that has a wild card VLAN ID, such as sap 1/1/1:*.

The **no** form of this command removes the PIM snooping configuration.

Platforms All

pim-snooping

Syntax [**no**] **pim-snooping**

Context **[Tree]** (debug>service>id pim-snooping)

Full Context debug service id pim-snooping

Description This command enables PIM-snooping debugging.

20.161 pim-ssm

pim-ssm

Syntax **pim-ssm** {*grp-ip-address/mask* | *grp-ip-address netmask*}
no pim-ssm

Context **[Tree]** (config>service>vprn>mvpn>pt>selective pim-ssm)

Full Context configure service vprn mvpn provider-tunnel selective pim-ssm

Description This command specifies the PIM SSM groups to use for the selective provider tunnel.

Parameters *group-address/mask* — Specifies a multicast group address and netmask length.

Platforms All

20.162 pim-ssm-scaling

pim-ssm-scaling

Syntax [**no**] **pim-ssm-scaling**

Context **[Tree]** (config>router>pim pim-ssm-scaling)

Full Context configure router pim pim-ssm-scaling

Description This command enables an increase of PIM SSM (S,G) scaling to a maximum of 256kper system. The per-complex (FP) multicast scaling limit is still in place, but multiple complexes can be used to achieve the 256k per-system (S,G) scaling.

The **no** form of this command disables the increase in PIM SSM scaling.

Default no pim-ssm-scaling

20.163 ping

ping

Syntax **ping** {*ip-address* | *dns-name*} [**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}] [**count** *requests*] [**detail** | **rapid**] [**do-not-fragment**] [**fc** *fc-name*] [**interval** {**centisecs** | **secs**}] [**pattern** *pattern*] [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**size** *bytes*] [**source** *ip-address*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

ping *ipv4-address* **subscriber-id** *sub-dent-string* [**count** *requests*] [**detail** | **rapid**] [**do-not-fragment**] [**fc** *fc-name*] [**interval** {**centisecs** | **secs**}] [**pattern** *pattern*] [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**size** *bytes*] [**source** *ip-address*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

Context **[Tree]** (global ping)

Full Context global ping

Description **Generic ping to verify IP reachability**

The **ping** {*ip-address* |*dns-name*} [{**bypass-routing** |{**interface** *interface-name*} |{**next-hop** *ip-address*}}] command is the TCP/IP utility that is used to verify IP reachability.

Ping to verify L2-aware remote host reachability

The **ping** *ipv4-address* **subscriber-id** *sub-dent-string* command can be initiated from the gateway IPv4 address in the inside routing context or from any IPv4 address in the outside routing context. If the gateway IPv4 address is used as the source address, it must be explicitly configured in the L2-Aware **ping** command.

To test the relevant NAT policy, any source address can be used for the ping. If the given source address refers to a policy that does not reside on the given router, the message “MINOR: OAM #2160 router ID is not an outside router for this subscriber” is displayed to the operator. The source address does not have to belong to the system.

If the outside routing context is not specified, by default, the Base router is selected. If the specified or the default Base router instance is not the outside routing context for the subscriber, the L2-Aware **ping** command execution fails and the message “MINOR: OAM #2160 router ID is not an outside router for this subscriber” is displayed to the operator.

The NAT application shares query IDs between L2-Aware pings and ICMP or GRE traffic that has undergone NAT and is destined to a DMZ host. If there is query ID space exhaustion, ICMP/GRE flows destined to DMZs hosts are deleted so their query IDs can be reused for the requested L2-Aware pings.

Parameters **bypass-routing** — Specifies whether to send the ping request to a host on a directly attached network, bypassing the routing table.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

bytes — Specifies the request packet size in bytes, expressed as a decimal integer.

Values 0 to 16384

Default 56

centiseconds | *secs* — Sets the interval.

Values 1 to 10000 centiseconds, if **rapid** is selected.
1 to 1000 seconds, if **secs** is selected.

Default 1 centisecond if **rapid** is selected.
1 second if **secs** is selected.

detail — Displays detailed information.

do-not-fragment — Sets the DF (Do Not Fragment) bit in the ICMP ping packet (does not apply to ICMPv6).

dns-name — Specifies the DNS name of the far-end device to which to send the **svc-ping** request message, expressed as a character string.

fc-name — Specifies the forwarding class of the MPLS echo request packets.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

interface-name — Specifies the name of an IP interface. The name must already exist in the **config>router>interface** context.

ip-address — Specifies the far-end IP address, in dotted decimal notation, to which to send the **svc-ping** request message.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x[-*interface*]	
	x:x:x:x:x:x:d.d.d.d[-*interface*]	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
	interface:	up to 32 characters, mandatory for link local addresses

next-hop *ip-address* — Displays only static routes with the specified next hop IP address.

Values

ipv4-address:	a.b.c.d (host bits must be 0)	
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

pattern — Specifies that the date portion in a ping packet that is filled with the pattern value specified. If not specified, position information is filled instead.

Values 0 to 65535

Default system-generated sequential pattern

rapid — Specifies that packets be generated as fast as possible instead of the default 1 per second.

requests — Specifies the number of times to perform an OAM ping probe operation. Each OAM echo message request must either time out or receive a reply before the next message request is sent.

Values 1 to 100000

Default 5

router-instance — Specifies the preferred method for entering a service name. Stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, *cpm-vr-name*, vpls-management
vprn-svc-name: The service name, up to 64 characters
cpm-vr-name: The CPM VR name, up to 32 characters

router-or-service — Specifies the routing instance or service, by number. The *router-instance* parameter is preferred for specifying the router or service.

Values router-name: Base, management, vpls-management
vprn-svc-id: 1 to 2147483647

Default Base

seconds — Overrides the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Default 5

Values 1 to 10

service-name — Specifies the alias function that allows the service-name to be used, converted, and stored as a service ID.

sub-ident-string — Specifies the L2-Aware NAT subscriber to which ICMP-ping is sent, up to 32 characters. The **subscriber-id** keyword serves as a differentiator between the subscribers with the same IP address in the same routing context (which is allowed in L2-Aware NAT). The **subscriber-id** keyword is mandatory for L2-Aware IPv4 ping, but optional in generic ping framework.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

source *ip-address* — Specifies the IP address to be used.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

timeout — Specifies the time out, in seconds.

Values 1 to 10

Default 5

type-of-service — Specifies the service type.

Values 0 to 255

Default 0

time-to-live — Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 128

Default 64

20.164 ping-reply

ping-reply

Syntax [**no**] **ping-reply**

Context **[Tree]** (config>service>ies>if>ipv6>vrrp ping-reply)

Full Context configure service ies interface ipv6 vrrp ping-reply

Description This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The ping request can be received on any routed interface.

Ping must not have been disabled at the management security level (either on the parental Ip interface or based on the ping source host address). when ping-reply is not enabled, icmp Echo Requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests regardless of the setting of ping-reply configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The ping-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ping-reply command is not executed, ICMP echo requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

Default no ping-reply

[Tree] (config>router>if>ipv6>vrrp ping-reply)

Full Context configure router interface ipv6 vrrp ping-reply
configure router interface vrrp ping-reply

Description This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

SR OS allows this access limitation to be selectively lifted for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ping-reply** command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The Ping request can be received on any routed interface. Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address).

ping-template

Syntax **ping-template** *template-name* [**create**]
no ping-template *template-name*

Context **[Tree]** (config>test-oam>icmp ping-template)

Full Context configure test-oam icmp ping-template

Description This command creates a ping-template that can be assigned to a VPRN or IES service IP interface.

The **no** form of this command removes the template name from the configuration.

Parameters *template-name* — Specifies the name of the ping template, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ping-template

Syntax **ping-template** *template-name*
no ping-template

Context **[Tree]** (config>service>ies>if ping-template)
[Tree] (config>service>vprn>if ping-template)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service ies interface ping-template
configure service vprn interface ping-template

Description This command maps a **ping-template** name to the service IP interface. The **ping-template** *template-name* is configured in the **config>test-oam>icmp** context and assigned to the service IP interface using this command.

The **config>service>ies|vprn**>if>ping-template must be shut down to remove or change the **destination-address** value.

The **no** form of this command removes the template name from the configuration.

Parameters *template-name* — Specifies the name of the ping template to be assigned to the IP interface, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

20.166 ping-test

ping-test

Syntax [**no**] **ping-test**

Context **[Tree]** (config>filter>redirect-policy>dest ping-test)

Full Context configure filter redirect-policy destination ping-test

Description This command configures parameters to perform connectivity ping tests to validate the ability for the destination to receive redirected traffic.

Default no ping-test

Platforms All

20.167 pip

pip

Syntax **pip**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if pip)

Full Context configure mcast-management multicast-info-policy video-policy video-interface pip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure within a video interface policy the properties relating to requests received by the video interface for Picture-in-Picture (PIP) channel requests.

Default none

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

20.168 pir

pir

Syntax **pir** *pir-rate*
pir max
no pir

Context **[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl pir)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level pir

Description This command configures the PIR which is enforced for all queues pertaining to this category.

The **no** form of this command reverts to the default.

Parameters *pir-rate* — Specifies the amount of bandwidth in kilobits per second.

Values 1 to 100000000

max — Specifies to use the maximum amount of bandwidth.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pir

Syntax **pir** *congested-pir*
no pir

Context **[Tree]** (config>app-assure>group>policer>congestion-override pir)

Full Context configure application-assurance group policer congestion-override pir

Description This command provides a mechanism to configure the PIR for the congestion override policer. It is recommended that the PIR is configured larger than twice the maximum MTU for the traffic handled by the policer to allow for some burstiness of the traffic.

The **no** form of this command resets the PIR value to its default.

Default pir max

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *congested-pir* — Specifies an integer value defining size, in kbytes, for the PIR of the policer.

Values 0 to 100000000, max

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pir

Syntax **pir** *pir-rate*
no pir

Context **[Tree]** (config>app-assure>group>pol>cng-ovrd-stg2 pir)

Full Context configure application-assurance group policer congestion-override-stage2 pir

Description This command provides a mechanism to configure the PIR for the congestion override policer. It is recommended that the PIR is configured larger than twice the maximum MTU for the traffic handled by the policer to allow for some burstiness of the traffic.

The **no** form of this command resets the PIR value to its default.

Default pir max

Parameters *congested-pir* — Specifies an integer value defining size, in kbytes, for the PIR of the policer.

Values 0 to 100000000, max

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.170 pkt-too-big

pkt-too-big

Syntax [**no**] **pkt-too-big**

Context **[Tree]** (config>ipsec>tnl-temp>icmp6-gen pkt-too-big)
[Tree] (config>service>ies>if>ipsec>ipsec-tunnel>icmp6-gen pkt-too-big)
[Tree] (config>service>vprn>if>ipsec>ipsec-tunnel>icmp6-gen pkt-too-big)
[Tree] (config>service>vprn>if>sap>ipsec-tun>icmp6-gen pkt-too-big)
[Tree] (config>router>if>ipsec-tunnel>icmp-gen pkt-too-big)

Full Context configure ipsec tunnel-template icmp6-generation pkt-too-big
configure router interface ipsec-tunnel icmp-gen pkt-too-big
configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big

Description This command enables the system to send ICMPv6 PTB (Packet Too Big) messages on the private side and optionally specifies the rate.

With this command configured, the system sends PTB back if it received an IPv6 packet on the private side that is bigger than 1280 bytes and also exceeds the private MTU of the tunnel.

The **ip-mtu** command (under **ipsec-tunnel** or **tunnel-template**) specifies the private MTU for the ipsec-tunnel or dynamic tunnel.

The **no** form of this command reverts **interval** and **message-count** values to their default values.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec tunnel-template icmp6-generation pkt-too-big
- configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big

VSR

- configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
- configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big

20.173 pmt-repetition

pmt-repetition

Syntax **pcr-repetition** [**tnc** *tnc-milli-seconds* **qos** *qos-milli-seconds* **poa** *poa-milli-seconds*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no pcr-repetition

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pmt-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pmt-repetition)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms pmt-repetition)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pmt-repetition
configure mcast-management multicast-info-policy bundle channel video analyzer alarms pmt-repetition
configure mcast-management multicast-info-policy bundle video analyzer alarms pmt-repetition

Description This command configures the analyzer to check for the program map table (PMT). It is expected that the PMT arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PMT fails to arrive within the specified interval. As the delay increases between two consecutive PMTs, the type of alarm raised becomes more critical, from TNC to POA.

Default no pmt-repetition

Parameters *tnc-milli-seconds* — Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

Values 100 to 4800 in multiples of 100 only

Default 400

qos-milli-seconds — Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

Values 200 to 4900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

Default 800

poa-milli-seconds — Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

Values 300 to 5000 in multiples of 100 only and higher than the *qos-milli-seconds* value

Default 2000

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

20.174 pmt-syntax

pmt-syntax

Syntax [**no**] **pat-syntax**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms pmt-syntax)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms pmt-syntax)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms pmt-syntax)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pmt-syntax
configure mcast-management multicast-info-policy bundle channel video analyzer alarms pmt-syntax
configure mcast-management multicast-info-policy bundle video analyzer alarms pmt-syntax

Description This command configures the analyzer to check for PMT syntax errors.

Default no pmt-syntax

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

20.175 pmtu-discovery-aging

pmtu-discovery-aging

Syntax **pmtu-discovery-aging** *seconds*

policer

Syntax [**no**] **policer** *policer-id*

Context **[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos policer)
[Tree] (config>subscr-mgmt>sla-prof>egress>qos policer)

Full Context configure subscriber-mgmt sla-profile egress qos policer
configure subscriber-mgmt sla-profile ingress qos policer

Description This command is used in the sap-ingress and sap-egress QoS policies to create, modify or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that is associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policer-id* — Specifies the policer ID. The policer-id must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID is created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 63

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

policer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates, modifies or deletes a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping fails.

The **no** form of this command deletes a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters *policer-id* — Specifies that the *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 32

configure service fpipe sap egress policer-override policer
configure service fpipe sap ingress policer-override policer
configure service ipipe sap egress policer-override policer
configure service ipipe sap ingress policer-override policer

Description This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

Parameters *policer-id* — The *policer-id* parameter is required when executing the policer command within the policer-overrides context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the policer-id.

create — The create keyword is required when a **policer** policer-id override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

Context **[Tree]** (config>service>vpls>sap>egress>policer-override policer)
[Tree] (config>service>vpls>sap>ingress>policer-override policer)

Full Context configure service vpls sap egress policer-override policer
configure service vpls sap ingress policer-override policer

Description This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

Parameters *policer-id* — The policer-id parameter is required when executing the policer command within the policer-overrides context. The specified policer-id must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the policer-id.

create — The create keyword is required when a policer policer-id override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

policer

Syntax **policer** *policer-id* [**create**]
no policer *policer-id*

Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>ies>if>sap>egress>policer-override policer)
[Tree] (config>service>ies>if>sap>ingress>policer-override policer)

Full Context configure service ies interface sap egress policer-override policer
configure service ies interface sap ingress policer-override policer

Description This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

Parameters *policer-id* — This parameter is required when executing the policer command within the policer-override context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the *policer-id*.

create — The create keyword is required when a policer override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit configuration, the **create** keyword is not required.

policer

Syntax **policer** *policer-name* **type** *type* **granularity** *granularity* [**create**]
policer *policer-name*
no policer *policer-name*

Context **[Tree]** (config>app-assure>group policer)

Full Context configure application-assurance group policer

Description This command creates application assurance policer profile of a specified type. Policers can be bandwidth or flow limiting and can have a system scope (limits traffic entering AA ISA for all or a subset of AA subscribers), subscriber scope or granularity (limits apply to each AA subscriber traffic).

The policer type and granularity can only be configured during creation. They cannot be modified. The policer profile must be removed from all AQPs in order to be removed. Changes to policer profile parameters take effect immediately for policers instantiated as result of AQP actions using this profile.

The **no** form of this command deletes the specified policer from the configuration.

Parameters *policer-name* — Specifies a string of up to 32 characters that identifies the policer.

type — Specifies the policer type.

Values **single-bucket-bandwidth** — Creates a profile for a single bucket (PIR) bandwidth limiting policer.

dual-bucket-bandwidth — Creates profile for a dual bucket (PIR, CIR) bandwidth limiting policer.

flow-rate-limit — Creates profile for a policer limiting rate of flow set-ups.

flow-count-limit — Creates profile for a policer limiting total flow count.

granularity — Specifies the granularity type.

Values **system** — Creates a system policer profile for a policer that limits the traffic in the scope of all or a subset of AA subscribers on a given AA ISA.

subscriber — Creates a policer profile for a policer for each AA subscriber that limits the traffic in the scope of that subscriber.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

access-network-location — Creates a policer profile for a policer instance for each ANL that limits traffic bandwidth in the scope of that ANL. For ANL, only single-bucket bandwidth policers can be configured.

create — Keyword used to create the policer name and parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

policer

Syntax **policer** *policer-name* **direction** *direction* [**create**]
no policer *policer-name* **direction** *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca policer)

Full Context configure application-assurance group statistics threshold-crossing-alert policer

Description This command configures a TCA for the counter capturing drops or admit events due to the specified flow policer. A policer TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a policer TCA.

Parameters *policer-name* — Specifies the name of the flow policer, up to 32 characters

direction — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

policer

Syntax **policer** *policer-id* [**fp-redirect-group**]
no policer

Context **[Tree]** (config>qos>sap-ingress>fc policer)

Full Context configure qos sap-ingress fc policer

Description Within a sap-ingress QoS policy forwarding class context, the **policer** command is used to map packets that match the forwarding class and are considered unicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination. If ingress forwarding logic has resolved a unicast destination (the packet does not need to be sent to multiple destinations), it is considered to be a unicast packet and will be mapped to either an ingress queue (using the **queue** *queue-id* or **queue** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**policer** *policer-id*).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **queue** and **policer** commands within the forwarding class context are mutually exclusive. By default, the unicast forwarding type is mapped to the SAP ingress default queue (queue 1). If the **policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

When the unicast forwarding type within a forwarding class is mapped to a policer, the unicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unicast forwarding type within the forwarding class to the default queue. If all forwarding class forwarding types had been removed from the default queue, the queue will not exist on the SAPs or subscriber or multiservice sites associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the unicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters *policer-id* — When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group — Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

policer

Syntax **policer** *policer-id* [**create**]
no policer *policer-id*

Context **[Tree]** (config>qos>sap-ingress policer)

Full Context configure qos sap-ingress policer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used in the sap-ingress and sap-egress QoS policies to create, modify, or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may be defined to have up to 63 policers (numbered 1 through 63) while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers or multiservice sites associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

When a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet, based on a defined number of bytes.

When a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscriber or multiservice sites associated with the QoS policy when all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters *policer-id* — The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 63

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

policer

Syntax **policer** *policer-id* [{[**port-redirect-group-queue**] [**queue** *queue-id*] | **group** *group-name* [**instance** *instance-id*] [**queue** *queue-id*]}]
no policer

Context **[Tree]** (config>qos>sap-egress>fc policer)

Full Context configure qos sap-egress fc policer

Description Within a sap-egress QoS policy forwarding class context, the policer command is used to map packets that match the forwarding class to the specified policer-id. The specified policer-id must already exist within the sap-egress QoS policy. The forwarding class of the packet is first discovered at ingress, based on the ingress classification rules. When the packet arrives at egress, the sap-egress QoS policy may match a forwarding class reclassification rule that overrides the ingress derived forwarding class. The forwarding class context within the sap-egress QoS policy is then used to map the packet to an egress queue (using the queue queue-id, or port-redirect-group queue queue-id, or group queue-group-name instance instance-id queue queue-id commands) or an egress policer (policer policer-id). The queue and policer commands within the forwarding class context are mutually exclusive. By default, the forwarding class is mapped to the SAP egress default queue (queue 1). If the **policer** *policer- id* command is executed, any previous policer mapping or queue mapping for the forwarding class is overridden if the policer mapping is successful.

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default no policer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policer-id* — When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

Values 1 to 63

port-redirect-group-queue — Used to override the forwarding class default egress queue destination to an egress port queue group. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the SAP. Therefore, this parameter is only valid if SAP-based redirection is required.

queue *queue-id* — This parameter overrides the forwarding class default egress queue destination to a specified *queue-id*. If port-redirect-group is not configured, this will be a local SAP queue of that *queue-id*. A queue of ID *queue-id* must exist within the egress QoS policy. If **port-redirect-group-queue** is configured, the **queue** *queue-id* in the egress port queue group instance is used.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition.

group *group-name* — The **group** *queue-group-name* is optional and is used to override the forwarding class's default egress queue destination. If the queue group-queue-id parameter is not specified, the forwarding class map within the specified group's template is used to derive which queue within the group will receive the forwarding class's packets. An egress queue group template must exist for the specified queue-group-name or the policer command will fail. The specified queue-group-name must also exist as an egress queue group on the ports where SAPs and subscribers associated with the sap-egress policy are applied or the policer command will fail.

Values Any qualifying egress queue group name

Default policer-output-queues

queue *queue-id* — The **queue** *group-queue-id* is optional when the group queue-group-name parameter is specified and is used to override the forwarding class mapping within the group's egress queue group template. The specified group-queue-id must exist within the group's egress queue group template or the policer command will fail.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition

instance *instance-id* — This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 40960

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

policer

Syntax **policer** *policer-id* [**create**]
no policer

Context **[Tree]** (config>qos>sap-egress policer)

Full Context configure qos sap-egress policer

Description A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.
- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default no policer

Parameters *policer-id* — When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

Values 1 to 63

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

policer

Syntax **policer** *policer-id* [**create**]
no policer *policer-id*

Context **[Tree]** (config>qos>qgrps>ing>queue-group policer)
[Tree] (cfg>qos>qgrps>egr>queue-group policer)

Full Context configure qos queue-group-templates egress queue-group policer
configure qos queue-group-templates ingress queue-group policer

Description This command is used in ingress and egress queue-group templates to create, modify, or delete a policer.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. While a policer may be defined in a queue-group template, it is not actually created until the queue-group template is instantiated on the ingress context of a forwarding plane or on the egress context of a port.

When a policer is created, the policer's metering rate and profiling rates may be defined, as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

When a policer is created, it cannot be deleted from the queue-group template unless any forwarding classes that are redirected to the policer are first removed.

The **no** version of this command deletes the policer.

Parameters *policer-id* — The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the **create** keyword to actually add the new policer ID to the QoS policy) and the system enters that new policer's context for possible parameter modification.

configure service ipipe sap egress policer-control-override
configure service ipipe sap ingress policer-control-override

Description This command, within the SAP ingress or egress contexts, creates a CLI node for specific overrides to the applied policer-control-policy. A policy must be applied for a policer-control-overrides node to be created. If the policer-control-policy is removed or changed, the policer-control-overrides node is automatically deleted from the SAP.

The **no** form of this command removes any existing policer-control-policy overrides and the policer-control-overrides node from the SAP.

Default no policer-control-override

Parameters **create** — The create keyword is required when the policer-control-overrides node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

Full Context configure subscriber-mgmt sub-profile egress policer-control-policy
configure subscriber-mgmt sub-profile ingress policer-control-policy

Description This command is used to create, delete, or modify policer control policies. The **policer-control-policy** controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy can also be applied to the ingress or egress context of a sub-profile.

The **no** form of this command reverts to the default.

Parameters *policy-name* — Specifies the policer control policy name. Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

create — The **create** keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

configure service ipipe sap ingress policer-control-policy

Description This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied.

When applied to a sub-profile on a 7450 ESS and 7750 SR, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis.

For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

As previously stated, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated in the Tier 1 and Tier 2 Arbiter subsection, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

Each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

Parameters *policy-name* — Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

Description This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters *policy-name* — Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

policer-control-policy

Syntax **policer-control-policy** *policy-name*
no policer-control-policy

Context **[Tree]** (config>service>ies>if>sap>egress policer-control-policy)
[Tree] (config>service>ies>if>sap>ingress policer-control-policy)

Full Context configure service ies interface sap egress policer-control-policy
configure service ies interface sap ingress policer-control-policy

Description This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters *policy-name* — Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

Description This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation
