from

Syntax **from** [**main**] [**security**] [**change**] [**debug-trace**]
no from

Context **[Tree]** (config>service>vprn>log>log-id from)

Full Context configure service vprn log log-id from

Description This command selects the source stream to be sent to a log destination.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

One or more source streams must be specified. The source of the data stream must be identified using the **from** command before you can configure the destination using the **to** command. The **from** command can identify multiple source streams in a single statement (for example: **from main change debug-trace**).

Only one **from** command may be entered for a single *log-id*. If multiple **from** commands are configured, then the last command entered overwrites the previous **from** command.

The **no** form of this command removes all previously configured source streams.

Default No source stream is configured.

Parameters **main** — Instructs all events in the main event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The main event stream contains the events that are not explicitly directed to any other event stream. To limit the events forwarded to the destination, configure filters using the **filter** command.

security — Instructs all events in the security event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The security event stream contains all events that pertain to attempts to breach system security. To limit the events forwarded to the destination, configure filters using the **filter** command.

change — Instructs all events in the user activity stream to be sent to the destination configured in the **to** command for this destination *log-id*. The change event stream contains all events that directly affect the configuration or operation of this node. To limit the events forwarded to the change stream destination, configure filters using the filter command.

debug-trace — Instructs all events in the debug-trace event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The debug-trace event stream contains all events that pertain to trace or other debugging information. To limit the events forwarded to the destination, configure filters using the **filter** command.

Platforms All

from

Syntax **from** *ip-address*

Context **[Tree]** (config>router>mpls>lsp from)
[Tree] (config>router>mpls>lsp-template from)

Full Context configure router mpls lsp from
configure router mpls lsp-template from

Description This optional command specifies the IP address of the ingress router for the LSP. When this command is not specified, the system IP address is used. IP addresses that are not defined in the system are allowed. If an invalid IP address is entered, LSP bring-up fails and an error is logged.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If an interface IP address is specified as the **from** address, and the egress interface of the LSP nexthop IP address is a different interface, the LSP is not signaled. As the egress interface changes due to changes in the routing topology, it is recommended to set the **from** IP address to the system IP address or to the address of a loopback interface to ensure the LSP recovers.

Only one **from** address can be configured.

Default The system IP address

Parameters *ip-address* — Specifies the IP address of the ingress router. This can be either the interface, the system or a loopback interface IP address. If the IP address is local, the LSP must egress through that local interface which ensures local strictness. When the LSP type is **sr-te**, then an IPv6 address can be used.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

Platforms All

Syntax **from li**
no from

Context **[Tree]** (config>li>log>log-id from)

Full Context configure li log log-id from

Description This command configures a bit mask that specifies the log event source stream(s) to be forwarded to the destination specified in the log destination (memory, session, SNMP). Events from more than one source can be forwarded to the log destination.

Parameters **li** — Specifies the **li** event stream that contains all events configured for Lawful Intercept activities.

If the requester does not have access to the **li** context, the event stream will fail.

Context [Tree] (config>oam-pm>session>mpls>lsp>rsvp-auto from)

Full Context configure oam-pm session mpls lsp rsvp-auto from

Description One of three mandatory configuration statements that are required to identify automatically create RSVP LSPs, created using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp** *lsp-template* links three distinct functions. The **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and config>router>mpls> lsp-template. The from address under the test context is the same as the config>router>mpls>lsp-template>from address.

The three required identifiers are from, lsp-template and to, all under this container.

The **no** form of this command deletes the IP address from the configuration.

Parameters *ipv4-address* — Specifies the IPv4 address.

Values a.b.c.d.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context [Tree] (config>log>log-id from)

Full Context configure log log-id from

Description This command selects the source stream to be sent to a log destination.

One or more source streams must be specified. The source of the data stream must be identified using the **from** command before you can configure the destination using the **to** command. The **from** command can identify multiple source streams in a single statement (for example: **from main change debug-trace**).

Only one **from** command may be entered for a single *log-id*. If multiple **from** commands are configured, then the last command entered overwrites the previous **from** command.

The **no** form of this command removes all previously configured source streams.

Parameters **main** — Instructs all events in the main event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The main event stream contains the events that are not explicitly directed to any other event stream. To limit the events forwarded to the destination, configure filters using the **filter** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

security — Instructs all events in the security event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The security stream contains all events that affect attempts to breach system security such as failed login attempts, attempts to access MIB tables to which the user is not granted access or attempts to enter a branch of the CLI to which access has not been granted. To limit the events forwarded to the destination, configure filters using the **filter** command.

change — Instructs all events in the user activity stream to be sent to the destination configured in the **to** command for this destination *log-id*. The change event stream contains all events that directly affect the configuration or operation of this node. To limit the events forwarded to the change stream destination, configure filters using the **filter** command.

debug-trace — Instructs all debug-trace messages in the debug stream to be sent to the destination configured in the **to** command for this destination *log-id*. Filters applied to debug messages are limited to application and subject.

from-subscriber

Syntax **from-subscriber**

Context **[Tree]** (config>isa>aa-grp>qos>egress from-subscriber)

Full Context configure isa application-assurance-group qos egress from-subscriber

Description Commands in this context configure Quality of Service for this application assurance group from-subscriber logical port, traffic entering the system from AA subscribers and entering an application assurance engine.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.160 from-vpls

from-vpls

Syntax **from-vpls** *service-id*
no from-vpls

Context **[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mvr from-vpls)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mvr from-vpls

Description This command configures the VPLS from which multicast traffic is copied upon receipt of an IGMP join request.

IGMP snooping must be enabled on the MVR VPLS.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — Specifies the MVR VPLS from which multicast channels be copied into an MSAP.

Values
service-id: 1 to 2147483647
service-name: up to 64 characters (applies only to the 7750 SR)

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

from-vpls

Syntax **from-vpls** *vpls-id*
no from-vpls

configure service vpls sap mld-snooping mvr from-vpls

Description This command configures the VPLS from which multicast traffic is copied upon receipt of an IGMP join request. IGMP snooping must be enabled on the MVR VPLS.

Default no from-vpls

Parameters *vpls-id* — Specifies the MVR VPLS from which multicast channels should be copied into this SAP

Values *service-id*:1 to 2147483648

Platforms All

10.161 frr

frr

Syntax **frr** [**detail**]
no frr

Context **[Tree]** (debug>router>mpls>event frr)

Full Context debug router mpls event frr

Description This command debugs fast re-route events.

The **no** form of the command disables the debugging.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **detail** — Displays detailed information about re-route events.

Platforms All

10.162 frr-object

frr-object

Syntax [**no**] **frr-object**

Context **[Tree]** (config>router>mpls frr-object)

Full Context configure router mpls frr-object

Description This command specifies whether fast reroute for LSPs using the **facility** bypass method is signaled with or without the fast reroute object using the **one-to-one** keyword. The value is ignored if fast reroute is disabled for the LSP or if the LSP is using one-to-one Backup.

Default frr-object — Specifies the value is by default inherited by all LSPs.

Platforms All

configure service vprn segment-routing-v6 locator function

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure SRv6 SID function values and parameters for the locator.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

10.168 function-length

function-length

Syntax **function-length** *function-length*
no function-length

Context **[Tree]** (config>router>segment-routing>srv6>locator function-length)

Full Context configure router segment-routing segment-routing-v6 locator function-length

Description This command configures the length of the function field of an SRv6 locator.

The sum of the function length and the locator prefix length must not exceed 128 bits. This is enforced by CLI validation.

The **no** form of this command reverts to the default value.

Default function-length 20

Parameters *function-length* — Specifies the function length, in bits.

Values 20 to 96

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

10.169 fwd-inside-router

fwd-inside-router

Syntax **fwd-inside-router** *router-instance*
fwd-inside-router service-name *service-name*
no fwd-inside-router

Context **[Tree]** (config>router>pcp-server>server fwd-inside-router)

Full Context configure router pcp-server server fwd-inside-router

Description This command configures the PCP forwarding inside virtual router instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default no fwd-inside-router

Parameters *router-instance* — Specifies the router name or the VPRN service ID.

Values
router-instance: *router name* | *vprn-svc-id*

router-name	Base
vprn-svc-id	1 to 2147483647

service-name — Specifies the service name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

10.170 fwd-path-ext

fwd-path-ext

Syntax **fwd-path-ext**

Context **[Tree]** (config fwd-path-ext)

Full Context configure fwd-path-ext

Description This command provides context for configuring Forwarding Path Extensions (FPE). FPE is utilized by certain applications that rely on PXC functionality. Its purpose is to simplify configuration of such applications.

Platforms All

10.171 fwd-wholesale

fwd-wholesale

Syntax **fwd-wholesale**

Context **[Tree]** (config>service>vprn>if>sap fwd-wholesale)

11 g Commands

11.1 garp-flood-evpn

garp-flood-evpn

Syntax [**no**] **garp-flood-evpn**

Context **[Tree]** (config>service>vpls>proxy-arp garp-flood-evpn)

Full Context configure service vpls proxy-arp garp-flood-evpn

Description This command controls whether the system floods GARP-requests and GARP-replies to the EVPN. The GARPs impacted by this command are identified by the sender's IP being equal to the target's IP and the MAC DA being broadcast.

The **no** form of the command only floods to local SAPs or binds but not to EVPN destinations.

Disabling this command is only recommended in networks where CEs are routers that are directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood GARP messages in the EVPN to ensure that the remote caches are updated and the BGP does not miss the advertisement of these entries.

Default garp-flood-evpn

Platforms All

11.2 gateway

gateway

Syntax **gateway name** *name* **tunnel** *ip-address*[**:***port*] [**nat-ip** *nat-ip*[**:***port*]] [**detail**] [**no-dpd-debug**] [**display-keys**]
no gateway name *name* **tunnel** *ip-address*[**:***port*] [**nat-ip** *nat-ip*[**:***port*]
gateway name *name* **tunnel-subnet** *ip-prefix/ip-prefix-length* [**port** *port*] [**detail**] [**no-dpd-debug**] [**display-keys**]
no gateway name *name* **tunnel-subnet** *ip-prefix/ip-prefix-length*

Context **[Tree]** (debug>ipsec gateway)

Full Context debug ipsec gateway

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables debugging for dynamic IPsec tunnels that terminate on the specified IPsec gateway.

The tunnel to be debugged can be specified by either its source address or source subnet. If a subnet is specified, the system will enable debugging for all tunnels with source addresses in the specified subnet.

Parameters *name* — Specifies the name of the IPsec gateway up to 32 characters.

ip-address:port — Specifies the tunnel IP address of the remote peer and, optionally, the remote UDP port of IKE.

nat-ip:port — Specifies the inside IP address of the NAT tunnel and, optionally, the port.

detail — Specifies to display detailed debug information.

no-dpd-debug — Specifies to stop logging IKEv1 and IKEv2 DPD events during debug in order to produce less noise.

ip-prefix/ip-prefix-length — Specifies the subnet of the peer's tunnel address.

display-keys — Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gateway

Syntax **gateway** [**create**]
no gateway

Context **[Tree]** (config>mirror>mirror-dest>encap>layer-3-encap gateway)

Full Context configure mirror mirror-dest encap layer-3-encap gateway

Description This command configures the parameters to send the mirrored packets to a remote destination gateway. Once a gateway is created, no changes to the **layer-3-encap** type, router or direction-bit are allowed.

Platforms All

11.3 gateway-ip

gateway-ip

Syntax **gateway-ip** *ip-address*
no gateway-ip

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vpls>video-interface gateway-ip)

Full Context configure service vpls video-interface gateway-ip

Description This command assigns a gateway IP address for the video interface within the VPLS service. Because VPLS is a Layer 2 service and the video interface is modeled like a host within the service, the video interface needs a gateway IP to send requests to devices outside of the VPLS subnet.

The **no** form of the command deletes the gateway IP address from the VPLS video interface.

Default none

Parameters *ip-address* — Specifies the gateway IP address of the VPLS video interface.

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

11.4 gen-keypair

gen-keypair

Syntax **gen-keypair** *url-string* **curve** {**secp256r1** | **secp384r1** | **secp521r1**}
gen-keypair *url-string* [**size** *key-size*] [**type** {**rsa** | **dsa**}]

Context [Tree] (admin>certificate gen-keypair)

Full Context admin certificate gen-keypair

Description This command generates RSA, DSA, or ECDSA private key or public key pairs at the specified location.

Parameters *url-string* — Specifies the path of the key file.

Values

url-string	<local-url> [up to 99 characters]
local-url	<cflash-id>/<file-path>
cflash-id	cf1: | cf2: | cf3:

curve — Generates an ECDSA key with a specified curve.

Values secp256r1, secp384r1, secp521r1

key-size — Specifies the key size in bits.

The minimum key-size is 1024 when running in FIPS-140-2 mode.

Values 512 to 8192

Default 2048

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

type — Specifies the type of key.

Values rsa, dsa

Default rsa

Platforms All

11.5 gen-local-cert-req

gen-local-cert-req

Syntax **gen-local-cert-req keypair** *url-string* **subject-dn** *subject-dn* [**domain-name** *name*] [**ip-addr** *ip-address*] **file** *cert-req-file-url* [**hash-alg hash-algorithm**]

Context **[Tree]** (admin>certificate gen-local-cert-req)

Full Context admin certificate gen-local-cert-req

Description This command generates a PKCS#10 formatted certificate request by using a local existing key pair file.

Parameters *url-string* — Specifies the name of the keyfile in cf3:\system-pki\key that is used to generate a certificate request.

Values

url-string	<local-url> [up to 99 characters]
local-url	<cflash-id>/<file-path>
cflash-id	cf1: | cf2: | cf3:

subject-dn — Specifies the distinguish name that is used as the subject in a certificate request, including:

- C-Country
- ST-State
- O-Organization name
- OU-Organization Unit name
- CN-common name

This parameter is formatted as a text string including any of the above attributes. The attribute and its value is linked by using “=”, and “,” is used to separate different attributes.

For example: C=US,ST=CA,O=ALU,CN=SR12

Values attr1=val1,attr2=val2... where: attrN={C| ST| O| OU| CN}, 256 chars max

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

domain-name — Specifies a domain name string can be specified and included as the dNSName in the Subject Alternative Name extension of the certificate request.

ip-address — Specifies an IPv4 address string can be specified and included as the ipAddress in the Subject Alternative Name extension of the certificate request.

cert-req-file-url — Specifies the certificate URL. This URL could be either a local CF card path and filename to save the certificate request; or an FTP URL to upload the certificate request.

hash-algorithm — Specifies the hash algorithm to be used in a certificate request.

Values sha1, sha224, sha256, sha384, sha512

Platforms All

11.6 general-port

general-port

Syntax **general-port** *port-number*
no general-port

Context **[Tree]** (config>system>snmp general-port)

Full Context configure system snmp general-port

Description This command configures the port number used by this node to receive SNMP request messages and to send replies. SNMP notifications generated by the agent are sent from the port specified in the **config>log>snmp-trap-group>trap-target** CLI command.

The **no** form of the command reverts to the default value.

Default general-port 161

Parameters *port-number* — Specifies the port number used to send SNMP traffic other than traps.

Values 1 to 65535

Platforms All

Use subject to Terms available at: www.nokia.com

11.7 generalized-pid

generalized-pid

Syntax **generalized-pid** *generalized-pid*
no generalized-pid

Context **[Tree]** (config>router>gmpls>lsp generalized-pid)

Full Context configure router gmpls lsp generalized-pid

Description This command configures the type of payload carried by the gLSP. Standard ethertype values are used for packet and Ethernet LSPs (see RFC 3471).

Default generalized-pid ethernet

Parameters *generalized-pid* — Specifies the name of the generalized-pid.

Values ethernet

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.8 generate-basic-fec-only

generate-basic-fec-only

Syntax [**no**] **generate-basic-fec-only**

Context **[Tree]** (config>router>ldp generate-basic-fec-only)

Full Context configure router ldp generate-basic-fec-only

Description This command enables mLDP to generate a basic FEC despite the actual root node being resolved using BGP. This functionality is useful if a connected router does not support the mLDP recursive FEC type.

This command only operates with recursive opaque type 7 FECs and non-recursive type 1 FECs.

The **no** form of the command causes mLDP to generate a recursive FEC if the actual root node is resolved using BGP.

Default no generate-basic-fec-only

Platforms All

11.9 generate-icmp

generate-icmp

Syntax [**no**] **generate-icmp**

Context **[Tree]** (config>service>vprn>static-route-entry>black-hole generate-icmp)

Full Context configure service vprn static-route-entry black-hole generate-icmp

Description This optional command causes the ICMP unreachable messages to be sent when received packets match the associated static route. By default, the ICMP unreachable messages for those types of static routes are not generated.

This command can only be associated with a static route that has a black-hole next-hop

The **no** form of this command removes the black-hole next-hop from static route configuration.

Default no generate-icmp

Platforms All

generate-icmp

Syntax [**no**] **generate-icmp**

Context **[Tree]** (config>router>static-route-entry>black-hole generate-icmp)

Full Context configure router static-route-entry black-hole generate-icmp

Description This optional command causes the ICMP unreachable messages to be sent when received packets match the associated static route. By default, the ICMP unreachable messages for those types of static routes are not generated.

This command can only be associated with a static route that has a blackhole next-hop

The **no** form of this command removes the black-hole nexthop from the static route configuration.

Default no generate-icmp

11.10 generate-traps

generate-traps

Syntax [**no**] **generate-traps**

Context **[Tree]** (config>system>network-element-discovery generate-traps)

Full Context configure system network-element-discovery generate-traps

Description This command configures whether traps are generated every time a node is updated, added, or removed from the OSPF opaque database (using LSA type 10 opaque update).

The **no** form of causes traps to not be generated for database changes.

Platforms All

11.11 get

get

Syntax [**no**] **get**

Context **[Tree]** (config>service>nat>pcp-server-policy>opcode get)

Full Context configure service nat pcp-server-policy opcode get

Description This command enables/disables support for the **get** opcode.

Default no get

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

get

Syntax [**no**] **get**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization get)

Full Context configure system security profile netconf base-op-authorization get

Description This command enables the NETCONF get operation.

The **no** form of this command disables the operation.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no get

Note: The operation is enabled by default in the built-in system-generated administrative profile.

Platforms All

11.12 get-config

get-config

Syntax [**no**] **get-config**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization get-config)

Full Context configure system security profile netconf base-op-authorization get-config

Description This command enables the NETCONF get-config operation.

The **no** form of this command disables the operation.

Default no get-config

Note: The operation is enabled by default in the built-in system-generated administrative profile.

Platforms All

11.13 get-data

get-data

Syntax [**no**] **get-data**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization get-data)

Full Context configure system security profile netconf base-op-authorization get-data

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the NETCONF get-data operation.

The **no** form of this command disables the operation.

Default no get-data

Note: The operation is enabled by default in the built-in system-generated administrative profile.

Platforms All

11.14 get-schema

get-schema

Syntax [**no**] **get-schema**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization get-schema)

Full Context configure system security profile netconf base-op-authorization get-schema

Description This command enables the NETCONF get-schema operation.

The **no** form of this command disables the operation.

Default no get-schema

Note: The operation is enabled by default in the built-in system-generated administrative profile.

Platforms All

11.15 ggsn

ggsn

Syntax **ggsn**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>subscr-mgmt>gtp>peer-profile ggsn)

Full Context configure subscriber-mgmt gtp peer-profile ggsn

Description Commands in this context configure communication with a GGSN Mobile Gateway.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.16 ggsn-address

ggsn-address

Syntax **ggsn-address** {**ipv4** | **ipv6**}
no ggsn-address

Context [Tree] (config>subscr-mgmt>diam-appl-plcy>gy>avp ggsn-address)

Full Context configure subscriber-mgmt diameter-application-policy gy include-avp ggsn-address

Description The command includes the GGSN-Address AVP value in all Diameter DCCA CCR messages. The value is either the local IPv4 address or local IPv6 address used to set up the diameter peer.

The **no** form of this command removes the GGSN-Address AVP from the Diameter DCCA CCR messages.

Parameters **ipv4** | **ipv6** — Specifies to include either the IPv4 or IPv6 address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.17 gi-address

gi-address

Syntax **gi-address** *ip-address*
no gi-address

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host gi-address)

Full Context configure subscriber-mgmt local-user-db ipoe host gi-address

Description This command allows selection of GI addresses based on the host entry in LUDB.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The gi-address must be a valid address (associated with an interface) within the routing context that received the DHCP message on the access side.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the IPv4 gi-address.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

gi-address

Syntax **gi-address** *ip-address* [**src-ip-address**]
no gi-address

Context **[Tree]** (config>service>ies>if>dhcp gi-address)
[Tree] (config>service>vprn>if>dhcp gi-address)
[Tree] (config>service>vprn>sub-if>dhcp gi-address)
[Tree] (config>service>ies>sub-if>grp-if>dhcp gi-address)
[Tree] (config>service>ies>sub-if>dhcp gi-address)

Full Context configure service ies interface dhcp gi-address
configure service ies subscriber-interface dhcp gi-address
configure service ies subscriber-interface group-interface dhcp gi-address
configure service vprn interface dhcp gi-address
configure service vprn subscriber-interface dhcp gi-address

Description This command configures the gateway interface address for the DHCP relay. A subscriber interface can include multiple group interfaces with multiple SAPs. The GI address is needed, when the router functions as a DHCP relay, to distinguish between the different subscriber interfaces and potentially between the group interfaces defined.

By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces a GI address must be specified under the group interface DHCP context or subscriber-interface DHCP context in order for DHCP to function.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the host IP address to be used for DHCP relay packets.

Values a.b.c.d

src-ip-address — Specifies that this GI address is to be the source IP address for DHCP relay packets. This parameter is not applicable for PPPoE DHCP client messages (**dhcp client-applications ppp**).

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface dhcp gi-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure service vprn subscriber-interface dhcp gi-address
- configure service ies subscriber-interface group-interface dhcp gi-address

All

- configure service vprn interface dhcp gi-address
- configure service ies interface dhcp gi-address

gi-address

Syntax **gi-address** *ip-address*
no gi-address

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw>dhcp gi-address)
[Tree] (config>service>vprn>if>sap>ipsec-gw>dhcp gi-address)

Full Context configure service ies interface sap ipsec-gw dhcp gi-address
configure service vprn interface sap ipsec-gw dhcp gi-address

Description This command specifies the gateway IP address of the DHCPv4 packets sent by the system. IPsec DHCP Relay uses only the **gi-address** configuration found under the IPsec gateway and does not take into account **gi-address** with **src-ip-addr** configuration below other interfaces.

Default no gi-address

Parameters *ip-address* — Specifies the host IP address to be used for DHCP relay packets.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gi-address

Syntax **gi-address** *ip-address* [**src-ip-addr**]
no gi-address

Context **[Tree]** (config>router>if>dhcp gi-address)

Full Context configure router interface dhcp gi-address

Description This command configures the gateway interface address for the DHCP relay. The GI address is needed, when the router functions as a DHCP relay, to distinguish between the different subscriber interfaces and potentially between the group interfaces defined.

Default no gi-address

Parameters *ip-address* — Specifies the host IP address to be used for DHCP relay packets.

src-ip-addr — Uses the GI address as the source IP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

11.18 global

global

Syntax **global** *file-url*
no global

Context **[Tree]** (config>system>login-control>login-scripts global)

Full Context configure system login-control login-scripts global

Description This command enables an operator to define a common CLI script that executes when any user logs into a CLI session. This login exec script is executed when any user (authenticated by any means including local user database, TACACS+, or RADIUS) opens a CLI session. This allows a user, for example, to define a common set of CLI aliases that are made available on the router for all users. This global login exec script is executed before any user-specific login exec files that may be configured.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

The **no** form of this command disables the execution of a global login-script.

Default no global

Parameters *file-url* — The path or directory name.

Platforms All

11.19 global-id

global-id

Syntax **global-id** *global-id*
no global-id

Context **[Tree]** (config>router>mpls>mpls-tp global-id)

Full Context configure router mpls mpls-tp global-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the MPLS-TP Global ID for the node. This is used as the 'from' Global ID used by MPLS-TP LSPs originating at this node. If a value is not entered, the Global ID is taken to be Zero. This is used if the global-id is not configured. If an operator expects that inter-domain LSPs will be configured, then it is recommended that the global ID should be set to the local ASN of the node, as configured under **config**>**system**. If two-byte ASNs are used, then the most significant two bytes of the global-id are padded with zeros.

In order to change the value of the **global-id**, **config**>**router**>**mpls**>**mpls-tp** must be in the shutdown state. This will bring down all of the MPLS-TP LSPs on the node. New values a propagated to the system when a no shutdown is performed.

Default no global-id

Parameters *global-id* — Specifies the global ID for the node.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.20 global-timeouts

global-timeouts

Syntax **global-timeouts**

Context **[Tree]** (config>system>management-interface>ops global-timeouts)

Full Context configure system management-interface operations global-timeouts

Description Commands in this context configure system timeout parameters for operational commands.

Timeout parameters provide default system-level control for various types of operational commands in model-driven interfaces. The timeout values are used when specific execution and retention timeouts are not requested for a specific operation.

Platforms All

11.21 global-variables

global-variables

Syntax **global-variables**
no global-variables

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>policy-options global-variables)

Full Context configure router policy-options global-variables

Description This command enables the **global-variables** configuration context.

The **no** form of this command removes all global variables.

Platforms All

11.22 glsp

glsp

Syntax [**no**] **glsp session-name** *name*

Context [Tree] (config>gmpls-tun-grp>member glsp)

Full Context configure gmpls-tun-grp member glsp

Description This command binds a GMPLS LSP as a member of the GMPLS tunnel group. The session name is used to identify the GMPLS LSP. This is the LSP name of the GMPLS LSP.

The **no** form of this command removes the member.

Parameters **session-name name** — Specifies the session name of the GMPLS LSP, up to 80 characters.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.23 gmpls

gmpls

Syntax [**no**] **gmpls**

Context [Tree] (config>router gmpls)

Full Context configure router gmpls

Description Commands in this context configure GMPLS parameters. GMPLS is not enabled by default and must be explicitly enabled using **no shutdown**. The **shutdown** command administratively disables GMPLS.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes this GMPLS protocol instance; this will remove all configuration parameters for this GMPLS instance.

GMPLS must be shut down before the GMPLS instance can be deleted. If GMPLS is not shut down when the **no gmpls** command is executed, a warning message on the console indicates that GMPLS is still administratively up.

Default no gmpls

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

gmpls

Syntax **gmpls** [**lsp** *lsp-name*] [**sender** *sender-address*] [**endpoint** *endpoint-address*] [**tunnel-id** *tunnel-id*] [**lsp-id** *lsp-id*] [**peer** *peer-node-id*]
no gmpls

Context **[Tree]** (debug>router gmpls)

Full Context debug router gmpls

Description This command enables and configures debugging for GMPLS.

The **no** form of the command disables debugging for GMPLS.

Parameters *lsp-name* — Debug all GMPLS instances that contain the specified LSP. 80 characters max.

sender-address — Debug all GMPLS instances that contain the specified sender IP address, in dotted decimal notation.

Values a.b.c.d

endpoint-address — Debug all GMPLS instances that contain the specified endpoint IP address, in dotted decimal notation.

Values a.b.c.d

tunnel-id — Debug all GMPLS instances that contain the specified identifier of a tunnel.

Values 0 to 4294967295

lsp-id — Debug all GMPLS instances that contain the specified identifier of an LSP.

Values 1 to 65535

peer-node-id — Debug all GMPLS instances that contain the specified identifier or IP address of a peer node.

Values 1 to 4294967295 | a.b.c.d

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.24 gmpls-loopback-address

gmpls-loopback-address

Syntax **gmpls-loopback-address** *ip-address*
no gmpls-loopback-address

Context **[Tree]** (config>router>lmp gmpls-loopback-address)

Full Context configure router lmp gmpls-loopback-address

Description This command specifies the GMPLS Loopback Address to be used by LMP. A corresponding **gmpls-loopback** interface must have been configured for LMP to be enabled.

Default no gmpls-loopback-address

Parameters *ip-address* — Specifies an IPv4 address.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

gmpls-loopback-address

Syntax **gmpls-loopback-address** *ipv4-address*
no gmpls-loopback-address

Context **[Tree]** (config>router>lmp>peer>control-channel-router gmpls-loopback-address)

Full Context configure router lmp peer control-channel-router gmpls-loopback-address

Description This command configures a loopback address to refer to the GMPLS loopback IP interface configured within the control channel router.

The **no** form of the command removes the configured loopback address.

Default no gmpls-loopback-address

Parameters *ipv4-address* — Specifies an IPv4 address.

Values a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.25 gmpls-tun-grp

gmpls-tun-grp

Syntax [**no**] **gmpls-tun-grp** *gmpls-tunnel-group-id*

Context **[Tree]** (config gmpls-tun-grp)

Full Context configure gmpls-tun-grp

Description This command configures a GMPLS tunnel group. A GMPLS tunnel group is a bundle of GMPLS LSPs providing an abstraction of the data bearers that are intended to be associated to one IP interface. This object allows, for example, end-to-end load balancing across the set of data bearers corresponding to a set of gLSPs. A gLSP is bound to an overlay tunnel group by a gLSP tunnel name at both the head end and the tail end UNI-C nodes of a gLSP. A sender-address may be optionally configured for the tail end of a gLSP in case overlapping GMPLS LSP tunnel names are used by different head end nodes.

The **no** form of this command removes the tunnel group. All members of a GMPLS tunnel group must be removed and the tunnel group shutdown before the tunnel group can be deleted.

Default no gmpls-tun-grp

Parameters *gmpls-tunnel-group-id* — Specifies the identifier of the GMPLS tunnel group.

Values 1 to 1024

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.26 gnmi

gnmi

Syntax **gnmi**

Context **[Tree]** (config>system>grpc gnmi)

Full Context configure system grpc gnmi

Description Commands in this context configure a gNMI service on gRPC.

Platforms All

11.27 gnmi-capabilities

gnmi-capabilities

Syntax **gnmi-capabilities** {**permit** | **deny**}

Context **[Tree]** (config>system>security>profile>grpc>rpc-authorization gnmi-capabilities)

Full Context configure system security profile grpc rpc-authorization gnmi-capabilities

Description This command permits the use of Capability RPC for a user associated with the given format.

The **no** form of this command reverts to the default value.

Default gnmi-capabilities permit

Parameters **permit** — Specifies that the use of the Capability RPC is permitted.

deny — Specifies that the use of the Capability RPC is denied.

Platforms All

11.28 gnmi-get

gnmi-get

Syntax **gnmi-get** {**permit** | **deny**}

Context **[Tree]** (config>system>security>profile>grpc>rpc-authorization gnmi-get)

Full Context configure system security profile grpc rpc-authorization gnmi-get

Description This command permits the use of Get RPC.

The **no** form of this command reverts to the default value.

Default gnmi-get permit

Parameters **permit** — Specifies that the use of the Get RPC is permitted.

deny — Specifies that the use of the Get RPC is denied.

Platforms All

11.49 goto

goto

Syntax **goto** *line*

Context **[Tree]** (candidate goto)

Full Context candidate goto

Description This command changes the edit point of the candidate configuration. The edit point is the point after which new commands are inserted into the candidate configuration as an operator navigates the CLI and issues commands in edit-cfg mode.

Parameters **line** — Indicates which line to change starting at the point indicated by the following options.

Values

line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

11.50 gprs-negotiated-qos-profile

gprs-negotiated-qos-profile

Syntax [**no**] **gprs-negotiated-qos-profile**

Context **[Tree]** (config>subscr-mgmt>auth-plcy>include-radius-attribute gprs-negotiated-qos-profile)

Full Context configure subscriber-mgmt authentication-policy include-radius-attribute gprs-negotiated-qos-profile

Description This command enables the inclusion of the 3GPP QoS specification in AAA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.51 gr-helper

gr-helper

Syntax **gr-helper** [**enable** | **disable**]

Context **[Tree]** (config>router>rsvp>if gr-helper)

Full Context configure router rsvp interface gr-helper

Description This command enables the RSVP Graceful Restart Helper feature.

The RSVP-TE Graceful Restart helper mode allows the SR OS based system (the helper node) to provide another router that has requested it (the restarting node) a grace period, during which the system will continue to use RSVP sessions to neighbors requesting the grace period. This is typically used when another router is rebooting its control plane but its forwarding plane is expected to continue to forward traffic based on the previously available Path and Resv states.

The user can enable Graceful Restart helper on each RSVP interface separately. When the GR helper feature is enabled on an RSVP interface, the node starts inserting a new Restart_Cap Object in the Hello packets to its neighbor. The restarting node does the same and indicates to the helper node the desired Restart Time and Recovery Time.

The GR Restart helper consists of a couple of phases. Once it loses Hello communication with its neighbor, the helper node enters the Restart phase. During this phase, it preserves the state of all RSVP sessions to its neighbor and waits for a new Hello message.

Once the Hello message is received indicating the restarting node preserved state, the helper node enters the recovery phase in which it starts refreshing all the sessions that were preserved. The restarting node will activate all the stale sessions that are refreshed by the helper node. Any Path state which did not get a Resv message from the restarting node once the Recovery Phase time is over is considered to have expired and is deleted by the helper node causing the proper Path Tear generation downstream.

The duration of the restart phase (recovery phase) is equal to the minimum of the neighbor's advertised Restart Time (Recovery Time) in its last Hello message and the locally configured value of the max-restart (max-recovery) parameter.

When GR helper is enabled on an RSVP interface, its procedures apply to the state of both P2P and P2MP RSVP LSP to a neighbor over this interface.

11.52 gr-helper-time

gr-helper-time

Syntax **gr-helper-time max-recovery** *recovery-interval* **max-restart** *restart-interval*
no gr-helper-time

Context **[Tree]** (config>router>gmpls gr-helper-time)

Full Context configure router gmpls gr-helper-time

Description This command configures the local values for the max-recovery and the max-restart intervals used in the RSVP Graceful Restart Helper feature when applied to a GMPLS UNI.

The values are configured globally in GMPLS.

The **no** version of this command re-instates the default value for the delay timer.

Default gr-helper-time max-recovery 300 max-restart 180

Parameters *recovery-interval* — Specifies the maximum recovery interval value, in s.

Values 1 to 1800

restart-interval — Specifies the maximum restart interval value, in s.

Values 1 to 300

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

gr-helper-time

Syntax **gr-helper-time max-recovery** *recovery-interval* **max-restart** *restart-interval*
no gr-helper-time

Context **[Tree]** (config>router>rsvp gr-helper-time)

Full Context configure router rsvp gr-helper-time

Description This command configures the local values for the max-recovery and the max-restart intervals used in the RSVP Graceful Restart Helper feature.

The values are configured globally in RSVP but separate instances of the timers are applied to each RSVP interface that has the RSVP Graceful Restart Helper enabled.

The **no** version of this command re-instates the default value for the delay timer.

Default gr-helper-time max-recovery 300 max-restart 120

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *recovery-interval* — Specifies the max recovery interval value in seconds.

Values 1 to 1800

restart-interval — Specifies the max restart interval value in seconds.

Values 1 to 300

11.54 grace-tx-enable

grace-tx-enable

Syntax [**no**] **grace-tx-enable**

Context [Tree] (config>system>ethernet>efm-oam grace-tx-enable)
[Tree] (config>port>ethernet>efm-oam grace-tx-enable)

Full Context configure port ethernet efm-oam grace-tx-enable
configure system ethernet efm-oam grace-tx-enable

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Enables the sending of grace for all the enabled EFM-OAM sessions on the node. Disabled by default at the system level and enabled by default at the port level. The combination of the system level and port level configuration will determine if the grace function is enabled on the individual ports. Both the system level and the port level must be enabled in order to support grace on a specific port. If either level is disabled, grace is not enabled on those ports. Enabling grace during an active ISSU or soft reset does not invoke the grace function for the active event.

When both **grace-tx-enable** and **config>system>ethernet>efm-oam dying-gasp-tx-on-reset**, **config>port>ethernet>efm-oam dying-gasp-tx-on-reset** are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **config>port>ethernet>efm-oam grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer.

The **no** form of this command disables the sending of the Nokia Vendor Specific Grace TLV.

Default config>system>ethernet>efm-oam>no grace-tx-enable

config>port>ethernet>efm-oam>grace-tx-enable

Platforms All

grace-tx-enable

Syntax [**no**] **grace-tx-enable**

Context **[Tree]** (config>eth-cfm>system grace-tx-enable)

Full Context configure eth-cfm system grace-tx-enable

Description This command enables ETH-CFM grace transmission at the system level when a soft reset message is received and processed by the ETH-CFM module. Individual MEP configuration determines which of the two supported grace functions, ETH-VSM or ETH-ED, is used to announce grace.

This command controls the overall capability to transmit grace and does not control which grace announcement to use. This command also has no impact on the reception and processing of grace-style PDUs.

The **no** form of this command disables ETH-CFM grace transmission at the system level.

Default grace-tx-enable

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.

11.55 grace-vendor-oui

grace-vendor-oui

Syntax **grace-vendor-oui** *oui*
no grace-vendor-oui

Context **[Tree]** (config>port>ethernet>efm-oam grace-vendor-oui)

Full Context configure port ethernet efm-oam grace-vendor-oui

Description This optional command configures an additional peer vendor OUI which indicates support for the Vendor Specific EFM-OAM Grace functionality, allowing grace to be preferred over dying gasp when both are configured. This is in addition to the Nokia Vendor OUI 00:16:4d.

When both **grace-tx-enable (config>system>ethernet>efm-oam grace-tx-enable**, **config>port>ethernet>efm-oam grace-tx-enable)** and **dying-gasp-tx-on-reset (config>system>ethernet>efm-oam dying-gasp-tx-on-reset**, **config>port>ethernet>efm-oam dying-gasp-tx-on-reset)** are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer, including Nokia 7750 SR equipment prior to release 11.0 R4.

The **no** form of this command removes the additional Vendor OUI but does not remove the Nokia 00:16:4d value.

Default no grace-vendor-oui

Parameters *oui* — Hex value in the range 00:00:00 to FF:FF:FF.

configure service vprn bgp group neighbor graceful-restart

Description This command enables BGP graceful restart helper procedures (the “receiving router” role defined in the standard) for address families included in the GR capabilities of both peers. In a VPRN, SR OS can support GR helper functionality for IPv4, IPv6, label-ipv4, flow-ipv4 (IPv4 FlowSpec) and flow-ipv6 (IPv6 FlowSpec) routes.

When a neighbor covered by the GR helper mode restarts its control plane, forwarding can continue uninterrupted while the session is re-established and routes are re-learned.

The **no** form of this command disables graceful restart.

Platforms All

graceful-restart

Syntax [**no**] **graceful-restart**

Context **[Tree]** (config>service>vprn>isis graceful-restart)

Full Context configure service vprn isis graceful-restart

Description This command enables IS-IS graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve IS-IS forwarding information. Traffic continues to be forwarded to the restarting router using the last known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal IS-IS operation. If the grace period expires, then the restarting router is presumed inactive and the IS-IS topology is recalculated to route traffic around the failure.

The **no** form of this command disables graceful restart and removes the graceful restart configuration from the IS-IS instance.

Default no graceful-restart

Platforms All

graceful-shutdown

Syntax [**no**] **graceful-shutdown**

Context **[Tree]** (config>router>rsvp graceful-shutdown)
[Tree] (config>router>rsvp>interface graceful-shutdown)

Full Context configure router rsvp graceful-shutdown
configure router rsvp interface graceful-shutdown

Description This command initiates a graceful shutdown of the specified RSVP interface or all RSVP interfaces on the node if applied at the RSVP level. These are referred to as maintenance interface and maintenance node, respectively.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To initiate a graceful shutdown the maintenance node generates a PathErr message with a specific error sub-code of Local Maintenance on TE Link required for each LSP that is exiting the maintenance interface.

The node performs a single make-before-break attempt for all adaptive CSPF LSPs it originates and LSP paths using the maintenance interfaces. If an alternative path for an affected LSP is not found, then the LSP is maintained on its current path. The maintenance node also tears down and re-signals any detour LSP path using listed maintenance interfaces as soon as they are not active.

The maintenance node floods an IGP TE LSA/LSP containing Link TLV for the links under graceful shutdown with TE metric set to 0xffffffff and Unreserved Bandwidth parameter set to zero (0).

A head-end LER node, upon receipt of the PathErr message performs a single make-before-break attempt on the affected adaptive CSPF LSP. If an alternative path is not found, then the LSP is maintained on its current path.

A node does not take any action on the paths of the following originating LSPs after receiving the PathErr message:

a. An adaptive CSPF LSP for which the PathErr indicates a node address in the address list and the node corresponds to the destination of the LSP. In this case, there are no alternative paths which can be found.

b. An adaptive CSPF LSP whose path has explicit hops defined using the listed maintenance interface(s)/node(s).

c. A CSPF LSP with the adaptive option disabled and which current path is over the listed maintenance interfaces in the PathErr message. These are not subject to make-before-break.

d. A non CSPF LSP which current path is over the listed maintenance interfaces in the PathErr message.

The head-end LER node upon receipt of the updates IPG TE LSA/LSP for the maintenance interfaces updates the TE database. This information will be used at the next scheduled CSPF computation for any LSP which path may traverse any of the maintenance interfaces.

The **no** form of this command disables the graceful shutdown operation at the RSVP interface level or at the RSVP level. The configured TE parameters of the maintenance links are restored and the maintenance node floods the links.

11.58 grafts

grafts

Syntax **grafts** [**source** *ip-address*] [**group** *grp-ip-address*] [**detail**]
no grafts

Context **[Tree]** (debug>router>pim grafts)

Full Context debug router pim grafts

Description This command enables debugging for PIM grafts.

The **no** form of this command disables PIM graft debugging.

Parameters *ip-address* — Debugs graft information associated with the specified source.

Values source address (ipv4, ipv6)

grp-ip-address — Debugs graft information associated with the specified group.

Values multicast group address (ipv4, ipv6)

detail — Debugs detailed graft information.

11.59 granularity

granularity

Syntax **granularity** {**percent** *percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}
no granularity

Context **[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution granularity)

Full Context configure qos adv-config-policy child-control bandwidth-distribution granularity

Description This command is used to create a step-like behavior where the operational PIR will round up to the nearest increment of the specified granularity before being applied to the child. The only exception is when the distributed bandwidth is less than 1% above a lower step value, in which case the lower step value is used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This step-like behavior may be useful when the bandwidth used by an active child is well known. While the **above-offered-cap** command automatically adds a specified amount to the operational PIR of a child, the **granularity** command only increments the operational PIR to the next step value. While not expected to be used in conjunction, the **above-offered-cap** and **granularity** commands may be used simultaneously, in which case the above-offered-cap increase will be applied first, followed by the granularity rounding to the next step value.

If the **granularity** command is used with a percent-based value, the rounding up function of the configured PIR value on the policer or queue is based on the child's administrative PIR. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the percent-rate command with the local parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

If the child's administrative PIR is modified while a percent-based granularity is in effect, the system automatically uses the new relative rounding value the next time the child's operational PIR is determined.

When this command is not specified or removed, the system makes no attempt to round up the child's determined operational PIR.

The **no** form of this command is used to remove the operational PIR rounding behavior from all child policers and queues associated with the policy.

Parameters *percent-of-admin-pir* — When the percent qualifier is used, the following percent-of-admin-pir parameter specifies the percentage of the child's administrative PIR that should be used as the rounding step value. If a value of 0 or 0.00 is used, the system will interpret this equivalent to no granularity.

Values 0.00 to 100.00

rate-in-kilobits-per-second — When the rate qualifier is used, the following rate-in-kilobits-per-second parameter specifies an explicit rate, in kb/s, that should be used as the child's rounding step value. If a rate step of 0 is specified, the system interprets this equivalent to no granularity.

Values 0 to 100,000,000

Platforms All

granularity

Syntax **granularity** {**percent** *percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}
no granularity

Context **[Tree]** (config>qos>adv-config-policy>child-control>offered-measurement granularity)

Full Context configure qos adv-config-policy child-control offered-measurement granularity

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to adjust the sensitivity of the virtual scheduler to changes in the child offered rate. As the child offered rate is determined, it is compared to the previous offered rate. If the delta does not exceed the sensitivity threshold determined for the current offered rate, the change in offered rate is ignored for that iteration.

While it is assumed that changing the offered rate change sensitivity will be a rare occurrence, it may be prudent to react to smaller changes in the offered rate of a particular child policer or queue. Another possible reason for changing the sensitivity is that it may be desired to lower the impact of changes in offered rate on the virtual scheduler for a particular child by raising the granularity.

A side effect of higher sensitivity (lower granularity) is that the virtual scheduler may need to adjust the distributed bandwidth between all children more often, resulting in the possibility of lowering resources available to other virtual scheduler instances on the slot.

A side effect of lower sensitivity (higher granularity) is that the parent virtual scheduler may distribute insufficient bandwidth to the child resulting in dropped packets.

If the granularity command is used with a percent-based value, the sensitivity is a function of the configured PIR value on the policer or queue. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the percent-rate command with the local parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

Except for the overall cap on the offered input into the virtual scheduler, the child's administrative PIR has no effect on the calculated sensitivity if an explicit rate is specified.

If the child's administrative PIR is modified while a percent-based granularity is in effect, the system automatically uses the new relative sensitivity value the next time the child's offered rate is determined.

The **no** form of this command is used to restore the default offered rate sensitivity behavior to all child policers and queues associated with the policy.

Parameters *percent-of-admin-pir* — When the percent qualifier is used, this parameter specifies the percentage of the child's administrative PIR that are used as the threshold sensitivity to offered rate change. If a value of 0 or 0.00 is used, the system will interpret this equivalent to no granularity.

Values 1.00 to 100.00

rate-in-kilobits-per-second — When the rate qualifier is used, this parameter specifies an explicit rate, in kb/s, that are used as the child's offered rate change sensitivity value. If a rate sensitivity of 0 is specified, the system interprets this equivalent to no granularity.

Values 0 to 100,000,000

11.60 gratuitous-arp

gratuitous-arp

Syntax **gratuitous-arp {one-per-sap| one-per-outer-tag}**

Context **[Tree]** (config>subscr-mgmt>up-resiliency>fsg-template gratuitous-arp)

Full Context configure subscriber-mgmt up-resiliency fate-sharing-group-template gratuitous-arp

Description This command configures the granularity with which Gratuitous ARP packets are sent upon switchover events.

Parameters **one-per-sap** — Specifies to send a single GARP per SAP. The Sender Protocol Address is any subnet associated with the SAP. If no subnet is available, the system IP is used.

one-per-outer-tag — Specifies to send a single GARP for all q-in-q SAPs sharing the same outer tag. For dot1q SAPs this behaves the same as **one-per-sap**. The Sender Protocol Address is any subnet associated with the SAP. If no subnet is available, the system IP is used.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure test-oam build-packet header gre

Description This command creates a GRE header for inclusion in test OAM build packet instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.63 gre-eth-bridged

gre-eth-bridged

Syntax **gre-eth-bridged**

Context [Tree] (config>service>system gre-eth-bridged)

Full Context configure service system gre-eth-bridged

Description Commands in this context configure parameters related to termination of a GRE tunnel carrying Ethernet payload onto a PW port by using Forwarding Path Extensions (FPE).

Platforms All

11.64 gre-header

gre-header

Syntax **gre-header send-key** *send-key* **receive-key** *receive-key*
no gre-header

Context [Tree] (config>service>ies>if>sap>ip-tunnel gre-header)
[Tree] (config>service>vprn>if>sap>ip-tunnel gre-header)

Full Context configure service ies interface sap ip-tunnel gre-header
configure service vprn interface sap ip-tunnel gre-header

Description This command configures the type of the IP tunnel. If the **gre-header** command is configured then the tunnel is a GRE tunnel with a GRE header inserted between the outer and inner IP headers. If the **no** form of this command is configured then the tunnel is a simple IP-IP tunnel.

Default no gre-header

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **send-key** *send-key* — Specifies a 32-bit unsigned integer.

Values 0 to 4294967295

receive-key *receive-key* — Specifies a 32-bit unsigned integer.

Values 0 to 4294967295

Platforms All

11.65 gre-key

gre-key

Syntax **gre-key if-index**
no gre-key

Context **[Tree]** (config>filter>gre-tun-tmp>ipv4 gre-key)

Full Context configure filter gre-tunnel-template ipv4 gre-key

Description This command enables the population of the GRE key field in the GRE header sent with the encapsulated IP packet.

The **no** form of this command disables the population of the optional GRE key field when the matching IP packet is sent encapsulated in a GRE tunnel.

Parameters **if-index** — Causes the GRE key field to be populated with the ifIndex of the ingress interface on which the matching IP packet was received.

Platforms All

11.66 gre-termination

gre-termination

Syntax [**no**] **gre-termination**

Context **[Tree]** (config>router>if gre-termination)

Full Context configure router interface gre-termination

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the termination of MPLS-over-GRE and IP-over-GRE packets on destination IP addresses from a user-defined subnet. The user defines a subnet for the termination of GRE packets by applying the **gre-termination** command to a numbered network IP interface, including a loopback interface.

For more information, refer to “IP-over-GRE and MPLS-over-GRE Termination on a User-Configured Subnet” in the 7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide.

The **no** form of this command disables the termination of MPLS-over-GRE and IP-over-GRE packets on the subnet of the interface. Packets are dropped.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.67 gre-tunnel-template

gre-tunnel-template

Syntax **gre-tunnel-template** *name* [**create**]
no gre-tunnel-template *name*

Context **[Tree]** (config>filter gre-tunnel-template)

Full Context configure filter gre-tunnel-template

Description Commands in this context configure a GRE tunnel template parameters to be used to tunnel associated traffic.

The **no** form of this command removes the GRE tunnel template from the configuration.

Parameters *name* — Specifies a GRE tunnel template name up to 32 characters.

create — This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms All

Syntax **group** *tunnel-group-name* [**create**]
group *tunnel-group-name* [**create**] [**protocol** *protocol*]
no group *tunnel-group-name*

Context [Tree] (config>router>l2tp group)
[Tree] (config>service>vprn>l2tp group)

Full Context configure router l2tp group
configure service vprn l2tp group

Description This command configures an L2TP tunnel group.

The **no** form of this command reverts removes the tunnel group name from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *tunnel-group-name* — Specifies a name string to identify a L2TP group up to 63 characters in length.

create — This keyword is mandatory when creating a tunnel group name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

protocol — Specifies the l2tp protocol for use.

Values v2, v3, v3draft

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group

Syntax **group** *tunnel-group-name*

Context **[Tree]** (debug>router>l2tp group)

Full Context debug router l2tp group

Description This command enables and configures debugging for an L2TP group.

Parameters *tunnel-group-name* — Specifies the tunnel group name, up to 63 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group

Syntax **group** *name* [**create**]
no group *name*

Context **[Tree]** (config>service>vpls>gsmp group)
[Tree] (config>service>vprn>gsmp group)

Full Context configure service vpls gsmp group
configure service vprn gsmp group

Description This command specifies a GSMP name. A GSMP group name is unique only within the scope of the service in which it is defined.

The **no** form of this command reverts to the default.

Parameters *name* — Specifies a GSMP name up to 32 characters.

create — Keyword used to create the GSMP group name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

group

Syntax [**no**] **group** *ip-address*

Context **[Tree]** (config>subscr-mgmt>igmp-policy>static group)

Full Context configure subscriber-mgmt igmp-policy static group

Description This command adds or removes a static multicast group.

The **no** form of this command reverts to the default value.

Parameters *ip-address* — Specifies the multicast group IP address.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group

Syntax [**no**] **group** *grp-ipv6-address*

Context **[Tree]** (config>subscr-mgmt>mld-policy>static group)

Full Context configure subscriber-mgmt mld-policy static group

Description This command configures a static multicast group.

The **no** form of this command reverts to the default.

Parameters *grp-ipv6-address* — Specifies the IPv6 address.

Values ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D
- multicast group IPv6 address

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group

Syntax [**no**] **group** *group-name*

Context **[Tree]** (config>service>vprn>rip group)
[Tree] (config>service>ies>rip group)

Full Context configure service ies rip group
configure service vprn rip group

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command creates a context for configuring a RIP group of neighbors. RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.

The **no** form of this command deletes the RIP neighbor interface group. Deleting the group also removes the RIP configuration of all the neighbor interfaces currently assigned to this group.

Default no group

Parameters *group-name* — The RIP group name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

group

Syntax **group** *group-id* **rate** *rate*
no group *group-id*

Context **[Tree]** (config>port>ethernet>egress>hs-sched-ovr group)

Full Context configure port ethernet egress hs-scheduler-overrides group

Description This command overrides a group rate configured in the HS scheduler policy applied to the port egress.

The **no** form of this command removes the rate override from the port egress configuration.

Parameters *group-id* — Specifies the group ID.

Values 1

rate — Specifies the maximum rate in megabits per second. When the **max** keyword follows the **rate** keyword, the bandwidth limitation is removed from the group. The **max** keyword is mutually exclusive to the **rate** parameter. Either the **max** keyword or a rate value must follow the **rate** keyword.

Values 1 to 100000, max

Platforms 7750 SR-7/12/12e

group

Syntax **group** *sonet-sdh-index* **payload** {**tu3** | **vt2** | **vt15**}

Context **[Tree]** (config>port>sonet-sdh group)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port sonet-sdh group

Description This command configures payload of the SONET/SDH group.

This command is supported by TDM satellite, however the **tu3** parameter is not.

For example:

config>port>sonet-sdh#

group tug3-1.1 payload tu3 group tug3-1.2 payload vt2 group tug3-1.3 payload vt2 group tug3-2.1 payload vt15 group tug3-2.2 payload vt15 group tug3-2.3 payload tu3 group tug3-3.1 payload tu3 group tug3-3.2 payload tu3 group tug3-3.3 payload tu3

Parameters *sonet-sdh-index* — Specifies the components making up the specified SONET/SDH path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path.

tu3 — Specifies the Tributary Unit Group (TUG3) on a path. Configures the port or channel for transport network use.

vt2 — Configures the path as a virtual tributary group of type vt2.

vt15 — Configures the path as a virtual tributary group of type vt15.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

group

Syntax [**no**] **group** *name*

Context **[Tree]** (config>router>bgp group)

Full Context configure router bgp group

Description Commands in this context configure a BGP peer group.

The **no** form of this command deletes the specified peer group and all configurations associated with the peer group. The group must be shut down before it can be deleted.

Default no group

Parameters *name* — Specifies the peer group name. Allowed values are any string, up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

© 2022 Nokia.

configure service vpls mesh-sdp mld-snooping static group
configure service vpls sap igmp-snooping static group
configure service vpls sap mld-snooping static group
configure service vpls spoke-sdp igmp-snooping static group
configure service vpls spoke-sdp mld-snooping static group

Description Commands in this context add a static multicast group as a (*, G) or as one or more (S,G) records. When a static MLD or IGMP group is added, multicast data for that (*,G) or (S,G) is forwarded to the specific SAP or SDP without receiving any membership report from a host.

Parameters *grp-ip-address* — Specifies an IGMP multicast group address that receives data on an interface. The IP address must be unique for each static group.

grp-ipv6-address — Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms All

group

Syntax **group** *name* [**esm-dynamic-peer**]
no group *name*

Context **[Tree]** (config>service>vprn>bgp group)

Full Context configure service vprn bgp group

Description This command creates a context to configure a BGP peer group.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes the specified peer group and all configurations associated with the peer group. The group must be shut down before it can be deleted.

Parameters *name* — Specifies the peer group name. Allowed values is a string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

esm-dynamic-peer — Specifies that the given BGP group is used by BGP peers created dynamically based on subscriber-hosts pointing to corresponding BGP peering policy. There can be only one BGP group with this flag set in any given VPRN. No BGP neighbors can be manually configured in a BGP group with this flag set.

Default disabled

Platforms All

group

Syntax [**no**] **group** *grp-ip-address*
[**no**] **group start** *grp-ip-address* **end** *grp-ip-address* [**step** *ip-address*]

Context **[Tree]** (config>service>vprn>igmp>if>static group)

Full Context configure service vprn igmp interface static group

Description This command adds a static multicast group either as a (*,G) or one or more (S,G) records. Use IGMP static group memberships to test multicast forwarding without a receiver host. When IGMP static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static IGMP group entries do not generate join messages toward the RP.

Parameters *grp-ip-address* — Specifies an IGMP multicast group address that receives data on an interface. The IP address must be unique for each static group. The address must be in dotted decimal notation.

start *grp-ip-address* — Specifies the start multicast group address.

end *grp-ip-address* — Specifies the end multicast group address.

step *ip-address* — Specifies the step increment.

group

Syntax [**no**] **group** *grp-ipv6-address*
[**no**] **group start** *grp-ipv6-address* **end** *grp-ipv6-address* [**step** *ipv6-address*]

Context **[Tree]** (config>service>vprn>mld>if>static group)

Full Context configure service vprn mld interface static group

Description Commands in this context add a static multicast group either as a (*,G) or one or more (S,G) records. Use MLD static group memberships to test multicast forwarding without a receiver host. When MLD static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static MLD group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static MLD group entries do not generate join messages toward the RP.

The **no** form of this command removes the IPv6 address from the configuration.

Parameters *grp-ipv6-address* — Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

start *grp-ipv6-address* — Specifies the start multicast group address.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

end *grp-ipv6-address* — Specifies the end multicast group address.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

step *ipv6-address* — Specifies the step increment.

group

Syntax [**no**] **group** *group-name*

Context **[Tree]** (config>service>vprn>msdp group)

Full Context configure service vprn msdp group

Description This command enables access to the context to create or modify a Multicast Source Discovery Protocol (MSDP) group. To configure multiple MSDP groups, include multiple group statements.

By default, the group's options are inherited from the global MSDP options. To override these global options, group-specific options within the group statement can be configured.

If the group name provided is already configured then this command only provides the context to configure the options pertaining to this group.

If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case, the $ prompt to indicate that a new entity (group) is being created should be used.

For a group to be of use, at least one peer must be configured.

Default no group

Parameters *group-name* — Specifies a unique name for the MSDP group.

Platforms All

group

Syntax [**no**] **group** *ip-address* [/*mask*]

Context **[Tree]** (config>service>vprn>mvpn>pt>selective>multistream-spmsi group)

Full Context configure service vprn mvpn provider-tunnel selective multistream-spmsi group

Description This command creates group prefixes that map to the multicast stream. At least one source must be specified for the policy to be active.

Parameters *Ip-address/mask* — Specifies the IP address.

Values

ipv4-prefix	a.b.c.d	
	ipv4-prefix-le	[0..32]
ipv6-prefix		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
	x	[0..FFFF]H

Syntax **group** *aa-group-id*[**:***partition-id* [**create**]
no group *aa-group-id*:*partition-id*

Context **[Tree]** (config>app-assure group)

Full Context configure application-assurance group

Description This command configures and enables the context to configure an application assurance group and partition parameters.

Parameters *aa-group-id* — Specifies a group of ISA MDAs.

Values 1 to 255

partition-id — Specifies a partition within a group.

Values 1 to 65535

create — Keyword used to create the partition in the group.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group

Syntax **group** *aa-group-id*

Context **[Tree]** (admin>app-assure group)

Full Context admin application-assurance group

Description This commands performs a group-specific upgrade.

Parameters *aa-group-id* — Specifies the AA group identifier.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group

Syntax **group** *aa-group-id*[**:***partition-id*]

© 2022 Nokia.

Context [Tree] (debug>app-assure group)

Full Context debug application-assurance group

Description This command configures application-assurance within a group/partition debugging.

Parameters *aa-group-id[:partition-id]* — Specifies the existing application assurance group and partition id.

Values

*aa-group-id:parti** : *aa-group-id*[:*partition-id]*	
aa-group-id	[1..255]
partition-id	[1..65535]

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group

Syntax [**no**] **group** *grp-ip-address*
[**no**] **group start** *grp-ip-address* **end** *grp-ip-address* [**step** *ip-address*]

Context [Tree] (config>router>igmp>if>static group)

Full Context configure router igmp interface static group

Description Commands in this context add a static multicast group either as a (*,G) or one or more (S,G) records. Use IGMP static group memberships to test multicast forwarding without a receiver host. When IGMP static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static IGMP group entries do not generate join messages toward the RP.

Parameters *ip-address* — Specifies an IGMP multicast group address that receives data on an interface. The IP address must be unique for each static group.

start *grp-ip-address* — Specifies the start multicast group address.

end *grp-ip-address* — Specifies the end multicast group address.

step *ip-address* — Specifies the step increment.

Platforms All

group

Syntax [**no**] **group** *grp-ip-address*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>igmp>tunnel-interface>static group)

Full Context configure router igmp tunnel-interface static group

Description Commands in this context add a static multicast group either as a (*,G) or one or more (S,G) records.

The user can assign static multicast group joins to a tunnel interface associated with an RSVP P2MP LSP.

A given (*,G) or (S,G) can only be associated with a single tunnel interface.

A multicast packet which is received on an interface and which succeeds the RPF check for the source address will be replicated and forwarded to all OIFs which correspond to the branches of the P2MP LSP. The packet is sent on each OIF with the label stack indicated in the NHLFE of this OIF. The packets will also be replicated and forwarded natively on all OIFs which have received IGMP or PIM joins for this (S,G).

The multicast packet can be received over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

Parameters *grp-ip-address* — Specifies a multicast group address that receives data on a tunnel interface. The IP address must be unique for each static group.

Platforms All

group

Syntax [**no**] **group** *grp-ipv6-address*
[**no**] **group start** *grp-ipv6-address* **end** *grp-ipv6-address* [**step** *ipv6-address*]

Context [Tree] (config>router>mld>if>static group)

Full Context configure router mld interface static group

Description Commands in this context add a static multicast group either as a (*,G) or one or more (S,G) records. Use MLD static group memberships to test multicast forwarding without a receiver host. When MLD static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static MLD group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static MLD group entries do not generate join messages toward the RP.

The **no** form of this command removes the IPv6 address from the configuration.

Parameters *grp-ipv6-address* — Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

start *grp-ipv6-address* — Specifies the start multicast group address.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

end *grp-ipv6-address* — Specifies the end multicast group address.

Values ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

step *ipv6-address* — Specifies the step increment.

Platforms All

group

Syntax [**no**] **group** *group-name*

Context **[Tree]** (config>router>msdp group)

Full Context configure router msdp group

Description This command enables access to the context to create or modify a Multicast Source Discovery Protocol (MSDP) group. To configure multiple MSDP groups, include multiple group statements.

By default, the group's options are inherited from the global MSDP options. To override these global options, group-specific options within the group statement can be configured.

If the group name provided is already configured then this command only provides the context to configure the options pertaining to this group.

If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case, the $ prompt to indicate that a new entity (group) is being created should be used.

For a group to be of use, at least one peer must be configured.

The **no** form of this command removes the *group-name* from the MSDP configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no group

Parameters *group-name* — Species a MSDP group name, up to 32 characters.

Platforms All

group

Syntax **group** *group-id* **rate** *rate*
no group *group-id*

Context **[Tree]** (config>qos>hs-scheduler-policy group)

Full Context configure qos hs-scheduler-policy group

Description This command defines the maximum rate allowed for the scheduling classes mapped to the specified *group-id*. A group is a scheduling component used to combine up to six consecutive scheduling classes into a single strict priority level. Each scheduling class within the group has an associated weight. When the scheduler is servicing the strict level associated with the group, the ratio of bandwidth allocated to each scheduling class within the group during congestion is relative to the ratio of the weight of each active member.

The **no** form of the command reverts to the default.

Default group 1 rate max

Parameters *group-id* — Specifies the group ID. The group always exists and does not need to be created prior to defining group membership.

Values 1

rate — Specifies the maximum rate in megabits per second. When the **max** keyword follows the rate keyword, the bandwidth limitation is removed from the group. The **max** keyword and the *rate* parameter are mutually exclusive. Either **max** or a rate value must follow the **rate** keyword.

Values 1 to 100000, max

Platforms 7750 SR-7/12/12e

group

Syntax **group** *name* [**create**]
no group *name*

Context **[Tree]** (config>qos>port-scheduler-policy group)

Full Context configure qos port-scheduler-policy group

Description This command defines a weighted scheduler group within a port scheduler policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The port scheduler policy defines a set of eight priority levels. The weighted scheduler group allows for the application of a scheduling weight to groups of child queues competing at the same priority level of the port scheduler policy applied to a Vport defined in the context of the egress of an Ethernet port or applied to the egress of an Ethernet port.

Up to eight groups can be defined within each port scheduler policy. One or more levels can map to the same group. A group has a rate and, optionally, a cir-rate, and inherits the highest scheduling priority of its member levels. A group receives bandwidth from the port or from the Vport and distributes it within the member levels of the group according to the weight of each level within the group.

Each priority level will compete for bandwidth within the group based on its weight under a congestion situation. If there is no congestion, a priority level can achieve up to its rate (cir-rate) worth of bandwidth.

CLI will enforce that mapping of levels to a group are contiguous. A user would not be able to add a priority level to a group unless the resulting set of priority levels is contiguous.

The **no** form of this command removes the group from the port scheduler policy.

Parameters *name* — Specifies the name of the weighted scheduler group and can be up to 32 ASCII characters.

create — This keyword is mandatory when creating the specified group.

Platforms All

group

Syntax **group** *aa-group-id*

Context **[Tree]** (admin>application-assurance group)

Full Context admin application-assurance group

Description Commands in this context perform a group-specific upgrade.

Parameters *aa-group-id* — Specifies an AA ISA group ID.

Values 1 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group

Syntax **group** *group-name*
no group

Context **[Tree]** (config>system>security>user>snmp group)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system security user snmp group

Description This command associates (or links) a user to a group name. The group name must be configured with the **config>system>security>user >snmp>group** command. The **config>system>security>user access** command links the group with one or more views, security model (s), security level (s), and read, write, and notify permissions.

Parameters *group-name* — Enter the group name (between 1 and 32 alphanumeric characters) that is associated with this user. A user can be associated with one group-name per security model.

Platforms All

group

Syntax [**no**] **group** *group-name*

Context **[Tree]** (config>router>rip group)
[Tree] (config>router>ripng group)

Full Context configure router rip group
configure router ripng group

Description This command creates a context for configuring a RIP group of neighbor interfaces.

RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.

The **no** form of the command deletes the RIP neighbor interface group. Deleting the group will also remove the RIP configuration of all the neighbor interfaces currently assigned to this group.

Default no group

Parameters *group-name* — Specifies the RIP group name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

group

Syntax [**no**] **group** *ip-address* [/*mask*]

Context **[Tree]** (config>service>vprn>mvpn>pt>selective>umh-rm group)

Full Context configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group

Description This command configures UMH bandwidth monitoring for the specified <S,G>.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command removes UMH bandwidth monitoring from the specified <S,G>.

Parameters *ip-address/mask* — Specifies the IP address.

Values

ipv4-prefix	a.b.c.d	
	ipv4-prefix-le	[0..32]
ipv6-prefix		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
	x	[0..FFFF]H

11.69 group down

group down

Syntax **group down** *time* | **no group down**

Context **[Tree]** (config>service>oper-group>hold-time group down)

Full Context configure service oper-group hold-time group down

Description This command configures the number of seconds to wait before notifying clients monitoring this group when its operational status transitions from up to down.

The **no** form of the command sets the values back to the default.

Default group down 0

11.70 group up

group up

Syntax **group up** *time* | **no group up**

Context **[Tree]** (config>service>oper-group>hold-time group up)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service oper-group hold-time group up

Description This command configures the number of seconds to wait before notifying clients monitoring this group when its operational status transitions from down to up. A value of zero indicates that transitions are reported immediately to monitoring clients. The up time option is a must to achieve fast convergence: when the group comes up, the monitoring MH site which tracks the group status may wait without impacting the overall convergence; there is usually a pair MH site that is already handling the traffic.

The **no** form of the command reverts to the default.

Default group-up 4

Parameters *time* — Specifies the group up time value.

Values 0 to 3600

11.71 group-address

group-address

Syntax **group-address** *prefix-list-name*
no group-address

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from group-address)

Full Context configure router policy-options policy-statement entry from group-address

Description This command specifies the multicast group-address prefix list containing multicast group-addresses that are embedded in the join or prune packet as a filter criterion. The prefix list must be configured prior to entering this command. Prefix lists are configured in the **config>router>policy-options>prefix-list** context.

The **no** form of this command removes the criterion from the configuration.

Default no group-address

Parameters *prefix-list-name* — Specifies the prefix-list name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

group-encryption

Syntax **group-encryption**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw group-encryption)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw group-encryption)

Full Context configure service ies subscriber-interface group-interface wlan-gw group-encryption
configure service vprn subscriber-interface group-interface wlan-gw group-encryption

Description This command configures group encryption for the WLAN-GW group interface.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group-encryption

Syntax [**no**] **group-encryption**

Context **[Tree]** (config>router>interface group-encryption)

Full Context configure router interface group-encryption

Description This command enables NGE on the router interface. When NGE is enabled on the interface, all received Layer 3 packets that have the protocol ID configured as ESP are considered to be NGE packets and must be encrypted using a valid set of keys from any preconfigured key group on the system.

The **no** form of this command disables NGE on the interface. NGE cannot be disabled unless all key groups and IP exception filters are removed.

Default no group-encryption

Platforms VSR

group-encryption

Syntax **group-encryption**

Context **[Tree]** (config group-encryption)

Full Context configure group-encryption

Description Commands in this context configure group encryption parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.73 group-encryption-label

group-encryption-label

Syntax **group-encryption-label** *encryption-label*
no group-encryption-label

Context **[Tree]** (config>grp-encryp group-encryption-label)

Full Context configure group-encryption group-encryption-label

Description This command configures the group encryption label used to identify when an MPLS payload is encrypted. This label must be unique network-wide and must be configured consistently on all nodes participating in a network group encryption domain. The label cannot be changed or deleted when there are any key groups configured on the node.

The **no** form of the command reverts to the default setting.

Parameters *encryption-label* — The network-wide, unique reserved MPLS label for group encryption.

Values 32 to 2047

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.74 group-inserted-entries

group-inserted-entries

Syntax **group-inserted-entries application** *application* **location** *location*

Context **[Tree]** (config>filter>ip-filter group-inserted-entries)
[Tree] (config>filter>ipv6-filter group-inserted-entries)

Full Context configure filter ip-filter group-inserted-entries
configure filter ipv6-filter group-inserted-entries

Description This command groups automatically-inserted entries.

Parameters *application* — Specifies the application for which the group entries are inserted.

Values radius, credit-control

location — Specifies the location in the entry list in which the group entries are inserted.

Values top, bottom

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure subscriber-mgmt local-user-db ipoe host msap-defaults group-interface
configure subscriber-mgmt local-user-db ppp host msap-defaults group-interface

Description This command configures the group interface.

The **no** form of this command removes the group interface parameters from the configuration.

Parameters *ip-int-name* — Specifies the IP interface name, up to 32 characters.

prefix *port-id* — Specifies the port ID as the prefix to the specified IP interface name.

suffix *port-id* — Specifies the port ID as the suffix to the specified IP interface name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-interface

Syntax **group-interface** *ip-int-name* [**create**] [**type**]
no group-interface *ip-int-name*

Context **[Tree]** (config>service>ies>sub-if group-interface)
[Tree] (config>service>vprn>sub-if group-interface)

Full Context configure service ies subscriber-interface group-interface
configure service vprn subscriber-interface group-interface

Description This command creates a group interface. This interface is designed for triple play services where multiple SAPs are part of the same subnet. A group interface may contain one or more SAPs.

The **no** form of this command removes the group interface from the subscriber interface.

Default no group-interface

Parameters *ip-int-name* — Specifies the interface name of a group interface. If the string contains special characters (#, $, spaces, and so on.), the entire string must be enclosed within double quotes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

type — Specifies the interface type.

Values bonding — Specifies to use connection bonding.
gtp — Specifies to use GTP.
lns — Specifies to use LNS.
wlangw — Specifies to use WLANGW.

create — Keyword used to create the group interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-interface

Syntax **group-interface** *interface-name* **svc-id** *service-id*
no group-interface

Context **[Tree]** (config>subscr-mgmt>gtp>apn-policy>apn>defaults group-interface)

Full Context configure subscriber-mgmt gtp apn-policy apn defaults group-interface

Description This command configures the default group interface where the hosts of the GTP connection is enabled. The group interface must be of type **gtp**.

The **no** form of this command removes the default group interface. In this case, a group interface must be specified using authentication.

Default no group-interface

Parameters *interface-name* — Specifies the name of the group interface, up to 32 characters.

service-id — Specifies the ID of the service where the group interface resides.

Values
service-id: 1 to 2147483647
svc-name: up to 64 characters

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

group-interface

Syntax [**no**] **group-interface** *ip-int-name*
[**no**] **group-interface fwd-service** *service-id ip-int-name*

Full Context configure service vprn igmp group-interface

Description This command configures IGMP group interfaces.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Parameters *ip-int-name* — Specifies the name of the IP interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

fwd-service *service-id* — Specifies the service ID. This is only configured in the retailer VRF. This construct references the wholesaler service under which the group-interface (and the subscriber) is actually defined.

Values 1 to 2147483650, svc-name up to 64 characters

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-interface

Syntax [**no**] **group-interface** [**fwd-service** *service-id*] [*ip-int-name*]

Context **[Tree]** (debug>router>igmp group-interface)

Full Context debug router igmp group-interface

Description This command enables debugging for IGMP group-interface.

The **no** form of the command disables debugging.

Parameters *service-id* — Debugs information associated with the service ID.

Values service-id: 1 to 2148278386
svc-name: up to 64 characters.

ip-int-name — Debugs information associated with the specified IP interface name.

Values IP interface address

Platforms All

group-interface

Syntax [**no**] **group-interface** *ip-int-name*

Context **[Tree]** (config>router>igmp group-interface)
[Tree] (config>router>igmp>if group-interface)

Full Context configure router igmp group-interface
configure router igmp interface group-interface

Description This command enables IGMP on a group-interface in a VRF context. Activating IGMP under the group-interface is a prerequisite for subscriber replication. The group-interface is also needed so that MCAC can be applied and various IGMP parameters defined.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This command can be used in a regular, wholesaler or retailer type of VRF. The retailer VRF does not have the concept of group-interfaces under the subscriber-interface hierarchy. In the case that this command is applied to a retailer VRF instance, the optional **fwd-service** command must be configured. The **fwd-service** command is referencing the wholesaler VRF in which the traffic is ultimately replicated. Redirection in the retailer VRF is supported.

This command enables IGMP on a group-interface in the Global Routing Table (GRT). The group-interface in GRT is defined under the IES service. Activating IGMP under the group-interface is a prerequisite for subscriber replication. The group-interface is also needed so that MCAC can be applied and various IGMP parameters defined.

Parameters *ip-int-name* — Specifies the name of the group interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-interface

Syntax [**no**] **group-interface** *ip-int-name*

Context **[Tree]** (config>router>mld group-interface)

Full Context configure router mld group-interface

Description This command creates and enables the context to configure MLD group interface parameters.

The **no** form of this command removes the interface name from the MLD configuration.

Parameters *ip-int-name* — Specifies the IP group interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.76 group-interface-statistics

group-interface-statistics

Syntax **group-interface-statistics**

Context **[Tree]** (config>subscr-mgmt group-interface-statistics)

Full Context configure subscriber-mgmt group-interface-statistics

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context enable or disable the collection of group interface statistics.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.77 group-interface-template

group-interface-template

Syntax **group-interface-template** *name* [**create**]
no group-interface-template *name*

Context **[Tree]** (config>subscr-mgmt group-interface-template)

Full Context configure subscriber-mgmt group-interface-template

Description This command creates a template for specifying parameters for automatically generated group interfaces, for example, the creation of CUPS sessions. When no specific name is specified, a template named “default” is used, if it has been manually provisioned.

Parameters *name* — Specifies the name of the group interface, up to 32 characters.

create — Keyword used to create the group interface template.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.78 group-name

group-name

Syntax **group-name** *group-name* **value** *group-value*
no group-name *group-name*

Context **[Tree]** (config>service>sdp-group group-name)

Full Context configure service sdp-group group-name

Description This command defines SDP administrative groups, referred to as SDP admin groups.

SDP admin groups provide a way for services using a pseudowire template to automatically include or exclude specific provisioned SDPs. SDPs sharing a specific characteristic or attribute can be made members of the same admin group. When users configure a pseudowire template, they can include and/or exclude one or more admin groups. When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the **sdp-include** and **sdp-exclude** commands.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A maximum of 32 admin groups can be created. The group value ranges from zero (0) to 31. It is uniquely associated with the group name at creation time. If the user attempts to configure another group name for a group value that is already assigned to an existing group name, the SDP admin group creation is failed. The same happens if the user attempts to configure an SDP admin group with a new name but associates it to a group value already assigned to an existing group name.

The **no** option of this command deletes the SDP admin group but is only allowed if the group-name is not referenced in a PW template or SDP.

Parameters *group-name* — Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

group-value — Specifies the group value associated with this SDP admin group. This value is unique within the system.

Values 0 to 31

Platforms All

11.79 group-policy

group-policy

Syntax **group-policy** *policy-name*
no group-policy

Context **[Tree]** (config>service>vpls>pim-snooping group-policy)
[Tree] (config>service>vpls>sap>igmp-snooping>mvr group-policy)
[Tree] (config>service>vpls>mld-snooping>mvr group-policy)

Full Context configure service vpls igmp-snooping mvr group-policy
configure service vpls mld-snooping mvr group-policy
configure service vpls pim-snooping group-policy
configure service vpls sap igmp-snooping mvr group-policy

Description This command identifies filter policy of multicast groups to be applied to this VPLS entity. The sources of the multicast traffic must be a member of the VPLS.

The **no** form of this command removes the policy association from the VPLS configuration.

Default no group-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policy-name* — Specifies the group policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Routing policies are configured in the config>router>policy-options context. The router policy must be defined before it can be imported.

Platforms All

11.80 group-prefix

group-prefix

Syntax **group-prefix** *ip-address/mask* [*ip-address/mask*] [**starg**]
no group-prefix *ip-address/mask*

Context **[Tree]** (config>service>vprn>mvpn>rpf-select>core-mvpn group-prefix)

Full Context configure service vprn mvpn rpf-select core-mvpn group-prefix

Description This command configures multicast group IPv4 prefixes for the MVPN with per-group mapping extranet functionality. Multiple lines are allowed. Duplicate prefixes are ignored.

When the starg option is specified, extranet functionality is enabled for PIM ASM as for the specified group. When the option is not specified (not recommended with PIM ASM), the PIM ASM join will be mapped and data plane will be established, but the control plane will not be updated on SPT switchover, unless the switchover is driven by a CPE router on a receiver side.

The **no** form of this command deletes specified prefix from the list, or removes mapping of all prefixes if group-prefix any was specified.

Parameters *ip-address/mask* — Specifies the IPv4 multicast address prefix with mask. Up to 8 addresses can be specified in a single statement.

Platforms All

group-prefix

Syntax **group-prefix** *ip-address*/*mask* [*ip-address*/*mask*...(up to 8 max)] [**starg**]
group-prefix any
no group-prefix *ip-address/mask*
no group-prefix any

Context **[Tree]** (config>service>vprn>pim>rpf-select>grt-extranet group-prefix)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn pim rpf-select grt-extranet group-prefix

Description This command configures multicast group IPv4 prefixes for the multicast GRT/VRF with per group mapping extranet functionality. Multiple lines are allowed. Duplicate prefixes are ignored. Operator can either configure specific groups for extranet or specify all groups by using key-word any. The two options are mutually exclusive in configuration.

When the starg option is specified, extranet functionality is enabled for PIM ASM as for the specified group. When the option is not specified (not recommended with PIM ASM), the PIM ASM join will be mapped and data plane will be established, but the control plane will not be updated on SPT switchover, unless the switchover is driven by a CPE router on a receiver side.

The **no** form of this command deletes specified prefix from the list, or removes mapping of all prefixes if group-prefix any was specified.

Parameters *ip-address/mask* — Specifies the IPv4 multicast address prefix with mask.

group-prefix

Syntax [**no**] **group-prefix grp-ipv6-address/prefix-length**

Context **[Tree]** (config>service>vprn>pim>rp>ipv6>static group-prefix)

Full Context configure service vprn pim rp ipv6 static group-prefix

Description The group-prefix for a static-rp defines a range of multicast-ip-addresses for which this static RP is applicable.

The **no** form of this command removes the criterion.

Parameters *grp-ipv6-address* — Specifies the multicast IPv6 address.

prefix-length — Specifies the address prefix length.

Values

grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D
prefix-length	[8 to 128]

group-prefix

Syntax [**no**] **group-prefix** {*grp-ip-address*/*mask* | *grp-ip-address netmask*}

Context **[Tree]** (config>service>vprn>pim>rp>static group-prefix)

Full Context configure service vprn pim rp static group-prefix

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description The **group-prefix** for a static-rp defines a range of multicast-ip-addresses for which a certain RP is applicable.

The **no** form of this command removes the criterion.

Parameters *grp-ip-address* — Specifies the multicast IP address.

mask — Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

group-prefix

Syntax [**no**] **group-prefix** *grp-ipv6-address*/*prefix-length*

Context **[Tree]** (config>router>pim>rp>static>address group-prefix)
[Tree] (config>router>pim>rp>ipv6>static>address group-prefix)

Full Context configure router pim rp ipv6 static address group-prefix
configure router pim rp static address group-prefix

Description This command specifies the range of multicast group addresses which should be used by the router as the Rendezvous Point (RP). The **config**>**router**>**pim**>**rp**>**static**>**address** *a.b.c.d* implicitly defaults to deny all for all multicast groups (224.0.0.0/4). A group-prefix must be specified for that static address. This command does not apply to the whole group range.

The **no** form of this command removes the group-prefix from the configuration.

Parameters *grp-ipv6-address* — Specifies the multicast group IPv6 address expressed in dotted decimal notation.

Values grp-ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0..FFFF]H
d [0..255]D

prefix-length — Specifies the prefix length of the IPv6 address.

Values 8 to 128

Syntax [**no**] **group-range** {*ip-prefix/mask* | *ip-prefix netmask*}

Context **[Tree]** (config>router>pim>ssm-groups group-range)

Full Context configure router pim ssm-groups group-range

Description This command configures the address ranges of the multicast groups for this router. When there are parameters present, the command configures the SSM group ranges for IPv6 addresses and netmasks.

The **no** form of this command removes the parameter from the configuration.

Parameters *ip-prefix/mask* — Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area ipv6-prefix.

Values ipv4-prefix:

- a.b.c.d

ipv4-prefix-le: 0 to 32

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ipv6-prefix-le: 0 to 128

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

© 2022 Nokia.

Description This command assigns an existing GTP filter as an action on flows matching this AQP entry.

The **no** form of this command removes this GTP filter from actions on flows matching this AQP entry.

Default no gtp-filter

Parameters *gtp-filter-name* — Specifies the name of an existing GTP filter for this application assurance profile. The *gtp-filter-name* is configured in the **config>app-assure>group[:partition]>gtp>gtp-filter** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gtp-filter

Syntax **gtp-filter** *filter-name*

Context **[Tree]** (config>app-assure>group>statistics>tca gtp-filter)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter

Description This command configures TCA generation for a GTP filter.

Parameters *filter-name* — Specifies the name of the GTP filter, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gtp-filter

Syntax **gtp-filter** *gtp-filter-name* [**create**]
no gtp-filter *gtp-filter-name*

Context **[Tree]** (config>app-assure>group>gtp gtp-filter)

Full Context configure application-assurance group gtp gtp-filter

Description This command allows AA to treat traffic on UDP port number 2152 as GTP-u. Without further specifying any other parameters within this GTP context, AA performs basic GTP-u header sanity checks and discards packets that are malformed. This GTP context allows the operator to configure various GTP filters (maximum of 128 GTP filters).

Parameters *gtp-filter-name* — Specifies a GTP filter name, up to 32 characters.

create — Keyword used to create the GTP filter name and parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.95 gtp-filter-stats

gtp-filter-stats

Syntax [**no**] **gtp-filter-stats**

Context **[Tree]** (config>app-assure>group>statistics>aa-admit-deny gtp-filter-stats)

Full Context configure application-assurance group statistics aa-admit-deny gtp-filter-stats

Description This command configures whether to include or exclude GTP filter admit-deny statistics in accounting records.

Default no gtp-filter-stats

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.96 gtp-in-gtp

gtp-in-gtp

Syntax **gtp-in-gtp direction** *direction* [**create**]
no gtp-in-gtp direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>gtp-filter gtp-in-gtp)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter gtp-in-gtp

Description This command configures a TCA for the counter capturing drops due to the GTP filter GTP-in-GTP packet check. A gtp-in-gtp drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a gtp-in-gtp TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gtp-in-gtp

Syntax **gtp-in-gtp**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>app-assure>group>gtp>gtp-fltr gtp-in-gtp)

Full Context configure application-assurance group gtp gtp-filter gtp-in-gtp

Description This command configures GTP-in-GTP packet filtering.

Default gtp-in gtp permit

Parameters **permit | deny** — Specifies the action to take for GTP packets that are encapsulated in GTP (GTP-in-GTP).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.97 gtp-local-breakout

gtp-local-breakout

Syntax **gtp-local-breakout**

Context [Tree] (config>filter>ip-filter>entry>action gtp-local-breakout)

Full Context configure filter ip-filter entry action gtp-local-breakout

Description This command specifies the filter entry action to gtp-local-breakout.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.98 gtp-mobility

gtp-mobility

Syntax [**no**] **gtp-mobility**

Context [Tree] (config>subscr-mgmt>acct-plcy>triggered-updates gtp-mobility)

Full Context configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-mobility

Description This command, when enabled causes an interim update to be sent whenever a mobility event for ESM over GTP is detected. Mobility events include X2 mobility, service re-activation after idling, notification changes and any detected change of ULI or RAT-Type.

The **no** version of this command disables generating mobility related events.

Default no gtp-mobility

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.99 gtp-parameters

gtp-parameters

Syntax **gtp-parameters**

Context **[Tree]** (config>service>vprn>sub-if>grp-if gtp-parameters)
[Tree] (config>service>ies>sub-if>grp-if gtp-parameters)

Full Context configure service ies subscriber-interface group-interface gtp-parameters
configure service vprn subscriber-interface group-interface gtp-parameters

Description Commands in this context configure GTP parameters. The configuration of parameters under this context is only allowed when the group interface is created with the GTP parameter specified.

11.100 gtp-peer-clear-timeout

gtp-peer-clear-timeout

Syntax **gtp-peer-clear-timeout** *seconds*
no gtp-peer-clear-timeout

Context **[Tree]** (config>service>vprn>wlan-gw>dsm gtp-peer-clear-timeout)

Full Context configure service vprn wlan-gw dsm gtp-peer-clear-timeout

Description This command configures a GTP peer cleanup timeout to terminate a handover wait state.

Parameters *seconds* — Specifies a GTP peer cleanup timeout, in seconds, to terminate a handover wait state.

Values 0 to 3600

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.101 gtp-ping

gtp-ping

Syntax **gtp-ping** *gtp-interface* [**router** *router-instance*] [**source** *ip-address*] **destination** *ip-address* **udp-port** *port-number* [**retry-count** *count*] [**time-out** *timeout*]

Context **[Tree]** (oam gtp-ping)

Full Context oam gtp-ping

Description This command verifies whether a GTPv2 peer is reachable and correctly responds to GTPv2-C Echo Request messages. This command can be executed if no peering exists for the specified peer.

Parameters *gtp-interface* — Specifies the GTP interface where the echo is sent.

Values s11, s1u, gnc, gnu, s2bc, s2bu, s2ac, s2au

router-instance — Specifies the router or VRF in which the GTP echo is sent.

Values *router-name* — Base, management
vprn-svc-id — 1 to 2147483647

Default Base

source *ip-address* — Specifies the source IP address to be used in the GTP ping.

Values a.b.c.d

destination *ip-address* — Specifies the destination IP address to be used in the GTP ping.

Values a.b.c.d

port-number — Specifies the port number to be used. Suggested port numbers are 2123 (GTP-C) or 2152 (GTP-U).

Values 1 to 65535

count — Specifies the number of echo message requests before the peer is considered unreachable.

Values 1 to 100

Default 1

timeout — Specifies the timeout, in seconds, of a single echo message.

Values 1 to 10

Default 5

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.102 gtp-sanity-drop

gtp-sanity-drop

Syntax **gtp-sanity-drop direction** *direction* [**create**]
no gtp-sanity-drop direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca gtp-sanity-drop)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-sanity-drop

Description This command configures a TCA for the counter capturing drops due to basic GTP header sanity checks, such as validating that the GTP-U version is 1 and that the protocol bit is set to 1 for UDP traffic destined to port 2152. A GTP sanity drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a default action TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.103 gtp-traffic

gtp-traffic

Syntax [**no**] **gtp-traffic**

Context **[Tree]** (config>app-assure>group>policer gtp-traffic)

Full Context configure application-assurance group policer gtp-traffic

Description This command provides a mechanism to configure a policer to function at the GTP tunnel level. GTP tunnels are defined by a TEID and destination IP address as oppose to normal flows that are defined by IP 5 tuple values. By setting this value, the policer then can be used to limit GTP traffic (SeGW GTP firewall application).

The **no** form of this command resets policer behavior to act at the normal 5 tuple flow level and not at the GTP tunnel level.

Default no gtp-traffic

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.104 gtp-tunnel-database

gtp-tunnel-database

Syntax **gtp-tunnel-database**

Context **[Tree]** (config>app-assure>group>gtp>gtp-fltr gtp-tunnel-database)

Full Context configure application-assurance group gtp gtp-filter gtp-tunnel-database

Description Commands in this context configure GTP advanced firewall functions (such as validating GTP tunnels, sequence numbers, source IP addresses).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

gtp-tunnel-database

Syntax **gtp-tunnel-database** *size*

Context **[Tree]** (config>isa>aa-grp>shr-res-pool gtp-tunnel-database)

Full Context configure isa application-assurance-group shared-resources gtp-tunnel-database

Description This command configures the allocation of memory resources required for stateful GTP firewall deployment on 3GPP S5/S8/Gn/Gp interfaces.

Default gtp-tunnel-database 0

Parameters *size* — Specifies the percentage of allocated memory resources.

Values 0 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.105 gtp-user

gtp-user

Syntax **gtp-user**

Context **[Tree]** (config>test-oam>build-packet>header gtp-user)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (debug>oam>build-packet>packet>field-override>header gtp-user)

Full Context configure test-oam build-packet header gtp-user
debug oam build-packet packet field-override header gtp-user

Description This command causes the associated header to be defined as a GTP user header template and enables the context to define the GTP parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.106 gtp-user-name

gtp-user-name

Syntax **gtp-user-name** {**imsi** | **imsi-apn** | **msisdn** | **msisdn-apn**}
no gtp-user-name

Context **[Tree]** (config>subscr-mgmt>auth-plcy gtp-user-name)

Full Context configure subscriber-mgmt authentication-policy gtp-user-name

Description This command configures the username used to authenticate an FWA session. If a PAP message is present in the PCO IE of the Create Session request, the system uses that for authentication instead of the format specified for this command. If you specify a format that includes APN, the separator is an @ character; for example, msisdn@apn.

The **no** form of this command reverts to the default.

Default gtp-user-name imsi

Parameters **imsi** — Specifies to use IMSI as the username.

imsi-apn — Specifies to use IMSI and APN as the username; for example, imsi@apn.

msisdn — Specifies to use MSISDN as the username.

msisdn-apn — Specifies to use MSISDN and APN as the username; for example, msisdn@apn.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

11.107 gtpc-inspection

gtpc-inspection

Syntax [**no**] **gtpc-inspection**

Context **[Tree]** (config>app-assure>group>gtp gtpc-inspection)

Full Context configure application-assurance group gtp gtpc-inspection

Description This command configures the inspection of GTP-C packets. This is relevant only when AA GTP FW is deployed on S8/S5/Gp/Gn interfaces. The **gtpc-inspection** command must be enabled before configuring related features, such as APN filtering, GTP tunnel validation, message-type-v2 filtering, sequence number validation, SRC IP validation.

The **no** form of this command disables GTP-C packet inspection.

Default no gtpc-inspection

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.108 gtpv1-c

gtpv1-c

Syntax **gtpv1-c** *type* **direction** {**ingress** | **egress**} **script** [*script*]
no gtpv1-c *type* **direction** {**ingress** | **egress**}

Context **[Tree]** (config>python>py-policy gtpv1-c)

Full Context configure python python-policy gtpv1-c

Description This command configures a Python script for the specified GTPv1-C message type in the specified direction.

The **no** form of this command reverts to the default.

Parameters *type* — Specifies the message type.

Values echo-request, echo-response, version-not-supported, create-pdp-context-request, create-pdp-context-response, delete-pdp-context-request, delete-pdp-context-response, error-indication

direction {**ingress** | **egress**} — Specifies if the message is incoming or outgoing.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

script — Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms All

11.109 gtpv2-c

gtpv2-c

Syntax **gtpv2-c** *type* **direction** {**ingress** | **egress**} **script** [*script*]
no gtpv2-c *type* **direction** {**ingress** | **egress**}

Context **[Tree]** (config>python>py-policy gtpv2-c)

Full Context configure python python-policy gtpv2-c

Description This command configures a Python script for the specified GTPv2-C message type in the specified direction.

The **no** form of this command reverts to the default.

Parameters *type* — Specifies the message type

Values echo-request, echo-response, version-not-supported, create-session-request, create-session-response, delete-session-request, delete-session-response, delete-bearer-request, delete-bearer-response, modify-bearer-request, modify-bearer-response, release-access-bearers-request, release-access-bearers-response, downlink-data-notification, downlink-data-notification-ack, change-notification-request, change-notification-response, stop-paging-indication

direction {**ingress** | **egress**} — Specifies if the message is incoming or outgoing.

script — Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

Platforms All

Use subject to Terms available at: www.nokia.com

11.110 guard-time

guard-time

Syntax **guard-time** *time*
no guard-time

Context **[Tree]** (config>eth-ring guard-time)

Full Context configure eth-ring guard-time

Description This command configures the guard time for an Eth-Ring. The guard timer is standard and is configurable from “x” ms to 2 seconds.

The **no** form of this command restores the default guard-time.

Default no guard-time

Parameters *value* — Specifies the guard-time, in deciseconds.

Values 1 to 20

Default 5

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

11.111 gw-address-range

gw-address-range

Syntax **gw-address-range start** *start* **end** *end*
no gw-address-range

Context **[Tree]** (config>subscr-mgmt>isa-svc-chain>evpn>export gw-address-range)

Full Context configure subscriber-mgmt isa-service-chaining evpn export gw-address-range

Description This command specifies the address range to be used for the gateway IP address field in EVPN type-5 routes that are advertised for configured NAT pools, to the peer for service-chaining. The system allocates one address for each ISA in the NAT group out of the specified range.

The **no** form of this command removes the values from the configuration..

Parameters *start* — Specifies the starting gateway address range (V4) for this EVPN service.

Values ipv4-address: a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

end — Specifies the ending gateway address range (V4) for this EVPN service.

Values ipv4-address: a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.112 gw-addresses

gw-addresses

Syntax **gw-addresses**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw gw-addresses)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw gw-addresses)

Full Context configure service ies subscriber-interface group-interface wlan-gw gw-addresses
configure service vprn subscriber-interface group-interface wlan-gw gw-addresses

Description This command specifies gateway endpoint address for the wlan-gw tunnel.

The **no** form of this command removes the gateway ipv4 or IPv6 endpoint address for the wlan-gw tunnel.

Parameters *ip-address* — Specifies the IP address of the wlan-gw tunnels on this group interface.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

11.113 gw-mac

gw-mac

Syntax **gw-mac** *mac-address*
no gw-mac

Context **[Tree]** (config>service>vprn>sub-if>grp-if>srrp gw-mac)

Full Context configure service vprn subscriber-interface group-interface srrp gw-mac

Description This command overrides the default SRRP gateway MAC address used by the SRRP instance. Unless specified, the system uses the same base MAC address for all SRRP instances with the last octet overridden by the lower 8 bits of the SRRP instance ID. The same SRRP gateway MAC address should be in-use by both the local and remote routers participating in the same SRRP context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

One reason to change the default SRRP gateway MAC address is if two SRRP instances sharing the same broadcast domain are using the same SRRP gateway MAC. The system will use the SRRP instance ID to separate the SRRP messages (by ignoring the messages that does not match the local instance ID), but a unique SRRP gateway MAC is essential to separate the routed packets for each gateway IP address.

The **no** form of this command removes the explicit SRRP gateway MAC address from the SRRP instance. The SRRP gateway MAC address can only be changed or removed when the SRRP instance is shutdown.

Parameters *mac-address* — Specifies a MAC address that is used to override the default SRRP base MAC address.

Values Any MAC address except all zeros, broadcast or multicast addresses. The offset is expressed in normal Ethernet MAC address notation. The defined gw-mac cannot be 00:00:00:00:00:00, ff:ff:ff:ff:ff:ff or any multicast address.

If not specified, the system uses the default SRRP gateway MAC address with the last octet set to the 8 least significant bits of the SRRP instance ID.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

gw-mac

Syntax **gw-mac** *mac-address*
no gw-mac

Context **[Tree]** (config>service>ies>sub-if>grp-if>srrp gw-mac)

Full Context configure service ies subscriber-interface group-interface srrp gw-mac

Description This command overrides the default SRRP gateway MAC address used by the SRRP instance. Unless specified, the system uses the same base MAC address for all SRRP instances with the last octet overridden by the lower 8 bits of the SRRP instance ID. The same SRRP gateway MAC address should be in-use by both the local and remote routers participating in the same SRRP context.

One reason to change the default SRRP gateway MAC address is if two SRRP instances sharing the same broadcast domain are using the same SRRP gateway MAC. The system will use the SRRP instance ID to separate the SRRP messages (by ignoring the messages that does not match the local instance ID), but a unique SRRP gateway MAC is essential to separate the routed packets for each gateway IP address.

The **no** form of this command removes the explicit SRRP gateway MAC address from the SRRP instance. The SRRP gateway MAC address can only be changed or removed when the SRRP instance is shutdown.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mac-address* — Specifies a MAC address that is used to override the default SRRP base MAC address.

Values Any MAC address except all zeros, broadcast or multicast addresses. The offset is expressed in normal Ethernet MAC address notation. The defined gw-mac cannot be 00:00:00:00:00:00, ff:ff:ff:ff:ff:ff or any multicast address.

If not specified, the system uses the default SRRP gateway MAC address with the last octet set to the 8 least significant bits of the SRRP instance ID.

11.114 gx

gx

Syntax **gx**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy gx)

Full Context configure subscriber-mgmt diameter-application-policy gx

Description Commands in this context configure Gx parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.115 gx-session-level-usage

gx-session-level-usage

Syntax [**no**] **gx-session-level-usage**

Context **[Tree]** (config>subscr-mgmt>cat-map gx-session-level-usage)

Full Context configure subscriber-mgmt category-map gx-session-level-usage

Description This command controls the instantiation of an internal category required for Diameter Gx session level Usage Monitoring (per IP-CAN session).

When configured, Gx session level Usage Monitoring can be enabled for sessions associated with this category map.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The internal category for Gx session level Usage Monitoring is counted against the maximum of sixteen categories that can be configured.

When not configured (default), then no internal category is instantiated and Gx session level Usage Monitoring cannot be enabled for sessions associated with this category map.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

11.116 gy

gy

Syntax **gy**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy gy)

Full Context configure subscriber-mgmt diameter-application-policy gy

Description Commands in this context configure Diameter Credit Control Application or Gy-specific options.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12 h Commands

12.1 half-life

half-life

Syntax **half-life** *half-life* **max-suppress-time** *max-time*

Context **[Tree]** (config>port>ethernet>dampening half-life)

Full Context configure port ethernet dampening half-life

Description This command configures the half-life decay time and the maximum period of time for which the port up state can be suppressed.

The *half-life* and *max-time* values must be set at the same time; the ratio of *max-time*/*half-life* must be less than or equal to 49 and greater than or equal to 1.

Parameters *half-life* — Specifies the required elapsed time, in seconds, before penalties decay to one-half the initial amount.

Values 1 to 2000

Default 5

max-time — Specifies the maximum suppression time, in seconds, which is the time it can take after the physical link comes up before the worst case accumulated penalties have decayed to the reuse threshold. The maximum penalty is derived from the maximum suppression time, half-life, and reuse threshold, using the following equation:

maximum penalty = (reuse threshold) × 2 expo:(max-time/half-life)

Values 1 to 43200

Default 20

Platforms All

half-life

Syntax **half-life** *minutes*
no half-life

Context **[Tree]** (config>router>policy-options>damping half-life)

Full Context configure router policy-options damping half-life

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the **half-life** parameter for the route damping profile.

The half-life value is the time, expressed in minutes, required for a route to remain stable in order for the Figure of Merit (FoM) value to be reduced by one half; for example, if the half-life value is 6 (minutes) and the route remains stable for 6 minutes, then the new FoM value is 3 (minutes). After another 3 minutes pass and the route remains stable, the new FoM value is 1.5 (minutes).

When the FoM value falls below the **config>router>policy-options>damping reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the half life parameter from the damping profile.

Default no half-life

Parameters *minutes* — Specifies the half-life in minutes expressed as a decimal integer.

Values 1 to 45

Platforms All

12.2 handler

handler

Syntax [**no**] **handler** *event-handler-name*

Context **[Tree]** (config>log>event-handling handler)

Full Context configure log event-handling handler

Description This command configures an EHS handler.

The **no** form of this command removes the specified EHS handler.

Parameters *event-handler-name* — Specifies the name of the EHS handler, up to 32 characters maximum.

Platforms All

handler

Syntax **handler** *name* **[create]**
no handler *name*

Context **[Tree]** (config>system>grpc-tunnel>tunnel handler)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system grpc-tunnel tunnel handler

Description Commands in this context configure tunnel handler parameters. There can be multiple handlers created for any tunnel.

The **no** form of this command removes the specified tunnel handler.

Parameters *name* — Specifies the handler name, up to 32 characters.

create — Keyword used to create a tunnel.

Platforms All

12.3 hardware-timestamp

hardware-timestamp

Syntax [**no**] **hardware-timestamp**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes hardware-timestamp)

Full Context configure aaa isa-radius-policy acct-include-attributes hardware-timestamp

Description This command enables the inclusion of the hardware timestamp attributes.

The **no** form of the command excludes the hardware timestamp attributes.

Default no hardware-timestamp

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.4 hash-algorithm

hash-algorithm

Syntax **hash-algorithm** {**hash** | **hash2** | **custom**| **cleartext**}
no hash-algorithm

Context **[Tree]** (config>system>security>management-interface>grpc hash-algorithm)
[Tree] (config>system>security>management-interface>md-cli hash-algorithm)
[Tree] (config>system>security>management-interface>netconf hash-algorithm)

configure system security management-interface netconf hash-algorithm

Description This command specifies the format of the input and output for encrypted configuration secrets.

The **no** form of this command reverts to the default value.

Default hash-algorithm hash2

Parameters **hash** — Specifies hash. Use this option to transport a phrase between modules and nodes.

hash2 — Specifies hash2 which is module-specific.

custom — Specifies the custom encryption to management interface.

cleartext — Specifies that the phrase is displayed as clear text everywhere.

Platforms All

12.5 hash-label

hash-label

Syntax **hash-label**
hash-label [**signal-capability**]
no hash-label

Context **[Tree]** (config>service>epipe>spoke-sdp hash-label)
[Tree] (config>service>fpipe>spoke-sdp hash-label)
[Tree] (config>service>ipipe>spoke-sdp hash-label)
[Tree] (config>service>pw-template hash-label)

Full Context configure service epipe spoke-sdp hash-label
configure service fpipe spoke-sdp hash-label
configure service ipipe spoke-sdp hash-label
configure service pw-template hash-label

Description This command enables the use of the hash label on a VLL, VPRN or VPLS service bound to any MPLS type encapsulated SDP, as well as to a VPRN service that is using the **auto-bind-tunnel** with the **resolution-filter** set to any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option. This feature is also not supported on multicast packets forwarded using RSVP P2MP LSP or mLDP LSP in both the base router instance and in the multicast VPN (mVPN) instance. It is, however, supported when forwarding multicast packets using an IES/VPRN spoke-interface.

When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to one (1).

To allow applications where the egress LER infers the presence of the hash label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the Hash Label. This means that the value of the hash label will always be in the range [524,288 - 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. Note, however, that for VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets generated in CPM and that are forwarded labeled within the context of a service (for example, OAM packets) must also include a Hash Label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The user enables the signaling of the hash-label capability under a VLL spoke-sdp, a VPLS spoke-sdp or mesh SDP, or an IES/VPRN spoke interface by adding the **signal-capability** option. In this case, the decision whether to insert the hash label on the user and control plane packets by the local PE is solely determined by the outcome of the signaling process and can override the local PE configuration. The following are the procedures:

- The local PE will insert the flow label interface parameters sub-TLV with F=1 in the PW ID FEC element in the label mapping message for that spoke SDP or mesh SDP.
- If the remote PE includes this sub-TLV with F=1 or F=0, then local PE must insert the hash label in the user and control plane packets.
- If remote PE does not include this sub-TLV (for example, it does not support it, or it is supported but the user did not enable the **hash-label** option or the **signal-capability** option), then the local PE establishes the PW but must not insert the hash label in the user and control packets over that spoke SDP or mesh SDP. If the remote PE does not support the **signal-capability** option, then there are a couple of possible outcomes:
  - If the **hash-label** option was enabled on the local configuration of the spoke SDP or mesh SDP at the remote PE, the PW packets received by the local PE will have the hash label included. These packets must be dropped. The only way to solve this is to disable the signaling capability option on the local node which will result in the insertion of the hash label by both PE nodes.
  - If the **hash-label** option is not supported or was not enabled on the local configuration of the spoke SDP or mesh SDP at the remote PE, the PW received by the local PE will not have the hash label included.

Use subject to Terms available at: www.nokia.com

- The user can enable or disable the signal-capability option in CLI as needed. When doing so, the 7450 ESS or 7750 SR must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F bit in the flow label interface parameters sub-TLV of the PW ID FEC element.

The **no** form of this command disables the use of the hash label.

Default no hash-label

Parameters **signal-capability** — Enables the signaling and negotiation of the use of the hash label between the local and remote PE nodes. The **signal-capability** option is not supported on a VPRN spoke-sdp.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

12.7 hash-weight-threshold

hash-weight-threshold

Syntax **hash-weight-threshold** *weight* [**action** *action*] [**cost** *static-cost*]
no hash-weight-threshold

Context [Tree] (config>lag hash-weight-threshold)

Full Context configure lag hash-weight-threshold

Description This command controls the operational status of the LAG or the IGP cost based on the sum of the **hash-weight** values for the active links in the LAG.

The **no** form of this command disables the hash weight threshold.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *weight* — Specifies the value for the sum of all the active LAG ports **hash-weight** at or below which the configured action is invoked. If the sum of **hash-weight** for operational LAG links exceeds the **hash-weight-threshold** value, then no action is taken.

Values 1 to 6400000

action — Specifies the action to take if the sum of the **hash-weight** for active links in the LAG is equal or below the threshold value.

Values
down — Specifies that the LAG is operationally DOWN. The LAG is only considered as UP once the number of **hash-weight** for the active links exceeds the configured threshold value.

dynamic-cost — Specifies that dynamic cost is activated. The LAG remains operationally UP with a link cost relative to the number of operational links. The link is only considered as operationally DOWN when all links in the LAG are down.

static-cost — Specifies that static cost is activated. The LAG remains operationally UP with the configured cost, regardless of the number of operational links. The link is only considered as operationally DOWN when all links in the LAG are down. If this parameter is used with an IGP, its **reference-bandwidth** must also be configured.

static-cost — Specifies the decimal integer static cost of the LAG.

Values 1 to 16777215

Platforms All

hashing

Syntax **hashing** {**bcrypt** | **sha2-pbkdf2**| **sha3-pbkdf2**}

Context **[Tree]** (config>system>security>password hashing)

Full Context configure system security password hashing

Description This command configures the password hashing algorithm.

Default hashing bcrypt

Parameters **bcrypt** — Keyword to indicate that the command configures the bcrypt algorithm.

sha2-pbkdf2 — Keyword to indicate that the command configures the PBKDF2 algorithm hashed via SHA2.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sha3-pbkdf2 — Keyword to indicate that the command configures the PBKDF2 algorithm hashed via SHA3.

Platforms All

12.9 hd

hd

Syntax **hd**

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if hd)

Full Context configure mcast-management multicast-info-policy video-policy video-interface hd

Description This command configures properties relating to requests received by the video interface for High Definition (HD) channel requests.

Default none

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

12.10 head-end

head-end

Syntax **head-end local**
head-end *ipv4-address*
no head-end

Context **[Tree]** (config>router>segment-routing>sr-policies>static-policy head-end)

Full Context configure router segment-routing sr-policies static-policy head-end

Description This command associates a head-end location with a statically-defined segment-routing policy. The head-end identifies the router that is the target to install the policy. This is a mandatory parameter and configuration command for enabling the segment-routing policy; if the head-end parameter value is not configured, the execution of the **no shutdown** command on the static segment routing policy fails.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

To associate a static policy with the local router as head-end, the keyword **local** must be specified. The static policy is associated with another (non-local) router, if the head-end parameter is set to any IPv4 address. When a non-local, static segment routing policy that originates as a BGP route is imported into BGP, the configured head-end address is converted to an IPv4-address specific route-target extended community that is automatically added to the route.

The **no** form of this command removes the head-end association.

Default no head-end

Parameters **local** — Keyword indicating that the policy is intended to be used by the local router and not advertised to other BGP routers.

ipv4-address — Specifies the IP address of the target head-end router.

Values
ipv4-address: a.b.c.d

Platforms All

12.11 header

header

Syntax **header** *header-number* [**create**]
no header *header-number*

Context **[Tree]** (config>test-oam>build-packet header)
[Tree] (debug>oam>build-packet>packet>field-override header)

Full Context configure test-oam build-packet header
debug oam build-packet packet field-override header

Description Commands in this context configure header parameters.

The **no** form of this command deletes the associated header.

Parameters *header-number* — Specifies the ID for the header being defined or referenced.

Values 1 to 65535

create — Creates a header instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.

12.12 header-sanity

header-sanity

Syntax **header-sanity direction** *direction* [**create**]
no header-sanity direction *direction*

Context **[Tree]** (config>app-assure>group>statistics>tca>gtp-fltr>msg header-sanity)

Full Context configure application-assurance group statistics threshold-crossing-alert gtp-filter message-type header-sanity

Description This command configures a TCA for the counter capturing hits for the GTP filter header sanity. A GTP filter header-sanity TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

Parameters *direction* — Specifies the traffic direction.

Values from-sub, to-sub

create — Keyword used to create the TCA.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.13 header-sequence

header-sequence

Syntax **header-sequence** *header-sequence*
no header-sequence

Context **[Tree]** (debug>oam>build-packet>packet header-sequence)

Full Context debug oam build-packet packet header-sequence

Description This command configures the sequence of headers for a packet to be launched by the OAM **find-egress** tool.

Parameters *header-sequence* — Specifies the sequence of headers, such as "h7/h255/h32", where h7 is the header for the lowest level protocol.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

12.14 health-check

health-check

Syntax **health-check**

Context **[Tree]** (config>aaa>radius-server-policy>servers health-check)

Full Context configure aaa radius-server-policy servers health-check

Description Commands in this context configure health check parameters for the RADIUS server.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

health-check

Syntax [**no**] **health-check** [**interval** *interval*]

Context **[Tree]** (config>system>security>password health-check)

Full Context configure system security password health-check

Description This command specifies that RADIUS, TACACS+, and LDAP servers are monitored for 3 seconds each at 30 second intervals. Servers that are not configured will have 3 seconds of idle time. If in this process a server is found to be unreachable, or a previously unreachable server starts responding, a trap will be sent based on the type of the server.

The **no** form of this command disables the periodic monitoring of the RADIUS, TACACS+, and LDAP servers. In this case, the operational status for the active server will be up if the last access was successful.

Default health-check interval 30

Parameters *interval* — Specifies the polling interval for RADIUS, TACACS+, and LDAP servers.

Values 6 to 1500

Default 30

Platforms All

12.15 heartbeat

heartbeat

Syntax **heartbeat**

Context **[Tree]** (config>subscr-mgmt>pfcp-association heartbeat)

Full Context configure subscriber-mgmt pfcp-association heartbeat

Description Commands in this context configure parameters for transmitting PFCP Heartbeat Request messages to a PFCP peer.

Default heartbeat

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.16 hello

hello

Syntax **hello** [**interval** *hello-interval*] **dead-interval** *hello-dead-interval*
hello interval *hello-interval* [**dead-interval** *hello-dead-interval*]

Context **[Tree]** (config>router>lmp>peer>control-channel hello)

Full Context configure router lmp peer control-channel hello

Description This command configures the transmission interval for LMP Hello packets. The **dead-interval** specifies the period after which the IPCC is declared down if no Hello packets are received from the LMP peer.

Default hello interval 1000 dead-interval 4000

Parameters *hello-interval* — The interval at which LMP Hello packets are sent on an IP control channel.

Values 1000 to 65535 ms

hello-dead-interval — The interval after which the IPCC is declared down if no Hello packets are received from the LMP peer.

Values 3000 to 65535 ms

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hello

Syntax **hello** [**detail**]
no hello

Context **[Tree]** (debug>router>gmpls>packet hello)

Full Context debug router gmpls packet hello

Description This command enables debugging for GMPLS Hello packets.

The **no** form of the command disables debugging for GMPLS Hello packets.

Parameters **detail** — Keyword to produce debug output in greater detail.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hello

Syntax **hello** *timeout factor*
no hello

Context **[Tree]** (config>router>ldp>if-params>if>ipv4 hello)
[Tree] (config>router>ldp>if-params>if>ipv6 hello)
[Tree] (config>router>ldp>if-params>ipv4 hello)
[Tree] (config>router>ldp>if-params>ipv6 hello)
[Tree] (config>router>ldp>targ-session>ipv4 hello)
[Tree] (config>router>ldp>targ-session>ipv6 hello)
[Tree] (config>router>ldp>targ-session>peer hello)
[Tree] (config>router>ldp>targ-session>peer-template hello)

Full Context configure router ldp interface-parameters interface ipv4 hello
configure router ldp interface-parameters interface ipv6 hello
configure router ldp interface-parameters ipv4 hello
configure router ldp interface-parameters ipv6 hello
configure router ldp targeted-session ipv4 hello
configure router ldp targeted-session ipv6 hello
configure router ldp targeted-session peer hello
configure router ldp targeted-session peer-template hello

Description This command configures the time interval to wait before declaring a neighbor down. The **factor** parameter derives the Hello interval.

The **config**>**router**>**ldp**>**if-params**>**ipv6**>**hello** and **config**>**router**>**ldp**>**targ-session**>**ipv6**>**hello** commands are not supported on the 7450 ESS.

Hold time is local to the system and sent in the Hello messages to the neighbor. Hold time cannot be less than three times the Hello interval. The hold time can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When LDP session is being set up, the hold down time is negotiated to the lower of the two peers. Once an operational value is agreed upon, the Hello factor is used to derive the value of the Hello interval.

The **no** form of the command at the interface-parameters and targeted-session level sets the **hello timeout** and the **hello factor** to the default values.

The **no** form of the command, at the interface level, sets the **hello timeout** and the **hello factor** to the value defined under the interface-parameters level.

The **no** form of this command, at the peer level, sets the **hello timeout** and the **hello factor** to the value defined under the targeted-session level.

The session must be flapped for the new settings to operate.

Default Table 61 lists the default values.

Table 61 **Hello Timeout Factors**

Context	Timeout	Factor
config>router>ldp>if-params	15	3
config>router>ldp>targ-session	45	3
config>router>ldp>if-params>if	Inherits values from interface-parameters context.	
config>router>ldp>targ-session>peer	Inherits values from targeted-session context.	

Parameters *timeout* — Configures the time interval, in seconds, that LDP waits before a neighbor down.

Values 1 to 65535

factor — Specifies the number of keepalive messages that should be sent on an idle LDP session in the Hello timeout interval.

Values 1 to 255

Platforms All

hello

Syntax **hello** [**detail**]
no hello

12.19 hello-authentication-key

hello-authentication-key

Syntax **hello-authentication-key** {*authentication-key* | *hash-key*} [**hash** | **hash2** | **custom**]
no hello-authentication-key

Context **[Tree]** (config>service>vprn>isis>if hello-authentication-key)
[Tree] (config>service>vprn>isis>if>level hello-authentication-key)

Full Context configure service vprn isis interface hello-authentication-key
configure service vprn isis interface level hello-authentication-key

Description This command configures the authentication key (password) for Hello PDUs. Neighboring routers use the password to verify the authenticity of Hello PDUs sent from this interface. Both the Hello authentication key and the Hello authentication type on a segment must match. The **hello-authentication-type** must be specified.

To configure the Hello authentication key in the interface context use the **hello-authentication-key** in the **config>router>isis>if** context.

To configure or override the Hello authentication key for a specific level, configure the **hello-authentication-key** in the **config>router>isis>if>level** context.

If both IS-IS and hello-authentication are configured, Hello messages are validated using Hello authentication. If only IS-IS authentication is configured, it will be used to authenticate all IS-IS (including Hello) protocol PDUs.

When the Hello authentication key is configured in the **config>router>isis>if** context, it applies to all levels configured for the interface.

The **no** form of this command removes the authentication-key from the configuration.

Default no hello-authentication-key — No Hello authentication key is configured.

Parameters *authentication-key* — The Hello authentication key (password). The key can be any combination of ASCII characters up to 254 characters in length (un-encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

hash-key — The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

Platforms All

hello-authentication-key

Syntax **hello-authentication-key** [*authentication-key* | *hash-key*] [**hash** | **hash2** | **custom**]
no hello-authentication-key

Context **[Tree]** (config>router>isis>interface hello-authentication-key)
[Tree] (config>router>isis>if>level hello-authentication-key)

Full Context configure router isis interface level hello-authentication-key
configure router isis interface hello-authentication-key

Description This command configures the authentication key (password) for Hello PDUs. Neighboring routers use the password to verify the authenticity of Hello PDUs sent from this interface. Both the Hello authentication key and the Hello authentication type on a segment must match. The **hello-authentication-type** must be specified.

To configure the Hello authentication key in the interface context, use the **hello-authentication-key** in the **config>router>isis>interface** context.

To configure or override the Hello authentication key for a specific level, configure the **hello-authentication-key** in the **config>router>isis>interface>level** context.

If both IS-IS and hello-authentication are configured, Hello messages are validated using Hello authentication. If only IS-IS authentication is configured, it will be used to authenticate all IS-IS (including Hello) protocol PDUs.

When the Hello authentication key is configured in the **config>router>isis>interface** context, it applies to all levels configured for the interface.

The **no** form of this command removes the authentication-key from the configuration.

Parameters *authentication-key* — Specifies the Hello authentication key (password). The key can be any combination of ASCII characters, up to 254 characters (un-encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

hash-key — Specifies the hash key. The key can be any combination of ASCII characters, up to 342 characters (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

no hello-authentication-type

Context **[Tree]** (config>service>vprn>isis>if hello-authentication-type)
[Tree] (config>service>vprn>isis>if>level hello-authentication-type)

Full Context configure service vprn isis interface hello-authentication-type
configure service vprn isis interface level hello-authentication-type

Description This command enables Hello authentication at either the interface or level context. Both the Hello authentication key and the Hello authentication type on a segment must match. The hello **authentication-key** statement must also be included.

To configure the Hello authentication type at the interface context, use **hello-authentication-type** in the **config>router>isis>if** context.

To configure or override the Hello authentication setting for a given level, configure the **hello-authentication-type** in the **config>router>isis>if>level** context.

The **no** form of this command disables Hello authentication.

Default no hello-authentication-type — Hello authentication is disabled

Parameters **password** — Specifies simple password (plain text) authentication is required.

message-digest — Specifies MD5 authentication in accordance with RFC2104 (HMAC: Keyed-Hashing for Message Authentication) is required.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hello-authentication-type

Syntax **hello-authentication-type** {**password** | **message-digest**}
no hello-authentication-type

Context **[Tree]** (config>router>isis>interface hello-authentication-type)
[Tree] (config>router>isis>if>level hello-authentication-type)

Full Context configure router isis interface level hello-authentication-type
configure router isis interface hello-authentication-type

Description This command enables Hello authentication at either the interface or level context. Both the Hello authentication key and the Hello authentication type on a segment must match. The hello **authentication-key** statement must also be included.

To configure the Hello authentication type at the interface context, use **hello-authentication-type** in the **config>router>isis>interface** context.

To configure or override the Hello authentication setting for a given level, configure the **hello-authentication-type** in the **config>router>isis>interface>level** context.

The **no** form of this command disables Hello authentication.

Parameters **password** — Specifies simple password (plain text) authentication is required.

message-digest — Specifies MD5 authentication in accordance with RFC 2104 (HMAC: Keyed-Hashing for Message Authentication) is required.

Use subject to Terms available at: www.nokia.com

configure router l2tp hello-interval
configure service vprn l2tp group hello-interval
configure service vprn l2tp group tunnel hello-interval
configure service vprn l2tp hello-interval

Description This command configures the time interval between two consecutive tunnel Hello messages. The Hello message is an L2TP control message sent by either peer of a LAC-LNS control connection. This control message is used as a keepalive for the tunnel.

The **no** form of this command removes the interval from the configuration.

Default hello-interval 300

Parameters *hello-interval* — Specifies the time interval, in seconds, between two consecutive tunnel Hello messages.

Default no hello-interval

Values 10 to 3600

infinite — Specifies that no Hello interval messages are sent.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval

Syntax **hello-interval** *timer*
no hello-interval

Context **[Tree]** (config>port>multilink-bundle>mlfr hello-interval)

Full Context configure port multilink-bundle mlfr hello-interval

Description This command specifies the value of the MLFR bundle T_HELLO timer. The timer controls the rate that Hello messages are sent. Following a period of T_HELLO duration, a Hello message is transmitted onto the bundle link.

Note that T_HELLO timer is also used during the bundle link add process as an additional delay before resending an ADD_LINK message to the peer bundle link when the peer bundle link does not answer as expected.

Default hello-interval 10

Parameters *timer* — Specifies the amount of time between HELLO messages in seconds.

Values 1 to 180

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hello-interval

Syntax **hello-interval** *seconds*
no hello-interval

Context **[Tree]** (config>service>vpls>sap>spb>level hello-interval)
[Tree] (config>service>vpls>spoke-sdp>spb>level hello-interval)

Full Context configure service vpls sap spb level hello-interval
configure service vpls spoke-sdp spb level hello-interval

Description This command configures the interval in seconds between Hello messages issued on this interface at this level. This command is valid only for interfaces on control B-VPLS.

The no form of this command to reverts to the default value.

Default hello-interval 3 — Hello interval default for the designated inter-system.

hello-interval 9 — Hello interval default for non-designated inter-systems.

Parameters *seconds* — The Hello interval in seconds expressed as a decimal integer.

Values 1 to 20000

Platforms All

hello-interval

Syntax **hello-interval** *seconds*
no hello-interval

Context **[Tree]** (config>router>isis>if>level hello-interval)
[Tree] (config>service>vprn>isis>if>level hello-interval)

Full Context configure router isis interface level hello-interval
configure service vprn isis interface level hello-interval

Description This command configures the interval between IS-IS Hello PDUs issued on the interface at this level. The **hello-interval**, along with the **hello-multiplier**, is used to calculate a hold time, which is communicated to a neighbor in a Hello PDU.

Note: The neighbor hold time is (hello multiplier × hello interval) on non-designated intermediate system broadcast interfaces and point-to-point interfaces and is (hello multiplier × hello interval / 3) on designated intermediate system broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold time should always be > 3 to reduce routing instability.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default 3 – for designated intermediate system interfaces

9 – for non-designated intermediate system interfaces and point-to-point interfaces

Parameters *seconds* — The Hello interval in seconds expressed as a decimal integer.

Values 1 to 20000

Platforms All

hello-interval

Syntax **hello-interval** *hello-interval*
no hello-interval

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive>pim hello-interval)

Full Context configure service vprn mvpn provider-tunnel inclusive pim hello-interval

Description This command configures the frequency at which PIM Hello messages are transmitted on this interface.

The **no** form of this command resets the configuration to the default value.

Default hello-interval 30

Parameters *hello-interval* — Specifies the Hello interval in seconds. A 0 (zero) value disables the sending of Hello messages (the PIM neighbor will never timeout the adjacency).

Values 0 to 255 seconds

Platforms All

hello-interval

Syntax **hello-interval** *seconds*
no hello-interval

configure service vprn ospf3 area interface hello-interval
configure service vprn ospf3 area virtual-link hello-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the interval between OSPF Hello messages issued on the interface, virtual link, or sham-link.

The Hello interval, in combination with the dead-interval, is used to establish and maintain the adjacency. Use this parameter to edit the frequency that Hello packets are sent.

Reducing the interval, in combination with an appropriate reduction in the associated **dead-interval**, allows for faster detection of link and/or router failures at the cost of higher processing costs.

The **no** form of this command reverts to the default value.

Default hello-interval 10 — a 10-second Hello interval

Special Cases **OSPF Interface —** If the configured **hello-interval** applies to an interface, then all nodes on the subnet must have the same Hello interval.

Virtual Link — If the configured **hello-interval** applies to a virtual link, then the interval on both termination points of the virtual link must have the same Hello interval.

Sham Link — If the configured **hello-interval** applies to a sham-link, then the interval on both endpoints of the sham-link must have the same Hello interval.

Parameters *seconds* — The Hello interval in seconds expressed as a decimal integer.

Values 1 to 65535

Platforms All

hello-interval

Syntax **hello-interval** *hello-interval*
no hello-interval

Context **[Tree]** (config>service>vprn>pim>if hello-interval)

Full Context configure service vprn pim interface hello-interval

Description This command configures the frequency at which PIM Hello messages are transmitted on this interface.

The **no** form of this command resets the configuration to the default value.

Default hello-interval 30

Parameters *hello-interval* — Specifies the Hello interval in seconds. A 0 (zero) value disables the sending of Hello messages (the PIM neighbor will never timeout the adjacency).

Values 0 to 255 seconds

Platforms All

hello-interval

Syntax [**no**] **hello-interval** *hello-interval*

Context **[Tree]** (config>router>gmpls>peer hello-interval)

Full Context configure router gmpls peer hello-interval

Description This command configures the RSVP Hello packet interval (in ms), towards the peer UNI-N node.

The **no** form of this command sets the **hello-interval** to the default value. A value of 0 disables RSVP Hellos.

Default hello-interval 3000

Parameters *hello-interval* — Specifies the RSVP Hello packet interval, in milliseconds.

Values 0 to 60000

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hello-interval

Syntax **hello-interval** *milli-seconds*
no hello-interval

Context **[Tree]** (config>router>rsvp>interface hello-interval)

Full Context configure router rsvp interface hello-interval

Description This command configures the time interval between RSVP Hello messages.

RSVP Hello packets are used to detect loss of RSVP connectivity with the neighboring node. Hello packets detect the loss of neighbor far quicker than it would take for the RSVP session to time out based on the refresh interval. After the loss of the of number keep-multiplier consecutive Hello packets, the neighbor is declared to be in a down state.

The **no** form of this command reverts to the default value of the hello-interval. To disable sending hello messages, set the value to zero.

Default hello-interval 3000

Parameters *milli-seconds* — Specifies the RSVP Hello interval (in ms), in multiples of 1000. A 0 (zero) value disables the sending of RSVP Hello messages.

Values 0 to 60000 ms (in multiples of 1000)

Platforms All

Parameters *number* — Specifies the Hello interval, in minutes.

Values 10 to 3600

Platforms All

12.22 hello-multiplier

hello-multiplier

Syntax **hello-multiplier** *multiplier*
no hello-multiplier

Context **[Tree]** (config>service>vpls>sap>spb>level hello-multiplier)
[Tree] (config>service>vpls>spoke-sdp>spb>level hello-multiplier)

Full Context configure service vpls sap spb level hello-multiplier
configure service vpls spoke-sdp spb level hello-multiplier

Description This command configures the number of missing Hello PDUs from a neighbor SPB declares the adjacency down. This command is valid only for interfaces on control B-VPLS.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The no form of this command reverts to the default value.

Default hello-interval 3 — SPB can miss up to 3 Hello messages before declaring the adjacency down.

Parameters *multiplier* — The multiplier for the Hello interval expressed as a decimal integer.

Values 2 to 100

Platforms All

hello-multiplier

Syntax **hello-multiplier** *multiplier*
no hello-multiplier

Context **[Tree]** (config>router>isis>if>level>level-number hello-multiplier)
[Tree] (config>service>vprn>isis>if>level hello-multiplier)

Full Context configure router isis interface level level-number hello-multiplier
configure service vprn isis interface level hello-multiplier

Description This command configures the number of missing Hello messages from a neighbor before the router declares the adjacency down.

Note: The neighbor hold time is (hello multiplier × hello interval) on point-to-point interfaces, and (hello multiplier × hello interval / 3) on broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold-time should always be > 3 to reduce routing instability.

The **no** form of this command reverts to the default value.

Default hello-multiplier 3

Parameters *multiplier* — The multiplier for the Hello interval expressed as a decimal integer.

Values 2 to 100

Platforms All

hello-multiplier

Syntax **hello-multiplier** *deci-units*
no hello-multiplier

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive>pim hello-multiplier)

Full Context configure service vprn mvpn provider-tunnel inclusive pim hello-multiplier

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the multiplier to determine the hold time for a PIM neighbor on this interface.

The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor.

Parameters *deci-units* — Specify the value, specified in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

(**hello-interval** × **hello-multiplier**) / 10

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

Values 20 to 100

Default 35

Platforms All

hello-multiplier

Syntax **hello-multiplier** *deci-units*
no hello-multiplier

Context **[Tree]** (config>service>vprn>pim>if hello-multiplier)

Full Context configure service vprn pim interface hello-multiplier

Description This command configures the multiplier to determine the hold time for a PIM neighbor on this interface.

The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor.

Default hello-multiplier 35

Parameters *deci-units* — Specify the value, specified in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

(**hello-interval** × **hello-multiplier**) / 10

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

Values 20 to 100

Platforms All

hello-multiplier

Syntax **hello-multiplier** *deci-units*
no hello-multiplier

Context [Tree] (config>router>pim>interface hello-multiplier)

Full Context configure router pim interface hello-multiplier

Description This command configures the multiplier to determine the holdtime for a PIM neighbor on this interface.

The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor.

The **no** form of this command reverts to the default value.

Default hello-multiplier 35

Parameters *deci-units* — Specifies the value, in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

(**hello-interval** × **hello-multiplier**) / 10

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

Values 20 to 100

Default 35

Platforms All

hello-multiplier

Syntax **hello-multiplier** *multiplier*
no hello-multiplier

Context [Tree] (config>router>isis>if>level hello-multiplier)

Full Context configure router isis interface level hello-multiplier

Description This command configures a Hello multiplier. The **hello-multiplier**, along with the **hello-interval**, is used to calculate a hold time, which is communicated to a neighbor in a Hello PDU.

The hold time is the time in which the neighbor expects to receive the next Hello PDU. If the neighbor receives a Hello within this time, the hold time is reset. If the neighbor does not receive a Hello within the hold time, it brings the adjacency down.

Note: The neighbor hold time is (hello multiplier × hello interval) on non-designated intermediate system broadcast interfaces and point-to-point interfaces and is (hello multiplier × hello interval / 3) on designated intermediate system broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold time should always be > 3 to reduce routing instability.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default hello-multiplier 3

Parameters *multiplier* — Specifies the multiplier for the Hello interval expressed as a decimal integer.

Values 2 to 100

Platforms All

12.23 hello-padding

hello-padding

Syntax **hello-padding** {**none** | **adaptive** | **loose** | **strict**}
no hello-padding

Context **[Tree]** (config>service>vprn>isis hello-padding)
[Tree] (config>service>vprn>isis>level hello-padding)
[Tree] (config>service>vprn>isis>if hello-padding)
[Tree] (config>service>vprn>isis>if>level hello-padding)

Full Context configure service vprn isis hello-padding
configure service vprn isis interface hello-padding
configure service vprn isis interface level hello-padding
configure service vprn isis level hello-padding

Description This command enables the IS-IS Hello (IIH) message padding to ensure that IS-IS LSPs can traverse the link. When this option is enabled, IS-IS Hello messages are padded to the maximum LSP MTU value, which can be set with the **lsp-mtu-size** command. If link MTU is greater than the maximum LSP MTU value, padding to the link MTU is applied.

The **no** form of this command disables IS-IS Hello message padding at this level. However, the router may still perform Hello padding if it was set at a higher level in the configuration. To ensure that Hello message padding is disabled, set all levels of configuration to **no hello-padding**.

Default no hello-padding

Parameters **adaptive** — Specifies the adaptive padding option; this option is able to detect MTU asymmetry from one side of the connection but uses more overhead than loose padding.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- point-to-point interface—Hello PDUs are padded until the sender declares an adjacency on the link to be in the state up. If the implementation supports RFC 3373/5303, *Three-Way Handshake for IS-IS Point-to-Point Adjacencies*, then this is when the three-way state is up. If the implementation uses the “classic” algorithm described in ISO 10589, this is when the adjacency state is up. If the neighbor does not support the adjacency state TLV, then padding continues.
- broadcast interface—Padding starts until at least one adjacency is up on the interface.

loose — Specifies the loose padding option; the loose padding may not be able to detect certain conditions such as asymmetrical MTUs between the routing devices.

- point-to-point interface—the Hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the INIT state
- broadcast interface—padding starts until at least one adjacency (broadcast only has up/down) is up on the interface

none — Specifies that the Hello message padding is not enabled at this level, even if it is configured at one of the parent levels.

strict — Specifies the strict padding option.

- point-to-point interface—padding is done for all adjacency states, and is continuous. Strict padding has the most overhead but detects MTU issues on both sides of a link
- broadcast interface—padding is done for all adjacency states, and is continuous. Strict padding has the most overhead but detects MTU issues on both sides of a link

[Tree] (config>router>ldp>targ-session>peer hello-reduction)
[Tree] (config>router>ldp>targ-session>peer-template hello-reduction)

Full Context

configure router ldp targeted-session ipv4 hello-reduction
configure router ldp targeted-session ipv6 hello-reduction
configure router ldp targeted-session peer hello-reduction
configure router ldp targeted-session peer-template hello-reduction

Description

This command enables the suppression of periodic targeted Hello messages between LDP peers once the targeted LDP session is brought up.

The **config**>**router**>**ldp**>**targ-session**>**ipv6**>**hello-reduction** command is not supported on the 7450 ESS.

When this feature is enabled, the target Hello adjacency is brought up by advertising the Hold-Time value the user configured in the "**hello** timeout" parameter for the targeted session. The LSR node will then start advertising an exponentially increasing Hold-Time value in the Hello message as soon as the targeted LDP session to the peer is up. Each new incremented Hold-Time value is sent in a number of Hello messages equal to the value of the argument *factor*, which represents the dampening factor, before the next exponential value is advertised. This provides time for the two peers to settle on the new value. When the Hold-Time reaches the maximum value of 0xffff (binary 65535), the two peers will send Hello messages at a frequency of every [(65535-1)/local helloFactor] seconds for the lifetime of the targeted-LDP session (for example, if the local Hello Factor is three (3), then Hello messages will be sent every 21844 seconds.

The LSR node continues to compute the frequency of sending the Hello messages based on the minimum of its local Hold-time value and the one advertised by its peer as in RFC 5036. Thus for the targeted LDP session to suppress the periodic Hello messages, both peers must bring their advertised Hold-Time to the maximum value. If one of the LDP peers does not, the frequency of the Hello messages sent by both peers will continue to be governed by the smaller of the two Hold-Time values.

When the user enables the Hello reduction option on the LSR node while the targeted LDP session to the peer is operationally up, the change will take effect immediately. In other words, the LSR node will start advertising an exponentially increasing Hold-Time value in the Hello message, starting with the current configured Hold-Time value.

When the user disables the Hello reduction option while the targeted LDP session to the peer is operationally up, the change in the Hold-Time from 0xffff (binary 65535) to the user configured value for this peer will take effect immediately. The local LSR will immediately advertise the value of the user configured Hold-Time value and will not wait until the next scheduled time to send a Hello to make sure the peer adjusts its local hold timeout value immediately.

In general, any configuration change to the parameters of the T-LDP Hello adjacency (modifying the Hello adjacency Hello Timeout or factor, enabling/disabling Hello reduction, or modifying Hello reduction factor) will cause the LSR node to trigger immediately an updated Hello message with the updated Hold Time value without waiting for the next scheduled time to send a Hello.

hello-time

Syntax **hello-time** *hello-time*
no hello-time [*hello-time*]

Context **[Tree]** (config>service>vpls>stp hello-time)
[Tree] (config>service>template>vpls-template>stp hello-time)

Full Context configure service template vpls-template stp hello-time
configure service vpls stp hello-time

Description This command configures the Spanning Tree Protocol (STP) Hello time for the Virtual Private LAN Service (VPLS) STP instance.

The Hello time parameter defines the default timer value that controls the sending interval between BPDU configuration messages by this bridge, on ports where this bridge assumes the designated role.

The active Hello time for the spanning tree is determined by the root bridge (except when the STP is running in RSTP mode, then the Hello time is always taken from the locally configured parameter).

The configured **hello-time** can also be used to calculate the forward delay. See **auto-edge** (**config>service>vpls>sap>stp auto-edge, config>service>template>vpls-sap-template>stp auto-edge, config>service>vpls>spoke-sdp>stp auto-edge**).

The **no** form of this command returns the Hello time to the default value.

Default hello-time 2

Parameters *hello-time* — The Hello time for the STP instance in seconds.

12.27 helper-disable

helper-disable

Syntax [**no**] **helper-disable**

Context **[Tree]** (config>service>vprn>isis>graceful-restart helper-disable)

Full Context configure service vprn isis graceful-restart helper-disable

Description This command disables helper support for IS-IS graceful restart (GR).

When **graceful-restart** is enabled, the router can be a helper (that is, the router is helping a neighbor to restart), a restarting router, or both. The router only supports helper mode. It will not act as a restarting router, because the high availability feature set already preserves IS-IS forwarding information such that this functionality is not needed. This command is a historical command and should not be disabled. Configuring **helper-disable** has the effect of disabling graceful restart, because the router only supports helper mode.

The **no helper-disable** command enables helper support and is the default when graceful restart is enabled.

Default no helper-disable

12.30 hi-bw-mcast-src

hi-bw-mcast-src

Syntax **hi-bw-mcast-src** [**alarm**] [**group** *group-id*] [**default-paths-only**]
no hi-bw-mcast-src

Context **[Tree]** (config>card>fp hi-bw-mcast-src)

Full Context configure card fp hi-bw-mcast-src

Description This command designates the forwarding plane as a high-bandwidth IP multicast source, expecting the ingress traffic to include high-bandwidth IP multicast traffic. When configured, the system attempts to allocate a dedicated multicast switch fabric plane (MSFP) to the forwarding plane. If a group is specified, all FPs in the group will share the same MSFP. If the alarm parameter is specified and the system cannot allocate a dedicated MSFP to the new group or FP, the FPs will be brought online and generate an event (SYSTEM: 2052 - tmnxChassisHiBwMulticastAlarm). Similarly, if during normal operation there is a failure or removal of resources, an event will be generated if the system cannot maintain separation of MSFPs for the MDAs.

The **no** form of this command removes the high-bandwidth IP multicast source designation from the forwarding plane.

Default no hi-bw-mcast-src

Parameters **alarm** — Enables event generation if the MDA is required to share an MSFP with another MDA that is in a different group. MDAs within the same group sharing an MSFP will not cause this alarm.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

group-id — Specifies the logical MSFP group for the MDA. MDAs configured with the same *group-id* will be placed on the same MSFP.

Values 0 to 32 (A value of 0 removes the MDA from the group).

Default By default, “none” is used, and the system will attempt to assign a unique MSFP to the MDA.

default-paths-only — When this parameter is specified the system will only attempt to allocate the two default paths (one high priority and one low priority) to dedicated MSFPs.

12.37 high-prio-only

high-prio-only

Syntax **high-prio-only** *percent*
no high-prio-only

Context **[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>queue high-prio-only)
[Tree] (config>subscr-mgmt>sla-prof>ingress>qos>queue high-prio-only)

Full Context configure subscriber-mgmt sla-profile egress qos queue high-prio-only
configure subscriber-mgmt sla-profile ingress qos queue high-prio-only

Description This command configures the value of the percentage of buffer space for the queue, used exclusively by high priority packets. The specified value overrides the default value for the context.

The priority of a packet can only be set in the SAP ingress QoS policy and is only applicable on the ingress queues for a SAP. The **high-prio-only** parameter is used to override the default value derived from the **network-queue** command.

The defined **high-prio-only** value cannot be greater than the MBS size of the queue. Attempting to change the MBS to a value smaller than the high priority reserve will generate an error and fail execution. Attempting to set the **high-prio-only** value larger than the current MBS size will also result in an error and fail execution.

The **no** form of this command returns high-prio-only to the size as configured in the QoS policy.

Parameters *percent* — The *percent* parameter is the percentage reserved for high priority traffic on the queue. If a value of 10KBytes is desired, enter the value 10. A value of 0 specifies that none of the MBS of the queue is reserved for high priority traffic. This does not affect RED slope operation for packets attempting to be queued.

Values 0 to 100, default

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

high-prio-only

Syntax **high-prio-only** *percent-of-mbs*
no high-prio-only

Context **[Tree]** (config>qos>sap-egress>policer high-prio-only)
[Tree] (config>qos>sap-ingress>policer high-prio-only)

Full Context configure qos sap-egress policer high-prio-only
configure qos sap-ingress policer high-prio-only

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to configure the percentage of the policer's PIR leaky bucket's MBS (maximum burst size) that is reserved for high-priority traffic. While the **mbs** value defines the policer's high-priority violate threshold, the percentage value defined is applied to the **mbs** value to derive the bucket's low-priority violate threshold. See the **mbs** command details for information about which types of traffic are associated with each violate threshold.

Parameters *percent-of-mbs* — The *percent-of-mbs* parameter is required when specifying **high-prio-only** and is expressed as a percentage.

Values 0 to 100

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

high-prio-only

Syntax **high-prio-only** *percent-of-mbs*
no high-prio-only

Context **[Tree]** (config>qos>qgrps>egr>qgrp>policer high-prio-only)
[Tree] (config>qos>qgrps>ing>qgrp>policer high-prio-only)

Full Context configure qos queue-group-templates egress queue-group policer high-prio-only
configure qos queue-group-templates ingress queue-group policer high-prio-only

Description This command is used to configure the percentage of the policer's PIR leaky bucket's MBS (maximum burst size) that is reserved for high-priority traffic. While the **mbs** value defines the policer's high-priority violate threshold, the percentage value defined is applied to the **mbs** value to derive the bucket's low-priority violate threshold. See the **mbs** command details for information on which types of traffic is associated with each violate threshold.

Parameters *percent-of-mbs* — The *percent-of-mbs* parameter is required when specifying **high-prio-only** and is expressed as a percentage.

Values 0 to 100

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

12.38 high-rate-hold-time

high-rate-hold-time

Syntax **high-rate-hold-time** *seconds* [**active-min-only**]
no high-rate-hold-time

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>qos>adv-config-policy>child-control>offered-measurement high-rate-hold-time)

Full Context configure qos adv-config-policy child-control offered-measurement high-rate-hold-time

Description This command sets a time period that the current offered rate should be maintained for a child policer or queue when it is seen that the offered rate is decreasing. The offered measurement that triggers the hold time is used when the hold timer expires, unless a higher offered rate is seen in the interim. When a higher rate is observed, the hold timer is canceled and the higher offered rate is used immediately.

A possible reason to define a hold timer for an offered rate is to allow a child queue is to dampen the effects of a child with a fluctuating rate on the virtual scheduler. This works similar to the max-decrement in that the child holds on to bandwidth from the virtual scheduler in case it may be needed in the near future.

This parameter has no effect on an increase to the child's offered rate. If the rate increase is above the change sensitivity, the new offered rate is immediately used.

When this command is not specified or removed, the virtual scheduler immediately reacts to measured decreases in offered load.

The **no** form of this command is used to remove any currently configured hold time for all child policers and queues associated with the policy. When the hold time is removed, any current hold timers for child policers are automatically canceled.

Parameters *seconds* — The hold time configured must be specified in seconds. A value of 0 is equivalent to no high-rate-hold-time.

Default 0

Values 0 to 60

active-min-only — When this optional parameter is specified, the **high-rate-hold-time** command will accept the optional **active-min-only** parameter. Attempting to remove the active-min-only parameter from the **add** command, or removing the **add** command itself, will fail while **active-min-only** is enabled on the **high-rate-hold-time** command. When specified, the respective rate or percentage is treated as the minimum offered rate for a queue, only when the queue has an actual non-zero offered rate. This is intended to limit the artificial increase in offered rate to queues that are currently active. When a queue's measured offered rate drops to zero, the system stops enforcing the minimum value.

12.39 high-slope

high-slope

Syntax [**no**] **high-slope**

Context **[Tree]** (config>qos>slope-policy high-slope)

Full Context configure qos slope-policy high-slope

Description The **high-slope** context contains the commands and parameters for defining the high Random Early Detection (RED) slope graph. Each buffer pool supports a high RED slope for managing access to the shared portion of the buffer pool for in-profile packets.

The **high-slope** parameters can be changed at any time and the affected buffer pool high RED slopes will be adjusted appropriately.

The **no** form of this command restores the high slope configuration commands to the default values. If the commands within **high-slope** are set to the default parameters, the **high-slope** node will not appear in save config and show config output unless the detail parameter is present.

12.45 hli-event

hli-event

Syntax **hli-event** {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]
no hli-event {**forward** | **backward** | **aggregate**}

Context **[Tree]** (config>oam-pm>session>ethernet>slm>loss-events hli-event)
[Tree] (config>oam-pm>session>ethernet>lmm>loss-events hli-event)
[Tree] (config>oam-pm>session>ip>twamp-light>loss-events hli-event)

Full Context configure oam-pm session ethernet lmm loss-events hli-event
configure oam-pm session ethernet slm loss-events hli-event
configure oam-pm session ip twamp-light loss-events hli-event

Description This command sets the high loss interval (HLI) threshold to be monitored and the associated thresholds using the counter of the specified direction. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default no hli-event forward

no hli-event backward

no hli-event aggregate

Parameters **forward** — Specifies the threshold is applied to the forward direction count.

backward — Specifies the threshold is applied to the backward direction count.

aggregate — Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold — Specifies the rising threshold that determines when the event is to be generated, when the percentage of loss value is reached.

Values 1 to 864000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

clear-threshold — Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the HLI counter must be 0.

Context **[Tree]** (config>oam-pm>session>ethernet>lmm>availability hli-force-count)
[Tree] (config>oam-pm>session>ethernet>slm hli-force-count)

Full Context configure oam-pm session ethernet lmm availability hli-force-count
configure oam-pm session ethernet slm hli-force-count

Description This command allows High Loss Interval (HLI) and Consecutive High Loss Interval (CHLI) counters to increment regardless of availability. Without this command, HLI and CHLI counters can only increment during times of availability, which includes undetermined availability. During times of complete packet loss, the forward direction HLI is marked as high loss. The backward direction is not marked as high loss during times of complete packet loss.

The **no** form of this command configures HLI and CHLI counters to increment during times of availability only.

Full Context configure vrrp policy priority-event host-unreachable hold-clear
configure vrrp policy priority-event lag-port-down hold-clear
configure vrrp policy priority-event mc-ipsec-non-forwarding hold-clear
configure vrrp policy priority-event port-down hold-clear
configure vrrp policy priority-event route-unknown hold-clear

Description This command configures the hold clear time for the event. The *seconds* parameter specifies the hold-clear time, the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.

The hold-clear time is used to prevent black hole conditions when a virtual router instance advertises itself as a master before other conditions associated with the cleared event have had a chance to enter a forwarding state.

Default no hold-clear

Parameters *seconds* — Specifies the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.

Values 0 to 86400

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt authentication-policy radius-authentication-server hold-down-time

Description This command determines the interval during which no new communication attempts is made to a RADIUS server that is marked **down** to prevent immediately overloading the server when it is starting up. The only exception is when all servers in the authentication policy are marked **down**; in that case they will all be used again to prevent failures on new client connections.

The **no** form of this command reverts to the default.

Default hold-down-time 30

Parameters *seconds* — Specifies the hold time before re-using a RADIUS server that was down.

Values 30 to 900

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hold-down-time

Syntax **hold-down-time** [**sec** *seconds*] [**min** *minutes*] [**hrs** *hours*] [**days** *days*]
no hold-down-time

Context **[Tree]** (config>aaa>radius-srv-plcy>servers hold-down-time)

Full Context configure aaa radius-server-policy servers hold-down-time

Description This command determines the interval during which no new communication attempts are made to a RADIUS server that is marked down to prevent immediately overloading the server when it is starting up. The only exception is when all servers in the authentication policy are marked down; in that case, they will all be used again to prevent failures on new client connections.

The **no** form of this command reverts to the default.

Default hold-down-time sec 30

Parameters *days* — Specifies the hold time in days before re-using a RADIUS server that was down.

Values 1 to 1

hours — Specifies the hold time in hours before re-using a RADIUS server that was down.

Values 1 to 23

minutes — Specifies the hold time in minutes before re-using a RADIUS server that was down.

Values 1 to 59

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

seconds — Specifies the hold time in seconds before re-using a RADIUS server that was down.

hold-down-time

Syntax **hold-down-time** *seconds*
no hold-down-time

Context **[Tree]** (config>service>sdp>keep-alive hold-down-time)

Full Context configure service sdp keep-alive hold-down-time

Description This command configures the minimum time period the SDP will remain in the operationally down state in response to SDP keepalive monitoring.

This parameter can be used to prevent the SDP operational state from “flapping” by rapidly transitioning between the operationally up and operationally down states based on keepalive messages.

When an SDP keepalive response is received that indicates an error condition or the **max-drop-count** keepalive messages receive no reply, the *sdp-id* will immediately be brought operationally down. If a keepalive response is received that indicates the error has cleared, the *sdp-id* will be eligible to be put into the operationally up state only after the **hold-down-time** interval has expired.

The **no** form of this command reverts the **hold-down-time seconds** *value* to the default setting.

Default hold-down-time 10

Parameters *seconds* — Specifies time, in seconds, expressed as a decimal integer. The SDP ID will remain in the operationally down state before it is eligible to enter the operationally up state. A value of 0 indicates that no **hold-down-time** will be enforced for SDP ID.

Values 0 to 3600

Platforms All

12.50 hold-down-timer

hold-down-timer

Syntax **hold-down-timer** *hold-down-timer*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no hold-down-timer

Context [Tree] (config>router>segment-routing>maintenance-policy hold-down-timer)

Full Context configure router segment-routing maintenance-policy hold-down-timer

Description This command configures the hold down timer for SR policy candidate paths.

This command is intended to prevent bouncing of the SR policy path state if one or more S-BFD sessions associated with segment lists flap and therefore cause the threshold to be repeatedly crossed in a short period of time. It is started when the number of up S-BFD sessions drops below the threshold. The SR policy path is not considered to be up again until the hold down timer has expired and the number of up S-BFD sessions equals or exceeds the threshold and the internal hold timer is not running.

Note: If the revert timer is also configured, the revert timer is not started until after the number of S-BFD sessions that are up ≥ threshold and the hold down timer for the primary candidate path has expired.

The **no** form of this command reverts to the default.

Default hold-down-timer 0

Parameters *hold-down-timer* — Specifies the hold-down timer, in deciseconds, in 10ms steps.

Values 0 to 5000

Platforms All

configure vrrp policy priority-event mc-ipsec-non-forwarding hold-set
configure vrrp policy priority-event port-down hold-set
configure vrrp policy priority-event route-unknown hold-set

Description This command specifies the amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events. A flapping event continually transitions between clear and set.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **hold-set** command is used to dampen the effect of a flapping event. The **hold-set** value is loaded into a hold-set timer that prevents a set event from transitioning to the cleared state until it expires.

Each time an event transitions between cleared and set, the timer is loaded and begins a countdown to zero. When the timer reaches zero, the event is allowed to enter the cleared state. Entering the cleared state is dependent on the object controlling the event, conforming to the requirements defined in the event itself. It is possible, on some event types, to have another set action reload the hold-set timer. This extends the amount of time that must expire before entering the cleared state.

Once the hold-set timer expires and the event meets the cleared state requirements or is set to a lower threshold, the current set effect on the virtual router instances in-use priority can be removed. As with **lag-port-down** events, this may be a decrease in the set effect if the *clearing* amounts to a lower set threshold.

The **hold-set** command can be executed at any time. If the hold-set timer value is configured larger than the new *seconds* setting, the timer is loaded with the new **hold-set** value.

The **no** form of the command disables the hold timer so that event transitions are processed immediately.

Default no hold-set

Parameters *seconds* — The number of seconds that the hold-set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type.

The value of 0 disables the hold-set timer, preventing any delay in processing lower set thresholds or cleared events.

Values 0 to 86400

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.54 hold-time

hold-time

Syntax **hold-time** *seconds*
no hold-time

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy hold-time)

Full Context configure subscriber-mgmt bgp-peering-policy hold-time

Description This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection.

Even though the router OS implementation allows setting the keepalive time separately, the configured keepalive timer is overridden by the hold-time value under the following circumstances:

If the specified hold-time is less than the configured keepalive time, then the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed.

If the hold-time is set to zero, then the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

The **no** form of this command reverts to the default.

Parameters *seconds* — Specifies the hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

Values 0, 3 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hold-time

Syntax **hold-time** *seconds*
hold-time [**days** *days*] [**hrs** *hrs*] [**min** *min*] [**sec** *sec*]
no hold-time

configure service vprn subscriber-interface group-interface wlan-gw egress hold-time

Description This command configures the time for which egress shaping resources associated with a wlan-gw tunnel are held after the last subscriber on a tunnel is deleted.

Parameters *time* — Specifies the time, in seconds, for which shaping resources are held in seconds after last subscriber is deleted.

Values infinite to 1 to 86400

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

hold-time

Syntax **hold-time** *time*
no hold-time

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>mobility hold-time)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>mobility hold-time)

Full Context configure service ies subscriber-interface group-interface wlan-gw mobility hold-time
configure service vprn subscriber-interface group-interface wlan-gw mobility hold-time

Description This command configures the minimum time that a UE is held associated with its current Access Point (AP) before being associated with a new AP.

The hold time is used to prevent overwhelming the system with mobility triggers, by limiting the rate at which a UE can move from one AP to another while the system is very busy already.

Default hold-time 5

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *time* — Specifies a hold-down time, in seconds, for handling of successive mobility triggers for a UE. It is the minimal time a UE stays associated with an AP.

Values 0 to 255

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

hold-time

Syntax **hold-time infinite**
hold-time *seconds*
no hold-time

Context **[Tree]** (config>subscr-mgmt>sap-template hold-time)

Full Context configure subscriber-mgmt sap-template hold-time

Description This command configures the time for which an SAP is retained after the last session has been removed. Such SAPs can be forcefully removed using the **idle-saps** option in the **clear**>**subscriber-mgmt**>**sap-template** context.

The **no** form of this command reverts to the default.

Default hold-time 30

Parameters **infinite** — Keyword specifying to never automatically remove the SAP.

seconds — Specifies the time, in seconds, that the SAP is retained.

Values 30 to 2592000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hold-time

Syntax **hold-time** *hold-time*
no hold-time

Context **[Tree]** (config>port>aps hold-time)

Full Context configure port aps hold-time

Description This command specifies how much time can pass, in 100s of milliseconds, without receiving an advertise packet from the neighbor before the multi-chassis signaling link is considered not operational.

The **hold-time** is usually 3 times the value of the **advertise-interval**. The value of the **advertise-interval** is valid only for a multi-chassis APS as indicated by the value of neighbor IP address if it is not set to 0.0.0.0.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *hold-time* — Specifies how long to wait for an APS advertisement packet before the peer in a Multi-Chassis APS group is considered operationally down.

Values 10 to 650

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

hold-time

Syntax **hold-time** *time-value*
no hold-time

Context **[Tree]** (config>port>ethernet>efm-oam hold-time)

Full Context configure port ethernet efm-oam hold-time

Description This command configures efm-oam operational transition dampening timers which reduce the number of efm-oam state transitions reported to upper layers.

Default no hold-time

Parameters *time-value* — Indicates the number of seconds that the efm-oam protocol will wait before going back to the operational state after leaving the operational state. Note that the hold-time does not apply if efm-oam moved from operational to link-fault.

A hold-time value of zero indicates that there should be no delay in transitioning to the operational state. A non-zero value will cause the efm-oam protocol to attempt to negotiate with a peer if possible, but it will remain in the send-local-remote-ok state until the hold time has expired if negotiation is successful.

If efm-oam is administratively shutdown while it was in the operational state and then re-enabled when a non-zero hold time is configured, efm-oam will attempt transition to the operational state immediately.

The **no** form of this command reverts the value to the default.

Values 0 to 50

Default 0

Platforms All

hold-time

Syntax **hold-time** {[**up** *hold-time-up*] [**down** *hold-time-down*] [**seconds** | **centiseconds**]}
no hold-time

Context **[Tree]** (config>port>ethernet hold-time)

Full Context configure port ethernet hold-time

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures port link dampening timers which reduce the number of link transitions reported to upper layer protocols. The **hold-time** value dampens interface transitions.

When an interface transitions from an up state to a down state, it is immediately advertised to the rest of the system if the hold-time down interval is zero, but if the hold-time down interval is greater than zero, interface down transitions are not advertised to upper layers until the hold-time down interval has expired. Likewise, an interface is immediately advertised as up to the rest of the system if the hold-time up interval is zero, but if the hold-time up interval is greater than zero, up transitions are not advertised until the hold-time up interval has expired.

For ESM SRRP setup, MCS synchronizes subscriber information between the two chassis. After a chassis recovers from a power reset/down, MCS immediately synchronizes all subscriber information at once. The longer the host list, the longer it will take to synchronize the chassis. In a fully populated chassis, it is recommended to allow at least 45 minutes for MCS synchronization. It is also recommended to hold the port down, facing the subscriber, on the recovering chassis for 45 minutes before it is allowed to forward traffic again.

The **no** form of this command reverts to the default values.

Default down 0 seconds — No port link down dampening is enabled; link down transitions are immediately reported to upper layer protocols.

up 0 seconds — No port link up dampening is enabled; link up transitions are immediately reported to upper layer protocols.

Parameters *hold-time-up* — The delay, in seconds or centiseconds, after which to notify the upper layers when an interface transitions from a down state to an up state.

Values 0 to 36000 seconds, 0 or 10 to 3600000 centiseconds in 5 centisecond increments

The minimum non-zero *hold-time-up* interval on 10G or higher ports is 10 centiseconds with a granularity of 5 centiseconds. The granularity on 1G ports is 1 second. Centiseconds are not supported on 1G ports.

hold-time-down — The delay, in seconds or centiseconds, after which to notify the upper layers when an interface transitions from an up state to a down state.

Values 0 to 36000 seconds, 0 or 10 to 3600000 centiseconds in 5 centisecond increments

The minimum non-zero *hold-time-down* interval on 10G or higher ports is 10 centiseconds with a granularity of 5 centiseconds. The granularity on 1G ports is 1 second. Centiseconds are not supported on 1G ports.

seconds | centiseconds — Specifies the hold time units as **seconds** or **centiseconds**.

hold-time

Syntax **hold-time** {[**up** *hold-time-up*] [**down** *hold-time-down*]}
no hold-time

Context **[Tree]** (config>port>sonet-sdh hold-time)

Full Context configure port sonet-sdh hold-time

Description This command configures SONET link dampening timers in 100s of milliseconds. This guards against reporting excessive interface transitions. This is implemented by not advertising subsequent transitions of the interface to upper layer protocols until the configured timer has expired.

Note: For APS configurations, the **hold-time down** and **up** default values are 100 ms and 500 ms respectively. If there is a large communication delay (time to exchange K1/K2 bytes) between the APS Controllers of the two endpoints of an APS link, it is highly suggested to increase the default hold-time down timer on the APS group port accordingly with the communication delay. See the **config>port aps** command for more information.

This command is supported by TDM satellite.

Default no hold-time

Parameters **up** *hold-time-up* — Configures the hold-timer for link up event dampening. A value of zero (0) indicates that an up transition is reported immediately.

Values 0 to 100

down *hold-time-down* — The hold-timer for link down event dampening. A value of zero (0) indicates that a down transition is reported immediately.

Values 0 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hold-time

Syntax **hold-time** {[**up** *hold-time-up*] [**down** *hold-time-down*]}
no hold-time

Context **[Tree]** (config>port>tdm hold-time)

Full Context configure port tdm hold-time

Description This command configures link dampening timers in 100s of milliseconds. This guards against reporting excessive interface transitions. This is implemented by not advertising subsequent transitions of the interface to upper layer protocols until the configured timer has expired.

This command is only supported on the m4-chds3-as, m12-chds3-as, and c4-ds3 MDAs.

Default no hold-time

Parameters *hold-time-up* — Configures the hold-timer for link up event dampening. A value of zero (0) indicates that an up transition is reported immediately.

Values 0 to 100 in 100s of milliseconds (default 0)

hold-time-down — The hold-timer for link down event dampening. A value of zero (0) indicates that a down transition is reported immediately.

Values 0 to 100 in 100s of milliseconds (default 5)

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

hold-time

Syntax **hold-time down** *hold-down-time*
no hold-time

Context **[Tree]** (config>lag hold-time)

Full Context configure lag hold-time

Description This command specifies the timer, in tenths of seconds, which controls the delay between detecting that a LAG is down (all active ports are down) and reporting it to the higher levels.

A non-zero value can be configured, for example, when active/standby signaling is used in a 1:1 fashion to avoid informing higher levels during the small time interval between detecting that the LAG is down and the time needed to activate the standby link.

Default no hold-time

Parameters *hold-down-time* — Specifies the hold-time for event reporting.

Values 0 to 2000

Platforms All

hold-time

Syntax **hold-time** *value*
no hold-time

Context **[Tree]** (config>service>vpls>mrp>mvrp hold-time)

Full Context configure service vpls mrp mvrp hold-time

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the dampening timer and applies to both types of provisioned SAPs – end-station and UNI. When a value is configured for the timer, it controls the delay between detecting that the last provisioned SAP in VPLS goes down and reporting it to the MVRP module. The CPM will wait for the time specified in the value parameter before reporting it to the MVRP module. If the SAP comes up before the hold-timer expires, the event will not be reported to MVRP module.

The non-zero hold-time does not apply for SAP transition from down to up, This kind of transition is reported immediately to MVRP module without waiting for hold-time expiration. Also this parameter applies only to the provisioned SAPs. It does not apply to the SAPs configured with the **vpls-sap-template** command. Also when end-station QinQ SAPs are present only the “no hold-time” configuration is allowed.

The **no** form of this command disables tracking of the operational status for the last active SAP in the VPLS. MVRP will stop declaring the VLAN only when the last provisioned customer (UNI) SAP associated locally with the service is deleted. Also MVRP will declare the associated VLAN attribute as soon as the first provisioned SAP is created in the associated VPLS instance, regardless of the operational state of the SAP.

Default no hold-time

Parameters *value* — Specifies the hold time in minutes

Values 1 to 30

Platforms All

hold-time

Syntax **hold-time** *seconds*
no hold-time

Context **[Tree]** (config>service>vpls>pim-snooping hold-time)

Full Context configure service vpls pim-snooping hold-time

Description This command configures the duration that allows the PIM-snooping switch to snoop all the PIM states in the VPLS. During this duration, multicast traffic is flooded in the VPLS. At the end of this duration, multicast traffic is forwarded using the snooped states.

When PIM snooping is enabled in VPLS, there is a period of time when the PIM snooping switch may not have built complete snooping state. The switch cannot build states until the routers connected to the VPLS refresh their PIM messages.

This parameter is applicable only if PIM snooping is enabled.

Parameters *seconds* — Specifies the PIM snooping hold time, in seconds.

Values 0 to 300

Default 90

hold-time

Syntax **hold-time** *seconds* [**min** *seconds2*]
no hold-time

Context **[Tree]** (config>service>vprn>bgp hold-time)
[Tree] (config>service>vprn>bgp>group hold-time)
[Tree] (config>service>vprn>bgp>group>neighbor hold-time)

Full Context configure service vprn bgp group hold-time
configure service vprn bgp group neighbor hold-time
configure service vprn bgp hold-time

Description This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

Even though the router OS implementation allows setting the **keepalive** (**config>service>vprn>bgp keepalive**, **config>service>vprn>bgp>group keepalive**, **config>service>vprn>bgp>group>neighbor keepalive**) time separately, the configured **keepalive** timer is overridden by the **hold-time** value under the following circumstances:

- If the specified hold-time is less than the configured **keepalive** time, then the operational **keepalive** time is set to a third of the **hold-time**; the configured **keepalive** time is not changed.
- If the **hold-time** is set to zero, then the operational value of the **keepalive** time is set to zero; the configured **keepalive** time is not changed. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default hold-time 90

Parameters *seconds* — Specifies the hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

Values 0, 3 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

seconds2 — Specifies the minimum hold-time that is accepted for the session. If the peer proposes a hold-time lower than this value the session attempt is rejected.

home-directory

Syntax **home-directory** *url-prefix* [*directory*] [*directoryIdirectory*]
no home-directory

Context **[Tree]** (config>system>security>user home-directory)
[Tree] (config>system>security>user-template home-directory)

Full Context configure system security user home-directory
configure system security user-template home-directory

Description This command configures the local home directory for the user for both console (file commands and '>' redirection) and FTP access.

If the URL or the specified URL/directory structure is not present, then a warning message is issued and the default is assumed.

The **no** form of this command removes the configured home directory.

Default no home-directory

Note: If restricted-to-home has been configured no file access is granted and no home-directory is created. If restricted-to-home is not applied then root becomes the user's home-directory.

Parameters *local-url-prefix* [*directory*] [*directory/directory*] — Specifies the user's local home directory URL prefix and directory structure, up to 190 characters.

Platforms All

12.63 hop

hop

Syntax **hop** *hop-index* **node-id** *node-id* [**te-link** *te-link-id*] {**strict** | **loose**}
no hop *hop-index*

Context **[Tree]** (config>router>gmpls>path hop)

Full Context configure router gmpls path hop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the node ID of the hops that the GMPLS LSP should traverse on its way to the egress UNI-C router.

The GMPLS LSP ingress and egress node IDs can be included as the first and the last hop. This is necessary when inter-operating with the Nokia 1830 PSS.

The **no** form of this command deletes hop list entries for the path. All of the GMPLS LSPs currently using the path are affected. Additionally, all services actively using these GMPLS LSPs are affected. The path must be shut down first in order to delete the hop from the hop list. The **no hop** *hop-index* command will not result in any action except a warning message on the console indicating that the path is administratively up.

Parameters *hop-index* — Specifies the order of the hops. The LSP always traverses from the lowest hop index to the highest. The hop index does not need to be sequential.

Values 1 to 1024

node-id — Specified the node ID of the transit GMPLS LSR. This can be an IPv4 address or a 32-bit unsigned integer identifier of the data plane switching node of the adjacent UNI-N.

te-link-id — Specifies the ID of the TE Link.

Values 1 to 4294967295

loose — Specifies that the route taken by the GMPLS LSP from the previous hop to this hop can traverse through other LSRs. Multiple hop entries with the *node-id* are flagged as errors. Either the loose or strict keyword must be specified.

strict — Specifies that the LSP must take a direct path from the previous hop router to this router. No transit routers between the previous router and this router are allowed. If the IP address specified is the interface address, then the LSP must use that interface. If there are direct parallel links between the previous router and this router, and if the system IP address is specified, then any one of the available interfaces can be used by the LSP. The user must ensure that the previous router and this router have a direct link. Multiple hop entries with the same IP address are flagged as errors. Either the loose or strict keyword must be specified.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hop

Syntax **hop** *hop-index ip-address* {**strict** | **loose**}
hop *hop-index* **sid-label** *sid-value*
no hop *hop-index*

Context **[Tree]** (config>router>mpls>path hop)

Full Context configure router mpls path hop

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the hops that the LSP should traverse on its way to the egress router. When specified, the IP address can be the interface IP address, a loopback interface address, or the system IP address. If a loopback interface or the system IP address is specified then the LSP can choose the best available interface.

When an IPv6 hop is specified, the interface IP address must be a global unicast IPv6 address. A link-local address is not allowed and is rejected in the configuration if attempted.

Optionally, the LSP ingress and egress IP address can be included as the first and the last hop. A hop list can include the ingress interface IP address, the system IP address, and the egress IP address of any of the hops being specified.

When the **sid-label** parameter is specified, this command specifies an MPLS label value for a hop in the path of an SR-TE LSP. The label value implied by the SID is only used when the path is used by an SR-TE LSP.

The **no** form of this command deletes hop list entries for the path. All the LSPs currently using this path are affected. Additionally, all services actively using these LSPs are affected. The path must be shutdown first in order to delete the hop from the hop list. The **no hop** *hop-index* command will not result in any action except a warning message on the console indicating that the path is administratively up.

Parameters *hop-index* — Specifies the hop index is used to order the hops specified. The LSP always traverses from the lowest hop index to the highest. The hop index does not need to be sequential.

Values 1 to 1024

ip-address — Specifies a loopback interface, the system or network interface IP address of the transit router. An interface IPv6 address must be a global unicast address.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

loose — This keyword specifies that the route taken by the LSP from the previous hop to this hop can traverse through other routers. Multiple hop entries with the same IP address are flagged as errors. Either the **loose** *or* **strict** keyword must be specified.

strict — This keyword specifies that the LSP must take a direct path from the previous hop router to this router. No transit routers between the previous router and this router are allowed. If the IP address specified is the interface address, then that is the interface the LSP must use. If there are direct parallel links between the previous router and this router and if system IP address is specified, then any one of the available interfaces can be used by the LSP. The user must ensure that the previous router and this router have a direct link. Multiple hop entries with the same IP address are flagged as errors. Either the **loose** *or* **strict** keyword must be specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sid-value — Specifies the SID value. The *sid-value* can be any valid MPLS/SR label value. It is not restricted by any locally-defined label ranges since these may be different on the remote node or adjacency for which the SID is defined.

Values 32 to 1048575

Platforms All

hop

Syntax **hop** *hop-index ip-address*
no hop *hop-index*

Context **[Tree]** (config>service>pw-routing>path hop)

Full Context configure service pw-routing path hop

Description This command configures each hop on an explicit path that can be used by one or more dynamic MS-PWs. It specifies the IP addresses of the hops that the MS-PE should traverse. These IP addresses can correspond to the system IP address of each S-PE, or the IP address on which the T-LDP session to a given S-PE terminates.

The **no** form of this command deletes hop list entries for the path. All the MS-PWs currently using this path are unaffected. Additionally, all services actively using these MS-PWs are unaffected. The path must be shutdown first in order to delete the hop from the hop list. The '**no hop hop-index**' command will not result in any action, except for a warning message on the console indicating that the path is administratively up.

Default no hop

Parameters *hop-index* — Specifies a locally significant numeric identifier for the hop. The hop index is used to order the hops specified. The LSP always traverses from the lowest hop index to the highest. The hop index does not need to be sequential.

Values 1 to 1024

ip-address — Specifies the system IP address or terminating IP address for the T-LDP session to the S-PE corresponding to this hop. For a given IP address on a hop, the system will choose the appropriate SDP to use.

Platforms All

Context **[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry>match hop-by-hop-opt)

Full Context configure system security cpm-filter ipv6-filter entry match hop-by-hop-opt

Description This command enables match on existence of Hop-by-Hop Options Extension Header in the IPv6 filter policy. This command applies to the 7750 SR and 7950 XRS.

The **no** form of this command ignores Hop-by-Hop Options Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

Default no hop-by-hop-opt

Parameters **true** — Match if a packet contains Hop-by-Hop Options Extension Header.

false — Match if a packet does not contain Hop-by-Hop Options Extension Header.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

12.65 hop-limit

hop-limit

Syntax **hop-limit** *limit*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no hop-limit

Context [Tree] (config>router>mpls>lsp>fast-reroute hop-limit)
[Tree] (config>router>mpls>lsp-template>fast-reroute hop-limit)

Full Context configure router mpls lsp fast-reroute hop-limit
configure router mpls lsp-template fast-reroute hop-limit

Description For fast reroute, how many more routers a detour is allowed to traverse compared to the LSP itself. For example, if an LSP traverses four routers, any detour for the LSP can be no more than ten router hops, including the ingress and egress routers.

The **no** form of this command reverts to the default value.

Default hop-limit 16

Parameters *limit* — Specify the maximum number of hops.

Values 0 to 255

Platforms All

hop-limit

Syntax **hop-limit** *number*
no hop-limit

Context [Tree] (config>router>mpls>lsp hop-limit)
[Tree] (config>router>mpls>lsp>primary-p2mp-instance hop-limit)

Full Context configure router mpls lsp hop-limit
configure router mpls lsp primary-p2mp-instance hop-limit

Description This command specifies the maximum number of hops that an LSP can traverse, including the ingress and egress routers. An LSP is not set up if the hop limit is exceeded. This value can be changed dynamically for an LSP that is already set up with the following implications.

If the new value is less than the current number of hops of the established LSP, the LSP is brought down. The software then tries to re-establish the LSP within the new **hop-limit** number. If the new value is equal to or greater than the current number hops of the established LSP, the LSP is not affected.

The **config**>**router**>**mpls**>**lsp**>**primary-p2mp-instance**>**hop-limit** command is not supported on the 7450 ESS.

The **no** form of this command returns the parameter to the default value.

Default hop-limit 255

Parameters *number* — Specifies the number of hops the LSP can traverse, expressed as an integer.

Values 2 to 255

Platforms All

hop-limit

Syntax **hop-limit** *number*
no hop-limit

Context **[Tree]** (config>router>mpls>lsp>primary hop-limit)
[Tree] (config>router>mpls>lsp>secondary hop-limit)

Full Context configure router mpls lsp primary hop-limit
configure router mpls lsp secondary hop-limit

Description This optional command overrides the **config>router>mpls>lsp** *lsp-name***>hop-limit** command. This command specifies the total number of hops that an LSP traverses, including the ingress and egress routers.

This value can be changed dynamically for an LSP that is already set up with the following implications:

If the new value is less than the current hops of the established LSP, the LSP is brought down. MPLS then tries to re-establish the LSP within the new hop-limit number. If the new value is equal or more than the current hops of the established LSP then the LSP will be unaffected.

The **no** form of this command reverts the values defined under the LSP definition using the **config>router>mpls>lsp** *lsp-name***>hop-limit** command.

Default no hop-limit

Parameters *number* — Specifies the number of hops the LSP can traverse, expressed as an integer.

Values 2 to 255

Platforms All

hop-limit

Syntax **hop-limit** {**lt** | **gt** | **eq**} *hop-limit-value*
hop-limit range *hop-limit-value hop-limit-value*
no hop-limit

Context **[Tree]** (config>filter>ipv6-filter>entry>match hop-limit)

Full Context configure filter ipv6-filter entry match hop-limit

Description This command configures the Time To Live (TTL) match criteria.

The **no** form of this command removes the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no hop-limit

Parameters **lt** — Specifies “less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies “greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies “equal to”.

hop-limit-value — Specifies the hop limit value for the rate limit action.

Values 0 to 255

Platforms All

12.66 host

host

Syntax **host** *host-name* [**create**]
no host *host-name*

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe host)
[Tree] (config>subscr-mgmt>loc-user-db>ppp host)

Full Context configure subscriber-mgmt local-user-db ipoe host
configure subscriber-mgmt local-user-db ppp host

Description This command creates an IPoE or PPP host entry in the local user database. A host entry in the local user database is matched based on the specified match-list criteria and an optional mask that is applied to the host-identification parameters.

A default host entry can be created without host-identification parameters which is used when no other host entries match. Note that creating a default host entry also requires a match-list to be specified.

The **no** form of this command removes the host entry from the local user database.

Parameters *host-name* — Specifies a unique host name, up to 32 characters. The *host-name* **default** creates a special match-all host entry that should not have host-identification parameters and is used when no other host entries match.

create — Keyword used to create the host name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

host

Syntax [**no**] **host** [*ip-address*]
[**no**] **host** [**fwd-service** *service-id*] **group-interface** *ip-int-name*

Context **[Tree]** (debug>router>igmp host)

Full Context debug router igmp host

Description This command enables debugging for the IGMP host.

The **no** form of the command disables debugging.

Parameters *ip-address* — Debugs the information associated with the specified IP address.

service-id — Debugs information associated with the service ID.

Values service-id: 1 to 2148278386
svc-name: up to 64 characters.

group-interface *ip-int-name* — Debugs the information associated with the specified IP interface name.

Values IP interface address

Platforms All

12.67 host-accounting

host-accounting

Syntax [**no**] **host-accounting** [**interim-update**]

Context **[Tree]** (config>subscr-mgmt>acct-plcy host-accounting)

Full Context configure subscriber-mgmt radius-accounting-policy host-accounting

Description This command enables per-host accounting. In host accounting mode, the acct-session-id is generated per host. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance. CoA and LI is supported based on the acct-session-id of the host.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **interim-update** — Specifies that no interim-update messages are sent for the related subscriber hosts when the session is deleted. Without this keyword, only START and STOP accounting messages are generated when the host is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.68 host-connectivity-verify

host-connectivity-verify

Syntax **host-connectivity-verify source-ip** *ip-address* [**source-mac** *ieee-address*] [**interval** *interval*] [**action** {**remove** | **alarm**}] [**timeout** *retry-timeout*] [**retry-count** *count*]

Context **[Tree]** (config>service>vpls host-connectivity-verify)
[Tree] (config>service>vpls>sap host-connectivity-verify)

Full Context configure service vpls host-connectivity-verify
configure service vpls sap host-connectivity-verify

Description This command enables subscriber host connectivity verification on a given VPLS SAP or within a VPLS service.

This tool will periodically scan all known hosts (from dhcp-state) and perform a UC ARP request. The subscriber host connectivity verification will maintain state (connected vs. not-connected) for all hosts.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies an unused IP address in the same network for generation of subscriber host connectivity verification packets.

ieee-address — Specifies the source MAC address to be used for generation of subscriber host connectivity verification packets.

interval — The interval, in minutes, which specifies the time interval in which all known sources should be verified. The actual rate is then dependent on number of known hosts and interval.

Values 1 to 6000 Note that a zero value can be used by the SNMP agent to disable host-connectivity-verify.

action {**remove** | **alarm**} — Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes the dhcp-state and releases all allocated resources (queues, table entries, and so on). A DHCP release is signaled to corresponding DHCP server. The static host is never removed. The **alarm** keyword raises an alarm indicating that the host is disconnected.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

retry-timeout — Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

Values 0 to 120

count — Specifies the number of connectivity check retransmissions.

Values 10 to 60 seconds

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-connectivity-verify

Syntax **host-connectivity-verify** [**interval** *interval*] [**action** {**remove** | **alarm**}] [**timeout** *retry-timeout*] [**retry-count** *count*] [**family** *family*]

Context **[Tree]** (config>service>ies>sub-if>grp-if host-connectivity-verify)
[Tree] (config>service>vprn>sub-if>grp-if host-connectivity-verify)

Full Context configure service ies subscriber-interface group-interface host-connectivity-verify
configure service vprn subscriber-interface group-interface host-connectivity-verify

Description This command enables subscriber host connectivity verification on a given SAP within a service. This tool periodically scans all known hosts (from dhcp-state) and perform UC ARP requests. The subscriber host connectivity verification maintains state (connected versus. not-connected) for all hosts.

The **no** form of this command reverts to the default.

Parameters *interval* — Specifies the interval, in minutes, which specifies the time interval which all known sources should be verified. The actual rate is then dependent on the number of known hosts and interval.

Values 1 to 6000

A zero value can be used by the SNMP agent to disable host-connectivity-verify.

action {remove | alarm} — Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes dhcp-state and releases all allocated resources (queues, table entries and so on). DHCP-RELEASE is signaled to corresponding DHCP server. Static hosts is never removed. The **alarm** keyword raises an alarm indicating that the host is disconnected.

retry-timeout — Specifies the retry timeout.

Values 10 to 60 seconds

count — Specifies the number of retry requests.

Values 2 to 29

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

family — Allows the host connectivity checks to be performed for IPv4 endpoint, IPv6 endpoint or both. With family IPv6 configured, host connectivity checks is performed on the global unicast address (assigned via SLAAC or DHCPv6 IA_NA) and link-local address of a Layer 3 RG or bridged hosts. In case of SLAAC assignment, host connectivity can only be performed if the /128 is known (via downstream ND). DHCPv6 PD assigned prefixes is removed if link-local address is determined to be unreachable via host connectivity check" Reachability checks for GUA and link-local address is done simultaneously.

Values ipv4, ipv6, both

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-connectivity-verify

Syntax **host-connectivity-verify** [**source** {**vrrp** | **interface**}] [**interval** *interval*] [**action** {**remove** | **alarm**}] [**timeout** *retry-timeout*] [**retry-count** *retry-count*]

Context **[Tree]** (config>service>ies>if host-connectivity-verify)
[Tree] (config>service>vprn>if host-connectivity-verify)

Full Context configure service ies interface host-connectivity-verify
configure service vprn interface host-connectivity-verify

Description This command enables subscriber host connectivity verification for all hosts on this interface. This tool periodically scans all known hosts (from dhcp-state) and perform UC ARP requests. The subscriber host connectivity verification maintains state (connected vs. not-connected) for all hosts.

The **no** form of this command reverts to the default.

Parameters **source** {**vrrp** | **interface**} — Specifies the source to be used for generation of subscriber host connectivity verification packets. The **vrrp** keyword specifies that the VRRP state should be used to select proper IP and MAC (active uses VRID, back-up uses interface addresses). The **interface** keyword forces the use of the interface mac and ip addresses.

Note: There are up to 256 possible subnets on a given interface, therefore, the subscriber host connectivity verification tool always uses an address of the subnet to which the given host is pertaining. For group-interfaces, one of the parent subscriber interface subnets (depending on host's address) is used.

action {**remove** | **alarm**} — Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes dhcp-state and releases all allocated resources (queues, table entries, and so on). The **alarm** keyword raises an alarm indicating that the host is disconnected.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

interval — Specifies the interval, expressed in minutes, which specifies when all known sources should be verified. The actual rate is then dependent on number of known hosts and interval.

Values 1 to 6000

Note: A zero value can be used by the SNMP agent to disable host-connectivity-verification.

retry-timeout — Specifies the timeout, in seconds, before a connectivity check retransmission.

Values 10 to 60

retry-count — Specifies the number of connectivity check retransmissions.

Values 2 to 29

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-connectivity-verify

Syntax [**no**] **host-connectivity-verify**

Context **[Tree]** (debug>service>id host-connectivity-verify)

Full Context debug service id host-connectivity-verify

Description This command enables Subscriber Host Connectivity Verification (SHCV) debugging.

The **no** form of the command disables the SHCV debugging.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-connectivity-verify

Syntax **host-connectivity-verify service** *service-id* [**sap** *sap-id*]
host-connectivity-verify subscriber *sub-ident-string* [**sla-profile** *sla-profile-name*]

Context **[Tree]** (oam host-connectivity-verify)

Full Context oam host-connectivity-verify

Description This command triggers the host connectivity verification checks and applies only to the 7450 ESS and 7750 SR.

Parameters *service-id* — Specifies the service ID to diagnose or manage.

Values 1 to 2147483647, service-name: up to 64 characters

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sap-id — Specifies the physical port identifier portion of the SAP definition.

sub-indent-string — Specifies an existing subscriber-id, up to 32 characters.

sla-profile-name — Specifies an existing SLA profile name, up to 32 characters. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

Platforms All

12.69 host-identification

host-identification

Syntax **host-identification**

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host host-identification)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host host-identification)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification
configure subscriber-mgmt local-user-db ppp host host-identification

Description Commands in this context configure host identification parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.70 host-ip

host-ip

Syntax **host-ip** *prefix-list-name*

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from host-ip)

Full Context configure router policy-options policy-statement entry from host-ip

Description This command specifies a prefix list host IP address as a match criterion for the route policy-statement entry.

Default no host-ip

Parameters *prefix-list-name* — Specifies the prefix-list name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

Platforms All

12.71 host-key

host-key

Syntax **host-key** {**mac**}
no host-key

Context **[Tree]** (config>subscr-mgmt>host-lockout-plcy host-key)

Full Context configure subscriber-mgmt host-lockout-policy host-key

Description This command specifies the parameters used in host identification for lockout on a given SAP or capture SAP.

no host-key – include (MAC address, Circuit-Id, Remote-Id)

host-key mac – include MAC address only

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

"host-key mac" should be used in DHCPv4 scenarios where Circuit-Id and Remote-Id are changed with "dhcp option action replace" configuration: a host lockout context is created with the replaced Circuit-Id/Remote-Id; with the default host-key (including Circuit-Id and Remote-Id), lockout does not kick in on the original trigger packet when it is retransmitted by the client.

Changing the host-key to mac should be used with care: all hosts with the same MAC address on a given SAP or capture SAP are identified as a single host with respect to host-lockout.

This command cannot be changed when the **host-lockout-policy** is referenced (configured under a SAP context).

The **no** form of this command reverts to the default value.

Parameters **mac** — Specifies to use the MAC address only for host identification for lockout.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.72 host-limit

host-limit

Syntax **host-limit** *max-num-hosts*
no host-limit

Context **[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>arp-host host-limit)
[Tree] (config>service>vpls>sap>arp-host host-limit)
[Tree] (config>service>ies>sub-if>grp-if>arp-host host-limit)
[Tree] (config>service>vprn>sub-if>grp-if>arp-host host-limit)

Full Context configure service ies subscriber-interface group-interface arp-host host-limit
configure service vpls sap arp-host host-limit
configure service vprn subscriber-interface group-interface arp-host host-limit
configure subscriber-mgmt msap-policy vpls-only-sap-parameters arp-host host-limit

Description This command configures the maximum number of ARP hosts.

The **no** form of this command reverts to the default.

Default host-limit 1

Parameters *max-num-hosts* — Specifies the maximum number of ARP hosts allowed on this SAP.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Values 1 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-limit

Syntax **host-limit** *max-num-hosts*
no host-limit

Context **[Tree]** (config>service>ies>sub-if>grp-if host-limit)

Full Context configure service ies subscriber-interface group-interface host-limit

Description This command configures the maximum number of ARP hosts.

Parameters *max-num-hosts* — Specifies the maximum number of ARP hosts.

Values 1 to 32767

12.73 host-limits

host-limits

Syntax [**no**] **no host-limits**

Context **[Tree]** (config>subscr-mgmt>sla-profile host-limits)
[Tree] (config>subscr-mgmt>sub-profile host-limits)

Full Context configure subscriber-mgmt sla-profile host-limits
configure subscriber-mgmt sub-profile host-limits

Description Commands in this context configure host limits per SLA profile instance or per subscriber.

The **no** form of this command removes the host limit configuration.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.74 host-lockout-policy

host-lockout-policy

Syntax **host-lockout-policy** *policy-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no host-lockout-policy

Context [Tree] (config>service>ies>if>sap host-lockout-policy)
[Tree] (config>service>ies>sub-if>grp-if>sap host-lockout-policy)
[Tree] (config>service>vpls>sap host-lockout-policy)
[Tree] (config>service>vprn>if>sap host-lockout-policy)
[Tree] (config>service>vprn>sub-if>grp-if>sap host-lockout-policy)

Full Context configure service ies interface sap host-lockout-policy
configure service ies subscriber-interface group-interface sap host-lockout-policy
configure service vpls sap host-lockout-policy
configure service vprn interface sap host-lockout-policy
configure service vprn subscriber-interface group-interface sap host-lockout-policy

Description This command selects an existing host lockout policy. The **host-lockout-policy** *policy-name* is created in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the SAP configuration.

Parameters *policy-name* — Specifies an existing host lockout policy, up to 32 characters, to associate with the SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-lockout-policy

Syntax **host-lockout-policy** *policy-name* [**create**]
no host-lockout-policy *policy-name*

Context [Tree] (config>subscr-mgmt host-lockout-policy)

Full Context configure subscriber-mgmt host-lockout-policy

Description This command creates a host lockout policy. The policy contains set of host lockout configuration parameters. It is applied to SAP or MSAPs (by a MSAP-policy). Any change does not impact existing locked-out hosts, but only new incoming hosts that enter lockout.

The **no** form of this command removes the policy name from the configuration. The policy must not be associated with any entity.

Parameters *policy-name* — Specifies an existing host lockout policy to associate with the SAP.

create — Specifies the keyword required to create the host lockout policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.75 host-match

host-match

Syntax **host-match dest** *destination-string* [**create**]
no host-match dest *destination-string*

Context **[Tree]** (config>port>ethernet>access>egr>qgrp host-match)

Full Context configure port ethernet access egress queue-group host-match

Description This command configures host matching for the Ethernet port egress queue-group.

The **no** form of this command removes the destination string from the configuration.

Parameters *destination-string* — Specify a host match destination string up to 32 characters.

create — Keyword used to create the host match. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms All

host-match

Syntax **host-match dest** *description-string* [**create**]
no host-match dest *destination-string*

Context **[Tree]** (config>port>sonet-sdh>path>access>egress>vport host-match)
[Tree] (config>port>ethernet>access>egress>vport host-match)

Full Context configure port ethernet access egress vport host-match
configure port sonet-sdh path access egress vport host-match

Description This command specifies the destination and organization strings to be used for matching subscriber hosts with this Vport.

The parent Vport of a subscriber host queue, which has the port-parent option enabled, is determined by matching the destination string **dest** string associated with the subscriber and the organization string org string associated with the subscriber host with the strings defined under a Vport on the port associated with the subscriber.

If a given subscriber host queue does not have the port-parent option enabled, it will be foster-parented to the Vport used by this subscriber and which is based on matching the dest string and org string. If the subscriber could not be matched with a Vport on the egress port, the host queue will not be bandwidth controlled and will compete for bandwidth directly based on its own PIR and CIR parameters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, a subscriber host queue with the port-parent option enabled is scheduled within the context of the port's port scheduler policy.

Parameters *description-string* — The destination character string. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path access egress vport host-match

All

- configure port ethernet access egress vport host-match

12.76 host-port

host-port

Syntax [**no**] **host-port** *port-id*

Context **[Tree]** (config>esa host-port)

Full Context configure esa host-port

Description This command configures an Ethernet port associated to the ESA instance.

The **no** form of this command removes the host-port.

Parameters *port-id* — Specifies the port identifier of any valid Ethernet port on a supported IOM.

Values *slot*/*mda*/*port*

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

host-port

Syntax **host-port** *port-id*
no host-port

Context **[Tree]** (config>esa>vm host-port)

Full Context configure esa vm host-port

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures an Ethernet port associated to an ESA-VM instance. The *port-id* used must be the same as the port associated with the ESA context on which the ESA-VM is configured.

The **no** form of this command removes the specified host-port for the ESA-VM instance.

Parameters *port-id* — Specifies the port identifier of any valid Ethernet port ID on the supported IOM.

Values *slot*/*mda*/*port*

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

12.77 host-shutdown

host-shutdown

Syntax [**no**] **host-shutdown**

Context **[Tree]** (config>service>ies>if>sap host-shutdown)

Full Context configure service ies interface sap host-shutdown

Description This command administratively enables host creation on this SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-shutdown

Syntax [**no**] **host-shutdown**

Context **[Tree]** (config>service>vprn>if>sap host-shutdown)

Full Context configure service vprn interface sap host-shutdown

Description This command administratively enables host creation on this SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.78 host-tracking-policy

host-tracking-policy

Syntax **host-tracking-policy** *policy-name* [**create**]
no host-tracking-policy *policy-name*

Context **[Tree]** (config>subscr-mgmt host-tracking-policy)
[Tree] (config>subscr-mgmt>sub-prof host-tracking-policy)

Full Context configure subscriber-mgmt host-tracking-policy
configure subscriber-mgmt sub-profile host-tracking-policy

Description This command configures a host tracking policy. IGMP host tracking is an option in the subscriber profile that allows the factoring in of a subscriber's (multicast) video traffic by reducing the unicast operational egress aggregate rate or the rate of the scheduler specified in the ANCP policy to account for a subscriber's multicast traffic. If no ANCP policy is defined, the egress aggregate rate configured in the subscriber profile is reduced. If an ANCP policy is defined, the **rate-modify** command in the policy specifies whether the egress aggregate rate or the rate of the egress policer specified in the policy is to be reduced to account for the subscriber's multicast traffic.

The **no** form of this command reverts to the default value.

Parameters *policy-name* — Specifies a host tracking policy name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

12.79 host-unreachable

host-unreachable

Syntax [**no**] **host-unreachable** *ip-address*
[**no**] **host-unreachable** *ipv6-address*

Context **[Tree]** (config>vrrp>policy>priority-event host-unreachable)

Full Context configure vrrp policy priority-event host-unreachable

Description This command creates the context to configure a host unreachable priority control event to monitor the ability to receive ICMP echo reply packets from an IP host address.

A host unreachable priority event creates a continuous ICMP echo request (ping) probe to the specified *ip-address*. If a ping fails, the event is considered to be set. If a ping is successful, the event is considered to be cleared.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Multiple unique (different *ip-address*) **host-unreachable** event nodes can be configured within the **priority-event** node to a maximum of 32 events.

The **host-unreachable** command can reference any valid local or remote IP address. The ability to ARP a local IP address or find a remote IP address within a route prefix in the route table is considered part of the monitoring procedure. The **host-unreachable** priority event operational state tracks ARP or route table entries dynamically appearing and disappearing from the system. The operational state of the **host-unreachable** event are listed in Table 62.

Table 62 **Host Unreachable Operational States**

Host Unreachable Operational State	Description
Set – no ARP	No ARP address found for *ip-addr* for **drop-count** consecutive attempts; only applies when IP address is considered local
Set – no route	No route exists for *ip-addr* for **drop-count** consecutive attempts; only when IP address is considered remote
Set – host unreachable	ICMP host unreachable message received for **drop-count** consecutive attempts
Set – no reply	ICMP echo request timed out for **drop-count** consecutive attempts
Set – reply received	Last ICMP echo request attempt received an echo reply but historically not able to clear the event
Cleared – no ARP	No ARP address found for *ip-addr* - not enough failed attempts to set the event
Cleared – no route	No route exists for *ip-addr* - not enough failed attempts to set the event
Cleared – host unreachable	ICMP host unreachable message received - not enough failed attempts to set the event
Cleared – no reply	ICMP echo request timed out - not enough failed attempts to set the event
Cleared – reply received	Event is cleared - last ICMP echo request received an echo reply

Unlike other priority event types, the **host-unreachable** priority event monitors a repetitive task. A historical evaluation is performed on the success rate of receiving ICMP echo reply messages. The operational state takes its cleared and set orientation from the historical success rate. The informational portion of the operational state is derived from the last attempt's result. It is possible for the previous attempt to fail while the operational state is still cleared due to an insufficient number of failures to cause it to become set. It is also possible for the state to be set while the previous attempt was successful.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The hold-set timer be expired and the historical success rate must be met prior to the event operational state becoming cleared.

The **no** form of the command deletes the specific IP host monitoring event. The event may be deleted at any time. When the event is deleted, the in-use priority of all associated virtual router instances must be reevaluated. The event's **hold-set** timer has no effect on the removal procedure.

Default no host-unreachable — No host unreachable priority events are created.

Parameters *ip-address* — The IP address of the host for which the specific event will monitor connectivity. The *ip-addr* can only be monitored by a single event in this policy. The IP address can be monitored by multiple VRRP priority control policies. The IP address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ip-addr* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x[-interface]	
	x:	[0..FFFF]H
	interface:	32 chars maximum, mandatory for link local addresses

The link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

12.80 host-unsolicited-na-flood-evpn

host-unsolicited-na-flood-evpn

Syntax [**no**] **host-unsolicited-na-flood-evpn**

Context **[Tree]** (config>service>vpls>proxy-nd host-unsolicited-na-flood-evpn)

Full Context configure service vpls proxy-nd host-unsolicited-na-flood-evpn

Description This command controls whether the system floods host unsolicited Neighbor Advertisements to the EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=0.

The **no** form of the command will only flood to local SAPs/binds but not to the EVPN destinations. This is only recommended in networks where CEs are routers that are directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in the EVPN to ensure that the remote caches are updated and the BGP does not miss the advertisement of these entries.

Default host-unsolicited-na-flood-evpn

Platforms All

12.81 hour

hour

Syntax **hour** *hour-number* [*..hour-number*] | **all**}
no hour

Context **[Tree]** (config>system>cron>sched hour)

Full Context configure system cron schedule hour

Description This command specifies which hour to schedule a command. Multiple hours of the day can be specified. When multiple hours are configured, each of them will cause the schedule to trigger. **Day-of-month** or **weekday** must also be specified. All days of the month or weekdays can be specified. If an hour is configured without configuring month, weekday, day-of-month, and minute, the event will not execute.

The **no** form of this command removes the specified hour from the configuration.

Default no hour

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *hour-number* — Specifies the hour to schedule a command.

Values 0 to 23 (maximum 24 hour-numbers)

all — Specifies all hours.

Platforms All

12.82 hqos-algorithm

hqos-algorithm

Syntax **hqos-algorithm** {**default** | **above-offered-allowance-control**}
no hqos-algorithm

Context **[Tree]** (config>qos>port-scheduler-policy hqos-algorithm)

Full Context configure qos port-scheduler-policy hqos-algorithm

Description This command configures the port scheduler H-QoS algorithm used to calculate the operational rates for the children connected to the port scheduler. The algorithm can be changed on the fly.

Default default

Parameters **default** — Specifies that the default H-QoS algorithm is used by the port scheduler.

above-offered-allowance-control — Enables the control of the amount of bandwidth in excess of the offered rate to be given to a queue or scheduler. This algorithm is supported when only queues and schedulers are parented to the port scheduler on Ethernet Vports or Ethernet physical ports.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

12.83 hqos-mode

hqos-mode

Syntax **hqos-mode** {**port-scheduler** | **hw-agg-shaping**}

Context **[Tree]** (config>qos>fp-resource-policy>ports hqos-mode)

Full Context configure qos fp-resource-policy ports hqos-mode

Description This command configures the default HQoS mode for ports on the specified FP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default hqos-mode port-scheduler

Parameters **port-scheduler** — Specifies that the default HQoS mode is port scheduler.

hw-agg-shaping — Specifies that the default HQoS mode is hardware aggregate shaping.

Platforms 7750 SR-1, 7750 SR-s

12.84 hs-agg-rate-limit

hs-agg-rate-limit

Syntax **hs-agg-rate-limit** *kilobits-per-second*
no hs-agg-rate-limit

Context **[Tree]** (config>subscr-mgmt>sla-profile>egress hs-agg-rate-limit)

Full Context configure subscriber-mgmt sla-profile egress hs-agg-rate-limit

Description This command configures high scale (HS) aggregate rate limit of the SLA profile instance (SPI) associated with the subscriber in expanded SLA mode. The aggregate rate of the subscriber (the primary shaper) is configured in the **config>subscr-mgmt>sub-profile>egress>hs-agg-rate-limit** context.

The **no** form of this command removes the value from the configuration.

Parameters *kilobits-per-second* — Specifies the HS egress aggregate rate limit.

Values 1 to 100000000

Platforms 7750 SR-7/12/12e

hs-agg-rate-limit

Syntax **hs-agg-rate-limit** *kilobits-per-second* [**min-resv-bw** *min-rate*]
hs-agg-rate-limit max [**min-resv-bw** *min-rate*]
no hs-agg-rate-limit

Context **[Tree]** (config>subscr-mgmt>sub-profile>egress hs-agg-rate-limit)

Full Context configure subscriber-mgmt sub-profile egress hs-agg-rate-limit

Description This command configures the HS aggregate rate limit for the subscriber in single SLA mode. In single SLA mode, the **hs-aggregate-rate-limit** command under the **config>subscr-mgmt>sla-profile** context should not be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When both, **sub-profile>egress>hs-agg-rate-limit** and **sla-profile>egress>hs-agg-rate-limit** are configured, the system takes the minimum of the two to program the subscriber's aggregate rate.

The **no** form of this command removes the value from the configuration.

Parameters *kilobits-per-second* — Specifies the HS egress aggregate rate limit.

Values 1 to 100000000

min-rate — Specifies the minimum rate of the minimum reserved bandwidth for unicast data traffic. Since minimum rate can oversubscribe subscriber bandwidth to guarantee a minimum bandwidth for unicast traffic, care must be taken in QoS provisioning to prioritize packets accordingly (downstream network elements such as the access node or aggregation nodes) when congestion occurs.

Values 0 to 100000000

max — Specifies that the egress aggregate rate limit for the subscriber is unlimited. Scheduling for the subscriber queues will only be governed by the individual queue parameters and any congestion on the port relative to each queues scheduling priority.

Platforms 7750 SR-7/12/12e

12.85 hs-alt-port-class-pool

hs-alt-port-class-pool

Syntax [**no**] **hs-alt-port-class-pool**

Context **[Tree]** (config>qos>network-queue>queue hs-alt-port-class-pool)

Full Context configure qos network-queue queue hs-alt-port-class-pool

Description This command specifies that the HSQ queue group queues use buffers from the HS alternate port class buffer pool.

The **no** form of the command reverts to the HSQ queue group queues using buffers from HS standard port class pools.

Platforms 7750 SR-7/12/12e

hs-alt-port-class-pool

Syntax [**no**] **hs-alt-port-class-pool**

Context **[Tree]** (config>qos>sap-egress>queue hs-alt-port-class-pool)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure qos sap-egress queue hs-alt-port-class-pool

Description This command specifies that the HSQ queue group queues use buffers from the HS alternate port class buffer pool.

The **no** form of the command reverts to the HSQ queue group queues using buffers from HS standard port class pools.

Platforms 7750 SR-7/12/12e

hs-alt-port-class-pool

Syntax [**no**] **hs-alt-port-class-pool**

Context **[Tree]** (config>qos>qgrps>egr>qgrp>queue hs-alt-port-class-pool)

Full Context configure qos queue-group-templates egress queue-group queue hs-alt-port-class-pool

Description This command specifies that the HSQ queue group queues use the class buffers from the HS alternate port class buffer pools.

The **no** form of the command reverts to the HSQ queue group queues using buffers from HS standard port class pools.

Platforms 7750 SR-7/12/12e

12.86 hs-attachment-policy

hs-attachment-policy

Syntax **hs-attachment-policy** *policy-name* [**create**]
no hs-attachment-policy *policy-name*

Context **[Tree]** (config>qos hs-attachment-policy)

Full Context configure qos hs-attachment-policy

Description This command specifies how the queues within an HSQ queue group associated with the SAP egress policy instance, egress queue group instance, or egress network queue policy instance attaches to the HSQ scheduling classes managed by the port scheduler. On the HSQ IOM, eight queues are allocated per egress SAP or subscriber SLA profile instance (SPI), or per egress (access or network) queue group instance, or per egress network port, numbered 1 through 8. The port scheduler maintains six scheduling classes numbered from 1 through 6 (6 being the highest relative priority and 1 being the lowest). The set of eight queues may also be placed into one of two local Weighted Round Robin (WRR) groups which

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

collapse the member queues into a single scheduling class while providing a weighted fair distribution of scheduling opportunities per member. The attachment policy contains the **attachment** commands that map the queue IDs and WRR groups to the scheduling classes. The attachment policy also defines the mapping of the scheduling classes to the queue's aggregate shapers low and high burst limit thresholds.

The **no** form of the command deletes the HS attachment policy from the system, which is only possible if the policy is not being referenced.

Parameters *policy-name* — Specifies an existing attachment policy, up to 32 characters. Each HS attachment policy must be uniquely named within the system.

create — This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms 7750 SR-7/12/12e

hs-attachment-policy

Syntax **hs-attachment-policy** *policy-name*
no hs-attachment-policy

Context **[Tree]** (config>qos>network-queue hs-attachment-policy)

Full Context configure qos network-queue hs-attachment-policy

Description This command associates an existing HS attachment policy with the network queue QoS policy. The HS attachment policy controls how the network queues are attached to scheduler classes or WRR groups, and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with a network queue policy.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

Parameters *policy-name* — Specifies an existing attachment policy up, to 32 characters. Each HSQ attachment policy must be uniquely named within the system.

Platforms 7750 SR-7/12/12e

hs-attachment-policy

Syntax **hs-attachment-policy** *policy-name*
no hs-attachment-policy

Context **[Tree]** (config>qos>sap-egress hs-attachment-policy)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure qos sap-egress hs-attachment-policy

Description This command associates an existing HS attachment policy with the SAP egress QoS policy. The HS attachment policy controls how the SAP egress queues are attached to scheduler classes or WRR groups, and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with a SAP egress policy.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

Parameters *policy-name* — Specifies an existing attachment policy up, to 32 characters. Each HSQ attachment policy must be uniquely named within the system.

Platforms 7750 SR-7/12/12e

hs-attachment-policy

Syntax **hs-attachment-policy** *policy-name*
no hs-attachment-policy

Context **[Tree]** (config>qos>qgrps>egr>qgrp hs-attachment-policy)

Full Context configure qos queue-group-templates egress queue-group hs-attachment-policy

Description This command associates an existing HS attachment policy with the egress queue group template. The HS attachment policy controls how the egress queue group instance queues are attached to scheduler classes or WRR groups, and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with an egress queue group template.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

Parameters *policy-name* — Specifies an existing attachment policy, up to 32 characters. Each HS attachment policy must be uniquely named within the system.

Platforms 7750 SR-7/12/12e

hs-attachment-policy

Syntax **hs-attachment-policy** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy hs-attachment-policy)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure qos copy hs-attachment-policy

Description This command copies existing QoS policy entries for a QoS policy ID to another QoS policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters *src-name dst-name* — Indicates that the source policy ID and the destination policy ID are HS policy IDs. Specify the source policy ID that the copy command attempts to copy from and specify the destination policy ID to which the command copies a duplicate of the policy.

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy ID exists.

```
SR>config>qos# copy hs-pool-policy policy1 policy2
MINOR: CLI Destination "policy2" exists use {overwrite}.
SR>config>qos# copy hs-pool-policy policy1 policy2
 overwrite
```

Platforms 7750 SR-7/12/12e

12.87 hs-class-weight

hs-class-weight

Syntax **hs-class-weight** *weight*
no hs-class-weight

Context **[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>queue hs-class-weight)
[Tree] (config>subscr-mgmt>sla-prof>egress>qos>hs-wrr-grp hs-class-weight)

Full Context configure subscriber-mgmt sla-profile egress qos hs-wrr-group hs-class-weight
configure subscriber-mgmt sla-profile egress qos queue hs-class-weight

Description This command configures the class-weight override for expanded egress HS queues or the WRR group.

The **no** form of this command removes the weight value from the configuration.

Parameters *weight* — Specifies the weight of the scheduling class.

Values 1, 2, 4, 8

Platforms 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no hs-class-weight

Context [Tree] (config>qos>qgrps>egr>qgrp>hs-wrr-group hs-class-weight)

Full Context configure qos queue-group-templates egress queue-group hs-wrr-group hs-class-weight

Description This command specifies the class weight of this WRR group at its parent primary shaper, relative to the other queues and WRR groups in different HSQ queue groups in the same scheduling class. This allows the capacity available at the primary shaper scheduling class to be shared in a WRR manner between the HSQ queue group queues and WRR groups attached to that scheduling class. The **hs-class-weight** parameter can be used to give unequal shares of the available capacity to different types of service offerings.

The **no** form of the command reverts to the default value.

Default hs-class-weight 1

Parameters *weight* — Specifies the class weight of the HS WRR group.

Values 1, 2, 4, 8

Platforms 7750 SR-7/12/12e

hs-class-weight

Syntax **hs-class-weight** *weight*
no hs-class-weight

Context [Tree] (config>qos>qgrps>egr>qgrp>queue hs-class-weight)

Full Context configure qos queue-group-templates egress queue-group queue hs-class-weight

Description This command specifies the class weight of this queue at its parent primary shaper, relative to the other queues and WRR groups in different HSQ queue groups in the same scheduling class. This allows the capacity available at the primary shaper scheduling class to be shared in a WRR manner between the HSQ queue group queues and WRR groups attached to that scheduling class. The **hs-class-weight** parameter can be used to give unequal shares of the available capacity to different types of service offerings.

This command is ignored for egress HSQ queue group queues, which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the **hs-class-weight** is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of the command reverts to the default value.

Default hs-class-weight 1

Parameters *weight* — Specifies the class weight of the queue.

Values 1, 2, 4, 8

12.88 hs-fixed-high-thresh-delta

hs-fixed-high-thresh-delta

Syntax **hs-fixed-high-thresh-delta** *size-in-bytes*
no hs-fixed-high-thresh-delta

Context **[Tree]** (config>card>fp>egress hs-fixed-high-thresh-delta)

Full Context configure card fp egress hs-fixed-high-thresh-delta

Description This command specifies the egress aggregate shaper high burst limit threshold delta for this HSQ IOM FP. An aggregate rate can be applied to each egress HSQ queue group, HS secondary shaper and (for subscribers configured with HS SLA expanded mode) primary shaper which manages the maximum burst limit over a specified shaping rate. Each aggregate shaper supports two thresholds which are used in conjunction with the low burst class setting. The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper under run conditions. The high burst limit threshold is determined by adding the configured value of this command to the aggregate's low burst limit threshold value. This configured value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The configured value for this command can be changed at any time. Modifying the setting causes all aggregate shapers on this FP to reconfigure the low and high burst limit thresholds to reflect the new value.

The **no** form of this command reverts this parameter to the default.

Default hs-fixed-high-thresh-delta 4000

Parameters *size-in-bytes* — Specifies high threshold data in bytes.

Values 0 to 65536

Platforms 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.89 hs-low-burst-max-class

hs-low-burst-max-class

Syntax **hs-low-burst-max-class** *class*
no hs-low-burst-max-class

Context **[Tree]** (config>subscr-mgmt>sub-prof>egress hs-low-burst-max-class)

Full Context configure subscriber-mgmt sub-profile egress hs-low-burst-max-class

Description This command specifies which scheduling classes map to the low burst limit threshold of an egress HS primary shaper. The HS primary shaper is used to manage aggregate bandwidth of the subscriber with multiple SLA profile instances (expanded SLA mode).

Each HS primary shaper supports two burst thresholds, a low burst limit threshold and a high burst limit threshold. The two thresholds allow separation of burstiness between low and high scheduling classes.

When the low burst threshold of the HS primary shaper is reached, the lower scheduling classes, up to the scheduling class configured by this command, stops being served. Traffic on higher scheduling classes still goes through until the high burst threshold is reached. When the high burst threshold is exceeded, all scheduling classes associated with the HS primary shaper and stops being serve, which effectively shuts off the traffic flow.

Typically, the queues associated with higher scheduling classes are individually rate-limited so that their aggregate allowed throughput is less than the configured rate of the HS primary shaper. Determining the **hs-low-burst-max-class** *class* value involves anticipating the proper dividing line between the low and high scheduling classes by evaluating the forwarding behavior and SLA enforcement of each class.

By default, all scheduling classes are mapped to the low burst limit threshold. When mapping scheduling classes to the high burst limit threshold, an adequate value for the **config>card>fp>egress>hs-fixed-high-thresh-delta** should be specified (by default, it is set to 4000 bytes). This is because the queues associated with the lower scheduling classes may burst over the lower threshold during normal operation due to the scheduler forwarding whole packets. The **hs-fixed-high-thresh-delta** value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system uses the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value to the aggregate low burst limit threshold value.

The **hs-low-burst-max-class** value for HS primary shaper can be changed at any time in the subscriber profile (sub-profile).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command restores the low burst limit threshold of the scheduling classes to the default value. This causes all scheduling classes associated with the HS primary shaper to be mapped to the low burst limit threshold.

Default hs-low-burst-max-class 6

Parameters *class* — Specifies the highest scheduling class that is associated with the low burst limit threshold of the HS primary shaper. Scheduling classes that are higher than the scheduling class ID are associated with the high burst limit threshold.

Values 1 to 6

Platforms 7750 SR-7/12/12e

12.90 hs-mbs

hs-mbs

Syntax **hs-mbs** *percent-of-queue-rate*
no hs-mbs

Context **[Tree]** (config>qos>network-queue>queue hs-mbs)

Full Context configure qos network-queue queue hs-mbs

Description This command configures the queue size of an HSQ queue group network queue. Its value is calculated based on the specified percentage of one second of the queue PIR converted to bytes (the regular **mbs** parameter is ignored in the network queue policy).

The **no** form of the command reverts to the default value.

Default hs-mbs 100

Parameters *percent-of-queue-rate* — Specifies the buffer space for the queue as a percentage of its PIR (in bytes).

Values 0.00 to 100.0

Platforms 7750 SR-7/12/12e

© 2022 Nokia.

12.91 hs-pool-policy

hs-pool-policy

Syntax **hs-pool-policy** *name*
no hs-pool-policy

Context **[Tree]** (config>card>fp>egress hs-pool-policy)

Full Context configure card fp egress hs-pool-policy

Description This command specifies the HS pool policy for this FP.

An HS pool policy contains the required parameters to create and size root and mid-tier buffer pools on an HSQ IOM, and apply a slope policy to each.

A single HS pool policy is supported per port FP. This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the policy and reapplies the default policy.

Default hs-pool-policy default

Parameters *name* — Specifies the HS pool policy name, up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-pool-policy

Syntax **hs-pool-policy** *policy-name* [**create**]
no hs-pool-policy *policy-name*

Context **[Tree]** (config>qos hs-pool-policy)

Full Context configure qos hs-pool-policy

Description Commands in this context create HS pool policy parameters. The policy can be assigned to an egress forwarding plane of an HSQ IOM. The policy contains the required parameters to create and size root and mid-tier buffer pools on an HSQ IOM, and apply a slope policy to each. The HS pool policy can be applied using the **hs-pool-policy** command within the **config>card>fp** *fp-number* **egress** context.

The system supports 63 HS pool policies including the default HS pool policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- HSQ IOM System Reserved Buffers — The HSQ IOM maintains two types of queues; provisioned queues and system reserved queues. The HSQ IOM ensures that provisioned queues cannot consume buffers that must be available for internal system queues required for correct operating behavior. To prevent buffer starvation between the two types of queues, the system divides the available buffers into two portions. The first portion is given to system root pools and is allocated to HSQ queues reserved for internal functions. The second portion is given to the provisioned or user-defined root pools and is available for egress service queues, network queues, queue-group queues or subscriber queues. By default, 5% of the total buffers available are given to the system root pools leaving 95% for the provisioned root pools.

  The default separation between the system and the provisioned root pools can be overridden using the **system-reserve** command.
- Root Pools — Root pools are the buffer pools at the bottom of the buffer allocation hierarchy. Two sets of root pools exist: the system root pools and the provisioned root pools. The system root pools cannot be managed by the HS pool policy; only the total number of buffers given to the system root pools can be adjusted by using the **system-reserve** command.

  The HS pool policy manages sixteen provisioned root pools defined under the **root-tier** context and specified as root-pool 1 through 16. Each root pool accepts a weight command that defines the relative quantity of buffers that are allocated to each root pool. Root pools are deactivated by defining a weight equal to 0. Root pools with a non-zero weight are sized based on the pool's weight divided by the sum of all root pool weights, multiplied by the available buffer space. In this manner, all buffers not reserved for system use are distributed between the provisioned root pools without oversubscription. The lack of oversubscription prevents buffer starvation between the root pools allowing root pools, to act as protected buffer space between different types of traffic (best-effort, expedited, or real-time). Root pools allocate buffers to the FP-level mid-tier pools.
- Mid-Tier Pools — Mid-tier pools are the buffer pools that act as aggregators for port-class pools. Multiple mid-tier pools can be mapped to a single root pool and each mid-tier pool is assigned a percentage of that root pool's buffer space. The sum of the percentages may exceed 100%, allowing for oversubscription of the root pool's buffer space. Due to statistical multiplexing principles, oversubscribing the root pool's buffer allocation may allow more efficient use of the available buffers as not all mid-tier pools are expected to use their fair share simultaneously. Examples of a multiple mid-tier pool application are multiple assured forwarding (AF) or best-effort classes being grouped together in the same root pool. The HS pool policy manages the sixteen mid-tier pools on an HSQ IOM, defined under the **mid-tier** context and specified as mid-pool 1 through 16.
- Port Class Pools — The HSQ IOM maintains two sets of scheduler class pools per port: a standard (or default) set and an alternate set. Each set contains six pools, one for each scheduler class serviced by the HSQ IOM port scheduler. Each queue or WRR group is mapped to a scheduling class based on the HS attachment policy defined within the policy or template used to create the queue. Within the SAP egress policy, network queue policy and egress queue group template, an **alt-port-class-pool** command specifies whether the queues created through the policy use the standard or alternate set of port class pools on the physical port. Further, the scheduling class servicing the queue defines which port-class pool (1 through 6) within the set allocate buffers to the queue.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Port-class pools are defined within the **hs-port-pool-policy**, which is applied to each physical port. Further information on HSQ IOM port-class pools is contained in the HS port pool policy section.

- HSQ Stable Pool Sizing Equivalency — Stable pool sizing is a feature supported on ingress and on non-HSQ egress forwarding planes. By default, the system tries to make all buffers available to active ports (provisioned and equipped). This leads to a condition where an IOM may have only a single MDA populated and the users on that MDA receive all available buffers. At a later date, the second MDA can be populated, causing the buffer space to be fragmented between the users on each MDA. The users on the earlier populated MDA may perceive a degradation in service based on the change in available buffers. The stable pool sizing feature mitigates this potential issue by segregating the buffer space per MDA.

  The HSQ IOM can be made to operate in this stable buffer allocation mechanism by utilizing per-MDA buffer pools. This is accomplished by performing the following steps:

  1. Create two sets of root-pools and two sets of mid-pools in the **hs-pool-policy** applied to the IOM's FP egress CLI context. The first set of mid-pools should be parented to the first set of root-pools. The second set of mid-pools should be parented to the second set of root-pools.
  2. Create two distinct HS port pool policies. One is applied to the ports on the first MDA and has the port-class pools parented to the first set of mid-tier pools from the FP level policy. The second HS port pool policy is applied to the ports on the second MDA (when it is provisioned) and has the port-class pools parented to the second set of mid-tier pools from the FP level policy. This provides deterministic pool sizing independent of MDA equipping events.
  3. Configure further control at the port-class level by utilizing **explicit-percent** based port-class pool sizing, which eliminates the effect of changing port states, including bandwidth changes.

- HSQ Queue Buffer Allocation — As each packet arrives at an HSQ queue, the queue must obtain buffers to admit the packet on the queue. The queue first checks the depth of the queue relative to the packet's congestion priority (based on the in, out, or exceed profile) to determine if the packet should be discarded based on early congestion detection or based on the MBS threshold. If the packet is allowed into the queue, the HSQ IOM continues to determine buffer availability using checks to the queue's port-class pool, the port-class pool's mid-tier pool, and the mid-tier pool's root pool. The same RED slope type used at the queue (high, low, or exceed) is used within each buffer pool. If a buffer is available, the buffer can be allocated, and given to the queue.
- Default HSQ Pool Policy — An HSQ pool policy with the name **default** always exists on the system and does not need to be created. The default pool policy cannot be changed and is used by all HSQ IOMs within the system unless an explicitly created **hs-pool-policy** is associated with a forwarding plane.

  The default policy contains the following parameters:

  system-reserve: 5%

  root-pool 1

  allocation-weight:75

  slope-policy:_tmnx_hs_default

  root-pool 2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

allocation-weight:25
slope-policy:_tmnx_hs_default
root-pool 3 to **16**
allocation-weight:0
slope-policy:_tmnx_hs_default
mid-pool 1
parent-root-pool:1
allocation-percent:40%
slope-policy:_tmnx_hs_default
mid-pool 2
parent-root-pool:1
allocation-percent:35%
slope-policy:_tmnx_hs_default
mid-pool 3
parent-root-pool:1
allocation-percent:30%
slope-policy:_tmnx_hs_default
mid-pool 4
parent-root-pool:1
allocation-percent:25%
slope-policy:_tmnx_hs_default
mid-pool 5
parent-root-pool:2
allocation-percent:80%
slope-policy:_tmnx_hs_default
mid-pool 6
parent-root-pool:2
allocation-percent:20%
slope-policy:_tmnx_hs_default
mid-pool 7 to **16**
parent-root-pool:None
allocation-percent:1%
slope-policy:_tmnx_hs_default

The **no** form of the command removes the HS pool policy from the system. If the HS pool policy is currently associated with a forwarding plane, the command fails.

Parameters *policy-name* — Specifies pool policy name, up to 32 characters. Each HS pool policy must be uniquely named within the system.

create — This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms 7750 SR-7/12/12e

hs-pool-policy

Syntax **hs-pool-policy** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy hs-pool-policy)

Full Context configure qos copy hs-pool-policy

Description This command copies existing QoS policy entries for a QoS policy ID to another QoS policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters *src-name dst-name* — Indicates that the source policy ID and the destination policy ID are HS policy IDs. Specify the source policy ID that the copy command attempts to copy from and specify the destination policy ID to which the command copies a duplicate of the policy.

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy ID exists.

```
SR>config>qos# copy hs-pool-policy policy1 policy2
MINOR: CLI Destination "policy2" exists use {overwrite}.
SR>config>qos# copy hs-pool-policy policy1 policy2
 overwrite
```

Platforms 7750 SR-7/12/12e

12.92 hs-port-pool-policy

hs-port-pool-policy

Syntax **hs-port-pool-policy** *policy-name*
no hs-port-pool-policy

Context **[Tree]** (config>port>ethernet>egress hs-port-pool-policy)

Full Context configure port ethernet egress hs-port-pool-policy

Description This command specifies an HS port pool policy to associate with the port egress.

An HS port buffer pool policy defines and sizes the port-class buffer pools on an HSQ IOM egress port.

A single HS port pool policy is supported per port egress. This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the policy and reapplies the default policy.

Default hs-port-pool-policy default

Parameters *policy-name* — Specifies the HS port pool policy up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-port-pool-policy

Syntax **hs-port-pool-policy** *policy-name* [**create**]
no hs-port-pool-policy *policy-name*

Context **[Tree]** (config>qos hs-port-pool-policy)

Full Context configure qos hs-port-pool-policy

Description This command creates an HS port buffer pool policy. The policy can be assigned to an egress port on an HSQ IOM. The policy contains the required commands to define and size port-class buffer pools on an HSQ IOM. The policy can be applied using the **hs-port-pool-policy** command within the **config>port>ethernet>egress** context.

SR OS supports 2047 HS port pool policies including the default HS port pool policy.

HSQ IOM port buffer pools provide buffer control for queues based on the queue's scheduling class. Two sets of scheduling class pools exist per port: a standard (or default) set and an alternative set. The SAP egress policy, network queue policy, and egress queue group template have a parameter (**alt-port-class-pool**) that specifies that the queues created by the policy or template uses the alternate port-class pools, as opposed to the default standard port-class pools. Each set has six pools, one for each scheduling class. Based on the **alt-port-class-pool** setting and the queue's scheduling class (based on the HS attachment policy configuration), each queue is mapped to a specific port-class pool.

The HS port pool policy defines how each of these pools are parented (mapped) to an FP level mid-pool and how each pool is sized.

The system allows two separate mechanisms to size each port-class pool:

- dynamic sizing based on port bandwidth, relative to bandwidth of other ports
- explicit sizing based on a percentage of the port-class pool's parent mid-pool

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Dynamic Port-Class Pool Sizing — Dynamic port-class pool sizing is a mechanism that provides a fair share of a mid-pool's size to each of the port-class pools based on the potential bandwidth represented by each port. To understand port-class pool sizing, consider the following:

- Each port's bandwidth is the minimum of the port's line rate, the port's configured **egress-rate**, and the port's **hs-scheduler-policy** *max-rate*.
- The port's bandwidth can be further modified by the port's **egr-percentage-of-rate** command, which increases or decreases the port's bandwidth derived by the specified percent. This parameter allows the port to have a higher or lower bandwidth-derived weight based on how the port is actually being used instead of bandwidth alone.
- Because the port-class pools are user mapped to the mid-pools, not every port has a port-class pool associated with a mid-pool, requiring that the system perform the relative bandwidth calculations separately per mid-pool.
- Each port's portion of a specified mid-pool's size is calculated based on:

  Port_Portion = (Port_Adj_Bw / Sigma_Mid_Pool_Ports_Adj_Bw) * Mid_Pool_Size

  where Sigma_Mid_Pool_Ports_Adj_Bw is the sum of the adjusted bandwidths for all ports with port-class pools mapped to the mid-pool that are not sized using explicit-percent.
- A port without any port-class pools associated with a given mid-pool has a port portion of zero for that mid-pool.
- Multiple port-class pools on the same port can be mapped to the same mid-pool, requiring a mechanism to distribute the portion of the mid-pool given to the port between multiple port-class pools. Each mid-pool's **port-bw-weight** parameter is used to determine how much of the port's mid-pool portion is given to each port-class pool associated with mid-pool. Port-class pools sized using an **explicit-percent** value instead of port bandwidth are assumed to have a **port-bw-weight** equal to 0, causing those port-class pools to not participate in the port portion distribution. It is expected (but not required) that one of port bandwidth-based sizing or explicit percent-based sizing is used and any concurrent use of both mechanisms is transitory in nature.
- The port bandwidth weighting mechanism allocates 100% of the mid-pool size to the associated port-class pools. To allow the port-class pools to oversubscribe the parent mid-pool, a mid-pool **port-bw-oversub-factor** parameter is supported that allows the port-class pools sized by dynamic port bandwidth to increase in size by the specified oversubscription factor. This oversubscription factor can provide a more efficient use of the mid-pool's available buffers because it is not expected that all port-class pools are utilizing their allotted size simultaneously.

Explicit Port-Class Pool Sizing — The port-class pool's allocation **explicit-percent** *percent-of-parent-pool* command is used to override the dynamic pool sizing mechanism for a given mid-pool. The specified percentage value is applied to the port-class's parent mid-pool's size to derive the port-class pool size.

Explicit and Dynamic Sizing from the Same Mid-Pool Parent — If explicit and dynamic pool sizing are used simultaneously for port-class pools parented to the same mid-pool, unexpected contention or underutilization of the mid-pool's available buffers may result. While this is not a proscribed condition, it is expected most instances of dual-sizing mechanisms are transitory, based on moving between the two mechanisms.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Port-Class Pool Slope Policy Association — The HS port pool policy also provides the ability to specify a slope policy on each port-class pool. The slope policy is used to define the high, low, and exceed slope parameters used to manage contention within the port-class pool.

Default HS Port Pool Policy — An HS port pool policy with the name **default** always exists on the system and does not need to be created. The default port pool policy cannot be changed and is used by all HSQ IOMs within the system unless an explicitly created **hs-port-pool-policy** is associated with an HSQ egress port.

The default policy contains the following parameters:

Standard Port-Class Pools

Port-Class-Pool 1

Parent:Mid-Pool 1

Port-Class-Pool 2

Parent:Mid-Pool 2

Port-Class-Pool 3

Parent:Mid-Pool 3

Port-Class-Pool 4

Context [Tree] (config>port>ethernet>egress hs-scheduler-policy)

Full Context configure port ethernet egress hs-scheduler-policy

Description This command specifies an HS scheduler policy to associate with the port egress which provisions the scheduling behavior of the HSQ scheduler classes.

A single HS scheduler policy is supported per port egress. This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the policy and reapplies the default policy.

Default hs-scheduler-policy default

Parameters *policy-name* — Specifies the policy name up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-scheduler-policy

Syntax **hs-scheduler-policy** *policy-name* [**create**]
no hs-scheduler-policy *policy-name*

Context [Tree] (config>qos hs-scheduler-policy)

Full Context configure qos hs-scheduler-policy

Description This command configures an HS scheduler policy. The HS scheduler policies are applied to egress HSQ ports in the **config>port>ethernet>egress** context. The policy contains the required commands to provision the scheduling behavior of the HSQ scheduler classes. When assigned to an HSQ egress port, the policy is used to define the scheduling behavior for all queues associated with the egress port. The values defined in the policy can be overridden on each scheduler instance using the **config>port>ethernet>egress>hs-scheduler-overrides** command.

HSQ Queue Groups — A fundamental concept on an HSQ IOM is the queue group. Queue groups are not directly managed by the provisioning. Instead, they are indirectly assigned when creating SAPs or subscribers on an HSQ port. A queue group has eight queue members, numbered from 1 through 8. When creating a SAP or subscriber associated on an HSQ egress port, a queue group is allocated to the object. Within the SAP egress policy, network queue policy and egress queue group template, provisioned queue IDs 1 through 8 correspond directly to queue group queue IDs 1 through 8. Each group also allows each queue to be dynamically placed in a scheduling class or on one of two WRR groups local to the queue group.

Each queue within the group has three RED slopes (managed by associating a slope policy to the queue), an MBS defined in bytes, a packet byte offset parameter used to add or subtract bytes to or from each packet handled by the queue for accounting purposes, and a PIR shaper used to rate limit the queue. An HSQ attachment policy associated with the queue group defines how each queue maps either directly to a scheduling class or one of the WRR groups within the queue group. The attachment policy also defines the scheduling class attachments for the WRR groups.

The queue group supports an aggregate shaper used to manage an aggregate rate limit for all queues within the group. Scheduling for queues within the queue group is stopped and started based on the rate set on the shaper.

Scheduling Classes and Scheduling Priorities — HSQ supports six scheduler classes (1 through 6). The scheduler class should not be confused with a QoS policy forwarding class. Forwarding classes within the system are used between the ingress and egress forwarding complexes and help the system to map a packet to per-hop and per-domain behavior. Scheduling classes are slices of scheduling opportunity within a port-scheduling context. Each port scheduler maintains six strict priority levels, where 6 is the highest priority and 1 is the lowest. As a rule, the scheduler services all active queues associated with priority level 6 before moving to queues on priority level 5. This strict behavior continues through priority level 1. Scheduling classes are mapped either to their corresponding scheduling priority level (scheduling class 1 mapped to priority level 1 through scheduling class 6 mapped to priority level 6) or to a single port level WRR group. The WRR group allows collapsing up to 6 of the scheduling classes into a single scheduling priority. The WRR group provides a weighted fair scheduling behavior for its member scheduling classes at that strict priority level.

Strict Priority Level PIR — The scheduler supports a strict scheduling level PIR that limits the amount of bandwidth allowed for the level. The rate is defined in increments of megabits per second and can be set to **max** (the default setting) which disables the shaping function. The scheduler includes the full Ethernet frame encapsulation overhead when updating the priority level PIR, including the 12-byte inter-frame gap and the 8-byte preamble.

Scheduler Maximum Rate — A maximum scheduling rate can be defined for the scheduler. The rate is specified in megabits per second and the default rate is **max** which allows the scheduler to operate without a set limit. When the HS scheduling policy is applied to an egress port, the maximum scheduling rate can be used to define a rate less than the available line rate of the port. The scheduler includes the full Ethernet frame encapsulation overhead when updating the scheduler level PIR, including the 12-byte inter-frame gap and the 8-byte preamble.

HS Scheduler Policy Overrides — After an HS scheduler is applied to an egress port, the various parameters can be overridden, allowing an HS scheduler policy to be adapted to changing needs on a port without requiring a new policy to be created.

Default HS Scheduling Policy — An HS scheduling policy with the name **default** always exists on the system and does not need to be created. The default policy cannot be modified or deleted.

The default policy contains the following parameters:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 63 **HS Scheduler Policy Parameter Defaults**

Parameter	Sub-Parameter	Default
max-rate	—	max
scheduling-class 1 through 6	rate	max
	group	—
	weight	—
group 1	rate	max

Default The **no** form of the command removes an HS scheduler policy from the system. If the HS scheduler policy is currently associated with an egress port, the command fails.

Parameters *policy-name* — Specifies the HS scheduler policy up to 32 characters. Each HS scheduler policy must be uniquely named within the system.

create — This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms 7750 SR-7/12/12e

hs-scheduler-policy

Syntax **hs-scheduler-policy** *src-name dst-name* [**overwrite**]

Context **[Tree]** (config>qos>copy hs-scheduler-policy)

Full Context configure qos copy hs-scheduler-policy

Description This command copies existing QoS policy entries for a QoS policy ID to another QoS policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

Parameters *src-name dst-name* — Indicates that the source policy ID and the destination policy ID are HS policy IDs. Specify the source policy ID that the copy command attempts to copy from and specify the destination policy ID to which the command copies a duplicate of the policy.

overwrite — Specifies to replace the existing destination policy. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy ID exists.

```
SR>config>qos# copy hs-pool-policy policy1 policy2
```

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

```
MINOR: CLI Destination "policy2" exists use {overwrite}.
SR>config>qos# copy hs-pool-policy policy1 policy2
 overwrite
```

12.96 hs-secondary-shaper

hs-secondary-shaper

Syntax **hs-secondary-shaper** *secondary-shaper-name* [**create**]
no hs-secondary-shaper *secondary-shaper-name*

Context **[Tree]** (config>port>ethernet>egress hs-secondary-shaper)

Full Context configure port ethernet egress hs-secondary-shaper

Description This command specifies an HS secondary shaper on the port egress. HS secondary shapers are used to apply an aggregate rate and per-scheduling class rates to the set of SAP egress HSQ queue groups which reference them using the SAP egress queue-override **hs-secondary-shaper** command.

By default, the **hs-secondary-shaper** default is applied to each port egress on all HSQ ports and the settings under it can be modified.

Multiple HS secondary shapers are supported per port egress, up to the number supported per-HSQ FP, which is 4096 HS secondary shapers. The number of HS secondary shapers allocated on an HSQ FP can be seen using the **tools dump resource-usage card** *slot-number* **fp** *fp-number* command.

Non-default HS secondary shapers are only configurable on access or hybrid mode ports.

This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the HS secondary shaper from the port egress configuration. An HS scheduler policy cannot be removed when HS scheduler overrides exist on the port egress.

Default hs-secondary-shaper default

Parameters *secondary-shaper-name* — Specifies the secondary shaper name up to 32 characters.

Platforms 7750 SR-7/12/12e

Use subject to Terms available at: www.nokia.com

hs-secondary-shaper

Syntax **hs-secondary-shaper** *policy-name*
no hs-secondary-shaper

Context **[Tree]** (config>service>epipe>sap>egress>queue-override hs-secondary-shaper)
[Tree] (config>service>ipipe>sap>egress>queue-override hs-secondary-shaper)

Full Context configure service epipe sap egress queue-override hs-secondary-shaper
configure service ipipe sap egress queue-override hs-secondary-shaper

Description This command configures the HS secondary shaper to be used to apply an aggregate rate and per-scheduling class rates to the SAP egress HSQ queue group.

The **no** form of this command removes the HS secondary shaper override from the configuration, reverting the SAP egress HSQ queue group to the default HS secondary shaper on that port.

Parameters *policy-name* — Specifies the secondary shaper name, up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-secondary-shaper

Syntax **hs-secondary-shaper** *policy-name*
no hs-secondary-shaper

Context **[Tree]** (config>service>vprn>sap>queue-override hs-secondary-shaper)

Full Context configure service vprn sap queue-override hs-secondary-shaper

Description This command configures the HS secondary shaper to be used to apply an aggregate rate and per-scheduling class rates to the SAP egress HSQ queue group.

The **no** form of this command removes the HS secondary shaper override from the configuration, reverting the SAP egress HSQ queue group to the default HS secondary shaper on that port.

Parameters *policy-name* — Specifies the secondary shaper name, up to 32 characters.

hs-secondary-shaper

Syntax **hs-secondary-shaper** *policy-name*
no hs-secondary-shaper

Context **[Tree]** (config>service>ies>if>sap>egress>queue-override hs-secondary-shaper)

Full Context configure service ies interface sap egress queue-override hs-secondary-shaper

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the HS secondary shaper to be used to apply an aggregate rate and per-scheduling class rates to the SAP egress HSQ queue group.

The **no** form of this command removes the HS secondary shaper override from the configuration returning the SAP egress HSQ queue group to the default HS secondary shaper on that port.

Parameters *policy-name* — Specifies the secondary shaper name, up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-secondary-shaper

Syntax **hs-secondary-shaper** *policy-name*
no hs-secondary-shaper

Context **[Tree]** (config>service>vprn>if>sap>egress>queue-override hs-secondary-shaper)

Full Context configure service vprn interface sap egress queue-override hs-secondary-shaper

Description This command configures the HS secondary shaper to be used to apply an aggregate rate and per-scheduling class rates to the SAP egress HSQ queue group.

The **no** form of this command removes the HS secondary shaper override from the configuration, returning the SAP egress HSQ queue group to the default HS secondary shaper on that port.

Parameters *policy-name* — Specifies the secondary shaper name, up to 32 characters.

Platforms 7750 SR-7/12/12e

12.97 hs-sla-mode

hs-sla-mode

Syntax **hs-sla-mode** {**expanded** | **single**}
no hs-sla-mode

Context **[Tree]** (config>subscr-mgmt>sub-prof hs-sla-mode)

Full Context configure subscriber-mgmt sub-profile hs-sla-mode

Description This command specifies the SLA profile handling mode for the subscriber if on an HS board.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **expanded** — Specifies the expanded SLA profile handling mode for the subscriber if on an HS board.

single — Specifies a single SLA profile handling mode for the subscriber if on an HS board.

Platforms 7750 SR-7/12/12e

12.98 hs-turbo

hs-turbo

Syntax [**no**] **hs-turbo**

Context **[Tree]** (config>port>ethernet>access>egress>queue-group hs-turbo)
[Tree] (config>port>ethernet>network>egress>queue-group hs-turbo)

Full Context configure port ethernet access egress queue-group hs-turbo
configure port ethernet network egress queue-group hs-turbo

Description This command enables HS turbo queues which allows the corresponding HSQ queue group queues to achieve a higher throughput. The **hs-turbo** command is not applicable to 10G ports and is ignored when configured under a queue group instance on a 10G port.

This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command disables the command.

Platforms 7750 SR-7/12/12e

12.99 hs-wred-queue

hs-wred-queue

Syntax **hs-wred-queue policy** *slope-policy-name*
no hs-wred-queue

Context **[Tree]** (config>service>epipe>sap>egress>queue-override>queue hs-wred-queue)
[Tree] (config>service>ipipe>sap>egress>queue-override>queue hs-wred-queue)

Full Context configure service epipe sap egress queue-override queue hs-wred-queue
configure service ipipe sap egress queue-override queue hs-wred-queue

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command overrides the slope policy applied to the HSQ queue group queue.

The **no** form of this command removes the WRED queue policy override value from the configuration.

Parameters *slope-policy-name* — Specifies an existing slope policy name to apply to this HSQ queue group queue, up to 32 characters.

Platforms 7750 SR-7/12/12e

hs-wred-queue

Syntax **hs-wred-queue policy** *slope-policy-name*
no hs-wred-queue

Context **[Tree]** (config>service>vpls>sap>egress>queue-override>queue hs-wred-queue)

Full Context configure service vpls sap egress queue-override queue hs-wred-queue

Description This command overrides the slope policy applied to the HSQ queue group queue.

The **no** form of this command removes the WRED queue policy override value from the configuration.

Parameters *slope-policy-name* — Specifies an existing slope policy name to apply to this HSQ queue group queue.

Platforms 7750 SR-7/12/12e

hs-wred-queue

Syntax **hs-wred-queue policy** *slope-policy-name*
no hs-wred-queue

Full Context configure qos sap-egress queue hs-wrr-weight

Description This command specifies the WRR relative weight, with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy. The weight of each queue determines how much bandwidth that queue gets out of the total rate for the HSQ WRR group.

The **no** form of the command reverts to the default value.

Default hs-wrr-weight 1

Parameters *weight* — Specifies the HS WRR group queue weight.

Values 1 to 127

Platforms 7750 SR-7/12/12e

hs-wrr-weight

Syntax **hs-wrr-weight** *weight*
no hs-wrr-weight

Context **[Tree]** (config>qos>qgrps>egr>qgrp>queue hs-wrr-weight)

Full Context configure qos queue-group-templates egress queue-group queue hs-wrr-weight

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the WRR relative weight, with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy. The weight of each queue determines how much bandwidth that queue gets out of the total rate for the HSQ WRR group.

The **no** form of the command reverts to the default value.

Default hs-wrr-weight 1

Parameters *weight* — Specifies HS WRR group queue weight.

Values 1 to 127

Platforms 7750 SR-7/12/12e

12.103 http-auth

http-auth

Syntax **http-auth password** *password* [**hash | hash2**]
http-auth username *user-name*
http-auth username *user-name* **password** *password* [**hash | hash2**]
no http-auth

Context **[Tree]** (config>system>security>pki>est-profile http-auth)

Full Context configure system security pki est-profile http-auth

Description This command configures HTTP authentication parameters. HTTP authentication is used by a client when requested by the server. When disabled, there is no HTTP-level client authentication.

The **no** form of the command reverts to the default value.

Default no http-auth

Parameters *password* — Specifies a text string containing the password. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

user-name — Specifies the name of the user to authenticate, up to 32 characters.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

Platforms All

12.104 http-connections

http-connections

Syntax **http-connections** [*ip-address/prefix-length*]
http-connections any
http-connections [*ipv6-address/prefix-length*]
no http-connections

Context **[Tree]** (debug>system http-connections)

Full Context debug system http-connections

Description This command displays HTTP connections debug information.

Parameters *ip-address/prefix-length* — Displays information for the specified host IP address and prefix length.

Values ip-address: a.b.c.d
prefix-length: 0 to 32

any — Specifies that any address can be used.

ipv6-address/prefix-length — Displays information for the specified host IPv6 address and prefix length.

Values ipv6-address:
- x:x:x:x:x:x:x:x: (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x [0 to FFFFF] H
- d [0 to 255] D

prefix-length: 0 to 128

12.105 http-enrich

http-enrich

Syntax **http-enrich** *http-enrich-name* [**create**]
no http-enrich *http-enrich-name*

Context **[Tree]** (config>app-assure>group http-enrich)

Full Context configure application-assurance group http-enrich

Description This command configures an HTTP enrichment policy.

The **no** form of this command removes the http enrichment policy from the configuration.

Parameters *http-enrich-name* — Specifies the name of the http enrichment policy up to 32 characters.

create — Mandatory keyword used when creating an application profile. The create keyword requirement can be enabled and disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

http-enrich

Syntax **http-enrich** *http-enrich-name*
no http-enrich

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action http-enrich)

Full Context configure application-assurance group policy app-qos-policy entry action http-enrich

Description This command configures the HTTP header enrichment template name that will be applied as defined in the tmnxBsxHttpEnrichTable. An empty value specifies no HTTP header enrichment template.

Default no http-enrich

Parameters *http-enrich-name* — Specifies the HTTP header enrichment template name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.106 http-enrich-max-pkt

http-enrich-max-pkt

Syntax [**no**] **http-enrich-max-pkt** *size*

Context **[Tree]** (config>isa>aa-grp http-enrich-max-pkt)

Full Context configure isa application-assurance-group http-enrich-max-pkt

Description This command configures the maximum HTTP enriched packet size.

Parameters *size* — Specifies the maximum HTTP enriched packet size in octets.

Values 576 to 9212

Default 1500

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.107 http-error-redirect

http-error-redirect

Syntax **http-error-redirect** *redirect-name* [**create**]
no http-error-redirect *redirect-name*

Context **[Tree]** (config>app-assure>group http-error-redirect)

Full Context configure application-assurance group http-error-redirect

Description This command configures an HTTP error redirect policy. The policy contains important information relevant to the redirect server.

The **no** form of this command removes the redirect name from the group configuration.

Parameters *redirect-name* — Specifies a string, up to 32 characters, that identifies the HTTP error redirect policy.

create — Keyword to create the HTTP error redirect policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

http-error-redirect

Syntax **http-error-redirect** *redirect-name*
no http-error-redirect

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action http-error-redirect)

Full Context configure application-assurance group policy app-qos-policy entry action http-error-redirect

Description This command specifies the HTTP error redirect that will be applied as defined in the redirect table. An empty value specifies no HTTP error redirect.

Default no http-error-redirect

Parameters *redirect-name* — Specifies an http-error redirect action, up to 32 characters, for flows matching this entry.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.108 http-host

http-host

Syntax **http-host** *http-host*
no http-host

Context **[Tree]** (config>app-assure>group>http-error-redirect http-host)

Full Context configure application-assurance group http-error-redirect http-host

Description This command refers to the http host name of the landing server (Barefruit or Xerocole). It is used in the HTTP GET operation from the client (which is being redirected) to the redirect search landing server. It must contain a valid IP address or HTTP host name / URI for the HTTP GET from the client to the landing server to work.

The **no** form of this command removes the HTTP host string from the configuration.

Default no http-host

Parameters *http-host* — Specifies a string of 255 chars max length, that refers to the HTTP host name of the landing server (barefruit or xerocole).

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.109 http-host-recorder

http-host-recorder

Syntax [**no**] **http-host-recorder**

Context **[Tree]** (debug>app-assure>group http-host-recorder)

Full Context debug application-assurance group http-host-recorder

Description This command enables the http-host-recorder feature on a particular group:partition.

The **no** form of the command disables the http-host-recorder feature.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.110 http-listening-port

http-listening-port

Syntax **http-listening-port** *http-listening-port*
no http-listening-port

Context **[Tree]** (config>service>upnp>upnp-policy http-listening-port)

Full Context configure service upnp upnp-policy http-listening-port

Description This command specifies the listening port of UPnP server.

The **no** form of the command reverts to the default.

Default http-listening-port 5000

Parameters *http-listening-port* — Specifies the HTTP TCP port this UPnP IGD listens to.

Values 1 to 65535

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.111 http-match-all-requests

http-match-all-requests

Syntax [**no**] **http-match-all-requests**

Context **[Tree]** (config>app-assure>group http-match-all-requests)
[Tree] (config>app-assure>group>policy>app-filter>entry http-match-all-requests)

Full Context configure application-assurance group http-match-all-requests
configure application-assurance group policy app-filter entry http-match-all-requests

Description This command enables HTTP matching for all requests for a given HTTP expression.

The **no** form of this command restores the default (removes http-match-all-request for this particular expression) by this app-filter entry.

Default no http-match-all-requests

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.112 http-notification

http-notification

Syntax **http-notification** *http-notification-name* [**create**]
no http-notification *http-notification-name*

Context **[Tree]** (config>app-assure>group http-notification)

Full Context configure application-assurance group http-notification

Description This command configures an http-notification object for subscriber in browser notification.

The **no** form of this command removes the http notification policy from the configuration.

Parameters *http-notification-name* — Specifies the name of the HTTP Notification policy.

create — Specifies the mandatory keyword to create the policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

http-notification

Syntax **http-notification** *http-notification*
no http-notification

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action http-notification)

Full Context configure application-assurance group policy app-qos-policy entry action http-notification

Description This command configures an HTTP notification action for flows matching this entry.

Default no http-notification

Parameters *http-notification* — specifies the Application-Assurance HTTP Notification that will be applied as defined in the tmnxBsxHttpNotifTable. If no string is configured then no HTTP notification will occur.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.113 http-port

http-port

Syntax **http-port** {**eq** | **neq**} *port-num*
http-port {**eq** | **neq**} **port-list** *port-list-name*
no http-port

Context **[Tree]** (config>app-assure>group>policy>app-filter>entry http-port)

Full Context configure application-assurance group policy app-filter entry http-port

Description This command specifies an HTTP server TCP or UDP port number or port list to use in the application definition.

The **no** form of this command restores the default by removing the HTTP port or port list from the application criteria defined by this app-filter entry.

Default no http-port

Parameters **eq** — Specifies that the value configured and the value in the flow are equal.

neq — Specifies that the value configured differs from the value in the flow.

port-list-name — Specifies the name of the port list containing a set or range of ports, up to 32 characters.

port-num — Specifies a valid server port number.

Values 0 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.114 http-redirect

http-redirect

Syntax **http-redirect** *redirect-name* [**create**]
no http-redirect *redirect-name*

Context **[Tree]** (config>app-assure>group http-redirect)

Full Context configure application-assurance group http-redirect

Description This command configures an HTTP redirect.

The **no** form of this command removes the HTTP redirect policy from the configuration.

Parameters *redirect-name* — Specifies the HTTP redirect that will be applied. If no redirect name is specified, then HTTP redirect is not enabled.

create — Keyword to create the HTTP redirect policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

http-redirect

Syntax **http-redirect** *http-redirect–name* **flow-type** *flow-type*
no http-redirect

Context **[Tree]** (config>app-assure>group>policy>aqp>entry>action http-redirect)

Full Context configure application-assurance group policy app-qos-policy entry action http-redirect

Description This command assigns an existing http redirect policy as an action on flows matching this AQP entry.

The redirect only takes effect if the matching flows are HTTP and the condition specified after the **http-redirect** command, admitted flows or dropped-flows, is met. The condition specified by “dropped-flows” means the flow is dropped due to an AQP actions such as “flow rate/count policers” or “drop” actions. HTTP Policy Redirect on admitted-flows allows the operator to redirect HTTP traffic to a web portal while allowing non-HTTP matching the same AQP rule to be forwarded.

No HTTP redirect will take place if HTTP redirect action and a “drop/flow-police” action are part of the default AQP policy, because in this case, any flow drop actions will take place before identification of the application/application-group.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes http redirect from actions on flows matching this AQP entry.

Default no http-redirect

Parameters *http-redirect-name* — Specifies the name of the existing http policy redirect for this application assurance profile. The HTTP redirect name is configured in the **config>app-assure>group>http-redirect** context.

flow-type — Specifies the flow type.

Values **admitted-flows** — Redirect HTTP flows matching the AQP criteria.
dropped-flows — Redirects those HTTP flows that are dropped due to an AQP action.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

http-redirect

Syntax **http-redirect** *http-redirect-name*

Context **[Tree]** (config>app-assure>group>sess-fltr>entry>action http-redirect)

Full Context configure application-assurance group session-filter entry action http-redirect

Description This command configures a session filter entry action to HTTP redirect the subscriber flows. The HTTP redirect policy referenced within this session filter entry is configured for captive redirect with the appropriate VLAN id assigned.

Parameters *http-redirect-name* — Specifies the name of the http-redirect-policy.

http-redirect

Syntax **http-redirect** *http-redirect-name*
no http-redirect

Context **[Tree]** (config>app-assure>group>url-filter http-redirect)

Full Context configure application-assurance group url-filter http-redirect

Description This command specifies the HTTP redirect that will be applied when the URL filter blocks an HTTP request.

Default no http-redirect

Parameters *http-redirect-name* — Specifies the HTTP redirect name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

http-redirect

Syntax **http-redirect** *http-redirect-name*
no http-redirect

Context [Tree] (config>app-assure>group>url-filter>icap http-redirect)
[Tree] (config>app-assure>group>url-filter>web-service http-redirect)
[Tree] (config>app-assure>group>url-filter>local-filtering>deny-list http-redirect)

Full Context configure application-assurance group url-filter icap http-redirect
configure application-assurance group url-filter local-filtering deny-list http-redirect
configure application-assurance group url-filter web-service http-redirect

Description This command creates or modifies an HTTP redirect policy.

Default no http-redirect

The **no** form of this command removes the HTTP redirect policy from the configuration.

Parameters *http-redirect-name* — Specifies the name of the HTTP redirect policy, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

http-redirect

Syntax **http-redirect** *rdr-url-string* [**allow-radius-override**]
http-redirect url-from-cpf

Context [Tree] (config>filter>ip-filter>entry>action http-redirect)
[Tree] (config>filter>ipv6-filter>entry>action http-redirect)

Full Context configure filter ip-filter entry action http-redirect
configure filter ipv6-filter entry action http-redirect

Description This command sets the filter entry action to **http-redirect** and specifies the redirect URL.

Parameters *rdr-url-string* — Specifies the HTTP redirect URL, up to 255 characters. This option can be used for any session.

Values The following macro substitutions may be used:

$URL — request-URI in the HTTP GET request received

$MAC — a string that represents the MAC address of the subscriber host

$IP — a string that represents the IP address of the subscriber host

$SUB — a string that represents the subscriber ID

$SAP — a string that represents a SAP ID

$SAPDESC — description string configured on the SAP

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

$CID — a string that represents the circuit ID or interface ID of the subscriber host (hexadecimal format)

$RID — a string that represents the remote ID of the subscriber host (hexadecimal format)

allow-radius-override — Specifies that the HTTP redirect URL configured by *rdr-url-string* can be optionally overridden by a URL returned by the RADIUS server; this does not apply for the **url-from-cpf** option.

url-from-cpf — Specifies that the HTTP redirect URL is from the BNG CUPS CPF. This option can be used for BNG CUPS ESM sessions only.

Platforms All

http-redirect

Syntax **http-redirect** *url*

Context **[Tree]** (config>filter>mac-filter>entry>action http-redirect)

Full Context configure filter mac-filter entry action http-redirect

Description This command sets the MAC filter entry action to HTTP redirect.

Parameters *url* — Specifies the URL, up to 255 characters.

Platforms All

12.115 http-redirect-policy

http-redirect-policy

Syntax **http-redirect-policy** *policy-name*
no http-redirect-policy

Context **[Tree]** (config>subscr-mgmt http-redirect-policy)

Full Context configure subscriber-mgmt http-redirect-policy

Description This command configures the redirect policy to constrain forwarding of an unauthenticated “migrant” WIFI user.

Parameters *policy-name* — Specifies the HTTP redirect policy name up to 32 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

http-redirect-policy

Syntax **http-redirect-policy** *policy-name*
no http-redirect-policy

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range http-redirect-policy)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range http-redirect-policy)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range http-redirect-policy
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range http-redirect-policy

Description This command specifies http redirect policy on ISA to redirect http traffic to the URL specified in the policy.

The **no** form of this command reverts to the default.

Parameters *policy-name* — Specifies the name of the http redirect policy under subscriber-management context.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.116 http-request-filtering

http-request-filtering

Syntax **http-request-filtering** {**all** | **first**}

Context **[Tree]** (config>app-assure>group>url-filter http-request-filtering)

Full Context configure application-assurance group url-filter http-request-filtering

Description HTTP Filtering can either be enabled for all HTTP request within a flow or limited to the first HTTP request in a flow.

Default http-request-filtering all

Parameters **all** — Specifies all HTTP Request within a flow.

first — Specifies the first HTTP Request within a flow.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.117 http-response-timeout

http-response-timeout

Syntax **http-response-timeout** *timeout*
no http-response-timeout

Context **[Tree]** (config>system>security>pki>ca-profile>cmpv2 http-response-timeout)

Full Context configure system security pki ca-profile cmpv2 http-response-timeout

Description This command specifies the timeout value for HTTP response that is used by CMPv2.

The **no** form of this command reverts to the default.

Default http-response-timeout 30

Parameters *timeout* — Specifies the HTTP response timeout, in seconds.

Values 1 to 3600

Platforms All

http-response-timeout

Syntax **http-response-timeout** *timeout*
no http-response-timeout

Context **[Tree]** (config>system>security>pki>ca-profile>cmp2 http-response-timeout)

Full Context configure system security pki ca-profile cmp2 http-response-timeout

Description This command specifies the timeout value for HTTP response that is used by CMPv2.

The **no** form of this command reverts to the default.

Default http-response-timeout 30

Parameters *timeout* — Specifies the HTTP response timeout in seconds.

Values 1 to 3600

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

12.118 http-version

http-version

Syntax **http-version** [**1.0** | **1.1**]

Context **[Tree]** (config>system>security>pki>ca-profile>cmpv2 http-version)

Full Context configure system security pki ca-profile cmpv2 http-version

Description This command configures the HTTP version for CMPv2 messages.

Default http-version 1.1

Platforms All

12.119 http-x-online-host

http-x-online-host

Syntax [**no**] **http-x-online-host**

Context **[Tree]** (config>app-assure>group http-x-online-host)

Full Context configure application-assurance group http-x-online-host

Description This command specifies whether X-Online-Host header field is used as a replacement for the HTTP Host header field.

The **no** form of this command disables the use of X-Online-Host header field used as a replacement.

Default no http-x-online-host

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

12.120 hw-agg-shaper-scheduler-policy

hw-agg-shaper-scheduler-policy

Syntax **hw-agg-shaper-scheduler-policy** *policy-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no hw-agg-shaper-scheduler-policy

Context [Tree] (config>port>ethernet>access>egress>vport hw-agg-shaper-scheduler-policy)

Full Context configure port ethernet access egress vport hw-agg-shaper-scheduler-policy

Description This command assigns a hardware aggregate shaper scheduler policy to the specified vport.

The **no** form removes the policy from the vport.

Parameters *policy-name* — Specifies the policy name.

Platforms 7750 SR-1, 7750 SR-s

hw-agg-shaper-scheduler-policy

Syntax **hw-agg-shaper-scheduler-policy** *policy-name* **[create]**
no hw-agg-shaper-scheduler-policy

Context [Tree] (config>qos hw-agg-shaper-scheduler-policy)

Full Context configure qos hw-agg-shaper-scheduler-policy

Description This command configures the name of the hardware aggregate shaper scheduler policy.

The **no** form removes the policy.

Parameters *policy-name* — Specifies the policy name, up to 64 characters.

create — Creates a new policy.

Platforms 7750 SR-1, 7750 SR-s

12.121 hw-agg-shapers

hw-agg-shapers

Syntax **hw-agg-shapers [subscribers] [saps] [queue-groups]**
no hw-agg-shapers

Context [Tree] (config>qos>fp-resource-policy>aggregate-shapers hw-agg-shapers)

Full Context configure qos fp-resource-policy aggregate-shapers hw-agg-shapers

Description This command enables the use of hardware aggregate shapers for subscribers, SAPs, or queue groups on the specified FP.

The **no** form disables the use of hardware aggregate shapers on a the specified FP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **subscribers** — Enables hardware aggregate shapers for subscribers.

saps — Enables hardware aggregate shapers for SAPs. This functionality is not currently supported.

queue-groups — Enables hardware aggregate shapers for queue groups. This functionality is not currently supported.

Platforms 7750 SR-1, 7750 SR-s

12.122 hybrid-buffer-allocation

hybrid-buffer-allocation

Syntax **hybrid-buffer-allocation**

Context **[Tree]** (config>port hybrid-buffer-allocation)

Full Context configure port hybrid-buffer-allocation

Description Commands in this context configure hybrid port buffer allocation parameters.

13 i Commands

13.1 i-counters

i-counters

Syntax **i-counters** [**all**]
no i-counters

Context **[Tree]** (config>subscr-mgmt>acct-plcy>cr>queue i-counters)
[Tree] (config>subscr-mgmt>acct-plcy>cr>ref-queue i-counters)

Full Context configure subscriber-mgmt radius-accounting-policy custom-record queue i-counters
configure subscriber-mgmt radius-accounting-policy custom-record ref-queue i-counters

Description This command configures ingress counter parameters for this custom record.

The **no** form of this command reverts to the default.

Parameters **all** — Includes all counters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

i-counters

Syntax **i-counters** [**all**]
no i-counters

Context **[Tree]** (config>log>acct-policy>cr>policer i-counters)
[Tree] (config>log>acct-policy>cr>queue i-counters)
[Tree] (config>log>acct-policy>cr>ref-policer i-counters)
[Tree] (config>log>acct-policy>cr>ref-queue i-counters)

Full Context configure log accounting-policy custom-record policer i-counters
configure log accounting-policy custom-record queue i-counters
configure log accounting-policy custom-record ref-policer i-counters
configure log accounting-policy custom-record ref-queue i-counters

Description This command configures ingress counter parameters for this custom record.

The **no** form of this command reverts all ingress counters to their default value.

Default i-counters

Parameters **all** — Specifies that all ingress counters should be included.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

13.2 i-sid

i-sid

Syntax **i-sid** *i-sid*
no i-sid

Context **[Tree]** (config>test-oam>build-packet>header>pbb i-sid)
[Tree] (debug>oam>build-packet>packet>field-override>header>pbb i-sid)

Full Context configure test-oam build-packet header pbb i-sid
debug oam build-packet packet field-override header pbb i-sid

Description This command defines the iSID value to be used in the test PBB header.

The **no** form of this command reverts to the default value.

Default i-sid 0

Parameters *i-sid* — Specifies the iSID value to be used in the test PBB header.

Values 0 to 16777215

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.3 ia-na

ia-na

Syntax **ia-na**

Context **[Tree]** (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client ia-na)
[Tree] (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client ia-na)

Full Context configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client ia-na
configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client ia-na

Description This command configures the IA-NA for the DHCPv6 client.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.4 ibgp-multipath

ibgp-multipath

Syntax [**no**] **ibgp-multipath**

Context **[Tree]** (config>service>vprn>bgp ibgp-multipath)

Full Context configure service vprn bgp ibgp-multipath

Description This command defines the type of IBGP multipath to use when adding BGP routes to the route table if the route resolving the BGP nexthop offers multiple next-hops.

The **no** form of this command disables the IBGP multipath load balancing feature.

Platforms All

ibgp-multipath

Syntax [**no**] **ibgp-multipath**

Context **[Tree]** (config>router>bgp ibgp-multipath)

Full Context configure router bgp ibgp-multipath

Description This command enables IBGP multipath load balancing when adding BGP routes to the route table if the route resolving the BGP nexthop offers multiple next-hops.

The **no** form of this command disables the IBGP multipath load balancing feature.

Default no ibgp-multipath

Platforms All

Full Context configure service ies interface icmp
configure service ies subscriber-interface group-interface icmp
configure service vprn interface icmp
configure service vprn network-interface icmp

Description Commands in this context configure Internet Control Message Protocol (ICMP) parameters on a service.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface icmp

All

- configure service vprn interface icmp
- configure service vprn network-interface icmp
- configure service ies interface icmp

icmp

Syntax **icmp**

Context **[Tree]** (config>subscr-mgmt>git>ipv4 icmp)

Full Context configure subscriber-mgmt group-interface-template ipv4 icmp

Description Commands in this context configure IPv4 Internet Control Message Protocol (ICMP) parameters.

Default icmp

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

icmp

Syntax **icmp**

Context **[Tree]** (config>router>if icmp)

Full Context configure router interface icmp

Description This command enables access to the context to configure Internet Control Message Protocol (ICMP) parameters on a network IP interface. ICMP is a message control and error reporting protocol that also provides information relevant to IP packet processing.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

icmp

Syntax [**no**] **icmp**

Context **[Tree]** (debug>router>ip icmp)

Full Context debug router ip icmp

Description This command enables ICMP debugging.

Platforms All

icmp

Syntax [**no**] **icmp**

Context **[Tree]** (config>sys>security>cpu-protection>ip>included-protocols icmp)

Full Context configure system security cpu-protection ip-src-monitoring included-protocols icmp

Description This command includes the extracted IPv4 ICMP packets for ip-src-monitoring. IPv4 ICMP packets will be subject to the per-source-rate of CPU protection policies.

Default no icmp

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

icmp

Syntax **icmp**

Context **[Tree]** (config>test-oam icmp)

Full Context configure test-oam icmp

Description This command configures test ICMP OAM parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.6 icmp-code

icmp-code

Syntax **icmp-code** *icmp-code*
no -code

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>filter>ip-exception>entry>match icmp-code)
[Tree] (config>filter>ip-filter>entry>match icmp-code)
[Tree] (config>filter>ipv6-exception>entry>match icmp-code)
[Tree] (config>filter>ipv6-filter>entry>match icmp-code)

Full Context configure filter ip-exception entry match icmp-code
configure filter ip-filter entry match icmp-code
configure filter ipv6-exception entry match icmp-code
configure filter ipv6-filter entry match icmp-code

Description Configures matching on /ICMPv6 code field in the /ICMPv6 header of an IPv4 or IPv6 packet as a filter match criterion or configures matching on the ICMP code field in the ICMP header of an IPv4 packet as an exception filter match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (for example, 2nd, 3rd) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**icmp-code** 0" match criterion, may match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the criterion from the match entry.

Default no icmp-code

Parameters *icmp-code* — Specifies the /ICMPv6 code value that must be present to match. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format, or even using keywords. The following value shows decimal integer only.

Values 0 to 255

Platforms All

- configure filter ipv6-filter entry match icmp-code
- configure filter ip-filter entry match icmp-code

VSR

- configure filter ip-exception entry match icmp-code
- configure filter ipv6-exception entry match icmp-code

icmp-code

Syntax **icmp-code** *icmp-code*
no icmp-code

Context [Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ip>entry>match icmp-code)

[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match icmp-code)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries entry match icmp-code

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries entry match icmp-code
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries entry match icmp-code
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries entry match icmp-code

Description This command configures the ICMP code match condition.

The **no** form of this command reverts to the default.

Parameters *icmp-code* — Specifies the ICMP code numbers accepted in DHB.

Values [0 to 255]D, [0X0..0XFF]H, [0b0..0b11111111]B

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

icmp-code

Syntax **icmp-code** *icmp-code*
no icmp-code

Context **[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match icmp-code)
[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match icmp-code)

Full Context configure system security cpm-filter ip-filter entry match icmp-code
configure system security cpm-filter ipv6-filter entry match icmp-code

Description This command configures matching on ICMP code field in the ICMP header of an IP packet as an IP filter match criterion.

Note: An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The behavior of the **icmp-code** value is dependent on the configured **icmp-type** value, thus a configuration with only an **icmp-code** value specified will have no effect. To match on the **icmp-code**, an associated **icmp-type** must also be specified.

The **no** form of this command removes the criterion from the match entry.

Default no icmp-code

Parameters *icmp-code* — Specifies the ICMP code values that must be present to match.

Values 0 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.7 icmp-echo-reply

icmp-echo-reply

Syntax [**no**] **icmp-echo-reply**

Context **[Tree]** (config>router>nat>outside>pool icmp-echo-reply)
[Tree] (config>service>vprn>nat>outside>pool icmp-echo-reply)

Full Context configure router nat outside pool icmp-echo-reply
configure service vprn nat outside pool icmp-echo-reply

Description IPv4 addresses in a NAT pool can be configured to respond to ICMP Echo Requests (PINGs). The configuration can be toggled online while the pool is in use.

In L2-aware NAT when **port-block-extensions** is disabled, the reply from an outside IP address is generated only when this IP address has at least one host (binding) behind it.

In L2-aware NAT when **port-block-extensions** is enabled, the reply from an outside IP address is generated regardless if a binding is present.

In LSN, the reply from an outside IP address is generated regardless if a binding is present.

The **no** form of the command disables ICMP echo replies.

Default no icmp-echo-reply

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.8 icmp-generation

icmp-generation

Syntax **icmp-generation**

configure service vprn interface sap ipsec-tunnel icmp-generation

Description This command enables the context to configure ICMP generation information.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ip-tunnel icmp-generation
- configure service ies interface sap ip-tunnel icmp-generation
- configure ipsec tunnel-template icmp-generation
- configure service vprn interface sap ipsec-tunnel icmp-generation

VSR

- configure router interface ipsec ipsec-tunnel icmp-generation

13.9 icmp-ping

icmp-ping

Syntax **icmp-ping** {*ip-address* | *dns-name*} [{**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}}] [**count** *requests*] [**do-not-fragment**] [**fc** *fc-name*] [**interval** {*centisecs* | *secs*}] [**pattern** *pattern*] [**rapid**] [{**router** *router-or-service* | **router-instance** *router-instance* | **service-name** *service-name*}] [**size** *bytes*] [**source** *ip-address*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

Context **[Tree]** (config>saa>test>type icmp-ping)

Full Context configure saa test type icmp-ping

Description This command configures an ICMP traceroute test.

Parameters *ip-address* | *dns-name* — Specifies the far-end IP address or DNS name to which to send the **svc-ping** request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
	interface	up to 32 characters. This is mandatory for link local addresses.
dns-name	up to 128 characters	

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

bypass-routing — Specifies whether to send the ping request to a host on a directly attached network bypassing the routing table.

interface-name — Specifies the name used to refer to the interface, up to 32 characters. The name must already exist in the **config>router>interface** context.

next-hop *ip-address* — Displays only static routes with the specified next-hop IP address.

Values

ipv4-address:	a.b.c.d (host bits must be 0)
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

requests — Specifies the number of times to perform an OAM ping probe operation. Each OAM echo message request must either time out or receive a reply before the next message request is sent.

Values 1 to 100000

Default 5

do-not-fragment — Sets the DF (Do Not Fragment) bit in the ICMP ping packet (does not apply to ICMPv6).

fc-name — Specifies the forwarding class of the SAA.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

interval {*centisecs* | *secs*} — Specifies the minimum amount of time, in seconds, that must expire before the next message request is sent. If the **rapid** parameter is configured, this value is measured in centiseconds (hundredths of a second) instead of seconds.

Values 1 to 10000

Default 1

pattern — Specifies the date portion in a ping packet is filled with the pattern value specified. If not specified, a system-generated sequential pattern is used.

Values 0 to 65535

rapid — Configures the *interval* parameter to use centiseconds (hundredths of a second) instead of seconds.

router-or-service — Specifies the numerical reference to the router instance or service. Well known router names "Base", "management", “vpm-vr-name”, and " vpls-management" are allowed for convenience, but are mapped numerically.

Values {*router-name* | *vprn-svc-id*}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

router-name: Base, management, cmp-vr-name, vpls-management
vprn-svc-id: 1 to 2147483647
cpm-vr-name: Up to 32 characters

The parameter *router-instance* is preferred for specifying the router or service.

Default Base

router-instance — Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes.

Values *router-name*, *vprn-svc-name*
router-name: Base, management, vpls-management, *cpm-vr-name*
vprn-svc-name: up to 64 characters
cpm-vr-name: up to 32 characters

service-name — Specifies the alias function that allows the service name to be used, converted and stored as a service ID, up to 64 characters.
The *router-instance* parameter is preferred for specifying the router or service.

bytes — Specifies the request packet size in bytes, expressed as a decimal integer.

Values 0 to 16384

Default 56

source *ip-address* — Specifies the IP address to be used.

Values
ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

timeout — Specifies the override time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

type-of-service — Specifies the service type.

Values 0 to 255

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

time-to-live — Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 128

Default 64

Platforms All

13.10 icmp-query

icmp-query

Syntax **icmp-query** [**min** *minutes*] [**sec** *seconds*]
no icmp-query

Context **[Tree]** (config>service>nat>nat-policy>timeouts icmp-query)
[Tree] (config>service>nat>up-nat-policy>timeouts icmp-query)

Full Context configure service nat nat-policy timeouts icmp-query
configure service nat up-nat-policy timeouts icmp-query

Description This command configures the timeout applied to an ICMP query session.

Default icmp-query min 1

Parameters **min** *minutes* — Specifies the timeout, in minutes, applied to an ICMP query session.

Values 1 to 4

Default 1

sec *seconds* — Specifies the timeout, in seconds, applied to an ICMP query session.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.11 icmp-trace

icmp-trace

Syntax **icmp-trace** [*ip-address* | *dns-name*] [**router** *router-or-service* | **router-instance** *router-instance* | **service-name** *service-name*] [**source** *ip-address*] [**tos** *type-of-service*] [**ttl** *ttl*] [**wait** *milliseconds*]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>saa>test>type icmp-trace)

Full Context configure saa test type icmp-trace

Description This command configures an ICMP traceroute test.

Parameters *ip-address* — Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
dns-name	up to 63 characters

dns-name — Specifies the DNS name of the far-end device to which to send the **svc-ping** request message, up to 63 characters.

router-instance — Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes.

Values {*router-name* | *vprn-svc-name*}
router-name: Base, management, vpls-management, *cpm-vr-name*
vprn-svc-name: up to 64 characters
cpm-vr-name: up to 32 characters

Default Base

router-or-service — Specifies the numerical reference to the router instance or service. Well known router names "Base", "management" and " vpls-management" are allowed for convenience, but are mapped numerically.

Values {*router-name* | *vprn-svc-id*}

router-name:	Base, management, vpls-management
vprn-svc-id:	1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

Default Base

service-name — Specifies the alias function that allows the service name to be used, converted and stored as service ID, up to 64 characters.
The parameter *router-instance* is preferred for specifying the router or service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

source *ip-address* — Specifies the IP address to be used.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
x:	[0 to FFFF]H
d:	[0 to 255]D

type-of-service — Specifies the service type.

Values 0 to 255

Default 0

ttl — Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds — Specifies the time, in milliseconds, to wait for a response to a probe, expressed as a decimal integer.

Values 10 to 60000

Default 5000

Platforms All

13.12 icmp-tunneling

icmp-tunneling

Syntax [**no**] **icmp-tunneling**

Context **[Tree]** (config>router icmp-tunneling)

Full Context configure router icmp-tunneling

Description This command enables the tunneling of ICMP reply packets over MPLS LSP at a LSR node as per RFC 3032.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The LSR part of this feature consists of crafting the reply ICMP packet of type=11- 'time exceeded', with a source address set to a local address of the LSR node, and appending the IP header and leading payload octets of the original datagram. The system skips the lookup of the source address of the sender of the label TTL expiry packet, which becomes the destination address of the ICMP reply packet. Instead, CPM injects the ICMP reply packet in the forward direction of the MPLS LSP the label TTL expiry packet was received from. The TTL of pushed labels should be set to 255.

The source address of the ICMP reply packet is determined as follows. The LSR uses the address of the outgoing interface for the MPLS LSP. With LDP LSP or BGP LSP multiple ECMP next-hops can exist and in such a case the first outgoing interface is selected. If that interface does not have an address of the same family (IPv4 or IPv6) as the ICMP packet, then the system address of the same family is selected. If one is not configured, the packet is dropped.

When the packet is received by the egress LER, it performs a regular user packet lookup in the data path in the GRT context for BGP shortcut, 6PE, and BGP label route prefixes, or in VPRN context for VPRN and 6VPE prefixes. It then forwards it to the destination, which is the sender of the original packet which TTL expired at the LSR.

If the egress LER does not have a route to the destination of the ICMP packet, it drops the packets.

The rate of the tunneled ICMP replies at the LSR can be directly or indirectly controlled by the existing IOM level and CPM levels mechanisms. Specifically, the rate of the incoming UDP traceroute packets received with a label stack can be controlled at ingress IOM using the distributed CPU protection feature. The rate of the ICMP replies by CPM can also be directly controlled by configuring a system wide rate limit for packets ICMP replies to MPLS expired packets which are successfully forwarded to CPM using the command 'configure system security vprn-network-exceptions'. While this command's name refers to VPRN service, this feature rate limits ICMP replies for packets received with any label stack, including VPRN and shortcuts.

The 7450 ESS, 7750 SR, and 7950 XRS implementation supports appending to the ICMP reply of type Time Exceeded the MPLS label stack object defined in RFC 4950. It does not include it in the ICMP reply type of Destination unreachable.

The new MPLS Label Stack object permits an LSR to include label stack information including label value, EXP, and TTL field values, from the encapsulation header of the packet that expired at the LSR node. The ICMP message continues to include the IP header and leading payload octets of the original datagram.

In order to include the MPLS Label Stack object, SR OS implementation adds support of RFC 4884 which defines extensions for a multi-part ICMPv4/v6 message of type Time Exceeded.

The **no** form of command disables the tunneling of ICMP reply packets over MPLS LSP at a LSR node.

Default no icmp-tunneling

Platforms All

13.13 icmp-type

icmp-type

Syntax **icmp-type** *icmp-type*
no icmp-type

Context **[Tree]** (config>filter>ip-exception>entry>match icmp-type)
[Tree] (config>filter>ip-filter>entry>match icmp-type)
[Tree] (config>filter>ipv6-exception>entry>match icmp-type)
[Tree] (config>filter>ipv6-filter>entry>match icmp-type)

Full Context configure filter ip-exception entry match icmp-type
configure filter ip-filter entry match icmp-type
configure filter ipv6-exception entry match icmp-type
configure filter ipv6-filter entry match icmp-type

Description This command configures matching on the /ICMPv6 type field in the /ICMPv6 header of an IPv4 or IPv6 packet as a filter match criterion or configures matching on the ICMP type field in the ICMP header of an IPv4 packet as an exception filter match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, etc.) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**icmp-type** 0" match criterion, may match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the criterion from the match entry.

Default no icmp-type

Parameters *icmp-type* — Specifies the /ICMPv6 type value that must be present to match. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format, or even using keywords. The following value shows decimal integer only.

Values 0 to 255

Platforms All

- configure filter ipv6-filter entry match icmp-type
- configure filter ip-filter entry match icmp-type

VSR

- configure filter ipv6-exception entry match icmp-type
- configure filter ip-exception entry match icmp-type

no icmp-type

Context **[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match icmp-type)
[Tree] (cfg>sys>sec>cpm>ipv6-filter>entry>match icmp-type)

Full Context configure system security cpm-filter ip-filter entry match icmp-type
configure system security cpm-filter ipv6-filter entry match icmp-type

Description This command configures matching on ICMP type field in the ICMP header of an IP packet as an IP filter match criterion.

Note: An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

Default no icmp-type

Parameters *icmp-type* — Specifies the ICMP type values that must be present to match.

Values 0 to 255

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com

13.14 icmp6

icmp6

Syntax **icmp6**

Context **[Tree]** (config>service>ies>if>ipv6 icmp6)
[Tree] (config>service>vprn>if>ipv6 icmp6)

Full Context configure service ies interface ipv6 icmp6
configure service vprn interface ipv6 icmp6

Description This command configures ICMPv6 parameters for the interface.

Platforms All

icmp6

Syntax **icmp6**

Context **[Tree]** (config>router>if>ipv6 icmp6)

Full Context configure router interface ipv6 icmp6

Description Commands in this context configure ICMPv6 parameters for the interface.

Platforms All

icmp6

Syntax **icmp6** [*ip-int-name*]
no icmp6

Context **[Tree]** (debug>router>ip icmp6)

Full Context debug router ip icmp6

Description This command enables ICMPv6 debugging.

Platforms All

Use subject to Terms available at: www.nokia.com

13.15 icmp6-generation

icmp6-generation

Syntax **icmp6-generation**

Context [Tree] (config>ipsec>tnl-temp icmp6-generation)
[Tree] (config>router>if>ipsec>ipsec-tunnel>dyn icmp6-generation)
[Tree] (config>router>if>ipsec>ipsec-tunnel icmp6-generation)
[Tree] (config>service>ies>if>ipsec>ipsec-tunnel icmp6-generation)
[Tree] (config>service>ies>if>sap>ip-tunnel icmp6-generation)
[Tree] (config>service>vprn>if>ipsec>ipsec-tunnel icmp6-generation)
[Tree] (config>service>vprn>if>sap>ip-tunnel icmp6-generation)
[Tree] (config>service>vprn>if>sap>ipsec-tun icmp6-generation)

Full Context configure ipsec tunnel-template icmp6-generation
configure router interface ipsec ipsec-tunnel dyn icmp6-generation
configure router interface ipsec ipsec-tunnel icmp6-generation
configure service ies interface ipsec ipsec-tunnel icmp6-generation
configure service ies interface sap ip-tunnel icmp6-generation
configure service vprn interface ipsec ipsec-tunnel icmp6-generation
configure service vprn interface sap ip-tunnel icmp6-generation
configure service vprn interface sap ipsec-tunnel icmp6-generation

Description This command enables the ICMPv6 packet generation configuration context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel icmp6-generation
- configure ipsec tunnel-template icmp6-generation
- configure service ies interface sap ip-tunnel icmp6-generation
- configure service vprn interface sap ip-tunnel icmp6-generation

VSR

- configure router interface ipsec ipsec-tunnel icmp6-generation
- configure service vprn interface ipsec ipsec-tunnel icmp6-generation
- configure service ies interface ipsec ipsec-tunnel icmp6-generation

Use subject to Terms available at: www.nokia.com

13.16 icmp6-query

icmp6-query

Syntax **icmp6-query** [**min** *minutes*] [**sec** *seconds*]
no icmp6-query

Context **[Tree]** (config>service>nat>firewall-policy>timeouts icmp6-query)

Full Context configure service nat firewall-policy timeouts icmp6-query

Description This command configures the timeout interval for ICMPv6 query mappings.

The **no** form of the command reverts the timeout interval to the default of 1 minute.

Default icmp6-query min 1

Parameters *minutes* — Specifies the number of minutes in the ICMP query mapping timeout interval.

Values 1 to 4

seconds — Specifies the number of seconds in the ICMP query mapping timeout interval.

Values 0 to 59

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.17 id

id

Syntax [**no**] **id** *service-id*

Context **[Tree]** (debug>service id)

Full Context debug service id

Description This command enables debugging for the specified service ID.

The **no** form of this command disables the debugging.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

id

Syntax **id** *service-id*

Context **[Tree]** (debug>service id)

Full Context debug service id

Description This command debugs commands for a specific service.

The **no** form of the command disables debugging.

Parameters *service-id* — The ID that uniquely identifies a service.

Values service-id: 1 to 214748364
svc-name: A string up to 64 characters in length

Platforms All

13.18 id-permission

id-permission

Syntax **id-permission** {**chassis**}
no id-permission

Context **[Tree]** (cfg>eth-cfm>domain>assoc>bridge id-permission)

Full Context configure eth-cfm domain association bridge-identifier id-permission

Description This command allows the operator to include the sender-id TLV information that was specified under the **config>eth>system>sender-id** configuration for service MEPs and MIPs. When this option is present under the maintenance association, the specific MPs in the association includes the **sender-id** TLV information in ETH-CFM PDUs. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs includes this value in the LBR and LTR PDUs.

Note: LBR functions reflect all TLVs received in the LBM unchanged including the SenderID TLV. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

Parameters **chassis** — Sends the configured chassis information defined under in the **eth-cfm>system>sender-id** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

id-permission

Syntax **id-permission** {**chassis** | **defer**}
no id-permission

Context **[Tree]** (config>eth-cfm>default-domain>bridge-identifier id-permission)

Full Context configure eth-cfm default-domain bridge-identifier id-permission

Description This command enables the inclusion of the Sender ID TLV information specified under the **config**>**eth**>**system**>**sender-id** command for installed MEPs and MIPs. The inclusion of the Sender ID TLV is based on the configured value. The Sender ID TLV is supported for ETH-CC, ETH-LB, and ETH-LB PDUs.

Note: LBR functions reflect back all TLVs received in the LBM, unchanged, including the Sender ID TLV. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

The **no** form of this command disables the inclusion of the Sender ID TLV.

Default id-permission defer (config>eth-cfm>default-domain>bridge-identifier)

no id-permission (config>eth-cfm>domain>association>bridge)

Parameters **chassis** — Keyword to include the Sender ID TLV with a value equal to the *sender-id* configured under the eth-cfm>system context.

defer — Keyword to specify that **id-permission** will inherit the value from the global read-only system values.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.19 identification-strings

identification-strings

Syntax **identification-strings** *option-number* [**create**]
no identification-strings

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host identification-strings)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host identification-strings)

Full Context configure subscriber-mgmt local-user-db ipoe host identification-strings
configure subscriber-mgmt local-user-db ppp host identification-strings

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies identification strings for the subscriber. This is useful when the server is centralized with Enhanced Subscriber Management (ESM) in a lower level in the network. These strings are parsed by a downstream Python script or they can be used literally if the **strings-from-option** option in the **config>subscr-mgmt>sub-ident-policy** context is set to this option number. In this case, the option number may be set to any allowed number (between 224 and 254 is suggested, as these are not dedicated to specific purposes). If the option number is not given, a default value of 254 is used. For PPPoE only, if the local user database is attached to the PPPoE node under the group interface and not to a local DHCP server, the strings are used internally so the option number is not used.

The **no** form of this command returns to the default.

Parameters *option-number* — Specifies identification strings for the subscriber.

Values 1 to 254

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.20 identifier

identifier

Syntax **identifier** *frf16-identifier*
no identifier

Context **[Tree]** (config>port>ml-bundle>mlfr identifier)

Full Context configure port multilink-bundle mlfr identifier

Description This command defines the identifier for the MLFR bundle. The **no** form of this command resets the value to null.

Default null

Parameters *frf16-identifier* — Specifies the bundle ID string. The string can be up to 49 characters long.

Platforms 7450 ESS, 7750 SR-7/12/12e

identifier

Syntax **identifier** *frf16-identifier*
no identifier

Context **[Tree]** (config>port>tdm>ds1>channel-group>frame-relay identifier)
[Tree] (config>port>tdm>e1>channel-group>frame-relay identifier)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure port tdm ds1 channel-group frame-relay identifier
configure port tdm e1 channel-group frame-relay identifier

Description This command defines the identifier for a frame-relay link when used in an MLFR bundle.

The **no** form of this command resets the value to null.

Default no identifier

Parameters *frf16-identifier* — Specifies the bundle ID string. The string can be up to 49 characters long.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

identifier

Syntax **identifier** *identifier*
no identifier

Context **[Tree]** (config>system>bluetooth>module identifier)

Full Context configure system bluetooth module identifier

Description This command defines an identifier string to be used to advertise the Bluetooth module during pairing operations.

If there is no identifier specified by the user, the default is derived from the platform type, the CPM slot, and the serial number of the chassis.

For example, a device with a platform field of 7750, SR-12 chassis, and a CPM serial number of NS23456 would have a Bluetooth identifier of "7750-SR-12-CPM-A-NS23456." for the CPM in slot A.

The **no** form of the command resets the identifier back to the default.

Parameters *identifier* — Specifies string, up to 32 characters, using the values in the range 0-9, a-z, or A-Z.

Platforms 7750 SR-1, 7750 SR-s

13.21 idi

idi

Syntax **idi any**
idi ipv4-prefix {**any** | *ipv4-prefix/ipv4-prefix-length*}

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

idi ipv6-prefix {**any** | *ipv6-prefix/ipv6-prefix-length*}
idi string-type *string-type* **string-value** *string-value*
no idi

Context **[Tree]** (config>ipsec>client-db>client>client-id idi)

Full Context configure ipsec client-db client client-identification idi

Description This command specifies a match criteria that uses the peer's identification initiator (IDi) as the input, only one IDi criteria can be configured for a given client entry. This command supports the following matching methods:

- **idi any**: Matches any type of IDi with any value.
- **idi ipv4-prefix**: Matches an IDi with the type ID_IPV4_ADDR. If the **any** parameter is specified, then it will match any IPv4 address. If an IPv4 prefix is specified, then it will match an IPv4 address that is within the specified prefix.
- **idi ipv6-prefix**: Matches an IDi with the type ID_IPV6_ADDR. If the **any** parameter is specified, then it will match any IPv6 address. If an IPv6 prefix is specified, then it will match an IPv6 address that is within the specified prefix.
- **idi string-type**: Supports following type of IDi:
  - FQDN: Either a full match or a suffix match
  - RFC822: Either a full match or a suffix match

The **no** form of this command reverts to the default.

Default no idi

Parameters **any** — Matches any type of IDi with any value.

ipv4-prefix/ipv4-prefix-length — Matches any IPv4 address and prefix.

ipv6-prefix/ipv6-prefix-length — Matches any IPv6 address and prefix.

string-type — Matches the type of IDi value for this IPsec client entry.

Values fqdn, fqdn-suffix, rfc822, rfc822-suffix

string-value — Matches the IDi value within the client ID for this IPsec client entry up to 256 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

idi

Syntax [**no**] **idi**

Context **[Tree]** (config>ipsec>client-db>match-list idi)

Full Context configure ipsec client-db match-list idi

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the Identification Initiator (IDi) type in the IPsec client matching process.

The **no** form of this command disables the IDi matching process.

Default no idi

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.22 idle-cycle-flag

idle-cycle-flag

Syntax **idle-cycle-flag** {**flags** | **ones**}
no idle-cycle-flag

Context **[Tree]** (config>port>tdm>ds1>channel-group idle-cycle-flag)
[Tree] (config>port>tdm>ds3 idle-cycle-flag)
[Tree] (config>port>tdm>e1>channel-group idle-cycle-flag)
[Tree] (config>port>tdm>e3 idle-cycle-flag)

Full Context configure port tdm ds1 channel-group idle-cycle-flag
configure port tdm ds3 idle-cycle-flag
configure port tdm e1 channel-group idle-cycle-flag
configure port tdm e3 idle-cycle-flag

Description This command configures the value that the HDLC TDM DS-0, E-1, E-3, DS-1, or DS-3 interface transmits during idle cycles. For ATM ports/channels/channel-groups, the configuration does not apply and only the no form is accepted.

The **no** form of this command reverts the idle cycle flag to the default value.

Default flags (0x7E)

no flags (ATM)

Parameters **flags** — Specifies that 0x7E is used as the idle cycle flag.

ones — Specifies that 0xFF is used as the idle cycle flag.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.23 idle-filter

idle-filter

Syntax [**no**] **idle-filter**

Context **[Tree]** (config>service>vpls>gsmp>group idle-filter)
[Tree] (config>service>vprn>gsmp>group idle-filter)

Full Context configure service vpls gsmp group idle-filter
configure service vprn gsmp group idle-filter

Description This command when applied will filter out new incoming ANCP messages while the subscriber DSL-line-state is idle. The command takes effect at the time that it is applied. Existing subscribers already in idle state are not purged from the database.

The **no** form of this command reverts to the default.

Platforms All

idle-filter

Syntax [**no**] **idle-filter**

Context **[Tree]** (config>service>vpls>gsmp idle-filter)

Full Context configure service vpls gsmp idle-filter

Description This command when applied will filter out new subscriber's ANCP messages from subscriber with "DSL-line-state" IDLE.

Default no idle-filter

idle-filter

Syntax **idle-filter**
no idle-filter

Context **[Tree]** (config>service>vprn>gsmp idle-filter)

Full Context configure service vprn gsmp idle-filter

Description This command when applied will filter out new subscriber's ANCP messages from subscriber with "DSL-line-state" IDLE.

Default no idle-filter

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.24 idle-payload-fill

idle-payload-fill

Syntax **idle-payload-fill** {**all-ones**}
idle-payload-fill pattern *pattern*
no idle-payload-fill

Context **[Tree]** (config>port>tdm>ds1>channel-group idle-payload-fill)
[Tree] (config>port>tdm>e1>channel-group idle-payload-fill)

Full Context configure port tdm ds1 channel-group idle-payload-fill
configure port tdm e1 channel-group idle-payload-fill

Description This command defines the data pattern to be transmitted when the circuit emulation service is not operational or temporarily experiences under-run conditions. This command is only valid for cesopsn and cesopsn-cas circuit emulation services. It is blocked with a warning for unstructured (satop) circuit emulation services.

Default idle-payload-fill all-ones

Parameters **all-ones** — Defines the 8 bit value to be transmitted as 11111111.

pattern — Transmits a user-defined pattern.

Values 0 to 255, accepted in decimal, hex or binary

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

13.25 idle-signal-fill

idle-signal-fill

Syntax **idle-signal-fill** {**all-ones**}
idle-signal-fill pattern *pattern*
no idle-signal-fill

Context **[Tree]** (config>port>tdm>ds1>channel-group idle-signal-fill)
[Tree] (config>port>tdm>e1>channel-group idle-signal-fill)

Full Context configure port tdm ds1 channel-group idle-signal-fill
configure port tdm e1 channel-group idle-signal-fill

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the signaling pattern to be transmitted when the circuit emulation service is not operational or temporarily experiences under-run conditions. This command is only valid for cesopsn-cas circuit emulation services. It is blocked with a warning for unstructured (satop) and basic cesopsn circuit emulation services.

Default idle-signal-fill all-ones

Parameters **all-ones** — Defines the 8 bit value to be transmitted as 11111111.

pattern — Transmits a user-defined pattern.

Values 0 to 15, accepted in decimal, hex or binary

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

13.26 idle-time

idle-time

Syntax **idle-time** *idle*
no idle-time

Context **[Tree]** (config>system>grpc>tcp-keepalive idle-time)
[Tree] (config>system>grpc-tunnel>destination-group>tcp-keepalive idle-time)
[Tree] (config>system>telemetry>destination-group>tcp-keepalive idle-time)

Full Context configure system grpc tcp-keepalive idle-time
configure system grpc-tunnel destination-group tcp-keepalive idle-time
configure system telemetry destination-group tcp-keepalive idle-time

Description This command configures the amount of time, in seconds, that the connection must remain idle before TCP keepalive probes are sent.

The **no** form of this command reverts to the default value.

Default idle-time 600

Parameters *idle* — Specifies the number of seconds before the first TCP keepalive probe is sent.

Values 1 to 100000

Default 600

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.27 idle-timeout

idle-timeout

Syntax **idle-timeout** *idle-timeout*
idle-timeout infinite
no idle-timeout

Context **[Tree]** (config>router>l2tp>group idle-timeout)
[Tree] (config>router>l2tp>group>tunnel idle-timeout)
[Tree] (config>service>vprn>l2tp idle-timeout)
[Tree] (config>service>vprn>l2tp>group idle-timeout)
[Tree] (config>service>vprn>l2tp>group>tunnel idle-timeout)

Full Context configure router l2tp group idle-timeout
configure router l2tp group tunnel idle-timeout
configure service vprn l2tp group idle-timeout
configure service vprn l2tp group tunnel idle-timeout
configure service vprn l2tp idle-timeout

Description This command configures the period of time that an established tunnel with no active sessions persists before being disconnected.

Enter the **no** form of this command to maintain a persistent tunnel.

The **no** form of this command removes the idle timeout from the configuration.

Default no idle-timeout

Parameters *idle-timeout* — Specifies the idle timeout value, in seconds until the group is removed.

Default no idle-timeout

Values 0 to 3600

infinite — Specifies that the tunnel is not closed when idle.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout

Syntax **idle-timeout** *timeout*
no idle-timeout

Context **[Tree]** (config>subscr-mgmt>sla-prof>cat-map>category idle-timeout)

Full Context configure subscriber-mgmt sla-profile category-map category idle-timeout

Description This command defines the idle-timeout value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Parameters *timeout* — Specifies the idle-timeout, in seconds.

Values 60 to 15552000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout

Syntax **idle-timeout action** *idle-timeout-action*
no idle-timeout

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range idle-timeout)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range idle-timeout)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range idle-timeout
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range idle-timeout

Description This command specifies idle-timeout behavior for DSM UEs and UEs undergoing (ISA-based) portal authentication. This knob only specifies the desired action, idle-timeout is activated by RADIUS on a per-UE basis.

The **no** form of this command resets the idle-timeout to its default

Default idle-timeout action remove

Parameters *action* — Specifies which action to perform when the idle-timeout timer goes off.

Values remove, shcv

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

idle-timeout

Syntax **idle-timeout** {*minutes* | **disable**}
no idle-timeout

Context **[Tree]** (config>system>login-control idle-timeout)

Full Context configure system login-control idle-timeout

Description This command configures the idle timeout for console, Telnet, SSH, and FTP sessions before the session is terminated by the system.

By default, each idle console, Telnet, SSH, or FTP session times out after 30 minutes of inactivity.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default value.

Default idle-timeout 30

Parameters *minutes* — Specifies the idle timeout in minutes. Allowed values are 1 to 1440.

Values 1 to 1440

disable — When the **disable** option is specified, a session will never timeout. To re-enable idle timeout, enter the command without the disable option.

Platforms All

13.28 idle-timeout-action

idle-timeout-action

Syntax **idle-timeout-action** {**shcv-check** | **terminate**}
no idle-timeout-action

Context **[Tree]** (config>subscr-mgmt>sla-prof>cat-map>category idle-timeout-action)

Full Context configure subscriber-mgmt sla-profile category-map category idle-timeout-action

Description This command defines the action to be executed when the idle-timeout is reached. The action is performed for all hosts associated with the sla-profile instance.

The **no** form of this command reverts to the default.

Default idle-timeout-action terminate

Parameters **shcv-check** — Performs a subscriber host connectivity verification check (IPoE hosts only).

Note: Host connectivity verification must be enabled on the group-interface where the host is connected.

If the check is successful, the hosts are not disconnected and the idle-timeout timer is reset.

If the check fails, the hosts are deleted, similar as for **idle-timeout-action terminate**.

terminate — Deletes the subscriber host from the system: for PPP hosts, a terminate request is send; for IPoE hosts a DHCP release is send to the DHCP server.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.29 ies

ies

Syntax **ies** *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**name** *name*]
no ies *service-id*

Context **[Tree]** (config>service ies)

Full Context configure service ies

Description This command creates or edits an IES service instance.

The **ies** command creates or maintains an Internet Ethernet Service (IES). If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

IES services allow the creation of customer facing IP interfaces in the same routing instance used for service network core routing connectivity. IES services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an IES service ID must have a SAP created as the access point to the subscriber network. This allows a combination of bridging and IP routing for redundancy purposes.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and recreated with a new customer association.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified results in an error.

Multiple IES services are created to separate customer owned IP interfaces. More than one IES service may be created for a single customer ID. More than one IP interface may be created within a single IES service ID. All IP interfaces created within an IES service ID belongs to the same customer.

By default, no IES service instances exist until they are explicitly created.

The **no** form of this command deletes the IES service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces defined within the service ID have been shut down and deleted.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 214748364

svc-name: A string up to 64 characters

customer-id — Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn-id — Specifies the VPN ID number used to identify virtual private networks (VPNs) by a VPN identification number.

Values 1 to 2147483647

Default **null** (0)

create — Keyword used to create the service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

name *name* — This parameter configures an optional service name, up to 64 characters, which adds a name identifier to a given service to then use that service name in configuration references as well as display and use service names in show commands throughout the system. This helps the service provider or administrator to identify and manage services within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

Values *name*: up to 64 characters

Platforms All

ies

Syntax [**no**] **ies** *service-id* **interface** *ip-int-name*
[**no**] **ies** *service-id* **subscriber-interface** *ip-int-name* **group-interface** *ip-int-name*

Context **[Tree]** (config>cflowd>collector>exp-filter>if-list>svc ies)

Full Context configure cflowd collector export-filter interface-list service ies

Description This command configures which IES service interfaces' flow data is being sent to this collector.

The **no** form of the command removes the values from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

Values *service-id*:1 to 2147483647
svc-name:64 characters maximum

interface *ip-int-name* — Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

subscriber-interface *ip-int-name* — Specifies the interface name of a subscriber interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

group-interface *ip-int-name* — Specifies the interface name of a group interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

Platforms All

13.30 ies-vprn-only-sap-parameters

ies-vprn-only-sap-parameters

Syntax **ies-vprn-only-sap-parameters**

Context **[Tree]** (config>subscr-mgmt>msap-policy ies-vprn-only-sap-parameters)

Full Context configure subscriber-mgmt msap-policy ies-vprn-only-sap-parameters

Description Commands in this context configure managed SAP IES and VPRN properties. VPRN services are supported on the 7750 SR only.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.31 if-attribute

if-attribute

Syntax **if-attribute**

Context **[Tree]** (config>router if-attribute)
[Tree] (config>router>interface if-attribute)
[Tree] (config>service>ies>interface if-attribute)
[Tree] (config>service>vprn>interface if-attribute)

Full Context configure router if-attribute
configure router interface if-attribute
configure service ies interface if-attribute
configure service vprn interface if-attribute

Description This command creates the context to configure or apply IP interface attributes such as administrative group (admin-group) or Shared Risk Loss Group (SRLG).

Platforms All

13.32 if-num

if-num

Syntax **if-num** *if-num*
no if-num

Context **[Tree]** (config>router>mpls>if>mpls-tp-mep if-num)

Full Context configure router mpls interface mpls-tp-mep if-num

Description This command configures the MPLS-TP interface number for the MPLS interface. This is a 32-bit unsigned integer that is node-wide unique.

Parameters *if-num* — Specifies a 32-bit value that is unique to the node.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.33 if-num-validation

if-num-validation

Syntax **if-num-validation** {**enable** | **disable**}
no if-num-validation

Context **[Tree]** (config>router>mpls>if>mpls-tp-mep if-num-validation)

Full Context configure router mpls interface mpls-tp-mep if-num-validation

Description The if-num-validation command is used to enable or disable validation of the if-num in LSP Trace packet against the locally configured if-num for the interface over which the LSP Trace packet was received at the egress LER. This is because some third-party implementations may not perform interface validation for unnumbered MPLS-TP interfaces and instead set the if-num in the DSMAP TLV to 0. If the value is **enable**, the node performs the validation of the ingress and egress if-nums received in the LSP echo request messages that ingress on this MPLS-interface. It validates that the message arrives on the interface as identified by the ingress if-num, and is forwarded on the interface as identified by the egress if-num.

If the value is **disable**, no validation is performed for the ingress and egress if-nums received in the LSP echo request messages that ingress on this MPLS-interface.

Default if-num-validation enable

Parameters **enable** — Enables interface number validation.

disable — Disables interface number validation.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.34 if-policy

if-policy

Syntax **if-policy** *mcac-if-policy-name*
no if-policy

Context **[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac if-policy)

Full Context configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac if-policy

Description This command assigns an existing MCAC interface policy to this MSAP policy.

The **no** form of this command removes the MCAC interface policy association.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mcac-if-policy-name* — Specifies an existing MCAC interface policy up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

if-policy

Syntax **if-policy** *if-policy-name*
no if-policy

Context **[Tree]** (config>service>vpls>mesh-sdp>igmp-snooping>mcac if-policy)
[Tree] (config>service>vpls>mesh-sdp>mld-snooping>mcac if-policy)
[Tree] (config>service>vpls>sap>igmp-snooping>mcac if-policy)
[Tree] (config>service>vpls>sap>mld-snooping>mcac if-policy)
[Tree] (config>service>vpls>spoke-sdp>igmp-snooping>mcac if-policy)
[Tree] (config>service>vpls>spoke-sdp>mld-snooping>mcac if-policy)

Full Context configure service vpls mesh-sdp igmp-snooping mcac if-policy
configure service vpls mesh-sdp mld-snooping mcac if-policy
configure service vpls sap igmp-snooping mcac if-policy
configure service vpls sap mld-snooping mcac if-policy
configure service vpls spoke-sdp igmp-snooping mcac if-policy
configure service vpls spoke-sdp mld-snooping mcac if-policy

Description This command assigns existing MCAC interface policy to this interface. MCAC interface policy is not supported with MLD-snooping, therefore executing the command in the mld-snooping contexts will return an error.

The **no** form of this command removes the MCAC interface policy association.

Default no if-policy

Parameters *mcac-if-policy-name* — Specifies an existing MCAC interface policy

Platforms All

if-policy

Syntax **if-policy** *if-policy-name*
no if-policy

Context **[Tree]** (config>service>vprn>igmp>grp-if>mcac if-policy)

- configure router igmp interface mcac if-policy
- configure router pim interface mcac if-policy
- configure router mld interface mcac if-policy

if-policy

Syntax [**no**] **if-policy** *if-policy-name*

Context **[Tree]** (config>router>mcac if-policy)

Full Context configure router mcac if-policy

Description This command creates an MCAC interface policy and enables the context to configure parameters for the policy.

The **no** form of this command deletes the MCAC interface policy.

Parameters *if-policy-name* — Specifies the name of the MCAC interface policy, up to 32 characters.

Platforms All

13.35 ifdv-avg

ifdv-avg

Syntax [**no**] **ifdv-avg** {**forward** | **backward** | **round-trip**}

Context **[Tree]** (config>oam-pm>streaming>delay-template ifdv-avg)

Full Context configure oam-pm streaming delay-template ifdv-avg

Description This command specifies the sending of average inter-frame delay variation for a specified direction.

The **no** form of this command deletes the specified average direction.

Note: All directions can be specified if all directions are important for reporting. However, only enable those directions that are required.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **forward** — Specifies the measurement in the forward direction.

backward — Specifies the measurement in the backward direction.

round-trip — Specifies the measurement for the round trip.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.36 iff-attribute-uniform-propagation

iff-attribute-uniform-propagation

Syntax [**no**] **iff-attribute-uniform-propagation**

Context **[Tree]** (config>service>system>bgp-evpn>ip-prefix-routes iff-attribute-uniform-propagation)

Full Context configure service system bgp-evpn ip-prefix-routes iff-attribute-uniform-propagation

Description This command enables the uniform propagation of BGP attributes for EVPN Interface-ful (EVPN-IFF) routes. EVPN-IFF is used in R-VPLS services with **bgp-evpn**>**ip-route-advertisement**. When enabled, the received EVPN-IFF routes for the R-VPLS can be propagated with the original BGP path attributes into EVPN-IFL, IPVPN, EVPN-IFF (in other R-VPLS services), or BGP IP routes advertised for the attached VPRN. This command also enables the attribute propagation in the opposite direction; for example, from EVPN-IFL, IPVPN, IP, or EVPN-IFF routes into EVPN-IFF routes.

The propagation is in accordance with the uniform mode defined in *draft-ietf-bess-evpn-ipvpn-interworking*.

The **no** form of this command re-originates the BGP path attributes when propagating EVPN-IFF routes into other inter-subnet forwarding families.

Default no iff-attribute-uniform-propagation

Platforms All

13.37 iff-bgp-path-selection

iff-bgp-path-selection

Syntax **iff-bgp-path-selection** [**d-path-length-ignore**]
no iff-bgp-path-selection

Context **[Tree]** (config>service>system>bgp-evpn>ip-prefix-routes iff-bgp-path-selection)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service system bgp-evpn ip-prefix-routes iff-bgp-path-selection

Description This command enables BGP path selection for EVPN-IFF (Interface-ful) routes.

Once the command is enabled, the EVPN-IFF routes are ordered and selected in a similar manner as IPVPN or EVPN-IFL routes, that is, based on the regular BGP path selection process.

The **no** form of this command causes the system to order EVPN-IFF routes based on their {R-VPLS Ifindex, RD, Ethernet Tag}. For example, if two EVPN-IFF routes with different Route Distinguishers (RDs) are received for the same prefix on the same R-VPLS, the route with the lowest RD is selected.

Default no iff-bgp-path-selection

Parameters **d-path-length-ignore** — Keyword used to make EVPN ignore the D-PATH length when **iff-bgp-path-selection** is enabled.

Platforms All

13.38 igmp

igmp

Syntax [**no**] **igmp** [**host** *ip-address*] [**group** *grp-address*]

Context **[Tree]** (debug>mcast-mgmt>mcast-rprt-dest igmp)

Full Context debug mcast-management mcast-reporting-dest igmp

Description This command sets mcast reporting dest debug filtering options and applies only to the 7750 SR.

Platforms All

igmp

Syntax [**no**] **igmp**

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync igmp)

Full Context configure redundancy multi-chassis peer sync igmp

Description This command specifies whether IGMP protocol information should be synchronized with the multi-chassis peer.

Default no igmp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms All

igmp

Syntax [**no**] **igmp**

Context **[Tree]** (config>service>vprn igmp)

Full Context configure service vprn igmp

Description Commands in this context configure IGMP parameters.

The **no** form of this command disables IGMP.

Default no igmp

Platforms All

igmp

Syntax [**no**] **igmp**

Context **[Tree]** (config>router igmp)

Full Context configure router igmp

Description This command enables the Internet Group Management Protocol (IGMP) context. When the context is created, the IGMP protocol is enabled.

The Internet Group Management Protocol (IGMP) is used by IPv4 systems (hosts and routers) to report their IP multicast group memberships to neighboring multicast routers. An IP multicast router can be a member of one or more multicast groups, in which case it performs both the “multicast router part” of the protocol which collects the membership information needed by its multicast routing protocol, and the “group member part” of the protocol which informs itself and other neighboring multicast routers of its memberships.

The **no** form of the command disables the IGMP instance. To start or suspend execution of IGMP without affecting the configuration, use the **no shutdown** command.

Platforms All

igmp

Syntax [**no**] **igmp**

Context **[Tree]** (config>sys>security>cpu-protection>ip>included-protocols igmp)

Full Context configure system security cpu-protection ip-src-monitoring included-protocols igmp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command includes the extracted IPv4 IGMP packets for ip-src-monitoring. IPv4 IGMP packets will be subject to the per-source-rate of CPU protection policies.

Default no igmp

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

13.39 igmp-host-tracking

igmp-host-tracking

Syntax **igmp-host-tracking**

Context **[Tree]** (config>subscr-mgmt>msap-policy igmp-host-tracking)

Full Context configure subscriber-mgmt msap-policy igmp-host-tracking

Description Commands in this context configure IGMP host tracking parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

igmp-host-tracking

Syntax **igmp-host-tracking**

Context **[Tree]** (config>service>vprn>sub-if>grp-if>sap igmp-host-tracking)

Full Context configure service vprn subscriber-interface group-interface sap igmp-host-tracking

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

igmp-host-tracking

Syntax **igmp-host-tracking**

Context **[Tree]** (config>service>vprn igmp-host-tracking)
[Tree] (config>service>vprn>sap igmp-host-tracking)

Full Context configure service vprn igmp-host-tracking
configure service vprn sap igmp-host-tracking

Description Commands in this context configure IGMP host tracking parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.40 igmp-policy

igmp-policy

Syntax **igmp-policy** *policy-name* [**create**]
no igmp-policy

Context **[Tree]** (config>subscr-mgmt igmp-policy)

Full Context configure subscriber-mgmt igmp-policy

Description This command configures an IGMP policy.

The **no** form of this command reverts to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policy-name* — Specifies the policy name up to 32 characters.

create — Keyword used to create the IGMP policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

igmp-policy

Syntax **igmp-policy** *policy-name*
no igmp-policy

Context **[Tree]** (config>subscr-mgmt>sub-prof igmp-policy)

Full Context configure subscriber-mgmt sub-profile igmp-policy

Description This command will enable IGMP processing per subscriber host. Without this command IGMP states will not be maintained per subscriber hosts. The referenced policy is defined under the **configure>subscr-mgmt** context and can be only applied via the sub-profile.

The referenced policy contains entries such as:

- description statement
- import statement — IGMP filters
- egress-rate-modify statement—HQoS Adjustment
- mcast-redirection statement—redirection to alternate interface
- static statement—definition of static IGMP groups
- version statement —IGMP version
- fast-leave statement
- max-num-groups statement—the maximum number of multicast groups allowed

The **no** form of this command reverts to the default.

Parameters *policy-name* — Specifies the name of the IGMP policy for the subscriber. The policy itself is defined under the **configure>sub-mgmt** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.42 ignore-app-profile

ignore-app-profile

Syntax **ignore-app-profile**
no ignore-app-profile

Context **[Tree]** (config>subscr-mgmt>http-redirect-policy ignore-app-profile)

Full Context configure subscriber-mgmt http-redirect-policy ignore-app-profile

Description When enabled, the Alc-App-Prof-Str VSA is ignored in a RADIUS Accept that enables portal redirection using this redirect policy. AA functionality is disabled during portal authentication.

The **no** form of this command allows an Alc-App-Prof-Str to be present and enables Application Assurance during portal authentication. In this case redirection rules defined in this policy are bypassed and it is assumed the AA function is configured for portal redirection.

Default no ignore-app-profile

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.43 ignore-attached-bit

ignore-attached-bit

Syntax **ignore-attached-bit**
no ignore-attached-bit

Context **[Tree]** (config>service>vprn>isis ignore-attached-bit)

Full Context configure service vprn isis ignore-attached-bit

Description This command configures IS-IS to ignore the attached bit on received Level 1 LSPs to disable installation of default routes.

Platforms All

ignore-attached-bit

Syntax **ignore-attached-bit**
[**no**] **ignore-attached-bit**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>isis ignore-attached-bit)

Full Context configure router isis ignore-attached-bit

Description This command configures IS-IS to ignore the attached bit on received Level 1 LSPs to disable installation of default routes.

Platforms All

13.44 ignore-avps

ignore-avps

Syntax **ignore-avps** [**sequencing-required**]
no ignore-avps

Context [Tree] (config>router>l2tp ignore-avps)
[Tree] (config>service>vprn>l2tp ignore-avps)

Full Context configure router l2tp ignore-avps
configure service vprn l2tp ignore-avps

Description This command specifies the L2TP AVPs that should be ignored in L2TP session control.

The **no** form of this command reverts to the default.

Parameters **sequencing-required** — Ignores the [39] Sequencing Required AVP on LNS when present in the L2TP ICCN message received from LAC. By default, the session at LNS would be disconnected, in this case with the Call Disconnect Notify (CDN) error code unknownMandatoryReceive(8). Note that when configured, to ignore the Sequencing Required AVP there is no Sequence Numbers inserted into the data channel.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.45 ignore-default

ignore-default

Full Context configure router interface ipv6 urpf-check ignore-default
configure router interface urpf-check ignore-default

Description This command configures the uRPF check (if enabled) to ignore default routes for purposes of determining the validity of incoming packets. By default, default routes are considered eligible.

Platforms All

13.46 ignore-df-bit

ignore-df-bit

Syntax [**no**] **ignore-df-bit**

Context [Tree] (config>subscr-mgmt>loc-user-db>ppp>host ignore-df-bit)

Full Context configure subscriber-mgmt local-user-db ppp host ignore-df-bit

Description When this command is enabled for a subscriber host, the do-not-fragment (DF) bit in the IPv4 header for frames egressing the subscriber interface is ignored, the frames are fragmented according the applicable egress MTU. The DF bit is reset for frames that are fragmented.

This command applies to PPPoE PTA and L2TP LNS frames only. It is not applicable for L2TP LAC frames.

© 2022 Nokia.

ignore-df-bit

Syntax [**no**] **ignore-df-bit**

Context **[Tree]** (config>service>ies>sub-if>grp-if ignore-df-bit)
[Tree] (config>service>vprn>sub-if>grp-if ignore-df-bit)

Full Context configure service ies subscriber-interface group-interface ignore-df-bit
configure service vprn subscriber-interface group-interface ignore-df-bit

Description This command enables the **ignore-df-bit** flag that ignores the **do-not-fragment** (DF) bit for frames egressing the WLAN-GW group interface and fragments the frame according to the applicable egress MTU. The DF bit is reset for the frames that are fragmented.

The **no** form of this command causes the router to fragment a packet larger than the MTU if the DF bit is set to 0 and drops the packet if the DF bit is set to 1.

Default no ignore-df-bit

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.47 ignore-dn-bit

ignore-dn-bit

Syntax [**no**] **ignore-dn-bit**

Context **[Tree]** (config>service>vprn>ospf ignore-dn-bit)
[Tree] (config>service>vprn>ospf3 ignore-dn-bit)

Full Context configure service vprn ospf ignore-dn-bit
configure service vprn ospf3 ignore-dn-bit

Description This command specifies whether to ignore the DN bit for OSPF LSA packets for this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets are ignored.

The **no** form of this command does not ignore the DN bit for OSPF LSA packets.

Default no ignore-dn-bit

Description With this flag enabled, the remote IP address or prefix can be taken over immediately upon entering the PARTNER-DOWN state of the intercommunication link, without having to wait for the Maximum Client Lead Time (MCLT) to expire. By setting this flag, the lease times of the existing DHCP clients, while the intercommunication link is in the PARTNER-DOWN state, will still be reduced to the MCLT over time and all new lease times are set to MCLT. This behavior remains the same as originally intended for MCLT.

Some deployments require that the remote IP address/prefix range starts delegating new IP addresses and prefixes upon the failure of the intercommunication link, without waiting for the intercommunication link to transition from the COMM-INT state into the PARTNER-DOWN state and the MCLT to expire while in PARTNER-DOWN state.

This can be achieved by enabling the **ignore-mclt-on-takeover** flag and by configuring the **partner-down-delay** to 0.

Enabling this functionality must be exercised with caution. One needs to keep in mind that the partner-down-delay and MCLT timers were originally introduced to prevent IP address duplication in cases where DHCP redundant nodes transition out-of-sync due to the failure of intercommunication link. These timers (**partner-down-delay** and MCLT) would ensure that during their duration, the new IP addresses and prefixes are delegated only from one node, the one with local IP address-range/prefix. This causes the new IP address delegation to be delayed and the service is impacted.

If it can be assured that the intercommunication link is always available, then the DHCP nodes would stay in sync and the two timers would not be needed. Therefore, it is important that in this mode of operation, the intercommunication link is well protected by providing multiple paths between the two DHCP nodes. The only event that should cause intercommunication link to fail is the entire nodal failure. This failure is acceptable since in this case only one DHCP node is available to provide new IP addresses and prefixes.

The **no** form of this command reverts to the default.

13.57 ignore-received-srv6-tlvs

ignore-received-srv6-tlvs

Syntax [**no**] **ignore-received-srv6-tlvs**

Context **[Tree]** (config>router>bgp>srv6>family ignore-received-srv6-tlvs)

Full Context configure router bgp segment-routing-v6 family ignore-received-srv6-tlvs

Description This command specifies that SRv6 TLVs are ignored when present in received routes of the associated family. In this case the route resolution is only based on the BGP next hop.

The **no** form of this command specifies that the SRv6 TLV is processed when a route of the family is received with a prefix SID attribute carrying an SRv6 TLV. In this case, a route is resolved only if both its BGP next hop and the locator prefix are reachable. The datapath programming and IGP cost to reach the next hop (used by the BGP decision process) is based on the route to the locator prefix.

Default ignore-received-srv6-tlvs

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

13.58 ignore-router-id

ignore-router-id

Syntax **ignore-router-id include-internal** *family* [*family*]
[**no**] **ignore-router-id**

Context **[Tree]** (config>router>bgp>best-path-selection ignore-router-id)
[Tree] (config>service>vprn>bgp>best-path-selection ignore-router-id)

Full Context configure router bgp best-path-selection ignore-router-id
configure service vprn bgp best-path-selection ignore-router-id

Description When the **ignore-router-id** command is present, and the current best path to a destination was learned from EBGP peer X with BGP identifier x and a new path is received from EBGP peer Y with BGP identifier y, the best path remains unchanged if the new path is equivalent to the current best path up to the BGP identifier comparison – even if y is less than x.

The **no** form of this command restores the default behavior of selecting the route with the lowest BGP identifier (y) as best.

Default no ignore-router-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *family* — Specifies up to two internal families to be included in this configuration.

Values mvpn-ipv4, mvpn-ipv6

include-internal — Specifies to ignore the router ID value even when comparing two IGBP paths or an EBGP and an IBGP path.

Platforms All

13.59 ignore-standby-signaling

ignore-standby-signaling

Syntax [**no**] **ignore-standby-signaling**

Context **[Tree]** (config>service>vpls>endpoint ignore-standby-signaling)
[Tree] (config>service>vpls>spoke-sdp ignore-standby-signaling)

Full Context configure service vpls endpoint ignore-standby-signaling
configure service vpls spoke-sdp ignore-standby-signaling

Description When this command is enabled, the node ignores the standby-bit received from the TLDP peers for the specific spoke-SDP and performs internal tasks without taking it into account.

This command is present at the endpoint level and the spoke-SDP level. If the spoke-SDP is part of the explicit-endpoint, this setting cannot be changed at the spoke-SDP level. The existing spoke-SDP will become part of the explicit-endpoint only if the setting is not conflicting. The newly created spoke-SDP, which is a part of the specified explicit-endpoint, will inherit this setting from the endpoint configuration.

Default no ignore-standby-signaling

13.61 igp-shortcut

igp-shortcut

Syntax **igp-shortcut** [**lfa-protect** | **lfa-only**] [**relative-metric** [*offset*]]
no igp-shortcut

Context **[Tree]** (config>router>mpls>lsp igp-shortcut)
[Tree] (config>router>mpls>lsp-template igp-shortcut)

Full Context configure router mpls lsp igp-shortcut
configure router mpls lsp-template igp-shortcut

Description This command enables the use of a specific RSVP LSP by IS-IS and OSPF routing protocols as a shortcut or as a forwarding adjacency for resolving IGP routes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the **igp-shortcut** or the **advertise-tunnel-link** option is enabled at the IGP instance level, all RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config>router>mpls>lsp>to**, corresponds to a router-id of a remote node.

The **lfa-protect** option allows an LSP to be included in both the main SPF and the Loop-Free Alternate (LFA) SPF. For a given prefix, the LSP can be used either as a primary next-hop or as an LFA next-hop, but not both. If the main SPF computation selected a tunneled primary next-hop for a prefix, the LFA SPF will not select an LFA next-hop for this prefix and the protection of this prefix will rely on the RSVP LSP FRR protection. If the main SPF computation selected a direct primary next-hop, then the LFA SPF will select an LFA next-hop for this prefix but will prefer a direct LFA next-hop over a tunneled LFA next-hop.

The **lfa-only** option allows an LSP to be included in the LFA SPF only such that the introduction of IGP shortcuts does not impact the main SPF decision. For a given prefix, the main SPF always selects a direct primary next-hop. The LFA SPF will select a an LFA next-hop for this prefix but will prefer a direct LFA next-hop over a tunneled LFA next-hop.

When the **relative-metric** option is enabled, IGP will apply the shortest IGP cost between the endpoints of the LSP plus the value of the offset (instead of the LSP operational metric) when computing the cost of a prefix which is resolved to the LSP. The offset value is optional and it defaults to zero. The minimum net cost for a prefix is one (1) after applying the offset. The TTM continues the show the LSP operational metric as provided by MPLS. In other words, applications such as LDP-over-RSVP (when IGP shortcut is disabled) and BGP and static route shortcuts will continue to use the LSP operational metric.

The **relative-metric** option is mutually exclusive with the **lfa-protect** or the **lfa-only** options. In other words, an LSP with the **relative-metric** option enabled cannot be included in the LFA SPF, and vice-versa, when the **igp-shortcut** option is enabled in the IGP.

Finally, the **relative-metric** option is ignored when forwarding adjacency is enabled in IS-IS or OSPF. In this case, IGP advertises the LSP as a point-to-point unnumbered link along with the LSP operational metric as returned by MPLS and capped to maximum link metric allowed in that IGP. Both the main SPF and the LFA SPFs will use the local IGP database to resolve the routes.

The **no** form of this command disables the use of a specific RSVP LSP by IS-IS and OSPF routing protocols as a shortcut or a forwarding adjacency for resolving IGP routes.

Default igp-shortcut. All RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP corresponds to a router-id of a remote node.

Parameters **lfa-protect** — Specifies an LSP is included in both the main SPF and the LFA SPF.

lfa-only — Specifies an LSP is included in the LFA SPF only.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

relative-metric [*offset*] — Specifies the shortest IGP cost between the endpoints of the LSP plus the configured offset, instead of the LSP operational metric returned by MPLS, is used when calculating the cost of prefix resolved to this LSP. The offset parameter is an integer and is optional. An offset value of zero is used when the relative-metric option is enabled without specifying the offset parameter value.

Values [-10, +10]

Platforms All

igp-shortcut

Syntax **igp-shortcut**

Context **[Tree]** (config>router>isis igp-shortcut)

Full Context configure router isis igp-shortcut

Description This command enables the use of an RSVP-TE or SR-TE shortcut for resolving IGP routes by OSPF or IS-IS routing protocols.

This command instructs IGP to include RSVP LSPs and SR-TE LSPs originating on this node and terminating on the router ID of a remote node as direct links with a metric equal to the metric provided by MPLS.

During the IP reach calculation to determine the reachability of nodes and prefixes, LSPs are overlaid and the LSP metric is used to determine the subset of paths that are equal lowest cost to reach a node or a prefix. If the user enabled the **relative-metric** option for this LSP, IGP will apply the shortest IGP cost between the endpoints of the LSP plus the value of the offset, instead of the LSP operational metric, when computing the cost of a prefix that is resolved to the LSP.

When a prefix is resolved to a tunnel next-hop, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP-TE or SR-TE LSP, as well as the explicit-null IPv6 label at the bottom of the stack in the case of an IPv6 prefix. Any network event causing one or more IGP shortcuts to go down will trigger a full SPF computation, which may result in installing a new route over an updated set of tunnel next-hops and IP next-hops.

When **igp-shortcut** is enabled at the IGP instance level, all RSVP-TE and SR-TE LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config>router>mpls>lsp>to**, corresponds to a router ID of a remote node. LSPs with a destination corresponding to an interface address or any other loopback interface address of a remote node are automatically not considered by IGP. The user can, however, exclude a specific RSVP-TE or SR-TE LSP from being used as a shortcut for resolving IGP routes by entering the **config>router>mpls>lsp>no igp-shortcut** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The SPF in IGP only uses RSVP LSPs as forwarding adjacencies, IGP shortcuts, or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If two or more options are enabled in the same IGP instance, then forwarding adjacency takes precedence over the shortcut application, which takes precedence over the LDP-over-RSVP application.

The SPF in IGP uses SR-TE LSPs as IGP shortcuts only.

When ECMP is enabled on the system and multiple equal-cost paths exist for a prefix, the following selection criteria are used to pick up the set of tunnel and IP next-hops to program in the data path.

- Where a destination is a tunnel-endpoint (including external prefixes with tunnel-endpoint as the next-hop), the tunnel with lowest tunnel-index is selected (the IP next-hop is never used in this case).
- Where a destination is not a tunnel-endpoint:
  - LSPs with metric higher than underlying IGP cost between the endpoint of the LSP are excluded
  - Tunnel next-hops are preferred over IP next-hops
  - Within tunnel next-hops, the following priority applies to selection:
    i. The lowest endpoint-to-destination cost is selected
    ii. If the endpoint-to-destination costs are the same, the lowest endpoint node router ID is selected
    iii. If the router IDs are the same, the lowest tunnel index is selected
  - Within IP next-hops, the following priority applies to selection:
    i. The lowest downstream router ID is selected
    ii. If the downstream router IDs are the same, the lowest interface-index is selected

Note: Although ECMP is not performed across both the IP and tunnel next-hops, the tunnel endpoint may lie in one of the shortest IGP paths for that prefix. In that case, the tunnel next-hop is always selected as long as the prefix cost using the tunnel is equal to or lower than the IGP cost.

When both RSVP-TE and SR-TE IGP shortcuts are available, the IP reach calculation, in the unicast routing table, will first follow the above ECMP tunnel and IP next-hop selection rules when resolving a prefix over IGP shortcuts. After the set of ECMP tunnel and IP next-hops have been selected, the preference of tunnel type is then applied based on the user setting for prefix family resolution. If the user enabled resolution of the prefix family to both RSVP-TE and SR-TE tunnel types, the TTM tunnel preference value is used to select one type for the prefix. In other words, an RSVP-TE LSP type is preferred to an SR-TE LSP type on a per-prefix basis.

The ingress IOM sprays the packets for this prefix over the set of tunnel next-hops and IP next-hops based on the hashing routine currently supported for IPv4 packets.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This feature provides IGP with the capability to populate the multicast RTM with the prefix IP next-hop when both the **igp-shortcut** and the **multicast-import** options are enabled in IGP. The unicast RTM can still use the tunnel next-hop for the same prefix. The SPF keeps track of both the direct first hop and the tunneled first hop of a node, which is added to the Dijkstra tree.

The SPF in IGP only uses RSVP LSPs as forwarding adjacencies, IGP shortcuts, or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If two or more options are enabled in the same IGP instance, then forwarding adjacency takes precedence over the shortcut application, which takes precedence over the LDP-over-RSVP application.

The SPF in IGP uses SR-TE LSPs as IGP shortcuts only.

When ECMP is enabled on the system and multiple equal-cost paths exist for a prefix, the following selection criteria are used to pick up the set of tunnel and IP next-hops to program in the data path.

- Where a destination is a tunnel-endpoint (including external prefixes with tunnel-endpoint as the next hop), the tunnel with lowest tunnel-index is selected (the IP next hop is never used in this case).
- Where a destination is not a tunnel-endpoint:
  - LSPs with metric higher than underlying IGP cost between the endpoint of the LSP are excluded
  - Tunnel next-hops are preferred over IP next-hops
  - Within tunnel next-hops:
    i. The lowest endpoint-to-destination cost is selected
    ii. If the endpoint-to-destination costs are the same, the lowest endpoint node router ID is selected
    iii. If the router IDs are the same, the lowest tunnel index is selected
  - Within IP next-hops:
    i. The lowest downstream router ID is selected
    ii. If the downstream router IDs are the same, the lowest interface-index is selected

Note: Although ECMP is not performed across both the IP and tunnel next-hops, the tunnel endpoint may lie in one of the shortest IGP paths for that prefix. In that case, the tunnel next hop is always selected as long as the prefix cost using the tunnel is equal or lower than the IGP cost.

When both RSVP-TE and SR-TE IGP shortcuts are available, the IP reach calculation, in the unicast routing table, will first follow the above ECMP tunnel and IP next hop selection rules when resolving a prefix over IGP shortcuts. After the set of ECMP tunnel and IP next-hops have been selected, the preference of tunnel type is then applied based on the user setting of the resolution of the family of the prefix. If the user enabled resolution of the prefix family to both RSVP-TE and SR-TE tunnel types, the TTM tunnel preference value is used to select one type for the prefix. In other words, the RSVP-TE LSP type is preferred to an SR-TE LSP type on a per-prefix basis.

The ingress IOM sprays the packets for this prefix over the set of tunnel next-hops and IP next-hops based on the hashing routine currently supported for IPv4 packets.

This feature provides IGP with the capability to populate the multicast RTM with the prefix IP next hop when both the **igp-shortcut** and the **multicast-import** options are enabled in IGP. The unicast RTM can still make use of the tunnel next hop for the same prefix. This change is made possible with the enhancement by which SPF keeps track of both the direct first hop and the tunneled first hop of a node which is added to the Dijkstra tree.

Platforms All

13.62 iid-tlv-enable

iid-tlv-enable

Syntax [**no**] **iid-tlv-enable**

Context **[Tree]** (config>service>vprn>isis iid-tlv-enable)

Full Context configure service vprn isis iid-tlv-enable

Description This command enables IS-IS multi-instance (MI) as described in draft-ietf-isis-mi-02. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs.

The **iid-tlv-enable** (based on draft-ietf-isis-mi-02) and **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) commands cannot be configured in the same instance, because the MAC addresses and PDUs in each standard are incompatible.

Default no iid-tlv-enable

Platforms All

iid-tlv-enable

Syntax [**no**] **iid-tlv-enable**

Context **[Tree]** (config>router>isis iid-tlv-enable)

Full Context configure router isis iid-tlv-enable

Description This command enables IS-IS multi-instance (MI) as described in *draft-ietf-isis-mi-02*. Multiple instances allows the formation of instance-specific adjacencies that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV that identifies the instance and the topology to which the PDU belongs.

13.63 ike-auth-algorithm

ike-auth-algorithm

Syntax **ike-auth-algorithm** {**md5** | **sha1** | **sha256** | **sha384** | **sha512** | **aes-xcbc** | **auth-encryption**}

Context **[Tree]** (config>ipsec>ike-transform ike-auth-algorithm)

Full Context configure ipsec ike-transform ike-auth-algorithm

Description This command specifies the IKE authentication algorithm for the IKE transform

Default ike-auth-algorithm sha1

Parameters *auth-algorithm* — Specifies the values used to identify the hashing algorithm

Values
- **md5** — Configures the use of the hmac-md5 algorithm for authentication
- **sha1** — Configures the use of the hmac-sha1 algorithm for authentication
- **sha256** — Configures the use of the hmac-sha256 algorithm for authentication.
- **sha384** — Configures the use of the hmac-sha384 algorithm for authentication
- **sha512** — Configures the use of the hmac-sha512 algorithm for authentication.
- **aes-xcbc** — Configures the use of aes-xcbc (RFC 3566, *The AES-XCBC-MAC-96 Algorithm and Its Use With IPsec*) algorithm for authentication.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.64 ike-encryption-algorithm

ike-encryption-algorithm

Syntax **ike-encryption-algorithm** {**des** | **3des** | **aes128** | **aes192** | **aes256** | **aes128-gcm8** | **aes128-gcm16** | **aes256-gcm8** | **aes256-gcm16**}

Context **[Tree]** (config>ipsec>ike-transform ike-encryption-algorithm)

Full Context configure ipsec ike-transform ike-encryption-algorithm

Description This command specifies the IKE encryption algorithm to be used in the IKE transform instance.

Default ike-encryption-algorithm aes128

Parameters *encryption-algorithm* — Specifies the IKE encryption algorithm.

Values

des — Configures the 56-bit des algorithm for encryption. This is an older algorithm with relatively weak security. While better than nothing, it should only be used where a strong algorithm is not available on both ends at an acceptable performance level.

3des — Configures the 3-des algorithm for encryption. This is a modified application of the des algorithm which uses multiple des operations to make information more secure.

aes128 — Configures the aes algorithm with a block size of 128 bits. This is a mandatory implementation size for aes. This is a very strong algorithm choice.

aes192 — Configures the aes algorithm with a block size of 192 bits. This is a stronger version of aes.

aes256 — Configures the aes algorithm with a block size of 256 bits. This is the strongest available version of aes.

aes128-gcm8 - Configures ESP to use aes-gcm with a 128-bit key size and an 8-byte ICV for encryption and authentication.

aes128-gcm16 - Configures ESP to use aes-gcm with a 128-bit key size and a 16-byte ICV for encryption and authentication.

aes256-gcm8 - Configures ESP to use aes-gcm with a 256-bit key size and an 8-byte ICV for encryption and authentication.

aes256-gcm16 - This parameter configures ESP to use aes-gcm with a 256-bit key size and a 16-byte ICV for encryption and authentication.

13.65 ike-mode

ike-mode

Syntax **ike-mode** {**main** | **aggressive**}
no ike-mode

Context **[Tree]** (config>ipsec>ike-policy ike-mode)

Full Context configure ipsec ike-policy ike-mode

Description This command specifies one of either two modes of operation. IKE version 1 can support main mode and aggressive mode. The difference lies in the number of messages used to establish the session.

The **no** form of this command reverts to the default.

Default no ike-mode

Parameters **main** — Specifies identity protection for the hosts initiating the IPsec session. This mode takes slightly longer to complete.

aggressive — Specifies that the aggressive mode provides no identity protection but is faster.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.66 ike-policy

ike-policy

Syntax **ike-policy** *ike-policy-id* [**create**]
no ike-policy *ike-policy-id*

Context **[Tree]** (config>ipsec ike-policy)

Full Context configure ipsec ike-policy

Description Commands in this context configure an IKE policy.

The **no** form of this command

Parameters *ike-policy-id* — Specifies a policy ID value to identify the IKE policy.

Values 1 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ike-policy

Syntax **ike-policy** *ike-policy-id*
no ike-policy

Context **[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel>dyn ike-policy)
[Tree] (config>service>vprn>if>ipsec>ipsec-tunnel>dyn ike-policy)
[Tree] (config>service>ies>if>sap>ipsec-gw ike-policy)
[Tree] (config>service>vprn>if>sap>ipsec-gw ike-policy)
[Tree] (config>router>if>ipsec>ipsec-tunnel>dyn ike-policy)
[Tree] (config>ipsec>trans-mode-prof>dyn ike-policy)

Full Context configure ipsec ipsec-transport-mode-profile dynamic-keying ike-policy
configure router interface ipsec ipsec-tunnel dynamic-keying ike-policy
configure service ies interface ipsec ipsec-tunnel dynamic-keying ike-policy
configure service ies interface sap ipsec-gw ike-policy
configure service vprn interface ipsec ipsec-tunnel dynamic-keying ike-policy
configure service vprn interface sap ipsec-gw ike-policy

Description This command specifies the ID of the IKE policy used for IKE negotiation.

The **no** form of this command removes the IKE policy ID from the configuration.

Parameters *ike-policy-id* — Specifies the IKE policy ID.

Values 1 to 2048

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-gw ike-policy
- configure ipsec ipsec-transport-mode-profile dynamic-keying ike-policy
- configure service ies interface sap ipsec-gw ike-policy

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying ike-policy
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying ike-policy
- configure service ies interface ipsec ipsec-tunnel dynamic-keying ike-policy

13.67 ike-prf-algorithm

ike-prf-algorithm

Syntax **ike-prf-algorithm** {**md5** | **sha1** | **sha256** | **sha384** | **sha512** | **aes-xcbc** | **same-as-auth**}

Context **[Tree]** (config>ipsec>ike-transform ike-prf-algorithm)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure ipsec ike-transform ike-prf-algorithm

Description This command specifies the PRF algorithm to use for IKE security association.

Note: If an authenticated encryption algorithm like AES-GCM is used for IKE encryption algorithm, **same-as-auth** cannot be used for **ike-prf-algorithm**.

Default ike-prf-algorithm same-as-auth

Parameters **md5** — This parameter configures IKE to use the **hmac-md5** algorithm for PRF.

sha1 — This parameter configures IKE to use the **hmac-sha1** algorithm for PRF.

sha256 — This parameter configures IKE to use the **hmac-sha256** algorithm for PRF.

sha384 — This parameter configures IKE to use the **hmac-sha384** algorithm for PRF.

sha512 — This parameter configures IKE to use the **hmac-sha512** algorithm for PRF.

aes-xcbc — This parameter configures IKE to use the **aes128-xcbc** algorithm for PRF.

same-as-auth — This parameter configures the same algorithm as IKE authentication algorithm.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.68 ike-transform

ike-transform

Syntax **ike-transform** *ike-transform-id* [*ike-transform-id* ...(up to 4 max)]
no ike-transform

Context **[Tree]** (config>ipsec>ike-policy ike-transform)

Full Context configure ipsec ike-policy ike-transform

Description This command specifies the IKE transform to be used in the IKE policy. Up to four IKE transforms can be specified. If multiple IDs are specified, the system selects an IKE transform based on the peer's proposal. If the system is a tunnel initiator, it uses the configured IKE transform to generate the SA payload.

Default no ike-transform

Parameters *ike-transform-id* — Specifies up to four existing IKE transform instances to be associated with this IKE policy.

Values 1 to 4096

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ike-transform

Syntax **ike-transform** *ike-transform-id* [**create**]
no ike-transform *ike-transform-id*

Context **[Tree]** (config>ipsec ike-transform)

Full Context configure ipsec ike-transform

Description This commands creates a new or enters an existing IKE transform instance. The IKE transform include following configuration for IKE SA:

- DH Group
- IKE authentication algorithm
- IKE encryption algorithm
- IKE SA lifetime

The *ike-transform-id* is referenced in the **ike-policy** configuration.

Parameters *ike-transform* — Specifies a number used to uniquely identify an IKE transform instance.

Values 1 to 4096

create — Keyword used to create the ike-transform instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.69 ike-version

ike-version

Syntax **ike-version** {**1** | **2**}

Context **[Tree]** (config>ipsec>ike-policy ike-version)

Full Context configure ipsec ike-policy ike-version

Description This command sets the IKE version (1 or 2) that the ike-policy will use.

Default ike-version 1

Parameters **1 | 2** — Specifies the version of IKE protocol.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.70 ikev1-ph1-responder-delete-notify

ikev1-ph1-responder-delete-notify

Syntax [**no**] **ikev1-ph1-responder-delete-notify**

Context **[Tree]** (config>ipsec>ike-policy ikev1-ph1-responder-delete-notify)

Full Context configure ipsec ike-policy ikev1-ph1-responder-delete-notify

Description This command specifies the system, when deleting an IKEv1 phase 1 SA for which it was the responder, to send a delete notification to the peer. This command only applies when the configured ike-version 1. This command is ignored with IKE version 2.

The **no** form of this command reverts to the default.

Default ikev1-ph1-responder-delete-notify

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.71 ikev2-fragment

ikev2-fragment

Syntax **ikev2-fragment mtu** *octets* **reassembly-timeout** *seconds*
no ikev2-fragment

Context **[Tree]** (config>ipsec>ike-policy ikev2-fragment)

Full Context configure ipsec ike-policy ikev2-fragment

Description This command enables IKEv2 protocol level fragmentation (RFC 7383). The specified MTU is the maximum size of IKEv2 packet.

Default no ikev2-fragment

Parameters *octets* — Specifies the MTU for IKEv2 messages.

Values 512 to 9000

seconds — Specifies the timeout for reassembly.

Values 1 to 5

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.72 ilmi

ilmi

Syntax **ilmi** [*vpi/vci*]
no ilmi

Context **[Tree]** (config>port>sonet-sdh>path>atm ilmi)

Full Context configure port sonet-sdh path atm ilmi

Description This command creates an ILMI link PVCC by default on VPI/VCI 0/16. Deleting an ILMI link deletes the PVCC. ILMI is supported only on ATM interfaces on SONET/SDH paths.

Parameters *vpi/vci* — Specifies the PVC identifier (vpi/vci).

Values

vpi	0 to 4095 (NNI) 0 to 255 (UNI)
vci	1, 2, 5 to 65535

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

ilmi

Syntax **ilmi** [*port-id*]
no ilmi *port-id*

Context **[Tree]** (debug>atm ilmi)

Full Context debug atm ilmi

Description This command enables debugging for ATM ILMI.

The **no** form of this command turns off ILMI and debugging.

Parameters *port-id* — Specifies the port ID.

Values slot/mda/port [.channel] or
bundle-ima-slot/mda. bundle-num
bundle: keyword
ima: keyword
bundle-num: 1 to 56

Output The following output is an example of ATM ILMI information

13.73 ima

ima

Syntax **ima**

Context **[Tree]** (config>port>multilink-bundle ima)

Full Context configure port multilink-bundle ima

Description Commands in this context configure parameters for an Inverse Multiplexing over ATM (IMA) group. An IMA group is a collection of physical links bundled together and assigned to an ATM interface. IMA enables a high-speed channel that is composed of ATM cells to be transported as a number of lower-speed circuits. Then they are reassembled as the original high-speed ATM channel. This command is only valid for IMA bundles.

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.74 imei

imei

Syntax [**no**] **imei**

Context **[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute imei)
[Tree] (config>subscr-mgmt>auth-plcy>include-radius-attribute imei)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute imei
configure subscriber-mgmt authentication-policy include-radius-attribute imei

Description This command enables the inclusion of the IMEI in AA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

imei

Syntax [**no**] **imei**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>nasreq>include-avp imei)

Full Context configure subscriber-mgmt diameter-application-policy nasreq include-avp imei

Description This command enables the inclusion of the IMEI AVP, as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.75 implicit-generation

implicit-generation

Syntax [**no**] **implicit-generation**

Context **[Tree]** (config>subscr-mgmt>auto-sub-id-key implicit-generation)

Full Context configure subscriber-mgmt auto-sub-id-key implicit-generation

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description By default, the system automatically generates a subscriber identifier, using the characters A to Z and 0 to 9, that is used when a subscriber ID is not provided during the authentication of a subscriber host or session and when no explicit default **def-sub-id** is configured at the SAP or in the MSAP policy.

A subscriber ID obtained from authentication sources can conflict with the format of an implicit, automatically generated subscriber ID. When this happens, the subscriber host or session setup fails and generates the following message: “Non auto-generated sub-id 4574233754 with an auto sub-id format not allowed”. Therefore, when implicit subscriber ID generation is enabled (the default behavior), a 10-character string containing characters A to Z and 0 to 9 should not be returned from authentication sources.

The **no** form of this command disables the implicit automatic generation of subscriber IDs. When a subscriber ID is not provided in authentication and no explicit **def-sub-id** is configured, then the host or session setup fails and generates the following message: “Missing subscriber id”. A 10-character (A to Z and 0 to 9) subscriber ID format can be returned from authentication sources without the risk of conflicts.

Disabling the implicit automatic generation of subscriber IDs fail when there are active subscribers with an implicit automatically generated subscriber ID.

Enabling the implicit automatic generation of subscriber IDs fails when there are active subscribers.

Default implicit-generation

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.76 implicit-null-label

implicit-null-label

Syntax [**no**] **implicit-null-label**

Context **[Tree]** (config>router>ldp implicit-null-label)

Full Context configure router ldp implicit-null-label

Description This command enables the use of the implicit null label. Use this command to signal the implicit null option for all LDP FECs for which this node is the egress LER.

The **no** form of this command disables the signaling of the implicit null label.

Default no implicit-null-label

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

implicit-null-label

Syntax [**no**] **implicit-null-label**

Context **[Tree]** (config>router>rsvp implicit-null-label)

Full Context configure router rsvp implicit-null-label

Description This command enables the use of the implicit null label.

Signaling the IMPLICIT NULL label value for all RSVP LSPs can be enabled for which this node is the egress LER. RSVP must be shut down before being able to change this configuration option.

The egress LER does not signal the implicit null label value on P2MP RSVP LSPs. However, the Penultimate Hop Popping (PHP) node can honor a Resv message with the label value set to the implicit null.

The **no** form of this command disables the signaling of the implicit null label.

Default no implicit-null-label

Platforms All

implicit-null-label

Syntax **implicit-null-label** [**enable** | **disable**]
no implicit-null-label

Context **[Tree]** (config>router>rsvp>interface implicit-null-label)

Full Context configure router rsvp interface implicit-null-label

Description This command enables the use of the implicit null label over a specific RSVP interface.

All LSPs for which this node is the egress LER and for which the path message is received from the previous hop node over this RSVP interface will signal the implicit null label. This means that if the egress LER is also the merge-point (MP) node, then the incoming interface for the path refresh message over the bypass dictates if the packet will use the implicit null label or not. The same for a 1-to-1 detour LSP.

The user must shut down the RSVP interface before being able to change the implicit null configuration option.

The **no** form of this command returns the RSVP interface to use the RSVP level configuration value.

Default no implicit-null-label

Parameters *enable* — Enables the implicit null label.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

disable — Disables the implicit null label.

Platforms All

13.77 import

import

Syntax **import** *policy-name*
no import

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>mld-parameters import)
[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>mld-parameters import)

Full Context configure subscriber-mgmt local-user-db ipoe host mld-parameters import
configure subscriber-mgmt local-user-db ppp host mld-parameters import

Description This command configures an MLD import policy.

The LUDB allows a list of up to 14 MLD import policies per host. The MLD policy also allows the configuration of an additional import policy, providing a total of 15 MLD import policies per host. The import policy inside the MLD policy is always applied last, which determines if the list is a black list or a white list. To configure an MLD white list, the import policies in the LUDB should all be allowed or forward entries and the import policy in the MLD policy should have a default action to deny all. To configure a black list, the import policies inside the LUDB should drop entries and the MLD policy import policy default action should be to forward all. The 15 import policies can be configured to be a mixed white and black list. Since it is difficult to control the order of the import policies within the LUDB, it is recommended to provision the import policy inside the MLD policy first for deterministic behavior.

The **no** form of this command removes the specified import policy.

Parameters *policy-name* — Specifies the MLD import policy, up to 32 characters, used to control the multicast group accessible for the subscriber host.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vpls mesh-sdp mld-snooping import
configure service vpls sap igmp-snooping import
configure service vpls sap mld-snooping import
configure service vpls spoke-sdp igmp-snooping import
configure service vpls spoke-sdp mld-snooping import

Description This command specifies the import routing policy to be used for IGMP packets to be used on this SAP or SDP. Only a single policy can be imported on a SAP at any time.

The **no** form of this command removes the policy association from the SAP or SDP.

Default no import

Parameters *policy-name* — Specifies the routing policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Routing policies are configured in the **config>router>policy-options** context The router policy must be defined before it can be imported.

Platforms All

import

Syntax **import** *policy* [*policy*]
no import

Context [Tree] (config>subscr-mgmt>bgp-prng-plcy import)

Full Context configure subscriber-mgmt bgp-peering-policy import

Description This command specifies the import policies to be used to control routes advertised to BGP neighbors. Route policies are configured in the **config>router>policy-options** context. When multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The **no** form of this command removes all route policy names from the import list.

Default no import — BGP accepts all routes from configured BGP neighbors. Import policies can be used to limit or modify the routes accepted and their corresponding parameters and metrics.

Parameters *policy* — Specifies route policy statement name, up to 32 characters. Up to five policies can be specified.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>service>vprn>bgp>group>neighbor import)

Full Context configure service vprn bgp group import
configure service vprn bgp group neighbor import
configure service vprn bgp import

Description This command is used to specify route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in a peer-group) or neighbor level (only applies to the specified peer). The most specific level is used

The **import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **import** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **import** commands are issued, the last command entered overrides the previous command.

When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association.

Default no import

Parameters *plcy-or-long-expr* — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

import

Syntax **import** *policy-name* [*policy-name* ... (up to 5 max)]
no import

Context **[Tree]** (config>service>vprn>isis import)

Full Context configure service vprn isis import

Description This command applies one or more (up to five) route polices as IS-IS import policies.

When a prefix received in an IS-IS LSP is accepted by an entry in an IS-IS import policy, it is installed in the routing table, if it is the most preferred route to the destination.

When a prefix received in an IS-IS LSP is rejected by an entry in an IS-IS import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination.

The flooding of LSPs is unaffected by IS-IS import policy actions.

The **no** form of this command removes all policies from the configuration.

Default no import

Parameters *policy-name* — Identifies the export route policy name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. The specified name(s) must already be defined.

Platforms All

import

Syntax **import** *policy-name*
no import

Context **[Tree]** (config>service>vprn>mld>if import)

Full Context configure service vprn mld interface import

Description This command specifies the import route policy to be used for determining which membership reports are accepted by the router. Route policies are configured in the **config>router>policy-options** context.

When an import policy is not specified, all the MLD reports are accepted.

The **no** form of this command removes the policy association from the MLD instance.

Default no import

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policy-name* — Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

[Tree] (config>service>vprn>msdp>peer import)

Full Context configure service vprn msdp group import
configure service vprn msdp group peer import
configure service vprn msdp import
configure service vprn msdp peer import

Description This command specifies the policies to import source active state from Multicast Source Discovery Protocol (MSDP) into source active list.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

If you configure an import policy at the global level, each individual peer inherits the global policy.

If you configure an import policy at the group level, each individual peer in a group inherits the group's policy.

If you configure an import policy at the peer level, then policy only applies to the peer where it is configured.

The **no** form of this command removes all policies from the configuration.

Default no import

Parameters *policy-name* — Specifies the import policy name. Up to five policy-name arguments can be specified.

Platforms All

Full Context configure service vprn pim import

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the import route policy to be used for determining which routes are accepted from peers. Route policies are configured in the **config>router>policy-options** context. When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association from the IGMP instance.

Default no import join-policy

no import register-policy

Parameters **join-policy** — Use this command to filter PIM join messages which prevents unwanted multicast streams from traversing the network.

register-policy — This keyword filters register messages. PIM register filters prevent register messages from being processed by the RP. This filter can only be defined on an RP. When a match is found, the RP immediately sends back a register-stop message.

policy-name — Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

Context **[Tree]** (admin>certificate import)

Full Context admin certificate import

Description This command converts an input file (key/certificate/CRL) to a system format file. The following list summarizes the formats supported by this command:

- Certificate
  - PKCS #12
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - PEM
  - DER
- Key
  - PKCS #12
  - PEM
  - DER
- CRL
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - PEM
  - DER

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: If there are multiple objects with the same type in the input file, only the first object is extracted and converted.

Parameters **input** *url-string* — Specifies the URL for the input file. This URL could be either a local CF card URL file or a FP URL to download the input file.

Values

url-string	<local-url> up to 99 characters
local-url	<cflash-id>/<file-path>
cflash-id	cf1:| cf2:| cf3:

output *filename* — Specifies the name of output file up to 95 characters. The output directory depends on the file type like following:

- Key: cf3:\system-pki\key
- Cert: cf3:\system-pki\cert
- CRL: cf3:\system-pki\CRL

type — The type of input file.

Values cert, key, crl

format — Specifies the format of input file.

Values pkcs12, pkcs7-der, pkcs7-pem, pem, der

password — Specifies the password to decrypt the input file in case that it is an encrypted PKCS#12 file.

[Tree] (config>router>bgp>group import)
[Tree] (config>router>bgp>group>neighbor import)

Full Context configure router bgp group import
configure router bgp group neighbor import
configure router bgp import

Description This command specifies route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **config>router>policy-options** context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level is used.

The **import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters; the remaining 14 objects have a maximum length of 64 characters each.

When multiple **import** commands are issued, the last command entered overrides the previous command.

When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association.

Default no import

Parameters *plcy-or-long-expr* — Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 255 characters long). Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

plcy-or-expr — Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 64 characters long). Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

import

Syntax **import** *policy-name* [*policy-name*]
no import

Context **[Tree]** (config>router>isis import)

Full Context configure router isis import

Description This command specifies up to five route polices as IS-IS import policies.

When a prefix received in an IS-IS LSP is accepted by an entry in an IS-IS import policy, it is installed in the routing table, if it is the most preferred route to the destination.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When a prefix received in an IS-IS LSP is rejected by an entry in an IS-IS import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination.

The flooding of LSPs is unaffected by IS-IS import policy actions.

The **no** form of this command removes all policies from the configuration.

Default no import

Parameters *policy-name* — Specifies the import route policy name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

Platforms All

import

Syntax **import** *policy-name* [*policy-name*]
no import

Context **[Tree]** (config>router>ospf import)
[Tree] (config>router>ospf3 import)

Full Context configure router ospf import
configure router ospf3 import

Description This command applies one or more (up to 5) route polices as OSPF import policies. When a prefix received in an OSPF LSA is accepted by an entry in an OSPF import policy, it is installed in the routing table if it is the most preferred route to the destination. When a prefix received in an OSPF LSA is rejected by an entry in an OSPF import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination. The flooding of LSAs is unaffected by OSPF import policy actions. The **no** form of this command removes all policies from the configuration.

Default no import

Parameters *policy-name* — Specifies up to 5 export route policy names. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

Context [Tree] (config>router>ospf>area import)
[Tree] (config>router>ospf3>area import)

Full Context configure router ospf area import
configure router ospf3 area import

Description This command configures ABR import policies to filter OSPFv2 Type 3 Summary-LSAs or OSPFv3 Inter-Area-Prefix-LSA between areas, in order to only permit the specified routes from being imported into an area.

This command cannot be used in OSPF area 0.

The **no** form of this command reverts to the default value.

Default no import

Parameters *policy-name* — Specifies up to five import route policy names. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

[Tree] (config>router>ripng>group>neighbor import)

Full Context configure router rip group import
configure router rip group neighbor import
configure router rip import
configure router ripng group import
configure router ripng group neighbor import
configure router ripng import

Description This command configures import route policies to determine which routes are accepted from RIP neighbors. If no import policy is specified, RIP accepts all routes from configured RIP neighbors. Import policies can be used to limit or modify the routes accepted and their corresponding parameters and metrics.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

Default no import

Parameters *policy-name* — Specifies up to five import route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The specified names must already be defined.

Platforms All

13.78 import-grt

import-grt

Syntax **import-grt** *plcy-or-long-expr* [*plcy-or-expr*]
no import-grt

Context **[Tree]** (config>service>vprn>grt import-grt)

Full Context configure service vprn grt-lookup import-grt

Description This command associates policies to control the leaking of GRT routes into the associated VPRN.

The GRT route must have first been leaked by a **leak-export** policy defined under the **config>router** context. Then the route must match a route entry in the specified **import-grt** policy with an accept action. Refer to the *IP Router Configuration Command Reference* section in the *7750 SR Extensible Routing System Virtualized Service Router*.

The **no** form of this command removes route leaking policy associations and disables the leaking of GRT routes into the local VPRN.

Parameters *plcy-or-long-expr* — Specifies route policy names, up to 64 characters, or a policy logical expression, up to 255 characters.

Values *plcy-or-long-expr*: *policy-name* | *long-expr*
policy-name: up to 64 characters
long-expr: up to 255 characters

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

plcy-or-expr — Specifies up to four route policy names, up to 64 characters, or a policy logical expression, up to 64 characters.

Values *plcy-or-expr*: *policy-name* | *expr*
policy-name: up to 64 characters
expr: up to 64 characters

Platforms All

13.79 import-mcast-policy

import-mcast-policy

Syntax **import-mcast-policy** *policy-name* [*policy-name*]
no import-mcast-policy

Context **[Tree]** (config>router>ldp import-mcast-policy)

Full Context configure router ldp import-mcast-policy

Description This command configures an import policy for mLDP FECs arriving on the node. This command does not work for self-generated mLDP FECs. The action of the policy will accept or reject the FEC. If the FEC is rejected, it will be kept but is not resolved.

The **no** form of this command removes all policies from the configuration.

Default no import-mcast-policy

Parameters *policy-name* — Specifies up to five import route policy names, up to 32 characters, to be assigned to mLDP. The specified name(s) must already be defined.

Platforms All

13.80 import-pmsi-routes

import-pmsi-routes

Syntax **import-pmsi-routes**

Context **[Tree]** (config>router>ldp import-pmsi-routes)

Full Context configure router ldp import-pmsi-routes

Description Commands in this context configure import-pmsi-routes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For option B, the leafs or ABR/ASBR that are not directly connected to the root have no visibility of the root. As such, for LDP to build the recursive FEC it needs to cache the MVPN PMSI AD routes, this command gives the user the ability to manually enable caching of MVPN PMSI AD routes internally in LDP for EVPN or MVPN inter-as or **mvpn_no_export_community** intra-as.

Platforms All

13.81 import-prefixes

import-prefixes

Syntax [**no**] **import-prefixes** *policy-name*

Context **[Tree]** (config>router>ldp>session-params>peer import-prefixes)

Full Context configure router ldp session-parameters peer import-prefixes

Description This command configures the import FEC prefix policy to determine which prefixes received from this LDP peer are imported and installed by LDP on this node. If resolved these FEC prefixes are then re-distributed to other LDP and T-LDP peers. A FEC prefix that is filtered out (deny) will not be imported. A FEC prefix that is filtered in (accept) will be imported.

If no import policy is specified, the node will import all prefixes received from this LDP/T-LDP peer. This policy is applied in addition to the global LDP policy and targeted session policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified. Peer address has to be the peer LSR-ID address.

The **no** form of the command removes the policy from the configuration.

Default no import-prefixes - no import route policy is specified

Parameters *policy-name* — Specifies up to five import-prefix route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

Platforms All

import-prefixes

Syntax **import-prefixes** *policy-name* [*policy-name*]
no import-prefixes

Context **[Tree]** (config>router>ldp>targeted-session import-prefixes)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router ldp targeted-session import-prefixes

Description This command configures the import route policy to determine which FEC prefix label bindings are accepted from targeted LDP neighbors into this node. A label binding that is filtered out (deny) will not be imported. A route that is filtered in (accept) will be imported.

If no import policy is specified, this node session will accept all bindings from configured targeted LDP neighbors. This policy is applied in addition to the global LDP policy.

Policies are configured in the **config>router>policy-option**s context. A maximum of five policy names can be specified.

The **no** form of this command removes the policy from the configuration.

Parameters *policy-name* — Specifies up to five import policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

13.82 import-tunnel-table

import-tunnel-table

Syntax **import-tunnel-table** *policy-name* [*policy-name*]
no import-tunnel-table

Context **[Tree]** (config>router>ldp import-tunnel-table)

Full Context configure router ldp import-tunnel-table

Description This command controls the import, in the tunnel table, of LDP tunnels to non-host prefixes. This command is only intended for importing tunnels; it cannot be used for preventing the import of any specific prefix and only non-host prefixes will be considered when evaluating this policy in this context. The LDP tunnels to these non-host prefixes must be created before they can be imported.

This command does not affect the automatic import of LDP tunnels to host prefixes.

The **no** version of this command removes all of the import policies and, by consequence, any tunnels to non-host prefixes from the tunnel table. If a non-host prefix tunnel is currently being used for forwarding, disabling this command may be service-impacting.

Default no import-tunnel-table

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policy-name* — Specifies up to five import route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

The specified policy names must already be defined.

Use subject to Terms available at: www.nokia.com

Platforms All

improved-assert

Syntax [**no**] **improved-assert**

Context **[Tree]** (config>service>vprn>pim>if improved-assert)

Full Context configure service vprn pim interface improved-assert

Description This command enables improved assert processing on this interface. The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and forwarding planes.

The assert process is started when data is received on an outgoing interface. This could impact performance if data is continuously received on an outgoing interface.

When enabled, the PIM assert process is done entirely on the control-plane with no interaction between the control and forwarding plane.

Default improved-assert

Platforms All

improved-assert

Syntax [**no**] **improved-assert**

Context **[Tree]** (config>router>pim>interface improved-assert)

Full Context configure router pim interface improved-assert

Description This command enables improved assert processing. The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and forwarding planes. The assert process is started when data is received on an outgoing interface meaning that duplicate traffic is forwarded to the LAN until the forwarder is negotiated among the routers.

When the **improved-assert** command is enabled, the PIM assert process is done entirely in the control plane. The advantages are that it eliminates duplicate traffic forwarding to the LAN. It also improves performance since it removes the required interaction between the control and data planes.

Note: improved-assert is still fully interoperable with the RFC 4601, *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)* and RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM)*, implementations. However, there may be conformance tests that may fail if the tests expect control-data plane interaction in determining the assert winner. Disabling the **improved-assert** command when performing conformance tests is recommended.

Full Context configure router mpls mpls-tp transit-path forward-path in-label
configure router mpls mpls-tp transit-path reverse-path in-label

Description This command configures the label mapping associated with a forward path or reverse path of an MPLS-TP transit path to be configured.

The incoming label, outgoing label and outgoing interface must be configured, using the **in-label**, **out-label** and **out-link** parameters. If the out-link refers to a numbered IP interface, the user may optionally configure the **next-hop** parameter and the system will determine the interface to use to reach the configured next-hop, but will check that the user-entered value for the *out-link* corresponds to the link returned by the system. If they do not correspond, then the path will not come up.

Default no in-label

Parameters *in-label* — Specifies the in label.

Values 32 to 16415

out-label — Specifies the out label.

Values 32 to 16415

if-name — Specifies the name of the outgoing interface use for the path.

next-hop — Specifies the next-hop.

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms All

13.101 in-remark

in-remark

Syntax **in-remark** {**dscp** *dscp-name* | **prec** *ip-prec-value*}
no in-remark

Context **[Tree]** (config>qos>sap-ingress>fc in-remark)

Full Context configure qos sap-ingress fc in-remark

Description This command is used in a SAP ingress QoS policy to define an explicit in-profile remark action for a forwarding class or subclass. While the SAP ingress QoS policy may be applied to any SAP, the remarking functions are only enforced when the SAP is associated with an IP or subscriber interface (in an IES or VPRN). When the policy is applied to a Layer 2 SAP (i.e., Epipe or VPLS), the remarking definitions are silently ignored.

In the case where the policy is applied to a Layer 3 SAP, the in-profile remarking definition will be applied to packets that have been classified to the forwarding class or subclass. It is possible for a packet to match a classification command that maps the packet to a particular forwarding class or subclass, only to have a more explicit (higher priority match) override the association. Only the highest priority match forwarding class or subclass association will drive the in-profile marking.

The in-remark command is only applicable to ingress IP routed packets that are considered in-profile. The profile of a SAP ingress packet is affected by either the explicit in-profile/out-of-profile definitions or the ingress policing function applied to the packet. Table 64 shows the effect of the in-remark command on received SAP ingress packets. Within the in-profile IP packet's ToS field, either the six DSCP bits or the three precedence bits are remarked.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 64 **Effect of In-Remark Command on Received SAP Ingress Packets**

SAP Ingress Packet State	in-remark Command Effect
Non-Routed, Policed In-Profile	No Effect (non-routed packet)
Non-Routed, Policed Out-of-Profile	No Effect (non-routed packet)
Non-Routed, Explicit In-Profile	No Effect (non-routed packet)
Non-Routed, Explicit Out-of-Profile	No Effect (non-routed packet)
IP Routed, Policed In-Profile	in-remark value applied to IP header ToS field
IP Routed, Policed Out-of-Profile	No Effect (out-of-profile packet)
IP Routed, Explicit In-Profile	in-remark value applied to IP header ToS field
IP Routed, Explicit Out-of-Profile	No Effect (out-of-profile packet)

The **no** form of this command disables ingress remarking of in-profile packets classified to the forwarding class or subclass.

Parameters **dscp** *dscp-name* — Specifies that the matching packet's DSCP bits should be overridden with the value represented by dscp-name.

The *dscp-name* parameter is a 6-bit value. It must be one of the predefined DSCP names defined on the system.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

prec *ip-prec-value* — Specifies that the matching packet's precedence bits should be overridden with the value represented by *ip-prec-value*.

Values 0 to 7

13.102 inactive-flow-timeout

inactive-flow-timeout

Syntax **inactive-flow-timeout** *seconds*
no inactive-flow-timeout

Context **[Tree]** (config>cflowd inactive-flow-timeout)

Full Context configure cflowd inactive-flow-timeout

Description This command specifies the length of time, in seconds, that must elapse without a packet matching a flow before the flow is considered inactive.

The **no** form of this command resets the inactive flow timeout back to the default of 15 seconds.

Existing flows do not inherit the new **inactive-flow-timeout** value if this parameter is changed while **cflowd** is active. The **inactive-flow-timeout** value for a flow is set when the flow is first created in the active cache table and does not change dynamically.

Default inactive-flow-timeout 15

Parameters *seconds* — Specifies the length of time, in seconds, without a packet matching a flow before the flow is considered inactive.

Values 10 to 600

Platforms All

13.103 inactivity-mon

inactivity-mon

Syntax [**no**] **inactivity-mon**

Context **[Tree]** (config>app-assure>group>transit-ip-policy>transit-auto-create inactivity-mon)

Full Context configure application-assurance group transit-ip-policy transit-auto-create inactivity-mon

Description This command enables auto removal of inactive transit subscribers. Periodically AA removes any inactive auto-created subscriber where an inactive sub is defined as having no active flows in the last period.

The **no** form of this command disables the auto removal of inactive transit subscribers.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.104 inactivity-timeout

inactivity-timeout

Syntax **inactivity-timeout** *seconds*
no inactivity-timeout

Context **[Tree]** (config>test-oam>twamp>server inactivity-timeout)

Full Context configure test-oam twamp server inactivity-timeout

Description This command configures the inactivity time out for all TWAMP-control connections. If no TWAMP control message is exchanged over the TCP connection for this duration of time the connection is closed and all in-progress tests are terminated.

The **no** form of this command returns the value to the default.

Default inactivity-timeout 900

Parameters *seconds* — Specifies the duration of the inactivity time out.

Values 60 to 3600

Default 900

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

inactivity-timeout

Syntax **inactivity-timeout** *seconds*
no inactivity-timeout

Context **[Tree]** (config>test-oam>twamp>twamp-light inactivity-timeout)

Full Context configure test-oam twamp twamp-light inactivity-timeout

Description This command configures the length of time to maintain stale state on the session reflector. Stale state is test data that has not been refreshed or updated by newly arriving probes for that specific test in a predetermined length of time. Any single reflector can maintain up state for a maximum of 12000 tests. If the maximum value is exceeded, the session reflector lacks memory to allocate to new tests.

The **no** form of this command returns the value to the default.

Default inactivity-timeout 100

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the value in seconds for maintaining stale state.

Values 10 to 100

Default 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.105 inactivity-timer

inactivity-timer

Syntax **inactivity-timer** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no inactivity-timer

Context **[Tree]** (config>service>ies>sub-if>ipv6>rtr-sol inactivity-timer)
[Tree] (config>service>ies>sub-if>grp-if>ipv6>rtr-sol inactivity-timer)
[Tree] (config>service>vprn>sub-if>ipv6>rtr-sol inactivity-timer)

Full Context configure service ies subscriber-interface group-interface ipv6 router-solicit inactivity-timer
configure service ies subscriber-interface ipv6 router-solicit inactivity-timer
configure service vprn subscriber-interface ipv6 router-solicit inactivity-timer

Description This command specifies the time before an inactive host is removed.

The **no** form of this command reverts to the default.

Parameters **infinite** — Specifies that the idle host is never removed.

days — Specifies that the idle host is removed if idle within the number of specified days.

hours — Specifies that the idle host is removed if idle within the number of specified hours.

minutes — Specifies that the idle host is removed if idle within the number of specified minutes.

seconds — Specifies that the idle host is removed if idle within the number of specified seconds.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

inactivity-timer

Syntax **inactivity-timer** *timer*
no inactivity-timer

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>eth-cfm>slm inactivity-timer)

Full Context configure eth-cfm slm inactivity-timer

Description The time the responder keeps a test active. Should the time between packets exceed this values within a test the responder will mark the previous test as complete. It will treat any new packets from a peer with the same test-id, source-mac and MEP-ID as a new test responding with the sequence number one.

The **no** form of the command reverts the timeout to the default value.

Default inactivity-timer 100

Parameters *timer* — Specifies the amount of time in seconds.

Values 10 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.106 inband

inband

Syntax **inband** *service-id*
no inband

Context [Tree] (config>system>security>vprn-aaa-server inband)

Full Context configure system security vprn-aaa-server inband

Description This command configures TACACS+ or RADIUS servers in a VPRN to be used for AAA by that VPRN and by sessions in the Base routing instance.

The **no** form of this command disables the use of servers for in-band management.

Default no inband

Parameters *service-id* — Specifies the VPRN server for AAA to use for in-band sessions.

Values *service-id*: 1 to 2147483648
svc-name: 64 characters maximum

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.107 inband-collector-export-only

inband-collector-export-only

Syntax [**no**] **inband-collector-export-only**

Context **[Tree]** (config>cflowd inband-collector-export-only)

Full Context configure cflowd inband-collector-export-only

Description This command, when the **inband-collector-export-only** command is enabled, allows only collectors that are reachable through inband interfaces and enables a higher flow export rate.

The **no** form of this command, the default, re-enables the use of the out-of-band management Ethernet port.

Platforms All

13.108 inbound-max-sessions

inbound-max-sessions

Syntax **inbound-max-sessions** *number-of-sessions*
no inbound-max-sessions

Context **[Tree]** (config>system>login-control>ftp inbound-max-sessions)

Full Context configure system login-control ftp inbound-max-sessions

Description This command configures the maximum number of concurrent inbound FTP sessions.

This value is the combined total of inbound and outbound sessions.

The **no** form of this command reverts to the default value.

Default inbound-max-sessions 3

Parameters *value* — Specifies the maximum number of concurrent FTP sessions on the node.

Values 0 to 5

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

inbound-max-sessions

Syntax **inbound-max-sessions** *number-of-sessions*
no inbound-max-sessions

Context **[Tree]** (config>system>login-control>telnet inbound-max-sessions)
[Tree] (config>system>login-control>ssh inbound-max-sessions)

Full Context configure system login-control ssh inbound-max-sessions
configure system login-control telnet inbound-max-sessions

Description This parameter limits the number of inbound Telnet and SSH sessions. A maximum of 30 telnet and ssh connections can be established to the router. The local serial port cannot be disabled.

Telnet and SSH maximum sessions can also use the combined total of both inbound sessions (SSH+Telnet). While it is acceptable to continue to internally limit the combined total of SSH and Telnet sessions to N, either SSH or Telnet sessions can use the inbound maximum sessions, if so required by the Operator.

The **no** form of this command reverts to the default value.

Default inbound-max-sessions 5

Parameters *number-of-sessions* — The maximum number of concurrent inbound Telnet sessions, expressed as an integer.

Values 0 **to** 50 (default = 5) or 0 **to** N where N is the new total number of SSH+Telnet sessions if they are scaled

Platforms All

13.109 incl-mcast-orig-ip

incl-mcast-orig-ip

Syntax **incl-mcast-orig-ip** *ip-address*
no incl-mcast-orig-ip

Context **[Tree]** (config>service>vpls>bgp-evpn>mpls incl-mcast-orig-ip)

Full Context configure service vpls bgp-evpn mpls incl-mcast-orig-ip

Description The IP address configured by the user in the **incl-mcast-orig-ip** command is encoded in the **originating-ip** field of EVPN Inclusive Multicast Routes with tunnel type Ingress Replication (value 6), mLDP (2), and Composite IR and mLDP (130).

The configured address does not need to be reachable in the base router or have an interface in the base router. The originating-ip address is used solely for BGP route-key selection.

The originating-ip is never changed for Inclusive Multicast Routes with tunnel type AR (Assisted Replication, value 10).

The **no** version of the command withdraws the affected Inclusive Multicast Routes and re-advertises it with the default system-ip address in the originating-ip field.

Default incl-mcast-orig-ip 1

Parameters *ip-address* — Specifies the IPv4 address value.

Values a.b.c.d

13.110 include

include

Syntax **include** *group-name* [*group-name*]
no include [*group-name* [*group-name*]]

Context **[Tree]** (config>router>mpls>lsp include)
[Tree] (config>router>mpls>lsp>primary include)
[Tree] (config>router>mpls>lsp>primary-p2mp-instance include)
[Tree] (config>router>mpls>lsp>secondary include)
[Tree] (config>router>mpls>lsp-template include)

Full Context configure router mpls lsp include
configure router mpls lsp primary include
configure router mpls lsp primary-p2mp-instance include
configure router mpls lsp secondary include
configure router mpls lsp-template include

Description This command specifies the admin groups to be included when an LSP is set up. Up to five groups per operation can be specified, up to 32 maximum. The **include** statement instructs the CSPF algorithm to pick TE links among the links which belong to one or more of the specified admin groups. A link that does not belong to at least one of the specified admin groups is excluded and thus pruned from the TE database before the CSPF computation. However, a link can still be selected if it belongs to one of the groups in a **include** statement but also belongs to other groups which are not part of any **include** statement in the LSP or primary/secondary path configuration. In other words, the **include** statements implements the “include-any” behavior.

The **config**>**router**>**mpls**>**lsp**>**primary-p2mp-instance**>**include** command is not supported on the 7450 ESS.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes the specified groups in the specified context.

Default no include

Parameters *group-name* — Specifies admin groups to be included when an LSP is set up.

Platforms All

include

Syntax [**no**] **include**

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy include)

Full Context configure service nat syslog syslog-export-policy include

Description Commands in this context specify the optional fields to include in the NAT syslog messages.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

include

Syntax [**no**] **include** *tag*

Context **[Tree]** (config>router>admin-tags>route-admin-tag-policy include)

Full Context configure router admin-tags route-admin-tag-policy include

Description This configures an admin tag to be included when matching a route against an LSP.

Up to eight inclusion statements are supported per policy.

The **no** form of this command removes the admin tag from the include statement.

Parameters *tag* — Specifies the value of the admin tag, up to 32 characters.

13.115 include-group

include-group

Syntax **include-group** *ip-admin-group-name* [**pref** *preference*]
no include-group *ip-admin-group-name*

Context **[Tree]** (config>router>route-next-hop-policy>template include-group)

Full Context configure router route-next-hop-policy template include-group

Description This command configures the admin group constraint into the route next-hop policy template.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Each group is entered individually. The **include-group** statement instructs the LFA SPF selection algorithm to pick up a subset of LFA next-hops among the links which belong to one or more of the specified admin groups. A link which does not belong to at least one of the admin-groups is excluded. However, a link can still be selected if it belongs to one of the groups in a include-group statement but also belongs to other groups which are not part of any include-group statement in the route next-hop policy.

The **pref** option is used to provide a relative preference for the admin group to select. A lower preference value means that LFA SPF will first attempt to select a LFA backup next-hop which is a member of the corresponding admin group. If none is found, then the admin group with the next higher preference value is evaluated. If no preference is configured for a given admin group name, then it is supposed to be the least preferred, that is, numerically the highest preference value.

When evaluating multiple **include-group** statements within the same preference, any link which belongs to one or more of the included admin groups can be selected as an LFA next-hop. There is no relative preference based on how many of those included admin groups the link is a member of.

The **exclude-group** statement simply prunes all links belonging to the specified admin group before making the LFA backup next-hop selection for a prefix.

If the same group name is part of both include and exclude statements, the exclude statement will win. It other words, the exclude statement can be viewed as having an implicit preference value of 0.

The admin-group criteria are applied before running the LFA next-hop selection algorithm.

The **no** form deletes the admin group constraint from the route next-hop policy template.

Parameters *ip-admin-group-name* — Specifies the name of the group, up to 32 characters.

preference — An integer specifying the relative preference of a group.

Values 1 to 255

13.119 inclusive

inclusive

Syntax **inclusive**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vpls>provider-tunnel inclusive)

Full Context configure service vpls provider-tunnel inclusive

Description Commands in this context configure the use of a P2MP LSP as the default tree for forwarding Broadcast, Unknown unicast, and Multicast (BUM) packets of a VPLS or B-VPLS instance. The P2MP LSP is referred to, in this case, as the Inclusive Provider Multicast Service Interface (I-PMSI).

When enabled, this feature relies on BGP Auto-Discovery (BGP-AD), BGP-VPLS or BGP-EVPN to discover the PE nodes participating in a specified VPLS/B-VPLS instance. In the case of BGP-AD or BGP-VPLS, the BGP route contains the information required to signal both point-to-point (P2P) PWs used to forward unicast known Ethernet frames, and the RSVP or mLDP P2MP LSP used to forward the BUM frames. In the case of BGP-EVPN, the EVPN IMET route contains the information to set up the mLDP P2MP LSP and may also contain the information that enables the remote leaf-only nodes to setup an EVPN destination to the sending PE.

Note: The provider-tunnel for a specified service must be configured with an owner protocol (BGP-AD, BGP-VPLS or BGP-EVPN); only one owner must be configured. Use the **owner {bgp-ad|bgp-vpls|bgp-evpn-mpls}** command to configure an owner.

With an mLDP I-PMSI, each leaf node will initiate the signaling of the mLDP P2MP LSP upstream using the P2MP FEC information in the I-PMSI tunnel information discovered through the BGP.

If IGMP or PIM snooping are configured on the VPLS/B-VPLS instance, multicast packets matching an L2 multicast Forwarding Information Base (FIB) record will also be forwarded over the P2MP LSP.

Use the **mldp** command to enable the use of an LDP P2MP LSP as the I-PMSI for forwarding Ethernet BUM and IP multicast packets in a VPLS instance:

config>service>vpls [b-vpls]>provider-tunnel>inclusive>mldp

When a **no shutdown** is performed under the context of the inclusive node and the expiration of a delay timer, BUM packets will be forwarded over an automatically signaled mLDP P2MP LSP.

Use the **root-and-leaf** command to configure the node to operate as both root and leaf in the VPLS instance:

config>service>vpls [b-vpls]>provider-tunnel>inclusive>root-and-leaf

The node behaves as a leaf-only node by default. For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs in the case of BGP-AD or BGP-VPLS, or using EVPN destinations in the case of BGP-EVPN.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: Either BGP-AD/VPLS or BGP-EVPN must be enabled in the VPLS/B-VPLS instance otherwise the execution of the **no shutdown** command under the context of the inclusive node will fail and the I-PMSI will not come up.

If the P2MP LSP instance goes down, the VPLS/B-VPLS immediately reverts the forwarding of BUM packets to the P2P PWs or EVPN destinations (in the case of BGP-EVPN). Performing a shutdown under the context of the inclusive node will allow the user to restore BUM packet forwarding over the P2P PWs or EVPN destinations.

This feature is supported with VPLS and B-VPLS; it is not supported with I-VPLS. Although Routed VPLS is supported, routed traffic cannot be sent over the I-PMSI tree.

incoming-sid

Syntax **incoming-sid** *static label*
no incoming-sid

Context **[Tree]** (config>router>p2mp-sr-tree>replication-segment incoming-sid)

Full Context configure router p2mp-sr-tree replication-segment incoming-sid

Description This command configures the incoming replication SID for this P2MP SR tree replication segment entry.

The **no** form of this command removes the incoming replication SID.

Parameters *static label* — Specifies the incoming replication SID label.

Values 0 to 4294967295

Platforms All

13.121 incremental-spf-wait

incremental-spf-wait

Syntax **incremental-spf-wait** *incremental-spf-wait*
no incremental-spf-wait

Context **[Tree]** (config>router>ospf>timers incremental-spf-wait)
[Tree] (config>router>ospf3>timers incremental-spf-wait)

Full Context configure router ospf timers incremental-spf-wait
configure router ospf3 timers incremental-spf-wait

Description This command sets the delay before an incremental SPF calculation is performed when LSA types 3, 4, 5, or 7 are received. This allows multiple updates to be processed in the same SPF calculation. Type 1 or type 2 LSAs are considered a topology change and will always trigger a full SPF calculation.

The **no** form of this command resets the timer value back to the default value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is ≥ 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default incremental-spf-wait 1000

Parameters *incremental-spf-wait* — Specifies the OSPF incremental SPF calculation delay, in milliseconds.

Values 0 to 1000

Platforms All

13.122 index

index

Syntax **index** *index* [**create**]
no index *index*

Context **[Tree]** (config>service>dynsvc>ladb>user index)

Full Context configure service dynamic-services local-auth-db user-name index

Description This command creates an index entry containing authentication data for a dynamic service SAP. Up to 32 indexes can be created per user name entry, representing up to 32 dynamic service SAPs that can be instantiated with a single dynamic service data trigger. One of the dynamic service SAPs must be the data trigger SAP.

The **no** form of this command removes the index entry from the user name entry in the local authentication database configuration.

Parameters *index* — Specifies the index entry identifier.

Values 1 to 32

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.123 indirect

indirect

Syntax [**no**] **indirect** *ip-address*

Context **[Tree]** (config>service>vprn>static-route-entry indirect)

Full Context configure service vprn static-route-entry indirect

Description This command specifies that the route is indirect and specifies the next hop IP address used to reach the destination.

The configured *ip-addr*ess is not directly connected to a network configured on this node. The destination can be reached via multiple paths. The indirect address can only be resolved from dynamic routing protocol. Another static route cannot be used to resolve the indirect address.

The *ip-address* configured here can be either on the network side or the access side and is typically at least one hop away from this node.

Default no indirect

Parameters *ip-address* — The IP address of the IP interface.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x-[interface]

Platforms All

indirect

Syntax [**no**] **indirect** *ip-address*

Context **[Tree]** (config>router>static-route-entry indirect)

info [**detail**] [**objective**] **operational**

Context **[Tree]** (configure info)

Full Context configure info

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command displays the running configuration for the configuration context where it is entered and all branches below that context level. It can be used in any branch under configure, but not with **configure** itself.

By default, the command only enters the configuration parameters that vary from the default values.

The **detail** keyword causes all configuration parameters to be displayed. The **include-dynamic** objective keyword includes configuration parameters from dynamic sources such as VSD or dynamic data services Python scripts. These dynamic configuration parameters are not saved in the configuration file.

The **operational** keyword is available in edit-cfg mode only, in which case the keyword is mandatory when using the **info** command.

Example:

```

13.126 info-notification

info-notification

Syntax **info-notification**

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>local-sf-action info-notification)

Full Context configure port ethernet efm-oam link-monitoring local-sf-action info-notification

Description The context allows the operator to set different flags in the Information OAM PDU. The flags can be used to notify the peer that a local signal failure threshold has been exceeded within the configured window. This is useful when the local node supports the link monitoring function, but the remote peer does not support this capability. Information OAM PDUs are sent on the interval where the Event Notification OAM PDU is typically only sent on the initial sf-threshold crossing event. It is strongly suggested one of the Information OAM PDU Flag fields used to continually communicate current monitor state to the peer.

Interactions: The signal failure threshold will trigger these actions.

Platforms All

13.127 ing-percentage-of-rate

ing-percentage-of-rate

Syntax **ing-percentage-of-rate** *ing-rate-percentage*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no ing-percentage-of-rate

Context [Tree] (config>port>modify-buffer-allocation-rate ing-percentage-of-rate)

Full Context configure port modify-buffer-allocation-rate ing-percentage-of-rate

Description This command increases or decreases the active bandwidth associated with the ingress port that affects the amount of ingress buffer space managed by the port. Changing a port's active bandwidth using the **ing-percentage-of-rate** command is an effective means of artificially lowering the buffers managed by one ingress port and giving them to other ingress ports on the same MDA.

The **ing-percentage-of-rate** command accepts a percentage value that increases or decreases the active bandwidth based on the defined percentage. A value of 50% causes the active bandwidth to be reduced by 50%. A value of 150% causes the active bandwidth to be increased by 50%. Values from 1 to 1000 percent are supported.

A value of 100 (the default value) is equivalent to executing the **no ing-percentage-of-rate** command and restores the ingress active rate to the normal value.

The **no** form of this command removes any artificial increase or decrease of the ingress active bandwidth used for ingress buffer space allocation to the port. The **no ing-percentage-of-rate** command sets the ingress rate percentage to 100%.

Parameters *ing-rate-percentage* — The *ing-rate-percentage* parameter is required and specifies the percentage value used to modify the current ingress active bandwidth of the port. This does not actually change the bandwidth available on the port in any way. The defined *ing-rate-percentage* parameter is multiplied by the ingress active bandwidth of the port. A value of 150 results in an increase of 50% (1.5 x Rate).

Values 1 to 1000

Default 100 (no change to active rate)

13.128 ing-weight

ing-weight

Syntax **ing-weight access** *access-weight* **network** *network-weight*
no ing-weight

Context [Tree] (config>port>hybrid-buffer-allocation ing-weight)

Full Context configure port hybrid-buffer-allocation ing-weight

Description This command configures the sharing of the ingress buffers allocated to a hybrid port among the access and network contexts. By default, it is split equally between network and access.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default values for the ingress access and network weights.

Parameters *access-weight* — Specifies the access weight as an integer.

Values 0 to 100

Default 50

network-weight — Specifies the network weight as an integer.

Values 0 to 100

Default 50

ingress

Syntax **ingress**

Context [Tree] (config>qos>network ingress)

Full Context configure qos network ingress

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to enter the CLI node that creates or edits policy entries that specify the DiffServ code points-to-forwarding class mapping for all IP packets and define the MPLS EXP bits-to-forwarding class mapping for all labeled packets.

When premarked IP or MPLS packets ingress on a network port, they get a Per Hop Behavior (that is, the QoS treatment through the router, based on the mapping defined under the current node).

Platforms All

ingress

Syntax **ingress**

Context **[Tree]** (config>qos>queue-group-templates ingress)

Full Context configure qos queue-group-templates ingress

Description Commands in this context create ingress queue group templates. Ingress queue group templates can be applied to ingress ports to create an ingress queue group of the same name.

An ingress template must be created for a group-name prior to creating a queue group with the same name on an ingress port.

Platforms All

ingress

Syntax **ingress**

Context **[Tree]** (config>router>if ingress)

Full Context configure router interface ingress

Description This command enables access to the context to configure ingress network filter policies for the IP interface. If an ingress filter is not defined, no filtering is performed.

Platforms All

ingress

Syntax **ingress**

Context **[Tree]** (config>service>cust>multi-service-site ingress)

Full Context configure subscriber-mgmt msap-policy atm ingress

Description Commands in this context configure MSAP ATM ingress parameters.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

ingress

Syntax **ingress**

Context **[Tree]** (config>subscr-mgmt>sub-prof ingress)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure subscriber-mgmt sub-profile ingress

Description Commands in this context configure subscriber profile ingress setting parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.130 ingress-buffer-allocation

ingress-buffer-allocation

Syntax **ingress-buffer-allocation** *percentage*
no ingress-buffer-allocation

Context **[Tree]** (config>card>fp ingress-buffer-allocation)

Full Context configure card fp ingress-buffer-allocation

Description This command allows the user to configure an ingress buffer allocation percentage per forwarding plane from 20.00% to 80.00%. Ingress buffer allocation applies to user-accessible buffers (total buffers less those reserved for system use).

The ingress buffer allocation percentage determines how much of the user-accessible buffers will be available for ingress purposes. The remaining buffers will be available for egress purposes.

This command is supported on all 50G FP2-based and 100G/200G FP3-based hardware. It is not supported on other FP2 or FP3-based hardware, nor on FP4-based hardware.

The **no** form of this command reverts the ingress buffer allocation to the default value.

Default ingress-buffer-allocation 50.00

Parameters *percentage* — Specifies the buffer allocation percentage.

Values 20.00 to 80.00

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

13.131 ingress-counter-map

ingress-counter-map

Syntax **ingress-counter-map policer** *policer-id* **traffic-type** {**unicast** | **multicast** | **broadcast**} [**create**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ingress-counter-map queue *queue-id* **traffic-type** {**unicast** | **multicast** | **broadcast**} [**create**]
no ingress-counter-map policer *policer-id*
no ingress-counter-map queue *queue-id*

Context [Tree] (config>sflow ingress-counter-map)

Full Context configure sflow ingress-counter-map

Description This command configures the ingress counter map for sFlow. The map must be configured so sFlow agent understands how to interpret data collected against SAP queues and policers. Multiple queues/policers can be mapped to the same **traffic-type** using separate line entries.

The **no** form of this command deletes a SAP policy queue/policer from the map.

Parameters *policer-id* — Specifies the policer ID in a SAP ingress QoS policy. If the SAP policy does not have a policer with the specified ID, the map entry will be ignored for this SAP.

Values 1 to 32

queue-id — Specifies the queue ID in a SAP ingress QoS policy. If the SAP policy does not have a queue with the specified ID, the map entry will be ignored for this SAP.

Values 1 to 32

Platforms 7750 SR, 7750 SR-s, 7950 XRS

13.132 ingress-ip-filter-entries

ingress-ip-filter-entries

Syntax [**no**] **ingress-ip-filter-entries**

Context [Tree] (config>subscr-mgmt>cat-map>category>exh-lvl ingress-ip-filter-entries)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries

Description Commands in this context configure the ingress IP filter parameters.

The **no** form of this command reverts to the default.

Default ingress-ip-filter-entries

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.133 ingress-ipv6-filter-entries

ingress-ipv6-filter-entries

Syntax [**no**] **ingress-ipv6-filter-entries**

Context **[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl ingress-ipv6-filter-entries)

Full Context configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries

Description Commands in this context configure the ingress IPv6 filter parameters.

The **no** form of this command reverts to the default.

Default ingress-ipv6-filter-entries

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.134 ingress-label

ingress-label

Syntax **ingress-label** *label* [*label*]
no ingress-label [*label*]

Context **[Tree]** (debug>mirror-source ingress-label)

Full Context debug mirror-source ingress-label

Description This command enables ingress mirroring based on MPLS labels with the following limitations.

- The ingress label provisioned must be a MPLS transport label and can be at any label stack as long as it is known by the system. Transport label distributed by LDP, RSVP, and segment routing are supported. For BGP-specific label distribution mirroring, the following are supported.
  - BGP label-unicast (RFC 3107, *Carrying Label Information in BGP-4*)
  - VPN service labels distributed by BGP for Carrier Supporting Carrier (CSC) VPNs (RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*)
  - VPN service labels distributed by BGP in an ASBR (inter-as-option-B)
  - VPN service labels distributed by BGP in a route reflector with next-hop-self (RR + NHS)
- VPN service label mirroring is not supported in a provider edge (PE) router.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- The ingress label can only be mirrored to a single mirror destination. If the same label is defined with multiple mirror destinations, an error is generated and the original mirror destination remains unchanged.

The ingress label mirror source overrides all other mirror source definitions. The MPLS frame is mirrored to the mirror destination as it is received on the ingress network port. The router MPLS label space is global for the system. A specific label is mirrored to a mirror destination regardless of the ingress interface. In addition to mirroring known labels, debug also allows pre-provisioning label values which are yet to be known by the system. Be aware that debug mirroring requires provisioning of static label values while labels distributed by label distribution protocols are dynamic in nature. Therefore, when label values change due to network changes, labels provisioned in debug mirroring must be changed or deleted manually.

By default, no ingress MPLS frames are mirrored. The **ingress-label** command must be executed to start mirroring on a specific MPLS label.

Parameters *label* — Specifies up to eight transport labels received on ingress to be mirrored. Each label can only be mirrored to a single mirror destination.

If the label does not exist on any ingress network ports, no packets are mirrored for that label. An error will not occur. Once the label exists on a network port, ingress mirroring begins for that label.

Values 0 to 1048575

The local MPLS stack may not support portions of this range.

Platforms All

13.135 ingress-percent-of-total

ingress-percent-of-total

Syntax **ingress-percent-of-total** *percent-of-total-queues*
no ingress-percent-of-total

Context **[Tree]** (config>qos>fp-resource-policy>queues ingress-percent-of-total)

Full Context configure qos fp-resource-policy queues ingress-percent-of-total

Description This command configures the percentage of the total number of queues on the FP on which the policy is applied that are allocated to ingress, with the remainder allocated to egress. The ingress and egress buffer pool sizes are not affected by the queue allocation.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The allocation is performed in sets of 8192 queues, with a minimum of 8192 queues at ingress and 8192 queues at egress. If the percentage configured results in the queue allocation not being a multiple of 8192, the number of queues at ingress is rounded down to the next 8192 boundary, and consequently the number of queues at egress is rounded up to the next 8192 boundary, both while respecting the minimum at ingress and egress.

If the FP resources policy being applied to any FP and the updated allocation is not achievable with the current ingress or egress queue consumption on any of the related FPs, then the command fails.

The configuration of **ingress-percent-of-total** command, including removing this parameter to return to its default configuration, causes the router to immediately reset the associated cards, XIOMs, and MDAs, except on the 7750 SR-1 where the configuration must be saved, and the router rebooted, immediately after committing the configuration transaction.

The **no** form of this command reverts the percentage of ingress queues, and consequently egress queues, to their default allocation.

Default ingress-percent-of-total 50.00

Parameters *percent-of-total-queues* — Specifies the percentage of total ingress queues as two fraction digits.

Values 4.00 to 97.00

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

13.136 ingress-policer

ingress-policer

Syntax **ingress-policer** *policer-name*
no ingress-policer

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm ingress-policer)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm ingress-policer)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt ingress-policer
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt ingress-policer

Description .This command specifies the ingress policer applied to all UEs corresponding to default vlan-range (such as group-interface) or the specified vlan-range. The policer can be created in the **config>subscr-mgmt>isa-policer** context. The ingress policer can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *policer-name* — Specifies the identifier of the distributed-sub-mgmt policer for ingress traffic.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.137 ingress-rate

ingress-rate

Syntax **ingress-rate** *sub-rate*
no ingress-rate

Context **[Tree]** (config>port>ethernet ingress-rate)

Full Context configure port ethernet ingress-rate

Description This command configures the maximum amount of ingress bandwidth that this port can receive with the configured sub-rate using packet-based accounting.

The **no** form of this command returns the value to the default.

Default no ingress-rate

Parameters *sub-rate* — Specifies the ingress rate, in Mb/s.

Values 1 to 400000

Platforms All

13.138 ingress-repl-inc-mcast-advertisement

ingress-repl-inc-mcast-advertisement

Syntax [**no**] **ingress-repl-inc-mcast-advertisement**

Context **[Tree]** (config>service>vpls>bgp-evpn ingress-repl-inc-mcast-advertisement)

Full Context configure service vpls bgp-evpn ingress-repl-inc-mcast-advertisement

Description This command enables and disables the advertisement of the Inclusive Multicast Ethernet Tag route (IMET route) with tunnel-type Ingress-Replication in the PMSI Tunnel Attribute, or with the tunnel-type Composite Point-to-Multipoint and Ingress-Replication (P2MP+IR) in the root-and-leaf nodes. The following must be considered:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- When **no ingress-repl-inc-mcast-advertisement** is configured, no IMET routes will be sent for the service unless the **provider-tunnel** is configured with **owner bgp-evpn-mpls** and **root-and-leaf**, in which case, an IMET-P2MP route is sent.
- When **ingress-repl-inc-mcast-advertisement** and **provider-tunnel** are configured for **bgp-evpn-mpls** with **root-and-leaf**, the system will send an IMET-P2MP-IR route, that is, an IMET route with a composite P2MP+IR tunnel type.
- When **no ingress-repl-inc-mcast-advertisement** and **assisted-replication replicator** are configured, the system will send IMET-AR routes, but IMET-IR routes will not be sent.

Default ingress-repl-inc-mcast-advertisement

Platforms All

13.139 ingress-replication-bum-label

ingress-replication-bum-label

Syntax [**no**] **no-ingress-replication-bum-label**

Context **[Tree]** (config>service>vpls>bgp-evpn>mpls ingress-replication-bum-label)

Full Context configure service vpls bgp-evpn mpls ingress-replication-bum-label

Description This command allows the user to configure the system so that a separate label is sent for BUM (Broadcast, Unknown unicast and Multicast) traffic in a specified service. By default (**no ingress-replication-bum-label**), the same label is used for unicast and flooded BUM packets when for-warding traffic to remote PEs.

When saving labels, this might cause transient traffic duplication for all-active multi-homing. By enabling **ingress-replication-bum-label**, the system will advertise two labels per EVPN VPLS instance, one for unicast and one for BUM traffic. The ingress PE will use the BUM label for flooded traffic to the advertising egress PE, so that the egress PE can determine if the unicast traffic has been flooded by the ingress PE. Depending on the scale required in the network, the user may choose between saving label space or avoiding transient packet duplication sent to an all-active multi-homed CE for certain macs.

Default no ingress-replication-bum-label

13.140 ingress-statistics

ingress-statistics

Syntax **ingress-statistics**

Context **[Tree]** (config>router>mpls ingress-statistics)

Full Context configure router mpls ingress-statistics

Description Commands in this context enable ingress-statistics on an MPLS-TP LSP.

Platforms All

ingress-statistics

Syntax **ingress-statistics**

Context **[Tree]** (config>router>mpls>lsp ingress-statistics)

Full Context configure router mpls lsp ingress-statistics

Description Commands in this context enter the LSP names for the purpose of enabling ingress data path statistics at the terminating node of the LSP, for example, egress LER.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ingress-statistics

Syntax [**no**] **ingress-statistics**

Context **[Tree]** (config>router>mpls>fwd-policies>fwd-policy ingress-statistics)

Full Context configure router mpls forwarding-policies forwarding-policy ingress-statistics

Description This command configures ingress statistics in an MPLS forwarding policy.

The ingress statistics are associated with a binding label, that is the ILM of the forwarding policy, and provides aggregate packet and byte counters for packets matching the binding label.

The **no** form of this command removes the statistics from the MPLS forwarding policy.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ingress-statistics

Syntax **ingress-statistics**

Context **[Tree]** (config>router>isis>segm-rtng ingress-statistics)
[Tree] (config>router>ospf>segm-rtng ingress-statistics)
[Tree] (config>router>ospf3>segm-rtng ingress-statistics)

Full Context configure router isis segment-routing ingress-statistics
configure router ospf segment-routing ingress-statistics
configure router ospf3 segment-routing ingress-statistics

Description Commands in this context configure the ingress statistics for IGP SIDs.

Platforms All

ingress-statistics

Syntax [**no**] **ingress-statistics**

Context **[Tree]** (config>router>segment-routing>sr-policies ingress-statistics)

Full Context configure router segment-routing sr-policies ingress-statistics

Description This command administratively enables the collection of ingress traffic statistics for all segment routing policies. The statistics provide counts for the number of incoming packets and bytes corresponding to each (color, endpoint) combination.

If there are any SR-MPLS interfaces on an FP2 or older line-cards, an attempt to enable this command will fail.

The **no** form of this command disables ingress stats collection for all segment routing policies.

Default no ingress-statistics

Platforms All

ingress-statistics

Syntax [**no**] **ingress-statistics**

Context **[Tree]** (config>router>policy-options>policy-statement>entry>action ingress-statistics)
[Tree] (config>router>policy-options>policy-statement>default-action ingress-statistics)

Full Context configure router policy-options policy-statement default-action ingress-statistics
configure router policy-options policy-statement entry action ingress-statistics

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the allocation of statistical indexes to BGP-LU route entries that are programmed on ingress data paths. For effective operation, a prefix must be advertised with a label per prefix for ILM statistics.

The **no** form of this command disables the allocation of statistical indexes to BGP-LU route entries.

Default no ingress-statistics

Platforms All

13.141 ingress-xpl

ingress-xpl

Syntax **ingress-xpl**

Context **[Tree]** (config>card>mda ingress-xpl)

Full Context configure card mda ingress-xpl

Description Commands in this context configure ingress MDA XPL interface error parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.142 init

init

Syntax **init** [**detail**]
no init

Context **[Tree]** (debug>router>ldp>peer>packet init)

Full Context debug router ldp peer packet init

Description This command enables debugging for LDP Init packets.

The **no** form of the command disables the debugging output.

Parameters **detail** — Displays detailed information.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.143 init-cwnd-size

init-cwnd-size

Syntax **init-cwnd-size** *init-cwnd-size*

Context **[Tree]** (config>app-assure>group>tcp-optimizer init-cwnd-size)

Full Context configure application-assurance group tcp-optimizer init-cwnd-size

Description This command configures the initial TCP congestion window (cwnd) used during the TCP Slow Start (SS) period.

Parameters *init-cwnd-size* — Specifies the initial TCP congestion window size value in maximum segment size (mss).

Values 1 to 256

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Default 10

13.144 init-delay

init-delay

Syntax **init-delay** *seconds*
no init-delay

Context **[Tree]** (config>service>ies>if>ipv6>vrrp init-delay)

Full Context configure service ies interface ipv6 vrrp init-delay

Description This command configures a VRRP initialization delay timer.

Default no init-delay

Parameters *seconds* — Specifies the initialization delay timer for VRRP, in seconds.

Values 1 to 65535

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

init-delay

Syntax **init-delay** *seconds*
no init-delay

Context **[Tree]** (config>service>ies>if>vrrp init-delay)

Full Context configure service ies interface vrrp init-delay

Description This command configures a VRRP initialization delay timer.

Default no init-delay

Parameters *seconds* — Specifies the initialization delay timer for VRRP, in seconds.

Values 1 to 65535

Platforms All

init-delay

Syntax **init-delay** *seconds*
no init-delay

Context **[Tree]** (config>service>vprn>if>vrrp init-delay)
[Tree] (config>service>vprn>if>ipv6>vrrp init-delay)

Full Context configure service vprn interface ipv6 vrrp init-delay
configure service vprn interface vrrp init-delay

Description This command configures a VRRP initialization delay timer.

Default no init-delay

Parameters *seconds* — Specifies the initialization delay timer for VRRP, in seconds.

Values 1 to 65535

Platforms All

init-delay

Syntax **init-delay** *seconds*
no init-delay

Context **[Tree]** (config>router>if>vrrp init-delay)

Full Context configure router interface ipv6 vrrp init-delay
configure router interface vrrp init-delay

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures a VRRP initialization delay timer.

Default no init-delay

Parameters *seconds* — Specifies the initialization delay timer for VRRP, in seconds.

Values 1 to 65535

Platforms All

13.145 init-extract-prio-mode

init-extract-prio-mode

Syntax **init-extract-prio-mode** {**uniform** | **l3-classify**}

Context **[Tree]** (config>card>fp init-extract-prio-mode)

Full Context configure card fp init-extract-prio-mode

Description This command determines the scheme used to select the initial drop priority of extracted control plane traffic. The initial drop priority of extracted packets can be either low or high priority. The drop priority of the extracted packets can be subsequently altered by mechanisms such as CPU protection. High-priority traffic receives preferential treatment in control plane congestion situations over low-priority traffic.

Default init-extract-prio-mode uniform

Parameters **uniform** — Initializes the drop priority of all extracted control traffic as high priority. Drop priority can then be altered (marked low priority) by distributed CPU protection (DCP) or centralized CPU protection rate-limiting functions in order to achieve protocol and interface isolation.

l3-classify — Initializes the drop priority of Layer 3 extracted control traffic (BGP and OSPF) based on the QoS classification of the packets. This is useful in networks where the DSCP and EXP markings can be trusted as the primary method to distinguish, protect, and isolate good terminating protocol traffic from unknown or potentially harmful protocol traffic instead of using the rate-based DCP and centralized CPU protection traffic marking/coloring mechanisms (for example, **out-profile-rate** and **exceed-action low-priority**).

For network interfaces, the QoS classification profile result selects the drop priority (in = high priority, out = low priority) for extracted control traffic, and the default QoS classification maps different DSCP and EXP values to different in/out profile states.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For access interfaces, the QoS classification priority result typically selects the drop priority for extracted control traffic. The default access QoS classification (**default-priority**) maps all traffic to **low**. If the queues in the access QoS policy are configured as **profile-mode** queues (rather than the default **priority-mode**) extracted traffic will use the QoS classification profile value configured against the associated FC (rather than the priority result) to select the drop priority.

Layer 2 extracted control traffic (ARP or ETH-CFM) and protocols that cannot always be QoS-classified, such as IS-IS, are initialized as low drop priority in order to protect Layer 2 protocol traffic on uniform interfaces (which would typically be subject to centralized CPU protection). Alternately, DCP can be used (by configuring a non-zero rate with **exceed-action** of **low-priority** for the **all-unspecified** protocol) to mark some of this traffic as high priority.

Platforms All

13.146 init-ss-threshold

init-ss-threshold

Syntax **init-ss-threshold** *init-ss-threshold*

Context **[Tree]** (config>app-assure>group>tcp-optimizer init-ss-threshold)

Full Context configure application-assurance group tcp-optimizer init-ss-threshold

Description This command configures the initial Slow Start (SS) threshold for a given TCP optimizer policy. Nokia recommends to set the threshold close to the access network Bandwidth Delay Product (BDP).

Default 1000000

Parameters *init-ss-threshold* — Specifies the initial SS threshold value in kilobytes.

Values auto, 0 to 1000000

The auto value instructs the system to use an intelligent mechanismto set the optimum value for the initial SS threshold to dynamicallytrack the BDP of the access network.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.147 initial-app-profile

initial-app-profile

Syntax **initial-app-profile** *app-profile-name*
no initial-app-profile

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>wpp initial-app-profile)
[Tree] (config>service>ies>sub-if>grp-if>wpp initial-app-profile)
[Tree] (config>service>vprn>sub-if>grp-if>wpp initial-app-profile)

Full Context configure service ies subscriber-interface group-interface wpp initial-app-profile
configure service vprn subscriber-interface group-interface wpp initial-app-profile
configure subscriber-mgmt local-user-db ipoe host wpp initial-app-profile

Description This command specifies the initial app-profile for the hosts created on the group-interface. This initial app-profile is replaced after hosts pass web portal authentication.

The **no** form of this command reverts to the default.

Default no initial-app-profile

Parameters *app-profile-name* — Specifies the initial application profile, up to 32 characters, to be used during the WPP authentication phase of the IPoE hosts.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.148 initial-hold-time

initial-hold-time

Syntax **initial-hold-time** *seconds*
initial-hold-time [**min** *min*] [**sec** *sec*]
no initial-hold-time

Context **[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile initial-hold-time)

Full Context configure subscriber-mgmt vrgw brg brg-profile initial-hold-time

Description This hold time applies to BRG instances that are created without any hosts; for example, triggered due to proxy authentication. During this initial hold-time the BRG is not deleted and no connectivity-verification is started. When this timer expires, connectivity verification is started. If connectivity verification is disabled and no hosts are associated with the BRG upon expiry, the regular hold time is started and the BRG instance will be removed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This command allows an operator to have fast BRG removal (no connectivity-verification and **no hold-time**) but still use BRG proxy authentication. Without an initial hold time the BRG would be removed immediately after creation.

This command does not apply to BRG instances that are created through host setup.

The **no** form of this command reverts to the default.

Default initial-hold-time min 5

Parameters *seconds* — Specifies the initial time, in seconds, to hold on to a BRG after the system considered it down.

Values 0 to 900

min — Specifies the initial time in minutes.

Values 1 to 15

sec — Specifies the initial time in seconds.

Values 1 to 59

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.149 initial-lease-time

initial-lease-time

Syntax **initial-lease-time** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no initial-lease-time

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>dhcp initial-lease-time)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>dhcp initial-lease-time)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dhcp initial-lease-time)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dhcp initial-lease-time)

Full Context configure service ies subscriber-interface group-interface wlan-gw dhcp initial-lease-time
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp initial-lease-time
configure service vprn subscriber-interface group-interface wlan-gw dhcp initial-lease-time
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp initial-lease-time

Description This command configures the lease time for a user which is migrant (unauthenticated).

Default initial-lease-time min 10

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *hours* — Specifies the number of initial lease time hours.

Values 1 to 1

minutes — Specifies the number of initial lease time minutes.

Values 5 to 59

seconds — Specifies the number of initial lease time.

Values 1 to 59

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.150 initial-preferred-lifetime

initial-preferred-lifetime

Syntax **initial-preferred-lifetime** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no initial-preferred-lifetime

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dhcp6 initial-preferred-lifetime)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dhcp6 initial-preferred-lifetime)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>slaac initial-preferred-lifetime)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>slaac initial-preferred-lifetime)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-preferred-lifetime
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-preferred-lifetime
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-preferred-lifetime
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-preferred-lifetime

Description This command specifies the signaled preferred lifetime in DHCPv6 or SLAAC after full authentication (DSM and/or ESM).

The **no** form of this command reverts to the default.

Default initial-preferred-lifetime min 5

Parameters *hours* — Specifies the number of initial preferred lifetime hours.

Values 1 to 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

minutes — Specifies the number of initial preferred lifetime minutes.

Values 5 to 59

seconds — Specifies the number of initial preferred lifetime seconds.

Values 1 to 59

Combined values: min 5 – hrs 1

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.151 initial-registration

initial-registration

Syntax **initial-registration ca** *ca-profile-name* **key-to-certify** *key-filename* **protection-alg** {**password** *password* **reference** *ref-number* | **signature** [**cert** *cert-file-name* [**send-chain** [**with-ca** *ca-profile-name*]]] [**protection-key** *key-file-name*] [**hash-alg** {**md5** | **sha1** | **sha224** | **sha256** | **sha384** | **sha512**}]} **subject-dn** *dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* | *ipv6-address*] **save-as** *save-path-of-result-cert*

Context **[Tree]** (admin>certificate>cmpv2 initial-registration)

Full Context admin certificate cmpv2 initial-registration

Description This command request initial certificate from CA by using CMPv2 initial registration procedure.

The **ca** parameter specifies a CA-profile which includes CMP server information.

The **key-to-certify** is an imported key file to be certified by the CA.

The protection-key is an imported key file used to for message protection if protection-alg is signature.

The request is authenticated either of following methods:

- A password and a reference number that pre-distributed by CA via out-of-band means.
- The specified password and reference number are not necessarily in the cmp-keylist configured in the corresponding CA-Profile
- A signature signed by the protection-key or key-to-certify, optionally along with the corresponding certificate. If the protection-key is not specified, system will use the key-to-certify for message protection. The hash algorithm used for signature is depends on key type:
- DSA key: SHA1
- RSA key: MD5/SHA1/SHA224 | SHA256 | SHA384 | SHA512, by default is SHA1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Optionally, the system could also send a certificate or a chain of certificates in extraCerts field. Certificate is specified by the “cert” parameter, it must include the public key of the key used for message protection.

Sending a chain is enabled by specify the **send-chain** parameter.

subject-dn specifies the subject of the requesting certificate.

save-as specifies full path name of saving the result certificate.

In some cases, CA may not return certificate immediately, due to reason like request processing need manual intervention. In such cases, the **admin certificate cmpv2** poll command could be used to poll the status of the request. If key-list is not configured in the corresponding **ca-profile**, then the system will use the existing password to authenticate the CMPv2 packets from server if it is in password protection.

If key-list is configured in the corresponding **ca-profile** and server does not send SenderKID, then the system will use lexicographical first key in the key-list to authenticate the CMPv2 packets from server in case it is in password protection.

Parameters *ca-profile-name* — Specifies a ca-profile name which includes CMP server information up to 32 characters.

key-filename — Specifies the file name of the key to certify up to 95 characters.

password — Specifies an ASCII string up to 64 characters.

ref-number — Specifies the reference number for this CA initial authentication key up to 64 characters.

cert-file-name — specifies the certificate file up to 95 characters.

ca-profile-name — Specifies to send the chain.

key-file-name — Specifies the protection key associated with the action on the CA profile.

hash-algorithm — Specifies the hash algorithm for RSA key.

Values md5,sha1,sha224,sha256,sha384,sha512

dn — Specifies the subject of the requesting certificate up to 256 characters.

Values attr1 equals val1
attr2 equals val2 where: attrN equals {C | ST | O | OU | CN}

save-path-of-result-cert — Specifies the save full path name of saving the result certificate up to 200 characters.

domain-name *domain-names* — Specifies FQDNs for SubjectAltName of the requesting certificate, separated by commas, up to 512 characters.

ip-address **|** *ipv6-address* — Specifies an IPv4 or IPv6 address for SubjectAtName of the requesting certificate.

13.152 initial-send-delay-zero

initial-send-delay-zero

Syntax [**no**] **initial-send-delay-zero**

Context **[Tree]** (config>service>vprn>bgp initial-send-delay-zero)
[Tree] (config>service>vprn>bgp>group initial-send-delay-zero)
[Tree] (config>service>vprn>bgp>group>neighbor initial-send-delay-zero)

Full Context configure service vprn bgp group initial-send-delay-zero
configure service vprn bgp group neighbor initial-send-delay-zero
configure service vprn bgp initial-send-delay-zero

Description This command configures BGP to send UPDATE messages announcing reachability information to a peer or set of peers immediately after the sessions come up (become established) with these peers.

The default behavior, provided by the **no** form of this command, is to wait for min-route-advertisement time after each session is established before sending the first set of UPDATE messages.

Platforms All

initial-send-delay-zero

Syntax [**no**] **initial-send-delay-zero**

Context **[Tree]** (config>router>bgp initial-send-delay-zero)
[Tree] (config>router>bgp>group initial-send-delay-zero)
[Tree] (config>router>bgp>group>neighbor initial-send-delay-zero)

Full Context configure router bgp group initial-send-delay-zero
configure router bgp group neighbor initial-send-delay-zero
configure router bgp initial-send-delay-zero

Description This command configures BGP to send UPDATE messages announcing reachability information to a peer or set of peers immediately after the sessions become established with these peers.

The **no** form of this command waits for **min-route-advertisement** time after each session is established before sending the first set of UPDATE messages.

13.153 initial-sla-profile

initial-sla-profile

Syntax **initial-sla-profile** *sla-profile-name*
no initial-sla-profile

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>wpp initial-sla-profile)
[Tree] (config>service>ies>sub-if>grp-if>wpp initial-sla-profile)
[Tree] (config>service>vprn>sub-if>grp-if>wpp initial-sla-profile)

Full Context configure service ies subscriber-interface group-interface wpp initial-sla-profile
configure service vprn subscriber-interface group-interface wpp initial-sla-profile
configure subscriber-mgmt local-user-db ipoe host wpp initial-sla-profile

Description This command specifies the initial sla-profile for the hosts created on the group-interface. This initial sla-profile is replaced after hosts pass web portal authentication.

The **no** form of this command reverts to the default.

Parameters *sla-profile-name* — Specifies the initial SLA profile, up to 32 characters, to be used during the WPP authentication phase of the IPOE host.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

initial-sla-profile

Syntax **initial-sla-profile** *profile-name*
no initial-sla-profile

Context **[Tree]** (config>router>wpp initial-sla-profile)

Full Context configure router wpp initial-sla-profile

Description This command specifies the initial sla-profile for the hosts created on the group-interface. This initial sla-profile is replaced after hosts pass the web portal authentication.

Default no initial-sla-profile

Parameters *profile-name* — Specifies the name of sla-profile.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.154 initial-sub-profile

initial-sub-profile

Syntax **initial-sub-profile** *sub-profile-name*
no initial-sub-profile

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>wpp initial-sub-profile)
[Tree] (config>service>ies>sub-if>grp-if>wpp initial-sub-profile)
[Tree] (config>service>vprn>sub-if>grp-if>wpp initial-sub-profile)

Full Context configure service ies subscriber-interface group-interface wpp initial-sub-profile
configure service vprn subscriber-interface group-interface wpp initial-sub-profile
configure subscriber-mgmt local-user-db ipoe host wpp initial-sub-profile

Description This command specifies the initial sub-profile for the hosts created on the group-interface. This initial sub-profile is replaced after hosts pass web portal authentication.

The **no** form of this command reverts to the default.

Default no initial-sub-profile

Parameters *sub-profile-name* — Specifies the initial subscriber profile, up to 32 characters, to be used during the WPP authentication phase of the IPoE host.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.155 initial-valid-lifetime

initial-valid-lifetime

Syntax **initial-valid-lifetime** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]
no initial-valid-lifetime

Context [Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dhcp6 initial-valid-lifetime)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dhcp6 initial-valid-lifetime)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>slaac initial-valid-lifetime)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>slaac initial-valid-lifetime)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-valid-lifetime

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-valid-lifetime
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-valid-lifetime
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-valid-lifetime

Description This command specifies the signaled preferred lifetime in DHCPv6 or SLAAC during a migrant phase.

The **no** form of this command reverts to the default.

Default initial-valid-lifetime min 5

Parameters *hours* — Specifies the number of initial preferred lifetime hours.

Values 1 to 1

minutes — Specifies the number of initial preferred lifetime minutes.

Values 5 to 59

seconds — Specifies the number of initial preferred lifetime seconds.

Values 1 to 59

Combined values: min 5 – hrs 1

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.156 initiation-message

initiation-message

Syntax **initiation-message** [*initiation-message*]
no initiation-message

Context **[Tree]** (config>bmp>station initiation-message)

Full Context configure bmp station initiation-message

Description This command configures a free-form initiation message for a type 0 TLV to be sent to the BMP monitoring station. The message is transmitted when a BMP monitoring station establishes a connection to the device. Information can be provided to the BMP station system administrator (for example, a contact phone number). The initiation message includes a type 1 TLV containing the SNMP sysDescr value specified in RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*, and a type 2 TLV containing the SNMP sysName value also from RFC 1213. The string in the initiation-message is UTF-8 encoded.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes initiation message from the configuration and causes a free-form message to be included in the type 0 information TLV and the corresponding tlv-length is made 0.

Parameters *initiation-message* — Specifies an initiation message up to 256 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

13.157 inner-tag

inner-tag

Syntax **inner-tag** *value* [*vid-mask*]
no inner-tag

Context **[Tree]** (config>qos>sap-ingress>mac-criteria>entry>match inner-tag)

Full Context configure qos sap-ingress mac-criteria entry match inner-tag

Description This command configures the matching of the second tag that is carried transparently through the service. The inner tag on ingress is the second tag on the frame if there are no service delimiting tags. The inner tag is the second tag before any service delimiting tags on egress but is dependent in the ingress configuration and may be set to 0 even in cases where additional tags are on the frame. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

The inner tag is not applicable in ingress on dot1Q SAPs. The inner tag may be populated on egress depending on the ingress SAP type.

On QinQ SAPs of null and default that do not strip tags, the inner-tag will contain the second tag (which is still the second tag carried transparently through the service.) On ingress SAPs that strip any tags, the inner tag will contain 0 even if there are more than two tags on the frame.

The optional vid_mask is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value and vid-mask) = = (tag and vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS, the VID type cannot be specified on the default QoS policy.

The default vid-mask is set to 4095 for exact match.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

inner-tag

Syntax **inner-tag** *value* [*vid-mask*]
no inner-tag

Context **[Tree]** (config>filter>mac-filter>entry>match inner-tag)

Full Context configure filter mac-filter entry match inner-tag

Description This command configures the matching of the second tag that is carried transparently through the service. The inner-tag on ingress is the second tag on the frame if there are no service delimiting tags. Inner tag is the second tag before any service delimiting tags on egress but is dependent in the ingress configuration and may be set to 0 even in cases where additional tags are on the frame. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

The inner-tag is not applicable in ingress on dot1Q SAPs. The inner-tag may be populated on egress depending on the ingress SAP type.

On QinQ SAPs of null and default that do not strip tags inner-tag will contain the second tag (which is still the second tag carried transparently through the service.) On ingress SAPs that strip any tags, inner-tag will contain 0 even if there are more than 2 tags on the frame.

The optional *vid-mask* is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is ((value and vid-mask) = = (tag and vid-mask)). A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS the VID type cannot be specified on the default QoS policy.

The default vid-mask is set to 4095 for exact match.

Default no inner-tag

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.158 input

input

Syntax **input**

Context **[Tree]** (config>system>sync-if-timing>bits input)

Full Context configure system sync-if-timing bits input

Description This command provides a context to enable or disable the external BITS timing reference inputs to the central clock of the router. In redundant systems with BITS ports, there are two possible BITS-in interfaces, one for each CPM or CCM.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.159 input-power-mode

input-power-mode

Syntax **input-power-mode** *amperage*

Context **[Tree]** (config>system>pwr-mgmt>peq input-power-mode)

Full Context configure system power-management peq input-power-mode

Description This command sets the input-power-mode of the APEQ for the designated APEQ slot. This command is supported in the 7750 SR-S OS and 7950 XRS only.

Parameters *amperage* — Sets the APEQ input power mode.

Values 60, 80

Default 60

Platforms 7750 SR-12e, 7950 XRS

13.160 insert

insert

Syntax **insert** [*line*]

Context **[Tree]** (candidate insert)

Full Context candidate insert

Description This command inserts the contents of the temporary buffer (populated by a previous copy or delete command) into the candidate configuration. The contents are inserted by default after the current edit point. Optional parameters allow the insertion after some other point of the candidate. The contents of the temporary buffer are deleted when the operator exits candidate edit mode.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Insertions are context-aware. The temporary buffer always stores the CLI context (such as the current CLI branch) for each line deleted or copied. If the lines to be inserted are supported at the context of the insertion point then the lines are simply inserted into the configuration. If the lines to be inserted are not supported at the context of the insertion point, then the context at the insertion point is first closed using multiple exit statements, the context of the lines to be inserted is built (added) into the candidate at the insertion point, then the lines themselves are added, the context of the inserted lines is closed using exit statements and finally the context from the original insertion point is built again leaving the context at the same point as it was before the insertion.

Parameters *line* — Indicates where to insert the line starting at the point indicated by the following options.

Values

line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

13.161 insert-ipv6-fragment-header

insert-ipv6-fragment-header

Syntax [**no**] **insert-ipv6-fragment-header**

Context **[Tree]** (config>service>vprn>inside>nat64 insert-ipv6-fragment-header)

Full Context configure service vprn inside nat64 insert-ipv6-fragment-header

Description This command specifies if the system always inserts an IPv6 fragment header, to indicate that the sender allows fragmentation.

The **no** form of the command does not allow the system to insert an IPv6 fragment header.

Default disabled

insert-ipv6-fragment-header

Syntax [**no**] **insert-ipv6-fragment-header**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vprn>nat>inside>nat64 insert-ipv6-fragment-header)
[Tree] (config>router>nat>inside>nat64 insert-ipv6-fragment-header)

Full Context configure router nat inside nat64 insert-ipv6-fragment-header
configure service vprn nat inside nat64 insert-ipv6-fragment-header

Description This command specifies whether the NAT64 node will insert IPv6 fragment header to IPv6 packets for which the DF bit is not set in the corresponding IPv4 packet, and is not already a fragment.

The **no** form of the command disables the insertion.

Default disabled

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.162 insert-nsh

insert-nsh

Syntax [**no**] **insert-nsh**

Context [Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action insert-nsh)

Full Context configure subscriber-mgmt isa-service-chaining vas-filter entry action insert-nsh

Description Commands in this context configure NSH parameters in the steered traffic.

The **no** form of this command removes insert NSA parameters from the configuration.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.163 insert-subscriber-id

insert-subscriber-id

Syntax [**no**] **insert-subscriber-id**

Context [Tree] (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action>insert-nsh>meta-data insert-subscriber-id)

Full Context configure subscriber-mgmt isa-service-chaining vas-filter entry action insert-nsh meta-data insert-subscriber-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies that the metadata to be inserted in NSH (with MD-Type set to 1) must contain a subscriber identifier that is derived from the subscriber string that comes from the AAA server (in Alc-Subsc-Id-Str VSA). The subscriber string is truncated after the first 16 bytes, and therefore, the first 16 bytes should be unique. The **insert-subscriber-id** and **insert-subscriber-id** commands are mutually exclusive.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.164 inside

inside

Syntax **inside**

Context **[Tree]** (config>service>vprn>nat inside)
[Tree] (config>router>nat inside)

Full Context configure router nat inside
configure service vprn nat inside

Description Commands in this context the inside NAT instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.165 inside-service-id

inside-service-id

Syntax [**no**] **inside-service-id**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes inside-service-id)

Full Context configure aaa isa-radius-policy acct-include-attributes inside-service-id

Description This command enables the inclusion of the NAT inside service ID attributes.

The **no** form of the command excludes NAT inside service ID attributes.

Default no inside-service-id

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.166 install-backup-path

install-backup-path

Syntax **install-backup-path**
no install-backup-path

Context **[Tree]** (config>router>policy-options>policy-statement>entry>action install-backup-path)
[Tree] (config>router>policy-options>policy-statement>default-action install-backup-path)

Full Context configure router policy-options policy-statement default-action install-backup-path
configure router policy-options policy-statement entry action install-backup-path

Description When the best BGP route for an IPv4 or IPv6 prefix is matched by a policy entry or policy default action with this command, BGP attempts to find and install a preprogrammed backup path for the prefix in order to provide BGP fast reroute protection.

The **install-backup-path** command overrides and has no dependency on commands such as the BGP instance **backup-path** command or the VPRN-level **enable-bgp-vpn-backup** command, which enable BGP fast reroute for an entire address family. The **install-backup-path** command provides more precise control over which IP prefixes are supported with preprogrammed backup paths.

In VPRN, if the best path for an IP prefix is provided by a VPRN BGP route, the backup path can be provided by another VPRN BGP route or an imported VPN-IP route. If the best path for an IP prefix is provided by an imported VPN-IP route, the backup path can be provided by another VPN-IP route.

The **install-backup-path** command is supported only in BGP and VRF import policies and has no effect on other types. The **install-backup-path** command applies only to the following types of matched routes: IPv4, IPv6, label-IPv4, label-IPv6, VPN-IPv4, and VPN-IPv6.

The **no** form of this command disables the install-backup-path functionality.

Default no install-backup-path

Platforms All

13.167 instance

instance

Syntax **instance** *instance*

Context **[Tree]** (debug>dynsvc>scripts instance)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug dynamic-services scripts instance

Description Commands in this context configure dynamic services script debugging for a specific instance.

Parameters *instance* — Specifies the instance name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

instance

Syntax [**no**] **instance** *instance*

Context **[Tree]** (debug>vsd>scripts instance)

Full Context debug vsd scripts instance

Description This command enables/disables the generation of script debugging for a specific instance

Parameters *instance* — Specifies the instance name.

Platforms All

instance

Syntax **instance** *instance-id* **instance-value** *instance-value*
no instance *instance-id*

Context **[Tree]** (config>router>p2mp-sr-tree>p2mp-policy>p2mp-candidate-path>instances instance)

Full Context configure router p2mp-sr-tree p2mp-policy p2mp-candidate-path instances instance

Description This command configures the candidate path instance for the P2MP SR tree as primary or secondary, and the instance identifier.

The **no** form of this command removes the candidate path instance.

Parameters *instance-id* — Specifies the instance as primary (1) or secondary (2).

Values 1, 2

instance-value — Specifies the instance identifier.

Values 1 to 4294967295

Platforms All

© 2022 Nokia.

13.168 instance-id

instance-id

Syntax **instance-id** *instance-id*
no instance-id

Context **[Tree]** (config>router>p2mp-sr-tree>replication-segment instance-id)

Full Context configure router p2mp-sr-tree replication-segment instance-id

Description This command configures the instance ID for the P2MP SR tree replication segment entry.

The ID is a unique identifier for the P2MP LSP on the root. The combination of root ID, tree ID, and instance ID uniquely identifies a P2MP LSP throughout the network.

The **no** form of this command removes the instance.

Parameters *instance-id* — Specifies the ID of the instance.

Values 1 to 4294967295

Platforms All

13.169 instances

instances

Syntax **instances**

Context **[Tree]** (config>router>p2mp-sr-tree>p2mp-policy>p2mp-candidate-path instances)

Full Context configure router p2mp-sr-tree p2mp-policy p2mp-candidate-path instances

Description Commands in this context configure the instance entries of the candidate path.

Multiple path instances can exist in a candidate path for the P2MP SR tree. Each path instance is a P2MP LSP and has an instance ID. Path instances are used for global optimization of the active candidate path.

13.170 instant-prune-echo

instant-prune-echo

Syntax [**no**] **instant-prune-echo**

Context **[Tree]** (config>service>vprn>pim>if instant-prune-echo)

Full Context configure service vprn pim interface instant-prune-echo

Description This command enables PIM to send an instant prune echo when the router starts the prune pending timer for a group on the interface. All downstream routers will see the prune message immediately, and can send a join override if they are interested in receiving the group. Configuring instant-prune-echo is recommended on broadcast interfaces with more than one PIM neighbor to optimize multicast convergence.

The **no** form of this command disables instant Prune Echo on the PIM interface.

Default no instant-prune-echo

Platforms All

instant-prune-echo

Syntax [**no**] **instant-prune-echo**

Context **[Tree]** (config>router>pim>interface instant-prune-echo)

Full Context configure router pim interface instant-prune-echo

Description This command enables PIM to send an instant prune echo when the router starts the prune pending timer for a group on the interface. All downstream routers will see the prune message immediately, and can send a join override if they are interested in receiving the group. Configuring instant-prune-echo is recommended on broadcast interfaces with more than one PIM neighbor to optimize multicast convergence.

13.171 int-dest-id

int-dest-id

Syntax **int-dest-id** *int-dest-id*
no int-dest-id

Context **[Tree]** (config>service>sdp>binding>pw-port>egress>shaper int-dest-id)

Full Context configure service sdp binding pw-port egress shaper int-dest-id

Description This command configures an intermediate destination identifier applicable to ESM PW SAPs.

The **no** form of the command removes the intermediate destination identifier from the configuration.

Default no int-dest-id

Parameters *int-dest-id* — Specifies the intermediate destination ID.

Platforms All

int-dest-id

Syntax **int-dest-id** *name*
no int-dest-id

Context **[Tree]** (config>service>epipe>pw-port>egress>shaper int-dest-id)

Full Context configure service epipe pw-port egress shaper int-dest-id

Description This command configures an intermediate destination identifier applicable to ESM PW SAPs.

Parameters *name* — Specifies the default intermediate destination identifier, up to 32 characters in length, on the egress side for this PW-port entry.

Default no interactive-authentication

Platforms All

interactive-authentication

Syntax [**no**] **interactive-authentication**

Context **[Tree]** (config>service>vprn>aaa>remote-servers>tacplus interactive-authentication)

Full Context configure service vprn aaa remote-servers tacplus interactive-authentication

Description This configuration instructs the SR OS to send no username nor password in the TACACS+ start message, and to display the *server_msg* in the GETUSER and GETPASS response from the TACACS+ server. Interactive authentication can be used to support a One Time Password scheme (such as an S/Key). An example flow (such as with a telnet connection) is as follows:

- The SR OS sends an authentication start request to the TACACS+ server with no username nor password.
- TACACS+ server replies with TAC_PLUS_AUTHEN_STATUS_GETUSER and a *server_msg*.
- The SR OS displays the *server_msg*, and collects the username.
- The SR OS sends a continue message with the username.
- TACACS+ server replies with TAC_PLUS_AUTHEN_STATUS_GETPASS and a *server_msg*.
- The SR OS displays the *server_msg* (which may contain, for example, an S/Key for One Time Password operation), and collects the password.
- The SR OS sends a continue message with the password.
- TACACS+ server replies with PASS or FAIL.

When interactive-authentication is disabled the SR OS will send the username and password in the *tacplus* start message. An example flow (e.g. with a telnet connection) is as follows:

- TAC_PLUS_AUTHEN_TYPE_ASCII.
  - the login username in the “user” field.
  - the password in the *user_msg* field (while this is non-standard, it does not cause interoperability problems).
- TACACS+ server ignores the password and replies with TAC_PLUS_AUTHEN_STATUS_GETPASS.
- The SR OS sends a continue packet with the password in the *user_msg* field.
- TACACS+ server replies with PASS or FAIL.

When interactive-authentication is enabled, tacplus must be the first method specified in the authentication-order configuration.

Default no interactive-authentication

13.176 intercept-id

intercept-id

Syntax **intercept-id** *id*
no intercept-id

Context **[Tree]** (config>li>li-source>nat>classic-lsn-sub intercept-id)
[Tree] (config>li>li-source>nat>dslite-lsn-sub intercept-id)
[Tree] (config>li>li-source>nat>ethernet-header intercept-id)
[Tree] (config>li>li-source>nat>l2-aware-sub intercept-id)
[Tree] (config>li>li-source>nat>nat64-lsn-sub intercept-id)

Full Context configure li li-source nat classic-lsn-sub intercept-id
configure li li-source nat dslite-lsn-sub intercept-id
configure li li-source nat ethernet-header intercept-id
configure li li-source nat l2-aware-sub intercept-id
configure li li-source nat nat64-lsn-sub intercept-id

Description This command configures the intercept-id that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This **intercept-id** can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

For nat mirroring (a **nat li-source** entry type), when the mirror service is not configured with any routable encap (for example, no ip-udp-shim or ip-gre configured under **config>mirror>mirror-dest>encap**), the presence of a configured intercept-id against an li-source (nat) entry will cause the insertion of the intercept-id after a configurable mac-da, mac-sa and etype (configured under **li-source>nat>ethernet-header**), at the front of each packet mirrored for that particular li-source entry. If there is no **intercept-id** configured (for a

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

nat entry using a mirror service without routable encap), then a configurable mac-da and mac-sa are added to the front of the packets (but no intercept-id). In both cases a non-configurable etype is also added immediately before the mirrored customer packet. Note that routable encapsulation configured in the mirror-dest takes precedence over the ethernet-header configuration in the li-source nat entries. If routable encapsulation is configured, then the ethernet-header config is ignored and no mac header is added to the packet (the encap is determined by the mirror-dest in this case).

For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an intercept-id field (as part of the routable encap) is always present in the mirrored packets. If there is no intercept ID configured for an li-source entry, then the default value will be inserted. When the mirror service is configured with ip-gre routable encap, no intercept-id is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the value from the configuration.

Default no intercept-id (an id of 0, or no id)

Parameters *id* — Specifies the intercept ID value to insert into the header of the mirrored packets.

Values 1 to 4294967295 (32b) For nat li-source entries that are using a mirror service that is not configured with routable encap

Values 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and with the direction-bit enabled.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

intercept-id

Syntax **intercept-id** [*intercept-id*]
no intercept-id

Context **[Tree]** (config>li>li-source>wlan-gw intercept-id)

Full Context configure li li-source wlan-gw intercept-id

Description This command configures the intercept-id inserted in the packet header for all mirrored packets of the associated li-source. When the mirror service is configured with the **ip-udp-shim** routable encapsulation, the intercept-id field (as part of the routable encap) is always present in the mirrored packets. The intercept ID can be used by the LIG to identify a particular LI session to which the packet belongs.

Parameters *intercept-id* — Specifies the intercept ID inserted in the LI header.

13.177 interconnect

interconnect

Syntax **interconnect** {**ring-id** *ring-index* | **vpls**}
no interconnect

Context **[Tree]** (config>eth-ring>sub-ring interconnect)

Full Context configure eth-ring sub-ring interconnect

Description This command links the G.8032 sub-ring to a ring instance or to a VPLS instance. The ring instance must be a complete ring with two paths but may itself be a sub-ring or a major ring (declared by its configuration on another node).

When the interconnection is to another node, the sub-ring may have a virtual link or a non-virtual-link.

When the sub-ring is configured with a non-virtual link, the sub ring may be alternatively connected to a VPLS service.

This command is only valid on the interconnection node where a single sub-ring port connects to a major ring or terminates on a VPLS service.

The **no** form of this command removes the interconnect node.

Default no interconnect

Parameters *ring-id* — Specifies the identifier for the ring instance of the connection ring for this sub-ring on this node.

Values 0 to 128

vpls — Specifies that the sub-ring is connected to the VPLS instance that contains the sub-ring SAP.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn dhcp6 interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure interface parameters.

Parameters *ip-int-name* — Specifies the name of the IP interface, up to 32 characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

interface

Syntax **interface** *ip-int-name* [**create**]
interface *ip-int-name* [**create**] **tunnel**
no interface *ip-int-name*

Context **[Tree]** (config>service>vprn interface)
[Tree] (config>service>ies interface)

Full Context configure service ies interface
configure service vprn interface

Description This command creates a logical IP routing interface. Once created, attributes like an IP address and service access point (SAP) can be associated with the IP interface.

The **interface** command, under the context of services, is used to create and maintain IP routing interfaces within service IDs. The **interface** command can be executed in the context of a service ID. The IP interface created is associated with the service core network routing instance and default routing table. The typical use for IP interfaces created in this manner is for subscriber Internet access. An IP address cannot be assigned to an IES interface. Multiple SAPs can be assigned to a single group interface.

Interface names are case sensitive and must be unique within the group of defined IP interfaces defined for **config>router>interface**, **config>service>ies>interface** and **config>service>vprn>interface** (that is, the network core router instance). Interface names must not be in the dotted decimal notation of an IP address. For example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either interface names or the IP addresses. Use unique IP address values and IP address names to maintain clarity. It could be unclear to the user if the same IP address and IP address name values are used. Although not recommended, duplicate interface names can exist in different router instances.

When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

By default, there are no default IP interface names defined within the system. All IP interfaces must be explicitly defined. Interfaces are created in an enabled state.

The **no** form of this command removes IP the interface and all the associated configuration. The interface must be administratively shut down before issuing the **no interface** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The IP interface must be shut down before the SAP on that interface may be removed. IES and VPRN services do not have the **shutdown** command in the SAP CLI context. The service SAPs rely on the interface status to enable and disable them.

Parameters *ip-int-name* — Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and config service vprn interface commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

If *ip-int-name* already exists within the service ID, the context will be changed to maintain that IP interface. If *ip-int-name* already exists within another service ID or is an IP interface defined within the **config router** commands, an error will occur and context will not be changed to that IP interface. If *ip-int-name* does not exist, the interface is created and context is changed to that interface for further command processing.

tunnel — Specifies that the interface is configured as tunnel interface, which could be used to terminate IPsec or GRE runnels in the private service.

create — Creates the IPsec interface instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>igmp interface)

Full Context configure router igmp interface

Description Commands in this context configure an IGMP interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of the command deletes the IGMP interface. The **shutdown** command in the **config>router>igmp>interface** context can be used to disable an interface without removing the configuration for the interface.

Default no interface

Parameters *ip-int-name* — The IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>mld interface)

Full Context configure router mld interface

Description Commands in this context configure an Multicast Listener Discovery (MLD) interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of this command deletes the MLD interface. The **shutdown** command in the **config>router>mld>interface** context can be used to disable an interface without removing the configuration for the interface.

Default no interface — No interfaces are defined.

Parameters *ip-int-name* — Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config>router>interface** and **config>service>ies>interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

Full Context configure subscriber-mgmt pfcp-association interface

Description This command configures the interface from which PFCP messages are sent and on which PFCP messages are received.

The **no** form of this command removes the interface.

Default no interface

Parameters *router-instance* — Specifies the router instance.

Values *router-name* | *vprn-svc-id*
router-name: Base Default - Base
vprn-svc-id: 1 to 2147483647

interface-name — Specifies the interface name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>service>vpls interface)

Full Context configure service vpls interface

Description This command creates a logical IP routing interface for a VPLS service. Once created, attributes such as IP address and service access points (SAP) can be associated with the IP interface.

The interface command, under the context of services, is used to create and maintain IP routing interfaces within the VPLS service IDs. The IP interface created is associated with the VPLS management routing instance. This instance does not support routing.

Interface names are case-sensitive and must be unique within the group of defined IP interfaces defined for the network core router instance. Interface names in the dotted decimal notation of an IP address are not allowed. For example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either interface names or the IP addresses. Use unique IP address values and IP address names to maintain clarity. Duplicate interface names can exist in different router instances.

Enter a new name to create a logical router interface. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

By default, no default IP interface names are defined within the system. All VPLS IP interfaces must be explicitly defined in an enabled state.

The no form of this command removes the IP interface and the entire associated configuration. The interface must be administratively shut down before issuing the no interface command.

For VPLS services, the IP interface must be shut down before the SAP on that interface is removed.

For VPLS service, ping and traceroute are the only applications supported.

Parameters *ip-int-name* — Specifies the name of the IP interface. Interface names must be unique within the group of defined IP.

An interface name:

- Should not be in the form of an IP address.
- Can be from 1 to 32 alphanumeric characters.
- If the string contains special characters (such as #,$,spaces), the entire string must be enclosed within double quotes.

If ip-int-name already exists within the service ID, the context changes to maintain that IP interface. If ip-int-name already exists within another service ID, an error occurs and the context does not change to that IP interface. If ip-int-name does not exist, the interface is created and the context is changed to that interface for further command processing.

Platforms All

interface

Syntax [**no**] **interface** [*ip-int-name* | *ip-address*]

Context **[Tree]** (debug>router>igmp interface)

Full Context debug router igmp interface

Description This command enables debugging for IGMP interfaces.

The **no** form of this command disables the IGMP interface debugging for the specifies interface name or IP address.

Parameters *ip-int-name* — Debugs the information associated with the specified IP interface name.

ip-address — Debugs the information associated with the specified IP address.

Full Context configure service vprn mld interface

Description Commands in this context configure an Multicast Listener Discovery (MLD) interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of this command deletes the MLD interface. The **shutdown** command in the **config>router>mld>if** context can be used to disable an interface without removing the configuration for the interface.

Default no interface

Parameters *ip-int-name* — Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

Platforms All

interface

Syntax **interface** *ip-int-name* [**secondary**]
no interface *ip-int-name*

Context **[Tree]** (config>service>vprn>ospf>area interface)
[Tree] (config>service>vprn>ospf3>area interface)

Full Context configure service vprn ospf area interface
configure service vprn ospf3 area interface

Description This command creates a context to configure an OSPF interface.

By default interfaces are not activated in any interior gateway protocol, such as OSPF, unless explicitly configured.

The **no** form of this command deletes the OSPF interface configuration for this interface. The **shutdown** command in the **config>router>ospf>if** context can be used to disable an interface without removing the configuration for the interface.

Default no interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-int-name* — Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service vprn interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

secondary — Keyword used to allow multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This keyword can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>service>vprn>pim interface)

Full Context configure service vprn pim interface

Description This command enables PIM on an interface and enables the context to configure interface-specific parameters. By default interfaces are activated in PIM based on the **apply-to** command, and do not have to be configured on an individual basis unless the default values must be changed.

The **no** form of this command deletes the PIM interface configuration for this interface. If the **apply-to** command parameter is configured, then the **no interface** form must be saved in the configuration to avoid automatic (re)creation after the next **apply-to** is executed as part of a reboot.

The **shutdown** command can be used to disable an interface without removing the configuration for the interface.

Default Interfaces are activated in PIM based on the apply-to command.

Parameters *ip-int-name* — Specifies the interface name. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>service>vprn>router-advertisement interface)

Full Context configure service vprn router-advertisement interface

Description This command configures router advertisement properties on a specific interface. The interface must already exist in the **config>router>if** context.

Default No interfaces are configured by default.

Parameters *ip-int-name* — Specifies the interface name. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name* [**dual-stack**]

Context **[Tree]** (config>router>ldp>interface-parameters interface)

Full Context configure router ldp interface-parameters interface

Description This command enables LDP on the specified IP interface.

The **no** form of the command deletes the LDP interface and all configuration information associated with the LDP interface.

The LDP interface must be disabled using the **shutdown** command before it can be deleted.

The user can configure different parameters for IPv4 and IPv6 LDP interfaces by entering **ipv4** or **ipv6** as the next command.

Parameters *ip-int-name* — Specifies the name of an existing interface. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

dual-stack — This optional keyword allows the user to explicitly indicate if this interface should create the IPv4 context automatically or not. With the introduction of LDP IPv6, the creation of the interface does not automatically mean it is to be used for IPv4 like with legacy IPv4 only LDP interface. Thus the dual-stack keyword is an indication to the system that user will manually enable the IPv4, IPv6, or the dual-stack IPv4/IPv6 contexts manually.

The following are some of the key points for this keyword:

- If the keyword is provided, then IPv4 interface context will not be created automatically. If it is not provided, the IPv4 interface context will be created like in the legacy single stack LDP IPv4 interface behavior.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- This new keyword will always show in a configuration.
- When entering an already configured interface, there is no need to provide the keyword, but it will be ignored if provided.
- When deleting a configured interface, the keyword will not be accepted in the **no** version of the **interface** command.

Platforms All

interface

Syntax [**no**] **interface** *interface-name family*

Context **[Tree]** (debug>router>ldp interface)

Full Context debug router ldp interface

Description Use this command for debugging an LDP interface.

Parameters *interface-name* — The name of an existing interface.

family — Specifies the family type.

Values ipv4, ipv6

Platforms All

interface

Syntax **interface** *ip-address* **srlg-group** *group-name* [*group-name*]
no interface *ip-address* [**srlg-group** *group-name*]

Context **[Tree]** (config>router>mpls>srlg-database>router-id interface)

Full Context configure router mpls srlg-database router-id interface

Description This command allows the operator to manually enter the SRLG membership information for any link in the network, including links on this node, into the user SRLG database.

An interface can be associated with up to five SRLG groups for each execution of this command. The operator can associate an interface with up to 64 SRLG groups by executing the command multiple times.

CSPF will not use entered SRLG membership if an interface is not validated as part of a router ID in the routing table.

The **no** form of this command deletes a specific interface entry in this user SRLG database. The *group-name* must already exist in the config>router>if-attribute>srlg-group context.

Parameters *ip-address* — Specifies the IPv4 address in a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

srlg-group *group-name* — Specifies the SRLG group name. Up to 1024 group names can be defined in the config>router>if-attribute context. The SRLG group names must be identical across all routers in a single domain.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>mpls interface)

Full Context configure router mpls interface

Description This command specifies MPLS protocol support on an IP interface. No MPLS commands are executed on an IP interface where MPLS is not enabled. An MPLS interface must be explicitly enabled (**no shutdown**).

The **no** form of this command deletes all MPLS commands such as **label-map** which are defined under the interface. The MPLS interface must be shutdown first in order to delete the interface definition. If the interface is not shutdown, the **no interface** *ip-int-name* command does nothing except issue a warning message on the console indicating that the interface is administratively up.

Default shutdown

Parameters *ip-int-name* — Specifies the name of the network IP interface. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Values 1 to 32 alphanumeric characters.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>rsvp interface)

Full Context configure router rsvp interface

Description This command enables RSVP protocol support on an IP interface. No RSVP commands are executed on an IP interface where RSVP is not enabled.

The **no** form of this command deletes all RSVP commands such as **hello-interval** and **subscription**, which are defined for the interface. The RSVP interface must be **shutdown** it can be deleted. If the interface is not shut down, the **no interface** *ip-int-name* command does nothing except issue a warning message on the console indicating that the interface is administratively up.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default shutdown

Parameters *ip-int-name* — Specifies the name of the network IP interface. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Values 1 to 32

Platforms All

interface

Syntax **interface** [*ip-int-name* | *mt-int-name* | *ip-address*] [**detail**]
no interface

Context **[Tree]** (debug>router>pim interface)

Full Context debug router pim interface

Description This command enables debugging for PIM interface information.

The **no** form of this command disables PIM interface debugging.

Parameters *ip-int-name* — Debugs the information associated with the specified IP interface name.

Values IPv4 or IPv6 interface address

mt-int-name — Debugs the information associated with the specified VPRN ID and group address.

ip-address — Debugs the information associated with the specified IP address.

detail — Debugs detailed IP interface information.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>pim interface)

Full Context configure router pim interface

Description This command creates a PIM interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Interface names are case-sensitive and must be unique within the group of defined IP interfaces defined for **config>router>interface**, **config>service>ies>interface**, and **config>service>ies>subscriber-interface>group-interface**. Interface names must not be in the dotted decimal notation of an IP address. For example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it may be confusing.

By default, no interfaces or names are defined within PIM.

The **no** form of this command removes the IP interface and all the associated configurations.

Parameters *ip-int-name* — Specifies the name of the IP interface, up to 32 characters. Interface names must be unique within the group of defined IP interfaces for **config router interface**, **config service ies interface**, and **config service ies subscriber-interface group-interface** commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on.), the entire string must be enclosed within double quotes.

If the *ip-int-name* already exists, the context is changed to maintain that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

Platforms All

interface

Syntax **interface** *interface-name* [**unnumbered-mpls-tp**]
interface *interface-name* **control-tunnel**
interface *interface-name* **gmpls-loopback**
interface *interface-name* **pdn**
no interface *interface-name*

Context **[Tree]** (config>router interface)

Full Context configure router interface

Description This command creates a logical IP routing or unnumbered MPLS-TP interface. Once created, attributes like IP address, port, or system can be associated with the IP interface.

Interface names are case-sensitive and must be unique within the group of IP interfaces defined for **config router interface** and **config service ies interface**. Interface names must not be in the dotted decimal notation of an IP address.; for example, the name “1.1.1.1” is not allowed, but “int-1.1.1.1” is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it is confusing.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

Although not a keyword, the ip-int-name "**system**" is associated with the network entity (such as a specific router), not a specific interface. The system interface is also referred to as the loopback address.

An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as unnumbered-mpls-tp, then it can only be associated with an Ethernet port or VLAN, using the port command, then either a unicast, multicast, or broadcast remote MAC address may be configured. Only static ARP is supported.

A GMPLS loopback interface is a special type of loopback interface that is used as the IP interface for a GMPLS IP Control Channel (IPCC). RSVP and LMP packets associated with GMPLS are associated with this loopback interface. All other IP protocols are blocked on this interface. One **gmpls-loopback** interface is required for each GMPLS peer node.

The control-tunnel parameter creates a loopback interface representing a GRE tunnel. One IP tunnel can be created in this interface.

Only the primary IPv4 interface address and only one IP tunnel per interface are allowed. Multiple tunnels can be configured using up to four controlTunnel loopback interfaces. A static route can take the new controlTunnel interface as a next hop.

The **no** form of this command removes the IP interface and all the associated configurations. The interface must be administratively shut down before issuing the **no interface** command.

Parameters *interface-name* — Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Values 1 to 32 alphanumeric characters

If the *ip-int-name* already exists, the context is changed to maintain that IP interface. If *ip-int-name* already exists within another service ID or is an IP interface defined within the **config router** commands, an error will occur and the context will not be changed to that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

unnumbered-mpls-tp — Specifies that an interface is an unnumbered MPLS-TP. An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as **unnumbered-mpls-tp**, then it can only be associated with an Ethernet port or VLAN, using the **port** command. A unicast, multicast, or broadcast remote MAC address can be configured using the **static-arp** command. Only static ARP is supported.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

gmpls-loopback — Specifies that the interface is a loopback interface for GMPLS control plane packets.

control-tunnel — Specifies that the interface represents a loopback interface for a GRE tunnel to be used for the GMPLS IPCC.

pdn — Specifies that the interface is a PDN.

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>router-advert interface)

Full Context configure router router-advertisement interface

Description This command configures router advertisement properties on a specific interface. The interface must already exist in the **config**>**router**>**if** context.

Parameters *ip-int-name* — Specifies the interface name. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

interface

Syntax [**no**] **interface** *interface-name*

Context **[Tree]** (config>router>pcp-server>server interface)

Full Context configure router pcp-server server interface

Description This command associates an interface.

The **no** form of this command reverts to the default value.

Parameters *interface-name* — Specifies the interface name, up to 32 characters. The interface name must start with a letter.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface

Syntax [**no**] **interface** [{*ip-int-name* | *ip-address*}]

Context **[Tree]** (debug>router>ip interface)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug router ip interface

Description This command displays the router IP interface table sorted by interface index.

Parameters *ip-int-name* — Only displays the interface information associated with the specified IP interface name.

Values 32 characters maximum

ip-address — Only displays the interface information associated with the specified IP address.

Values The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Values The following values apply to the 7450 ESS:
ipv4-address: a.b.c.d (host bits must be 0)

Platforms All

interface

Syntax [**no**] **interface** *ip-int-name*

Context **[Tree]** (config>router>isis interface)

Full Context configure router isis interface

Description This command creates the context to configure an IS-IS interface.

When an area is defined, the interfaces belong to that area. Interfaces cannot belong to separate areas.

When the interface is a POS channel, the OSINLCP is enabled when the interface is created and removed when the interface is deleted.

The **no** form of this command removes IS-IS from the interface.

The **shutdown** command in the **config>router>isis>interface** context administratively disables IS-IS on the interface without affecting the IS-IS configuration.

Parameters *ip-int-name* — Identify the IP interface name created in the **config>router>interface** context. The IP interface name must already exist.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

interface

Syntax **interface** [*ip-int-name* | *ip-address*]
no interface

Context **[Tree]** (debug>router>isis interface)

Full Context debug router isis interface

Description This command enables debugging for IS-IS interface.

The **no** form of the command disables debugging.

Parameters *ip-address* — When specified, only the interface with the specified interface address is debugged.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ip-int-name — When specified, only the interface with the specified interface name is debugged.

no interface *ip-int-name*

Context **[Tree]** (config>router>ospf>area interface)
[Tree] (config>router>ospf3>area interface)

Full Context configure router ospf area interface
configure router ospf3 area interface

Description This command configures an OSPF interface.

Unless they are explicitly configured, interfaces are not activated, by default, in any interior gateway protocol, such as OSPF.

The **no** form of this command deletes the OSPF interface configuration for this interface. Use the **shutdown** command in the **config**>**router**>**ospf**>**interface** context to disable an interface without removing the configuration for the interface.

Default no interface

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-int-name* — Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for the **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message is returned.

If the IP interface exists in a different area it is moved to this area.

secondary — Keyword used to allow multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This keyword can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

Platforms All

13.182 interface-group-handler

interface-group-handler

Syntax [**no**] **interface-group-handler** *index*

Context **[Tree]** (config interface-group-handler)

Full Context configure interface-group-handler

Description This command creates an interface group handler that can be associated with a number of independent IP links. The purpose of the group is to operationally disable all interfaces in a common group if the number of active links drops below the minimum interface threshold.

The **no** form of this command deletes the interface group handler. All members must be removed before the IGH can be deleted.

Parameters *index* — Identifies the specific Interface Group Handler.

Values 1 to 100

Platforms All

13.183 interface-id

interface-id

Syntax **interface-id** [**ascii-tuple**]
interface-id ifindex
interface-id sap-id
interface-id string *string*
no interface-id

Context **[Tree]** (config>service>ies>if>ipv6>dhcp6>option interface-id)
[Tree] (config>service>vprn>if>ipv6>dhcp6>option interface-id)

Full Context configure service ies interface ipv6 dhcp6-relay option interface-id
configure service vprn interface ipv6 dhcp6-relay option interface-id

Description This command enables the sending of interface ID options in the DHCPv6 relay packet.

The **no** form of this command disables the sending of interface ID options in the DHCPv6 relay packet.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **ascii-tuple** — Specifies that the ASCII-encoded concatenated tuple is used which consists of the access-node-identifier, service-id, and interface-name, separated by "| ".

ifindex — Specifies that the interface index is used. The If Index of a router interface can be displayed using the **show>router>interface>detail** command.

sap-id — Specifies that the SAP identifier is used.

string — Specifies that a string is used.

string — Specifies a string of up to 80 characters long, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

interface-id

Syntax **interface-id** [**ascii-tuple**]
interface-id ifindex
interface-id sap-id
interface-id string *string*
no interface-id

Context **[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>option interface-id)

Full Context configure service vprn subscriber-interface group-interface ipv6 dhcp6 option interface-id

Description This command enables the sending of interface ID options in the DHCPv6 relay packet.

The **no** form of this command disables the sending of interface ID options in the DHCPv6 relay packet.

Parameters **ascii-tuple** — Specifies that the ASCII-encoded concatenated tuple is used which consists of the access-node-identifier, service-id, and interface-name, separated by "| ".

ifindex — Specifies that the interface index is used (the If Index of a router interface can be displayed using the command **show>router>if>detail**).

sap-id — Specifies that the SAP identifier is used.

string — Specifies a string, up to 32 characters long, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed between double quotes.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.184 interface-id-mapping

interface-id-mapping

Syntax [**no**] **interface-id-mapping**

Context **[Tree]** (config>router>dhcp6>server interface-id-mapping)
[Tree] (config>service>vprn>dhcp6>server interface-id-mapping)

Full Context configure router dhcp6 local-dhcp-server interface-id-mapping
configure service vprn dhcp6 local-dhcp-server interface-id-mapping

Description This command enables the behavior where unique /64 prefix is allocated per interface-id, and all clients having the same interface-id get an address allocated out of this /64 prefix for DHCP6. This is relevant for bridged clients behind the same local-loop (and same SAP), where sharing the same prefix allows communication between bridged clients behind the same local-loop to stay local. For SLAAC based assignment, downstream neighbor-discovery is automatically enabled to resolve the assigned address.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context [Tree] (config>router>policy-options>policy-statement>entry>from interface-subnets)

Full Context configure router policy-options policy-statement entry from interface-subnets

Description This command configures the applied router instance and interfaces that are used as matching condition within each policy-statement entry. A maximum of 10 *interface-name* entries is supported, and all entries must belong to the same routing context (either **base** or **service**). The interface subnet policy-statement match criterion is applied to the following unicast use case contexts:

- **export**, when used with OSPFv2, OSPFv3, IS-IS, RIP, RIPng, and BGP
- **route-table-import**, when used with BGP
- **vrf-export**, when used with MP-BGP

The **no** form of this command removes all policies from the configuration.

Default no interface-subnets

Parameters **service** — Specifies the context in which the configured interface exists. By default, the base routing instance is assumed. However, the configured service context is used only when the service is configured.

service-id — Specifies the service ID of the service to match.

Values *service-id* — 1 to 2147483647
svc-name — 64 characters maximum

interface-name — Specifies the interface name, up to 32 characters, to match when exporting the IP address of the associated interface to a routing protocol.

configure service vpls mesh-sdp eth-cfm mep ais-enable interface-support-enable
configure service vpls sap eth-cfm mep ais-enable interface-support-enable
configure service vpls spoke-sdp eth-cfm mep ais-enable interface-support-enable

Description This command enables the AIS function to consider the operational state of the entity on which it is configured. With this command, ETH-AIS on DOWN MEPs are triggered and cleared based on the operational status of the entity on which it is configured. If CCM is also enabled, then transmission of the AIS PDU is based on either the non-operational state of the entity or on any CCM defect condition. AIS generation ceases if both the operational state is UP and the CCM has no defect conditions. If the MEP is not CCM-enabled then the operational state of the entity is the only consideration, assuming this command is present for the MEP. By default, AIS is not generated or stopped based on the state of the entity on which the DOWN MEP is configured.

The **no** form of this command disables the AIS function to consider the operational state of the entity on which it is configured.

Default no interface-support-enabled

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context [Tree] (config>subscr-mgmt>gtp>peer-profile interface-type)

Full Context configure subscriber-mgmt gtp peer-profile interface-type

Description This command specifies the interface applicable for communications to the peer. If the interface type does not match the given context in an uplink context, the peer setup will fail.

The **no** form of this command reverts to the default value.

Default interface-type s2a

Parameters **gn** — Signaling interface with the peer is Gn as specified in 3GPP TS 29.060.

s2a — Signaling interface with the peer is s2a as specified in 3GPP TS 29.274.

s2b — Signaling interface with the peer is s2b as specified in 3GPP TS 29.274.

s11 — Signaling interface with the peer is s11 as specified in 3GPP TS 29.274.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface-type

Syntax **interface-type** {**broadcast** | **point-to-point**}
no interface-type

Context [Tree] (config>service>vprn>isis>if interface-type)

Full Context configure service vprn isis interface interface-type

Description This command configures the IS-IS interface type as either broadcast or point-to-point.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the designated IS-IS overhead if the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to IS-IS and subsequently the IP interface is bound (or moved) to a different interface type, then this command must be entered manually.

The **no** form of this command reverts to the default value.

Default point-to-point — For IP interfaces on SONET channels.

broadcast — For IP interfaces on Ethernet or unknown type physical interfaces.

Special Cases **SONET —** Interfaces on SONET channels default to the point-to-point type.

Ethernet or Unknown — Physical interfaces that are Ethernet or unknown default to the broadcast type.

Parameters **broadcast** — Configures the interface to maintain this link as a broadcast network.

point-to-point — Configures the interface to maintain this link as a point-to-point link.

© 2022 Nokia.

[Tree] (config>service>vprn>ospf3>area>if interface-type)

Full Context configure service vprn ospf area interface interface-type
configure service vprn ospf3 area interface interface-type

Description This command configures the interface type to be one of broadcast, point-to-point, or non-broadcast.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to OSPF and subsequently the IP interface is bound (or moved) to a different interface type, this command must be entered manually.

The **no** form of this command reverts to the default value.

Default point-to-point — If the physical interface is SONET.

broadcast — If the physical interface is Ethernet or unknown.

Special Cases **Virtual-Link —** A virtual link is always regarded as a point-to-point interface and is not configurable.

Parameters **broadcast** — Configures the interface as a broadcast network. To significantly improve adjacency forming and network convergence, configure the network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

point-to-point — Configures the interface as a point-to-point link.

non-broadcast — Configures the interface as a non-broadcast network.

Platforms All

interface-type

Syntax **interface-type** {**ds1** [{**esf** | **sf**}] | **e1** [{**pcm30crc** | **pcm31crc**}]}
no interface-type

Context **[Tree]** (config>system>sync-if-timing>bits interface-type)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system sync-if-timing bits interface-type

Description This command configures the Building Integrated Timing Source (BITS) timing reference.

The **no** form of the command reverts to the default configuration.

Default interface-type ds1 esf

Parameters **ds1 esf** — Specifies Extended Super Frame (ESF). This is a framing type used on DS1 circuits that consists of 24 192-bit frames, The 193rd bit provides timing and other functions.

ds1 sf — Specifies Super Frame (SF), also called D4 framing. This is a common framing type used on DS1 circuits. SF consists of 12 192-bit frames. The 193rd bit provides error checking and other functions. ESF supersedes SF.

e1 pcm30crc — Specifies the pulse code modulation (PCM) type. PCM30CRC uses PCM to separate the signal into 30 user channels with CRC protection.

e1 pcm31crc — Specifies the pulse code modulation (PCM) type. PCM31CRC uses PCM to separate the signal into 31 user channels with CRC protection.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interface-type

Syntax **interface-type** {**broadcast** | **point-to-point**}
no interface-type

Context **[Tree]** (config>router>isis>interface interface-type)

Full Context configure router isis interface interface-type

Description This command configures the IS-IS interface type as either broadcast or point-to-point.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the designated IS-IS overhead if the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to IS-IS and subsequently the IP interface is bound (or moved) to a different interface type, then this command must be entered manually.

The **no** form of this command reverts to the default value.

Default interface-type point-to-point — For IP interfaces on SONET channels.

interface-type broadcast — For IP interfaces on Ethernet or unknown type physical interfaces.

Special Cases **SONET —** Interfaces on SONET channels default to the point-to-point type.

Ethernet or Unknown — Physical interfaces that are Ethernet or unknown default to the broadcast type.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **broadcast** — Configures the interface to maintain this link as a broadcast network.

point-to-point — Configures the interface to maintain this link as a point-to-point link.

no interim-update

Context **[Tree]** (config>router>wlan-gw>mobility-triggered-acct interim-update)
[Tree] (config>service>vprn>wlan-gw>mobility-triggered-acct interim-update)

Full Context configure router wlan-gw mobility-triggered-acct interim-update
configure service vprn wlan-gw mobility-triggered-acct interim-update

Description This command enables the inclusion of counters with a **hold-down** time option in mobility-triggered interim-updates. When enabled, to disable the inclusion of counters, interim updates must be disabled and then re-enabled without the **include-counters** keyword. By default, the **hold-down** time is not imposed.

The **no** form of this command disables generation of flash interim accounting updates to RADIUS when change in location of the UE is detected.

Default no interim-update

Parameters **include-counters** — Specifies the inclusion of counters in mobility triggered interim-updates.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

seconds — Specifies the time, in seconds, that must elapse after a mobility- triggered interim with counters sent for the next mobility-triggered interim with counters to be sent.

Values 60 to 864000

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.192 interim-update-interval

interim-update-interval

no interim-update-interval

Context **[Tree]** (config>app-assure>rad-acct-plcy interim-update-interval)

Full Context configure application-assurance radius-accounting-policy interim-update-interval

Description This command configures the interim update interval.

The **no** form of this command reverts to the default.

Default no interim-update-interval

Parameters *minutes* — Specifies the interval at which subscriber accounting data will be updated. If set no value is specified then no interim updates will be sent.

Values 5 to 1080

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.193 interleave

interleave

Syntax [**no**] **interleave**

Context **[Tree]** (config>router>l2tp>group>mlppp interleave)
[Tree] (config>service>vprn>l2tp>group>mlppp interleave)

Full Context configure router l2tp group mlppp interleave
configure service vprn l2tp group mlppp interleave

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is applicable only to LNS. Interleaving is supported only on MLPPPoX bundles that contain a single member link. If more than one link is present in the MLPPPoX bundle, interleaving is automatically disabled and a TRAP/log (tmnxMlpppBundleIndicatorsChange) is generated.

The minimum supported rate of the link on which interleaving is performed is 1 kb/s.

If configured at this level, interleaving is enabled on all tunnels within the group, unless it is explicitly disable per tunnel.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

interleave

Syntax **interleave** {**always** | **never**}
no interleave

Context **[Tree]** (config>router>l2tp>group>tunnel>mlppp interleave)
[Tree] (config>service>vprn>l2tp>group>tunnel>mlppp interleave)

Full Context configure router l2tp group tunnel mlppp interleave
configure service vprn l2tp group tunnel mlppp interleave

Description This command configures the user of link fragmentation and interleaving and is applicable only to LNS. Interleaving is supported only on MLPPPoX bundles that contain a single member link. If more than one link is present in the MLPPPoX bundle, interleaving is automatically disabled and a TRAP/log (tmnxMlpppBundleIndicatorsChange) is generated.

The minimum supported rate of the link on which interleaving is performed is 1 kb/s.

Interleaving configured on this level overwrites the configuration option under the group hierarchy. If the **no** form of this command is configured for interleaving at this level, the interleaving configuration inherits the configuration option configured under the L2TP group.

The **no** form of this command reverts to the default.

Parameters **always** — Always perform interleaving on single linked MLPPPoX sessions within this tunnel, regardless of the configuration option for interleaving under the group level.

never — Never perform interleaving on single linked MLPPPoX sessions within this tunnel, regardless of the configuration option for interleaving under the group level.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

Context [Tree] (config>service>epipe>sap>frame-relay>frf.12 interleave)
[Tree] (config>service>ipipe>sap>frame-relay>frf.12 interleave)

Full Context configure service epipe sap frame-relay frf.12 interleave
configure service ipipe sap frame-relay frf.12 interleave

Description This command enables interleaving of high priority frames and low priority frame fragments within a FR SAP using FRF.12 end-to-end fragmentation.

When this option is enabled, only frames of the FR SAP non-expedited forwarding class queues are subject to fragmentation. The frames of the FR SAP expedited queues are interleaved, with no fragmentation header, among the fragmented frames. In effect, this provides a behavior like in MLPPP Link Fragment Interleaving (LFI).

When this option is disabled, frames of all the FR SAP forwarding class queues are subject to fragmentation. The fragmentation header is however not included when the frame size is smaller than the user configured fragmentation size. In this mode, the SAP transmits all fragments of a frame before sending the next full or fragmented frame.

The receive direction of the FR SAP supports both modes of operation concurrently, with and without fragment interleaving.

The **no** form of this command restores the default mode of operation.

Default no interleave

interleave

Syntax **interleave no interleave**

Context [Tree] (config>service>vpls>sap>frame-relay>frf.12 interleave)

13.199 internal-ip6-dns

internal-ip6-dns

Syntax [**no**] **internal-ip6-dns**

Context **[Tree]** (config>ipsec>ike-policy>relay-unsol-attr internal-ip6-dns)

Full Context configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip6-dns

Description This command will return IPv6 DNS server address from source (RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG_REQUEST payload.

Default no internal-ip6-dns

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.200 internal-lease-ipsec

internal-lease-ipsec

Syntax [**no**] **internal-lease-ipsec**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>dhcp>server>lease-hold-time-for internal-lease-ipsec)
[Tree] (config>router>dhcp6>server>lease-hold-time-for internal-lease-ipsec)
[Tree] (config>service>vprn>dhcp>server>lease-hold-time-for internal-lease-ipsec)
[Tree] (config>service>vprn>dhcp6>server>lease-hold-time-for internal-lease-ipsec)

Full Context configure router dhcp local-dhcp-server lease-hold-time-for internal-lease-ipsec
configure router dhcp6 local-dhcp-server lease-hold-time-for internal-lease-ipsec
configure service vprn dhcp local-dhcp-server lease-hold-time-for internal-lease-ipsec
configure service vprn dhcp6 local-dhcp-server lease-hold-time-for internal-lease-ipsec

Description This command enables the server to hold up the lease of local IPsec clients.

The **no** form of this command disables the ability of the server to hold up the lease of local IPsec clients.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.201 internal-scheduler-weight-mode

internal-scheduler-weight-mode

Syntax **internal-scheduler-weight-mode** {**default** | **force-equal** | **offered-load** | **capped-offered-load**}
no internal-scheduler-weight-mode

Context [Tree] (config>card>virt-sched-adj internal-scheduler-weight-mode)

Full Context configure card virtual-scheduler-adjustment internal-scheduler-weight-mode

Description This command specifies the internal scheduler (tier 0) weight mode for all ingress queues on a LAG on the card on which it is applied.

Default internal-scheduler-weight-mode default

Parameters **default** — Specifies that ingress queues are weighted based on port speed or, if configured, the hash weight.

force-equal — Specifies that the ingress queues are always equally weighted.

offered-load — Specifies that the ingress queues are weighted based on observed offered load.

capped-offered-load — Specifies that the ingress queues are weighted based on observed offered load capped by PIR.

Platforms All

Use subject to Terms available at: www.nokia.com

internal-scheduler-weight-mode

Syntax **internal-scheduler-weight-mode** {**default** | **force-equal** | **offered-load** | **capped-offered-load**}
no internal-scheduler-weight-mode

Context **[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution internal-scheduler-weight-mode)

Full Context configure qos adv-config-policy child-control bandwidth-distribution internal-scheduler-weight-mode

Description This command specifies the internal scheduler (tier 0) weight mode for the queues on a LAG on which the advanced configuration policy is applied.

Default internal-scheduler-weight-mode default

Parameters **default** — Specifies that queues are weighted based on the port speed or, if configured, the hash weight.

force-equal — Specifies that the queues are always equally weighted.

offered-load — Specifies that the queues are weighted based on the observed offered load.

capped-offered-load — Specifies that the queues are weighted based on the observed offered load capped by PIR.

Platforms All

13.202 intersite-shared

intersite-shared

Syntax **intersite-shared** [**persistent-type5-adv**] [**kat-type5-adv-withdraw**]
no intersite-shared

Context **[Tree]** (config>service>vprn>mvpn intersite-shared)

Full Context configure service vprn mvpn intersite-shared

Description This command specifies whether to use inter-site shared C-trees or not. Optional parameters allow enabling additional inter-site shared functionality. Not specifying an optional parameter when executing the command disables that parameter.

Default n/a

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **persistent-type5-adv** — When specified for inter-site shared trees enabled, this parameter ensures that Type 5 SA routes are generated for the multicast source even if no joins are present for that source. When the parameter is not specified, the Type 5 SA routes are withdrawn where the prune from the last receiver is received for the multicast source.

kat-type5-adv-withdraw — When specified for inter-site shared trees, this parameter allows operators to enable KeepAlive Timers (KAT) on source PEs for ng-MVPN inter-site shared deployments. On a multicast source failure, a KAT expiry on source PEs will trigger a withdrawal of Type-5 Source-Active (S-A) route and switch from (C-S,C-G) to (C-*,C-G). When receiver PEs process reflected Type-5 S-A route withdrawals, they will withdraw their Type-7 ng-MVPN routes to the failed multicast source. The following conditions apply:

- KAT must only be enabled on source PEs.
- Functionality is supported with mLDP and RSVP-TE in the P-instance.
- Local receiver per (C-S, C-G) must be configured on source PEs running KAT.

Platforms All

13.203 interval

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>ccrt-replay interval)
[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>ccrt-replay interval)

Full Context configure subscriber-mgmt diameter-application-policy gx ccrt-replay interval
configure subscriber-mgmt diameter-application-policy gy ccrt-replay interval

Description This command specifies the interval at which CCR-T messages for Diameter Gx or Gy sessions that belong to the Diameter application policy are replayed, until a valid CCA-t response is received or until the configured **max-lifetime** period expires.

The **no** form of this command resets the interval to the default setting.

Default interval 3600

Parameters *seconds* — Specifies the interval at which the CCR-T messages are replayed for a gx session. The messages are replayed until a valid CCA-t response is received or until a 24 hour period expires, whichever comes first.

Values 60 to 86400

Default 3600

© 2022 Nokia.

no interval

Context [Tree] (config>subscr-mgmt>diam-appl-plcy>gx>ccrt-replay interval)
[Tree] (config>subscr-mgmt>diam-appl-plcy>gy>ccrt-replay interval)

Full Context configure subscriber-mgmt diameter-application-policy gx ccrt-replay interval
configure subscriber-mgmt diameter-application-policy gy ccrt-replay interval

Description This command specifies the interval at which CCR-T messages for Diameter Gx or Gy sessions that belong to the Diameter application policy are replayed, until a valid CCA-t response is received or until the configured **max-lifetime** period expires.

The **no** form of this command resets the interval to the default setting.

Default interval 3600

Parameters *seconds* — Specifies the interval at which the CCR-T messages are replayed for a gx session. The messages are replayed until a valid CCA-t response is received or until a 24 hour period expires, whichever comes first.

Values 60 to 86400

Default 3600

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interval

Syntax **interval** *interval*

Context [Tree] (config>redundancy>mc>peer>mcr>ring>cv interval)
[Tree] (config>redundancy>mc>peer>mc>l3-ring>cv interval)

Full Context configure redundancy multi-chassis peer multi-chassis l3-ring cv interval
configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify interval

Description This command specifies the polling interval of the ring-node connectivity verification of this ring node.

The **no** form of this command reverts to the default.

Default interval 5

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *interval* — Specifies the polling interval of the ring-node connectivity verification of this ring node.

Values 1 to 6000

Platforms All

interval

Syntax **interval** *minutes*
no interval

Context **[Tree]** (config>subscr-mgmt>shcv-policy>periodic interval)

Full Context configure subscriber-mgmt shcv-policy periodic interval

Description This command specifies the time interval which all known sources should be verified. The actual rate is dependent on the number of known hosts and intervals.

The **no** form of this command reverts to the default.

Default interval 30 minutes

Parameters *minutes* — Specifies the interval, in minutes, between periodic connectivity checks.

Values 1 to 6000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>aaa>radius-srv-plcy>servers>health-check>test-account interval)

Full Context configure aaa radius-server-policy servers health-check test-account interval

Description This command specifies the intervals at which the test account will send its access requests to probe the RADIUS servers.

Default interval 3

Parameters *seconds* — Specifies the probing interval.

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

interval

Syntax **interval** *seconds*

Context **[Tree]** (config>subscr-mgmt>pfcp-association>heartbeat interval)

Full Context configure subscriber-mgmt pfcp-association heartbeat interval

Description This command configures the interval between successive, successful heartbeats.

Default interval 60

Parameters *seconds* — Specifies the time frame, in seconds, between successive, successful heartbeats. This interval must be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

Values 60 to 180

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interval

Syntax **interval** {**1** | **60**}
no interval

Context **[Tree]** (config>port>ethernet>eth-cfm>mep>ais-enable interval)
[Tree] (config>lag>eth-cfm>mep>ais-enable interval)

Full Context configure lag eth-cfm mep ais-enable interval
configure port ethernet eth-cfm mep ais-enable interval

Description This command specifies the transmission interval of AIS messages in seconds.

The **no** form of this command reverts to the default values.

Parameters **1 | 60** — The transmission interval of AIS messages, in seconds.

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** *deci-seconds*
no interval

Context **[Tree]** (config>service>mac-notification interval)

Full Context configure service mac-notification interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command controls the frequency of subsequent MAC notification messages.

Parameters *deci-seconds* — Specifies the frequency of subsequent MAC notification messages, in deciseconds

Values 1 to 100

Platforms All

interval

Syntax **interval** {**1** | **60**}
no interval

Context **[Tree]** (config>service>epipe>sap>eth-cfm>mep>ais-enable interval)
[Tree] (config>service>epipe>spoke-sdp>eth-cfm>ais-enable interval)

Full Context configure service epipe sap eth-cfm mep ais-enable interval
configure service epipe spoke-sdp eth-cfm ais-enable interval

Description This command specifies the transmission interval of AIS messages in seconds.

Parameters **1 | 60** — Specifies the transmission interval of AIS messages in seconds.

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** *deci-seconds*
no interval

Context **[Tree]** (config>service>vpls>mac-notification interval)

Full Context configure service vpls mac-notification interval

Description This command controls the frequency of subsequent MAC notification messages.

By default, this command inherits the chassis level configuration from **config>service>mac-notification**.

Parameters *deci-seconds* — Specifies the frequency of subsequent MAC notification messages, in deciseconds

Values 1 to 100

Platforms All

Syntax **interval** {**1** | **60**}
no interval

Context **[Tree]** (config>service>vpls>mesh-sdp>eth-cfm>mep>ais-enable interval)
[Tree] (config>service>vpls>spoke-sdp>eth-cfm>mep>ais-enable interval)

Full Context configure service vpls mesh-sdp eth-cfm mep ais-enable interval
configure service vpls spoke-sdp eth-cfm mep ais-enable interval

Description This command specifies the transmission interval of AIS messages in seconds.

Parameters **1 | 60** — The transmission interval of AIS messages in seconds

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>service>vprn>static-route-entry>indirect>cpe-check interval)
[Tree] (config>service>vprn>static-route-entry>next-hop>cpe-check interval)

Full Context configure service vprn static-route-entry indirect cpe-check interval
configure service vprn static-route-entry next-hop cpe-check interval

Description This optional parameter specifies the interval between ICMP pings to the target IP address.

Default interval 1

Parameters *seconds* — An integer interval value.

Values 1 to 255

Platforms All

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>router>mpls>lsp-self-ping interval)

Full Context configure router mpls lsp-self-ping interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the interval at which LSP Self Ping packets are periodically sent on a candidate path of an RSVP LSP. This value is used for all LSPs that have LSP Self Ping enabled.

The **no** form of this command reverts to the default value.

Default interval 1

Parameters *seconds* — Specifies the value, in seconds, used as the fast retry timer for a secondary path.

Values 1 to 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** {**one-time** | *minimum-interval*}

Context **[Tree]** (config>app-assure>group>http-notif interval)

Full Context configure application-assurance group http-notification interval

Description This command configures the minimum interval in between notification messages. It can be set to **one-time** or a value in minutes from 1 to 1440.

The **no** form of this command removes the interval from the http-notification policy.

Default interval one-time

Parameters *minimum-interval* — Represents the minimum interval value in minutes in between two http notifications.

Values 1 to 1440

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval

Syntax **interval** *seconds*

Context **[Tree]** (config>ipsec>tnl-temp>icmp6-gen>pkt-too-big interval)
[Tree] (config>service>ies>if>ipsec>ipsec-tunnel>icmp6-gen>pkt-too-big interval)
[Tree] (config>router>if>ipsec-tunnel>icmp-gen>pkt-too-big interval)

Full Context configure ipsec tunnel-template icmp6-generation pkt-too-big interval
configure router interface ipsec-tunnel icmp-gen pkt-too-big interval
configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval

Description This command configures the maximum interval during which messages can be sent.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the maximum interval during which messages can be sent, in seconds.

Values 1 to 60

Default 10

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec tunnel-template icmp6-generation pkt-too-big interval

VSR

- configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval

[Tree] (config>service>vprn>if>sap>ipsec-tun>icmp6-gen>pkt-too-big interval)

Full Context configure ipsec tunnel-template icmp6-generation pkt-too-big interval
configure router interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval
configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval
configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval
configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big interval

Description This command configures the interval for sending ICMPv6 Packet Too Big (code 2) messages. The maximum number of messages that can be sent during the interval is configured by the **message-count** command.

The **no** form of the command reverts to the default value.

Default interval 10

Parameters *seconds* — Specifies the time, in seconds, for sending 'message-count' ICMPv6 messages

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big interval
- configure ipsec tunnel-template icmp6-generation pkt-too-big interval

- configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big interval

interval

Syntax **interval** *minutes*
no interval

Context **[Tree]** (config>test-oam>ldp-treetrace>path-discovery interval)

Full Context configure test-oam ldp-treetrace path-discovery interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the frequency of the LDP ECMP OAM path discovery. Every interval, the node sends LSP trace messages to attempt to discover the entire ECMP path tree for a given destination FEC.

The **no** form of this command removes the value from the configuration.

Default no interval

Parameters *minutes* — Specifies the number of minutes to wait before repeating the LDP tree auto discovery process.

Values 60 to 1440

Platforms All

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>test-oam>icmp>ping-template interval)

Full Context configure test-oam icmp ping-template interval

Description This command configures the packet transmit interval used when the interface is operational and possibly transitioning from up to down, but not down to up, because of the ping-template function.

The **no** form of this command reverts to the default value.

Default interval 60

Parameters *seconds* — Sets the packet transmit interval, in seconds, when the interface is operational.

Values 1 to 60

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** *minutes*
no interval

Context **[Tree]** (config>test-oam>ldp-treetrace>path-probing interval)

Full Context configure test-oam ldp-treetrace path-probing interval

Description This command configures the frequency of the LSP Ping messages used in the path probing phase to probe the paths of all LDP FECs discovered by the LDP tree trace path discovery.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command resets the interval to its default value.

Default no interval

Parameters *minutes* — Specifies the number of minutes to probe all active ECMP paths for each LDP FEC.

Values 1 to 60

Platforms All

interval

Syntax **interval** *interval*
no interval

Context **[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy interval)

Full Context configure saa test type-multi-line lsp-ping sr-policy interval
configure saa test type-multi-line lsp-trace sr-policy interval

Description This command configures the number of seconds to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

The **no** form of this command reverts to the default value.

Default interval 1

Parameters *interval* — Specifies the number of seconds to wait before the next message request is sent.

Values 1 to 10

Default 1

Platforms All

interval

Syntax **interval** *milliseconds*
no interval

Context **[Tree]** (config>oam-pm>session>ethernet>dmm interval)
[Tree] (config>oam-pm>session>ethernet>lmm interval)

Full Context configure oam-pm session ethernet dmm interval
configure oam-pm session ethernet lmm interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command defines the message period or probe spacing for the transmission of the DMM or LMM frame.

The **no** form of this command sets the interval to the default. If an LMM test is in **no shutdown** state, it always has timing parameters, whether default or operator configured.

Parameters *milliseconds* — Specifies the number of milliseconds between the transmission of the DMM or LMM frames. The default value for the DMM or LMM interval is different than the default interval for SLM. This is intentional.

Values 100, 1000, 10000

Default 1000

Platforms All

interval

Syntax **interval** *milliseconds*
no interval

Context **[Tree]** (config>oam-pm>session>ip>twamp-light interval)

Full Context configure oam-pm session ip twamp-light interval

Description This command defines the message period, or probe spacing, for transmitting a TWAMP Light frame.

The **no** form of this command sets the interval to the default value.

Default interval 1000

Parameters *milliseconds* — Specifies the number of milliseconds between TWAMP Light frame transmission.

Values 100, 1000, 10000

Default 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** *milliseconds*
no interval

Context **[Tree]** (config>oam-pm>session>mpls>dm interval)

Full Context configure oam-pm session mpls dm interval

Description This command defines the message period, or probe spacing, to transmit a DM frame.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command sets the interval to the default value.

Parameters *milliseconds* — Specifies the number of milliseconds between DM frame transmissions.

Values 1000, 2000, 3000, 4000, 5000, 6000, 7000, 8000, 9000, 10000

Default 1000

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval

Syntax **interval** [*seconds*]
no interval

Context **[Tree]** (config>filter>redirect-policy>dest>ping-test interval)

Full Context configure filter redirect-policy destination ping-test interval

Description This command specifies the amount of time, in seconds, between consecutive requests sent to the far end host.

Default interval 1

Parameters *seconds* — Specifies the amount of time, in seconds, between consecutive requests sent to the far end host.

Values 1 to 60

Platforms All

interval

Syntax **interval** *seconds*
no interval

Context **[Tree]** (config>router>static-route-entry>indirect>cpe-check interval)

- configure service vprn interface ipsec ipsec-tunnel icmp-generation frag-required interval
- configure router interface ipsec ipsec-tunnel icmp-generation frag-required interval
- configure service ies interface ipsec ipsec-tunnel icmp-generation frag-required interval

interval

Syntax **interval** *seconds*

Context **[Tree]** (config>test-oam>link-meas>template interval)

Full Context configure test-oam link-measurement measurement-template interval

Description This command configures the length of time between test packet transmission.

Default interval 1

Parameters *seconds* — Specifies the elapsed time between transmission of test packets for the specified template

Values 1 to 10

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.204 intervals-stored

intervals-stored

Syntax **intervals-stored** *intervals*
no intervals-stored

Context **[Tree]** (config>oam-pm>session>meas-interval intervals-stored)

Full Context configure oam-pm session meas-interval intervals-stored

Description This command defines the number of completed measurement intervals per session to be stored in volatile system memory. The entire block of memory is allocated for the measurement interval when the test is active (**no shutdown**) to ensure memory is available. The numbers are increasing from 1 to the configured value + 1. The active pm data is stored in the interval number 1 and older runs are stored, in order, to the upper most number with

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

the oldest rolling off when the number of completed measurement intervals exceeds the configured value+1. As new test measurement intervals complete for the session, the stored intervals are renumbered to maintain the described order. Use caution when setting this value. There must be a balance between completed runs stored in volatile memory and the use of the write-to-flash function of the accounting policy.

The **5-mins** and **15-mins** measurement intervals share the same (1 to 96) retention pool. In the event that both intervals are required, the sum total of both intervals cannot exceed 96. The **1-hour** and **1-day** measurement intervals utilize their own ranges.

If this command is omitted when configuring the measurement interval, the default value is used.

The **no** form of the command reverts to the default.

Default intervals-stored 1

Parameters *intervals* — Specifies the number of measurement intervals.

Values **5-mins**: 1 to 96
15-mins: 1 to 96
1-hour: 1 to 24
1-day: 1

Default **5-mins**: 32
15-mins: 32
1-hour: 8
1-day: 1

13.205 interworking

interworking

Syntax **interworking** *frf-5*
no interworking

Context **[Tree]** (config>service>apipe interworking)

Full Context configure service apipe interworking

Description This command specifies the interworking function that should be applied for packets that ingress or egress SAPs that are part of an Apipe service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Interworking must be configured before adding a Frame-Relay SAP to an Apipe service. Interworking is applicable only when the two endpoints (that is, the two SAPs or the SAP and the spoke SDP) are of different types. Also, there are limitations on the combinations of SAP type, vc-type, and interworking values as shown in Table 66.

Table 66 **SAP Types, VC-Types and Interworking Values**

SAP Type	Allowed VC-Type Value	Allowed Interworking Value
ATM VC	atm-vcc, atm-sdu	—
	fr-dlci	
FR DLCI	fr-dlci	—
	atm-sdu	frf-5

Parameters *frf-5* — Specifies Frame Relay to ATM Network Interworking (FRF.5).

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

13.206 invert-data

invert-data

Syntax [**no**] **invert-data**

Context **[Tree]** (config>port>tdm>ds1 invert-data)
[Tree] (config>port>tdm>e1 invert-data)

Full Context configure port tdm ds1 invert-data
configure port tdm e1 invert-data

Description This command causes all data bits to be inverted, to guarantee ones density. Typically used with AMI line encoding.

Default no invert-data

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.207 iom

iom

Syntax **iom** *slot-number* **type** {[**load-balancer**] [**ue-anchor**]}
no iom *slot-number*

Context **[Tree]** (config>isa>wlan-gw-group iom)

Full Context configure isa wlan-gw-group iom

Description This command designates the specified IOM as a WLAN-GW IOM. Each WLAN-GW IOM must be provisioned with two ISA-BB modules on a hardware chassis and with an ISA-BB module in the first MDA slot in the VSR.

The **no** form of this command removes the IOM from the configuration.

Parameters *slot-number* — Indicates the IOM slot to be used in the WLAN-GW group.

Values 1 to 10

type {[**load-balancer**] [**ue-anchor**]} — This parameter is supported on the VSR only. It determines if an IOM slot is used for load-balancing or UE anchoring and processing, or both. When the **wlan-gw-group** has only a single IOM, it is required to put this IOM in both modes at the same time.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

iom

Syntax **iom** [**detail**]
no iom

Context **[Tree]** (debug>router>mpls>event iom)

Full Context debug router mpls event iom

Description This command reports MPLS debug events originating from the XMA.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about MPLS events originating from the XMA.

Platforms All

13.208 ip

ip

Syntax **ip** *address*
no ip

Context **[Tree]** (config>service>vpls>mcr-default-gtw ip)

Full Context configure service vpls mcr-default-gtw ip

Description This command relates to a system configured for Dual Homing in L2-TPSDA. It defines the IP address used when the system sends out a gratuitous ARP on an active SAP after a ring heals or fails in order to attract traffic from subscribers on the ring with connectivity to that SAP.

The **no** form of this command reverts to the default.

Default no ip

Parameters *address* — Specifies the IP address in a.b.c.d. format.

Platforms All

ip

Syntax **ip** *ip-filter-id*
no ip

Context **[Tree]** (config>service>template>epipe-sap-template>egress>filter ip)
[Tree] (config>service>template>epipe-sap-template>ingress>filter ip)

Full Context configure service template epipe-sap-template egress filter ip
configure service template epipe-sap-template ingress filter ip

Description This command associates an existing IP filter policy with the template.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

Parameters *ip-filter-id* — Specifies the IP filter policy ID. The filter ID must already exist within the created IP filters.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip

Syntax **ip** *name*
no ip

Context **[Tree]** (config>service>template>epipe-sap-template>egress>filter-name ip)
[Tree] (config>service>template>epipe-sap-template>ingress>filter-name ip)

Full Context configure service template epipe-sap-template egress filter-name ip
configure service template epipe-sap-template ingress filter-name ip

Description This command associates an existing IP filter policy with the template.

Parameters *name* — Specifies the IP filter policy name, up to 64 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip

Syntax **ip** *name*
no ip

Context **[Tree]** (config>service>template>vpls-sap-template>egress>filter-name ip)
[Tree] (config>service>template>vpls-sap-template>ingress>filter-name ip)

Full Context configure service template vpls-sap-template egress filter-name ip
configure service template vpls-sap-template ingress filter-name ip

Description This command associates an existing IP filter policy with the template.

Parameters *name* — Specifies the IP filter policy name, up to 64 characters.

Platforms All

ip

Syntax [**no**] **ip** *ip-address*

Context **[Tree]** (debug>service>id>arp-host ip)

Full Context debug service id arp-host ip

Description This command displays ARP host events for a particular IP address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip

Syntax [**no**] **ip** *ip-address*

Context **[Tree]** (debug>service>id>host-connectivity-verify ip)

Full Context debug service id host-connectivity-verify ip

Description This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular IP address.

Parameters *ip-address* — The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip

Syntax [**no**] **ip** *ip-address*[/*mask*]

Context **[Tree]** (config>app-assure>group>policy>transit-ip-policy>static-aa-sub ip)

Full Context configure application-assurance group policy transit-ip-policy static-aa-sub ip

Description This command configures the /32 IP address for a static transit aa-sub.

The **no** form of this command deletes the ip address assigned to the static transit aa-sub from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the IP address in a.b.c.d form.

Values

ipv6-address/prefix:	ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D prefix-length /32 to /64

ip

Syntax **ip src** *ip-address* **dest** *ip-address*
no ip

Context **[Tree]** (config>mirror>mirror-dest>encap>layer-3-encap>gateway ip)

Full Context configure mirror mirror-dest encap layer-3-encap gateway ip

Description This command configures the source IPv4 address and destination IPv4 address to use in the IPv4 header part of the routable LI encapsulation.

Parameters **src** *ip-address* — Specifies source IP address.

Values a.b.c.d

dest *ip-address* — Specifies destination IP address.

Values a.b.c.d

Platforms All

ip

Syntax **ip**

Context **[Tree]** (config>oam-pm>session ip)

Full Context configure oam-pm session ip

Description Commands in this context configure the IP-specific source and destination information, the priority, and the IP test tools on the launch point.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ip

Syntax [**no**] **ip** *ip-filter-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>filter>system-filter ip)

Full Context configure filter system-filter ip

Description This command activates an IPv4 system filter policy. Once activated, all IPv4 ACL filter policies that chain to the system filter (**config>filter>ip-filter>chain-to-system-filter**) will automatically execute system filter policy rules first.

The **no** form of the command deactivates the system filter policy.

Parameters *ip-filter-id* — Specifies the existing IPv4 filter policy with scope **system**. This parameter can either be expressed as a decimal integer, or as an ASCII string of up to 64 characters.

Values 1 to 65535 or the filter policy name (*filter-name*, 64 char max)

Platforms All

ip

Syntax [**no**] **ip**

Context [Tree] (debug>router ip)

Full Context debug router ip

Description This command configures debugging for IP.

Platforms All

ip

Syntax **ip**

Context [Tree] (config>system ip)

Full Context configure system ip

Description This command configures system-wide IP router parameters.

Platforms All

ip

Syntax **ip** *ip-address netmask*
ip *ip-address/mask*
ip ip-prefix-list *ip-prefix-list-name*
no ip

© 2022 Nokia.

Context [Tree] (config>filter>ip-filter>entry>match ip)

Full Context configure filter ip-filter entry match ip

Description This command configures a destination or source IP address to be used as an IP match criterion.

Parameters *ip-address/mask* — Specifies the IPv4 address and mask.

Values

ip-address	a.b.c.d

netmask — Specifies the name of the IP prefix list, up to 256 characters.

ip-prefix-list-name — Specifies the name of an IP prefix list, up to 32 characters.

Platforms All

ip

Syntax **ip** *ipv6-address ipv6-address-mask*
ip *ipv6-address/mask*
ip ipv6-prefix-list *prefix-list-name*
no ip

Context [Tree] (config>filter>ipv6-filter>entry>match ip)

Full Context configure filter ipv6-filter entry match ip

Description This command configures a destination or source IP address to be used as an IP match criterion.

Parameters *ipv6-address/mask* — Specifies the IPv6 address and mask.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

ip-prefix-list-name — Specifies the name of an IPv6 prefix list, up to 32 characters.

13.209 ip-addr-backup

ip-addr-backup

Syntax **ip-addr-backup** *ip-address*[:*port*]
no ip-addr-backup

Context **[Tree]** (config>sflow>receiver ip-addr-backup)

Full Context configure sflow receiver ip-addr-backup

Description This command configures back-up IPv4 or IPv6 destination address for the sFlow agent to send sFlow datagrams to. Optionally a destination port can also be configured (by default port 6343 is used).

The **no** form of this command deletes backup sFlow receiver destination.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address to send the sFlow datagrams to.

Values

a.b.c.d	(IPv4)
x:x:x:x:x:x:x:x	(IPv6)
[x:x:x:x:x:x:x:x]	(IPv6)
x - [0 to FFFF]H	

port — Specifies the UDP destination port to send the sFlow datagrams to.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-s, 7950 XRS

13.210 ip-addr-primary

ip-addr-primary

Syntax **ip-addr-primary** *ip-address*[:*port*]
no ip-addr-primary

Context **[Tree]** (config>sflow>receiver ip-addr-primary)

Full Context configure sflow receiver ip-addr-primary

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures primary IPv4 or IPv6 destination address for the sFlow agent to send sFlow datagrams to. Optionally a destination port can also be configured (by default port 6343 is used).

The **no** form of this command deletes primary sFlow receiver destination.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address to send the sFlow datagrams.

Values

a.b.c.d	(IPv4)
x:x:x:x:x:x:x:x	(IPv6)
[x:x:x:x:x:x:x:x]	(IPv6)
x - [0..FFFF]H	

port — Specifies the UDP destination port to send the sFlow datagrams.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-s, 7950 XRS

13.211 ip-addr1

ip-addr1

Syntax **ip-addr1** {**eq** | **neq**} *ip-address*
no ip-addr1

Context **[Tree]** (debug>app-assure>group>traffic-capture>match ip-addr1)

Full Context debug application-assurance group traffic-capture match ip-addr1

Description This command configures debugging on IP address 1.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.212 ip-addr2

ip-addr2

Syntax **ip-addr2** {**eq** | **neq**} *ip-address*
no ip-addr2

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (debug>app-assure>group>traffic-capture>match ip-addr2)

Full Context debug application-assurance group traffic-capture match ip-addr2

Description This command configures debugging on IP address 2.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.213 ip-address

ip-address

Syntax **ip-address** *ip-address*
no ip-address

Context [Tree] (config>aaa>isa-radius-plcy>servers>server ip-address)

Full Context configure aaa isa-radius-policy servers server ip-address

Description This command configures the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Default no ip-address

Parameters *ip-address* — Specifies the IP address of the RADIUS server.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.214 ip-advertise-routes

ip-advertise-routes

Syntax **ip-advertise-routes**

Context [Tree] (config>subscr-mgmt>isa-svc-chain>evpn>export ip-advertise-routes)

Full Context configure subscriber-mgmt isa-service-chaining evpn export ip-advertise-routes

Description Commands in this context configure EVPN routes to be advertised to a BGP EVPN peer participating in service chaining.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.215 ip-assigned

ip-assigned

Syntax [**no**] **ip-assigned**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query>state ip-assigned)

Full Context configure subscriber-mgmt wlan-gw ue-query state ip-assigned

Description This command enables matching on UEs in an IP-assigned state, meaning that the UE already has an IP assigned but it is not yet authorized. This usually only applies when **auth-on-dhcp** is not configured.

The **no** form of this command disables matching on UEs in an IP-assigned state, unless all state matching is disabled.

Default no ip-assigned

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.216 ip-assigned-authorized

ip-assigned-authorized

Syntax [**no**] **ip-assigned-authorized**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query>state ip-assigned-authorized)

Full Context configure subscriber-mgmt wlan-gw ue-query state ip-assigned-authorized

Description This command enables matching on UEs in an IP-assigned and authorized state, meaning that the UE already has an IP assigned and is authorized, but is not yet promoted to a final state such as ESM or DSM. This applies to UEs authenticated by distributed RADIUS proxy without **auth-on-dhcp** configured. UEs move to this state upon DHCP completion and continue to a more final state (such as DSM, ESM, or portal) upon receiving the first data packet.

The **no** form of this command disables matching on UEs in an IP-assigned and authorized state, unless all state matching is disabled.

Default no ip-assigned-authorized

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.217 ip-cache

ip-cache

Syntax **ip-cache**

Context **[Tree]** (config>app-assure>group>dns-ip-cache ip-cache)

Full Context configure application-assurance group dns-ip-cache ip-cache

Description This command configures the dns-ip-cache cache parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.218 ip-can-type

ip-can-type

Syntax [**no**] **ip-can-type**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp ip-can-type)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp ip-can-type

Description This command includes the ip-can-type.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.219 ip-criteria

ip-criteria

Syntax [**no**] **ip-criteria**

Context **[Tree]** (config>qos>sap-egress ip-criteria)
[Tree] (config>qos>sap-ingress ip-criteria)

Full Context configure qos sap-egress ip-criteria
configure qos sap-ingress ip-criteria

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description IP criteria-based SAP ingress or egress policies are used to select the appropriate ingress or egress queue or policer and corresponding forwarding class and packet profile for matched traffic.

This command is used to enter the context to create or edit policy entries that specify IP criteria such as IP quintuple lookup or DiffServ code point.

The software implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

The **no** form of this command deletes all the entries specified under this node. When IP criteria entries are removed from a SAP ingress or egress policy, the IP criteria is removed from all services where that policy is applied.

Platforms All

ip-criteria

Syntax [**no**] **ip-criteria**

Context **[Tree]** (config>qos>network>ingress ip-criteria)
[Tree] (config>qos>network>egress ip-criteria)

Full Context configure qos network egress ip-criteria
configure qos network ingress ip-criteria

Description IP criteria-based network ingress and egress policies are used to select the appropriate ingress or egress queue or policer, and the corresponding forwarding class and packet profile for matched traffic. This command is used to enter the context to create or edit policy entries that specify IP criteria such as IP quintuple lookup or DSCP.

The 7750 SR OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. Entries must be sequenced correctly from most to least explicit.

The ingress classification only applies to the outer IP header of non-tunneled traffic. The only exception is for traffic received on a Draft Rosen tunnel, for which only classification on the outer IP header is supported.

Attempting to apply a network QoS policy containing an **ip-criteria** statement to any object except a network IP interface will result in an error.

The **no** form of this command deletes all entries specified under this node. When IP criteria entries are removed from a network policy, the IP criteria are removed from all network interfaces to which that policy is applied.

Platforms All

13.220 ip-exception

ip-exception

Syntax **ip-exception** *filter-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no ip-exception

Context [Tree] (config>router>if>ipsec ip-exception)
[Tree] (config>service>ies>if>ipsec ip-exception)
[Tree] (config>service>vprn>if>ipsec ip-exception)

Full Context configure router interface ipsec ip-exception
configure service ies interface ipsec ip-exception
configure service vprn interface ipsec ip-exception

Description This command configures the IP exception filter for the secured interface. All ingress traffic matching by the specified filter bypasses IPsec processing.

The **no** form of this command removes the policy from the configuration.

Default no ip-exception

Parameters *filter-id* — Specifies IP filter policy that will be used to bypass encryption.

Platforms VSR

ip-exception

Syntax **ip-exception** *filter-id* [**create**]
no ip-exception *filter-id*

Context [Tree] (config>filter ip-exception)

Full Context configure filter ip-exception

Description Commands in this context configure the specified IPv4 exception filter.

The **no** form of the command deletes the IPv4 exception filter.

Parameters *filter-id* — Specifies the IPv4 filter policy ID expressed as a decimal integer.

Values 1 to 65535

create — This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms VSR

ip-exception

Syntax **ip-exception** *filter-id* **direction** {**inbound** | **outbound**}
no ip-exception direction {**inbound** | **outbound**}

Context [Tree] (config>router>if>group-encryption ip-exception)

Full Context configure router interface group-encryption ip-exception

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command associates an IP exception filter policy with an NGE-enabled router interface to allow packets matching the exception criteria to transit the NGE domain as clear text.

When an exception filter is added for inbound traffic, packets matching the criteria in the IP exception filter policy are allowed to be received in clear text even if an inbound key group is configured. If no inbound key group is configured, then associated inbound IP exception filter policies will be ignored.

When an exception filter is added for outbound traffic, packets matching the criteria in the IP exception filter policy are not encrypted when sent out of the router interface even if an outbound key group is configured. If no outbound key group is configured, then associated outbound IP exception filter policies will be ignored.

The **no** form of this command removes the IP exception filter policy from the specified direction.

Default no ip-exception direction inbound
no ip-exception direction outbound

Parameters *filter-id* — Specifies the IP exception filter policy. The IP exception ID or exception name must have already been created.

Values 1 to 6553, *filter-name* (64 characters maximum)

inbound — Binds the exception filter policy in the inbound direction.

outbound — Binds the exception filter policy in the outbound direction.

Platforms VSR

13.221 ip-fast-reroute

ip-fast-reroute

Syntax [**no**] **ip-fast-reroute**

Context **[Tree]** (config>router ip-fast-reroute)

Full Context configure router ip-fast-reroute

Description This command enables IP Fast-Reroute (FRR) feature on the system.

This feature provides for the use of a Loop-Free Alternate (LFA) backup next-hop for forwarding in-transit and CPM generated IP packets when the primary next-hop is not available. IP FRR is supported on IPv4 and IPv6 OSPF/IS-IS prefixes forwarded in the base router instance to a network IP interface or to an IES SAP interface or spoke interface. It is also supported for VPRN VPN-IPv4 OSPF prefixes and VPN-IPv6 OSPF prefixes forwarded to a VPRN SAP interface or spoke interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

IP FRR also provides a LFA backup next-hop for the destination prefix of a GRE tunnel used in an SDP or in VPRN auto-bind.

When any of the following events occurs, IGP instructs in the fast path on the XMAs to enable the LFA backup next-hop:

- OSPF/IS-IS interface goes operationally down: physical or local admin shutdown.
- Timeout of a BFD session to a next-hop when BFD is enabled on the OSPF/IS-IS interface

When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Therefore, the IP prefix will resolve to the multiple equal-cost primary next-hops that provide the required protection.

The **no** form of this command disables the IP FRR feature on the system

Default no ip-fast-reroute

ip-filter

Syntax **ip-filter** *ip-filter-id* **entry** *entry-id* [*entry-id*]
no ip-filter *ip-filter-id* [**entry** *entry-id*]

Context **[Tree]** (config>mirror>mirror-source ip-filter)

Full Context configure mirror mirror-source ip-filter

Description This command enables mirroring of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP or IP interface, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IP filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IP filters are mirrored. Mirroring of IP filter entries must be explicitly defined.

The **no ip-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters *ip-filter-id* — Specifies the IP filter ID whose entries are mirrored. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ip-filter-id* is defined on a SAP or IP interface.

Values 1 to 65535
name, up to 64 characters

entry-id — Specifies the IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

Values 1 to 2097151

Platforms All

ip-filter

Syntax [**no**] **ip-filter** *ip-filter-id*

Context **[Tree]** (config>li>li-filter-block-reservation>li-reserved-block ip-filter)

Full Context configure li li-filter-block-reservation li-reserved-block ip-filter

Description This command configures to which normal IPv4 address filters the entry reservation is applied.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

The **no** form of this command removes the IPv4 filter ID from the configuration.

Parameters *ip-filter-id* — Specifies the filter identification identifies the normal IPv4 address filters.

Values {*filter-id* | *filter-name*}

filter-id:	1 to 65535
filter-name:	up to 64 characters (*filter-name* is an alias for input only. The *filter-name* gets replaced with an id automatically by SR OS in the configuration).

Use subject to Terms available at: www.nokia.com

Description This command specifies the IP filter(s) into which the entries from the specified li-ip-filter are to be inserted. The **li-ip-filter** and **ip-filter** must already exist before the association is made. If the normal IP filter is deleted then the association is also removed (and not re-created if the IP filter comes into existence in the future).

The **no** form of this command removes the IP filter name from the configuration.

Parameters *ip-filter-id* — Specifies an existing IP filter policy.

Values *filter-id* — 1 to 65535
filter-name — up to 64 characters

Platforms All

ip-filter

Syntax **ip-filter** *ip-filter-id* **entry** *entry-id* [*entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** *session-id* [*session-id*]]
no ip-filter *ip-filter-id* [**entry** *entry-id* [*entry-id*]]

Context **[Tree]** (config>li>li-source ip-filter)

Full Context configure li li-source ip-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be intercepted to the destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error occurs. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP, IP interface or subscriber, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are intercepted. Ingress packets are sent to the destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are intercepted. Egress packets are sent to the destination after all egress packet modifications.

An *entry-id* within an IP filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

By default, no packets matching any IP filters are intercepted. Interception of IP filter entries must be explicitly defined.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, interception of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being intercepted, no error will occur for that *entry-id* and the command will execute normally.

Parameters *ip-filter-id* — Specifies the IP filter ID whose entries are to be intercepted. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Intercepting packets will commence when the *ip-filter-id* is defined on a SAP or IP interface.

entry-id — Specifies the IP filter entries to use as match criteria for lawful intercept (LI). The **entry** keyword begins a list of *entry-id*'s for interception. Multiple *entry-id* entries can be specified with a single command. Each *entry-id* must be separated by a space. Up to <N><n> 8 entry IDs may be specified in a single command.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

intercept-id — Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This intercept ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value is inserted. When the mirror service is configured with **ip-gre** routable encapsulation, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) for **nat li-source** entries that are using a mirror service that is not configured with routable encap

1 to 1073741824 (30b) for all types of **li-source** entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

1 to 536870912 (29b) for all types of **li-source** entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the **direction-bit** enabled.

session-id — Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-udp-shim routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

ip-filter

Syntax **ip-filter** *ip-filter-id* **entry** *entry-id* [*entry-id*]
no ip-filter *ip-filter-id* [**entry** *entry-id*]

Context **[Tree]** (debug>mirror-source ip-filter)

Full Context debug mirror-source ip-filter

Description This command enables mirroring of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP or IP interface, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IP filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IP filters are mirrored. Mirroring of IP filter entries must be explicitly defined.

The **no ip-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-filter-id* — The IP filter ID whose entries are mirrored. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ip-filter-id* is defined on a SAP or IP interface.

entry-id — The IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. A maximum of eight *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

Platforms All

ip-filter

Syntax **ip-filter** *filter-id* [**name**] [**create**]
no ip-filter {*filter-id* | *filter-name*}

Context **[Tree]** (config>filter ip-filter)

Full Context configure filter ip-filter

Description Commands in this context configure the specified IPv4 filter policy.

The **no** form of the command deletes the IPv4 filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

Default none

Parameters *filter-id* — Specifies the IPv4 filter policy ID expressed as a decimal integer.

Values 1 to 65535

name — Configures an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

filter-name — Specifies a string, up to 64 characters, uniquely identifying this IPv4 filter policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

create — This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

ip-filter

Syntax **ip-filter** *src-filter-id* [**src-entry** *src-entry-id*] **to** *dst-filter-id* [**dst-entry** *dst-entry-id*] [**overwrite**]

Context **[Tree]** (config>filter>copy ip-filter)

Full Context configure filter copy ip-filter

Description This command copies an existing filter entry for a specific filter ID to another filter ID. The command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

Parameters *src-filter-id* — Identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword (**ip-filter**).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

dst-filter-id — Identifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

overwrite — Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

Platforms All

13.223 ip-filter-max-size

ip-filter-max-size

Syntax **ip-filter-max-size** {*value* | **default**}

Context **[Tree]** (config>service>vprn>flowspec ip-filter-max-size)

Full Context configure service vprn flowspec ip-filter-max-size

Description This command configures the maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy for a specified routing instance. FlowSpec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and “offset + ip-filter-max-size – 1”.

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv4 filter that embeds IPv4 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv4 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where *N*<*M*, then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

Default ip-filter-max-size default

Parameters *value* — The maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

Values 0 to 262143

default — Configures the maximum size as 512.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-filter-max-size

Syntax **ip-filter-max-size** {*value* | **default**}

Context **[Tree]** (config>router>flowspec ip-filter-max-size)

Full Context configure router flowspec ip-filter-max-size

Description This command configures the maximum number of FlowSpec routes or rules that can be embedded into the auto-created embedded filter (fSpec-*X*). FlowSpec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between “embedding offset + 1” and “embedding offset + ip-filter-max-size”.

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv4 filter that embeds IPv4 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv4 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where *N*<*M*, then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

Default ip-filter-max-size 512

Parameters *value* — Specifies the maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

Values 0 to 262143

default — Keyword to configure the maximum size as 512.

Full Context configure router nat inside dual-stack-lite address ip-fragmentation
configure router nat inside nat64 ip-fragmentation
configure service vprn nat inside dslite addressip-fragmentation ip-fragmentation
configure service vprn nat inside nat64 ip-fragmentation

Description This command configures downstream IPv6 fragmentation behavior in DS-Lite and NAT64. IPv6 fragmentation is performed in the ISA. IPv4 fragmentation is not affected by this command. If desired, downstream IPv4 packet can be fragmented in the carrier IOM before the packet reaches ISA (and the NAT function). The IPv4 fragmentation in the downstream direction can be set by the **config>router/vprn>nat>outside>mtu** command.

DS-Lite IPv6 Fragmentation in Downstream Direction (IPv4 to IPv6)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In case that the length of the received IPv4 packet is larger than the configured tunnel-mtu value while fragmentation is allowed, the resulting IPv6 packet will be fragmented (IPv4 is tunneled within IPv6). The maximum size of the of the fragmented IPv6 packet will be 48bytes larger than the configured tunnel-mtu value. This is due to the size of the tunneling IPv6 header: 40bytes basic IPv6 header + 8 bytes of extended fragmentation IPv6 header.

In case that fragmentation is not allowed while the IPv4 packet size is larger than configured tunnel-mtu size, the IPv4 packet will be dropped and an ICMPv4 Datagram Too Big message will be generated towards the source. The advertised mtu size in that ICMP message will be set to configured tunnel-mtu value.

NAT64 IPv6 Fragmentation in Downstream Direction (IPv4to IPv6)

In contrast to DS-Lite, NAT64 transport is not based on tunneling. Instead, IP headers are translated between IPv4 and IPv6. Consequently, NAT64 fragmentation operates based on the ipv6-mtu, as opposed to tunnel-mtu in DS-Lite which represents the size of the tunnel payload (IPv4 packet).

In case that the length of the translated IPv6 packet exceeds the size of the configured ipv6-mtu value while fragmentation is allowed, the resulting IPv6 packet will be fragmented. The maximum size of the of the fragmented IPv6 packet will be the configured ipv6-mtu value.

In case that fragmentation is not allowed while the translated IPv6 packet size is larger than configured ipv6-mtu size, the IPv4 packet (that is supposed to be translated into IPv6) will be dropped and an ICMPv4 Datagram Too Big message will be generated towards the source. The advertised mtu size in that ICMP message will be set to the ipv6-mtu value minus 28bytes. The 28bytes comes from the size of the IPv6 overhead of the translated packet (20bytes difference between the IP header sizes ? 40bytes in IPv6 vs 20bytes in IPv4; 8 bytes for extended IPv6 fragmentation header).

Default disabled

Parameters **disabled** — IPv6 Fragmentation is disabled. In case that the packet size is larger than what is set by the mtu value (tunnel-mtu or ipv6-mtu) the IPv4 packet will be dropped and ICPMv4 Datagram Too Big messages will be sent back to the source.

fragment-ipv6 — IPv6 fragmentation will be performed in all cases, regardless of the DF bit setting in the tunneled/translated IPv4 packet.

fragment-ipv6-unless-ipv4-df-set — IPv6 Fragmentation will be performed only in cases when DF bit in tunneled/translated IPv4 packet is cleared.

Description This command enables broadcast UDP packets received on the associated interface to be redirected to the specified gateway address and then forwarded on to the gateway.

The **no** form of this command removes the gateway address from the interface configuration and stops the UDP broadcast redirect function.

Parameters *gateway-address* — Specifies the IPv4 address of the target UDP broadcast gateway.

Platforms All

13.227 ip-mirror

ip-mirror

Syntax **ip-mirror**

Context **[Tree]** (config>mirror>mirror-dest>sap>egress ip-mirror)

Full Context configure mirror mirror-dest sap egress ip-mirror

Description This command configures IP mirror information.

Platforms All

13.228 ip-mirror-interface

ip-mirror-interface

Syntax **ip-mirror-interface** *ip-int-name* [**create**]
no ip-mirror-interface *ip-int-name*

Context **[Tree]** (config>service>vprn ip-mirror-interface)

Full Context configure service vprn ip-mirror-interface

Description This command is used for remote mirroring, where the mirror source is a separate system then the mirror destination. The mirror source can only be of IP type and is only supported for the following services: IES, VPRN, VPLS and Ipipe. The mirror destination on a remote system will configure an interface on a VPRN as **ip-mirror-interface**. This interface only supports spoke sdp termination. The IP mirror interface requires PBR to determine the next outgoing interface for the mirror packet to be delivered to.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the interface name from the configuration.

Parameters *ip-int-name* — Specifies the name of the IP interface, up to 32 characters. An interface name cannot be in the form of an IP address.

create — Keyword used to create an IP mirror interface.

Platforms All

13.229 ip-mtu

ip-mtu

Syntax **ip-mtu** *octets*
no ip-mtu

Context **[Tree]** (config>service>ies>sub-if>grp-if ip-mtu)
[Tree] (config>service>vprn>sub-if>grp-if ip-mtu)

Full Context configure service ies subscriber-interface group-interface ip-mtu
configure service vprn subscriber-interface group-interface ip-mtu

Description This command specifies the maximum size of IP packets on this group interface. Packets larger than this are fragmented.

The **ip-mtu** applies to all IPoE host types (dhcp, arp, static). For PPP/L2TP sessions, the **ip-mtu** is not considered for the MTU negotiation. The **ppp-mtu** in the **ppp-policy** should be used instead.

The **no** form of this command reverts to the default.

Parameters *octets* — Specifies the largest frame size (in octets) that this interface can handle.

Values 512 to 9786

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip-mtu

Syntax **ip-mtu** *octets*
no ip-mtu

Context **[Tree]** (config>service>ies>if ip-mtu)
[Tree] (config>service>ies>if>sap>ip-tunnel ip-mtu)

Full Context configure service ies interface ip-mtu
configure service ies interface sap ip-tunnel ip-mtu

Description This command configures the IP maximum transmit unit (packet) for this interface.

Because this connects a Layer 2 to a Layer 3 service, this parameter can be adjusted under the IES interface.

The MTU that is advertised from the IES size is:

MINIMUM((SdpOperPathMtu - EtherHeaderSize), (Configured ip-mtu))

By default (for Ethernet network interface) if no ip-mtu is configured it is (1568 - 14) = 1554.

The **no** form of this command returns the default value.

Default no ip-mtu

Parameters *octets* — Specifies the maximum number of octets that can be transmitted.

Values 512 to 9786 (for IES interface)
512 to 9000 (for ip-tunnel interface)

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface ipsec ipsec-tunnel ip-mtu
configure service vprn interface ipsec ipsec-tunnel ip-mtu
configure service vprn interface sap ip-tunnel ip-mtu
configure service vprn interface sap ipsec-tunnel ip-mtu

Description This command configures the IP maximum transmit unit (packet) for this interface.

Because this connects a Layer 2 to a Layer 3 service, this parameter can be adjusted under the IES interface.

The MTU that is advertised from the IES size is:

MINIMUM((SdpOperPathMtu - EtherHeaderSize), (Configured ip-mtu))

By default (for the Ethernet network interface), if no ip-mtu is configured it is (1568 - 14) equals 1554.

The **ip-mtu** command instructs the MS-ISA to perform IP packet fragmentation, prior to IPsec encryption and encapsulation, based on the configured MTU value. In particular:

If the length of a payload IP packet (including its header) exceeds the configured MTU value and the DF flag is clear (due to the presence of the clear-df-bit command or because the original DF value was 0) then the MS-ISA fragments the payload packet as efficiently as possible (i.e. it creates the minimum number of fragments each less than or equal to the configured MTU size); in each created fragment the DF bit shall be 0.

If the length of a payload IP packet (including its header) exceeds the configured MTU value and the DF flag is set (because the original DF value was 1 and the tunnel has no clear-df-bit in its configuration) then the MS-ISA discards the payload packet without sending an ICMP type 3/code 4 message back to the packet’s source address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The effective MTU for packets entering a tunnel is the minimum of the private tunnel SAP interface IP MTU value (used by the IOM) and the tunnel IP MTU value (configured using the above command and used by the MS-ISA). To fragment IP packets larger than X bytes with DF set, rather than discarding them, the tunnel IP MTU should be set to X and the private tunnel SAP interface IP MTU should be set to a value larger than X.

The **no ip-mtu** command, corresponding to the default behavior, disables fragmentation of IP packets by the MS-ISA; all IP packets, regardless of size or DF bit setting, are allowed into the tunnel.

Default no ip-mtu

Parameters *bytes* — Specifies the IP maximum transmit unit (packet) for this interface.

Values 512 to 9000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context **[Tree]** (config>router>if ip-mtu)

Full Context configure router interface ip-mtu

Description This command configures the IP maximum transmit unit (packet) for the associated router IP interface.

The operational IP MTU that is used for the interface is determined based on both the configured IP MTU and the port MTU of the port bound to this interface.

The MTU that is used is:

MINIMUM((Port_MTU - EthernetHeaderSize), (configured ip-mtu))

The **no** form of this command returns the associated IP interfaces MTU to its default value, which is calculated based on the port MTU setting. (For Ethernet ports the default IP MTU is 1500 octets.)

Default no ip-mtu

Parameters *octets* — Specifies the IP MTU value associated with the IP interface, specified in octets. If the interface supports IPv6 packets, the IP-MTU must be set to a value greater than or equal to (≥) 1280 in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.

Values 512 to 9786

Platforms All

ip-mtu

Syntax **ip-mtu** *octets*
no ip-mtu

Context **[Tree]** (bof ip-mtu)

Full Context bof ip-mtu

Description This command configures the IP maximum transmit unit (packet) for the management router instance.

The operational IP MTU that is used for the interface is determined based on both the configured IP MTU and the port MTU of the port bound to this interface.

The MTU that is used is:

MINIMUM((Port_MTU - EthernetHeaderSize), (configured ip-mtu))

For the management port, the port MTU is fixed at 1514 and the EthernetHeaderSize is 14 so the first element of the equation above is 1500 octets.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the associated IP interfaces MTU to its default value, which is calculated based on the port MTU setting. (For the management port the default IP MTU is 1500 octets.)

Default ip-mtu 1500

Parameters *octets* — Specifies the IP MTU value associated with the IP interface, specified in octets. If the interface supports IPv6 packets, the IP-MTU must be set to a value greater than or equal to (≥) 1280 in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.

no ip-option

Context [Tree] (config>filter>ip-filter>entry>match ip-option)

Full Context configure filter ip-filter entry match ip-option

Description This command configures matching packets with a specific IP option or a range of IP options in the first option of the IP header as an IP filter match criterion.

The option-type octet contains 3 fields:

- 1 bit copied flag (copy options in all fragments)
- 2 bits option class
- 5 bits option number

The **no** form of the command removes the match criterion.

Default no ip-option

Parameters *ip-option-value* — Specifies the 8 bit option-type as a decimal integer, binary, or hexadecimal format. The mask is applied as an AND to the option byte, the result is compared with the option-value.

The decimal value entered for the match should be a combined value of the eight bit option type field and not just the option number. Therefore, to match on IP packets that contain the Router Alert option (option number = 20), enter the option type of 148 (10010100).

Values 0 to 255

ip-option-mask — Specifies an optional parameter that can be used when specifying a range of option numbers to use as the match criteria.

This 8 bit mask can be configured using the following formats:

Table 67 **ip-option-mask Formats**

Format Style	Format Syntax	Example
Decimal	DDD	20
Hexadecimal	0xHH	0x14
Binary	0bBBBBBBBB	0b0010100

Default 255 (decimal) (exact match)

Values 1 to 255 (decimal)

13.231 ip-prefix

ip-prefix

Syntax **ip-prefix** *ip-prefix/ip-prefix-length*
no ip-prefix

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident ip-prefix)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification ip-prefix

Description This command specifies the source IPv4/IPv6 address/prefix of the data trigger packet as the host identification.

Note: This command is only used when **ip** is configured as one of the **match-list** parameters.

The **no** form of this command removes the IP prefix from the configuration.

Parameters *ip-prefix/ip-prefix-length* — Specifies the IPv4 address, IPv6 address, or IPv6 prefix.

Values	ipv4-prefix	a.b.c.d
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x to [0 to FFFF]H d to [0 to 255]D
	ipv6-prefix-length	0 to 128

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip-prefix

Syntax **ip-prefix** *ipv6-prefixIprefix-length*
no ip-prefix

Context **[Tree]** (conf>router>segment-routing>srv6>loc>prefix ip-prefix)

Full Context configure router segment-routing segment-routing-v6 locator prefix ip-prefix

Description This command configures the IPv6 prefix and prefix length for an SRv6 locator.

The locator prefix length is the sum of the lengths of the block field and that of the node ID field.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command deletes the IPv6 prefix from this locator.

Default no ip-prefix

Parameters *ipv6-prefix/prefix-length* — Specifies an IPv6 address prefix written as hexadecimalnumbers separated by colons with host bits set to 0.

Values

ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
ipv6-prefix-length	4 to 96

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

13.232 ip-prefix-list

ip-prefix-list

Syntax **ip-prefix-list** *ip-prefix-list-name* [**create**]
no ip-prefix-list *ip-prefix-list-name*

Context **[Tree]** (config>app-assure>group ip-prefix-list)

Full Context configure application-assurance group ip-prefix-list

Description This command configures an IP prefix list.

Parameters *ip-prefix-list-name* — Specifies the name of the IP prefix list, up to 32 characters.

create — Mandatory keyword used when creating an application profile. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-prefix-list

Syntax **ip-prefix-list** *ip-prefix-list-name* [**create**]
no ip-prefix-list *ip-prefix-list-name*

Context **[Tree]** (config>qos>match-list ip-prefix-list)

Full Context configure qos match-list ip-prefix-list

Description This command creates a list of IPv4 prefixes for match criteria in QoS policies.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

An IP prefix list must contain only IPv4 address prefixes created using the prefix command and cannot be deleted if it is referenced by a QoS policy.

The **no** form of this command deletes the specified list.

Parameters *ip-prefix-list-name* — A string of up to 32 characters of printable ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The name **default** (case insensitive) is reserved by the system.

Platforms All

ip-prefix-list

Syntax **ip-prefix-list** *ip-prefix-list-name* [**create**]
no ip-prefix-list *ip-prefix-list-name*

Context **[Tree]** (config>filter>match-list ip-prefix-list)

Full Context configure filter match-list ip-prefix-list

Description This command creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

The **no** form of this command deletes the specified list.

Operational Notes:

An **ip-prefix-list** must contain only IPv4 address prefixes.

An IPv4 prefix match list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

Parameters *ip-prefix-list-name* — Specifies a string of up to 32 printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms All

13.234 ip-protocol-num

ip-protocol-num

Syntax **ip-protocol-num** {**eq** | **neq**} *protocol-id*
no ip-protocol-num

Context **[Tree]** (config>app-assure>group>policy>app-filter>entry ip-protocol-num)
[Tree] (config>app-assure>group>policy>aqp>entry>match ip-protocol-num)

Full Context configure application-assurance group policy app-filter entry ip-protocol-num
configure application-assurance group policy app-qos-policy entry match ip-protocol-num

Description This command configures the IP protocol to use in the application definition.

The **no** form of this command restores the default (removes IP protocol number from application criteria defined by this app-filter entry).

Default no ip-protocol-num

Parameters **eq** — Specifies that the value configured and the value in the flow must be equal.

neq — Specifies that the value configured differs from the value in the flow.

protocol-id — Specifies the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP (1), TCP (6), UDP (17).

The **no** form the command removes the protocol from the match criteria.

Values 1 to 255 (Decimal, Hexadecimal, or Binary representation).

Supported IANA IP protocol names:

none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, sctp, stp, tcp, udp, vrrp

* - udp/tcp wildcard

ip-protocol-num

Syntax **ip-protocol-num** *ip-protocol number*
no ip-protocol-num

Context **[Tree]** (config>app-assure>group>policy>sess-fltr>entry>match ip-protocol-num)

Full Context configure application-assurance group policy session-filter entry match ip-protocol-num

Description This command configures the IP protocol to use in the application definition.

The **no** form of this command restores the default (removes IP protocol number from application criteria defined by this app-filter entry).

Default no ip-protocol-num

Parameters *ip-protocol-number* — Specifies the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP (1), TCP (6), UDP (17).

The **no** form the command removes the protocol from the match criteria.

Values *protocol-number*: 0 to 255 (decimal, hexadecimal, or binary representation)

protocol-name: Supported IANA IP protocol names:

none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, sctp, stp, tcp, udp, vrrp

* - udp/tcp wildcard

ip-protocol-num

Syntax **ip-protocol-num** {**eq** | **neq**} *protocol-id*
no ip-protocol-num

Context **[Tree]** (debug>app-assure>group>traffic-capture>match ip-protocol-num)

Full Context debug application-assurance group traffic-capture match ip-protocol-num

Description This command configures debugging on an IP protocol number.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.235 ip-route-advertisement

ip-route-advertisement

Syntax **ip-route-advertisement** [**incl-host**] [**domain-id** *global-field*:*local-field*]
no ip-route-advertisement

Context **[Tree]** (config>service>vpls>bgp-evpn ip-route-advertisement)

Full Context configure service vpls bgp-evpn ip-route-advertisement

Description This command enables and disables the advertisement of IP prefixes in EVPN. If enabled, any active route in the R-VPLS VPRN route table are advertised in EVPN using the VPLS BGP configuration. The interface host addresses are not advertised in EVPN unless the **ip-route-advertisement incl-host** command is enabled.

The **no** form of this command disables IP prefixes advertisement in EVPN.

Default no ip-route-advertisement

Parameters **incl-host** — Specifies to advertise the interface host addresses in EVPN.

global-field:local-field — Specifies the domain ID.

Values

4byte-GlobalAdminValue:2byte-LocalAdminValue

4byte-GlobalAdminValue:	0 to 4294967295
2byte-LocalAdminValue	0 to 65535

Platforms All

13.236 ip-src

ip-src

Syntax **ip-src** *ip-address*
no ip-src

Context **[Tree]** (config>li>mirror-dest-template>layer-3-encap ip-src)

Full Context configure li mirror-dest-template layer-3-encap ip-src

Description This command configures the source IPv4 address to use in the IPv4 header part of the routable LI encapsulation.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* — Specifies the source IPv4 address.

Values a.b.c.d

Platforms All

13.237 ip-ttl

ip-ttl

Syntax **ip-ttl** *hops*
no ip-ttl

Context **[Tree]** (config>subscr-mgmt>gtp>peer-profile ip-ttl)

Full Context configure subscriber-mgmt gtp peer-profile ip-ttl

Description This command configures the value to put in the IP header's TTL field for GTP control messages.

The **no** form of this command reverts to the default value.

Default ip-ttl 255

Parameters *hops* — Specifies the IP TTL.

Values 1 to 255

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.238 ip-tunnel

ip-tunnel

Syntax **ip-tunnel** *name* [**create**]
no ip-tunnel *name*

Context **[Tree]** (config>service>ies>if>sap ip-tunnel)
[Tree] (config>service>vprn>if>sap ip-tunnel)

Full Context configure service ies interface sap ip-tunnel
configure service vprn interface sap ip-tunnel

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to configure an IP-GRE or IP-IP tunnel and associate it with a private tunnel SAP within an IES or VPRN service.

The **no** form of this command deletes the specified IP/GRE or IP-IP tunnel from the configuration. The tunnel must be administratively shutdown before issuing the **no ip-tunnel** command.

Default no-ip tunnel *name*

Parameters *name* — Specifies the name of the IP tunnel. Tunnel names can be from 1 to 32 alphanumeric characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

Platforms All

ip-tunnel

Syntax **ip-tunnel**

Context **[Tree]** (config>router>if ip-tunnel)

Full Context configure router interface ip-tunnel

Description Commands in this context configure parameters for an IP tunnel on a **control-channel** loopback interface. The default encapsulation is IP/GRE. The local end tunnel IP address will be configured using the interface primary IP address.

The **ip-tunnel** command can only be configured on **control-channel** loopback interfaces.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.239 ipcp

ipcp

Syntax **ipcp**

Context **[Tree]** (config>service>ies>if ipcp)

Full Context configure service ies interface ipcp

Description This command enables access to the IPCP context within the interface configuration. Within this context, IPCP extensions can be configured to define such things as the remote IP address and DNS IP address to be signaled via IPCP on the associated PPP interface. This command is only applicable if the associated SAP or port is a PPP or MLPPP interface.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipcp

Syntax **ipcp**

Context **[Tree]** (config>service>vprn>if ipcp)

Full Context configure service vprn interface ipcp

Description This command creates allows access to the IPCP context within the interface configuration. Within this context, IPCP extensions can be configured to define such things as the remote IP address and DNS IP address to be signaled via IPCP on the associated PPP interface.

This command is only applicable if the associated SAP/port is a PPP/MLPPP interface.

Platforms All

13.240 ipcp-subnet-negotiation

ipcp-subnet-negotiation

Syntax **no ipcp-subnet-negotiation**

Context **[Tree]** (config>router>l2tp>group>ppp ipcp-subnet-negotiation)
[Tree] (config>router>l2tp>group>tunnel>ppp ipcp-subnet-negotiation)
[Tree] (config>service>vprn>l2tp>group>ppp ipcp-subnet-negotiation)
[Tree] (config>service>vprn>l2tp>group>tunnel>ppp ipcp-subnet-negotiation)

Full Context configure router l2tp group ppp ipcp-subnet-negotiation
configure router l2tp group tunnel ppp ipcp-subnet-negotiation
configure service vprn l2tp group ppp ipcp-subnet-negotiation
configure service vprn l2tp group tunnel ppp ipcp-subnet-negotiation

Description This command configures the IPCP subnet negotiation using PPP IPCP Subnet-Mask option (0x90) if requested by the client. The subnet can be obtained from RADIUS (Framed-IP-Netmask attribute) or local user database. The subnet is installed as a managed route of the PPP session. This requires the anti-spoof type on the SAP to be configured to nh-mac.

By default, an IPCP Config Request with IPCP Subnet-Mask option (0x90) is rejected.

The **no** form of this command reverts to the default value.

Default no ipcp-subnet-negotiation

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipcp-subnet-negotiation

Syntax [**no**] **ipcp-subnet-negotiation**

Context **[Tree]** (config>subscr-mgmt>ppp-policy ipcp-subnet-negotiation)

Full Context configure subscriber-mgmt ppp-policy ipcp-subnet-negotiation

Description This command enables subnet negotiation using PPP IPCP Subnet-Mask option (0x90) if requested by the client. The subnet can be obtained from RADIUS (Framed-IP-Netmask attribute) or local user database. The subnet is installed as a managed route of the PPP session. This requires the anti-spoof type on the SAP to be configured to nh-mac.

By default, an IPCP Config Request with IPCP Subnet-Mask option (0x90) is rejected.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.241 ipfix

ipfix

Syntax **ipfix**

Context **[Tree]** (config>service ipfix)

Full Context configure service ipfix

Description Commands in this context configure IPFIX parameters.

Platforms All

13.242 ipfix-export-policy

ipfix-export-policy

Syntax **ipfix-export-policy** *policy-name*
no ipfix-export-policy

Context **[Tree]** (config>service>nat>nat-policy ipfix-export-policy)
[Tree] (config>service>nat>up-nat-policy ipfix-export-policy)

Full Context configure service nat nat-policy ipfix-export-policy
configure service nat up-nat-policy ipfix-export-policy

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the IP flow information export policy.

The **no** form of the command removes the IP flow information export policy.

Default no ipfix-export-policy

Parameters *policy-name* — Specifies the name of the policy, up to 32 characters. The specified policy must be created in the **config**>**service**>**ipfix ipfix-export-policy** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipfix-export-policy

Syntax **ipfix-export-policy** *policy-name* [**create**]
no ipfix-export-policy *policy-name*

Context **[Tree]** (config>service>ipfix ipfix-export-policy)

Full Context configure service ipfix ipfix-export-policy

Description This command creates an IPFIX export policy with a set of transport parameters that will be used to transmit IPFIX records generated by an application within 7750 SR node to an external collector node. This policy name can be referenced from each application within 7750 SR that requires flow logging.

Default none

Parameters *policy-name* — Specifies the name of the policy that can be referenced within an application in 7750 SR node that requires flow logging.

create — Keyword used to create the policy.

Platforms All

13.243 ipipe

ipipe

Syntax **ipipe** *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**vc-switching**] [**name** *name*]
no ipipe *service-id*

Context **[Tree]** (config>service ipipe)

Full Context configure service ipipe

Description This command configures an IP-Pipe service.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *service-id* — The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7450 ESS or 7750 SR on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: up to 64 characters

customer-id — Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id — Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number.

Values 1 to 2147483647

Default null (0)

vc-switching — Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

create — Keyword used to create the Ipipe service instance. The **create** keyword requirement can be enabled/disabled in the **environment**>**create** context.

name *name* — Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Values *name*: up to 64 characters

Platforms All

13.244 ipoe

ipoe

Syntax **ipoe**

Context **[Tree]** (config>subscr-mgmt>loc-user-db ipoe)

Full Context configure subscriber-mgmt local-user-db ipoe

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure IPoE host parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe

Syntax **ipoe**

Context **[Tree]** (debug>call-trace ipoe)

Full Context debug call-trace ipoe

Description Commands in this context set up call trace debugging for IP over Ethernet (IPoE) sessions.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe

Syntax **ipoe** *origin*

Context **[Tree]** (config>li>x-interfaces>correlation-id ipoe)

Full Context configure li x-interfaces correlation-id ipoe

Description This command specifies the type of RADIUS accounting session ID to use for IPoE subscriber correlation.

Default host

Parameters *origin* — Specifies the correlation identifier origin type for IPoE.

Values host, queue, session

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ipoe

Syntax **ipoe** *max-nr-of-sessions*
no ipoe

Context **[Tree]** (config>subscr-mgmt>sla-profile>session-limits ipoe)
[Tree] (config>subscr-mgmt>sub-profile>session-limits ipoe)

Full Context configure subscriber-mgmt sla-profile session-limits ipoe
configure subscriber-mgmt sub-profile session-limits ipoe

Description This command configures the maximum number of IPoE sessions per SLA profile instance or per subscriber.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the maximum number of IPoE sessions limit.

Parameters *max-nr-of-sessions* — Specifies the maximum number of IPoE sessions.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.245 ipoe-bridged-mode

ipoe-bridged-mode

Syntax [**no**] **ipoe-bridged-mode**

Context **[Tree]** (config>service>ies>sub-if>ipv6 ipoe-bridged-mode)
[Tree] (config>service>ies>sub-if>grp-if>ipv6 ipoe-bridged-mode)
[Tree] (config>service>vprn>sub-if>ipv6 ipoe-bridged-mode)
[Tree] (config>service>vprn>sub-if>grp-if>ipv6 ipoe-bridged-mode)

Full Context configure service ies subscriber-interface group-interface ipv6 ipoe-bridged-mode
configure service ies subscriber-interface ipv6 ipoe-bridged-mode
configure service vprn subscriber-interface group-interface ipv6 ipoe-bridged-mode
configure service vprn subscriber-interface ipv6 ipoe-bridged-mode

Description This command enables IPv6 IPoE bridged mode.

The **no** form of this command disables the IPv6 IPoE bridged mode.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.246 ipoe-linking

ipoe-linking

Syntax **ipoe-linking**

Context **[Tree]** (config>service>ies>sub-if ipoe-linking)
[Tree] (config>service>vprn>sub-if ipoe-linking)
[Tree] (config>service>ies>sub-if>grp-if ipoe-linking)

[Tree] (config>service>ies>sub-if ipoe-session)
[Tree] (config>service>vprn>sub-if ipoe-session)

Full Context configure service ies subscriber-interface group-interface ipoe-session
configure service ies subscriber-interface ipoe-session
configure service vpls sap ipoe-session
configure service vprn subscriber-interface group-interface ipoe-session
configure service vprn subscriber-interface ipoe-session

Description Commands in this context configure IPoE session parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.248 ipoe-session-policy

ipoe-session-policy

Syntax **ipoe-session-policy** *policy-name* [**create**]
no ipoe-session-policy *policy-name*

Context **[Tree]** (config>subscr-mgmt ipoe-session-policy)

Full Context configure subscriber-mgmt ipoe-session-policy

Description This command configures an IPoE session policy. The policies are referenced from subscriber interfaces, group interfaces and capture SAPs. Multiple IPoE session policies can be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the policy name from the configuration.

Parameters *policy-name* — Specifies the IPoE policy name up to 32 characters.

create — Keyword required to create the configuration context

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe-session-policy

Syntax **ipoe-session-policy** *policy-name*
no ipoe-session-policy

Context **[Tree]** (config>service>vpls>sap>ipoe-session ipoe-session-policy)
[Tree] (config>service>ies>sub-if>grp-if>ipoe-session ipoe-session-policy)
[Tree] (config>service>vprn>sub-if>grp-if>ipoe-session ipoe-session-policy)

Full Context configure service ies subscriber-interface group-interface ipoe-session ipoe-session-policy
configure service vpls sap ipoe-session ipoe-session-policy
configure service vprn subscriber-interface group-interface ipoe-session ipoe-session-policy

Description This command specifies the IPoE session policy applicable for this group interface or capture SAP.

On WLAN GW group interfaces, it is not possible to change this value.

The **no** form of this command reverts to the default.

Default no ipoe-session-policy ipoe-session-policy default on WLAN GW group interfaces

Parameters *policy-name* — Specifies the IPoE session policy name up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.249 ipoe-sub-id-key

ipoe-sub-id-key

Syntax **ipoe-sub-id-key** *sub-id-key* [*sub-id-key*]
no ipoe-sub-id-key

Context **[Tree]** (config>subscr-mgmt>auto-sub-id-key ipoe-sub-id-key)

Full Context configure subscriber-mgmt auto-sub-id-key ipoe-sub-id-key

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables certain fields to become the base for auto-generation of the default sub-id name. The sub-id name is auto generated if there is not a more specific method available. Such more specific methods would be a default sub-id name as a sap-id, a preconfigured static string or explicit mappings based on RADIUS/LUDB returned strings.

In case that a more specific sub-id name generation method is not available and the auto-id keyword is defined under the def-sub-id hierarchy, the sub-id name is generated by concatenating fields defined in this command separated by a "|" character.

The maximum *sub-id* name length is 32 characters while the concatenation of subscriber identification fields can easily exceed 32 characters. Subscriber host instantiation fails if the *sub-id* name is based on subscriber identification fields whose concatenated length exceeds 32 characters. Failing the host creation rather than truncating *sub-id* name on a 32 character boundary prevents collision of sub-ids (subscriber name duplication).

If the more specific *sub-id* name generation method is not available and the **auto-id** keyword is not defined under the **def-sub-id** hierarchy, the *sub-id* name is a random 10 character encoded string based on the fields defined under this command.

There is only one set of identification fields allowed per host type (IPoE or PPP) per chassis.

The **no** form of this command reverts to the default.

Default ipoe-sub-id-key mac sap-id

Parameters *sub-id-key* — Specifies the auto-generated sub-id keys for IPoE hosts.

Values **mac** — Specifies that the MAC address can be combined with other subscriber host identification fields (circuit-id, remote-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the mac address is used as a concatenation field in the sub-id name, then its format becomes a string xx:xx:xx:xx:xx:xx with the length 17B.

The MAC address as the subscriber host identification field is not applicable to static hosts.

circuit-id — Specifies that the circuit-id can be combined with other subscriber host identification fields (mac, remote-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit-id is used as a concatenation field in the sub-id name, then its format becomes access-node-id eth slot/port:[vlan-id] or access-node-id atm slot/port:vpi.vci with a variable length.

Note: If circuit-id contains any non-printable ASCII characters, the entire circuit-id string is formatted in hex in the sub-id name output. Otherwise all characters in circuit-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The circuit-id as the subscriber identification field is not applicable to ARP hosts or static hosts.

remote-id — Specifies that the remote-id can be combined with other subscriber host identification fields (mac, circuit-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the remote-id is used as a concatenation field in the sub-id name, then its format becomes a remote-id string with a variable length.

Note: If remote-id contains any non-printable ASCII characters, the entire remote-id string is formatted in hex in the sub-id name output. Otherwise all characters in remote-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The remote-id as the subscriber identification field is not applicable to ARP hosts or static hosts.

sap-id — Specifies that the sap-id can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, session-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If a circuit-id is used as a concatenation field in the sub-id name, then its format becomes: slot/mda:[outer-vlan].[inner-vlan] with a variable length.

The sap-id as the subscriber identification field is applicable to all hosts types with exception of static hosts.

dual-stack-remote-id — Specifies that the dual stack remote ID is used as the base for the auto-generated subscriber identification

service-name — Specifies that the service name that terminates the subscriber is used as the base for auto-generated subscriber identification.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.250 ipsec

ipsec

Syntax **ipsec**

Context **[Tree]** (admin ipsec)

Full Context admin ipsec

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context perform Internet Protocol Security (IPsec) operations. IPsec is a structure of open standards to ensure private, secure communications over Internet Protocol (IP) networks by using cryptographic security services.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipsec

Syntax [**no**] **ipsec**

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync ipsec)

Full Context configure redundancy multi-chassis peer sync ipsec

Description This command enables multi-chassis synchronization of IPsec states on system level.

Default no ipsec

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipsec

Syntax **ipsec**

Context **[Tree]** (config ipsec)

Full Context configure ipsec

Description Commands in this context configure Internet Protocol Security (IPsec) parameters. IPsec is a structure of open standards to ensure private, secure communications over Internet Protocol (IP) networks by using cryptographic security services.

Platforms All

ipsec

Syntax **ipsec** [**tunnel-group** *ipsec-group-id*] [**public-sap** *public-sap*]

ipsec-gw

Syntax **ipsec-gw** *name*
no ipsec-gw

Context **[Tree]** (config>service>ies>if>sap ipsec-gw)
[Tree] (config>service>vprn>if>sap ipsec-gw)

Full Context configure service ies interface sap ipsec-gw
configure service vprn interface sap ipsec-gw

Description This command configures an IPsec gateway.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.253 ipsec-lifetime

ipsec-lifetime

Syntax **ipsec-lifetime** *ipsec-lifetime*
no ipsec-lifetime

Context **[Tree]** (config>ipsec>ike-policy ipsec-lifetime)

Full Context configure ipsec ike-policy ipsec-lifetime

Description This command specifies the lifetime of the Phase 2 IKE key.

The **no** form of this command reverts to the default, which is 3600 seconds.

Default no ipsec-lifetime

Parameters *ipsec-lifetime* — Specifies the Phase 2 lifetime for this IKE policy in seconds.

Values 1200 to 31536000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipsec-lifetime

Syntax **ipsec-lifetime** *seconds*
ipsec-lifetime inherit

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>ipsec>ipsec-transform ipsec-lifetime)

Full Context configure ipsec ipsec-transform ipsec-lifetime

Description This command specifies the CHILD_SA. If the **inherit** parameter is specified, then the system uses the IPsec lifetime configuration in the corresponding IKE policy configured in the same IPsec gateway or IPsec tunnel.

Default ipsec-lifetime inherit

Parameters *seconds* — Specifies the lifetime of the Phase 2 IKE key in seconds.

Values 1200 to 31536000

inherit — Specifies that the system uses the **ipsec-lifetime** configuration in the corresponding IKE policy that is configured for the same IPsec gateway or IPsec tunnel.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.254 ipsec-responder-only

ipsec-responder-only

Syntax [**no**] **ipsec-responder-only**

Context [Tree] (config>isa>tunnel-group ipsec-responder-only)

Full Context configure isa tunnel-group ipsec-responder-only

Description With this command configured, system will only act as IKE responder except for the automatic CHILD_SA re-key upon MC-IPsec switchover.

Default no ipsec-responder-only

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.255 ipsec-transform

ipsec-transform

Syntax **ipsec-transform** *transform-id* [**create**]
no ipsec-transform *transform-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>ipsec ipsec-transform)

Full Context configure ipsec ipsec-transform

Description Commands in this context create an **ipsec-transform** policy. IPsec transforms policies can be shared. A change to the ipsec-transform is allowed at any time. The change will not impact tunnels that have been established until they are renegotiated. If the change is required immediately the tunnel must be cleared (reset) for force renegotiation.

IPsec transform policy assignments to a tunnel require the tunnel to be shutdown.

The **no** form of this command removes the ID from the configuration.

Parameters *transform-id* — Specifies a policy ID value to identify the IPsec transform policy.

Values 1 to 2048

create — This keyword is mandatory when creating an ipsec-transform policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.256 ipsec-transport-mode-profile

ipsec-transport-mode-profile

Syntax **ipsec-transport-mode-profile** *name* [**create**]
no ipsec-transport-mode-profile *name*

Context [Tree] (config>ipsec ipsec-transport-mode-profile)

Full Context configure ipsec ipsec-transport-mode-profile

Description Commands in this context configure an IPsec transport mode profile.

The **no** form of this command removes the name from the configuration.

Parameters *name* — Specifies the name of the IPsec transport mode profile, up to 32 characters.

create — Keyword used to create the IPsec transport mode profile instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipsec-transport-mode-profile

Syntax **ipsec-transport-mode-profile** *name*
no ipsec-transport-mode-profile

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>ies>if>sap>ip-tunnel ipsec-transport-mode-profile)
[Tree] (config>service>vprn>if>sap>ip-tunnel ipsec-transport-mode-profile)

Full Context configure service ies interface sap ip-tunnel ipsec-transport-mode-profile
configure service vprn interface sap ip-tunnel ipsec-transport-mode-profile

Description This command specifies an IPsec transport mode profile name to the SAP.

The **no** form of this command removes the profile name from the service configuration.

Parameters *name* — Specifies the name of an existing IPsec transport mode profile, up to 32 characters

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.257 ipsec-tunnel

ipsec-tunnel

Syntax **ipsec-tunnel** *ipsec-tunnel-name*
no ipsec-tunnel [*ipsec-tunnel-name*]

Context [Tree] (config>service>vprn>static-route-entry ipsec-tunnel)

Full Context configure service vprn static-route-entry ipsec-tunnel

Description This command creates a static route in a VPRN service context that points to the global routing context (base router). This is primarily used to allow traffic that ingress through a VPRN service to be routed out of the global routing context.

This **next-hop** type cannot be used in conjunction with any other next-hop types.

Default no ipsec-tunnel

Parameters *ipsec-tunnel-name* — IPsec tunnel name; maximum length up to 32 characters.

Platforms All

ipsec-tunnel

Syntax **ipsec-tunnel** *name* [**private-sap** [*0..4094*]] [**private-service-name** *private-service-name*] [**create**]
no ipsec-tunnel *ipsec-tunnel-name*

Context [Tree] (config>router>if>ipsec ipsec-tunnel)
[Tree] (config>service>ies>if>ipsec ipsec-tunnel)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>if>sap ipsec-tunnel)

Full Context configure router interface ipsec ipsec-tunnel
configure service ies interface ipsec ipsec-tunnel
configure service vprn interface sap ipsec-tunnel

Description This command configures a secured interfrace IPsec tunnel. If the **private-service-name** is not specified, the private service is the secured interface service.

The **no** form of this command removes the IPsec tunnel from the configuration.

Parameters *name* — Specifies the name of the IPsec tunnel.

private-sap — Specifies the private SAP ID.

Values 0 to 4094

private-service-name — Specifies the private service name.

create — Keyword used to create the IPsec tunnel instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel

VSR

- configure service ies interface ipsec ipsec-tunnel
- configure router interface ipsec ipsec-tunnel

13.258 ipv4

ipv4

Syntax **ipv4**

Context [Tree] (config>subscr-mgmt>git ipv4)

Full Context configure subscriber-mgmt group-interface-template ipv4

Description Commands in this context configure IPv4 parameters.

Default ipv4

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4

Syntax **ipv4**

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>to-client-options ipv4)

Full Context configure subscriber-mgmt local-user-db ipoe host to-client-options ipv4

Description Commands in this context configure DHCPv4 options.

Default ipv4

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv4

Syntax **ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no ipv4

Context **[Tree]** (config>service>vprn>bgp>multi-path ipv4)

Full Context configure service vprn bgp multi-path ipv4

Description This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multipath, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).
- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGP learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command removes IPv4-specific overrides.

Default no ipv4

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

egp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path-as — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (config>router>ldp>if-params>if ipv4)

Full Context configure router ldp interface-parameters interface ipv4

Description Commands in this context configure LDP interfaces and parameters applied to an IPv4 LDP interface.

Platforms All

ipv4

Syntax [**no**] **ipv4**

Context **[Tree]** (config>router>ldp>if-params ipv4)

Full Context configure router ldp interface-parameters ipv4

Description Commands in this context configure IPv4 LDP parameters applied to the interface.

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (config>router>ldp>targeted-session ipv4)

Full Context configure router ldp targeted-session ipv4

Description Commands in this context configure parameters applied to targeted sessions to all IPv4 LDP peers.

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (config>router>ldp>targeted-session>auto-tx ipv4)
[Tree] (config>router>ldp>targeted-session>auto-rx ipv4)

Full Context configure router ldp targeted-session auto-rx ipv4
configure router ldp targeted-session auto-tx ipv4

Description Commands in this context configure IPv4 parameters of an automatic targeted LDP session.

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw>lcl-addr-assign ipv4)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>service>vprn>if>sap>ipsec-gw>lcl-addr-assign ipv4)

Full Context configure service ies interface sap ipsec-gw local-address-assignment ipv4
configure service vprn interface sap ipsec-gw local-address-assignment ipv4

Description Commands in this context configure IPv4 local address assignment parameters for the IPsec gateway.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv4

Syntax **ipv4**

Context **[Tree]** (config>test-oam>build-packet>header ipv4)
[Tree] (debug>oam>build-packet>packet>field-override>header ipv4)

Full Context configure test-oam build-packet header ipv4
debug oam build-packet packet field-override header ipv4

Description This command causes the associated header to be defined as an IPv4 header template and enables the context to define the IPv4 parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ipv4

Syntax [**no**] **ipv4**

Context **[Tree]** (config>cflowd>collector>export-filter>family ipv4)

Full Context configure cflowd collector export-filter family ipv4

Description This command filters IPv4 flow data from being sent to the associated collector.

The **no** form of this command removes the filter, allowing IPv4 flow data to be sent to the associated collector.

Default no ipv4

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (config>filter>gre-tun-tmp ipv4)

Description Commands in this context configure GRE tunnel template IPv4 parameters.

Platforms All

ipv4

Syntax **ipv4**

Context **[Tree]** (bof>autoconfigure ipv4)

Full Context bof autoconfigure ipv4

Description Commands in this context autoconfigure the IPv4 DHCP client.

Platforms 7450 ESS-7, 7750 SR-1, 7750 SR-1e, 7750 SR-7, 7750 SR-s

ipv4

Syntax **ipv4** *ip-address*
ipv4 auto-generate [**vendor-id-value** *vendor-id-value*]
no ipv4

Context **[Tree]** (config>system>ned>prof>neip ipv4)

Full Context configure system network-element-discovery profile neip ipv4

Description This command configures the IPv4 NEIP for this profile. The NEIP can be configured manually or set to be automatically generated using the NEID. If the NEID option is set, the first most significant byte of the IPv4 NEIP is set to 140 and the remaining 3 bytes are set to the NEID value. The NEID can be configured with a vendor ID value, in which case the first most significant byte of the IPv4 NEIP is set to this vendor ID value.

The **no** form of this command removes the IPv4 address association for this profile.

Default no ipv4

Parameters *ip-address* — Specifies the IPv4 address of the NEIP.

auto-generate — Specifies that the NEIP is automatically generated using the NEID.

vendor-id-value — Specifies the vendor ID value.

Values 1 to 255

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4

Syntax **ipv4 send** *send-limit* **receive** [**none**]
ipv4 send *send-limit*
no ipv4

Context **[Tree]** (config>router>bgp>add-paths ipv4)
[Tree] (config>router>bgp>group>add-paths ipv4)
[Tree] (config>router>bgp>group>neighbor>add-paths ipv4)

Full Context configure router bgp add-paths ipv4
configure router bgp group add-paths ipv4
configure router bgp group neighbor add-paths ipv4

Description This command configures the add-paths capability for unlabeled IPv4 unicast routes. By default, add-paths is not enabled for unlabeled IPv4 unicast routes.

The maximum number of unlabeled unicast paths per IPv4 prefix to send is the configured send limit, which is a mandatory parameter. The capability to receive multiple unlabeled IPv4 unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for unlabeled IPv4 unicast routes, causing sessions established using add-paths for unlabeled IPv4 unicast to go down and come back up without the add-paths capability.

Default no ipv4

Parameters *send-limit* — Specifies the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to add-paths peers, the actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to IPv4 AFI/SAFI. If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each IPv4 NLRI if the peer has signaled support to receive multiple add-paths.

Values 1 to 16, none, multipaths

receive — Specifies that the router negotiates to receive multiple unlabeled unicast routes per IPv4 prefix.

none — Specifies that the router does not negotiate to receive multiple unlabeled unicast routes per IPv4 prefix.

Platforms All

ipv4

Syntax **ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

no ipv4

Context [Tree] (config>router>bgp>multi-path ipv4)

Full Context configure router bgp multi-path ipv4

Description This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes IPv4-specific overrides.

Default no ipv4

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

Platforms All

ipv4

Syntax **ipv4**

Context [Tree] (config>router>if>if-attr>delay>dyn>twamp ipv4)

Full Context configure router interface if-attribute delay dynamic twamp-light ipv4

Description Commands in this context select, enable, and specify the IPv4 addressing used to carry the TWAMP Light test packet.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.259 ipv4-address

ipv4-address

Syntax **ipv4-address** *ip-address*
no ipv4-address

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query ipv4-address)

Full Context configure subscriber-mgmt wlan-gw ue-query ipv4-address

Description This command enables matching on UEs with the specified IPv4 address.

The **no** form of this command disables matching on the IPv4 address.

Default no ipv4-address

Parameters *ip-address* — Specifies the IPv4 address.

Values a.b.c.d

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.260 ipv4-adjacency-sid

ipv4-adjacency-sid

Syntax **ipv4-adjacency-sid label** *value*
no ipv4-adjacency-sid

Context **[Tree]** (config>router>isis>interface ipv4-adjacency-sid)

Full Context configure router isis interface ipv4-adjacency-sid

Description This command allows a static value to be assigned to an IPv4 adjacency SID in IS-IS segment routing.

The **label** option specifies that the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *value* — Specifies the adjacency SID label.

Values 18432 to 5248 | 1048575 (FP4 only)

Platforms All

13.261 ipv4-arp

ipv4-arp

Syntax **ipv4-arp** *max-nr-of-hosts*
no ipv4-arp

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits ipv4-arp)
[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv4-arp)

Full Context configure subscriber-mgmt sla-profile host-limits ipv4-arp
configure subscriber-mgmt sub-profile host-limits ipv4-arp

Description This command configures the maximum number of IPv4 ARP hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv4 ARP hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv4 ARP hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.262 ipv4-dhcp

ipv4-dhcp

Syntax **ipv4-dhcp** *max-nr-of-hosts*
no ipv4-dhcp

Use subject to Terms available at: www.nokia.com

[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv4-dhcp)

Full Context configure subscriber-mgmt sla-profile host-limits ipv4-dhcp
configure subscriber-mgmt sub-profile host-limits ipv4-dhcp

Description This command limits the number of IPv4 DHCP hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv4 DHCP hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv4 DHCP hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.263 ipv4-mtu

ipv4-mtu

Syntax **ipv4-mtu** *bytes*
no ipv4-mtu

Context [Tree] (config>subscr-mgmt>gtp>peer-profile ipv4-mtu)

Full Context configure subscriber-mgmt gtp peer-profile ipv4-mtu

Description This command configures the value of the IPv4-MTU PCO sent in S11 GTP messages. This is the MTU a device should honor when sending data toward the SGW/PGW. For IPv6, this value is signaled in the RA message and which can be configured in the **grp-if> ipv6>rtr-adv>mtu** context.

The **no** form of this command resets the signaled IPv4 MTU to the default.

Default ipv4-mtu 1400

Parameters *bytes* — Specifies the MTU value in bytes.

Values 512 to 9000

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.264 ipv4-multicast

ipv4-multicast

Syntax [**no**] **ipv4-multicast**

Context **[Tree]** (config>service>vprn>isis>multi-topology ipv4-multicast)

Full Context configure service vprn isis multi-topology ipv4-multicast

Description This command enables support for the IPv4 topology (MT3) within the associate IS-IS instance.

The **no** form of this command disables support for the IPv4 topology (MT3) within the associated IS-IS instance.

Default no ipv4-multicast

Platforms All

Syntax **ipv4-multicast-metric** *metric*
no ipv4-multicast-metric

Context **[Tree]** (config>router>isis>if>level ipv4-multicast-metric)

Full Context configure router isis interface level ipv4-multicast-metric

Description This command configures the IS-IS interface metric for IPv4 multicast.

The **no** form of this command removes the metric from the configuration.

Parameters *metric* — Specifies the IS-IS interface metric for IPv4 multicast.

Values 1 to 16777215

Platforms All

13.267 ipv4-multicast-metric-offset

ipv4-multicast-metric-offset

Syntax **ipv4-multicast-metric-offset** *offset-value*
no ipv4-multicast-metric-offset

Context **[Tree]** (config>service>vprn>isis>link-group>level ipv4-multicast-metric-offset)

Full Context configure service vprn isis link-group level ipv4-multicast-metric-offset

Description This command sets the offset value for the IPv4 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv4 multicast topology

The **no** form of this command reverts the offset value to 0.

Default no ipv4-multicast-metric-offset

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

Values 0 to 6777215

Platforms All

ipv4-multicast-metric-offset

Syntax **ipv4-multicast-metric-offset** *offset-value*
no ipv4-multicast-metric-offset

Context **[Tree]** (config>router>isis>link-group>level ipv4-multicast-metric-offset)

Full Context configure router isis link-group level ipv4-multicast-metric-offset

Description This command sets the offset value for the IPv4 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv4 multicast topology.

The **no** form of this command reverts the offset value to 0.

Default no ipv4-multicast-metric-offset

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold

Values 0 to 6777215

Platforms All

13.268 ipv4-multicast-routing

ipv4-multicast-routing

Syntax **ipv4-multicast-routing** {**native** | **mt**}
[**no**] **ipv4-multicast-routing**

Context **[Tree]** (config>service>vprn>isis ipv4-multicast-routing)

Full Context configure service vprn isis ipv4-multicast-routing

Description The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv4 multicast RTM.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** ipv4-multicast-routing form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

Default ipv4-multicast-routing native

Parameters **native** — Causes IPv4 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

mt — Causes IPv4 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

Platforms All

ipv4-multicast-routing

Syntax **ipv4-multicast-routing** {**native** | **mt**}
[**no**] **ipv4-multicast-routing**

Context **[Tree]** (config>router>isis ipv4-multicast-routing)

Full Context configure router isis ipv4-multicast-routing

Description The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv4 multicast RTM.

The **no** form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

Default ipv4-multicast-routing native

Parameters **native** — Causes IPv4 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

mt — Causes IPv4 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

13.269 ipv4-node-sid

ipv4-node-sid

Syntax **ipv4-node-sid index** *index-value* [**clear-n-flag**]
ipv4-node-sid label *label-value* [**clear-n-flag**]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no ipv4-node-sid

Context [Tree] (config>router>isis>interface ipv4-node-sid)

Full Context configure router isis interface ipv4-node-sid

Description This command assigns a node SID index or label value to the prefix representing the primary address of an IPv4 network interface of **type loopback**. Only a single node SID can be assigned to an interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

The command fails if the network interface is not of **type loopback** or if the interface is defined in an IES or a VPRN context. Also, assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, a new segment routing module checks that the same index or label value cannot be assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required since the index and thus label ranges of the various IGP instance are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an IS-IS prefix SID sub-TLV originated for the IPv4 prefix of a loopback interface on the system.

By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID, meaning that it belongs to this node only. However, when the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, you must clear the N-flag to assure interoperability with third party implementations, which may perform a strict check on the receiving end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receiving end and accepts duplicate prefix SIDs with the N-flag set or cleared. SR OS will resolve to the closest owner, or owners if ECMP is configured, of the prefix SID according to its cost.

Default no ipv4-node-sid

Parameters **index** *index-value* — Specifies the index value.

Values 0 to 4294967295

label *label-value* — Specifies the label value.

Values 0 to 4294967295

clear-n-flag — Clears the node SID flag.

Default no clear-n-flag

13.270 ipv4-overall

ipv4-overall

Syntax **ipv4-overall** *max-nr-of-hosts*
no ipv4-overall

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits ipv4-overall)
[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv4-overall)

Full Context configure subscriber-mgmt sla-profile host-limits ipv4-overall
configure subscriber-mgmt sub-profile host-limits ipv4-overall

Description This command configures the maximum number of IPv4 hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv4 hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv4 hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.271 ipv4-ppp

ipv4-ppp

Syntax **ipv4-ppp** *max-nr-of-hosts*
no ipv4-ppp

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits ipv4-ppp)
[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv4-ppp)

Full Context configure subscriber-mgmt sla-profile host-limits ipv4-ppp
configure subscriber-mgmt sub-profile host-limits ipv4-ppp

Description This command configures the maximum number of IPv4 PPP hosts per SLA profile instance or per subscriber.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the maximum number of IPv4 PPP hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv4 PPP hosts.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.272 ipv4-prefix

ipv4-prefix

Syntax **ipv4-prefix** *ipv4-prefix*
no ipv4-prefix

Context **[Tree]** (config>service>nat>map-domain>mapping-rule ipv4-prefix)

Full Context configure service nat map-domain mapping-rule ipv4-prefix

Description This command configures an IPv4 MAP rule prefix.

Parameters *ipv4-prefix* — Specifies the IPv4 MAP prefix.

Values <*ipv4-prefix*>/<*ipv4-prefix-length*>
<*ipv4-prefix*> : a.b.c.d (host bits must be 0)
<*ipv4-prefix-length*> : [0..32]

Platforms VSR

ipv4-prefix

Syntax [**no**] **ipv4-prefix**

Context **[Tree]** (debug>router>rpki-session>packet ipv4-prefix)

Full Context debug router rpki-session packet ipv4-prefix

Description This command enables debugging for IPv4 prefix RPKI packets.

The **no** form of this command disables debugging for IPv4 prefix RPKI packets.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.273 ipv4-routing

ipv4-routing

Syntax [**no**] **ipv4-routing**

Context **[Tree]** (config>service>vprn>isis ipv4-routing)

Full Context configure service vprn isis ipv4-routing

Description This command specifies whether this IS-IS instance supports IPv4.

The **no** form of this command disables IPv4 on the IS-IS instance.

Default ipv4-routing

Platforms All

ipv4-routing

Syntax [**no**] **ipv4-routing**

Context **[Tree]** (config>router>isis ipv4-routing)

Full Context configure router isis ipv4-routing

Description This command specifies whether this IS-IS instance supports IPv4.

The **no** form of this command disables IPv4 on the IS-IS instance.

Default ipv4-routing

Platforms All

13.274 ipv4-sid

ipv4-sid

Syntax **ipv4-sid index** *index-id*
ipv4-sid label *label-id*
no ipv4-sid

Context **[Tree]** (config>router>segment-routing>sr-mpls>prefix-sids ipv4-sid)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router segment-routing sr-mpls prefix-sids ipv4-sid

Description This command is used to configure the IPv4 segment routing SID associated with the primary IPv4 address of the loopback or system interface.

The **no** form of this command removes the configuration of the IPv4 segment routing SID associated with the primary IPv4 interface address.

Default no ipv4-sid

Parameters **index** *index-id* — Specifies the node SID index for this interface.

Values 0 to 4294967295

label *label-id* — Specifies the label value for the node SID.

Values 32 to 1048575

Platforms All

13.275 ipv4-source-address

ipv4-source-address

Syntax **ipv4-source-address** *ipv4-address*
no ipv4-source-address

Context **[Tree]** (config>service>vprn>dns ipv4-source-address)

Full Context configure service vprn dns ipv4-source-address

Description This command configures the IPv4 address of the default secondary DNS server for the subscribers using this interface. Subscribers that cannot obtain an IPv4 DNS server address by other means, can use this for DNS name resolution.

The ipv4-address value can only be set to a nonzero value if the value of VPRN type is set to **subscriber-split-horizon**.

The **no** form of this command reverts to the default.

Parameters *ipv4-address* — Specifies the IPv4 address of the default secondary DNS server.

Values ipv4-address - a.b.c.d

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-source-address

Syntax **ipv4-source-address** *ip-address*
no ipv4-source-address

Context **[Tree]** (config>system>file-trans-prof ipv4-source-address)

Full Context configure system file-transmission-profile ipv4-source-address

Description This command specifies the IPv4 source address used for transport protocol.

The **no** form of this command uses the default source address which typically is the address of the egress interface.

Default no ipv4-source-address

Parameters *ip-address* — Specifies a unicast v4 address. This should be a local interface address.

Platforms All

ipv4-source-address

Syntax **ipv4-source-address** *ip-address*
no ipv4-source-address

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy>collector ipv4-source-address)

Full Context configure service nat syslog syslog-export-policy collector ipv4-source-address

Description This command configures the IPv4 source address from which the UDP streams containing syslog flow records are sourced.

The **no** form of the command removes the IPv4 address from the configuration.

Parameters *ip-address* — Specifies the source IPv4 address from which UDP streams are sent.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.276 ipv4-unicast-metric-offset

ipv4-unicast-metric-offset

Syntax **ipv4-unicast-metric-offset** *offset-value*
no ipv4-unicast-metric-offset

Context **[Tree]** (config>service>vprn>isis>link-group>level ipv4-unicast-metric-offset)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn isis link-group level ipv4-unicast-metric-offset

Description This command sets the offset value for the IPv4 unicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric.

The **no** form of this command reverts the offset value to 0.

Default no ipv4-unicast-metric-offset

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

Values 0 to 6777215

Platforms All

ipv4-unicast-metric-offset

Syntax **ipv4-unicast-metric-offset** *offset-value*
no ipv4-unicast-metric-offset

Context **[Tree]** (config>router>isis>link-group>level ipv4-unicast-metric-offset)

Full Context configure router isis link-group level ipv4-unicast-metric-offset

Description This command sets the offset value for the IPv4 unicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric.

The **no** form of this command reverts the offset value to 0.

Default no ipv4-unicast-metric-offset

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

Context [Tree] (config>service>template>epipe-sap-template>egress>filter ipv6)
[Tree] (config>service>template>epipe-sap-template>ingress>filter ipv6)

Full Context configure service template epipe-sap-template egress filter ipv6
configure service template epipe-sap-template ingress filter ipv6

Description This command associates an existing IPv6 filter policy with the template.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

Parameters *ipv6-filter-id* — Specifies the IPv6 filter policy. The filter ID must already exist within the created IPv6 filters.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6

Syntax **ipv6** *name*
no ipv6

Context [Tree] (config>service>template>epipe-sap-template>egress>filter-name ipv6)
[Tree] (config>service>template>epipe-sap-template>ingress>filter-name ipv6)

Full Context configure service template epipe-sap-template egress filter-name ipv6
configure service template epipe-sap-template ingress filter-name ipv6

Description This command associates an existing IP filter policy with the template.

Parameters *name* — Specifies the IPv6 filter policy name, up to 64 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6

Syntax **ipv6** *name*

ipv6

Syntax **ipv6 max-paths** [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no ipv6

Context **[Tree]** (config>service>vprn>bgp>multi-path ipv6)

Full Context configure service vprn bgp multi-path ipv6

Description This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv6 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multipath, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).
- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64)
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGP learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes IPv6-specific overrides.

Default no ipv6

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

egp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path-as — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

When enabled, the Alc-App-Prof-Str VSA is ignored in a radius Accept that enables portal redirection using this redirect policy. AA functionality will be disabled during portal authentication.

The **no** version of this command allows an Alc-App-Prof-Str to be present and will enable Application Assurance during portal authentication. In this case redirection rules defined in this policy are bypassed and it is assumed the AA function is configured for portal redirection.

Description This command enables context to configure list of redundant IPv6 source prefixes for preferred source selection.

Platforms All

ipv6

Syntax **ipv6**

Context **[Tree]** (config>service>vprn>pim>rp ipv6)

Full Context configure service vprn pim rp ipv6

Description This command enables access to the context to configure the rendezvous point (RP) of a PIM IPv6 protocol instance.

A Nokia IPv6 PIM router acting as an RP must respond to an IPv6 PIM register message specifying an SSM multicast group address by sending to the first hop router stop register message(s). It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range or from a multicast group address range that was explicitly configured for SSM.

Default ipv6 RP enabled when IPv6 PIM is enabled.

ipv6

Syntax [**no**] **ipv6**

Context **[Tree]** (config>router>if ipv6)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router interface ipv6

Description This command configures IPv6 for a router interface.

The **no** form of this command disables IPv6 on the interface.

Default no ipv6

Platforms All

ipv6

Syntax **ipv6**

Context **[Tree]** (bof>autoconfigure ipv6)

Full Context bof autoconfigure ipv6

Description Commands in this context autoconfigure the IPv6 DHCP client.

Platforms 7450 ESS-7, 7750 SR-1, 7750 SR-1e, 7750 SR-7, 7750 SR-s

ipv6

Syntax **ipv6** *ipv6-address*
ipv6 auto-generate [**vendor-id-value** *vendor-id*]
no ipv6

Context **[Tree]** (config>system>ned>prof>neip ipv6)

Full Context configure system network-element-discovery profile neip ipv6

Description This command configures the IPv6 NEIP for this profile. The NEIP can be configured manually or set to be automatically generated. If the NEIP is set to be automatically generated, the NEID is used for the subnet and host portion of the IPv6 address and the vendor ID value is set to 140 by default. The vendor ID value can be configured.

The **no** form of this command removes the IPv6 address association for this profile.

Default no ipv6

Parameters *ipv6-address* — Specifies the IPv6 address of the NEIP.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0..FFFF]H d: [0..255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

auto-generate — Specifies that the NEIP is automatically generated using the NEID.

vendor-id-value — Specifies the vendor ID value.

Values 1 to 255

Platforms All

ipv6

Syntax **ipv6 send** *send-limit* **receive** [**none**]
ipv6 send *send-limit*
no ipv6

Context **[Tree]** (config>router>bgp>add-paths ipv6)
[Tree] (config>router>bgp>group>add-paths ipv6)
[Tree] (config>router>bgp>group>neighbor>add-paths ipv6)

Full Context configure router bgp add-paths ipv6
configure router bgp group add-paths ipv6
configure router bgp group neighbor add-paths ipv6

Description This command configures the add-paths capability for unlabeled IPv6 unicast routes. By default, add-paths is not enabled for unlabeled IPv6 unicast routes.

The maximum number of unlabeled unicast paths per IPv6 prefix to send is the configured send limit, which is a mandatory parameter. The capability to receive multiple unlabeled IPv6 unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for unlabeled IPv6 unicast routes, causing sessions established using add-paths for unlabeled IPv6 unicast to go down and come back up without the add-paths capability.

Default no ipv6

Parameters **send** *send-limit* — Specifies the maximum number of paths per unlabeled IPv6 unicast prefix that are allowed to be advertised to add-paths peers. (The actual number of advertised routes may be less.) If the value is **none**, the router does not negotiate the send capability with respect to IPv6 AFI/SAFI. If the value is **multipaths**, then BGP advertises all the used BGP multipaths for each IPv6 NLRI if the peer has signaled support to receive multiple add-paths.

Values 1 to 16, none, multipaths

receive — Specifies the router negotiates to receive multiple unlabeled unicast routes per IPv6 prefix.

none — Specifies the router does not negotiate to receive multiple unlabeled unicast routes per IPv6 prefix.

Use subject to Terms available at: www.nokia.com

Platforms All

ipv6

Syntax **ipv6** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no ipv6

Context **[Tree]** (config>router>bgp>multi-path ipv6)

Full Context configure router bgp multi-path ipv6

Description This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv6 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes IPv6-specific overrides.

Default no ipv6

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

ipv6

Syntax [**no**] **ipv6**

Context **[Tree]** (config>router>isis>traffic-engineering-options ipv6)

Full Context configure router isis traffic-engineering-options ipv6

Description This command enables the advertisement of IPv6 TE in the IS-IS instance. When this command is enabled, traffic engineering behavior with IPv6 TE links is enabled. This IS-IS instance automatically begins advertising the new RFC 6119 IPv6 and TE TLVs and sub-TLVs.

The **no** form of this command disables IPv6 TE in this ISIS instance.

Default no ipv6

Platforms All

ipv6

Syntax **ipv6**

Context **[Tree]** (config>router>if>if-attr>delay>dyn>twamp ipv6)

Full Context configure router interface if-attribute delay dynamic twamp-light ipv6

Description Commands in this context select, enable, and specify the IPv6 addressing used to carry the TWAMP Light test packet.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

13.278 ipv6-address

ipv6-address

Syntax **ipv6-address** *ipv6-address*
no ipv6-address

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-address)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-address)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-address
configure subscriber-mgmt local-user-db ppp host ipv6-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures static DHCPv6 IA-NA address for the host. This address is delegated to the client as /128 via DHCPv6 proxy function within the router. This IP address must not be part of any DHCP pool within internal DHCP server.

The **no** form of this command removes the IPv6 address from the host configuration.

Parameters *ipv6-address* — Specifies the IPv6 address.

Values

ipv6-address: ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0 to FFFF]H
d [0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-address

Syntax **ipv6-address** *ipv6-address*
no ipv6-address

Context **[Tree]** (config>service>vprn>radius-proxy>server>wlan-gw ipv6-address)
[Tree] (config>router>radius-proxy>server>wlan-gw ipv6-address)

Full Context configure router radius-proxy server wlan-gw ipv6-address
configure service vprn radius-proxy server wlan-gw ipv6-address

Description This command configures the IPv6 address of the distributed RADIUS proxy server for use by the access points.

The **no** form of this command removes the address from the configuration.

Parameters *ipv6-address* — Specifies the destination IPv6 address of the RADIUS proxy server.

Values

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x [0 to FFFF]H
d [0 to 255]D

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context [Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute ipv6-address)

Full Context configure subscriber-mgmt radius-accounting-policy include-radius-attribute ipv6-address

Description This command enables the generation of the **ipv6-address** RADIUS attribute.

The **no** form of this command disables the generation of the **ipv6-address** RADIUS attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-address

Syntax [**no**] **ipv6-address**

Context [Tree] (config>aaa>isa-radius-plcy>auth-include-attributes ipv6-address)

Full Context configure aaa isa-radius-policy auth-include-attributes ipv6-address

Description This attribute defines if the ipv6 address of the UE is present during authentication if the datatrigger packet is IPv6.

Default no ipv6-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6-address

Syntax [**no**] **ipv6-address**

Context [Tree] (config>aaa>isa-radius-plcy>acct-include-attributes ipv6-address)

Full Context configure aaa isa-radius-policy acct-include-attributes ipv6-address

Description If an active IA_NA lease exists, this attribute defines if the IA_NA address of the UE is present in accounting.

Default no ipv6-address

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.279 ipv6-address-prefix-length

ipv6-address-prefix-length

Syntax **ipv6-address-prefix-length** *IPv6-prefix-length*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no ipv6-address-prefix-length

Context [Tree] (config>app-assure>group>transit-ip-policy ipv6-address-prefix-length)

Full Context configure application-assurance group transit-ip-policy ipv6-address-prefix-length

Description This command configures a transit IP policy IPv6 address prefix length.

Default no ipv6-address-prefix-length

Parameters *IPv6-prefix-length* — Specifies the prefix length of IPv6 addresses in this policy for both static and dynamic transits.

Values 32 to 64

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.280 ipv6-adjacency-sid

ipv6-adjacency-sid

Syntax **ipv6-adjacency-sid label** *value*
no ipv6-adjacency-sid

Context [Tree] (config>router>isis>interface ipv6-adjacency-sid)

Full Context configure router isis interface ipv6-adjacency-sid

Description This command allows a static value to be assigned to an IPv6 adjacency SID in IS-IS segment routing.

The **label** option specifies that the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters *value* — Specifies the adjacency SID label.

Values 18432 to 5248, 1048575 (FP4 only)

Platforms All

Use subject to Terms available at: www.nokia.com

13.281 ipv6-criteria

ipv6-criteria

Syntax [**no**] **ipv6-criteria**

Context **[Tree]** (config>qos>sap-egress ipv6-criteria)
[Tree] (config>qos>sap-ingress ipv6-criteria)

Full Context configure qos sap-egress ipv6-criteria
configure qos sap-ingress ipv6-criteria

Description IPv6 criteria-based SAP egress or ingress policies are used to select the appropriate ingress or egress queue or policer and corresponding forwarding class and packet profile for matched traffic.

This command is used to enter the node to create or edit policy entries that specify IPv6 criteria such as IP quintuple lookup or DiffServ code point.

The OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

The **no** form of this command deletes all the entries specified under this node. When ipv6-criteria entries are removed from a SAP ingress policy, the ipv6-criteria is removed from all services where that policy is applied.

Platforms All

ipv6-criteria

Syntax [**no**] **ipv6-criteria**

Context **[Tree]** (config>qos>network>ingress ipv6-criteria)
[Tree] (config>qos>network>egress ipv6-criteria)

Full Context configure qos network egress ipv6-criteria
configure qos network ingress ipv6-criteria

Description IPv6 criteria-based network ingress and egress policies are used to select the appropriate ingress or egress queue or policer, and the corresponding forwarding class and packet profile for matched traffic. This command is used to enter the context to create or edit policy entries that specify IPv6 criteria such as IP quintuple lookup or DSCP.

The 7750 SR OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. Entries must be sequenced correctly from most to least explicit.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The ingress classification only applies to the outer IPv6 header of non-tunneled traffic.

Attempting to apply a network QoS policy containing an **ipv6-criteria** statement to any object except a network IP interface will result in an error.

The **no** form of this command deletes all entries specified under this node. When IP criteria entries are removed from a network policy, the IPv6 criteria are removed from all network interfaces to which that policy is applied.

Platforms All

ipv6-criteria

Syntax [**no**] **ipv6-criteria**

Context **[Tree]** (config>service>apipe>sap>ingress>criteria-overrides ipv6-criteria)

13.282 ipv6-delegated-prefix

ipv6-delegated-prefix

Syntax **ipv6-delegated-prefix** *ipv6-prefix/prefix-length*
no ipv6-delegated-prefix

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-delegated-prefix)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-delegated-prefix)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-delegated-prefix
configure subscriber-mgmt local-user-db ppp host ipv6-delegated-prefix

Description This command configures static DHCPv6 IA-PD prefix for the host. This prefix can be further delegated by the host itself to its clients. The prefix length is restricted to 48 to 64 bits. This prefix must not be part of any DHCP pool within internal DHCP server.

Parameters *ipv6-address* — Specifies the IPv6 address.

Values

ipv6-address:	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
prefix-length	48 to 64	

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.283 ipv6-delegated-prefix-length

ipv6-delegated-prefix-length

Syntax **ipv6-delegated-prefix-length** *bits*
no ipv6-delegated-prefix-length

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-delegated-prefix-length)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-delegated-prefix-length)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-delegated-prefix-length

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure subscriber-mgmt local-user-db ppp host ipv6-delegated-prefix-length

Description This command allows configuration of delegated prefix length via local user database.

The **no** form of this command reverts to the default.

Parameters *bits* — Specifies the delegated prefix length, in bits.

Values 48 to 64

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.284 ipv6-delegated-prefix-pool

ipv6-delegated-prefix-pool

Syntax **ipv6-delegated-prefix-pool** *pool-name*
no ipv6-delegated-prefix-pool

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-delegated-prefix-pool)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-delegated-prefix-pool)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-delegated-prefix-pool
configure subscriber-mgmt local-user-db ppp host ipv6-delegated-prefix-pool

Description This command configures the pool name that is used in DHCPv6 server for DHCPv6 IA-PD prefix selection.

The **no** form of this command removes the pool name from the configuration.

Parameters *pool-name* — Specifies the pool name, up to 32 characters, to be assigned to the delegated prefix pool.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.285 ipv6-eh

ipv6-eh

Syntax **ipv6-eh** {**max** | **limited**}
no ipv6-eh

Context **[Tree]** (config>system>ip ipv6-eh)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system ip ipv6-eh

Description This command defines the maximum number of IPv6 extension headers parsed in the line cards. The system parses up to six extension headers when **ipv6-eh max** is configured.

When the **ipv6-eh limited** command is configured, the system does not parse IPv6 extension headers and provides consistent ipv6-filter matches for the next-header value found in the IPv6 packet header. LAG and ECMP hashing of IPv6 packets with extension headers is limited to Layer 3 IP addresses. Layer 4 ports, TEID, and SPI values are not available for hashing. MLD snooping on Layer 2 services is also not supported in this mode.

The **no** form of this command reverts to the default value.

Default ipv6-eh max

Parameters **max** — Specifies that the maximum number of IPv6 extension headers is parsed in the line cards.

limited — Specifies that the system does not parse IPv6 extension headers and provides consistent ipv6-filter matches for the next-header value found in the IPv6 packet header.

Platforms All

13.286 ipv6-error

ipv6-error

Syntax [**no**] **ipv6-error**

Context **[Tree]** (debug>router>ip>event ipv6-error)

Full Context debug router ip event ipv6-error

Description This command enables debugging for IPv6 error events.

The **no** form of this command disables debugging for IPv6 error events

Platforms All

Use subject to Terms available at: www.nokia.com

13.287 ipv6-exception

ipv6-exception

Syntax **ipv6-exception** *exception*
no ipv6-exception

Context **[Tree]** (config>router>if>ipsec ipv6-exception)
[Tree] (config>service>ies>if>ipsec ipv6-exception)
[Tree] (config>service>vprn>if>ipsec ipv6-exception)

Full Context configure router interface ipsec ipv6-exception
configure service ies interface ipsec ipv6-exception
configure service vprn interface ipsec ipv6-exception

Description This command configures the IPv6 filter exception for an IPsec-secured IPv6 interface. When an IPv6 filter exception is added, clear text packets that match the exception criteria in the IPv6 filter exception policy can ingress the interface, even when IPsec is enabled on that interface.

The **no** form of this command removes the IPv6 filter exception.

Default no ipv6-exception

Parameters *exception* — Specifies the IPv6 filter exception that is used to bypass encryption.

Values *exception-id*: 1 to 65535
exception-name: An existing IPv6 filter exception name up to 64 characters.

Platforms VSR

ipv6-exception

Syntax **ipv6-exception** *exception-id* [**name** *exception-name*] [**create**]
no ipv6-exception {*exception-id* | *exception-name*}

Context **[Tree]** (config>filter ipv6-exception)

Full Context configure filter ipv6-exception

Description Commands in this context configure the specified IPv6 exception filter.

The **no** form of the command deletes the IPv6 exception filter.

Parameters *exception-id* — Specifies the IPv6 filter exception ID expressed as a decimal integer.

Values 1 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

name *exception-name* — Specifies the IPv6 filter exception as a name, up to 64 characters.

create — This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms VSR

13.288 ipv6-filter

ipv6-filter

Syntax **ipv6-filter** *ipv6-filter-id*
no ipv6-filter [**force**]

Context **[Tree]** (config>subscr-mgmt>sla-profile>egress ipv6-filter)
[Tree] (config>subscr-mgmt>sla-profile>ingress ipv6-filter)

Full Context configure subscriber-mgmt sla-profile egress ipv6-filter
configure subscriber-mgmt sla-profile ingress ipv6-filter

Description This command configures an egress or ingress IPv6 filter.

The **no** form of this command reverts to the default.

Parameters *ipv6-filter-id* — Specifies an existing IPv6 filter policy ID.

Values 1 to 65535, or name, up to 64 characters

force — Forces the exclusion of the IPv6 filter.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-filter

Syntax **ipv6-filter** *ipv6-filter-id* **entry** *entry-id* [*entry-id*]
no ipv6-filter *ipv6-filter-id* [**entry** *entry-id*]

Context **[Tree]** (config>mirror>mirror-source ipv6-filter)

Full Context configure mirror mirror-source ipv6-filter

Description This command enables mirroring of packets that match specific entries in an existing IPv6 filter.

The **ipv6-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The IPv6 filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IPv6 filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IPv6 interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IPv6 filter is defined to a SAP or IPv6 interface, mirroring is enabled.

If the IPv6 filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IPv6 filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IPv6 filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IPv6 filters are mirrored. Mirroring of IPv6 filter entries must be explicitly defined.

The **no ipv6-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** form of this command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring that *entry-id* list is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID whose entries are mirrored. If the *ipv6-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ipv6-filter-id* is defined on a SAP or IPv6 interface.

entry-id — Specifies the IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

Platforms All

ipv6-filter

Syntax [**no**] **ipv6-filter** *ipv6-filter-id*

Context **[Tree]** (config>li>li-filter-block-reservation>li-reserved-block ipv6-filter)

Full Context configure li li-filter-block-reservation li-reserved-block ipv6-filter

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures to which normal IPv6 address filters the entry reservation is applied.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

The **no** form of this command removes the IPv6 filter ID from the configuration.

Parameters *ipv6-filter-id* — Specifies the filter identification identifies the normal IPv6 address filters.

Values {*filter-id* | *filter-name*}

filter-id:	1 to 65535
filter-name:	up to 64 characters (*filter-name* is an alias for input only. The *filter-name* gets replaced with an id automatically by SR OS in the configuration).

Platforms All

ipv6-filter

Syntax [**no**] **ipv6-filter** *ipv6-filter-id*

Context **[Tree]** (config>li>li-fltr-assoc>li-ipv6-fltr ipv6-filter)

Full Context configure li li-filter-associations li-ipv6-filter ipv6-filter

Description This command specifies the IP filter(s) into which the entries from the specified **li-ipv6-filter** are to be inserted. The **li-ipv6-filter** and **ipv6-filter** must already exist before the association is made. If the normal IPv6 filter is deleted then the association is also removed (and not re-created if the IPv6 filter comes into existence in the future).

The **no** form of this command removes the IPv6 filter ID from the configuration.

Parameters *ipv6-filter-id* — Specifies an existing IPv6 filter policy.

Values *filter-id* — 1 to 65535
filter-name — up to 64 characters

Context **[Tree]** (config>li>li-source ipv6-filter)

Full Context configure li li-source ipv6-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing IPv6 filter.

The **ipv6-filter** command directs packets which match the defined list of entry IDs to be intercepted to the destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IPv6 filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IPv6 filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IPv6 interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IPv6 filter is defined to a SAP, IPv6 interface or subscriber, mirroring is enabled (subscriber mirroring applies only to the 7750 SR).

If the IPv6 filter is defined as ingress, only ingress packets are intercepted. Ingress packets are sent to the destination prior to any ingress packet modifications.

If the IPv6 filter is defined as egress, only egress packets are intercepted. Egress packets are sent to the destination after all egress packet modifications.

An *entry-id* within an IPv6 filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

By default, no packets matching any IPv6 filters are intercepted. Interception of IPv6 filter entries must be explicitly defined.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, interception of that list of *entry-id*'s is terminated within the *ipv6-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being intercepted, no error will occur for that *entry-id* and the command will execute normally.

Parameters *ipv6-filter-id* — Specifies the IPv6 filter ID whose entries are to be intercepted. If the *ipv6-filter-id* does not exist, an error will occur and the command will not execute. Intercepting packets will commence when the *ipv6-filter-id* is defined on a SAP or IPv6 interface.

entry-id — Specifies the IPv6 filter entries to use as match criteria for lawful intercept (LI). The **entry** keyword begins a list of *entry-id*'s for interception. Multiple *entry-id* entries can be specified with a single command. Each *entry-id* must be separated by a space. Up to <N><n> 8 entry IDs may be specified in a single command.

If an *entry-id* does not exist within the IPv6 filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IPv6 filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

intercept-id — Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This intercept ID can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (**filter**, **nat**, **sap**, **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no intercept ID configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encapsulation, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4294967295 (32b) For nat li-source entries that are using a mirror service that is not configured with routable encap

Values 1t o 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

Values 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and with the direction-bit enabled.

session-id — Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

Values 1 to 4,294,967,295 (32b)

ipv6-filter

Syntax **ipv6-filter** *filter-id* [**name** *filter-name*] [**create**]
no ipv6-filter {*filter-id* | *filter-name*}

Context **[Tree]** (config>filter ipv6-filter)

Full Context configure filter ipv6-filter

Description Commands in this context configure the specified IPv6 filter policy.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command deletes the IPv6 filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

Parameters *filter-id* — Specifies the IPv6 filter policy ID expressed as a decimal integer.

Values 1 to 65535

name — Configures an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

Values *name*: 64 characters maximum

filter-name — Specifies a string of up to 64 characters uniquely identifying this IPv6 filter policy.

create — This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms All

ipv6-filter

Syntax [**no**] **ipv6-filter**

Context **[Tree]** (config>system>security>mgmt-access-filter ipv6-filter)

Full Context configure system security management-access-filter ipv6-filter

Description Commands in this context configure management access IPv6 filter parameters. This command only applies to the 7750 SR and 7950 XRS.

Platforms All

ipv6-filter

Syntax [**no**] **ipv6-filter**

Context **[Tree]** (config>system>security>cpm-filter ipv6-filter)

Full Context configure system security cpm-filter ipv6-filter

Description Commands in this context configure CPM IPv6 filter parameters. This command applies only to the 7750 SR and 7950 XRS.

Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ipv6-filter

Syntax **ipv6-filter** *src-filter-id* [**src-entry** *src-entry-id*] **to** *dst-filter-id* [**dst-entry** *dst-entry-id*] [**overwrite**]

Context **[Tree]** (config>filter>copy ipv6-filter)

Full Context configure filter copy ipv6-filter

Description This command copies an existing filter entry for a specific filter ID to another filter ID. The command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

Parameters *src-filter-id* — Identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword (**ipv6-filter**).

dst-filter-id — Identifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

overwrite — Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to destination occurs in a “break before make” manner and therefore should be handled with care.

13.289 ipv6-filter-max-size

ipv6-filter-max-size

Syntax **ipv6-filter-max-size** {*value* | **default**}

Context **[Tree]** (config>service>vprn>flowspec ipv6-filter-max-size)

Full Context configure service vprn flowspec ipv6-filter-max-size

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the maximum number of IPv6 FlowSpec routes or rules that can be embedded into an ingress IPv6 filter policy for a specified routing instance. Flowspec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and “offset + ip-filter-max-size – 1”.

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv6 filter that embeds IPv6 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv6 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where *N*<*M*, then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

Default ipv6-filter-max-size default

Parameters *value* — The maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

Values 0 to 262143

default — Configures the maximum size as 512.

Platforms All

Context [Tree] (config>router>isis>link-group>level ipv6-multicast-metric-offset)

Full Context configure router isis link-group level ipv6-multicast-metric-offset

Description This command sets the offset value for the IPv6 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv6 multicast topology.

The **no** form of this command reverts the offset value to 0.

Default no ipv6-multicast-metric-offset

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold

Values 0 to 6777215

Platforms All

13.298 ipv6-multicast-routing

ipv6-multicast-routing

Syntax **ipv6-multicast-routing** {**native** | **mt**}
[**no**] **ipv6-multicast-routing**

Context [Tree] (config>router>isis ipv6-multicast-routing)

Full Context configure router isis ipv6-multicast-routing

Description The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv6 multicast RTM.

The **no** form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

Default ipv6-multicast-routing native

Parameters **native** — Causes IPv6 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

mt — Causes IPv6 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

13.299 ipv6-node-sid

ipv6-node-sid

Syntax **ipv6-node-sid index** *index-value* [**clear-n-flag**]
ipv6-node-sid label *label-value* [**clear-n-flag**]
no ipv6-node-sid

Context **[Tree]** (config>router>isis>interface ipv6-node-sid)

Full Context configure router isis interface ipv6-node-sid

Description This command assigns a node SID index or label value to the prefix representing the primary address of an IPv6 network interface of type loopback. Only a single node SID can be assigned to an IPv6 interface. When an IPv6 interface has multiple global addresses, the primary address is always the first one in the list, as displayed by the **interface info** command.

The command fails if the network interface is not of loopback type or if the interface is defined in an IES or a VPRN context. Assigning the same SID index/label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, a new segment routing module checks that the same index or label value cannot be assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required since the index and thus label ranges of the various IGP instance are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an IS-IS prefix SID sub-TLV originated for the IPv6 prefix of a loopback interface on the system.

By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID, meaning that it belongs to this node only. However, when the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, you must clear the N-flag to assure interoperability with third-party implementations, which may perform a strict check on the receiving end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receiving end and accepts duplicate prefix SIDs with the N-flag set or cleared. SR OS will resolve to the closest owner, or owners if ECMP is configured, of the prefix SID according to its cost.

Default no ipv6-node-sid

Parameters *index-value* — Specifies the index value.

Values 0 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

label-value — Specifies the label value.

Values 0 to 4294967295

clear-n-flag — Clears the node SID flag.

Default no clear-n-flag

no ipv6-prefix-list *ipv6-prefix-list-name*

Context **[Tree]** (config>qos>match-list ipv6-prefix-list)

Full Context configure qos match-list ipv6-prefix-list

Description This command creates a list of IPv6 prefixes for match criteria in QoS policies. An ipv6-prefix-list must contain only IPv6 address prefixes created using the **prefix** command and cannot be deleted if it is referenced by a QoS policy.

The **no** form of this command deletes the specified list.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ipv6-prefix-list-name* — A string of up to 32 characters of printable ASCII characters. If special characters are used (#, $, spaces, and so on), the string must be enclosed within double quotes. The name **default** (case insensitive) is reserved by the system.

create — Creates IPv6 prefixes for match criteria in QoS policies.

Platforms All

ipv6-prefix-list

Syntax **ipv6-prefix-list** *ipv6-prefix-list-name* [**create**]
no ipv6-prefix-list *ipv6-prefix-list-name*

Context **[Tree]** (config>filter>match-list ipv6-prefix-list)

Full Context configure filter match-list ipv6-prefix-list

Description This command creates a list of IPv6 prefixes for match criteria in ACL and CPM IPv6 filter policies.

The **no** form of this command deletes the specified list.

Operational Notes:

An IPv6 prefix list must contain only IPv6 address prefixes.

An IPv6 prefix list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

Parameters *ipv6-prefix-list-name* — Specifies a string of up to 32 printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms All

13.306 ipv6-routing

ipv6-routing

Syntax [**no**] **ipv6-routing** {**native** | **mt**}

Context **[Tree]** (config>service>vprn>isis ipv6-routing)

Full Context configure service vprn isis ipv6-routing

Description This command enables IPv6 routing.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables support for IS-IS IPv6 TLVs for IPv6 routing.

Default no ipv6-routing

Parameters **native** — Enables IS-IS IPv6 TLVs for IPv6 routing and enables support for native IPv6 TLVs.

mt — Enables IS-IS multi-topology TLVs for IPv6 routing. When this parameter is specified, the support for native IPv6 TLVs is disabled.

Platforms All

ipv6-routing

Syntax [**no**] **ipv6-routing** {**native** | **mt**}

Context **[Tree]** (config>router>isis ipv6-routing)

Full Context configure router isis ipv6-routing

Description This command enables IPv6 routing.

The **no** form of this command disables support for IS-IS IPv6 TLVs for IPv6 routing.

Default no ipv6-routing

Parameters **native** — Enables IS-IS IPv6 TLVs for IPv6 routing and enables support for native IPv6 TLVs.

mt — Enables IS-IS multi-topology TLVs for IPv6 routing. When this parameter is specified, the support for native IPv6 TLVs is disabled.

Platforms All

13.307 ipv6-sid

ipv6-sid

Syntax **ipv6-sid index** *index-id*
ipv6-sid label *label-id*
no ipv6-sid

Context **[Tree]** (config>router>segment-routing>sr-mpls>prefix-sids ipv6-sid)

Full Context configure router segment-routing sr-mpls prefix-sids ipv6-sid

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to configure the IPv6 segment routing SID associated with the primary IPv6 address of the loopback or system interface.

The **no** form of this command removes the configuration of the IPv6 segment routing SID associated with the primary IPv6 interface address.

Default no ipv6-sid

Parameters **index** *index-id* — Specifies the node SID index for this interface.

Values 0 to 4294967295

label *label-id* — Specifies the label value for the node SID.

Values 32 to 1048575

Platforms All

13.308 ipv6-slaac-prefix

ipv6-slaac-prefix

Syntax **ipv6-slaac-prefix** *ipv6-prefix/prefix-length*
no ipv6-slaac-prefix

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host ipv6-slaac-prefix)
[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-slaac-prefix)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-slaac-prefix
configure subscriber-mgmt local-user-db ppp host ipv6-slaac-prefix

Description This command configures static IPv6 SLAAC prefix (PIO) for the host. The host will assign an IPv6 address to itself based on this prefix. The prefix length is 64 bits.

The **no** form of this command removes the static IPv6 SLAAC prefix (PIO) for the host from the configuration.

Default no ipv6-slaac-prefix

Parameters *ipv6-prefix/prefix-length* — Specifies the IPv6 address and prefix length.

Values

ipv6-prefix/prefix-length : ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D
prefix-length	64

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.309 ipv6-slaac-prefix-pool

ipv6-slaac-prefix-pool

Syntax **ipv6-slaac-prefix-pool** *pool*
no ipv6-slaac-prefix-pool

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-slaac-prefix-pool)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-slaac-prefix-pool)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-slaac-prefix-pool
configure subscriber-mgmt local-user-db ppp host ipv6-slaac-prefix-pool

Description This command configures the IPv6 SLAAC prefix pool of this host.

The **no** form of this command reverts to the default.

Parameters *pool* — Specifies the pool name, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.310 ipv6-source-address

ipv6-source-address

Syntax **ipv6-source-address** *ipv6-address*
no ipv6-source-address

Context **[Tree]** (config>aaa>diam-peer-plcy ipv6-source-address)

Full Context configure aaa diameter-peer-policy ipv6-source-address

Description This command configures IPv6 source address that the SR OS node will use for its peering connection.

The **no** form of this command removes the IPv6 source address from the configuration.

Parameters *ipv6-address* — Specifies the source IPv6 address to use for outgoing diameter messages to an IPv6-reachable peer.

Values
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-source-address

Syntax **ipv6-source-address** *ipv6-address* [**allow-connections**]
no ipv6-source-address

Context **[Tree]** (config>aaa>diam>node ipv6-source-address)

Full Context configure aaa diameter node ipv6-source-address

Description This command configures IPv6 source address that the SR OS node will use for its peering connection.

The **no** form of this command removes the IPv6 source address from the configuration.

Parameters *ipv6-address* — Specifies the source IPv6 address to use for outgoing diameter messages to an IPv6-reachable peer.

Values
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

allow-connections — Specifies to accept peering connections on the configured source IPv6 address. The peer initiating the connection can only be an inter-chassis peer.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-source-address

Syntax **ipv6-source-address** *ipv6-address*
no ipv6-source-address

Context **[Tree]** (config>aaa>radius-srv-plcy>servers ipv6-source-address)

Full Context configure aaa radius-server-policy servers ipv6-source-address

Description This command configures the source address of an IPv6 RADIUS packet.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When no ipv6-source-address is configured, the system IPv6 address (inband RADIUS server connection) or Boot Option File (BOF) IPv6 address (outband RADIUS server connection) must be configured in order for the RADIUS client to work with an IPv6 RADIUS server.

This address is also used in the NAS-IPv6-Address attribute.

The **no** form of this command reverts to the default value.

Parameters *ipv6-address* — Specifies the source address of an IPv6 RADIUS packet.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6-source-address

Syntax **ipv6-source-address** *ipv6-address*
no ipv6-source-address

Context **[Tree]** (config>service>vprn>dns ipv6-source-address)

Full Context configure service vprn dns ipv6-source-address

Description This command configures the IPv6 address of the default secondary DNS server for the subscribers using this interface. Subscribers that cannot obtain an IPv6 DNS server address by other means, can use this for DNS name resolution.

The ipv6-address value can only be set to a nonzero value if the value of VPRN type is set to **subscriber-split-horizon**.

The **no** form of this command reverts to the default.

Parameters *ipv6-address* — Specifies the IPv6 address of the default secondary DNS server.

Values ipv6-address - a.b.c.d

Platforms All

ipv6-source-address

Syntax **ipv6-source-address** *ipv6-address*
no ipv6-source-address

Context **[Tree]** (config>system>file-trans-prof ipv6-source-address)

Full Context configure system file-transmission-profile ipv6-source-address

Description This command specifies the IPv6 source address used for transport protocol.

The **no** form of this command uses the default source address which typically is the address of egress interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no ipv6-source-address

Parameters *Ipv6-address* — Specifies a unicast v6 address. This should be a local interface address.

Platforms All

13.311 ipv6-tcp-mss-adjust

ipv6-tcp-mss-adjust

Syntax **ipv6-tcp-mss-adjust** *segment-size*
no ipv6-tcp-mss-adjust

Context **[Tree]** (config>router>wlan-gw>dsm ipv6-tcp-mss-adjust)
[Tree] (config>service>vprn>wlan-gw>dsm ipv6-tcp-mss-adjust)

Full Context configure router wlan-gw distributed-sub-mgmt ipv6-tcp-mss-adjust
configure service vprn wlan-gw distributed-sub-mgmt ipv6-tcp-mss-adjust

Description This command specifies the value used for TCP-MSS-adjust in the IPv6 upstream direction for DSM. The downstream direction for both IPv4 and IPv6 are both configured under the group-interface. The upstream direction for IPv4 NAT hosts is configured under the NAT policy.

The defined segment size is inserted in a TCP SYN message if there is no existing MSS option or the value in the MSS option is bigger than the configured value.

The **no** form of this command disables upstream TCP MSS adjust for IPv6 DSM.

Default no ipv6-tcp-mss-adjust

Parameters *segment-size* — Specifies the segment size to be inserted.

Values 160 to 10240

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.312 ipv6-te-router-id

ipv6-te-router-id

Syntax **ipv6-te-router-id interface** *interface-name*
no ipv6-te-router-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router ipv6-te-router-id)

Full Context configure router ipv6-te-router-id

Description This command configures the IPv6 TE Router ID. The IPv6 TE Router ID, when configured, uniquely identifies the router as being IPv6 TE capable to other routers in an IGP TE domain.

IS-IS advertises this information using the IPv6 TE Router ID TLV.

If this command is not configured, the IPv6 TE Router ID will use the global unicast address of the system interface by default. The user can specify the system interface using this command to achieve the same result. If a different interface is specified, the preferred primary global unicast address of that interface is used instead

The **no** form of this command reverts the IPv6 TE Router ID to the default value.

Parameters **interface** *interface-name* — Specifies the name of the interface to be added or removed. Only system and loopback interfaces are accepted.

Platforms All

13.313 ipv6-unicast

ipv6-unicast

Syntax [**no**] **ipv6-unicast**

Context [Tree] (config>service>vprn>isis>multi-topology ipv6-unicast)

Full Context configure service vprn isis multi-topology ipv6-unicast

Description This command enables multi-topology TLVs.

The **no** form of this command disables multi-topology TLVs.

Platforms All

ipv6-unicast

Syntax [**no**] **ipv6-unicast**

Context [Tree] (config>router>isis>multi-topology ipv6-unicast)

Full Context configure router isis multi-topology ipv6-unicast

Description This command enables multi-topology TLVs.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables multi-topology TLVs.

Default no ipv6-unicast

Platforms All

13.314 ipv6-unicast-disable

ipv6-unicast-disable

Syntax [**no**] **ipv6-unicast-disable**

Context **[Tree]** (config>router>isis>if ipv6-unicast-disable)
[Tree] (config>service>vprn>isis>if ipv6-unicast-disable)

Full Context configure router isis interface ipv6-unicast-disable
configure service vprn isis interface ipv6-unicast-disable

Description This command disables IS-IS IPv6 unicast routing for the interface.

By default IPv6 unicast on all interfaces is enabled. However, IPv6 unicast routing on IS-IS is in effect when the **config>router>isis>ipv6-routing mt** command is configured.

The **no** form of this command enables IS-IS IPv6 unicast routing for the interface.

Platforms All

13.315 ipv6-unicast-metric

ipv6-unicast-metric

Syntax **ipv6-unicast-metric** *metric*
no ipv6-unicast-metric

Context **[Tree]** (config>service>vprn>isis>if>level ipv6-unicast-metric)

Full Context configure service vprn isis interface level ipv6-unicast-metric

Description This command configures IS-IS interface metric for IPv6 unicast.

The **no** form of this command removes the metric from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *metric* — Specifies the IS-IS interface metric for IPv6 unicast.

Values 1 to 16777215

Platforms All

ipv6-unicast-metric

Syntax **ipv6-unicast-metric** *metric*
no ipv6-unicast-metric

Context **[Tree]** (config>router>isis>if>level ipv6-unicast-metric)

Full Context configure router isis interface level ipv6-unicast-metric

Description This command configures the IS-IS interface metric for IPv6 unicast.

The **no** form of this command removes the metric from the configuration.

Default no ipv6-unicast-metric

Parameters *metric* — Specifies the IS-IS interface metric for IPv6 unicast.

Values 1 to 16777215

Platforms All

13.316 ipv6-unicast-metric-offset

ipv6-unicast-metric-offset

Syntax **ipv6-unicast-metric-offset** *offset-value*
no ipv6-unicast-metric-offset

Context **[Tree]** (config>service>vprn>isis>link-group>level ipv6-unicast-metric-offset)

Full Context configure service vprn isis link-group level ipv6-unicast-metric-offset

Description This command sets the offset value for the IPv6 unicast address family. If the number of operational links drops below the **oper-members** threshold, the configured offset is applied to the interface metric for the IPv6 topology.

The **no** form of this command reverts the offset value to 0.

Default no ipv6-unicast-metric-offset

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

Values 0 to 6777215

Platforms All

ipv6-unicast-metric-offset

Syntax **ipv6-unicast-metric-offset** *offset-value*
no ipv6-unicast-metric-offset

Context **[Tree]** (config>router>isis>link-group>level ipv6-unicast-metric-offset)

Full Context configure router isis link-group level ipv6-unicast-metric-offset

Description This command sets the offset value for the IPv6 unicast address family. If the number of operational links drops below the **oper-members** threshold, the configured offset is applied to the interface metric for the IPv6 topology.

The **no** form of this command reverts the offset value to 0.

Default no ipv6-unicast-metric-offset

Parameters *offset-value* — Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

Values 0 to 6777215

Platforms All

13.317 ipv6-wan-address-pool

ipv6-wan-address-pool

Syntax **ipv6-wan-address-pool** *pool-name*
no ipv6-wan-address-pool

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-wan-address-pool)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host ipv6-wan-address-pool)

Full Context configure subscriber-mgmt local-user-db ipoe host ipv6-wan-address-pool
configure subscriber-mgmt local-user-db ppp host ipv6-wan-address-pool

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the pool name that is used in the DHCPv6 server for DHCPv6 IA-PA address selection.

The **no** form of this command removes the pool name from the configuration.

Parameters *pool-name* — Specifies the WAN address pool, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.318 ipv6-wan-ipoe-dhcp

ipv6-wan-ipoe-dhcp

Syntax **ipv6-wan-ipoe-dhcp** *max-nr-of-hosts*
no ipv6-wan-ipoe-dhcp

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits ipv6-wan-ipoe-dhcp)
[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv6-wan-ipoe-dhcp)

Full Context configure subscriber-mgmt sla-profile host-limits ipv6-wan-ipoe-dhcp
configure subscriber-mgmt sub-profile host-limits ipv6-wan-ipoe-dhcp

Description This command configures the maximum number of IPv6 IPoE DHCP WAN hosts (IA-NA) per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv6 IPoE DHCP WAN hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.

[Tree] (config>subscr-mgmt>sub-profile>host-limits ipv6-wan-ppp-slaac)

Full Context configure subscriber-mgmt sla-profile host-limits ipv6-wan-ppp-slaac
configure subscriber-mgmt sub-profile host-limits ipv6-wan-ppp-slaac

Description This command configures the maximum number of IPv6 PPPoE SLAAC WAN hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv6 PPPoE SLAAC WAN hosts limit.

Parameters *max-nr-of-hosts* — Specifies the maximum number of IPv6 PPPoE SLAAC WAN hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.323 isa

isa

Syntax **isa**

Context **[Tree]** (config isa)

Full Context configure isa

Description Commands in this context configure Integrated Services Adapter (ISA) parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.324 isa-aa-group

isa-aa-group

Syntax **isa-aa-group** *aa-group-id*
no isa-aa-group

Context **[Tree]** (config>isa>wlan-gw-group>distributed-sub-mgmt isa-aa-group)

Full Context configure isa wlan-gw-group distributed-sub-mgmt isa-aa-group

Description This command configures an ISA application assurance group for WLAN gateway DSM subscribers.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

isa-aa-group

Syntax **isa-aa-group** *isa-aa-group-id* {**all** | **unknown**}
no isa-aa-group *isa-aa-group-id*

Context **[Tree]** (debug>mirror-source isa-aa-group)

Full Context debug mirror-source isa-aa-group

Description This command configures AA ISA group as a mirror source for this mirror service. Traffic is mirrored after AA processing takes place on AA ISAs of the group, therefore, any packets dropped as part of that AA processing are not mirrored.

Parameters *isa-aa-group-id* — Specifies the ISA ISA-AA group ID.

Values 1 to 255

all — Specifies that all traffic after AA processing will be mirrored.

unknown — Specifies that all traffic during the identification phase (may match policy entry or entries that have mirror action configured) and traffic that had been identified as unknown_tcp or unknown_udp after AA processing will be mirrored.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.325 isa-aa-oversubscription-factor

isa-aa-oversubscription-factor

Syntax **isa-aa-oversubscription-factor** *factor*
no isa-aa-oversubscription-factor

Context **[Tree]** (config>isa>wlan-gw-group>distributed-sub-mgmt isa-aa-oversubscription-factor)

Full Context configure isa wlan-gw-group distributed-sub-mgmt isa-aa-oversubscription-factor

Description This command specifies by how much an AA ISA is oversubscribed when linked to a WLAN-GW group. A factor of 1 indicates that each AA ISA is linked to a single WLAN-GW ISA, while a factor of 10 indicates that each AA ISA is linked to up to 10 WLAN-GW ISAs. The factor must be an integer but poses an oversubscription limit, not an exact ratio. For example, for 2 AA ISAs and 5 WLAN-GW ISAs, a factor of 3 or higher is valid. Additional standby ISAs can be added until the oversubscription limit is reached.

The **no** form of this command resets the configuration to the default value.

Default isa-aa-oversubscription-factor 1

Parameters *factor* — The number of WLAN GW ISAs that can be served by a single AA ISA.

Values 1 to 10

Platforms 7750 SR, 7750 SR-e, 7750 SR-s

13.326 isa-capacity-cost-high-threshold

isa-capacity-cost-high-threshold

Syntax **isa-capacity-cost-high-threshold** *threshold*
no isa-capacity-cost-high-threshold

Context **[Tree]** (config>isa>aa-grp isa-capacity-cost-high-threshold)

Full Context configure isa application-assurance-group isa-capacity-cost-high-threshold

Description This command configures the ISA-AA capacity cost high threshold.

The **no** form of this command reverts the threshold to the default value.

Default isa-capacity-cost-high-threshold 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *threshold* — Specifies the capacity cost high threshold for the ISA-AA group.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.327 isa-capacity-cost-low-threshold

isa-capacity-cost-low-threshold

Syntax **isa-capacity-cost-low-threshold** *threshold*
no isa-capacity-cost-low-threshold

Context **[Tree]** (config>isa>aa-grp isa-capacity-cost-low-threshold)

Full Context configure isa application-assurance-group isa-capacity-cost-low-threshold

Description This command configures the ISA-AA capacity cost low threshold.

The **no** form of this command reverts the threshold to the default value.

Default isa-capacity-cost-low-threshold 0

Parameters *threshold* — Specifies the capacity cost low threshold for the ISA-AA group.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.328 isa-dp-cpu-usage

isa-dp-cpu-usage

Syntax [**no**] **isa-dp-cpu-usage**

Context **[Tree]** (config>isa>tunnel-grp>stats-collection isa-dp-cpu-usage)

Full Context configure isa tunnel-group stats-collection isa-dp-cpu-usage

Description This command enables the system to collect statistics used to derive ISA CPU data plane usage. When enabled, this command impacts the ISA performance.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.329 isa-filter

isa-filter

Syntax **isa-filter** *name* [**type** {**dsm**}] [**create**]
no isa-filter *name*

Context **[Tree]** (config>subscr-mgmt isa-filter)

Full Context configure subscriber-mgmt isa-filter

Description Commands in this context configure ISA filter parameters.

Parameters *name* — Specifies the name of the filter.

type dsm — Selects DSM as the type.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.330 isa-overload-cut-through

isa-overload-cut-through

Syntax [**no**] **isa-overload-cut-through**

Context **[Tree]** (config>isa>aa-grp isa-overload-cut-through)

Full Context configure isa application-assurance-group isa-overload-cut-through

Description This command configures the ISA group to enable cut-through of traffic if an overload event occurs, triggered when the IOM weighted average queues depth exceeds the **wa-shared-high-wmark**. In this ISA state, packets are cut-through from application analysis but retain subscriber context with default subscriber policy applied.

The **no** form of this command disables cut-through processing on overload.

Default no isa-overload-cut-through

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

13.331 isa-policer

isa-policer

Syntax **isa-policer** *policer-name* [**type** *policer-type*] [**create**]
no isa-policer *policer-name*

Context **[Tree]** (config>subscr-mgmt isa-policer)

Full Context configure subscriber-mgmt isa-policer

Description This command creates the context to configure an ISA policer. When creating a policer for the first time, both the **create** and **type** parameters are required.

The **no** form of this command reverts to the default.

Parameters *policer-name* — Specifies the name by which this policer is referenced up to 32 characters.

policer-type — Specifies the policer type. The dual-bucket-bandwidth policer applies both a CIR and PIR.

Values single-bucket-bandwidth, dual-bucket-bandwidth

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

13.332 isa-radius-policy

isa-radius-policy

Syntax **isa-radius-policy** *name* [**create**]
no isa-radius-policy *name*

Context **[Tree]** (config>aaa isa-radius-policy)

Full Context configure aaa isa-radius-policy

Description This command creates a policy template related to transport of accounting messages from the BB-ISA card to the accounting server. It also defines accounting attributes that will be included in accounting messages. The policy template will be instantiated once it is applied to the BB-ISA cards in the nat-group.

The **no** form of the command removes the policy name from the configuration.

Default none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *name* — Specifies the name of the ISA RADIUS policy that can be referenced by a NAT application.

create — Keyword used to create the policy.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.333 isa-service-chaining

isa-service-chaining

Syntax [**no**] **isa-service-chaining**

Context **[Tree]** (config>router isa-service-chaining)

Full Context configure router isa-service-chaining

Description Commands in this context configure ISA service chaining parameters.

The **no** form of this command disables ISA service chaining parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

isa-service-chaining

Syntax **isa-service-chaining**

Context **[Tree]** (config>subscr-mgmt isa-service-chaining)

Full Context configure subscriber-mgmt isa-service-chaining

Description Commands in this context configure ISA-based service chaining for subscribers with L2-Aware NAT.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.334 isakmp-lifetime

isakmp-lifetime

Syntax **isakmp-lifetime** *seconds*

Context **[Tree]** (config>ipsec>ike-transform isakmp-lifetime)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure ipsec ike-transform isakmp-lifetime

Description This command specifies the lifetime of the IKE SA.

Default isakmp-lifetime 86400

Parameters *seconds* — Specifies the Phase 1 life time for this IKE transform.

Values 1200 to 31536000

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

13.335 isid

isid

Syntax **isid** *start* [**to** *to*]
no isid *start*

Context **[Tree]** (config>service>system>bgp-evpn>eth-seg>service-carving>manual isid)

Full Context configure service system bgp-evpn ethernet-segment service-carving manual isid

Description This command configures the ISID ranges for which the PE is primary, or uses the lowest preference algorithm.

Note: Multiple individual ISID values and ranges are allowed.

The following service-carving manual algorithms are supported for DF election:

- Manual non-preference

  A **preference** command is not configured for this algorithm. The primary PE for the configured ISIDs is determined by the ISID range. The manual non-preference algorithm only supports two PEs in the Ethernet Segment
- Manual preference-based

  If a **preference** command is configured, the algorithm uses the configured value to determine the DF election. For ISIDs not defined in the range, the highest-preference algorithm is used. For configured ISIDs, the lowest-preference algorithm is used.

Parameters *start* — Specifies the initial **isid** value of the range.

Values 1 to 16777215

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

to — Specifies the end **isid** value of the range. If not configured, only the individual start value is considered.

Values 1 to 16777215

Platforms All

isid

Syntax **isid** *value* [**to** *higher-value*]
no isid

Context **[Tree]** (config>filter>mac-filter>entry>match isid)

Full Context configure filter mac-filter entry match isid

Description This command configures an ISID value or a range of ISID values to be matched by the mac-filter parent. The pbb-etype value for the related SAP (inherited from the ethernet port configuration) or for the related SDP binding (inherited from SDP configuration) will be used to identify the ISID tag.

The **no** form of this command removes the ISID match criterion.

Default no isid

Parameters *value* — Specifies the ISID value, 24 bits as a decimal integer. When just one present identifies a specific ISID to be used for matching.

Values 0 to 16777215

to *higher-value* — Identifies a range of ISIDs to be used as matching criteria.

Platforms All

isid

Syntax **isid** *value* [**to** *higher-value*]
no isid
no isid *value* [**to** *higher-value*]

Context **[Tree]** (config>serv>mrp>mrp-policy>entry>match isid)

Full Context configure service mrp mrp-policy entry match isid

Description This command configures an ISID value or a range of ISID values to be matched by the mrp-policy parent when looking at the related MMRP attributes (Group B-MACs). The pbb-etype value for the related SAP (inherited from the ethernet port configuration) or for the related SDP binding (inherited from SDP configuration) will be used to identify the ISID tag.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Multiple ISID statements are allowed under a match node. The following rules govern the usage of multiple ISID statements:

- Overlapping values are allowed:
  - isid from 1 to 10
  - isid from 5 to 15
  - isid 16
- The minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with the “isid from 1 to 16” statement.
- There is no consistency check with the content of ISID statements from other entries. The entries are evaluated in the order of their IDs and the first match causes the implementation to execute the associated action for that entry and then to exit the mrp-policy.
- If there are no ISID statements under a match criteria but the **mac-filter** type is **isid** the following behaviors apply for different actions:
  - For **end-station**, it treats any ISID value as no match and goes to next entry or default action which must be “block” in this case
  - For **allow**, it treats any ISID value as a match and allows it
  - For **block**, it treats any ISID value as a match and blocks it

The **no** form of the command can be used in two ways:

no isid removes all the previous statements under one match node.

no isid *value* | **from** *value* **to** *higher-value* removes a specific ISID value or range. It must match a previously used positive statement: for example if the command **isid 16 to 100** was used using **no isid 16 to 50** will not work but **no isid 16 to 100** will be successful.

Default no isid

Parameters *value or higher-value* — Specifies the ISID value in 24 bits. When just one value is present, it identifies a particular ISID to be used for matching.

Values 0 to 16777215

from value to higher-value — Identifies a range of ISIDs to be used as matching criteria.

Platforms All

13.336 isid-policy

isid-policy

Syntax **isid-policy**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>service>vpls isid-policy)

Full Context configure service vpls isid-policy

Description This command configures ISID policies for individual ISIDs or ISID ranges in a B-VPLS using SPBM. The ISIDs may belong to I-VPLS services or may be static-isids defined on this node. Multiple entry statements are allowed under a **isid-policy**. ISIDs that are declared as static do not require and **isid-policy** unless the ISIDs are not to be advertised.

isid-policy allows finer control of ISID multicast but is not typically required for SPBM operation. Use of ISID policies can cause additional flooding of multicast traffic.

Platforms All

13.337 isid-range

isid-range

Syntax **isid-range** *from* [**to** *to*] {**auto-rt** | **route-target** *rt*}
no isid-range *from*

Context [Tree] (config>service>vpls>bgp-evpn>isid-route-target isid-range)

Full Context configure service vpls bgp-evpn isid-route-target isid-range

Description This command creates a range of ISIDs associated with a specified route-target that is advertised with BMAC-ISID and IMET-ISID routes for the ISID. The route-target can be explicitly configured or automatically assigned by the system if the **auto-rt** option is configured. Auto routes assignment is based on RFC 7623 as follows:

<2-byte-as-number>:<4-byte-value>, where 4-byte-value = 0x30+ISID

The **no** form of the command deletes the **isid-range** and its association with the **route-target**.

The **no** form is the default action, which advertises the BMAC-ISID and IMET-ISID routes with the B-VPLS configured route-target.

Default no isid-range

Parameters *from* — Specifies the start of the ISID range.

Values 1 to 16777215

to — Specifies the end of the ISID range. If it is not configured, the range is comprised of (only) the ISID specified in the *to* option.

Values 1 to 16777215

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

auto-rt — Automatically generates an ISID-derived **route-target** in the format: AS_number:0x30+ISID.

route-target — Specifies an explicit route target.

Values rt - target:{<ip-addr:comm-val>| <2byte-as-number:extcomm-val>| <4byte-asnumber:comm-val>}

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-as-number: [0 to 65535]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [0 to 4294967295]

Platforms All

13.338 isid-route-target

isid-route-target

Syntax **isid-route-target**

Context **[Tree]** (config>service>vpls>bgp-evpn isid-route-target)

Full Context configure service vpls bgp-evpn isid-route-target

Description Commands in this context configure the isid-range to route-target associations.

Platforms All

13.339 isis

isis

Syntax [**no**] **isis** *isis-instance*

Context **[Tree]** (config>service>vprn isis)

Full Context configure service vprn isis

Description Commands in this context configure the Intermediate-System-to-Intermediate-System (IS-IS) protocol instance in the VPRN.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The IS-IS protocol instance is enabled with the **no shutdown** command in the **config>service>vprn>isis** context. Alternatively, the IS-IS protocol instance is disabled with the **shutdown** command in the **config>service>vprn>isis** context.

IS-IS instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command disables the ISIS protocol instance from the given VPRN service.

Default 0

Parameters *isis-instance* — Specifies the instance ID for an IS-IS instance.

Values 0 to 127

Platforms All

isis

Syntax [**no**] **isis** [*isis-instance*]

Context **[Tree]** (config>router isis)

Full Context configure router isis

Description Commands in this context configure the Intermediate-System-to-Intermediate-System (IS-IS) protocol instance.

The IS-IS protocol instance is enabled with the **no shutdown** command in the **config>router>isis** context. Alternatively, the IS-IS protocol instance is disabled with the **shutdown** command in the **config>router>isis** context.

IS-IS instances are shutdown when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command deletes the IS-IS protocol instance. Deleting the protocol instance removes all configuration parameters for this IS-IS instance.

Parameters *isis-instance* — Specifies the instance ID for an IS-IS instance.

Values 0 to 127

Platforms All

isis

Syntax **isis** [*isis-instance*]

Context **[Tree]** (debug>router isis)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context debug router isis

Description Commands in this context debug IS-IS protocol entities.

Parameters *isis-instance* — Specifies the IS-IS instance.

Values 0 to 127

Output The following output is an example of the debugging information.

Sample Output

14 j Commands

14.1 jitter-event

jitter-event

Syntax **jitter-event rising-threshold** *threshold* [**falling-threshold** *threshold*] [*direction*]
no jitter-event

Context **[Tree]** (config>saa>test jitter-event)

Full Context configure saa test jitter-event

Description This command specifies that at the termination of an SAA test probe, the calculated jitter value is evaluated against the configured rising and falling jitter thresholds. SAA threshold events are generated as required.

Once the threshold (rising/falling) is crossed, it is disabled from generating additional events until the opposite threshold is crossed. If a **falling-threshold** is not supplied, the **rising-threshold** is re-enabled when it falls below the threshold after the initial crossing that generated the event.

The configuration of jitter event thresholds is optional.

The **no** form of the command disables the jitter event.

Parameters **rising-threshold** *threshold* — Specifies a rising threshold jitter value, in milliseconds. When the test run is completed, the calculated jitter value is compared to the configured jitter rising threshold. If the test run jitter value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483

Default 0

falling-threshold *threshold* — Specifies a falling threshold jitter value, in milliseconds. When the test run is completed, the calculated jitter value is compared to the configured jitter falling threshold. If the test run jitter value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

direction — Specifies the direction for OAM ping responses received for an OAM ping test run.

Values **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

outbound — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

roundtrip — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

Default roundtrip

14.2 join-time

join-time

Syntax **join-time** *value*
no join-time

Context **[Tree]** (config>service>vpls>sap>mrp join-time)
[Tree] (config>service>vpls>spoke-sdp>mrp join-time)
[Tree] (config>service>vpls>mesh-sdp>mrp join-time)

Full Context configure service vpls mesh-sdp mrp join-time
configure service vpls sap mrp join-time
configure service vpls spoke-sdp mrp join-time

Description This command controls the interval between transmit opportunities that are applied to the Applicant state machine. An instance of this Join Period Timer is required on a per-Port, per-MRP Participant basis. For additional information, refer to IEEE 802.1ak-2007 section 10.7.4.1.

Default join-time 2

Parameters *value* — The interval between transmit opportunities, in tenths of a second.

Values 1 to 10

Platforms All

15 k Commands

15.1 kb-memory-use-alarm

kb-memory-use-alarm

Syntax **kb-memory-use-alarm rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]
no kb-memory-use-warn

Context **[Tree]** (config>system>thresholds kb-memory-use-alarm)

Full Context configure system thresholds kb-memory-use-alarm

Description This command configures memory use, in kilobytes, alarm thresholds.

The **no** form of the command removes the parameters from the configuration.

Parameters **rising-threshold** *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units of kilobytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units of kilobytes.

Values -2147483648 to 2147483647

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

seconds — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type — Specifies the type of notification action to be taken when this event occurs.

Values log — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

startup-alarm *alarm-type* — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Platforms All

Context **[Tree]** (config>system>thresholds kb-memory-use-warn)

Full Context configure system thresholds kb-memory-use-warn

Description This command configures memory usage, in kilobytes, for warning thresholds

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **rising-threshold** *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units of kilobytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units of kilobytes.

Values -2147483648 to 2147483647

Default 0

seconds — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type — Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the show>system>thresholds CLI command.

trap — An SR OSS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

alarm-type — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Platforms All

15.3 keep-alive

keep-alive

Syntax **keep-alive** [**interval** *seconds*] [**retry-count** *value*] [**timeout** *retry-seconds*]
no keep-alive

Context **[Tree]** (config>subscr-mgmt>gtp>peer-profile keep-alive)

Full Context configure subscriber-mgmt gtp peer-profile keep-alive

Description This command configures Echo-Request messages.

The **no** form of this command reverts to the default values.

Default keep-alive interval 60 retry-count 4 timeout 5

Parameters *seconds* — Specifies, in seconds, the interval between keep-alive Echo-Request messages towards the same peer.

Values 0, 60 to 180

Default 60

value — Specifies, in seconds, the interval between keep-alive Echo-Request messages towards the same peer.

Values 1 to 15

Default 4

retry-seconds — Specifies the retry timeout, in seconds.

Values 1 to 20

Default 5

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keep-alive

Syntax **keep-alive** *timer*
no keep-alive

Context **[Tree]** (config>port>ethernet>dwl keep-alive)

Full Context configure port ethernet down-when-looped keep-alive

Description This command configures the time interval between keep-alive PDUs.

Default no keep-alive

Parameters *timer* — Specifies the time interval, in seconds, between keep-alive PDUs.

Values 1 to 120

Platforms All

keep-alive

Syntax **keep-alive** [**poll-frequency** *seconds*] [**poll-count** *value*] [**test-frequency** *seconds*]
no keep-alive

Context **[Tree]** (config>port>sonet-sdh>path>atm>ilmi keep-alive)

Full Context configure port sonet-sdh path atm ilmi keep-alive

Description This command configures keepalive parameters to monitor ILMI link connectivity.

The **no** form of this command resets the default values on an ILMI link.

Parameters **poll-frequency** *seconds* — Specifies the amount of time, in seconds, between successive transmissions of ILMI messages on this interface for the purpose of detecting the establishment of ILMI connectivity.

Values 1 to 255

value — Specifies the number of consecutive polls on this interface for which no ILMI response message is received before ILMI connectivity is declared lost.

Values 1 to 255

test-frequency *seconds* — Specifies the frequency for testing for connectivity when the link is establishing before polling begins.

Values 0 to 255

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

keep-alive

Syntax **keep-alive** *seconds*

Context [Tree] (config>li>x-interfaces>x2>timeouts keep-alive)
[Tree] (config>li>x-interfaces>x3>timeouts keep-alive)

Full Context configure li x-interfaces x2 timeouts keep-alive
configure li x-interfaces x3 timeouts keep-alive

Description This command configures the X2 and X3 keep-alive timeout.

Parameters *seconds* — Specifies the maximum time to wait for a LIC reply to a keep alive request. The system retries up to three more times, and if no reply is received, the system declares a connection fault and logs the failure event.

Values 300 to 600

Default 300

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

keep-alive

Syntax **keep-alive**

Context [Tree] (config>service>sdp keep-alive)

Full Context configure service sdp keep-alive

Description This command enables the context to configure SDP connectivity monitoring keepalive messages for the SDP ID.

SDP ID keepalive messages use SDP Echo Request and Reply messages to monitor SDP connectivity. The operating state of the SDP is affected by the keepalive state on the SDP ID. SDP Echo Request messages are only sent when the SDP ID is completely configured and administratively up. If the SDP ID is administratively down, keepalives for that SDP ID are disabled. SDP Echo Requests (when sent for keepalive messages) are always sent with the *originator-sdp-id*. All SDP ID keepalive SDP Echo Replies are sent using generic IP/GRE OAM encapsulation.

When a keepalive response is received that indicates an error condition, the SDP ID will immediately be brought operationally down. Once a response is received that indicates the error has cleared and the **hold-down-time** interval has expired, the SDP ID will be eligible to be put into the operationally up state. If no other condition prevents the operational change, the SDP ID will enter the operational state.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A set of event counters track the number of keepalive requests sent, the size of the message sent, non-error replies received and error replies received. A keepalive state value is kept indicating the last response event. A keepalive state timestamp value is kept indicating the time of the last event. With each keepalive event change, a log message is generated indicating the event type and the timestamp value.

Table 69 describes the keepalive interpretation of SDP echo reply response conditions and the effect on the SDP ID operational status.

Table 69 **Keepalive Interpretation and Effect of SDP Echo Reply**

Result of Request	Stored Response State	Operational State
keepalive request timeout without reply	Request Timeout	Down
keepalive request not sent due to non-existent *orig-sdp-id* (This condition should not occur)	Orig-SDP Non-Existent	Down
keepalive request not sent due to administratively down *orig-sdp-id*	Orig-SDP Admin-Down	Down
keepalive reply received, invalid origination-id	Far End: Originator-ID Invalid	Down
keepalive reply received, invalid responder-id	Far End: Responder-ID Error	Down
keepalive reply received, No Error	Success	Up (If no other condition prevents)

15.4 keep-alive-interval

keep-alive-interval

Syntax **keep-alive-interval** *interval*
no keep-alive-interval

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-lag keep-alive-interval)

Full Context configure redundancy multi-chassis peer mc-lag keep-alive-interval

Description This command sets the interval at which keep-alive messages are exchanged between two systems participating in MC-LAG. These keep-alive messages are used to determine remote-node failure and the interval is set in deciseconds.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command sets the interval to default value.

Default keep-alive-interval 10

Parameters *interval* — The time interval expressed in tenths of a second.

Values 5 to 500

Platforms All

keep-alive-interval

Syntax **keep-alive-interval** *interval*
no keep-alive-interval

Context **[Tree]** (config>service>ies>sub-if>grp-if>srrp keep-alive-interval)
[Tree] (config>service>vprn>sub-if>grp-if>srrp keep-alive-interval)

Full Context configure service ies subscriber-interface group-interface srrp keep-alive-interval
configure service vprn subscriber-interface group-interface srrp keep-alive-interval

Description This command defines the interval between SRRP advertisement messages sent when operating in the master state. The interval is also the basis for setting the master-down timer used to determine when the master is no longer sending. The system uses three times the keep-alive interval to set the timer. Every time an SRRP advertisement is seen that is better than the local priority, the timer is reset. If the timer expires, the SRRP instance assumes that a master does not exist and initiates the attempt to become master.

When in backup state, the SRRP instance takes the keep-alive interval of the master as represented in the masters SRRP advertisement message. Once in master state, the SRRP instance uses its own configured keep-alive interval.

The keep-alive-interval may be changed at any time, but will have no effect until the SRRP instance is in the master state.

The **no** form of this command restores the default interval.

Default keep-alive-interval 10

Parameters *interval* — Specifies the interval, in deciseconds, between SRRP advertisement messages sent when operating in the master state.

Values 1 to 100

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Full Context configure router l2tp group ppp keepalive
configure router l2tp group tunnel ppp keepalive
configure service vprn l2tp group ppp keepalive
configure service vprn l2tp group tunnel ppp keepalive

Description This command configures the PPP keepalive interval and multiplier.

Default keepalive 30 hold-up-multiplier 3

Parameters *seconds* — Specifies in seconds the interval.

Values 10 to 300

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

multiplier — Specifies the multiplier.

Values 1 to 5

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

keepalive

Syntax **keepalive** *seconds* [**hold-up-multiplier** *multiplier*]
no keepalive

Context **[Tree]** (config>subscr-mgmt>ppp-policy keepalive)

Full Context configure subscriber-mgmt ppp-policy keepalive

Description This command defines the keepalive interval and the number of keepalives that can be missed before the session is declared down for this PPP policy.

The **no** form of this command reverts to the default value.

Default keepalive 30 hold-up-multiplier 3

Parameters *seconds* — Specifies the keepalive interval in seconds.

Values 4 to 300

hold-up-multiplier *multiplier* — Specifies the number of keepalives that can be missed.

Values 1 to 5

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

keepalive

Syntax **keepalive** *seconds*
no keepalive

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy keepalive)

Full Context configure subscriber-mgmt bgp-peering-policy keepalive

Description This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires.

The keepalive value is generally one-third of the hold-time interval. Even though the OS implementation allows the keepalive value and the hold-time interval to be independently set, under the following circumstances, the configured keepalive value is overridden by the hold-time value:

If the specified keepalive value is greater than the configured hold-time, then the specified value is ignored, and the keepalive is set to one third of the current hold-time value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the specified hold-time interval is less than the configured keepalive value, then the keepalive value is reset to one third of the specified hold-time interval.

If the hold-time interval is set to zero, then the configured value of the keepalive value is ignored. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

Default keepalive 30

Parameters *seconds* — Specifies the keepalive timer in seconds, expressed as a decimal integer.

Values 0 to 21845

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

keepalive

Syntax **keepalive** *seconds*
no keepalive

[Tree] (config>port>tdm>e3>cisco-hdlc keepalive)

Full Context configure port sonet-sdh path cisco-hdlc keepalive
configure port tdm ds1 channel-group cisco-hdlc keepalive
configure port tdm ds3 cisco-hdlc keepalive
configure port tdm e1 channel-group cisco-hdlc keepalive
configure port tdm e3 cisco-hdlc keepalive

Description This command specifies the interval, in seconds, used to send periodic keepalive packets. The receiver process expects to receive a keepalive packet every “keepalive interval”. The link is declared down if the receiver process does not receive a keepalive within the “timeout interval”. The link is declared up once the number of continual keepalive packets received equals to the up-count. The nodes at the two endpoints of the cHDLC link should be provisioned with the same values. A keepalive value of 0 means no keepalive packets are sent.

Default keepalive 10

Parameters *time-interval* — Specifies the interval used to send periodic keepalive packets.

Values 0 to 300

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

keepalive

Syntax **keepalive** *seconds*
no keepalive

Context **[Tree]** (config>service>vprn>bgp keepalive)
[Tree] (config>service>vprn>bgp>group keepalive)
[Tree] (config>service>vprn>bgp>group>neighbor keepalive)

Full Context configure service vprn bgp group keepalive
configure service vprn bgp group neighbor keepalive
configure service vprn bgp keepalive

Description This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires. The **seconds** parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **keepalive** value is generally one-third of the **hold-time** interval. Even though the OS implementation allows the **keepalive** value and the **hold-time** interval to be independently set, under the following circumstances, the configured **keepalive** value is overridden by the **hold-time** value:

If the specified **keepalive** value is greater than the configured **hold-time**, then the specified value is ignored, and the **keepalive** is set to one third of the current **hold-time** value.

If the specified **hold-time** interval is less than the configured **hold-time** value, then the **keepalive** value is reset to one third of the specified **hold-time** interval.

If the **hold-time** interval is set to zero, then the configured value of the **keepalive** value is ignored. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default keepalive 30

Parameters *seconds* — The keepalive timer in seconds, expressed as a decimal integer.

Values 0 to 21845

Platforms All

[Tree] (config>router>ldp>targ-session>peer keepalive)
[Tree] (config>router>ldp>targ-session>peer-template keepalive)

Full Context configure router ldp interface-parameters interface ipv4 keepalive
configure router ldp interface-parameters interface ipv6 keepalive
configure router ldp interface-parameters ipv4 keepalive
configure router ldp interface-parameters ipv6 keepalive
configure router ldp targeted-session ipv4 keepalive
configure router ldp targeted-session ipv6 keepalive
configure router ldp targeted-session peer keepalive
configure router ldp targeted-session peer-template keepalive

Description This command configures the time interval (in s), that LDP waits before tearing down the session. The **factor** parameter derives the keepalive interval.

The **config**>**router**>**ldp**>**if-params**>**ipv6**>**keepalive** and **config**>**router**>**ldp**>**targ-session**>**ipv6**>**keepalive** commands are not supported on the 7450 ESS.

If no LDP messages are exchanged for the configured time interval, the LDP session is torn down. Keepalive timeout is usually three times the keepalive interval. To maintain the session permanently, regardless of the activity, set the value to zero.

When LDP session is being set up, the keepalive timeout is negotiated to the lower of the two peers. Once an operational value is agreed upon, the keepalive factor is used to derive the value of the keepalive interval.

The **no** form of the command at the interface-parameters and targeted-session levels sets the **keepalive timeout** and the **keepalive factor** to the default value.

The **no** form of this command, at the interface level, sets the **keepalive timeout** and the **keepalive factor** to the value defined under the **interface-parameters** level.

The **no** form of this command, at the peer level, sets the **keepalive timeout** and the **keepalive factor** to the value defined under the **targeted-session** level.

The session must be flapped for the new settings to operate.

Default Table 70 lists the default values.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 70 **Timeout Factor Defaults**

Context	Timeout	Factor
config>router>ldp>if-params	30	3
config>router>ldp>targ-session	40	4
config>router>ldp>if-params>if	Inherits values from interface-parameters context.	
config>router>ldp>targ-session>peer	Inherits values from targeted-session context.	

Parameters *timeout* — Configures the time interval, in seconds, that LDP waits before tearing down the session.

Values 1 to 65535

factor — Specifies the number of keepalive messages, expressed as a decimal integer, that should be sent on an idle LDP session in the keepalive timeout interval.

Values 1 to 255

Platforms All

keepalive

Syntax [**no**] **keepalive**

Context **[Tree]** (debug>router>ldp>peer>packet keepalive)

Full Context debug router ldp peer packet keepalive

Description This command enables debugging for LDP Keepalive packets.

The **no** form of the command disables the debugging output.

Platforms All

keepalive

Syntax **keepalive** *seconds*
no keepalive

Context **[Tree]** (config>router>pcep>pcc keepalive)
[Tree] (config>router>pcep>pce keepalive)

Full Context configure router pcep pcc keepalive
configure router pcep pce keepalive

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the PCEP session keep-alive value. A PCEP speaker (PCC or PCE) must send a keep-alive message if no other PCEP message is sent to the peer at the expiry of this timer. This timer is restarted every time a PCEP message or keep-alive message is sent.

The keep-alive mechanism is asymmetric, meaning that each peer can use a different keep-alive timer value at its end.

The **no** form of the command returns the keep-alive timer to the default value.

Default keepalive 30

Parameters *seconds* — the keep-alive value, in seconds

Values 1 to 255

Platforms All

keepalive

Syntax **keepalive** *deciseconds* **dropcount** *count*

Context **[Tree]** (config>isa>nat-group>inter-chassis-redundancy keepalive)

Full Context configure isa nat-group inter-chassis-redundancy keepalive

Description This command configures keepalives between the CPMs residing on different chassis. The keepalives are used to detect the presence of the peering node. If the redundant peer connectivity is lost beyond the limit defined by keepalives, then each node in the redundant pair transitions into a standalone mode. Keepalives use UDP transport.

Default keepalive 30 dropcount 2

Parameters *deciseconds* — Specifies the number of keepalives that are transported periodically at intervals defined by this parameter.

Values 2 to 250

count — Specifies the drop count. If the number of consecutive keepalives defined by this parameter is lost, then the peer is considered unreachable and the node transitions into a standalone mode of operation.

Values 2 to 20

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Syntax **keepalive** *seconds*
no keepalive

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context **[Tree]** (config>router>bgp keepalive)
[Tree] (config>router>bgp>group keepalive)
[Tree] (config>router>bgp>group>neighbor keepalive)

Full Context configure router bgp group keepalive
configure router bgp group neighbor keepalive
configure router bgp keepalive

Description This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires.

The **keepalive** parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **keepalive** value is generally one-third of the **hold-time** interval. Even though the implementation allows the **keepalive** value and the **hold-time** interval to be independently set, under the following circumstances, the configured **keepalive** value is overridden by the **hold-time** value:

- If the specified **keepalive** value is greater than the configured **hold-time**, then the specified value is ignored and the **keepalive** is set to one third of the current **hold-time** value.
- If the specified **hold-time** interval is less than the configured **keepalive** value, then the **keepalive** value is reset to one third of the specified **hold-time** interval.
- If the **hold-time** interval is set to zero, then the configured value of the **keepalive** value is ignored. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default keepalive 30

Parameters *seconds* — Specifies the keepalive timer, in seconds, expressed as a decimal integer.

Values 0 to 21845

Platforms All

keepalive

Syntax **keepalive** [**neighbor** *ip-addr* | **group** *name*]
no keepalive

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (debug>router>bgp keepalive)

Full Context debug router bgp keepalive

Description This command decodes and logs all sent and received keepalive messages in the debug log.

The **no** form of this command disables the debugging.

Parameters **neighbor** *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name* — Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms All

15.10 keepalive-override

keepalive-override

Syntax **keepalive-override** *keepalive-timer*
no keepalive-override

Context [Tree] (config>mcast-mgmt>mcast-info-policy>bundle keepalive-override)
[Tree] (config>mcast-mgmt>mcast-info-policy>bundle>channel keepalive-override)
[Tree] (config>mcast-mgmt>mcast-info-policy>bundle>channel>source-override keepalive-override)

Full Context configure mcast-management mcast-info-policy bundle channel keepalive-override
configure mcast-management mcast-info-policy bundle channel source-override keepalive-override
configure mcast-management mcast-info-policy bundle keepalive-override

Description This command configures the keepalive timer override. The PIM (S,G) Keepalive Timer (KAT) is used to maintain the (S,G) state when (S,G) join is not received. Expiry of the KAT causes the (S,G) entry to be removed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The KAT override configuration is performed with a multicast information policy, which must be applied to the related PIM routing instance. When a KAT override is configured under a channel (a group or a group range), it applies to all (S,G) entries that fall under it, except when the source-override is configured and a KAT override is also configured under the source-override. In this scenario, the specific KAT override must be used for the (S,G) entries that fall under the source-override, while other (S,G) entries under the bundle use the KAT override configured under the channel.

Parameters *keepalive-timer* — Specifies the keepalive timer override, in seconds.

Values 10 to 86000

15.11 kernel

kernel

Syntax **kernel password** *password*
no kernel

Context **[Tree]** (environment kernel)

Full Context environment kernel

Description This command enables and disables the kernel.

Parameters *password* — Specifies the password to access the kernel, up to 256 characters.

Platforms All

15.12 kex

kex

Syntax **kex** *index* **name** *kex-name*
no kex *index*

Context **[Tree]** (config>system>security>ssh>client-kex-list kex)
[Tree] (config>system>security>ssh>server-kex-list kex)

Full Context configure system security ssh client-kex-list kex
configure system security ssh server-kex-list kex

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command allows the user to configure phase 1 SSH v2 KEX algorithms for SR OS as an SSH server or an SSH client. By default, the client and server lists are empty. If the user configures this list, SSH uses the hard-coded list with the first-listed algorithm having the highest priority and so on. An empty server or client list is the default list and contains the following algorithms:

diffie-hellman-group16-sha512

diffie-hellman-group14-sha256

diffie-hellman-group14-sha1

diffie-hellman-group14-sha1

diffie-hellman-group1-sha1

The **no** form of this command removes the specified KEX index. If all KEX indexes are removed, the default list is used again.

Parameters *index* — Specifies the index of the algorithm in the list. The lowest index in the list is negotiated first on the SSH negotiation list, while the highest index is at the bottom of the SSH negotiation list.

Values 1 to 255

kex-name — Specifies the KEX algorithm for computing the shared secret key.

Values diffie-hellman-group16-sha512, diffie-hellman-group14-sha256, diffie-hellman-group14-sha1, diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1

Platforms All

15.13 key

key

Syntax **key packet-type** {**accept** | **request**} **attribute-type** *attribute-type* [**vendor** *vendor-id*]
no key

Context **[Tree]** (config>router>radius-proxy>server>cache key)
[Tree] (config>service>vprn>radius-proxy>server>cache key)

Full Context configure router radius-proxy server cache key
configure service vprn radius-proxy server cache key

Description This command specifies the RADIUS cache key that is used to match the information in subsequent DHCP requests for authorization.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **packet-type** — Specifies the packet type of the RADIUS messages to use to generate the key for the cache of this RADIUS proxy server.

Values accept, request

attribute-type — Specifies the RADIUS attribute type to cache for this RADIUS proxy. server.

Values 1 to 255

vendor-id — Specifies the RADIUS vendor ID.

Values 1 to 16777215, nokia

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

key

Syntax **key** *key-filename*
no key

Context **[Tree]** (config>ipsec>cert-profile>entry key)

Full Context configure ipsec cert-profile entry key

Description This command specifies the filename of an imported key for the **cert-profile entry**.

The **no** form of this command removes the key filename from the entry configuration.

Default no key

Parameters *key-filename* — Specifies the filename of an imported key.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

key

Syntax **key** *password* [**hash** | **hash2** | **custom**] **reference** *reference-number*
no key reference *reference-number*

Context **[Tree]** (config>system>security>pki>ca-profile>cmpv2>key-list key)

Full Context configure system security pki ca-profile cmpv2 key-list key

Description This command specifies a pre-shared key used for CMPv2 initial registration. Multiples of key commands are allowed to be configured under this context.

The password and reference-number is distributed by the CA via out-of-band means.

The configured password is stored in configuration file in an encrypted form by using SR OS hash2 algorithm.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the parameters from the configuration.

Parameters *password* — Specifies a printable ASCII string, up to 64 characters.

hash — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom — Specifies the custom encryption to management interface.

reference *reference-number* — Specifies a printable ASCII string, up to 64 characters in length.

Platforms All

key

Syntax **key** *key-filename*
no key

Context **[Tree]** (config>system>security>tls>cert-profile>entry key)

Full Context configure system security tls cert-profile entry key

Description This command specifies the file name of an imported key for the **cert-profile** entry.

The **no** form of the command removes the key.

Default no key

Parameters *key-filename* — Specifies the file name of the key.

Platforms All

15.14 key-list

key-list

Syntax **key-list**

Context **[Tree]** (config>system>security>pki>ca-profile>cmpv2 key-list)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure system security pki ca-profile cmpv2 key-list

Description This command enables the context to configure pre-shared key list parameters.

Platforms All

15.15 key-re-exchange

key-re-exchange

Syntax **key-re-exchange**

Context **[Tree]** (config>system>security>ssh key-re-exchange)

Full Context configure system security ssh key-re-exchange

Description This command enables the key re-exchange context.

Platforms All

15.16 key-rollover-interval

key-rollover-interval

Syntax **key-rollover-interval** *key-rollover-interval*

Context **[Tree]** (config>service>vprn>ospf3>area key-rollover-interval)

Full Context configure service vprn ospf3 area key-rollover-interval

Description This command configures the key rollover interval.

The **no** form of this command reverts to the default.

Default key-rollover-interval 10

Parameters *key-rollover-interval* — Specifies the time, in seconds, after which a key rollover will start.

Values 10 to 300

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

key-rollover-interval

Syntax **key-rollover-interval** *seconds*

Context **[Tree]** (config>router>ospf3>area key-rollover-interval)

Full Context configure router ospf3 area key-rollover-interval

Description This command configures the key rollover interval.

Default key-rollover-interval 10

Parameters *seconds* — Specifies the time, in seconds, after which a key rollover will start.

Values 10 to 300

Platforms All

15.17 key-update

key-update

Syntax **key-update ca** *ca-profile-name* **newkey** *key-filename* **oldkey** *key-filename* **oldcert** *cert-filename* [**hash-alg** *hash-algorithm*] **save-as** *save-path-of-result-cert*

Context **[Tree]** (admin>certificate>cmpv2 key-update)

Full Context admin certificate cmpv2 key-update

Description This command requests a new certificate from the CA to update an existing certificate due to reasons such as **key refresh** or **replacing compromised key**.

In some cases, the CA may not return certificate immediately, due to reasons such as request processing need manual intervention. In such cases, the admin certificate cmpv2 poll command can be used to poll the status of the request.

Parameters *ca-profile-name* — Specifies a ca-profile name which includes CMP server information, up to 32 characters.

newkey *key-filename* — Specifies the key file of the requesting certificate, up to 95 characters.

oldkey *key-filename* — Specifies the key to be replaced, up to 95 characters.

cert-filename — Specifies the file name of an imported certificate to be replaced, up to 95 characters.

hash-algorithm — Specifies the hash algorithm for RSA key.

Values md5,sha1,sha224,sha256,sha384,sha512

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

save-path-of-result-cert — Specifies the save full path name of saving the result certificate, up to 200 characters.

Platforms All

15.18 key-value

key-value

Syntax **key-value** *public-key-value*
no key-value

Context **[Tree]** (config>system>security>user>public-keys>ecdsa>ecdsa-key key-value)
[Tree] (config>system>security>user>public-keys>rsa>rsa-key key-value)

Full Context configure system security user public-keys ecdsa ecdsa-key key-value
configure system security user public-keys rsa rsa-key key-value

Description This command configures a value for the RSA or ECDSA public key. The public key must be enclosed in quotation marks. For RSA, the key is between 768 and 4096 bits. For ECDSA, the key is between 1 and 1024 bits.

Default no key-value

Parameters *public-key-value* — Specifies the public key value, up to 800 characters for RSA and up to 255 characters for ECDSA.

Platforms All

15.19 keychain

keychain

Syntax [**no**] **keychain** *keychain-name*

Context **[Tree]** (config>system>security keychain)

Full Context configure system security keychain

Description This command enables the context to configure keychain parameters. A keychain must be configured on the system before it can be applied to a session.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the keychain nodal context and everything under it from the configuration. If the keychain to be removed is in use when the no keychain command is entered, the command will not be accepted and an error indicating that the keychain is in use will be printed.

Parameters *keychain-name* — Specifies a keychain name which identifies this particular keychain entry.

Values An ASCII string up to 32 characters.

Platforms All

15.20 keygroup-name

keygroup-name

Syntax **keygroup-name** *keygroup-name*
no keygroup-name

Context **[Tree]** (config>grp-encryp>encryp-keygrp keygroup-name)

Full Context configure group-encryption encryption-keygroup keygroup-name

Description This command is used to name the key group. The key group name can be used to reference a key group when configuring services or displaying information.

The **no** form of the command reverts to the default value.

Parameters *keygroup-name* — The name of the key group, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

15.21 kill-session

kill-session

Syntax [**no**] **kill-session**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization kill-session)

Full Context configure system security profile netconf base-op-authorization kill-session

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command authorizes a user associated with the profile to send a NETCONF <kill-session> operation. This kill session operation allows a NETCONF client to kill another NETCONF session, but not the session in which the operation is requested.

The **no** form of the command denies the user from requesting a kill-session.

Default no kill-session

16 I Commands

16.1 l2

l2

Syntax [**no**] **l2**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>type l2)

Full Context configure subscriber-mgmt wlan-gw tunnel-query type l2

Description This command enables matching on Layer 2 tunnels.

The **no** form of this command disables matching on Layer 2 access points, unless no other tunnel type specifier is configured.

Default no l2

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2

Syntax [**no**] **l2**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query>state l2)

Full Context configure subscriber-mgmt wlan-gw ue-query state l2

Description This command enables matching on UEs in a Layer 2 wholesale state.

The **no** form of this command disables matching on UEs in a Layer 2 wholesale state, unless all state matching is disabled.

Default no l2

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.2 l2-access-id-alias

l2-access-id-alias

Syntax **l2-access-id-alias** *string*
no l2-access-id-alias

Context **[Tree]** (config>service>vpls>sap>pfcp l2-access-id-alias)

Full Context configure service vpls sap pfcp l2-access-id-alias

Description This command defines a Layer 2 access ID alias for the capture SAP. It replaces the default underlying port-based or LAG-based Layer 2 access ID. Different capture SAPs on the same underlying port or LAG can have different Layer 2 access ID aliases.

The **no** form of the command removes the configuration.

Parameters *string* — Specifies the Layer 2 access ID alias, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.3 l2-access-points

l2-access-points

Syntax **l2-access-points**

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw l2-access-points)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw l2-access-points)

Full Context configure service ies subscriber-interface group-interface wlan-gw l2-access-points
configure service vprn subscriber-interface group-interface wlan-gw l2-access-points

Description Commands in this context configure Layer 2 access points in WLAN gateway group interfaces.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.4 l2-ap

l2-ap

Syntax **l2-ap** *sap-id* [**create**]
no l2-ap *sap-id*

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>l2-access-points l2-ap)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>l2-access-points l2-ap)

Full Context configure service ies subscriber-interface group-interface wlan-gw l2-access-points l2-ap
configure service vprn subscriber-interface group-interface wlan-gw l2-access-points l2-ap

Description This command adds a specific SAP where Layer 2 WLAN gateway aggregation is performed. The following SAPs are supported:

- Ethernet
- LAG
- MPLS pseudowire SDPs

This command can be repeated multiple times to create multiple Layer 2 access points.

The **no** form of this command removes the Layer 2 access point. This is only allowed if the Layer 2 access point SAP is shutdown.

Parameters *sap-id* — Specifies SAP to be created.

create — Keyword used to create the Layer 2 WLAN gateway aggregation instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.5 l2-ap-auto-sub-id-fmt

l2-ap-auto-sub-id-fmt

Syntax **l2-ap-auto-sub-id-fmt** {**include-ap-tags** | **sap-only**}

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw l2-ap-auto-sub-id-fmt)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw l2-ap-auto-sub-id-fmt)

Full Context configure service ies subscriber-interface group-interface wlan-gw l2-ap-auto-sub-id-fmt
configure service vprn subscriber-interface group-interface wlan-gw l2-ap-auto-sub-id-fmt

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the contents of the auto-generated subscriber ID when the **ipoe-sub-id-key** command is set to include **sap-id** and the **def-sub-id** command is configured with **use-auto-id**. The VLANs must be configured so that the subscriber ID length is not exceeded.

This command can include either the SAP or the SAP + AP delimiting tags.

The **no** form of this command reverts to the default configuration.

Default l2-ap-auto-sub-id-fmt include-ap-tags

Parameters **include-ap-tags** — Specifies that the SAP + AP delimiting tags is used.

sap-only — Specifies that the SAP only is used.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.6 l2-ap-encap-type

l2-ap-encap-type

Syntax **l2-ap-encap-type** {**null** | **dot1q** | **qinq**}

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw l2-ap-encap-type)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw l2-ap-encap-type)

Full Context configure service ies subscriber-interface group-interface wlan-gw l2-ap-encap-type
configure service vprn subscriber-interface group-interface wlan-gw l2-ap-encap-type

Description This parameter specifies the number of AP identifying VLAN tags for an AP. This is the default value that can be overridden per SAP. This value must be at least equal to the number of VLANs configured in the SAP or enabling a SAP will fail.

A SAP VLAN is explicitly configured, for example **l2-ap 1/1/1:25**. Other VLANs on the same port can still be used in other contexts.

The number of VLAN tags Epiped to the WLAN gateway IOM equals the **l2-ap-encap-type** minus the encaps of the SAP. Upon receipt of a packet, these VLANs are stored as a Layer 2 tunnel identifier, and are only used in context of WLAN gateway.

The **no** form of this command sets the default value.

Default l2-ap-encap-type null

Parameters **null** — Both the SAP and the AP are not VLAN-tagged.

dot1q — Either the AP or the SAP uses one VLAN tag.

qinq — Up to two VLAN tags are used by the AP or SAP.

16.7 l2-aware

l2-aware

Syntax **l2-aware**

Context **[Tree]** (config>service>vprn>nat>inside l2-aware)

Full Context configure service vprn nat inside l2-aware

Description Commands in this context configure parameters specific to Layer2-Aware NAT.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2-aware

Syntax **l2-aware**

Context **[Tree]** (config>router>nat>inside l2-aware)

Full Context configure router nat inside l2-aware

Description Commands in this context configure Layer2-Aware NAT.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2-aware

Syntax **l2-aware subscriber** *sub-ident-string* **ip** *ip-address* **protocol** {**tcp** | **udp**} [**port** *port*] [**outside-ip** *ip-address*] [**outside-port** *port*] [**nat-policy** *policy-name*] [**member** *member-id*] [**port-range-start** *port*]
no l2-aware subscriber *sub-ident-string* **ip** *ip-address* **protocol** {**tcp** | **udp port** *port*

Context **[Tree]** (config>service>nat>fwd l2-aware)

Full Context configure service nat port-forwarding l2-aware

Description This command creates NAT static port forwards for Layer2-Aware subscribers. The ESM subscriber must be present in the system before this command is executed. The **no** form of the command deletes NAT static port forwards for Layer2-Aware subscribers.

Default none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **subscriber** *sub-ident-string* — This mandatory parameter specifies the ESM subscriber for which the SPF is to be created; ESM subscriber must be present in the system before the SPF can be created.

ip *ip-address* — This mandatory parameter specifies the source IPv4/IPv6 address for which SPF will be created.

protocol {**tcp** | **udp**} — This mandatory parameter specifies the protocol to use, either TCP or UDP.

port *port* — This optional parameter specifies a source port.

Values 1 to 65535

outside-ip *ipv4-address* — This mandatory parameter specifies the outside IPv4 address. If the outside IPv4 address is specified, then all other optional parameters become mandatory.

outside-port *port* — This optional parameter specifies the outside port.

nat-policy *policy-name* — If multiple NAT policies are used inside the routing context, then the NAT policy should be specified in the SPF request so the SPF is created in the correct NAT pool. Otherwise, the default NAT policy from the inside routing context will be used.

member *member-id* — This optional parameter should not be used by the operator. It is used only if the command is replayed via the **exec** command or at **boot-config**. The member ID indicates the identifier of the NAT ISA group member associated with this NAT subscriber.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.8 l2-aware-ip-address

l2-aware-ip-address

Syntax **l2-aware-ip-address** *ip-address*
l2-aware-ip-address from-pool
no l2-aware-ip-address

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dhcp l2-aware-ip-address)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dhcp l2-aware-ip-address)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp l2-aware-ip-address
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp l2-aware-ip-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the Layer2-Aware NAT inside IP address to be assigned via DHCP on the WLAN-GW ISA.

If the **from-pool** parameter is specified instead of an IPv4 address, a unique address is allocated to each UE. The pool used is managed by the dhcpv4-nat pool manager, configured under the same subscriber interface. This option is only available when **auth-on-dhcp** is also configured.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the Layer2-Aware NAT inside IP address.

from-pool — Specifies that the Layer2-Aware IP address is allocated from a pool.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.9 l2-aware-nat-bypass

l2-aware-nat-bypass

Syntax [**no**] **l2-aware-nat-bypass**

Context **[Tree]** (config>filter>ip-filter>entry>action l2-aware-nat-bypass)

Full Context configure filter ip-filter entry action l2-aware-nat-bypass

Description This command enables bypassing NAT for packets pertaining to L2-Aware hosts and matching this entry. This action is only applicable to L2-Aware NAT subscribers and it must be configured together with **action forward**. Traffic identified in the match condition bypasses L2-Aware NAT. A common use case is to bypass NAT for on-net destinations (within the customer network).

Traffic that is not classified for bypass is automatically diverted to L2-Aware NAT, unless it is explicitly configured in the IP filter to be dropped.

For selective NAT bypass to take effect, in addition to the IP filter configuration, the L2-Aware NAT subscriber must be specifically enabled for selective bypass via the **nat-allow-bypass** configuration option in the NAT CLI node in the SLA profile.

The **no** form of this command automatically diverts traffic to L2-Aware NAT, unless it is explicitly configured in the IP filter to be dropped.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.10 l2-aware-sub

l2-aware-sub

Syntax [**no**] **l2-aware-sub** *sub-ident-string*

Context **[Tree]** (config>li>li-source>nat l2-aware-sub)

Full Context configure li li-source nat l2-aware-sub

Description This command configures a Layer-2-Aware subscriber source.

The **no** form of this command removes the values from the configuration.

Parameters *sub-ident-string* — Specifies a source name.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.11 l2-inner-vlan

l2-inner-vlan

Syntax **l2-inner-vlan** *q-tag*
no l2-inner-vlan

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query l2-inner-vlan)

Full Context configure subscriber-mgmt wlan-gw tunnel-query l2-inner-vlan

Description This command enables matching on a Layer 2 access point with a specified C-VLAN.

The **no** form of this command disables matching on a C-VLAN.

Default no l2-inner-vlan

Parameters *q-tag* — Specifies the *q-tag* for the C-VLAN.

Values 0 to 4095

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.12 l2-ip

l2-ip

Syntax [**no**] **l2-ip**

Context **[Tree]** (config>cflowd>collector>export-filter>family l2-ip)

Full Context configure cflowd collector export-filter family l2-ip

Description This command filters Layer 2 IP flow data from being sent to the associated collector.

The **no** form of this command removes the filter, allowing Layer 2 IP flow data to be sent to the associated collector.

Default no l2-ip

Platforms All

16.13 l2-outer-vlan

l2-outer-vlan

Syntax **l2-outer-vlan** *q-tag*
no l2-outer-vlan

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query l2-outer-vlan)

Full Context configure subscriber-mgmt wlan-gw tunnel-query l2-outer-vlan

Description This command enables matching on a Layer 2 access point with a specified S-VLAN.

The **no** form of this command disables matching on an S-VLAN.

Default no l2-outer-vlan

Parameters *q-tag* — Specifies the *q-tag* for the S-VLAN.

Values 0 to 4095

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.14 l2-outside

l2-outside

Syntax **l2-outside**
no l2-outside

Context **[Tree]** (config>service>nat>nat-policy l2-outside)
[Tree] (config>service>nat>firewall-policy l2-outside)

Full Context configure service nat firewall-policy l2-outside
configure service nat nat-policy l2-outside

Description This command configures a NAT policy to be used with a Layer 2 outside service instead of a Layer 3 outside service. This command and the **pool** command are mutually exclusive.

Default no l2-outside

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy l2-outside

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy l2-outside

16.15 l2-sap

l2-sap

Syntax **l2-sap** *sap-id*
no l2-sap

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query l2-sap)

Full Context configure subscriber-mgmt wlan-gw tunnel-query l2-sap

Description This command enables matching on Layer 2 access points active on the specified SAP.

The **no** form of this command disables matching on the SAP.

Default no l2-sap

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *sap-id* — Specifies the SAP ID. For details on SAP ID parameter values, refer to section *Monitor CLI Commands* in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.16 l2-service

l2-service

Syntax **l2-service** *service-id*
no l2-service

Context **[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range l2-service)
[Tree] (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range l2-service)

Full Context configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range l2-service
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range l2-service

Description This command specifies the VPLS service used for L2 wholesale. When such a service is configured no other configuration is allowed under the vlan-range.

The **no** form of this command removes the L2 wholesale service, this is only allowed if the l2-service node is shut down.

Parameters *service-id* — Specifies the VPLS service ID to use for Layer 2 wholesale.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.17 l2pt-termination

l2pt-termination

Syntax **l2pt-termination** [**cdp**] [**dtp**] [**pagp**] [**stp**] [**udld**] [**vtp**]
no l2pt-termination

Context **[Tree]** (config>service>vpls>sap l2pt-termination)
[Tree] (config>service>template>vpls-sap-template l2pt-termination)
[Tree] (config>service>vpls>spoke-sdp l2pt-termination)

Full Context configure service template vpls-sap-template l2pt-termination

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vpls sap l2pt-termination
configure service vpls spoke-sdp l2pt-termination

Description This command enables Layer 2 Protocol Tunneling (L2PT) termination on a specified SAP or spoke-SDP. L2PT termination is supported only for STP BPDUs. PDUs of other protocols are discarded.

This feature can be enabled only if STP is disabled in the context of the specified VPLS service.

The **no** form of this command reverts to the default.

Default no l2pt-termination

Parameters **cdp** — Specifies the Cisco discovery protocol

dtp — Specifies the dynamic trunking protocol

pagp — Specifies the port aggregation protocol

stp — Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default)

udld — Specifies unidirectional link detection

vtp — Specifies the virtual trunk protocol

Platforms All

l2pt-termination

Syntax **l2pt-termination** [**cdp**] [**dtp**] [**pagp**] [**stp**] [**udld**] [**vtp**]
no l2pt-termination

Context **[Tree]** (config>service>pw-template l2pt-termination)

Full Context configure service pw-template l2pt-termination

Description This command enables Layer 2 Protocol Tunneling (L2PT) termination on a given SAP or spoke SDP. L2PT termination will be supported only for STP BPDUs. PDUs of other protocols will be discarded.

This feature can be enabled only if STP is disabled in the context of the given VPLS service.

Default no l2pt-termination

Parameters **cdp** — Specifies the Cisco discovery protocol.

dtp — Specifies the dynamic trunking protocol.

pagp — Specifies the port aggregation protocol.

stp — Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default).

udld — Specifies unidirectional link detection.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

vtp — Specifies the virtual trunk protocol.

Platforms All

16.18 l2tp

l2tp

Syntax **l2tp**

Context **[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host l2tp)

Full Context configure subscriber-mgmt local-user-db ppp host l2tp

Description Commands in this context configure L2TP parameters for the host.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax **l2tp**

Context **[Tree]** (config>router l2tp)

Full Context configure router l2tp

Description Commands in this context configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax [**no**] **l2tp**

Context **[Tree]** (debug>router l2tp)
[Tree] (debug>router>l2tp>assignment-id>packet l2tp)
[Tree] (debug>router>l2tp>group>packet l2tp)
[Tree] (debug>router>l2tp>packet l2tp)
[Tree] (debug>router>l2tp>peer>packet l2tp)

Full Context debug router l2tp
debug router l2tp assignment-id packet l2tp
debug router l2tp group packet l2tp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

debug router l2tp packet l2tp
debug router l2tp peer packet l2tp

Description This command sets debugging for L2TP packets.

The **no** form of this command removes the settings of debugging for L2TP packet.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax [**no**] **l2tp**

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync l2tp)

Full Context configure redundancy multi-chassis peer sync l2tp

Description This command enables L2TP.

The **no** form of this command disables L2TP.

Platforms All

l2tp

Syntax **l2tp** [**terminate-only**]
no l2tp

Context **[Tree]** (debug>service>id>ppp>event l2tp)

Full Context debug service id ppp event l2tp

Description This command enables PPP L2TP event debug.

Parameters **terminate-only** — Enables debug for local terminated PPP session.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax [**no**] **l2tp**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>type l2tp)

Full Context configure subscriber-mgmt wlan-gw tunnel-query type l2tp

Description This command enables matching on L2TP tunnels.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command disables matching on L2TP tunnels, unless no other tunnel type specifier is configured.

Default no l2tp

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax [**no**] **l2tp**

Context **[Tree]** (config>service>vprn l2tp)

Full Context configure service vprn l2tp

Description Commands in this context configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tp

Syntax **l2tp**

Context **[Tree]** (config>test-oam>build-packet>header l2tp)
[Tree] (debug>oam>build-packet>packet>field-override>header l2tp)

Full Context configure test-oam build-packet header l2tp
debug oam build-packet packet field-override header l2tp

Description This command causes the associated header to be defined as an L2TP header template and enables the context to define the L2TP parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.19 l2tp-accounting-policy

l2tp-accounting-policy

Syntax **l2tp-accounting-policy** *policy-name* [**create**]
no l2tp-accounting-policy *policy-name*

Context **[Tree]** (config>aaa l2tp-accounting-policy)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure aaa l2tp-accounting-policy

Description This command configures an L2TP accounting policy.

The **no** form of this command removes the policy-name from the configuration.

Parameters *policy-name* — Specifies a policy name.

create — This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.20 l2tp-lns

l2tp-lns

Syntax **l2tp-lns** *max-nr-of-sessions*
no l2tp-lns

Context **[Tree]** (config>subscr-mgmt>sla-profile>session-limits l2tp-lns)
[Tree] (config>subscr-mgmt>sub-profile>session-limits l2tp-lns)

Full Context configure subscriber-mgmt sla-profile session-limits l2tp-lns
configure subscriber-mgmt sub-profile session-limits l2tp-lns

Description This command configures the maximum number of L2TP LNS sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LNS sessions limit.

Parameters *max-nr-of-sessions* — Specifies the maximum number of L2TP LNS sessions.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.21 l2tp-load-balancing

l2tp-load-balancing

Syntax [**no**] **l2tp-load-balancing**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>load-balancing l2tp-load-balancing)

Full Context configure system load-balancing l2tp-load-balancing

Description This command enables the inclusion of the L2TPv2 session ID into the load-balancing hash algorithm to induce more variation and better load distribution over available links and next-hops.

The **no** form of this command disables the inclusion of the session-id.

Platforms All

16.22 l2tp-lts

l2tp-lts

Syntax **l2tp-lts** *max-nr-of-sessions*
no l2tp-lts

Context [Tree] (config>subscr-mgmt>sla-profile>session-limits l2tp-lts)
[Tree] (config>subscr-mgmt>sub-profile>session-limits l2tp-lts)

Full Context configure subscriber-mgmt sla-profile session-limits l2tp-lts
configure subscriber-mgmt sub-profile session-limits l2tp-lts

Description This command configures the maximum number of L2TP LTS sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LTS sessions limit.

Parameters *max-nr-of-sessions* — Specifies the maximum number of L2TP LTS sessions.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.23 l2tp-overall

l2tp-overall

Syntax **l2tp-overall** *max-nr-of-sessions*
no l2tp-overall

Context [Tree] (config>subscr-mgmt>sla-profile>session-limits l2tp-overall)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>subscr-mgmt>sub-profile>session-limits l2tp-overall)

Full Context configure subscriber-mgmt sla-profile session-limits l2tp-overall
configure subscriber-mgmt sub-profile session-limits l2tp-overall

Description This command configures the maximum number of L2TP sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP sessions limit.

Parameters *max-nr-of-sessions* — Specifies the maximum number of L2TP sessions.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.24 l2tp-tunnel-id-range

l2tp-tunnel-id-range

Syntax **l2tp-tunnel-id-range start** *l2tp-tunnel-id* **end** *l2tp-tunnel-id*
no l2tp-tunnel-id-range

Context [Tree] (config>redundancy>multi-chassis>peer>sync>track-srrp-instances>track-srrp l2tp-tunnel-id-range)

Full Context configure redundancy multi-chassis peer sync track-srrp-instances track-srrp l2tp-tunnel-id-range

Description This command sets the tunnel-id range that is used to allocate a new tunnel-id for a tunnel for which multi-chassis redundancy is configured to this MCS peer.

The **no** form of this command reverts to the default.

Parameters **start** *l2tp-tunnel-id* — Specifies the start of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

Values 1 to 16383

end *l2tp-tunnel-id* — Specifies the end of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

Values 1 to 16383

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.25 l2tpv3

l2tpv3

Syntax **l2tpv3**

Context **[Tree]** (config>router>l2tp l2tpv3)
[Tree] (config>router>l2tp>group l2tpv3)
[Tree] (config>router>l2tp>group>tunnel l2tpv3)
[Tree] (config>service>vprn>l2tp l2tpv3)
[Tree] (config>service>vprn>l2tp>group l2tpv3)
[Tree] (config>service>vprn>l2tp>group>tunnel l2tpv3)

Full Context configure router l2tp group l2tpv3
configure router l2tp group tunnel l2tpv3
configure router l2tp l2tpv3
configure service vprn l2tp group l2tpv3
configure service vprn l2tp group tunnel l2tpv3
configure service vprn l2tp l2tpv3

Description Commands in this context configure L2TPv3 parameters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Syntax **l2tpv3**

Context **[Tree]** (config>service>epipe>spoke-sdp>egress l2tpv3)
[Tree] (config>service>epipe>spoke-sdp>ingress l2tpv3)

Full Context configure service epipe spoke-sdp egress l2tpv3
configure service epipe spoke-sdp ingress l2tpv3

Description Commands in this context configure L2TPv3 spoke SDPs for Epipe services.

Platforms All

l2tpv3

Syntax **l2tpv3**

Context **[Tree]** (config>mirror>mirror-dest>spoke-sdp>egress l2tpv3)
[Tree] (config>mirror>mirror-dest>spoke-sdp>ingress l2tpv3)
[Tree] (config>mirror>mirror-dest>remote-src>spoke-sdp>ingress l2tpv3)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure mirror mirror-dest remote-source spoke-sdp ingress l2tpv3
configure mirror mirror-dest spoke-sdp egress l2tpv3
configure mirror mirror-dest spoke-sdp ingress l2tpv3

Description Commands in this context configure an RX/TX cookie for L2TPv3 egress spoke SDP or for the remote-source ingress spoke SDP.

Platforms All

16.26 l2tpv3-session

l2tpv3-session

Syntax **l2tpv3-session** [**create**]
no l2tpv3-session

Context **[Tree]** (config>service>epipe>sap l2tpv3-session)
[Tree] (config>service>vpls>sap l2tpv3-session)

Full Context configure service epipe sap l2tpv3-session
configure service vpls sap l2tpv3-session

Description This command creates the configuration context to define the L2TPv3 tunnel parameters.

The **no** form of this command deletes the L2TPv3 configuration context.

Parameters **create** — This keyword is mandatory while creating a L2TPv3 session.

Platforms All

16.27 l2w

l2w

Syntax [**no**] **l2w**

Context **[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state l2w)

Full Context configure subscriber-mgmt wlan-gw tunnel-query ue-state l2w

Description This command enables matching on tunnels with L2W UEs.

The **no** form of this command disables matching on L2W UEs, unless UE state matching is disabled altogether.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no l2w

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.28 l3-ring

l3-ring

Syntax **l3-ring** *name* [**create**]
no l3-ring name

Context **[Tree]** (config>redundancy>mc>peer>mcr l3-ring)

Full Context configure redundancy multi-chassis peer mc-ring l3-ring

Description This command configures a Layer 3 multi-chassis ring.

The **no** form of this command reverts to the default.

Platforms All

16.29 l4-load-balancing

l4-load-balancing

Syntax [**no**] **l4-load-balancing**

Context **[Tree]** (config>system>load-balancing l4-load-balancing)

Full Context configure system load-balancing l4-load-balancing

Description This command configures system-wide Layer 4 load balancing. The configuration at the system level can enable or disable load balancing based on Layer 4 fields. If enabled, the Layer 4 source and destination port fields will be included in hashing calculation for TCP/UDP packets.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network.

To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account L4 information (that is, src/dst L4-protocol port).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The hashing index can be calculated according to the following algorithm:

```
If [(TCP or UDP traffic) & enabled]
  hash (TCP/UDP ports, IP addresses)
else if (IP traffic)
  hash (IP addresses)
else
  hash (MAC addresses)
endif
```

This algorithm will be used in all cases where IP information in per-packet hashing is included (refer to "Traffic Load Balancing Options" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide*). However, the Layer 4 information (TCP/UDP ports) will not be used for fragmented packets.

Default no l4-load-balancing

Platforms All

16.30 l4-src-port

l4-src-port

Syntax **l4-src-port** *port* [*mask*]
no l4-src-port

Context **[Tree]** (config>system>security>mgmt-access-filter>ip-filter>entry l4-src-port)
[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry l4-src-port)

Full Context configure system security management-access-filter ip-filter entry l4-src-port
configure system security management-access-filter ipv6-filter entry l4-src-port

Description This command configures a destination TCP or UDP port number or port range for a management access filter match criterion.

The **no** form of this command reverts to the default values.

Default no l4-src-port

Parameters *port* — Specifies the destination TCP or UDP port number as a match criterion.

Values 1 to 65535

Default 6 (exact match)

mask — Specifies the mask used to select a range of source port numbers. Table 71 lists the format styles to configure the 16-bit mask.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 71 **Format Styles to Configure Mask**

Format Style	Format Syntax	Example
Decimal	DDDDD	63488
Hexadecimal	0xHHHH	0xF800
Binary	0bBBBBBBBBBBBBBBB	0b1111100000000000

To select a range from 1024 up to 2047, specify 1024 and 0xFC00 for port and maskrespectively.

Values 1 to 65535 (decimal)

Default 65535 (exact match)

Platforms All

16.31 label

label

Syntax **label** [**detail**]
no label

Context **[Tree]** (debug>router>ldp>peer>packet label)

Full Context debug router ldp peer packet label

Description This command enables debugging for LDP Label packets.

The **no** form of the command disables the debugging output.

Parameters **detail** — Displays detailed information.

Platforms All

label

Syntax **label** *label*
no label

Context **[Tree]** (config>test-oam>build-packet>header>mpls label)
[Tree] (debug>oam>build-packet>packet>field-override>header>mpls label)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure test-oam build-packet header mpls label
debug oam build-packet packet field-override header mpls label

Description This command defines the MPLS value to be used in the MPLS header.

The **no** form of this command removes the label value.

Default label 0

Parameters *label* — Specifies the MPLS label to be used in the MPLS header.

Values 0 to 1048575

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

label

Syntax [**no**] **label** *label*

Context **[Tree]** (debug>router>rib-api label)

Full Context debug router rib-api label

Description This command enables debugging for the specified RIB-API label.

Parameters *label* — Specifies the label of the specified RIB-API entry.

Values 32 to 1048575

Platforms All

16.32 label-allocation

label-allocation

Syntax **label-allocation**

Context **[Tree]** (config>router>bgp label-allocation)

Full Context configure router bgp label-allocation

Description This commands enables the context to configure the allocation of MPLS labels to specific BGP routes.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.33 label-block

label-block

Syntax **label-block** *name*
no label-block

Context **[Tree]** (conf>router>segment-routing>srv6>loc>static-function label-block)

Full Context configure router segment-routing segment-routing-v6 locator static-function label-block

Description This command configures a reserved label block name to be used in the termination of services on the SRv6 FPE.

Static values of the service SID function are mapped to label values drawn from this reserved label block. A static function value of 1 maps to the first label in this label block and so on.

Dynamic values of service SID function are mapped to label values drawn from the dynamic label range.

An End or End.X function does not map to a label value.

The **no** form of this command removes the label block name from the configuration.

Default no label-block

Parameters *name* — Specifies a reserved label block name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

16.34 label-ipv4

label-ipv4

Syntax **label-ipv4 max-paths** [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no label-ipv4

Context **[Tree]** (config>service>vprn>bgp>multi-path label-ipv4)

Full Context configure service vprn bgp multi-path label-ipv4

Description This command sets ECMP multipath parameters that apply only to the label IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multipath, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).
- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64).
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGP learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command removes label-IPv4-specific overrides.

Default no label-ipv4

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

egp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path-as — Specifies that the non-best path must have the same AS path as the best path.

unequal-cost — Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

Platforms All

label-ipv4

Syntax **label-ipv4 send** *send-limit*
label-ipv4 send *send-limit* **receive** [**none**]
no label-ipv4

Context **[Tree]** (config>router>bgp>add-paths label-ipv4)
[Tree] (config>router>bgp>group>add-paths label-ipv4)
[Tree] (config>router>bgp>group>neighbor>add-paths label-ipv4)

Full Context configure router bgp add-paths label-ipv4
configure router bgp group add-paths label-ipv4
configure router bgp group neighbor add-paths label-ipv4

Description This command configures the add-paths capability for labeled-unicast IPv4 routes. By default, add-paths is not enabled for labeled-unicast IPv4 routes.

The maximum number of labeled-unicast paths per IPv4 prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple labeled-unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default.

The **no** form of this command disables add-paths support for labeled-unicast IPv4 routes, causing sessions established using add-paths for labeled-unicast IPv4 to go down and come back up without the add-paths capability.

Default no label-ipv4

Parameters *send-limit* — Specifies the maximum number of paths per labeled-unicast IPv4 prefix that are allowed to be advertised to add-paths peers. (The actual number of advertised routes may be less.) If the value is none, the router does not negotiate the send capability with respect to label-IPv4 AFI/SAFI. If the value is **multipaths**, then BGP advertises all the used BGP multipaths for each IPv4 NLRI if the peer has signaled support to receive multiple add paths.

Values 1 to 16, none, multipaths

receive — Specifies the router negotiates to receive multiple labeled-unicast routes per IPv4 prefix.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

none — Specifies that the router does not negotiate to receive multiple labeled-unicast routes per IPv4 prefix.

Platforms All

label-ipv4

Syntax **label-ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]
no label-ipv4

Context **[Tree]** (config>router>bgp>multi-path label-ipv4)

Full Context configure router bgp multi-path label-ipv4

Description This command sets ECMP multipath parameters that apply only to the label IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes label-IPv4-specific overrides.

Default no label-ipv4

Parameters *max-paths* — Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

Values 1 to 64

ebgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route.

Values 1 to 64

ibgp-max-paths — Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

Values 1 to 64

restrict same-neighbor-as — Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

restrict exact-as-path — Specifies that the non-best path must have the same AS path as the best path.

Syntax **label-ipv6**

Context **[Tree]** (config>service>vprn>bgp>rib-management label-ipv6)

Full Context configure service vprn bgp rib-management label-ipv6

Description Commands in this context configure labeled IPv6 RIB.

Platforms All

16.36 label-ipv6-explicit-null

label-ipv6-explicit-null

Syntax [**no**] **label-ipv6-explicit-null**

Context **[Tree]** (config>router>bgp>next-hop-res>lbl-routes>use-bgp-routes label-ipv6-explicit-null)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router bgp next-hop-resolution labeled-routes use-bgp-routes label-ipv6-explicit-null

Description This command allows a labelled IPv6 route with the explicit-null label to be resolved by other labelled IPv6 routes with the explicit-null label, and also by unlabeled IPv4 routes and unlabeled IPv6 routes that are resolved by static routes, interface routes, or tunnels. Up to four levels of recursive resolution are supported when the top route is a labelled IPv6 route with an explicit-null label.

Regardless of setting, a labelled IPv6 route with a regular label (other than explicit-null) is never resolved by other labelled IPv6 routes.

The **no** form of this command disables the label-ipv6-explicit-null functionality. When disabled, a labeled IPv6 route cannot be resolved by other labeled IPv6 routes.

Default no label-ipv6-explicit-null

Platforms All

16.37 label-map

label-map

Syntax [**no**] **label-map** *in-label*

Context **[Tree]** (config>router>mpls>interface label-map)

Full Context configure router mpls interface label-map

Description This command is used on transit routers when a static LSP is defined. The static LSP on the ingress router is initiated using the **config router mpls static-lsp** *lsp-name* command. An *in-label* can be associated with either a **pop** or a **swap** action, but not both. If both actions are specified, the last action specified takes effect.

The **no** form of this command deletes the static LSP configuration associated with the *in-label*.

Parameters *in-label* — Specifies the incoming MPLS label on which to match.

Values 32 to 1023

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.38 label-mode

label-mode

Syntax **label-mode** {**vrf** | **next-hop**}
no label-mode

Context **[Tree]** (config>service>vprn label-mode)

Full Context configure service vprn label-mode

Description This command controls the method by which service labels are allocated to routes exported by the VPRN as BGP-VPN routes. The **vrf** option selects service label per VRF mode while the **next-hop** option selects service label per next-hop mode.

The **no** form of this command sets the mode to the default mode of service label per VRF.

Default no label-mode

Parameters **vrf** — Selects service label per VRF mode.

next-hop — Selects service label per next-hop mode.

Platforms All

16.39 label-preference

label-preference

Syntax **label-preference** *value*
no label-preference

Context **[Tree]** (config>service>vprn>bgp label-preference)
[Tree] (config>service>vprn>bgp>group label-preference)
[Tree] (config>service>vprn>bgp>group>neighbor label-preference)

Full Context configure service vprn bgp group label-preference
configure service vprn bgp group neighbor label-preference
configure service vprn bgp label-preference

Description This command configures the route preference for routes learned from labeled-unicast peers.

This command can be configured at three levels:

- Global level — applies to all peers

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Group level — applies to all peers in the peer-group
- Neighbor level — applies only to the specified peer

The most specific value is used.

The lower the preference, the higher the chance of the route being the active route.

The **no** form of this command used at the global level reverts to the default *value* of 170.

The **no** form of this command used at the group level reverts to the *value* defined at the global level.

The **no** form of this command used at the neighbor level reverts to the *value* defined at the group level.

Default no label-preference

Parameters *value* — Specifies the route preference value.

Values 1 to 255

Platforms All

label-preference

Syntax **label-preference** *value*
no label-preference

Context **[Tree]** (config>router>bgp label-preference)
[Tree] (config>router>bgp>group label-preference)
[Tree] (config>router>bgp>group>neighbor label-preference)

Full Context configure router bgp group label-preference
configure router bgp group neighbor label-preference
configure router bgp label-preference

Description This command configures the route preference for routes learned from labeled-unicast peers.

This command can be configured at three levels:

- Global level — applies to all peers
- Group level — applies to all peers in the peer-group
- Neighbor level — applies only to the specified peer

The most specific value is used.

The lower the preference, the higher the chance of the route being the active route.

The **no** form of this command used at the global level reverts to the default *value* of 170.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no label-preference

Parameters *value* — Specifies the route preference value.

Values 1 to 255

Platforms All

16.40 label-route-local

label-route-local

Syntax **label-route-local** [{**none** | **all**}]

Context **[Tree]** (config>router>ttl-propagate label-route-local)

Full Context configure router ttl-propagate label-route-local

Description This command configures the TTL propagation for locally generated packets which are forwarded over a BGP label route in the Global Routing Table (GRT) context.

For IPv4 and IPv6 packets forwarded using a RFC 3107 label route in the global routing instance, including 6PE, the all value of the command enables TTL propagation from the IP header into all labels in the transport label stack. The none value reverts to the default mode which disables TTL propagation from the IP header to the labels in the transport label stack. This command does not have a no version.

The TTL of the IP packet is always propagated into the RFC 3107 label itself, and this command only controls the propagation into the transport labels, for example, labels of the RSVP or LDP LSP to which the BGP label route resolves and which are pushed on top of the BGP label.

If the BGP peer advertised the implicit-null label value for the BGP label route, the TTL propagation will not follow the configuration described, but will follow the configuration to which the BGP label route resolves:

RSVP LSP shortcut:

- configure router mpls shortcut-local-ttl-propagate

LDP LSP shortcut:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- configure router ldp shortcut-local-ttl-propagate

This feature does not impact packets forwarded over BGP shortcuts. The ingress LER operates in uniform mode by default and can be changed into pipe mode using the configuration of TTL propagation for RSVP or LDP LSP shortcut listed.

Default label-route-local none

Parameters **none** — Specifies that the TTL of the IP packet is not propagated into the transport label stack.

all — Specifies that the TTL of the IP packet is propagated into all labels of the transport label stack.

Platforms All

16.41 label-route-transit

label-route-transit

Syntax **label-route-transit** [{**none** | **all**}]

Context **[Tree]** (config>router>ttl-propagate label-route-transit)

Full Context configure router ttl-propagate label-route-transit

Description This command configures the TTL propagation for transit packets which are forwarded over a BGP label route in the Global Routing Table (GRT) context.

For IPv4 and IPv6 packets forwarded using a RFC 3107 label route in the global routing instance, including 6PE, the all value of the command enables TTL propagation from the IP header into all labels in the transport label stack. The none value reverts to the default mode which disables TTL propagation from the IP header to the labels in the transport label stack. This command does not have a no version.

The TTL of the IP packet is always propagated into the RFC 3107 label itself, and this command only controls the propagation into the transport labels, for example, labels of the RSVP or LDP LSP to which the BGP label route resolves and which are pushed on top of the BGP label.

If the BGP peer advertised the implicit-null label value for the BGP label route, the TTL propagation will not follow the configuration described, but will follow the configuration to which the BGP label route resolves.

RSVP LSP shortcut:

- configure router mpls shortcut-transit-ttl-propagate

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

LDP LSP shortcut:

- configure router ldp shortcut-transit-ttl-propagate

This feature does not impact packets forwarded over BGP shortcuts. The ingress LER operates in uniform mode by default and can be changed into pipe mode using the configuration of TTL propagation for the listed RSVP or LDP LSP shortcut.

Default label-route-transit none

Parameters **none** — Specifies that the TTL of the IP packet is not propagated into the transport label stack.

all — Specifies that the TTL of the IP packet is propagated into all labels of the transport label stack.

Platforms All

16.42 label-stack-reduction

label-stack-reduction

Syntax [**no**] **label-stack-reduction**

Context **[Tree]** (config>router>mpls>lsp label-stack-reduction)
[Tree] (config>router>mpls>lsp-template label-stack-reduction)

Full Context configure router mpls lsp label-stack-reduction
configure router mpls lsp-template label-stack-reduction

Description This command enables the label stack size reduction for a SR-TE LSP or SR-TE LSP template.

At a high level, the label stack reduction algorithm attempts to replace a segment of a computed SR-TE LSP path with the farthest node SID on that path that results in using ECMP paths with links which still comply to the TE constraints of the LSP path.

The **no** form of this command returns the command to its default value.

Default no label-stack-reduction

16.43 label-stack-statistics-count

label-stack-statistics-count

Syntax **label-stack-statistics-count** *label-stack-statistics-count*
no label-stack-statistics-count

Context **[Tree]** (config>system>ip>mpls label-stack-statistics-count)

Full Context configure system ip mpls label-stack-statistics-count

Description This command enables the system to collect traffic statistics on the specified number of labels of the MPLS label stack.

The **no** form of this command disables the collecting of traffic statistics.

Default label-stack-statistics-count 1

Parameters *label-stack-statistics-count* — Specifies the number of labels on which the system can collect statistics.

Values 1, 2

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.44 label-withdrawal-delay

label-withdrawal-delay

Syntax **label-withdrawal-delay** *seconds*
no label-withdrawal-delay

Context **[Tree]** (config>router>ldp label-withdrawal-delay)

Full Context configure router ldp label-withdrawal-delay

Description This command specifies configures the time interval (in s), LDP will delay for the withdrawal of FEC-label binding it distributed to its neighbors when FEC is de-activated. When the timer expires, LDP then sends a label withdrawal for the FEC to all its neighbors. This is applicable only to LDP IPv4 prefix FECs and is not applicable to pseudowires (service FECs).

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

An example is PW redundancy where the primary PW doesn't have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

Default no label-withdrawal-delay

Parameters *seconds* — Specifies the time that LDP delays the withdrawal of FEC-label binding it distributed to its neighbors when FEC is de-activated.

Values 3 to 120

Platforms All

16.45 labeled-routes

labeled-routes

Syntax **labeled-routes**

Context **[Tree]** (config>router>bgp>next-hop-res labeled-routes)

Full Context configure router bgp next-hop-resolution labeled-routes

Description Commands in this context configure labeled route options for next-hop resolution.

Platforms All

16.46 lac-overall

lac-overall

Syntax **lac-overall** *max-nr-of-hosts*
no lac-overall

Context **[Tree]** (config>subscr-mgmt>sla-profile>host-limits lac-overall)
[Tree] (config>subscr-mgmt>sub-profile>host-limits lac-overall)

Full Context configure subscriber-mgmt sla-profile host-limits lac-overall
configure subscriber-mgmt sub-profile host-limits lac-overall

Description This command configures the maximum number of L2TP LAC hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LAC hosts limit.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *max-nr-of-hosts* — Specifies the maximum number of L2TP LAC hosts.

Note: The operational maximum value may be smaller due to equipped hardware dependencies.

Values 0 to 131071

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.47 lacp

lacp

Syntax **lacp** [**mode**] [**administrative-key** *admin-key*] [**system-id** *system-id*] [**system-priority** *priority*]
no lacp

Context **[Tree]** (config>lag lacp)

Full Context configure lag lacp

Description This command enables the LACP protocol. Per the IEEE 802.1ax standard, the Link Aggregation Control Protocol (LACP) provides a standardized means for exchanging information between Partner Systems on a link to allow their Link Aggregation Control instances to reach agreement on the identity of the Link Aggregation Group to which the link belongs, move the link to that Link Aggregation Group, and enable its transmission and reception functions in an orderly manner.

If any of the parameters are omitted, the existing configuration is preserved. The default parameter values are used if a parameter is never explicitly configured.

Default no lacp

Parameters **mode** — Specifies the mode in which LACP will operate.

Values **passive** — Starts transmitting LACP packets only after receiving packets.

active — Initiates the transmission of LACP packets.

admin-key — Specifies an administrative key value to identify the channel group on each port configured to use LACP. A random key is assigned by default if a value is not specified when using classic CLI only.

Values 1 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

system-id — Specifies the 48-bit system ID in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Values 1 to 65535

Default 32768

priority — Specifies the system priority.

Values 0 to 65535

Default 32768

Platforms All

16.48 lacp-mux-control

lacp-mux-control

Syntax **lacp-mux-control** {**coupled** | **independent**}
no lacp-mux-control

Context **[Tree]** (config>lag lacp-mux-control)

Full Context configure lag lacp-mux-control

Description This command configures the type of multiplexing machine control to be used in a LAG with LACP in active/passive modes.

The **no** form of this command disables multiplexing machine control.

Default lacp-mux-control coupled

Parameters **coupled** — Specifies that TX and RX activate together.

independent — Specifies that RX activates independent of TX.

Platforms All

16.49 lacp-system-priority

lacp-system-priority

Syntax **lacp-system-priority** *lacp-system-priority*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no lacp-system-priority

Context [Tree] (config>system lacp-system-priority)

Full Context configure system lacp-system-priority

Description This command configures the Link Aggregation Control Protocol (LACP) system priority on aggregated Ethernet interfaces. LACP allows the operator to aggregate multiple physical interfaces to form one logical interface.

Default lacp-system-priority 32768

Parameters *lacp-system-priority* — Specifies the LACP system priority.

Values 1 to 65535

Platforms All

16.50 lacp-tunnel

lacp-tunnel

Syntax [**no**] **lacp-tunnel**

Context [Tree] (config>port>ethernet lacp-tunnel)

Full Context configure port ethernet lacp-tunnel

Description This command enables LACP packet tunneling for the Ethernet port. When tunneling is enabled, the port will not process any LACP packets but will tunnel them instead. The port cannot be added as a member to a LAG group.

In this context, the **lacp-tunnel** command is supported for Epipe and VPLS services only.

The **no** form of this command disables LACP packet tunneling for the Ethernet port.

Default no lacp-tunnel

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.51 lacp-xmit-interval

lacp-xmit-interval

Syntax **lacp-xmit-interval** {**slow** | **fast**}
no lacp-xmit-interval

Context **[Tree]** (config>lag lacp-xmit-interval)

Full Context configure lag lacp-xmit-interval

Description This command specifies the interval signaled to the peer and tells the peer at which rate it should transmit.

Default lacp-xmit-interval fast

Parameters **slow** — Transmits packets every 30 seconds.

fast — Transmits packets every second.

Platforms All

16.52 lacp-xmit-stdby

lacp-xmit-stdby

Syntax [**no**] **lacp-xmit-stdby**

Context **[Tree]** (config>lag lacp-xmit-stdby)

Full Context configure lag lacp-xmit-stdby

Description This command enables LACP message transmission on standby links.

The **no** form of this command disables LACP message transmission. This command should be disabled for compatibility when using active/standby groups. This forces a timeout of the standby links by the peer. Use the **no** form if the peer does not implement the correct behavior regarding the lacp sync bit.

Default lacp-xmit-stdby

Platforms All

Use subject to Terms available at: www.nokia.com

16.53 lag

lag

Syntax **lag** *lag-id* **lacp-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority* **source-bmac-lsb use-lacp-key**
lag *lag-id* **lacp-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority* **source-bmac-lsb** *MAC-Lsb*
lag *lag-id* **lacp-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority*
lag *lag-id* [**remote-lag** *remote-lag-id*]
no lag *lag-id*

Context **[Tree]** (config>redundancy>multi-chassis>peer>mc-lag lag)

Full Context configure redundancy multi-chassis peer mc-lag lag

Description This command defines a LAG which is forming a redundant-pair for MC-LAG with a LAG configured on the given peer. The same LAG group can be defined only in the scope of 1 peer. In order MC-LAG to become operational, all parameters (**lacp-key**, **system-id**, **system-priority**) must be configured the same on both nodes of the same redundant pair.

The partner system (the system connected to all links forming MC-LAG) will consider all ports using the same **lacp-key**, **system-id**, **system-priority** as the part of the same LAG. In order to achieve this in MC operation, both redundant-pair nodes have to be configured with the same values. In case of the mismatch, MC-LAG is kept in oper-down status.

Note that the correct CLI command to enable MC LAG for a LAG in **standby-signaling power-off mode** is **lag** *lag-id* [**remote-lag** *remote-lag-id*]. In the CLI help output, the first three forms are used to enable MC LAG for a LAG in LACP mode. MC LAG is disabled (regardless of the mode) for a given LAG with **no lag** *lag-id.*

Parameters *lag-id* — The LAG identifier, expressed as an integer. Specifying the *lag-id* allows the mismatch between lag-id on redundant-pair. If no **lag-id** is specified it is assumed that neighbor system uses the same *lag-id* as a part of the given MC-LAG. If no matching MC-LAG group can be found between neighbor systems, the individual LAGs will operate as usual (no MC-LAG operation is established).

Values 1 to 800

admin-key — Specifies a 16 bit key that needs to be configured in the same manner on both sides of the MC-LAG in order for the MC-LAG to come up.

Values 1 to 65535

system-id — Specifies a 6 byte value expressed in the same notation as MAC address.

Values xx:xx:xx:xx:xx:xx - xx [00 to FF]

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

remote-lag-id — Specifies the LAG ID on the remote system.

Values 1 to 800

system-priority — Specifies the system priority to be used in the context of the MC-LAG. The partner system will consider all ports using the same **lacp-key**, **system-id**, and **system-priority** as part of the same LAG.

Values 1 to 65535

MAC-Lsb — Configures the last 16 bit of the MAC address to be used for all traffic ingressing the MC-LAG link(s) or if use-lacp-key option is used, it will only copy the value of lacp-key (redundancy multi-chassis mc-lag lag lacp-key admin-key). The command will fail if the *value* is the same with any of the following configured attributes:

- Source-bmac-lsb assigned to other MC-LAG ports.
- lsb 16 bits value for the source-bmac configured at chassis or BVPLS level

  The first 32 bits will be copied from the source B-MAC of the BVPLS associated with the IVPLS for a specific IVPLS SAP mapped to the MC-LAG. The BVPLS source B-MAC can be provisioned for each BVPLS or can be inherited from the chassis PBB configuration.

Values 1 to 65535 or xx-xx or xx:xx

Platforms All

lag

Syntax **lag** *lag-id* [**name** *lag-name*]
no lag *lag-id*

Context **[Tree]** (config lag)

Full Context configure lag

Description Commands in this context configure Link Aggregation Group (LAG) attributes.

A LAG is used to group multiple ports into one logical link. The aggregation of multiple physical links allows for load sharing and offers seamless redundancy. If one link fails, traffic is redistributed over the remaining links.

Note: For all ports in a LAG group, autonegotiation must be set to “limited” or “off”.

There are three possible settings for autonegotiation, as follows:

- “on” or enabled with full port capabilities advertised
- “off” or disabled where there is no autonegotiation advertisements

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- “limited” where a single speed/duplex is advertised.

When autonegotiation is enabled on a port, the link attempts to automatically negotiate the link speed and duplex parameters; the configured duplex and speed parameters are ignored.

When autonegotiation is disabled on a port, the port does not attempt to autonegotiate and will only operate at the **speed** and **duplex** settings configured for the port.

Note: Disabling autonegotiation on gigabit ports is not allowed. This is in accordance with the IEEE 802.3 specification for gigabit Ethernet, which requires gigabyte to be enabled for far end fault indication.

If the **config**>**port**>**ethernet autonegotiate limited** keyword option is specified, the port will autonegotiate but only advertise the **speed** and **duplex** settings configured for the port. Use the **limited** mode on multi-speed gigabit ports to force gigabit operation while keeping autonegotiation is enabled for compliance with IEEE 801.3.

The system requires autonegotiation to be disabled or limited for ports in a LAG to guarantee a specific port speed.

The **no** form of this command deletes the LAG from the configuration. A LAG can only be deleted while the LAG is administratively shut down. Any dependencies, such as IP-Interface configurations, must be removed from the configuration before the **no lag** command is issued.

Parameters *lag-id* — Specifies the LAG identifier, expressed as an integer.

The LAG ID ranging from 1 to 64 supports up to 64 LAG members and LAG ID above 64 supports 32 LAG members.

Values 1 to 800

lag-name — Specifies an optional LAG name, up to 27 characters.

In model-driven interfaces, the LAG name is used for configuration references and **show** commands. A service provider or administrator can use the defined LAG name to identify and manage LAGs within the SR OS platforms.

In the classic CLI interface, the user must assign a LAG ID to create the LAG. The LAG name is optional and, if specified, must always start with “lag-”. If a name is not specified, SR OS automatically assigns a string version of the LAG ID as “lag-<lag-id>”.

Values lag-<23 chars max>

Platforms All

lag

Syntax **lag** [**lag-id** *lag-id* [**port** *port-id*]] [**all**]
lag [**lag-id** *lag-id* [**port** *port-id*]] [**sm**] [**pkt**] [**cfg**] [**red**] [**iom-upd**] [**port-state**] [**timers**]

[**sel-logic**] [**mc**] [**mc-pkt**]
no lag [**lag-id** *lag-id*]

Context [Tree] (debug lag)

Full Context debug lag

Description This command enables debugging for LAG.

Parameters *lag-id* — Specifies the link aggregation group ID.

Values 1 to 800

port-id — Specifies the physical port ID.

Values *slot*/*mda*/*port*

all — Specifies to display all LAG information.

sm — Specifies to display trace LACP state machine.

pkt — Specifies to display trace LACP packets.

cfg — Specifies to display trace LAG configuration.

red — Specifies to display trace LAG high availability.

iom-upd — Specifies to display trace LAG IOM updates.

port-state — Specifies to display trace LAG port state transitions.

timers — Specifies to display trace LAG timers.

sel-logic — Specifies to display trace LACP selection logic.

mc — Specifies to display multi-chassis parameters.

mc-packet — Specifies to display the MC-LAG control packets with valid authentication were received on this system.

Platforms All

lag

Syntax **lag** *lag-id*
no lag

Context [Tree] (config>service>system>bgp-evpn>eth-seg lag)

Full Context configure service system bgp-evpn ethernet-segment lag

Description This command configures a lag-id associated to the Ethernet-Segment. When the Ethernet-Segment is configured as **all-active,** then only a lag or PW port can be associated to the Ethernet-Segment. When the Ethernet-Segment is configured as **single-active**, then a lag, port or sdp can be associated to the Ethernet-Segment. In either case, only one of the four objects can be configured in the Ethernet-Segment. A specified lag can be part of only one Ethernet-Segment.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no lag

Parameters *lag-id* — Specifies the lag-id associated with the Ethernet-Segment.

Values 1 to 800

Platforms All

lag

Syntax **lag** *lag-id*[**:***encap-val*]
no lag

Context **[Tree]** (config>service>vprn>nw-if lag)

Full Context configure service vprn network-interface lag

Description This command binds the interface to a Link Aggregation Group (LAG)

The **no** form of this command removes the LAG id from the configuration.

Parameters *lag-id[:encap-val]* — Specifies the LAG ID.

Values

lag-id	1 to 800
encap-val	0 (for null) 0 to 4094 (for dot1q)

Platforms All

16.54 lag-emulation

lag-emulation

Syntax **lag-emulation**

lag-link-map-profile

Syntax **lag-link-map-profile** *link-map-profile-id*
no lag-link-map-profile

Context **[Tree]** (config>service>vprn>if>sap lag-link-map-profile)

Full Context configure service vprn interface sap lag-link-map-profile

Description This command assigns a pre-configured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. Once assigned, the SAP or network interface egress traffic will be re-hashed over LAG as required by the new configuration.

The **no** form of this command reverts the SAP or network interface to use per-flow, service or link hash as configured for the service or LAG.

Default no lag-link-map-profile

Parameters *link-map-profile-id* — An integer from 1 to 64 that defines a unique LAG link map profile on which the LAG the SAP or network interface exist.

Platforms All

lag-link-map-profile

Syntax **lag-link-map-profile** *link-map-profile-id*
no lag-link-map-profile

Context **[Tree]** (config>router>if lag-link-map-profile)

Full Context configure router interface lag-link-map-profile

Description This command assigns a preconfigured lag link map profile to a SAP/network interface configured on a LAG or a PW port that exists on a LAG. Once assigned/unassigned, the SAP/network interface egress traffic will be re-hashed over LAG as required by the new configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts the SAP/network interface to use per-flow, service or link hash as configured for the service/LAG.

Default no lag-link-map-profile

Parameters *link-map-profile-id* — An integer from 1 to 32 that defines a unique lag link map profile on which the LAG the SAP/network interface exist.

Platforms All

16.56 lag-per-link-hash

lag-per-link-hash

Syntax **lag-per-link-hash class** {*class*} **weight** *weight*
no lag-per-link-hash

Context **[Tree]** (config>subscr-mgmt>sub-profile>egress lag-per-link-hash)

Full Context configure subscriber-mgmt sub-profile egress lag-per-link-hash

Description This command configures weight and class to be used on LAG egress when the LAG uses weighted per-link-hash by subscribers with the profile assigned. Subscribers using profile with lag-per-link-hash default configuration, inherit weight and class from the SAP configuration (1 and 1 respectively if none configured under SAP).

The **no** form of this command restores default configuration.

Parameters *class* — Specifies the class to be used to select a LAG link.

Values 1, 2, 3

Default 1

weight — Specifies the weight to be associated with this SAP when selecting a LAG link.

Values 1 to 1024

Default 1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lag-per-link-hash

Syntax **lag-per-link-hash class** {**1** | **2** | **3**} **weight** [*weight*]

16.57 lag-port-down

lag-port-down

Syntax **lag-port-down** *lag-id* **number-down** *number-lag-port-down* **level** *level-id*
no lag-port-down *lag-id* **number-down** *number-lag-port-down*

Context **[Tree]** (config>router>mcac>policy>bundle>mc-constraints lag-port-down)

Full Context configure router mcac policy bundle mc-constraints lag-port-down

Description This command configures the bandwidth available both at the interface and bundle level when a specific number of ports in a LAG group fail.

The **no** form of this command removes the values from the configuration.

Parameters *lag-id* — Specifies the LAG ID. When the number of ports available in the LAG link is reduced by the number of ports configured in this context then the *level-id* specified here must be applied.

number-lag-port-down — If the number of ports available in the LAG is reduced by the number of ports configured in this command here then bandwidth allowed for bundle and/or interface will be as per the levels configured in this context.

Values 1 to 64 (for 64-link LAG) 1 to 32 (for other LAGs)

level-id — Specifies the amount of bandwidth available within a given bundle for MC traffic for a specified level.

Values 1 to 8

Platforms All

lag-port-down

Syntax [**no**] **lag-port-down** *lag-id*

Context **[Tree]** (config>vrrp>policy>priority-event lag-port-down)

Full Context configure vrrp policy priority-event lag-port-down

Description This command creates the context to configure Link Aggregation Group (LAG) priority control events that monitor the operational state of the links in the LAG.

The **lag-port-down** command configures a priority control event. The event monitors the operational state of each port in the specified LAG. When one or more of the ports enter the operational down state, the event is considered to be set. When all the ports enter the operational up state, the event is considered to be clear. As ports enter the operational up state, any previous set threshold that represents more down ports is considered cleared, while the event is considered to be set.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Multiple unique **lag-port-down** event nodes can be configured within the **priority-event** node up to the maximum of 32 events.

The **lag-port-down** command can reference an arbitrary LAG. The *lag-id* does have to already exist within the system. The operational state of the **lag-port-down** event will indicate:

- Set – non-existent
- Set – one port down
- Set – two ports down
- Set – three ports down
- Set – four ports down
- Set – five ports down
- Set – six ports down
- Set – seven ports down
- Set – eight ports down
- Cleared – all ports up

When the *lag-id* is created, or a port in *lag-id* becomes operationally up or down, the event operational state must be updated appropriately.

When one or more of the LAG composite ports enters the operationally down state or the *lag-id* is deleted or does not exist, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **lag-port-down** event is considered to have a tiered event set state. While the priority impact per number of ports down is totally configurable, as more ports go down, the effect on the associated virtual router instances in-use priority is expected to increase (lowering the priority). When each configured threshold is crossed, any higher thresholds are considered further event sets and are processed immediately with the hold-set timer reset to the configured value of the **hold-set** command. As the thresholds are crossed in the opposite direction (fewer ports down then previously), the priority effect of the event is not processed until the hold-set timer expires. If the number of ports down threshold again increases before the hold-set timer expires, the timer is only reset to the **hold-set** value if the number of ports down is equal to or greater than the threshold that set the timer.

The event contains **number-down** nodes that define the priority delta or explicit value to be used based on the number of LAG composite ports that are in the operationally down state. These nodes represent the event set thresholds. Not all port down thresholds must be configured. As the number of down ports increase, the **number-down** *ports-down* node that expresses a value equal to or less than the number of down ports describes the delta or explicit priority value to be applied.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of the command deletes the specific LAG monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default no lag-port-down — No LAG priority control events are created.

Parameters *lag-id* — The LAG ID that the specific event is to monitor expressed as a decimal integer. The *lag-id* can only be monitored by a single event in this policy. The LAG may be monitored by multiple VRRP priority control policies. A port within the LAG and the LAG ID itself are considered to be separate entities. A composite port may be monitored with the **port-down** event while the *lag-id* the port is in is monitored by a **lag-port-down** event in the same policy.

Values 1 to 800 (apply to the 7750 SR and 7950 XRS)
1 to 200 (apply to the 7450 ESS)

16.58 lag-usage-optimization

lag-usage-optimization

Syntax [**no**] **lag-usage-optimization**

Context **[Tree]** (config>router>pim lag-usage-optimization)

Full Context configure router pim lag-usage-optimization

Description This command enables the router's usage of the LAG so traffic for a given multicast stream destined to an IP interface using the LAG is sent only to the forwarding complex that owns the LAG link on which it will actually be forwarded.

Changing the value causes the PIM protocol to be restarted.

If this optimization is disabled, the traffic is sent to all forwarding complexes that own at least one link in the LAG.

The **no** form of this command causes the traffic to be sent to all the forwarding complexes that own at least one link in the LAG.

Note: Changes made for multicast hashing cause Layer 4 multicast traffic to not be hashed. This is independent of if **lag-usage-optimization** is enabled or disabled.

Using this command and the **mc-ecmp-hashing-enabled** command on mixed port speed LAGs is not recommended, because some groups may be forwarded incorrectly.

16.66 last-reported-delay-hold

last-reported-delay-hold

Syntax **last-reported-delay-hold** *seconds*
no last-reported-delay-hold

Context **[Tree]** (config>test-oam>link-meas>template last-reported-delay-hold)

Full Context configure test-oam link-measurement measurement-template last-reported-delay-hold

Description This command configures the timer that specifies the wait time before the last reported delay measurement is flushed after a link measurement test enters the operationally down state. The aging timer delays the flushing of the last reported delay metric to the routing engine.

This timer starts a countdown to zero when an administrative function causes the operational state of the test on that specific interface to transition from up to down. If the timer expires before the operational state transitions to up, the previously reported value is flushed. The Delay Measurement Last Reported indicates "Cleared". The timestamp indicates the time of the clear event. The Triggered By indicates "Expired". If the administrative state recovers to operationally up before the expiration of the timer, the previous reported value is not flushed.

The aging timer does not apply to failure conditions that do not affect the administrative state of the interface, for example interface failure or routing changes.

The **no** form of this command reverts to the default value.

Default last-reported-delay-hold 86400

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *seconds* — Specifies the delay measurement retention time, in seconds, after the interface on which it was collected is administratively disabled. If the configured value is reached, the last reported measurement is cleared.

A configured value of 0 indicates that the previous reported value is cleared without additional wait time.

Values 0 to 86400

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.67 latency-event

latency-event

Syntax **latency-event rising-threshold** *threshold* [**falling-threshold** *threshold*] [*direction*]
no latency-event

Context **[Tree]** (config>saa>test latency-event)

Full Context configure saa test latency-event

Description Specifies that at the termination of an SAA test probe, the calculated latency event value is evaluated against the configured rising and falling latency event thresholds. SAA threshold events are generated as required.

Once the threshold (rising/falling) is crossed, it is disabled from generating additional events until the opposite threshold is crossed. If a **falling-threshold** is not supplied, the **rising-threshold** is re-enabled when it falls below the threshold after the initial crossing that generated the event.

The configuration of latency event thresholds is optional.

The **no** form of this command disables the latency event.

Parameters **rising-threshold** *threshold* — Specifies a rising threshold latency value, in milliseconds. When the test run is completed, the calculated latency value is compared to the configured latency rising threshold. If the test run latency value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

falling-threshold *threshold* — Specifies a falling threshold latency value, in milliseconds. When the test run is completed, the calculated latency value is compared to the configured latency falling threshold. If the test run latency value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483

Default 0

direction — Specifies the direction for OAM ping responses received for an OAM ping test run.

Values **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

outbound — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

roundtrip — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

Default roundtrip

Description This command enables hashing of MPLS Ethernet and MPLS IP packets received on the Epipe and VPLS service SAP using the MPLS labels, the inner IP addresses, the port numbers, and the GTP TEID field, if read by the system. This capability is supported on FP4-based line cards.

The **no** form of this command disables hashing.

Default no lbl-eth-or-ip-l4-teid

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.71 lbm-svc-act-responder

lbm-svc-act-responder

Syntax [**no**] **lbm-svc-act-responder**

Context **[Tree]** (config>service>epipe>sap>eth-cfm>mep lbm-svc-act-responder)
[Tree] (config>service>epipe>spoke-sdp>eth-cfm>mep lbm-svc-act-responder)

Full Context configure service epipe sap eth-cfm mep lbm-svc-act-responder
configure service epipe spoke-sdp eth-cfm mep lbm-svc-act-responder

Description This command enables the MEP to process service activation streams encapsulated in ETH-CFM LBM frames that are directed to the MEP. The MEP will be allocated additional resources to rapidly respond to a high-speed stream of LBM messages.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

A MEP created with this option will not validate any TLVs, will not validate the ETH-LBM MAC Address, and will not increment or compute any loopback statistics. Statistical computation and reporting is the responsibility of the test head-end. The ETH-CFM level of the high speed ETH-LBM stream must match the level of a MEP configured with this command. The high-speed stream must not target an ETH-CFM level that is not explicitly configured with this option. MEPs act as boundaries for lower levels, below the configured MEP level values. Those boundary levels do not inherit this function.

When the service activation test is complete, the MEP may be returned to standard processing by removing this command. If there is available bandwidth, the MEP will respond to other ETH-CFM PDUs, such as ETH-DMM marker packets, using standard processing.

The interaction between this command and the **tools perform service id** *service-id* **loopback eth** command must be carefully considered. It is recommended that either the **lbm-svc-act-responder** or the **tools perform service id** *service-id* **loopback eth** command be used at any given time within a service. If both commands must be configured, and the target reflection point is the MAC Swap Loopback function, the inbound stream of data must not include ETH-CFM traffic that is equal to or lower than the domain level of any configured MEP which would otherwise extract and process the ETH-CFM message. If the reflection target is a MEP configured with the **lbm-svc-act-responder** option, the mode (ingress or egress) of the SAP or SDP specified with this tools command and the MEP **direction** (up or down) must match when the functions are enabled on the same reflection point, and the domain level of the inbound ETH-LBM must be the same as that of the MEP configured with the **lbm-svc-act-responder** option. At no time should the two functions be conflicting with each other along the path of the stream. This conflict would lead to unpredictable and possibly destabilizing situations.

The **no** form of this command reverts to MEP LBM standard processing.

Default no lbm-svc-act-responder

[Tree] (config>service>vprn>l2tp>group>ppp lcp-force-ack-accm)
[Tree] (config>service>vprn>l2tp>group>tunnel>ppp lcp-force-ack-accm)

Full Context configure router l2tp group ppp lcp-force-ack-accm
configure router l2tp group tunnel ppp lcp-force-ack-accm
configure service vprn l2tp group ppp lcp-force-ack-accm
configure service vprn l2tp group tunnel ppp lcp-force-ack-accm

Description This command enables the LCP Asynchronous Control Character Map (ACCM) configuration option. When enabled, the LCP ACCM configuration option is acknowledged during LCP negotiation between the LNS and the PPP client. The option is then ignored and no ACCM mapping is done.

By default, an L2TP tunnel inherits the configuration from the L2TP group CLI context.

The **no** form of this command disables the LCP ACCM configuration option.

Parameters **always** — Specifies to acknowledge the LCP ACCM configuration option, but not to perform ACCM mapping. This option overrides the group level configuration.

never — Specifies to reject the LCP ACCM configuration option. This option overrides the group level configuration.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context **[Tree]** (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter ldp)

Full Context configure router static-route-entry indirect tunnel-next-hop resolution-filter ldp

Description This command enables the use of LDP-sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The **no** form of this command disables the use of LDP-sourced tunnel entries to resolve static route next hops.

Default no ldp

Platforms All

ldp

Syntax [**no**] **ldp**

Context **[Tree]** (config>service>sdp ldp)

Full Context configure service sdp ldp

Description This command enables LDP-signaled LSPs on MPLS-encapsulated SDPs.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In MPLS SDP configurations *either* one or more LSP names can be specified *or* LDP can be enabled. The SDP **ldp** and **lsp** commands are mutually exclusive except if the mixed-lsp-mode option is also enabled. If an LSP is specified on an MPLS SDP, then LDP cannot be enabled on the SDP. To enable LDP on the SDP when an LSP is already specified, the LSP must be removed from the configuration using the **no lsp** *lsp-name* command or the mixed-lsp-mode option is also enabled.

Alternatively, if LDP is already enabled on an MPLS SDP, then an LSP cannot be specified on the SDP. To specify an LSP on the SDP, the LDP must be disabled. The LSP must have already been created in the **config>router>mpls** context with a valid far-end IP address. The above rules are relaxed when the **mixed-lsp** option is enabled on the SDP.

Default no ldp (disabled)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure router mpls lsp-template ldp-over-rsvp

Description This command configures an LSP so that it can be used by the IGP to calculate its SPF tree.

When the **ldp-over-rsvp** option is also enabled in ISIS or OSPF, the IGP provides LDP with all ECMP IP next-hops and tunnel endpoints that it considers to be the lowest cost path to its destination.

IGP provides only the endpoints which are the closest to the destination in terms of IGP cost for each IP next-hop of a prefix. If this results in more endpoints than the ECMP value configured on the router, it will further prune the endpoints based on the lowest router-id and for the same router-id, it will select lowest interface-index first.

LDP then looks up the tunnel table to select the actual tunnels to the endpoint provided by IGP and further limits the endpoint selection to the ones which are the closest to destination across all the IP next-hops provided by IGP for a prefix. For each remaining endpoint, LDP selects a tunnel in a round-robin fashion until the router ECMP value is reached. For each endpoint, only tunnels with the same lowest metric are candidates. If more than one tunnel qualifies, the selection begins with the lowest tunnel-id.

Platforms All

16.80 ldp-shortcut

ldp-shortcut

Syntax [**no**] **ldp-shortcut**

Context **[Tree]** (config>router ldp-shortcut)

Full Context configure router ldp-shortcut

Description This command enables the resolution of IGP routes using LDP LSP across all network interfaces participating in the IS-IS and OSPF routing protocol in the system.

When LDP shortcut is enabled, LDP populates the routing table with next-hop entries corresponding to all prefixes for which it activated an LDP FEC. For a given prefix, two route entries are populated in the system routing table. One corresponds to the LDP shortcut next-hop and has an owner of LDP. The other one is the regular IP next-hop. The LDP shortcut next-hop always has preference over the regular IP next-hop for forwarding user packets and specified control packets over a given outgoing interface to the route next-hop.

All user and specified control packets for which the longest prefix match in RTM yields the FEC prefix will be forwarded over the LDP LSP.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet by the ingress forwarding engine will result in the packet being sent labeled with the label stack corresponding to the NHLFE of the LDP LSP when the preferred RTM entry corresponds to an LDP shortcut.

If the preferred RTM entry corresponds to an IP next-hop, the IPv4 packet is forwarded without a label.

When ECMP is enabled and multiple equal-cost next-hops exit for the IGP route, the ingress forwarding engine will spray the packets for this route based on hashing routine currently supported for IPv4 packets. When the preferred RTM entry corresponds to an LDP shortcut route, spraying will be performed across the multiple next-hops for the LDP FEC. The FEC next-hops can either be direct link LDP neighbors or T-LDP neighbors reachable over RSVP LSPs in the case of LDP-over-RSVP but not both.

When the preferred RTM entry corresponds to a regular IP route, spraying will be performed across regular IP next-hops for the prefix.

The **no** form of this command disables the resolution of IGP routes using LDP shortcuts.

Default no ldp-shortcut

Platforms All

16.81 ldp-sync

ldp-sync

Syntax [**no**] **ldp-sync**

Context **[Tree]** (config>service>vprn>static-route-entry>indirect ldp-sync)

Full Context configure service vprn static-route-entry indirect ldp-sync

Description This command extends the LDP synchronization feature to a static route. When an interface comes back up, it is possible that a preferred static route using the interface as next-hop for a given prefix is enabled before the LDP adjacency to the peer LSR comes up on this interface. In this case, traffic on an SDP that uses the static route for the far-end address would be black-holed until the LDP session comes up and the FECs exchanged.

This option when enabled delays the activation of the static route until the LDP session comes up over the interface and the ldp-sync-timer configured on that interface has expired

Default no ldp-sync

ldp-sync

Syntax [**no**] **ldp-sync**

Context **[Tree]** (config>router>static-route-entry>next-hop ldp-sync)

Full Context configure router static-route-entry next-hop ldp-sync

Description This command extends the LDP synchronization feature to a static route. When an interface comes back up, it is possible that a preferred static route using the interface as next-hop for a given prefix is enabled before the LDP adjacency to the peer LSR comes up on this interface. In this case, traffic on an SDP that uses the static route for the far-end address would be black-holed until the LDP session comes up and the FECs exchanged.

This option when enabled delays the activation of the static route until the LDP session comes up over the interface and the ldp-sync-timer configured on that interface has expired

Default no ldp-sync

Use subject to Terms available at: www.nokia.com

16.82 ldp-sync-timer

ldp-sync-timer

Syntax **ldp-sync-timer** *seconds* [**end-of-lib**]
no ldp-sync-timer

Context **[Tree]** (config>router>if ldp-sync-timer)

Full Context configure router interface ldp-sync-timer

Description This command enables synchronization of an IGP and LDP. When a link is restored after a failure, the IGP sets the link cost to infinity and advertises it. The actual value advertised in OSPF is 0xFFFF (65535). The actual value advertised in IS-IS regular metric is 0x3F (63) and in IS-IS wide-metric is 0xFFFFFE (16777214). This feature is not supported on RIP interfaces.

If an interface belongs to both IS-IS and OSPF, a physical failure will cause both IGPs to advertise an infinite metric and to follow the IGP-LDP synchronization procedures. If only one IGP bounces on this interface or on the system, then only the affected IGP advertises the infinite metric and follows the IGP-LDP synchronization procedures.

Next, an LDP Hello adjacency is brought up with the neighbor. The LDP synchronization timer is started by the IGP when the LDP session to the neighbor is up over the interface. This is to allow time for the label-FEC bindings to be exchanged.

When the LDP synchronization timer expires, the link cost is restored and is readvertised. The IGP will announce a new best next hop and LDP will use it if the label binding for the neighbor's FEC is available.

If the user changes the cost of an interface, the new value is advertised at the next flooding of link attributes by the IGP. However, if the LDP synchronization timer is still running, the new cost value will only be advertised after the timer expires. The new cost value will also be advertised after the user executes any of the following commands:

- **tools>perform>router>isis>ldp-sync-exit**
- **tools>perform>router>ospf>ldp-sync-exit**
- **config>router>if>no ldp-sync-timer**
- **config>router>ospf>disable-ldp-sync**
- **router>isis>disable-ldp-sync**

If the user changes the value of the LDP synchronization timer parameter, the new value will take effect at the next synchronization event. If the timer is still running, it will continue to use the previous value.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If parallel links exist to the same neighbor, then the bindings and services should remain up as long as there is one interface that is up. However, the user-configured LDP synchronization timer still applies on the interface that failed and was restored. In this case, the router will only consider this interface for forwarding after the IGP re-advertises its actual cost value.

The LDP Sync Timer State is not always synchronized across to the standby CPM. Therefore, after an activity switch, the timer state might not be same as it was on the previously active CPM.

If the **end-of-lib** option is configured, then the system will start the LDP synchronization timer as usual. If the LDP End of LIB Typed Wildcard FEC messages are received for every FEC type negotiated for a given session to an LDP peer for that IGP interface, the **ldp-sync-timer** is terminated early and the IGP link cost is restored. If the **ldp-sync-timer** expires before the LDP End of LIB messages are received for every negotiated FEC type, then the system will restore the IGP link cost. The **end-of-lib** option is disabled by default.

The **no** form of this command disables IGP-LDP synchronization and deletes the configuration.

Default no ldp-sync-timer

Parameters *seconds* — Specifies the time interval for the IGP-LDP synchronization timer.

Values 1 to 1800

end-of-lib — Specifies that the system should terminate the **ldp-sync-timer** early if the LDP End of LIB Typed Wildcard FEC messages are received for every FEC type negotiated for a given session to an LDP peer for that IGP interface.

16.83 ldp-treetrace

ldp-treetrace

Syntax **ldp-treetrace** {**prefix** *ip-prefix*/*mask*} [**downstream-map-tlv** {**dsmap** | **ddmap**}] [**fc** *fc-name* [**profile** {**in** | **out**}]] [**max-path** *max-paths*] [**max-ttl** *ttl-value*] [**retry-count** *retry-count*] [**timeout** *timeout*]

Context **[Tree]** (oam ldp-treetrace)

Full Context oam ldp-treetrace

Description This command allows the user to perform a single run of the LDP ECMP OAM tree trace to discover all ECMP paths of an LDP FEC.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-prefix/mask* — Specifies the address prefix and subnet mask of the target BGP IPv4 label route.

Values ip-prefix: a.b.c.dmask, the value must be 32

downstream-map-tlv {dsmap | ddmap} — Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424 and RFC 8029.

Default Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map** {**dsmap** | **ddmap**}.

fc-name — Specifies the FC and profile parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 72 summarizes this behavior.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 72 **ldp-treetrace Request Packet and Behavior**

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • pkt queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • pkt queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out} — Specifies the profile state of the MPLS echo request packet.

Values in, out

Default out

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

max-paths — Specifies the maximum number of paths for a ldp-treetrace test, expressed as a decimal integer.

Values 1 to 255

Default 128

ttl-value — Specifies the maximum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 30

retry-count — Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

Values 1 to 255

Default 5

timeout — Specifies the time, in seconds, used to override the default time out value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

Output The following is an example of treetrace prefix information.

Sample Output

```
*A:Dut-A# oam ldp-treetrace prefix 10.20.1.6/32

ldp-treetrace for Prefix 10.20.1.6/32:

The **no** form of the command disables debugging.

Parameters *ip-address* — When specified, only the specified address is debugged for IS-IS leaks.

Values ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

leak

Syntax **leak** [*ip-address*]
no leak

Context **[Tree]** (debug>router>ospf leak)
[Tree] (debug>router>ospf3 leak)

Full Context debug router ospf leak
debug router ospf3 leak

Description This command enables debugging for OSPF leaks.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address to debug OSPF leaks.

Values ipv4-address:
- a.b.c.d

ipv6-address:
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

16.85 leak-export

leak-export

Syntax **leak-export** *plcy-or-long-expr* [*plcy-or-expr* [*plcy-or-expr*]]
no leak-export

Context **[Tree]** (config>router leak-export)

Full Context configure router leak-export

Description This command associates up to four policies to control the leaking of GRT routes into the associated VPRN.

If a route is being evaluated and the action is accepted, then that route is subject leaking into an associated VPRN instance assuming the route is fully resolved and active.

This process creates the pool of routes that can be leaked. Within each VPRN a corresponding **import-grt** policy must be configured to import select routes into that specific VPRN instance.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes all route leaking policy associations and effectively disables the leaking of GRT routes into associated VPRNs.

Parameters *plcy-or-long-expr* — Specifies the route policy name, up to 64 characters or a policy logical expression, up to 255 characters.

Values *plcy-or-long-expr*: *policy-name* | *long-expr*
policy-name: up to 64 characters
long-expr: up to 255 characters

plcy-or-expr — Specifies the route policy name, up to 64 characters or a policy logical expression, up to 64 characters long. A maximum of four policy names or policy logical expressions can be specified in a single statement.

Values *plcy-or-expr*: *policy-name* | expr
policy-name: up to 64 characters
expr: up to 64 characters

Platforms All

16.86 leak-export-limit

leak-export-limit

Syntax [**no**] **leak-export-limit** [*value*]

Context **[Tree]** (config>router leak-export-limit)

Full Context configure router leak-export-limit

Description This command sets a maximum limit on the number of GRT routes that can be leaked into VPRNs.

The **no** form of this command resets the **leak-export-limit** to its default value of 5.

Default leak-export-limit 5

Parameters *value* — Specifies the maximum number of GRT routes that are eligible to be leaked into VPRN instances.

Values 1 to 10000

Platforms All

Use subject to Terms available at: www.nokia.com

16.87 leak-import

leak-import

Syntax **leak-import** *plcy-or-long-expr* [*plcy-or-expr*]
no leak-import

Context **[Tree]** (config>service>vprn>bgp>rib-management>ipv4 leak-import)
[Tree] (config>service>vprn>bgp>rib-management>label-ipv4 leak-import)
[Tree] (config>service>vprn>bgp>rib-management>ipv6 leak-import)
[Tree] (config>service>vprn>bgp>rib-management>label-ipv6 leak-import)

Full Context configure service vprn bgp rib-management ipv4 leak-import
configure service vprn bgp rib-management ipv6 leak-import
configure service vprn bgp rib-management label-ipv4 leak-import
configure service vprn bgp rib-management label-ipv6 leak-import

Description This command configures route policies that control the importation of leak-eligible routes from the BGP RIB of another routing instance into the unlabeled-IPv4, unlabeled-IPv6, labeled-IPv4, or labeled-IPv6 RIB of the VPRN instance. To leak a route from one routing instance to another, the origin and destination RIB types must be the same; for example, it is not possible to leak a route from an unlabeled-IPv4 RIB of a VPRN into the labeled-IPv4 RIB of the base router.

The **leak-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the final action to accept or reject the route.

Only one of the 15 objects referenced by the **leak-import** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When a **leak-import** policy is not specified, no BGP routes from other routing instances are leaked into the VPRN BGP RIB.

The **no** form of this command removes the policy association.

Default no leak-import

Parameters *plcy-or-long-expr* — Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string of characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

16.88 learn-ap-mac

learn-ap-mac

Syntax **learn-ap-mac** [**delay-auth**]
no learn-ap-mac

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw learn-ap-mac)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw learn-ap-mac)

Full Context configure service ies subscriber-interface group-interface wlan-gw learn-ap-mac
configure service vprn subscriber-interface group-interface wlan-gw learn-ap-mac

Description This command enables the sending of ARP or ND packets on the WLAN-GW GRE tunnel for certain events. The target IP address in the ARP/ND packet is the endpoint IP address of the AP. The ARP/ND response from the AP should contain the AP MAC, which subsequently can be reported in a called-station-id message. When enabled, a message will be sent for following events:

- CPM: Mobility to an AP for which the AP-MAC is not yet known
- CPM: RS-triggered authentication on an AP for which the AP-MAC is not yet known
- ISA: Any mobility event
- ISA: Any authentication where the AP-MAC is not yet known (for example, from a RADIUS proxy cache or a DHCP circuit-id). If the optional keyword **delay-auth** is configured, then the authentication will be delayed until the ARP/ND is answered or timed out, after which the AP-MAC can be included in the authentication.

This configuration is ignored for L2-AP and L2TPv3 access.

Parameters **delay-auth** — Specifies that authentication will be delayed until the ARP/ND is answered or timed out, after which the AP-MAC can be included in the authentication.

Full Context configure service ies interface vpls evpn arp learn-dynamic
configure service ies interface vpls evpn nd learn-dynamic
configure service vprn interface vpls evpn arp learn-dynamic
configure service vprn interface vpls evpn nd learn-dynamic

Description This command controls whether the ARP or ND frames received on EVPN binds are used to learn dynamic ARP and ND entries in the ARP/ND table.

The **no** form of the command reverts to the default.

Default learn-dynamic

Platforms All

16.90 learn-l2tp-cookie

learn-l2tp-cookie

Syntax **learn-l2tp-cookie** {**if-match** | **never** | **always**} [**cookie** *hex string*]
no learn-l2tp-cookie

Context **[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw learn-l2tp-cookie)
[Tree] (config>service>vprn>sub-if>grp-if>wlan-gw learn-l2tp-cookie)

Full Context configure service ies subscriber-interface group-interface wlan-gw learn-l2tp-cookie
configure service vprn subscriber-interface group-interface wlan-gw learn-l2tp-cookie

Description This command specifies when this system will learn the cookie from L2TP tunnels terminating on this interface. Learning the cookie means that the value of the octets 3-8 of the cookie is interpreted as an access point's MAC address, and used as such, for example in the Called-Station-Id attribute of RADIUS Interim-Update messages.

Parameters **if-match** — Specifies that the cookie is interpreted only if the value of the first two octets of the cookie is equal to the value of the object tmnxWlanGwSoftGreIfL2tpCookie.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

cookie *hex string* — Specifies the value used to compare the first two bytes of the cookie. This parameter is only valid if **if-match** is configured.

Values 0x0000 to 0xFFFF...(4 hex nibbles)

never — Specifies that the cookie value will always be ignored.

always — Always learn the AP-MAC from the cookie, regardless of the value of the first two bytes.

16.91 lease-hold-time

lease-hold-time

Syntax **lease-hold-time** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

configure service vprn subscriber-interface group-interface dhcp lease-populate
configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp lease-populate

Description Commands in this context configure IPoE host parameters.

For VPLS, DHCP snooping must be explicitly enabled (using the **snoop** command) at all points where DHCP messages requiring snooping enter the VPLS instance (both from the DHCP server and from the subscribers). Lease state information is extracted from snooped DHCP ACK messages to populate lease state table entries for the SAP.

The optional *nbr-of-leases* parameter defines the number lease state table entries allowed.

- for this SAP in case of a VPLS service
- for this interface in case of an IES or VPRN interface
- for each SAP in case of an IES or VPRN group-interface
- for this interface in case of an IES or VPRN retail subscriber-interface

If the *nbr-of-leases* parameter is omitted, only a single entry is allowed. Once the maximum number of entries has been reached, subsequent lease state entries are not allowed and subsequent DHCP ACK messages are discarded.

The retained lease state information representing dynamic hosts may be used to:

- Populate a SAP based anti-spoof filter table to provide dynamic anti-spoof filtering. If the system is unable to populate the dynamic host information in the anti-spoof filter table on the SAP, the DHCP ACK message must be discarded without adding new lease state entry or updating an existing lease state entry.
- Populate the system's ARP cache based on the arp-populate configuration. Applicable to IES and VPRN interfaces or group-interfaces.
- Populate managed entries into a VPLS forwarding database. VPLS forwarding database population is an implicit feature that automatically places the dynamic host's MAC address into the VPLS FDB. When a dynamic host's MAC address is placed in the lease state table, it will automatically be populated into the VPLS forwarding database associated with the SAP on which the host is learned. The dynamic host MAC address will override any static MAC entries using the same MAC and prevent dynamic learning of the MAC on another interface. Existing static MAC entries with the same MAC address as the dynamic host are marked as inactive but not deleted. If all entries in the lease state table associated with the MAC address are removed, the static MAC may be populated. New static MAC definitions for the VPLS instance may be created while a dynamic host exists associated with the static MAC address.
- Generate dynamic ARP replies if **arp-reply-agent** is enabled. Applicable to VPLS service SAPs

The **no** form of this command reverts to the default.

Parameters *nbr-of-leases* — Specifies the number of DHCPv4 leases allowed.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

l2-header — Indicates a mode of operation where anti-spoof entry associated with the given DHCP state is created based on the *src-mac* address from the Layer 2 header of the DHCP request message. The Layer 2 header flag is not set by default. This parameter is only applicable for group interfaces.

mac — Specifies that the provisioned *ieee-address* is used in the anti-spoofing entries for this SAP. The parameter may be changed mid-session. Existing sessions will not be re-programmed unless a **tools>perform>subscriber-mgmt>remap-lease-state** command is issued for the lease. This parameter is only applicable for group interfaces.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp lease-populate

no lease-populate

Context **[Tree]** (config>service>ies>if>ipv6>dhcp6-relay lease-populate)

Full Context configure service ies interface ipv6 dhcp6-relay lease-populate

Description This command specifies the maximum number of DHCPv6 lease states allocated by the DHCPv6 relay function, allowed on this interface.

Optionally, by specifying **route-populate** parameter, system could:

- Create routes based on the IA_PD/IA_NA/IA_TA prefix option in relay-reply message.
- Create black hole routes based on OPTION_PD_EXCLUDE in IA_PD in relay-reply message.

These routes could be redistributed into IGP/BGP by using route-policy, following protocol types that could be used in “from protocol”:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- dhcpv6-pd
- dhcpv6-na
- dhcpv6-ta
- dhcpv6-pd-excl

Parameters *nbr-of-leases* — Defines the number lease state table entries allowed for this interface. If this parameter is omitted, only a single entry is allowed. Once the maximum number of entries has been reached, subsequent lease state entries are not allowed and subsequent DHCPv6 REPLY messages are discarded.

Values 1 to 8000

route-populate — Specifies the route populate parameter.

Values pd/na/ta — Create route based on specified option.
exclude — Create blackhole route based on OPTION_PD_EXCLUDE.

Platforms All

configure service ies subscriber-interface group-interface dhcp proxy-server lease-time
configure service vpls sap dhcp proxy-server lease-time
configure service vprn interface dhcp proxy-server lease-time
configure service vprn subscriber-interface group-interface dhcp proxy-server lease-time
configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp proxy-server lease-time

Description
This command defines the length of lease-time that is provided to DHCP clients. By default, the local-proxy-server always makes use of the lease time information provide by either a RADIUS or DHCP server.

The **no** form of this command disables the use of the lease-time command. The local-proxy-server will use the lease-time offered by either a RADIUS or DHCP server.

Default
lease-time days 7

Parameters
override — Specifies that the local-proxy-server will use the configured lease-time information to provide DHCP clients

days — Specifies the number of days that the given IP address is valid.

Values 0 to 3650

hours — Specifies the number of hours that the given IP address is valid.

Values 0 to 23

minutes — Specifies the number of minutes that the given IP address is valid.

Values 0 to 59

seconds — Specifies the number of seconds that the given IP address is valid.

Values 0 to 59

16.98 least-fill

least-fill

Syntax [**no**] **least-fill**

Context **[Tree]** (config>router>mpls>lsp least-fill)
[Tree] (config>router>mpls>lsp-template least-fill)

Full Context configure router mpls lsp least-fill
configure router mpls lsp-template least-fill

Description This command enables the use of the least-fill path selection method for the computation of the path of this LSP.

When MPLS requests the computation of a path for this LSP, CSPF will find all equal cost shortest paths which satisfy the constraints of this path. Then, CSPF identifies the single link in each of these paths which has the least available bandwidth as a percentage of its maximum reservable bandwidth. It then selects the path which has the largest value of this percentage least available bandwidth figure. CSPF identifies the least available bandwidth link in each equal cost path after it has accounted for the bandwidth of the new requested path of this LSP.

CSPF applies the least-fill path selection method to all requests for a path, primary and secondary, of an LSP for which this option is enabled. The bandwidth of the path can be any value, including zero.

CSPF applies the least-fill criterion separately to each preemption priority in the base TE. A higher setup priority path can preemptively lower holding priority paths.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

CSPF also applies the least-fill criterion separately to each Diff-Serv TE class if Diff-Serv TE is enabled on this node. A higher setup priority path can preemptively lower holding priority paths within a Class Type.

MPLS will re-signal and move the LSP to the new path in the following cases:

- Initial LSP path signaling.
- Re-try of an LSP path after failure.
- Make-before-break (MBB) due to pending soft preemption of the LSP path.
- MBB due to LSP path configuration change, that is, a user change to bandwidth parameter of primary or secondary path, or a user enabling of fast-reroute option for the LSP.
- MBB of secondary path due to an update to primary path SRLG.
- MBB due to FRR Global Revertive procedures on the primary path.
- Manual re-signaling of an LSP path or of all LSP paths by the user.

During a manual re-signaling of an LSP path, MPLS will always re-signal the path regardless of whether the new path is exactly the same or different than the current path and regardless of whether the metric of the new path is different or not from that of the current path.

During a timer-based re-signaling of an LSP path which has the least-fill option enabled, MPLS will only re-signal the path if the metric of the new path is different than the one of the current path.

The **no** form of this command deletes a specific node entry in this database.

Default no least-fill. The path of an LSP is randomly chosen among a set of equal cost paths.

Platforms All

16.99 least-fill-min-thd

least-fill-min-thd

Syntax **least-fill-min-thd** *percent*
no least-fill-min-thd

Context **[Tree]** (config>router>mpls least-fill-min-thd)

Full Context configure router mpls least-fill-min-thd

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This parameter is used in the least-fill path selection process. When comparing the percentage of least available link bandwidth across the sorted paths, whenever two percentages differ by less than the value configured as the least-fill-min-thresh, CSPF will consider them equal and will apply a random number generator to select the path among these paths

The **no** form of this command resets this parameter to its default value.

Default least-fill-min-thd 5

Parameters *percentage* — Specifies the least fill minimum threshold value as a percentage.

Values 1 to 100%

Platforms All

16.100 least-fill-reoptim-thd

least-fill-reoptim-thd

Syntax **least-fill-reoptim-thd** *percent*
no least-fill-reoptim-thd

Context **[Tree]** (config>router>mpls least-fill-reoptim-thd)

Full Context configure router mpls least-fill-reoptim-thd

Description This parameter is used in the least-fill path selection method. During a timer-based re-signaling of an LSP path which has the least-fill option enabled, CSPF will first update the least-available bandwidth figure for the current path of this LSP. It then applies the least-fill path selection method to select a new path for this LSP. If the new computed path has the same cost as the current path, it will compare the least-available bandwidth figures of the two paths and if the difference exceeds the user configured optimization threshold, MPLS will generate a trap to indicate that a better least-fill path is available for this LSP. This trap can be used by an external SNMP based device to trigger a manual re-signaling of the LSP path since the timer-based re-signaling will not re-signal the path in this case. MPLS will generate a path update trap at the first MBB event which results in the re-signaling of the LSP path. This should clear the eligibility status of the path at the SNMP device.

The **no** form of this command resets this parameter to its default value.

Default least-fill-reoptim-thd 10

Parameters *percentage* — Specifies the least fill reoptimization threshold value as a percentage.

Values 1 to 100%

[Tree] (config>service>vpls>mesh-sdp>mrp leave-all-time)

Full Context configure service vpls mesh-sdp mrp leave-all-time
configure service vpls sap mrp leave-all-time
configure service vpls spoke-sdp mrp leave-all-time

Description This command controls the frequency with which the LeaveAll state machine generates LeaveAll PDUs. The timer is required on a per-Port, per-MRP Participant basis. The Leave All Period Timer is set to a random value, T, in the range LeaveAllTime<T<1.5*leave-all-time when it is started. Refer to IEEE 802.1ak-2007 section 10.7.4.3.

Default leave-all-time 100

Parameters *value* — The frequency with which the LeaveAll state machine generates LeaveAll PDUs, in tenths of a second.

Values 60 to 300

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.103 leave-time

leave-time

Syntax **leave-time** *value*
no leave-time

Context **[Tree]** (config>service>vpls>sap>mrp leave-time)
[Tree] (config>service>vpls>spoke-sdp>mrp leave-time)
[Tree] (config>service>vpls>mesh-sdp>mrp leave-time)

Full Context configure service vpls mesh-sdp mrp leave-time
configure service vpls sap mrp leave-time
configure service vpls spoke-sdp mrp leave-time

Description This command controls the period of time that the Registrar state machine will wait in the leave state before transitioning to the MT (Empty) state when it is removed. An instance of the timer is required for each state machine that is in the leave state. The leave period timer is set to the value specified for **leave-time** when it is started.

A registration is normally in an “in” state where there is an MFIB entry and traffic is being forwarded. When a “leave all” is performed (periodically around every 10-15 seconds per SAP/SDP binding - see leave-all-time-below), a node sends a message to its peer indicating a leave all is occurring and puts all of its registrations in leave state.

The peer refreshes its registrations based on the leave all PDU it receives and sends a PDU back to the originating node with the state of all its declarations.

Refer to IEEE 802.1ak-2007 section 10.7.4.2.

Default leave-time 30

Parameters *value* — The period of time that the Registrar state machine waits in the leave state before transitioning to the MT state, in tenths of a second.

Values 30 to 60

16.108 ler-use-dscp

ler-use-dscp

Syntax [**no**] **ler-use-dscp**

Context **[Tree]** (config>qos>network>ingress ler-use-dscp)

Full Context configure qos network ingress ler-use-dscp

Description This command is used to enable tunnel QoS mapping on all ingress network IP interfaces that the network-qos-policy-id is associated with. The command may be defined at any time after the network QoS policy has been created. Any network IP interfaces currently associated with the policy will immediately start to use the internal IP ToS field of any tunnel terminated IP routed packet received on the interface, ignoring any QoS markings in the tunnel portion of the packet.

This attribute provides the ability to ignore the network ingress QoS mapping of a terminated tunnel containing an IP packet that is to be routed to a base router or VPRN destination. This is advantageous when the mapping for the tunnel QoS marking does not accurately or completely reflect the required QoS handling for the IP routed packet. When the mechanism is enabled on an ingress network IP interface, the IP interface will ignore the tunnel's QoS mapping and derive the internal forwarding class and profile based on the precedence or DiffServ Code Point (DSCP) values within the routed IP header ToS field compared to the Network QoS policy defined on the IP interface.

The default state is not to enforce tunnel termination IP routed QoS override within the network QoS policy.

The **no** form of this command removes tunnel termination IP routed QoS override from the network QoS policy and all ingress network IP interfaces associated with the policy.

Default no ler-use-dscp

Platforms All

16.109 less-specific

less-specific

Syntax **less-specific** [**allow-default**]
no less-specific

Context **[Tree]** (config>vrrp>policy>priority-event>route-unknown less-specific)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure vrrp policy priority-event route-unknown less-specific

Description This command allows a CIDR shortest match hit on a route prefix that contains the IP route prefix associated with the route unknown priority event.

The **less-specific** command modifies the search parameters for the IP route prefix specified in the **route-unknown** priority event. Specifying **less-specific** allows a CIDR shortest match hit on a route prefix that contains the IP route prefix.

The **less-specific** command eases the RTM lookup criteria when searching for the *prefix/mask-length*. When the **route-unknown** priority event sends the prefix to the RTM (as if it was a destination lookup), the result route table prefix (if a result is found) is checked to see if it is an exact match or a less specific match. The **less-specific** command enables a less specific route table prefix to match the configured prefix. When **less-specific** is not specified, a less specific route table prefix fails to match the configured prefix. The **allow-default** optional parameter extends the **less-specific** match to include the default route (0.0.0.0).

The **no** form of the command prevents RTM lookup results that are less specific than the route prefix from matching.

Default no less-specific — The route unknown priority events requires an exact prefix/mask match.

Parameters **allow-default** — When the **allow-default** parameter is specified with the **less-specific** command, an RTM return of 0.0.0.0 matches the IP prefix. If **less-specific** is entered without the **allow-default** parameter, a return of 0.0.0.0 will not match the IP prefix. To disable **allow-default**, but continue to allow **less-specific** match operation, only enter the **less-specific** command (without the **allow-default** parameter).

Full Context configure port ethernet egress-scheduler-override level
configure port sonet-sdh path egress-scheduler-override level
configure port tdm ds1 channel-group egress-scheduler-override level
configure port tdm ds3 egress-scheduler-override level
configure port tdm e1 egress-scheduler-override level
configure port tdm e3 egress-scheduler-override level

Description This command overrides the maximum and CIR rate parameters for a specific priority level on the port or channel's port scheduler instance. When the **level** command is executed for a priority level, the corresponding priority level command in the port-scheduler-policy associated with the port is ignored.

The override level command supports the keyword **max** for the **rate** and **cir** parameter. When executing the level override command, at least the **rate** or **cir** keywords and associated parameters must be specified for the command to succeed.

The **no** form of this command removes the local port priority level rate overrides. Once removed, the port priority level will use the port scheduler policies level command for that priority level.

Parameters *priority-level* — Identifies which of the eight port priority levels are being overridden.

Values 1 to 8

pir-rate — Overrides the port scheduler policy's maximum level rate and requires either the **max** keyword or a rate defined in kilobits per second to follow.

Values For Ethernet: 1 to 6400000000, **max**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For SONET-SDH and TDM: 1 to 3200000000, **max**

cir-rate — Overrides the port scheduler policy's within-cir level rate and requires either the max keyword or a rate defined in kilobits per second to follow.

Values For Ethernet: 1 to 6400000000, **max**
For SONET-SDH and TDM: 1 to 3200000000, **max**

pir-percent — Specifies the PIR as a percentage.

Values 0.01 to 100.00

cir-percent — Specifies the CIR as a percentage.

Values 0.00 to 100.00

max — removes any existing rate limit imposed by the port scheduler policy for the priority level allowing it to use as much total bandwidth as possible.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path egress-scheduler-override level

Full Context configure service vprn isis interface level
configure service vprn isis level
configure service vprn isis link-group level

Description This command creates the context to configure IS-IS Level 1 or Level 2 area attributes.

A router can be configured as a Level 1, Level 2, or Level 1-2 system. A Level 1 adjacency can be established if there is at least one area address shared by this router and a neighbor. A Level 2 adjacency cannot be established over this interface.

Level 1/2 adjacency is created if the neighbor is also configured as Level 1/2 router and has at least one area address in common. A Level 2 adjacency is established if there are no common area IDs.

A Level 2 adjacency is established if another router is configured as Level 2 or a Level 1/2 router with interfaces configured as Level 1/2 or Level 2. Level 1 adjacencies are not established over this interface.

To reset global and/or interface level parameters to the default, the following commands must be entered independently:

level> no hello-authentication-key level> no hello-authentication-type level> no hello-interval level> no hello-multiplier level> no metric level> no passive level> no priority

Default level 1 or level 2

Special Cases **Global IS-IS Level —** The **config>router>isis** context configures default global parameters for both Level 1 and Level 2 interfaces.

IS-IS Interface Level — The **config>router>isis>if** context configures IS-IS operational characteristics of the interface at Level 1 and/or Level 2. A logical interface can be configured on one Level 1 and one Level 2. In this case, each level can be configured independently and parameters must be removed independently.

By default an interface operates in both Level 1 and Level 2 modes.

Parameters *level-number* — The IS-IS level number.

Values 1, 2

Platforms All

level

Syntax **level** *syslog-level*

Context **[Tree]** (config>service>vprn>log>syslog level)

Full Context configure service vprn log syslog level

Description This command configures the syslog message severity level threshold. All messages with severity level equal to or higher than the threshold are sent to the syslog target host.

Only a single threshold level can be specified. If multiple levels are entered, the last **level** entered will overwrite the previously entered commands.

Default level info

Parameters *syslog-* — The threshold severity level name.

Values emergency, alert, critical, error, warning, notice, info, debug

Router severity level	Numerical Severity (highest to lowest)	Configured Severity	Definition
	0	emergency	system is unusable
3	1	alert	action must be taken immediately
4	2	critical	critical condition
5	3	error	error condition
6	4	warning	warning condition
	5	notice	normal but significant condition

Context **[Tree]** (config>router>igmp>interface>mcac>mc-constraints level)
[Tree] (config>router>mcac>policy>bundle>mc-constraints level)
[Tree] (config>router>mld>interface>mcac>mc-constraints level)
[Tree] (config>router>pim>interface>mcac>mc-constraints level)

Full Context configure router igmp interface mcac mc-constraints level
configure router mcac policy bundle mc-constraints level
configure router mld interface mcac mc-constraints level
configure router pim interface mcac mc-constraints level

Description This command configures the amount of bandwidth available within a given bundle for MC traffic for a specified level. The amount of allowable BW for the specified level is expressed in kb/s and this can be defined for up to eight different levels.

If no bandwidth is defined for a given level then no limit is applied.

The **no** form of this command removes the level from the configuration.

Parameters *level* — Specifies the bandwidth for a given level. Level 1 has the highest priority. Level 8 has the lowest priority.

Values 1 to 8

bw *bandwidth* — Specifies the bandwidth, in kb/s, for the level.

Values 1 to 2147483647 kb/s

Default 1

no level *priority-level*

Context **[Tree]** (config>qos>port-scheduler-policy level)

Full Context configure qos port-scheduler-policy level

Description This command configures an explicit within-CIR bandwidth limit and a total bandwidth limit for each port scheduler's priority level. To understand how to set the level rate and CIR parameters, a basic understanding of the port-level scheduler bandwidth allocation mechanism is required. The port scheduler takes all available bandwidth for the port or channel (after the max-rate and any port egress-rate limits have been accounted for) and offers it to each of the eight priority levels twice.

The first pass is called the within-CIR pass and consists of providing the available port bandwidth to each of the 8 priority levels, starting with level 8 and moving down to level 1. Each level takes the offered load and distributes it to all child members that have a port-parent cir-level equal to the current priority level. (Any child with a cir-weight equal to 0 is skipped in this pass.) Each child may consume bandwidth up to the child's frame-based within-CIR offered load. The remaining available port bandwidth is then offered to the next lower priority level until level 1 is reached.

The second pass is called the above-CIR pass and consists of providing the remaining available port bandwidth to each of the eight priority levels a second time. Again, each level takes the offered load and distributes it to all child members that have a port-parent level equal to the current priority level. Each child may consume bandwidth up to the remainder of the child's frame-based offered load (some of the offered load may have been serviced during the within-CIR pass). The remaining available port bandwidth is then offered to the next priority level until level 1 is again reached.

If the port scheduling policy is using the default orphan behavior (orphan-override has not been configured on the policy), the system then takes any remaining port bandwidth and allocates it to the orphan queues and scheduler on priority level 1. In a non-override orphan state, all orphans are attached to priority level 1 using a weight of 0. The zero weight value causes the system to allocate bandwidth equally to all orphans based on each orphan queue or scheduler's ability to use the bandwidth. If the policy has an orphan-override configured, the orphans are handled based on the override commands parameters in a similar fashion to properly parented queues and schedulers.

The port scheduler priority level command rate keyword is used to optionally limit the total amount of bandwidth that is allocated to a priority level (total for the within-CIR and above-CIR passes). The cir keyword optionally limits the first pass bandwidth allocated to the priority level during the within-CIR pass.

When executing the level command, at least one of the optional keywords, **rate** or **cir,** must be specified. If neither keyword is included, the command will fail.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If a previous explicit value for rate or cir exists when the level command is executed, and either rate or cir is omitted, the previous value for the parameter is overwritten by the default value and the previous value is lost.

The configured priority level rate limits may be overridden at the egress port or channel using the egress-scheduler-override level priority-level command. When a scheduler instance has an override defined for a priority level, both the rate and cir values are overridden even when one of them is not explicitly expressed in the override command. For instance, if the cir kilobits per second portion of the override is not expressed, the scheduler instance defaults to not having a CIR rate limit for the priority level even when the port scheduler policy has an explicit CIR limit defined.

The **no** form of this command returns the level to its default value.

Default no level priority-level

Parameters *priority-level* — Specifies to which priority level the level command pertains. Each of the eight levels is represented by an integer value of 1 to 8, with 8 being the highest priority level.

Values 1 to 8 (8 is the highest priority)

pir-rate — Specifies the total bandwidth limits allocated to priority-level, in kilobits per second.

Values 1 to 6400000000, **max**

pir-percent — Specifies the percent bandwidth limits allocated to priority-level.

Values 0.01 to 100.00

cir-rate — The cir specified limits the total bandwidth allocated in the within-CIR distribution pass to priority-level. When cir is not specified, all the available port or channel bandwidth may be allocated to the specified priority level during the within-CIR pass.

Values 0 to 6400000000, **max**

The value given for kilobits per second is expressed in kilobits per second on a base 10 scale as is usual for line rate calculations. If a value of 1 is given, the result is 1000 bits per second (as opposed to a base 2 interpretation that would be 1024 bits per second).

cir-percent — Specifies the percent bandwidth limits allocated to priority-level.

Values 0.00 to 100.00

group *name* — specifies the existing group that the weighted scheduler group this level maps to, up to 32 characters.

weight — Specifies the weight of the level within this weighted scheduler group.

Values 1 to 100

Default 1

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

monitor-threshold *percent* — Specifies the percent of the configured rate. If the offered rate exceeds the configured threshold, a counter monitoring the threshold will be increased.

Values 0 to 100

Platforms All

level

Syntax **level** *syslog-level*
no level

Context **[Tree]** (config>log>syslog level)

Full Context configure log syslog level

Description This command configures the syslog message severity level threshold. All messages with severity level equal to or higher than the threshold are sent to the syslog target host.

Only a single threshold level can be specified. If multiple levels are entered, the last **level** entered will overwrite the previously entered commands.

The **no** form of this command reverts to the default value.

Default level info

Parameters *value* — Specifies the threshold severity level name.

Values emergency, alert, critical, error, warning, notice, info, debug

Table 73 **Level Parameter Value Descriptions**

Router severity level	Numerical Severity (highest to lowest)	Configured Severity	Definition
	0	emergency	system is unusable
3	1	alert	action must be taken immediately
4	2	critical	critical condition
5	3	error	error condition
6	4	warning	warning condition

level

Syntax **level** {**1** | **2**}

Context **[Tree]** (config>router>isis level)
[Tree] (config>router>isis>interface level)

Full Context configure router isis interface level
configure router isis level

Description This command creates the context to configure IS-IS Level 1 or Level 2 area attributes.

A router can be configured as a Level 1, Level 2, or Level 1-2 system. A Level 1 adjacency can be established if there is at least one area address shared by this router and a neighbor. A Level 2 adjacency cannot be established over this interface.

Level 1/2 adjacency is created if the neighbor is also configured as Level 1/2 router and has at least one area address in common. A Level 2 adjacency is established if there are no common area IDs.

A Level 2 adjacency is established if another router is configured as Level 2 or a Level 1/2 router with interfaces configured as Level 1/2 or Level 2. Level 1 adjacencies will not be established over this interface.

To reset global and/or interface level parameters to the default, the following commands must be entered independently:

CLI Syntax:
```
level>no hello-authentication-key
level>no hello-authentication-type
level>no hello-interval
level>no hello-multiplier
level>no metric
level>no passive
level>no priority
```

Default level 1 or level 2

Special Cases **Global IS-IS Level —** The **config>router>isis** context configures default global parameters for both Level 1 and Level 2 interfaces.

16.112 lfa-policy-map

lfa-policy-map

Syntax **lfa-policy-map route-nh-template** *template-name*
no lfa-policy-map

Context **[Tree]** (config>service>vprn>isis>if lfa-policy-map)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn isis interface lfa-policy-map

Description This command applies a route next-hop policy template to the IS-IS interface for the VPRN instance.

When a route next-hop policy template is applied to an interface in IS-IS, it is applied in both level 1 and level 2. When a route next-hop policy template is applied to an interface in OSPF, it is applied in all areas. However, the command in an OSPF interface context can only be executed under the area in which the specified interface is primary and then applied in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command fails.

If the user excluded the interface from LFA using the command **loopfree-alternate-exclude**, the LFA policy, if applied to the interface, has no effect.

Finally, if the user applied a route next-hop policy template to a loopback interface or to the system interface, the command will not be rejected, but it will result in no action being taken.

The **no** form deletes the mapping of a route next-hop policy template to an OSPF or IS-IS interface.

Parameters *template-name* — Specifies the name of the template, up to 32 characters.

Platforms All

lfa-policy-map

Syntax **lfa-policy-map route-nh-template** *template-name*

li-filter-lock-state

Syntax **li-filter-lock-state** {**locked** | **unlocked-for-li-users** | **unlocked-for-all-users**}
no li-filter-lock-state

Context **[Tree]** (config>li li-filter-lock-state)

Full Context configure li li-filter-lock-state

Description This command configures the lock state of the filters used by LI. With the configurable filter lock for LI feature an LI user can control the behavior of filters when they are used for LI.

Prior to Release 12.0.R1, when a filter entry was used as a Lawful Intercept (LI) mirror source criteria, all subsequent attempts to modify the filter were then blocked to avoid having the LI session impacted by a non-LI user.

The **no** form of this command reverts to the default.

Default li-filter-lock-state locked

Parameters **locked** — When an li-source criteria is configured that references any entry of filter Y, then filter Y can no longer be changed (until there are no longer any li-source references to entries of filter Y).

unlocked-for-li-users — Filters can continue to be edited by LI users only even when an li-source references an entry in that filter.

unlocked-for-all-users — Filters can continue to be edited by all users even when an li-source references an entry in that filter.

li-ip-filter

Syntax **li-ip-filter** *li-filter-name* [**create**]
no li-ip-filter *li-filter-name*

Context **[Tree]** (config>li>li-filter li-ip-filter)

Full Context configure li li-filter li-ip-filter

Description This command creates a Lawful Interception (LI) IPv4 filter list, or enters the CLI context for a LI IPv4 filter list. LI IPv4 filters are used as a manner to create confidential IPv4 filter based li-source entries. The LI IPv4 filter entries are inserted/merged into normal IPv4 filters as configured with the **li-filter-associations** and **li-filter-block-reservation** commands, but the LI IPv4 filter entries are not visible to users without LI permissions.

The **no** form of this command removes the LI IPv4 filter name from the configuration.

Parameters *li-filter-name* — Specifies the name of the IPv4 address filter. Filter names cannot start with an underscore character (for example, “_my-filter”) and cannot use the name “default”.

Platforms All

li-ip-filter

Syntax [**no**] **li-ip-filter** *li-filter-name*

Context **[Tree]** (config>li>li-filter-assoc li-ip-filter)

Full Context configure li li-filter-associations li-ip-filter

Description Specifies the **li-ip-filter** that will have its entries inserted into a list of normal IP filters.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the LI filter name from the configuration.

Parameters *li-filter-name* — Specifies an existing li-ip-filter, up to 32 characters.

Platforms All

li-ip-filter

Syntax **li-ip-filter** *li-filter-name* **entry** *li-entry-id* [*li-entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** *session-id* [*session-id*]]
no li-ip-filter *li-filter-name* [**entry** *li-entry-id* [*li-entry-id*]]

Context **[Tree]** (config>li>li-source li-ip-filter)

Full Context configure li li-source li-ip-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing LI IP filter that has been associated with a normal IP filter. The specification of an li-ip-filter entry as an li-source means that packets matching the li-ip-filter entry will be intercepted on all interfaces/saps/and so on where the associated normal ip-filter(s) are applied.

Parameters *li-filter-name* — Specifies the name of the **li-ip-filter**, up to 32 characters.

li-entry-id — Specifies the entry ID in the **li-ip-filter** that is to be used as an li-source criteria.

Values 1 to 65535

intercept-id — Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This intercept ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encap, no intercept ID is inserted and none should be specified against the **li-source** entries.

session-id — Specifies the session-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The session-id is only valid and used for mirror services that are configured with ip-udp-shim routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ip-udp-shim routable encap, a session-id field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an li-source entry, then the default value will be inserted. When a mirror service is configured with ip-gre routable encap, no session-id is inserted and none should be specified against the li-source entries.

Context **[Tree]** (config>li>li-filter li-ipv6-filter)

Full Context configure li li-filter li-ipv6-filter

Description This command creates a Lawful Interception (LI) IPv6 filter list, or enters the CLI context for a LI IPv6 filter list. LI IPv6 filters are used as a manner to create confidential IPv6 filter based li-source entries. The LI IPv6 filter entries are inserted or merged into normal IPv6 filters as configured with the **li-filter-associations** and **li-filter-block-reservation** commands, but the LI IPv6 filter entries are not visible to users without LI permissions.

The **no** form of this command removes the LI IPv6 filter name from the configuration.

Parameters *li-filter-name* — Specifies the name of the IPv6 address filter. Filter names cannot start with an underscore character (for example, “_my-filter”) and cannot use the name “default”.

create — creates a LI IPv6 filter.

Platforms All

li-ipv6-filter

Syntax [**no**] **li-ipv6-filter** *li-filter-name*

Context **[Tree]** (config>li>li-filter-assoc li-ipv6-filter)

Full Context configure li li-filter-associations li-ipv6-filter

Description This command specifies the **li-ipv6-filter** that will have its entries inserted into a list of normal IPv6 filters.

The **no** form of this command removes the filter name from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *li-filter-name* — Specifies an existing li-ipv6-filter up to 32 characters.

Platforms All

li-ipv6-filter

Syntax **li-ipv6-filter** *li-filter-name* **entry** *li-entry-id* [*li-entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** *session-id* [*session-id*]]
no li-ipv6-filter *li-filter-name* [**entry** *li-entry-id* [*li-entry-id*]]

Context **[Tree]** (config>li>li-source li-ipv6-filter)

Full Context configure li li-source li-ipv6-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing LI IPv6 filter that has been associated with a normal IPv6 filter. The specification of an li-ipv6-filter entry as an li-source means that packets matching the **li-ipv6-filter** entry will be intercepted on all interfaces/saps/and so on, where the associated normal ip-filter(s) are applied.

Parameters *li-filter-name* — Specifies the name of the **li-ipv6-filter** up to 32 characters.

li-entry-id — Specifies the entry ID in the **li-ipv6-filter** that is to be used as an LI source criteria.

Values 1 to 65535

intercept-id — Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an intercept-id field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with IP GRE routable encap, no intercept ID is inserted and none should be specified against the LI source entries.

session-id — Specifies the session ID that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example, by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of li-source entries (filter, nat, sap, subscriber), when the mirror service is configured with ip-udp-shim routable encap, a session-id field (as part of the routable encap) is always present in the mirrored packets. If there is no session ID configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with IP GRE routable encap, no session ID is inserted and none should be specified against the li-source entries.

Context **[Tree]** (config>li>li-source li-mac-filter)

Full Context configure li li-source li-mac-filter

Description This command enables lawful interception (LI) of packets that match specific entries in an existing LI MAC filter that has been associated with a normal MAC filter. The specification of an **li-mac-filter** entry as an li-source means that packets matching the **li-mac-filter** entry will be intercepted on all interfaces, saps and so on where the associated normal mac-filter(s) are applied.

Parameters *li-filter-name* — Specifies the name of the **li-mac-filter**, up to 32 characters.

li-entry-id — Specifies the entry id in the **li-mac-filter** that is to be used as an li-source criteria.

Values 1 to 65535

intercept-id — Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated li-source entry. This intercept ID can be used (for example, by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encap, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

session-id — Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

Platforms All

16.123 li-reserved-block

li-reserved-block

Syntax **li-reserved-block** *block-name* [**create**]
no li-reserved-block *block-name*

Context **[Tree]** (config>li>li-filter-block-reservation li-reserved-block)

Full Context configure li li-filter-block-reservation li-reserved-block

Description This command creates or edits an LI reserved block. An LI reserved block allows an operator to define where entries from an LI filter should be inserted into a normal filter. The block reserves a configurable number of entries in the normal filter that can only be used for entries inserted from associated LI filters. The LI filter entries that get inserted into the reserved block in each normal filter are not visible to non-LI operators. The block also defines to which normal filters the reservation is applied.

The **no** form of this command removes the block name from the configuration.

Parameters *block-name* — Specifies the name of the MAC filter. Block names cannot start with an underscore character (for example, “_my-filter”) and cannot use the name “default”.

Use subject to Terms available at: www.nokia.com

16.124 li-separate

li-separate

Syntax [**no**] **li-separate**

Context **[Tree]** (bof li-separate)

Full Context bof li-separate

Description This command specifies whether or not a non-LI user has access to lawful intercept (LI) information. When this command is enabled, a user who does not have LI access will not be allowed to access CLI or SNMP objects in the li context. Modifying this command will not take effect until the system is rebooted.

When the **no li-separate** command is set (the default mode), those who are allowed access to the **config>system>security>profile** context and user command nodes are allowed to modify the configuration of the LI parameters. In this mode, a user that has a profile allowing access to the **config>li** and/or **show>li** command contexts can enter and use the commands under those nodes.

When the **li-separate** command is configured, only users that have the LI access capabilities set in the **config>system>security>user>access li** context are allowed to access the **config>li** and/or **show>li** command contexts. A user who does not have LI access is not allowed to enter the **config>li** and **show>li** contexts even though they have a profile that allows access to these nodes. When in the **li-separate** mode, only users with **config>system>security>user>access li** set in their user account have the ability modify the setting LI parameters in either their own or other profiles and user configurations.

Default no li-separate

Use subject to Terms available at: www.nokia.com

no limit-init-exchange

Context [Tree] (config>ipsec>ike-policy limit-init-exchange)

Full Context configure ipsec ike-policy limit-init-exchange

Description This command limits the number of ongoing IKEv2 initial exchanges per tunnel to 1. When the system receives a new IKEv2 IKE_SA_INIT request when there is an ongoing IKEv2 initial exchange from same peer, then system reduces the timeout value of the existing exchange to the specified **reduced-max-exchange-timeout**. If the **reduced-max-exchange-timeout** is **disabled**, then the system does not reduce the timeout value.

The **no** form of this command reverts to the default value.

Default limit-init-exchange reduced-max-exchange-timeout 2

Parameters *seconds* — Specifies the maximum timeout for the in-progress initial IKE exchange.

Values 2 to 60, disabled

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.134 limit-mac-move

limit-mac-move

Syntax **limit-mac-move** [**blockable** | **non-blockable**]
no limit-mac-move

Context [Tree] (config>service>vpls>sap limit-mac-move)
[Tree] (config>service>vpls>spoke-sdp limit-mac-move)

Full Context configure service vpls sap limit-mac-move
configure service vpls spoke-sdp limit-mac-move

Description This command indicates whether or not the mac-move agent, when enabled using **config>service>vpls>mac-move** or **config>service>epipe>mac-move**, limits the MAC re-learn (move) rate on this SAP.

Default limit-mac-move blockable

Parameters **blockable** — Specifies that the agent monitors the MAC re-learn rate on the SAP, and it blocks it when the re-learn rate is exceeded.

non-blockable — Specifies that this SAP is not blocked, and another blockable SAP is blocked instead.

Platforms All

© 2022 Nokia.

limit-mac-move

Syntax **limit-mac-move** [**blockable** | **non-blockable**]
no limit-mac-move

Context **[Tree]** (config>service>pw-template limit-mac-move)

Full Context configure service pw-template limit-mac-move

Description This command indicates whether or not the mac-move agent will limit the MAC re-learn (move) rate.

Default limit-mac-move blockable

Parameters **blockable** — The agent will monitor the MAC re-learn rate, and it will block it when the re-learn rate is exceeded.

non-blockable — When specified, a SAP will not be blocked, and another blockable SAP will be blocked instead.

Platforms All

16.135 limit-pir-zero-drain

limit-pir-zero-drain

Syntax [**no**] **limit-pir-zero-drain**

Context **[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution limit-pir-zero-drain)

Full Context configure qos adv-config-policy child-control bandwidth-distribution limit-pir-zero-drain

Description This command is used to configure the system to use the minimum configurable PIR instead of an H-QoS derived zero operational PIR. The default behavior is to allow the operational PIR of the queue to remain the last configured value while setting the queue MBS to zero (preventing queuing of newly arriving packets). Retaining the previous PIR value may cause a momentary burst above an aggregate rate associated with the queue as it drains. Using the **limit-pir-zero-drain** command causes the queue to drain at the lowest rate possible (typically 1 kb/s) that limits overrun situations.

The **no** form of this command reverts to default behavior.

configure port ethernet network egress queue-group agg-rate limit-unused-bandwidth
configure port sonet-sdh path access egress vport limit-unused-bandwidth
configure service vprn subscriber-interface group-interface sap egress limit-unused-bandwidth

Description This command specifies to limit the unused bandwidth and allow a tighter control in allocation of bandwidth by HQoS. When enabled, HQoS algorithm distributes any unused aggregate bandwidth between queues operating below their fair share rates. This allows a simplified aggregate rate protection while allocating bandwidth by HQoS.

The **no** form of this command reverts to the default.

Platforms All

16.137 line-length

line-length

Syntax **line-length** {**110** | **220** | **330** | **440** | **550** | **660**}

Context **[Tree]** (config>system>sync-if-timing>bits>output line-length)

Full Context configure system sync-if-timing bits output line-length

Description This command configures the **line-length** parameter of the BITS output, This is the distance in feet between the network element and the office clock (BITS/SSU). There are two possible BITS-out interfaces, one for each CPM. They are configured together, but they are displayed separately in the show command. This command is only applicable when the interface-type is DS1.

Default line-length 110

Parameters **110** — Specifies that the distance is from 0 to 110 feet.

220 — Specifies that the distance is from 110 to 220 feet.

330 — Specifies that the distance is from 220 to 330 feet.

440 — Specifies that the distance is from 330 to 440 feet.

550 — Specifies that the distance is from 440 to 550 feet.

660 — Specifies that the distance is from 550 to 660 feet.

16.138 link

link

Syntax **link** *port-id* {**primary** | **secondary**}
no link *port-id*

Context **[Tree]** (config>lag>link-map-profile link)

Full Context configure lag link-map-profile link

Description This command designates one of the configured ports of the LAG to be used on egress as either a primary or secondary link (based on the option selected) by all SAPs and network interfaces that use this LAG link map profile.

Links are part of a profile When a link is added or deleted, all SAPs and network interfaces that use this link-map-profile may be re-hashed if required.

The **no** form of this command deletes the link from this LAG link mapping profile. A port must be deleted from all LAG link profiles if it is to be deleted from the LAG.

Parameters *port-id* — Specifies a physical port ID that is an existing member of this LAG.

port-id	*slot*/*mda*/*port*[.*channel*]	
eth-sat-id	esat-*id*/*slot*/*port*	
	esat	keyword
	id	1 to 20
pxc-id	pxc-*id*.*sub-port*	
	pxc	keyword
	id	1 to 64
	sub-port	a, b

primary — Designates one of the configured ports of the LAG to be used on egress as a primary link by SAPs/network interfaces that use this LAG link map profile.

secondary — Designates one of the configured ports of the LAG to be used on egress as a secondary link by SAPs/network interfaces that use this LAG link map profile.

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client ia-na link-addr
configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client slaac link-addr

Description This command specifies the ipv6-address that should be included in the link-address field of the relay header. This can be used for pool selection by the DHCPv6 server.

The **no** form of this command falls back to the default.

Parameters *ipv6-address* — Specifies the IPv6 address up to 32 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay link-address
configure service vprn subscriber-interface ipv6 dhcp6 relay link-address
configure subscriber-mgmt local-user-db ipoe host link-address

Description
This command configures the link address used for prefix selection at the DHCP server.

The link-address is a field in DHCP6 Relay-Forward message that is used in DHCP6 server to select the IPv6 address (IA-NA) or IPv6 prefix (IA-PD) from a pool with configured prefix range covering the link-address. The selection scope is the pool or a prefix range within the pool.

The **no** form of this command reverts to the default.

Default
no link-address

Parameters
ipv6-address — Specifies the link-address.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

Platforms
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface ipv6 dhcp6 relay link-address

link-address

Syntax **link-address** *ipv6-address*
no link-address

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw>dhcp6 link-address)
[Tree] (config>service>vprn>if>sap>ipsec-gw>dhcp6 link-address)

Full Context configure service ies interface sap ipsec-gw dhcp6 link-address
configure service vprn interface sap ipsec-gw dhcp6 link-address

Description This command specifies the link address of the relayed DHCPv6 packets sent by the system.

Default no link-address

Parameters *ipv6-address* — Specifies a global unicast IPv6 address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.141 link-bandwidth

link-bandwidth

Syntax **link-bandwidth**

Context **[Tree]** (config>service>vprn>bgp>group link-bandwidth)
[Tree] (config>service>vprn>bgp>group>neighbor link-bandwidth)

Full Context configure service vprn bgp group link-bandwidth
configure service vprn bgp group neighbor link-bandwidth

Description This command enables the configuration context for handling the link-bandwidth extended community attached to specific BGP routes.

When all used multipaths of an IP prefix correspond to BGP routes with a link-bandwidth extended community, the datapath is programmed to do weighted ECMP across the BGP next-hops in proportion to the bandwidth values.

Platforms All

16.142 link-delay

link-delay

Syntax **link-delay** {**activate** | **deactivate**} *milli-seconds*
no link-delay {**activate** | **deactivate**}

Context **[Tree]** (config>port>ml-bundle>ima link-delay)

Full Context configure port multilink-bundle ima link-delay

Description This command specifies the time to delay between detection of a link activation/deactivation condition and acting upon it (going in/out of the RX failure state on a link).

Parameters **activate** *milli-seconds* — Specifies the time, in milli-seconds, used to clear an existing LIF or LODS alarm. The time specified determines how long is needed for member links to stabilize before being activated.

Values 1 to 30000

Default 10000

deactivate *milli-seconds* — Specifies the time, in milli-seconds, used to raise an LIF or LODS alarm. The time specified determines how long before a member link is declared in error and is deactivated.

Values 1 to 30000

Default 2000

Platforms 7450 ESS, 7750 SR-7/12/12e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.143 link-fault

link-fault

Syntax **link-fault local-port-action** {**log-only** | **out-of-service**}

Context **[Tree]** (config>port>ethernet>efm-oam>peer-rdi-rx link-fault)

Full Context configure port ethernet efm-oam peer-rdi-rx link-fault

Description This command defines how to react to the reception of a link fault flag set in the informational PDU from a peer.

Default link-fault local-port-action out-of-service

Parameters **local-port-action** — Defines whether or not the local port will be affected when a link fault is received from a peer.

log-only — Keyword that prevents the port from being affected when the local peer receives a link fault. The dying gasp will be logged but the port will remain operational.

out-of-service — Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of link fault event. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

Platforms All

16.144 link-group

link-group

Syntax [**no**] **link-group** *link-group-name*

Context **[Tree]** (config>service>vprn>isis link-group)

Full Context configure service vprn isis link-group

Description This command configures a link-group for the router or VPRN instance.

The **no** form of this command removes the specified link-group.

Parameters *link-group-name* — Name of the link-group to be added or removed from the router or VPRN service.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

link-group

Syntax **link-group** *link-group-name*
no link-group

Context **[Tree]** (config>router>isis link-group)

Full Context configure router isis link-group

Description This command specifies the IS-IS link group associated with this particular level of the interface.

Parameters *link-group-name* — Specifies an IS-IS link group on the system up to 32 characters in length.

Platforms All

16.145 link-local-address

link-local-address

Syntax **link-local-address** *ipv6-address* [**dad-disable**]
no link-local-address

Context **[Tree]** (config>router>if>ipv6 link-local-address)
[Tree] (config>service>ies>if>ipv6 link-local-address)
[Tree] (config>service>ies>sub-if>ipv6 link-local-address)
[Tree] (config>service>vprn>if>ipv6 link-local-address)
[Tree] (config>service>vprn>sub-if>ipv6 link-local-address)

Full Context configure router interface ipv6 link-local-address
configure service ies interface ipv6 link-local-address
configure service ies subscriber-interface ipv6 link-local-address
configure service vprn interface ipv6 link-local-address
configure service vprn subscriber-interface ipv6 link-local-address

Description This command configures the IPv6 Link Local address that is used as a virtual SRRP IPv6 address by the Master SRRP node. This address is sent in the Router Advertisements initiated by the Master SRRP node. Clients use this address as IPv6 default-gateway. Both SRRP nodes, Master and Backup, must be configured with the same Link Local address.

Only one link-local-address is allowed per interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Caution: Removing a manually configured link local address may impact routing protocols or static routes that have a dependency on that address. It is not recommended to remove a link local address when there are active IPv6 subscriber hosts on an IES or VPRN interface.

The **no** form of this command reverts to the default.

Parameters *ipv6-address* — Specifies the IPv6 address in the form:

Values

ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

dad-disable — Disables Duplicate Address Detection (DAD) and sets the address to preferred, even if there is a duplicated address.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface ipv6 link-local-address
- configure service ies subscriber-interface ipv6 link-local-address

16.147 link-map-profile

link-map-profile

Syntax **link-map-profile** *link-map-profile-id* [**create**]
no link-map-profile *link-map-profile-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>lag link-map-profile)

Full Context configure lag link-map-profile

Description This command creates the link map profile that can to control which LAG ports are to be used on egress or enables the configuration context for previously created link map profile. link map profiles are not created by default.

The **no** form of this command, deletes the specified link map profile.

Parameters *link-map-profile-id* — An integer from 1 to 64 that defines a unique LAG link map profile on this LAG.

Platforms All

16.148 link-measurement

link-measurement

Syntax **link-measurement**

Context [Tree] (config>test-oam link-measurement)

Full Context configure test-oam link-measurement

Description Commands in this context configure various link measurement template attributes that are inherited on associated IP interfaces for delay reporting to the routing engine.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.149 link-monitoring

link-monitoring

Syntax [**no**] **link-monitoring**

Context [Tree] (config>port>ethernet>efm-oam>discovery>advertise-capabilities link-monitoring)

Full Context configure port ethernet efm-oam discovery advertise-capabilities link-monitoring

Description When the link monitoring function is in a no shutdown state, the Link Monitoring capability (EV) is advertised to the peer through the EFM OAM protocol. This may not be desired if the remote peer does not support the Link Monitoring functionality.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** version of this command suppresses the advertisement of capabilities.

Default link-monitoring

Platforms All

link-monitoring

Syntax **link-monitoring**

Context **[Tree]** (config>port>ethernet>efm-oam link-monitoring)

Full Context configure port ethernet efm-oam link-monitoring

Description This context contains link monitoring specific options defining the various local thresholds, port interaction and peer notification methods. In order to activate Link monitoring function, this context must be configured with the no shutdown option. Shutting down link monitoring will clear all historical link monitoring counters. If the port was removed from service and placed in a non-operational down state and a port state of link up because a signal failure threshold was crossed and link monitoring is shutdown, the port will be returned to service assuming no underlying conditions prevent this return to service.

When the link monitoring function is in a **no shutdown** state, the Link Monitoring capability (EV) is advertised to the peer through the EFM OAM protocol. This may not be desired if the remote peer does not support the Link Monitoring functionality.

Platforms All

16.150 link-name

link-name

Syntax **link-name** *te-link-name*
no link-name

Context **[Tree]** (config>router>lmp>te-link link-name)

Full Context configure router lmp te-link link-name

Description This command configures text names for the TE Link.

Parameters *te-link-name* — Specifies the text name for the TE Link.

Values 32 characters maximum text string

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.151 link-specific-rate

link-specific-rate

Syntax **link-specific-rate** *packet-rate-limit*
no link-specific-rate

Context **[Tree]** (config>sys>security>cpu-protection link-specific-rate)

Full Context configure system security cpu-protection link-specific-rate

Description This command configures a link-specific rate for CPU protection. This limit is applied to all ports within the system. The CPU will receive no more than the configured packet rate for all link level protocols such as LACP from any one port. The measurement is cleared each second and is based on the ingress port.

Default link-specific-rate 15000

Parameters *packet-rate-limit* — Specifies a packet arrival rate limit, in packets per second, for link level protocols.

Values 1 to 65535, **max** (no limit)

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

16.152 link-state-export-enable

link-state-export-enable

Syntax [**no**] **link-state-export-enable**

Context **[Tree]** (config>router>bgp link-state-export-enable)

Full Context configure router bgp link-state-export-enable

Description This command enables the export of link-state information from the BGP-LS address family into the local Traffic Engineering Database (TED).

The **no** form of this command disables the export of link state information into the TED.

Default no link-state-export-enable

Platforms All

16.155 linktrace

linktrace

Syntax **linktrace** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**ttl** *ttl-value*]

Context **[Tree]** (oam>eth-cfm linktrace)

Full Context oam eth-cfm linktrace

Description The command initiates a linktrace test.

Parameters *mac-address* — Specifies a unicast MAC address destination.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

remote-mepid *mep-id* — Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

mep *mep-id* — Specifies the local MEP ID.

Values 1 to 8191

md-index — Specifies the MD index.

Values 1 to 4294967295

ma-index — Specifies the MA index.

Values 1 to 4294967295

ttl-value — Specifies the TTL for a returned linktrace.

Values 0 to 255

Default 64

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.156 live-output

live-output

Syntax **live-output** {*ip-address* | *fqdn*} [**port** *port*] [**router** {*router-instance* | **service-name** *service-name*}]
no live-output

Context **[Tree]** (config>call-trace>trace-profile live-output)

Full Context configure call-trace trace-profile live-output

Description This command specifies a live output destination for this trace. When configured, captures will not be stored locally but sent (over UDP) to the server in the specified routing context. The destination can be specified as either an IP address or a DNS FQDN. The **live-output** and **debug-output** commands are mutually exclusive.

The **no** form of this command disables live output streaming.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the server to stream to.

fqdn — Specifies the FQDN that represents the server in DNS, up to 255 characters.

port — Specifies the UDP port on which the server is listening.

Values 1 to 65535

Default 29770

router-instance — Specifies the router instance in which the live output is forwarded.

service-name — Specifies the name of the Layer 3 service in which the live output is forwarded.

16.158 llf

llf

Syntax [**no**] **llf**

Context **[Tree]** (config>service>apipe>sap>atm llf)
[Tree] (config>service>epipe>sap>ethernet llf)

Full Context configure service apipe sap atm llf
configure service epipe sap ethernet llf

Description This command enables Link Loss Forwarding (LLF) on an Ethernet port or an ATM port. This feature provides an end-to-end OAM fault notification for Ethernet VLL service and for ATM VLL service of vc-type atm-cell. It brings down the Ethernet port (Ethernet LLF) or sends a SONET/SDH Path AIS (ATM LLF) toward the attached CE when there is a local fault on the Pseudowire or service, or a remote fault on the SAP or pseudowire, signaled with label withdrawal or T-LDP status bits. It ceases when the fault disappears.

The Ethernet port must be configured for null encapsulation.

For the 7750 SR, the ATM port must be configured as a SAP on an Apipe service of vc-type atm-cell. The ATM port must also be configured on the following MDAs:

- 1-port OC12/STM4 ASAP MDA. At OC3/STM1 port level
- 4-port ATM MDA at OC12/STM4 or OC3/STM1 port level

The ATM port must be configured as a SAP on an Apipe service of vc-type atm-cell. The ATM port must also be configured on the following MDAs:

- 1-port OC12/STM4 ASAP MDA. At OC3/STM1 port level
- 4-port ATM MDA at OC12/STM4 or OC3/STM1 port level

This feature is also supported in Epipes with BGP-EVPN enabled. In this case, upon removal of the EVPN destination, the port is brought oper-down with flag LinkLossFwd, however the AD per-EVI route for the SAP is still advertised (the SAP is kept oper-up).

The **no** form of this command disables LLF on an Ethernet port or an ATM port.

Default no llf

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

- configure service apipe sap atm llf

16.159 lmi

lmi

Syntax **lmi** [*port-id*]
no lmi

Context **[Tree]** (debug>frame-relay lmi)

Full Context debug frame-relay lmi

Description This debug command enables tracing of all the LMI messages in both receive and transmit directions for one or all of the Frame Relay interfaces. All types of Frame Relay interfaces are supported. If the port ID is not specified, debug is enabled on all Frame Relay interfaces.

The **no** form of this command turns off LMI and Frame-Relay debugging, **debug>frame-relay>no lmi** and **debug>no frame-relay**.

Parameters *port-id* — Specifies the ILMI-supporting port ID.

Values

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

Output The following output is an example of frame relay LMI information.

Sample Output

```
2959 2007/04/11 23:01:34.63 MINOR: DEBUG #2001 - FR
"FR: TX STATUS Msg on dce Port: 1/1/1 LMI: itu

configure port sonet-sdh path frame-relay lmi-type
configure port tdm ds1 channel-group frame-relay lmi-type
configure port tdm ds3 frame-relay lmi-type
configure port tdm e1 channel-group frame-relay lmi-type
configure port tdm e3 frame-relay lmi-type

Description This command configures the Local Management Interface (LMI) type for Frame Relay interfaces. LMIs are sets of enhancements to the basic Frame Relay specification.

The **no** form of this command changes the LMI type back to the default value.

Default itu

Parameters **ansi** — Specifies to use ANSI T1.617 Annex D.

itu — Specifies to use ITU-T Q933 Annex A.

none — Specifies to disable Frame Relay LMI on the given port/channel.

rev1 — Specifies to use the Rev 1 version of ANSI T1.617 Annex D.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path frame-relay lmi-type

16.161 lmm

lmm

Syntax **lmm** [**test-id** *test-id*] [**create**]
no lmm

Context **[Tree]** (config>oam-pm>session>ethernet lmm)

Full Context configure oam-pm session ethernet lmm

Description This command configures the LMM test ID to be assigned to the Tx and Rx counter-based loss test and creates the individual test. LMM does not carry this test ID in the PDU; the value is of local significance.

The **no** form of this command removes the LMM test function from the PM Session.

Parameters *test-id* — Specifies the value to be placed in the 4-byte test ID field of an ETH-DMM PDU.

Values 0 to 2147483647

create — Creates the test.

Platforms All

16.162 lmp

lmp

Syntax [**no**] **lmp**

Context **[Tree]** (config>router lmp)

Full Context configure router lmp

Description This command creates a context for the configuration of the Link Management Protocol (LMP) on the system.

Default no lmp

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.163 lns-group

lns-group

Syntax **lns-group** *lns-group-id*
no lns-group

Context **[Tree]** (config>router>l2tp>group lns-group)
[Tree] (config>router>l2tp>group>tunnel lns-group)
[Tree] (config>service>vprn>l2tp>group lns-group)
[Tree] (config>service>vprn>l2tp>group>tunnel lns-group)

Full Context configure router l2tp group lns-group
configure router l2tp group tunnel lns-group
configure service vprn l2tp group lns-group
configure service vprn l2tp group tunnel lns-group

Description This command configures the ISA LNS group for the L2TP group.

The **no** form of this command removes the LNS group ID from the configuration.

Default no lns-group

Parameters *lns-group-id* — Specifies the LNS group ID.

Values 1 to 4

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lns-group

Syntax **lns-group** *lns-group-id* [**create**]
no lns-group *lns-group-id*

Context **[Tree]** (config>isa lns-group)

Full Context configure isa lns-group

Description This command configures an LNS group.

The **no** form of the command removes the LNS group ID from the configuration.

Default none

Parameters *lns-group-id* — Specifies the LNS group identifier.

Values 1 to 4

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

create — Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.164 load

load

Syntax **load** *file-url* [**overwrite** | **insert** | **append**]

Context **[Tree]** (candidate load)

Full Context candidate load

Description This command loads a previously saved candidate configuration into the current candidate. The edit point will be set to the end of the loaded configuration lines. The candidate configuration cannot be modified while a load is in progress.

Default If the candidate is empty then a load without any of the optional parameters (such as overwrite, and so on) will load the file-url into the candidate. If the candidate is not empty then one of the options, such as overwrite, insert, and so on, must be specified.

Parameters *file-url* — Specifies the directory and filename to load.

overwrite — Discards the contents of the current candidate and replace it with the contents of the file.

insert — Inserts the contents of the file at the current edit point.

append — Inserts the contents of the file at the end of the current candidate.

16.165 load-balance-key

load-balance-key

Syntax **load-balance-key** [**vendor** *vendor-id* [*vendor-id*]] **attribute-type** *attribute-type* [*attribute-type*]
load-balance-key source-ip-udp
no load-balance-key

Context **[Tree]** (config>router>radius-proxy>server load-balance-key)
[Tree] (config>service>vprn>radius-proxy>server load-balance-key)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router radius-proxy server load-balance-key
configure service vprn radius-proxy server load-balance-key

Description This command specifies the key used in calculating a hash to select an external RADIUS server from the pool of configured servers.

The key can be the source IP and source UDP port tuple, or the specified RADIUS attribute in RADIUS packets.

The **no** form of this command removes the parameters from the configuration.

Parameters *vendor-id* — Specifies the vendor-id of vendor-specific attribute.

Values 0 to 16777215

attribute-type — Specifies that the key is constructed with the attributes in the RADIUS message.

Values 1 to 255

source-ip-udp — Specifies that the key consists of the source IP address and source UDP port of the RADIUS message.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.166 load-balance-method

load-balance-method

Syntax **load-balance-method** {**per-session** | **per-tunnel**}
no load-balance-method

Context **[Tree]** (config>router>l2tp>group load-balance-method)
[Tree] (config>router>l2tp>group>tunnel load-balance-method)
[Tree] (config>service>vprn>l2tp>group load-balance-method)
[Tree] (config>service>vprn>l2tp>group>tunnel load-balance-method)

Full Context configure router l2tp group load-balance-method
configure router l2tp group tunnel load-balance-method
configure service vprn l2tp group load-balance-method
configure service vprn l2tp group tunnel load-balance-method

Description This command is applicable only to LNS. By default traffic load balancing between the BB-ISAs is based on sessions. Each session is individually assigned to an BB-ISA during session establishment phase.

By introducing MLPPPoX, all sessions of a bundle must be terminated on the same LNS BB-ISA. This is necessary for two reasons:

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- QoS in the carrier IOM has a uniform view of the subscriber
- a single BB-ISA is responsible for MLPPPoX encapsulation/fragmentation for a given bundle.

Therefore, if fragmentation is enabled, load-balancing per tunnel must be configured. In the per tunnel load-balancing mode, all sessions within the same tunnel are terminated on the same LNS BB-ISA.

In the case that we have MLPPPoX sessions with a single member link, both load-balancing methods are valid.

The **no** form of this command reverts to the default.

Default load-balance-method per-session

Parameters **per-session** — Specifies that the traffic load balancing between the LNS BB-ISAs is based on individual PPPoE sessions.

per-tunnel — Specifies that the traffic load balancing between the LNS BB-ISAs is based on tunnels.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.167 load-balancing

load-balancing

Syntax load-balancing

Context **[Tree]** (config>service>epipe load-balancing)

Full Context configure service epipe load-balancing

Description This command enables the load-balancing context to configure interface per-flow load balancing options that will apply to traffic entering this interface and egressing over a LAG/ECMP on system-egress. This is a per interface setting. For load-balancing options that can also be enabled on the system level, the options enabled on the interface level overwrite system level configurations.

Default not applicable

Use subject to Terms available at: www.nokia.com

configure port tdm e3 load-balancing-algorithm

Description This command specifies the load balancing algorithm to be used on this port.

In the default mode, **no load-balancing-algorithm**, the port inherits the global settings. The value is not applicable for ports that do not pass any traffic.

The configuration of load-balancing-algorithm at logical port level has three possible values:

- **include-l4** — Enables inherits system-wide settings including Layer 4 source and destination port value in hashing algorithm.
- **exclude-l4** — Layer 4 source and destination port value will not be included in hashing.
- **no load-balancing-algorithm** — Inherits system-wide settings.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network. To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account Layer 4 information (src/dst L4-protocol port). The hashing index can be calculated according to the following algorithm:

If [(TCP or UDP traffic) & enabled]

hash (<TCP/UDP ports>, <IP addresses>)

else if (IP traffic)

hash (<IP addresses>)

else

hash (<MAC addresses>)

endif

This algorithm will be used in all cases where IP information in per-packet hashing is included (refer to “Traffic Load Balancing Options” in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide*). However the Layer 4 information (TCP/UDP ports) will not be used in the following cases:

- fragmented packets

Default no load-balancing-algorithm

Parameters *option* — Specifies the load balancing algorithm to be used on this port.

Values **include-l4** — Specifies that the source and destination ports are used in the hashing algorithm.**exclude-l4** — Specifies that the source and destination ports are not used in the hashing algorithm.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.169 load-balancing-weight

load-balancing-weight

Syntax **load-balancing-weight** *value*
no load-balancing-weight [*value*]

Context **[Tree]** (config>service>vprn>static-route-entry>next-hop load-balancing-weight)

Full Context configure service vprn static-route-entry next-hop load-balancing-weight

Description This command configures a weighted ECMP load-balancing weight for a static route next-hop.

If all of the ECMP next-hops of a static route have a configured load-balancing-weight then packets matching the route are sprayed according to the relative weights. In other words, the next-hop interface with the largest load-balancing weight should receive the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface and effectively disables weighted ECMP for the entire static route.

Parameters *value* — Specifies the cost metric value.

Values 0 to 4294967295

Platforms All

load-balancing-weight

Syntax **load-balancing-weight** [*weight*]
no load-balancing-weight

Context **[Tree]** (config>service>vprn>ospf>area>if load-balancing-weight)
[Tree] (config>service>vprn>ospf3>area>if load-balancing-weight)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure service vprn ospf area interface load-balancing-weight
configure service vprn ospf3 area interface load-balancing-weight

Description This command configures the weighted ECMP load-balancing weight for an IS-IS, OSPF, and OSPF3 interface. If the interface becomes an ECMP next hop for an IPv4 or IPv6 route, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the weights. This means that the interface with the largest load-balancing weight receives the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface which effectively disables weighted ECMP for any IP prefix that has this interface as a next hop.

Default no load-balancing-weight

Parameters *weight* — Specifies the load balancing weight.

Values 1 to 4294967295

Platforms All

load-balancing-weight

Syntax **load-balancing-weight** *weight*
no load-balancing-weight

Context **[Tree]** (config>service>vprn>isis>if load-balancing-weight)

Full Context configure service vprn isis interface load-balancing-weight

Description This command configures the weighted ECMP load-balancing weight for an IS-IS interface of the VPRN. If the interface becomes an ECMP next-hop for IPv4 or IPv6 route and all the other ECMP next-hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the weights. In other words, the interface with the largest **load-balancing-weight** should receive the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface and, therefore, effectively disables weighted ECMP for any IP prefix that has this interface as a next-hop.

Default no load-balancing-weight

Parameters *weight* — Specifies the load balancing weight.

Values 0 to 4294967295

Platforms All

load-balancing-weight

Syntax **load-balancing-weight** *weight*
no load-balancing-weight

Context **[Tree]** (config>router>ldp>if-params>if load-balancing-weight)

Full Context configure router ldp interface-parameters interface load-balancing-weight

Description This command configures the load balancing weight for the LDP interface. The load balancing weight, normalized to 64, is used for weighted ECMP of LDP labeled packets over direct network IP interfaces.

If the interface becomes an ECMP next hop for an LDP FEC, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the normalized weight with a granularity of 64.

If one or more of the LDP interfaces in the ECMP set does not have a configured load-balancing weight, then the system falls back to ECMP.

The **no** form of this command removes the load balancing weight for the LDP interface.

Parameters *weight* — Specifies the load balancing weight value.

Values 0 to 4294967295

Platforms All

load-balancing-weight

Syntax **load-balancing-weight** *weight*
no load-balancing-weight

Context **[Tree]** (config>router>mpls>lsp load-balancing-weight)

Full Context configure router mpls lsp load-balancing-weight

Description This command assigns a weight to an MPLS LSP for use in the weighted load-balancing, or weighted ECMP, over MPLS feature.

Parameters *weight* — Specifies a 32-bit integer representing the weight of the LSP.

Values 0 to 4294967295

Platforms All

load-balancing-weight

Syntax **load-balancing-weight** *weight*

16.170 local

local

Syntax [**no**] **local**

Context **[Tree]** (config>subscr-mgmt>sla-profile>control local)

Full Context configure subscriber-mgmt sla-profile control local

Description This command enables a session that is set up with local control plane handling to use this SLA profile. This command cannot be disabled.

Default local

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local

Syntax [**no**] **local**

Context **[Tree]** (config>subscr-mgmt>sub-profile>control local)

Full Context configure subscriber-mgmt sub-profile control local

Description This command enables a session that is set up with local control plane handling to use this subscriber profile. This command cannot be disabled.

Default local

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local

Syntax **local** [**inherit** | **all** | **vc-only** | **none**]

Context **[Tree]** (config>service>vprn>ttl-propagate local)

Full Context configure service vprn ttl-propagate local

Description This command overrides the global configuration of the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-local.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value

Default local inherit

Parameters **inherit** — Specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-local.

none — Specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only — Specifies the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

all — Specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Platforms All

local

Syntax **local**

Context **[Tree]** (config>ipsec>ts-list local)

Full Context configure ipsec ts-list local

Description Commands in this context configure local TS-list parameters. The TS-list is the traffic selector of the local system, such as TSr, when the system acts as an IKEv2 responder.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no local-address

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy local-address)

Full Context configure subscriber-mgmt bgp-peering-policy local-address

Description This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the 7750 SR OS uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of this command removes the configured local-address for BGP.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Parameters *ip-address* — Specifies the IPv4 or IPv6 address of the local address.

For IPv4, the local address is expressed in dotted decimal notation. Allowed values are a valid routable IP address on the router, either an interface or system IP address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

For IPv6, the local address is expressed in semi-colon hexadecimal notation. Allowed values is an interface or a system IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-address

Syntax **local-address** *ip-address*
no local-address

Context **[Tree]** (config>service>vpls>gsmp>group>neighbor local-address)
[Tree] (config>service>vprn>gsmp>group>neighbor local-address)

Full Context configure service vpls gsmp group neighbor local-address
configure service vprn gsmp group neighbor local-address

Description This command configures the source ip-address used in the connection towards the neighbor. The local address is optional. If specified the node will accept connections only for that address in the service running ANCP. The address may be created after the reference but connections will not be accepted until it is created. If the local address is not used, the system accepts connections on any interface within the routing context.

The **no** form of this command reverts to the default.

Parameters *ip-address* — Specifies the source IP address to be used in the connection toward the neighbor.

Values *ip-address*: a.b.c.d. (unicast address only)

Platforms All

local-address

Syntax **local-address** *ip-address*
no local-address

Full Context configure service vprn msdp group local-address
configure service vprn msdp group peer local-address
configure service vprn msdp local-address
configure service vprn msdp peer local-address

Description This command configures the local end of a Multicast Source Discovery Protocol (MSDP) session. For MSDP to function, at least one peer must be configured. When configuring a peer, you must include this **local-address** command to configure the local end of the MSDP session. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer.

If the user enters this command, then the address provided is validated and will be used as the local address for MSDP peers from that point. If a subsequent **local-address** command is entered, it will replace the existing configuration and existing sessions will be terminated.

Similarly, when the **no** form of this command is entered, the existing local address will be removed from the configuration and the existing sessions will be terminated.

Whenever a session is terminated, all information pertaining to and learned from that peer will be removed.

Whenever a new peering session is created or a peering session is lost, an event message should be generated.

The **no** form of this command removes the local address from the configuration.

Default no local-address

Parameters *ip-address* — Specifies an existing address on the node.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router pcep pcc local-address
configure router pcep pce local-address

Description This command configures the local address of the PCEP speaker.

The PCEP protocol operates over TCP using destination TCP port 4189. The PCE client (PCC) always initiates the connection. Once the user configures the PCEP local address and the peer address on the PCC, the latter initiates a TCP connection to the PCE. When the connection is established, the PCC and PCE exchange OPEN messages, which initializes the PCEP session and exchanges the session parameters to be negotiated.

The PCC always checks first if the remote PCE address is reachable out-of-band via the management port. If not, it will check if the remote PCE address is reachable in-band. When the session comes up out-of-band, the system IP address is always used. The local address configured by the user is only used for in-band sessions, and is otherwise ignored.

The **no** form of the command removes the configured local address of the PCEP speaker.

Parameters *ip-address* — the IP address of the PCEP speaker to be used for in-band sessions

Platforms All

local-address

no local-address

Context **[Tree]** (config>service>ies>video-interface>adi>scte30 local-address)
[Tree] (config>service>vprn>video-interface>adi>scte30 local-address)

Full Context configure service ies video-interface adi scte30 local-address
configure service vprn video-interface adi scte30 local-address

Description SCTE 30 requires a TCP session per zone-channel between the ad server and splicer for control communication and it requires UDP sessions on which the video ad stream is sent. This command specifies the splicer's control IP address to which the ad-servers should setup TCP connections and the data IP address to which the video ad streams should be sent.

The **no** form of the command removes the address information from the local address configuration.

Parameters **control** *ip-address* — Specifies the local IP address to which ad servers send Society of Cable Telecommunications Engineers 30 (SCTE 30) ad control streams. This address should be in the same subnet as the ip address assigned to the video interface.

The values of **control** *ip-address* and the **data** *ip-address* specify the local IP address to which ad servers send SCTE 30 ad data streams, must be set together in the same SNMP request PDU or else the set request will fail with an inconsistent value error.

Syntax **local-address** *ip-address*
no local-address

Context **[Tree]** (config>router>origin-validation>rpki-session local-address)

Full Context configure router origin-validation rpki-session local-address

Description This command configures the local address to use for setting up the TCP connection used by an RPKI-Router session. The default local-address is the outgoing interface IPv4 or IPv6 address. The local-address cannot be changed without first shutting down the session.

Default no local-address

Parameters *ip-address* — Specifies an IPv4 address or an IPv6 address.

Platforms All

local-address

Syntax **local-address** [*ip-int-name* | *ip-address* | *ipv6-address*]
no local-address

Context **[Tree]** (config>router>bgp>group local-address)
[Tree] (config>router>bgp>group>neighbor local-address)

Full Context configure router bgp group local-address
configure router bgp group neighbor local-address

Description This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the router uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

When set to a router interface, the **local-address** inherits the primary IPv4 or IPv6 address of the router interface depending on whether BGP is configured for IPv4 or IPv6. If the corresponding IPv4 or IPv6 address is not configured on the router interface, the BGP sessions that have this interface set as the **local-address** are kept down until an interface address is configured on the router interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the configured local-address for BGP.

The **no** form of this command used at the group level returns the configuration to the value defined at the global level.

The **no** form of this command used at the neighbor level returns the configuration to the value defined at the group level.

Default no local-address

Parameters *ip-address* — Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address — Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ip-int-name — Specifies the IP interface name whose address the local address will inherit. The interface can be any network interface configured on the system.

Platforms All

local-address

Syntax **local-address** *ip-address* | *ipv6-address*
no local-address

Context **[Tree]** (config>bmp>station>connection local-address)

Full Context configure bmp station connection local-address

Description This command configures the local IP address used by the local router when communicating with the BMP monitoring station. This configuration is optional.

Outgoing connections use the local-address as the source of the TCP connection when initiating connections with a monitoring station.

The BMP session may flap when this parameter is changed. Shut down the BMP session before changing the values.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the configured local-address for the BMP session. The default is to use the system IP address.

Default local-address ip-address (system IP address)

Parameters *ip-address* — Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address — Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H

Full Context configure service template vpls-template local-age
configure service vpls local-age

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Specifies the aging time for locally learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **local-age** timer specifies the aging time for local learned MAC addresses.

The **no** form of this command returns the local aging timer to the default value.

Default local age 300 — Local MACs aged after 300 seconds.

Parameters *aging-timer* — Specifies the aging time for local MACs expressed in seconds

Values 60 to 86400

Platforms All

16.174 local-as

local-as

Syntax **local-as** *as-number* [**private**]
no local-as

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy local-as)

Full Context configure subscriber-mgmt bgp-peering-policy local-as

Description This command configures a BGP virtual autonomous system (AS) number.

In addition to the AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number is configured. The virtual AS number is added to the as-path message before the router's AS number makes the virtual AS the second AS in the as-path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate as-number per EBGP session.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level will remove any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Parameters *as-number* — Specifies the virtual autonomous system number, expressed as a decimal integer.

Values 1 to 4294967295

private — Specifies that the local-as number is hidden in paths learned from the peering.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-as

Syntax **local-as** *as-number* [**private**] [**no-prepend-global-as**]
no local-as

Context **[Tree]** (config>service>vprn>bgp local-as)
[Tree] (config>service>vprn>bgp>group local-as)
[Tree] (config>service>vprn>bgp>group>neighbor local-as)

Full Context configure service vprn bgp group local-as
configure service vprn bgp group neighbor local-as
configure service vprn bgp local-as

Description This command configures a BGP virtual autonomous system (AS) number.

In addition to the global AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number can be configured to support various AS number migration scenarios. The local AS number is added to the to the beginning the as-path attribute ahead of the router's AS number.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This configuration parameter can be set at three levels: global level (applies to all EBGP peers), group level (applies to all EBGP peers in peer-group) or neighbor level (only applies to EBGP specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate local-as per EBGP session. The local-as command is not supported for IBGP sessions. When the optional **private** keyword is specified in the command the local-as number is not added to inbound routes from the EBGP peer that has **local-as** in effect.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level removes any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no local-as

Parameters *as-number* — The virtual autonomous system number, expressed as a decimal integer.

Values 1 to 65535

private — Specifies the local-as is hidden in paths learned from the peering.

no-prepend-global-as — Specifies that the global-as is hidden in paths announced to the EBGP peer.

Platforms All

local-as

Syntax **local-as** *as-number* [**private**] [no-prepend-global-as]
no local-as

© 2022 Nokia.

Context [Tree] (config>router>bgp local-as)
[Tree] (config>router>bgp>group local-as)
[Tree] (config>router>bgp>group>neighbor local-as)

Full Context configure router bgp group local-as
configure router bgp group neighbor local-as
configure router bgp local-as

Description This command configures a BGP local autonomous system (AS) number. In addition to the global AS number configured for BGP using the autonomous-system command, a local AS number can be configured to support various AS number migration scenarios.

When the **local-as** command is applied to a BGP neighbor and the local-as is different from the peer-as, the session comes up as EBGP and by default the global-AS number and then (in that order) the local-as number are prepended to the AS_PATH attribute in outbound routes sent to the peer. In received routes from the EBGP peer, the local AS is prepended to the AS path by default, but this can be disabled with the **private** option.

When the **local-as** command is applied to a BGP neighbor and the local-as is the same as the peer-as, the session comes up as IBGP, and by default, the global-AS number is prepended to the AS_PATH attribute in outbound routes sent to the peer.

This configuration parameter can be set at three levels: global level (applies to all BGP peers), group level (applies to all BGP peers in group) or neighbor level (only applies to one specific BGP neighbor). By specifying this at the neighbor level, it is possible to have a separate **local-as** for each BGP session.

When the optional **no-prepend-global-as** command is configured, the global-as number is not added in outbound routes sent to an IBGP or EBGP peer.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The private option can be added or removed dynamically by reissuing the command. Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no local-as

Parameters *as-number* — Specifies the virtual autonomous system number expressed as a decimal integer.

Values 1 to 4294967295

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

private — Specifies the local-as is hidden in paths learned from the peering.

no-prepend-global-as — Specifies that the global-as is hidden in paths announced to the BGP peer.

no local-dhcp-server *server-name*

Context **[Tree]** (config>router>dhcp local-dhcp-server)
[Tree] (config>service>vprn>dhcp local-dhcp-server)

Full Context configure router dhcp local-dhcp-server
configure service vprn dhcp local-dhcp-server

Description This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context it was which it was created.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command reverts to the default.

Parameters *server-name* — Specifies the name of local DHCP server, up to 32 characters.

create — Keyword used to create the local DHCP server. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-dhcp-server

Syntax **local-dhcp-server** *server-name* [**create**] [**auto-provisioned**]
no local-dhcp-server *server-name*

Context **[Tree]** (config>router>dhcp6 local-dhcp-server)

Full Context configure router dhcp6 local-dhcp-server

Description This command instantiates a DHCP6 server. A local DHCP6 server can serve multiple interfaces but is limited to the routing context it was which it was created.

The **no** form of this command reverts to the default.

Parameters *server-name* — Specifies the name of local DHCP6 server, up to 32 characters.

create — Keyword used to create the local DHCP or DHCP6 server. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

auto-provisioned — Specifies the auto provisioning mode. This parameter only applies to DHCP6 creation to configure DHCP6 default values.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-dhcp-server

Syntax [**no**] **local-dhcp-server** *server-name* [**lease-address** *ip-prefix*[*prefix-length*]]
[**no**] **local-dhcp-server** *server-name* [**mac** *ieee-address*]
[**no**] **local-dhcp-server** *server-name* [**link-local-address** *ipv6z-address*]

Context **[Tree]** (debug>router local-dhcp-server)

Full Context debug router local-dhcp-server

Description This command enables, disables or configures debugging for a local DHCP server.

Parameters *server-name* — Specifies an existing local DHCP server name.

ip-prefix[/prefix-length] — Specifies the IP prefix and prefix length of the subnet.

Values ip-prefix — a.b.c.d (host bits must be 0)
length — 0 to 32

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ieee-address — Specifies that the provisioned MAC address for the local DHCP server.

ipv6z-address — Specifies the IPv6z address.

ipv6-address:	x:x:x:x:x:x:x:x [-interface]
	x:x:x:x:x:x:d.d.d.d [-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
interface	up to 32 characters, mandatory for link local addresses

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-dhcp-server

Syntax [**no**] **local-dhcp-server**

Context **[Tree]** (config>redundancy>multi-chassis>peer>sync local-dhcp-server)

Full Context configure redundancy multi-chassis peer sync local-dhcp-server

Description This command synchronizes DHCP server information.

Default no local-dhcp-server

Platforms All

local-dhcp-server

Syntax **local-dhcp-server** *local-server-name*
no local-dhcp-server

Context **[Tree]** (config>service>ies>if local-dhcp-server)
[Tree] (config>service>vprn>if>ipv6 local-dhcp-server)

Full Context configure service ies interface local-dhcp-server
configure service vprn interface ipv6 local-dhcp-server

Description This command assigns a DHCP server to the interface.

Parameters *local-server-name* — Specifies an existing local server name.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-dhcp-server

Syntax **local-dhcp-server** *local-server-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no local-dhcp-server

Context [Tree] (config>router>if local-dhcp-server)
[Tree] (config>router>if>ipv6 local-dhcp-server)

Full Context configure router interface ipv6 local-dhcp-server
configure router interface local-dhcp-server

Description This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context in which it was created.

The **no** form of this command reverts to the default value.

Default no local-dhcp-server

Parameters *local-server-name* — Specifies the name of local DHCP server, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.178 local-ecid

local-ecid

Syntax **local-ecid** *emulated circuit identifier*
no local-ecid

Context [Tree] (config>service>epipe>sap>cem local-ecid)

Full Context configure service epipe sap cem local-ecid

Description This command defines the Emulated Circuit Identifiers (ECID) to be used for the local (source) end of the circuit emulation service.

The **no** form of this command removes the ECID from the configuration.

Default local-ecid 65535

Parameters *emulated circuit identifier* — Specifies the value to be used as the local (source) ECID for the circuit emulation service. On CES packet reception, the ECID in the packet will be compared to the configured local-ecid value. These must match for the packet payload to be used for the TDM circuit. The remote-ecid value is inserted into the MEF-8 CES packet to be transmitted.

Values 0 to 1048575

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.179 local-end

local-end

Syntax **local-end** {*ip-address* | *ipv6-address*}
no local-end

Context **[Tree]** (config>service>sdp local-end)

Full Context configure service sdp local-end

Description This command configures the local-end address of the following SDP encapsulation types:

- IPv6 address of the termination point of a SDP of encapsulation **l2tpv3** (L2TP v3 tunnel).
- IPv4/IPv6 source address of a SDP of encapsulation **eth-gre-bridged** (L2oGRE SDP).
- IPv4 source address of a SDP of encapsulation **gre** (GRE SDP).

A change to the value of the local-end parameter requires that the SDP be shut down.

When used as the source address of a SDP of encapsulation **gre** (GRE SDP), the primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **local-end** parameter value adheres to the following rules:

- A maximum of 15 distinct address values can be configured for all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context, and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address cannot be used in both contexts since an address configured for a L2oGRE SDP matches an internally created interface that is not available to other applications.
- The **local-end** address of a GRE SDP, when different from system, need not match the primary address of an interface that has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command removes the address from the local-end configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ip-address* | *ipv6-address* — Specifies a IPv4 or IPv6 address for local-end of an SDP in dotted decimal notation.

Values

ip-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

Platforms All

16.180 local-fcc-port

local-fcc-port

Syntax **local-fcc-port** *port*
no local-fcc-port

Context **[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video local-fcc-port)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video local-fcc-port)
[Tree] (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video local-fcc-port)

Full Context configure mcast-management multicast-info-policy bundle channel source-override video local-fcc-port
configure mcast-management multicast-info-policy bundle channel video local-fcc-port
configure mcast-management multicast-info-policy bundle video local-fcc-port

Description This command configures the local port on which Fast Channel Change (FCC) requests are received. The value of this object can only be set for the default bundle and will be used by all bundles and channels.

The **local-fcc-port** *port* value is the only configuration parameter in the bundle “default” context.

The **no** form of the command removes the port from the video configuration.

Parameters *port* — Specifies a local port for FCC requests.

Values 1024 to 5999, 6251 to 65535

Platforms 7450 ESS, 7750 SR-14s, 7750 SR-7/12/12e

16.181 local-filtering

local-filtering

Syntax **local-filtering**

Context **[Tree]** (config>app-assure>group>url-filter local-filtering)

Full Context configure application-assurance group url-filter local-filtering

Description This command configures a URL filter policy for local filtering in order to filter traffic based on a list of URLs located on a file stored in the router compact flash.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.182 local-forward

local-forward

Syntax **local-forward** *local-forward-id* [**create**]
no local-forward *local-forward-id*

Context **[Tree]** (config>system>satellite local-forward)

Full Context configure system satellite local-forward

Description This command creates a local-forward instance.

A local-forward instance creates a traffic bypass within the Ethernet satellite, which allows traffic to be forwarded between satellite client ports.

The **no** form of this command deletes the specified local-forward instance.

Parameters **local-forward-id** — Specifies the ID number for the local-forward instance.

Values 1 to 10240

create — Creates a new local-forward instance.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.183 local-gateway-address

local-gateway-address

Syntax **local-gateway-address** [*ip-address* | *ipv6-address*]
no local-gateway-address

Context **[Tree]** (config>router>if>ipsec>ipsec-tunnel local-gateway-address)
[Tree] (config>service>ies>if>ipsec>ipsec-tunnel local-gateway-address)

Full Context configure router interface ipsec ipsec-tunnel local-gateway-address
configure service ies interface ipsec ipsec-tunnel local-gateway-address

Description This command configures local gateway address of the IPsec gateway.

Parameters *ip-address* — Specifies a unicast IPv4 address, up to 64 characters.

ipv6-address — Specifies a unicast global unicast IPv6 address, up to 64 characters.

Platforms VSR

local-gateway-address

Syntax **local-gateway-address** *ip-address*
no local-gateway-address

Context **[Tree]** (config>service>ies>if>sap>ipsec-gw local-gateway-address)
[Tree] (config>service>vprn>if>sap>ipsec-gw local-gateway-address)

Full Context configure service ies interface sap ipsec-gw local-gateway-address
configure service vprn interface sap ipsec-gw local-gateway-address

Description This command configures local gateway address of the IPsec gateway.

Parameters *ip-address* — Specifies a unicast IPv4 address or a global unicast IPv6 address. This address must be within the subnet of the public interface.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-gateway-address

Syntax **local-gateway-address** *ip-address* **peer** *ip-address* **delivery-service** *service-id*
no local-gateway-address

Context **[Tree]** (config>service>vprn>if>sap>ipsec-tunnel local-gateway-address)

Full Context configure service vprn interface sap ipsec-tunnel local-gateway-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the local gateway address used for the tunnel and the address of the remote security gateway at the other end of the tunnel remote peer IP address to use.

Default no local-gateway-address

Parameters *ip-address* — IP address of the local end of the tunnel.

delivery-service *service-id* — The ID of the IES or VPRN (front-door) delivery service of this tunnel. Use this service-id to find the VPRN used for delivery.

Values *service-id*: 1 to 2147483648

svc-name: Specifies an existing service name up to 64 characters in length.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.184 local-id

local-id

Syntax **local-id** *type* [**value** *value*]
no local-id

Context **[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel>dyn local-id)
[Tree] (config>service>vprn>if>ipsec>ipsec-tunnel>dyn local-id)
[Tree] (config>service>ies>if>sap>ipsec-gw local-id)

[Tree] (config>service>vprn>if>sap>ipsec-tun>dyn local-id)
[Tree] (config>router>if>ipsec>ipsec-tunnel>dyn local-id)
[Tree] (config>ipsec>trans-mode-prof>dyn local-id)

Full Context configure ipsec ipsec-transport-mode-profile dynamic-keying local-id
configure router interface ipsec ipsec-tunnel dynamic-keying local-id
configure service ies interface ipsec ipsec-tunnel dynamic-keying local-id
configure service ies interface sap ipsec-gw local-id
configure service vprn interface ipsec ipsec-tunnel dynamic-keying local-id
configure service vprn interface sap ipsec-gw local-id
configure service vprn interface sap ipsec-tunnel dynamic-keying local-id

Description This command specifies the local ID used for IDi or IDr for IKEv2 negotiation.

The default behavior depends on the local-auth-method as follows:

- Psk: local tunnel IP address
- Cert-auth: subject of the local certificate

The **no** form of this command removes the parameters from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no local-id

Parameters *type* — Specifies the type of local ID payload, which could be IPv4 or IPv6 address or FQDN domain name or distinguish the name of the subject in the X.509 certificate.

Values ipv4 — Specifies to use IPv4 as the local ID type; the default value is the local tunnel end-point address.

ipv6 — Specifies to use IPv6 as the local ID type; the default value is the local tunnel end-point address.

fq1dn — Specifies to use FQDN as the local ID type. The value must be configured.

value — Specifies the data type as an enumerated integer that describes the local identifier type used for IDi or IDr for IKEv2, up to 255 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel dynamic-keying local-id
- configure service vprn interface sap ipsec-gw local-id
- configure ipsec ipsec-transport-mode-profile dynamic-keying local-id
- configure service ies interface sap ipsec-gw local-id

VSR

- configure service vprn interface ipsec ipsec-tunnel dynamic-keying local-id
- configure router interface ipsec ipsec-tunnel dynamic-keying local-id
- configure service ies interface ipsec ipsec-tunnel dynamic-keying local-id

16.185 local-ip

local-ip

Syntax **local-ip** {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

Context **[Tree]** (config>router>ipsec>sec-plcy>entry local-ip)
[Tree] (config>service>vprn>ipsec>sec-plcy>entry local-ip)

Full Context configure router ipsec security-policy entry local-ip
configure service vprn ipsec security-policy entry local-ip

Description This command configures the local (from the VPN) IP prefix/mask for the policy parameter entry.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system will evaluate the local IP as the source IP when traffic is examined in the direction of VPN to the tunnel and as the destination IP when traffic flows from the tunnel to the VPN. The remote IP will be evaluated as the source IP when traffic flows from the tunnel to the VPN when traffic flows from the VPN to the tunnel.

Parameters *ip-prefix* — The destination address of the aggregate route in dotted decimal notation

Values a.b.c.d (host bits must be 0)
prefix-length 1 to 32

netmask — The subnet mask in dotted decimal notation

any — keyword to specify that it can be any address

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn ipsec security-policy entry local-ip

VSR

- configure router ipsec security-policy entry local-ip

16.186 local-ip-address

local-ip-address

Syntax **local-ip-address** *ip-address*
no local-ip-address

Context **[Tree]** (config>lag>bfd>family local-ip-address)

Full Context configure lag bfd family local-ip-address

Description This command is used to specify the IPv4 or IPv6 address of the BFD source.

The **no** form of this command removes this address from the configuration.

Default no local-ip-address

Parameters *ip-address* — Specifies the IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x:-[0 to FFFF]H
	d: [0 to 255]D

Platforms All

16.187 local-ip-range-start

local-ip-range-start

Syntax **local-ip-range-start** *ip-address*
no local-ip-range-start

Context **[Tree]** (config>isa>nat-group>inter-chassis-redundancy local-ip-range-start)

Full Context configure isa nat-group inter-chassis-redundancy local-ip-range-start

Description This command configures the first IP address that is assigned to a first member ISA in the nat-group. The remaining member ISAs in the **nat-group** are automatically assigned the consecutive IP addresses, starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

The **no** form of this command reverts to the default.

Default no local-ip-range-start

Parameters *ip-address* — Specifies the first IP address from the range assigned to the first member ISA in the form of a.b.c.d

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.188 local-lsr-id

local-lsr-id

Syntax **local-lsr-id** {**system** | **interface**} [**32bit-format**]
local-lsr-id *interface-name* [**32bit-format**]
no local-lsr-id

Context **[Tree]** (config>router>ldp>if-params>if>ipv4 local-lsr-id)
[Tree] (config>router>ldp>if-params>if>ipv6 local-lsr-id)

Full Context configure router ldp interface-parameters interface ipv4 local-lsr-id
configure router ldp interface-parameters interface ipv6 local-lsr-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command enables the use of the address of the local LDP interface, or any other network interface configured on the system, as the LSR-ID to establish link LDP Hello adjacency and LDP session with directly connected LDP peers. The network interface can be a loopback or not.

Link LDP sessions to all peers discovered over a given LDP interface share the same local LSR-ID. However, LDP sessions on different LDP interfaces can use different network interface addresses as their local LSR-ID.

By default, the LDP session to a peer uses the system interface address as the LSR-ID unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

At initial configuration, the LDP session to a peer will remain down while the network interface used as LSR-ID is down. LDP will not try to bring it up using the system interface.

If the network IP interface used as LSR-ID goes down, the LDP sessions to all discovered peers using this LSR-ID go down.

When an interface other than the system is used as the LSR-ID, the transport connection (TCP) for the link LDP session will also use the address of that interface as the transport address. If the system or interface value is configured in the **config**>**router**>**ldp**>**if-params**>**if**>**ipv4** or **config**>**router**>**ldp**>**if-params**>**if**>**ipv6**>**transport-address** context, it will be overridden with the address of the LSR-ID interface.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish an LDP IPv6 Hello adjacency and an LDP IPv6 session with an RFC 7552 compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

Note: The system interface cannot be used as a local LSR-ID with the **32bit-format** option enabled because the system interface is the default LSR-ID and transport address for all LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

If the user enables the **32bit-format** option in the IPv6 context of a running LDP interface, the already established LDP IPv6 Hello adjacency and LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the LSR-ID value between **system**, **interface**, and *interface-name*, or enables the **32bit-format** option while the LDP session is up, LDP will immediately tear down all sessions using this LSR-ID and will attempt to re-establish them using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

Default no local-lsr-id

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **system** — Specifies the use of the address of the system interface as the value of the LSR-ID of this LDP LSR.

interface — Specifies the use of the address of the local LDP interface as the value of the LSR-ID of this LDP LSR.

interface-name *interface-name* — Specifies the name, up to 32 character, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

32bit-format — Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

Platforms All

local-lsr-id

Syntax **local-lsr-id** *interface-name* [**32bit-format**]
no local-lsr-id

Context **[Tree]** (config>router>ldp>targ-session>peer local-lsr-id)
[Tree] (config>router>ldp>targ-session>peer-template local-lsr-id)

Full Context configure router ldp targeted-session peer local-lsr-id
configure router ldp targeted-session peer-template local-lsr-id

Description This command enables the use of the address of any network interface configured on the system, as the LSR-ID to establish a targeted LDP Hello adjacency and a targeted LDP session with an LDP peer. The network interface can be a loopback or not.

By default, the targeted LDP session to a peer uses the system interface address as the LSR-ID and as the transport address, unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish a targeted LDP IPv6 Hello adjacency and a targeted LDP IPv6 session with an RFC 7552 compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

Note: The system interface cannot be used as a local LSR-ID with the 3**2bit-format** option enabled because the system interface is the default LSR-ID and transport address for all targeted LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the user enables the **32bit-format** option in the IPv6 context of a running targeted LDP peer, the already established targeted LDP IPv6 Hello adjacency and targeted LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the local LSR-ID value or enables/disables the **32bit-format** option, while the targeted LDP session is up, LDP will immediately tear down the targeted session using this LSR-ID and will attempt to re-establish it using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

Default no local-lsr-id

Parameters *interface-name* — Specifies the name, up to 32 characters, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

32bit-format — Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

16.190 local-monitoring-policer

local-monitoring-policer

Syntax [**no**] **local-monitoring-policer** *policer-name* [**create**]

Context **[Tree]** (config>sys>security>dist-cpu-protection>policy local-monitoring-policer)

Full Context configure system security dist-cpu-protection policy local-monitoring-policer

Description This command configures a monitoring policer that is used to monitor the aggregate rate of several protocols arriving on an object (for example, SAP). When the **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds) then the system will attempt to allocate dynamic policers for the particular object for any protocols associated with the local monitor (for example, using the **protocol** *name* **enforcement dynamic** *policer-name* CLI command).

If the system cannot allocate all the dynamic policers within 150 seconds, it will stop attempting to allocate dynamic policers, raise a LocMonExcdAllDynAlloc log event, and go back to using the local monitor. The local monitor may then detect exceeded packets again and make another attempt at allocating dynamic policers.

Once this *policer-name* is referenced by a protocol then this policer will be instantiated for each “object” that is created and references this DDoS policy. If there is no policer free then the object will be blocked from being created.

Parameters *policy-name* — Specifies name of the policy, up to 32 characters.

Platforms All

16.191 local-name

local-name

Syntax **local-name** *host-name*
no local-name

configure router l2tp group tunnel local-name
configure router l2tp local-name
configure service vprn l2tp group local-name
configure service vprn l2tp group tunnel local-name
configure service vprn l2tp local-name

Description This command creates the local host name used by this system for the tunnels in this L2TP group during the authentication phase of tunnel establishment. It can be used to distinguish tunnels.

The **no** form of this command removes the host name from the configuration.

Default no local-name

Parameters *host-name* — Specifies the host name, up to 64 characters in length, that the router will use to identify itself during L2TP authentication.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.192 local-port-action

local-port-action

Syntax **local-port-action** {**log-only** | **out-of-service**}

Context **[Tree]** (config>port>ethernet>efm-oam>link-mon>local-sf-action local-port-action)

Full Context configure port ethernet efm-oam link-monitoring local-sf-action local-port-action

Description This command configures the parameters that define if and how the local port will be affected when the local signal failure threshold (**sf-threshold**) has been reached within the configured window.

Interactions: The signal failure threshold will trigger these actions.

Default local-port-action out-of-service

Parameters **log-only** — Keyword that prevents the port from being affected when the configured signal failure threshold is reach within the window. The event will be logged but the port will remain operational.

out-of-service — Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged when the configured signal failure threshold (**sf-threshold**) is reached within the window. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

16.193 local-preference

local-preference

Syntax **local-preference** *local-preference*
no local-preference

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy local-preference)

Full Context configure subscriber-mgmt bgp-peering-policy local-preference

Description This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute. This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

The specified value can be overridden by any value set via a route policy.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

Parameters *local-preference* — The local preference value to be used as the override value, expressed as a decimal integer.

Values 0 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-preference

Syntax **local-preference** *local-preference*
no local-preference

[Tree] (config>service>vprn>bgp>group>neighbor local-preference)

Full Context configure service vprn bgp group local-preference
configure service vprn bgp group neighbor local-preference
configure service vprn bgp local-preference

Description This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute. This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The specified value can be overridden by any value set via a route policy. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no local-preference - Does not override the local-preference value set in arriving routes and analyze routes without local preference with value of 100.

Parameters *local-preference* — The local preference value to be used as the override value, expressed as a decimal integer.

Values 0 to 4294967295

Platforms All

local-preference

Syntax **local-preference** *local-preference*
no local-preference

Context **[Tree]** (config>router>bgp local-preference)

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default no local-preference

Parameters *local-preference* — Specifies the local preference value to be used as the override value expressed as a decimal integer.

Values 0 to 4294967295

Platforms All

local-preference

Syntax **local-preference** *preference* [**equal** | **or-higher** | **or-lower**]
no local-preference

Context **[Tree]** (config>router>policy-options>policy-statement>entry>from local-preference)

Full Context configure router policy-options policy-statement entry from local-preference

Description This command matches BGP routes based on local preference (the value in the LOCAL_PREF attribute).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

A non-BGP route does not match a policy entry if it contains the **local-preference** command.

Default no local-preference

Parameters *preference* — Specifies the local preference value.

Values 0 to 4294967295, or a parameter name delimited by starting and ending at-sign (@) characters

equal — Specifies that matched routes should have the same local preference as the value specified.

or-higher — Specifies that matched routes should have the same or a greater local preference as the value specified.

or-lower — Specifies that matched routes should have the same or a lower local preference as the value specified.

local-preference

Syntax **local-preference** *preference*
no local-preference

Context **[Tree]** (config>router>policy-options>policy-statement>default-action local-preference)
[Tree] (config>router>policy-options>policy-statement>entry local-preference)

Full Context configure router policy-options policy-statement default-action local-preference
configure router policy-options policy-statement entry local-preference

Description This command assigns a BGP local preference to routes matching a route policy statement entry.

If no local preference is specified, the BGP configured local preference is used.

The **no** form of this command disables assigning a local preference in the route policy entry.

Default no local-preference

Parameters *preference* — Specifies the local preference expressed as a decimal integer.

Values 0 to 4294967295 name — Specifies the local preference parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, “@variable@”.

16.194 local-prefix

local-prefix

Syntax **local-prefix** *local-prefix* [**create**]
no local-prefix *local-prefix*

Context **[Tree]** (config>service>pw-routing local-prefix)

Full Context configure service pw-routing local-prefix

Description This command configures one or more node prefix values to be used for MS-PW routing. At least one prefix must be configured on each node that is an S-PE or a T-PE.

The **no** form of this command removes a previously configured prefix, and will cause the corresponding route to be withdrawn if it has been advertised in BGP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no local-prefix

Parameters *local-prefix* — Specifies a 32 bit prefix for the AII. One or more prefix values, up to a maximum of 16, may be assigned to the 7450 ESS, 7750 SR, or 7950 XRS node. The global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN). The presence of a global ID based on the provider's ASN ensures that the AII for spoke-SDPs configured on the node will be globally unique.

Values <global-id>:<ip-addr>| <raw-prefix>

ip-addr	a.b.c.d
raw-prefix	1 to 4294967295
global-id	1 to 4294967295

Platforms All

16.195 local-priority

local-priority

Syntax **local-priority** *local-priority*

Context **[Tree]** (config>service>vprn>ptp>peer local-priority)

Full Context configure service vprn ptp peer local-priority

Description This command configures the local priority used to choose between PTP masters in the best master clock algorithm (BMCA). This setting is relevant when the profile is set to either g8265dot1-2010 or g8275dot1-2014. The parameter is ignored when any other profile is selected.

The value 1 is the highest priority and 255 is the lowest priority. The priority of a peer cannot be configured if the PTP profile is ieee1588-2008.

For g8265dot1-2010, this parameter configures the priority used to choose between master clocks with the same quality (see G.8265.1 for more information).

For g8275dot1-2014, this parameter sets the value of the **localPriority** associated with the Announce messages received from external clocks (**ptp>peer** or **ptp>port**), or the local clock (**ptp**). See G.8275.1 for more information.

Default local-priority 128

Parameters *local-priority* — Specifies the value of the local priority.

Values 1 to 255

[Tree] (config>service>vprn>sub-if>grp-if local-proxy-arp)

Full Context configure service ies interface local-proxy-arp
configure service ies subscriber-interface group-interface local-proxy-arp
configure service vprn interface local-proxy-arp
configure service vprn subscriber-interface group-interface local-proxy-arp

Description This command enables local proxy ARP. When local proxy ARP is enabled on an IP interface, the system responds to all ARP requests for IP addresses belonging to the subnet with its own MAC address, and thus becomes the forwarding point for all traffic between hosts in that subnet.

When **local-proxy-arp** is enabled, ICMP redirects on the ports associated with the service are automatically blocked.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface local-proxy-arp
- configure service ies subscriber-interface group-interface local-proxy-arp

local-routes-domain-id

Syntax **local-routes-domain-id** [*global-field*:*local-field*]
no local-routes-domain-id

Context [Tree] (config>service>vprn local-routes-domain-id)

Full Context configure service vprn local-routes-domain-id

Description This command specifies the domain ID that is used in the D-PATH attribute for local routes before those routes are exported to a BGP neighbor using BGP-IPVPN, EVPN-IFF, EVPN-IFL or PE-CE BGP. A local route is a non-BGP route installed in the VPRN route table and learned using static route or an IGP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The domain IDs are used in the D-PATH attribute, in accordance with *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN).

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The **no** form of this command removes the domain ID for local routes.

Default no local-routes-domain-id

Parameters *global-field:local-field* — Specifies the domain ID for local routes.

Values
4byte-GlobalAdminValue:2byte-LocalAdminValue

4byte-GlobalAdminValue:	0 to 4294967295
2byte-LocalAdminValue	0 to 65535

16.203 local-sr-protection

local-sr-protection

Syntax **local-sr-protection** *local-sr-protection*
no local-sr-protection

Context **[Tree]** (config>router>mpls>lsp local-sr-protection)
[Tree] (config>router>mpls>lsp-template local-sr-protection)

Full Context configure router mpls lsp local-sr-protection
configure router mpls lsp-template local-sr-protection

Description This command configures the SR LFA protection needed for the adjacencies used in the path computation of an SR-TE LSP by the local CSPF.

The default value of the command is **preferred**. The local CSPF will prefer a protected adjacency over an unprotected adjacency whenever both exist for a TE link. However, the entire computed path can combine both types of adjacencies.

When the user enables the **mandatory** value, CSPF uses it as an additional path constraint and selects protected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have an unprotected SID for each of their TE links.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Similarly, if the user enables the value **none**, CSPF uses it as an additional path constraint and selects unprotected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have a protected SID for each of their TE links.

The **no** form of this command returns the command to its default value.

Default no local-sr-protection

Parameters *local-sr-protection* — Specifies the local-sr-protection for LSPs.

Values none — Selects unprotected adjacencies only in the SR-TE LSP path computation.

preferred — Prefers protected adjacencies in the SR-TE LSP path computation.

mandatory — Selects protected adjacencies only in the SR-TE LSP path computation.

local-switching-service-state

Syntax **local-switching-service-state** {**pbb-tunnel** | **sap**}

Context **[Tree]** (config>service>epipe>pbb local-switching-service-state)

Full Context configure service epipe pbb local-switching-service-state

Description In a PBB Epipe with two SAPs and a PBB tunnel, this command controls whether the operational status of the PBB-Epipe service depends on the status of the PBB tunnel only.

Default local-switching-service-state sap

Parameters **pbb-tunnel** — Specifies that the operational state of the PBB-Epipe service is up if the PBB tunnel is operationally up, irrespective of the operational state of the two SAPs.

sap — Specifies that the operational state of the PBB-Epipe service is up, if two of the three endpoints (PBB tunnel and two SAPs) are up. This option implies that at least one of the SAPs must be up for the PBB-Epipe service to be operationally up.

Context **[Tree]** (config>subscr-mgmt local-user-db)

Full Context configure subscriber-mgmt local-user-db

Description Commands in this context configure a local user database.

The **no** form of this command reverts to the default.

Parameters *local-user-db-name* — Specifies the name of a local user database, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.207 local-v6-ip

local-v6-ip

Syntax **local-v6-ip** *ipv6-prefix/prefix-length*
local-v6-ip any
no local-v6-ip

Context **[Tree]** (config>router>ipsec>sec-plcy>entry local-v6-ip)
[Tree] (config>service>vprn>ipsec>sec-plcy>entry local-v6-ip)

Full Context configure router ipsec security-policy entry local-v6-ip
configure service vprn ipsec security-policy entry local-v6-ip

Description This command specifies the local v6 prefix for the security-policy entry.

Parameters *ipv6-prefix/prefix-length* — Specifies the local v6 prefix and length

Values

ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d	
	x [0 to FFFF]H	
	d [0 to 255]D	
	host bits must be 0	
	:: not allowed	
	prefix-length [1 to 128]	

any — keyword to specify that it can be any address.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn ipsec security-policy entry local-v6-ip

VSR

- configure router ipsec security-policy entry local-v6-ip

16.208 location

location

Syntax **location** *cflash-id*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no location

Context [Tree] (config>system>persistence>ancp location)
[Tree] (config>system>persistence>dhcp-server location)
[Tree] (config>system>persistence>nat-fwd location)
[Tree] (config>system>persistence>python location)
[Tree] (config>system>persistence>subscriber-mgmt location)

Full Context configure system persistence ancp location
configure system persistence dhcp-server location
configure system persistence nat-port-forwarding location
configure system persistence python-policy-cache location
configure system persistence subscriber-mgmt location

Description This command instructs the system where to write the persistency files for the corresponding application. Each application creates two files on the flash card, one with suffix .i<version>, referencing an index file, and the other with suffix .0<version>, where <version> is a 2-digit number reflecting the file version. These versions are not related to the SR OS release running on the node. The <version> can remain the same over two major releases, for example, when no format change is made to the persistency file. On boot, the system scans the file systems looking for the corresponding persistency files, and the load begins.

For example, in the subscriber management context, the location specifies the flash device on a CPM card where the data for handling subscriber management persistency is stored.

The **no** form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

Default no location

Parameters *cflash-id* — Specifies the compact flash device name.

Values cf1:, cf2:, cf3:

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure system persistence dhcp-server location
- configure system persistence subscriber-mgmt location

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure system persistence nat-port-forwarding location

All

- configure system persistence ancp location
- configure system persistence python-policy-cache location

Use subject to Terms available at: www.nokia.com

location

Syntax **location** {**cf1** | **cf2**}

Context **[Tree]** (config>call-trace location)

Full Context configure call-trace location

Description This command specifies the compact flash (CF) configuration to store call trace files.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

location

Syntax **location** *cflash-id*
no location

Context **[Tree]** (config>system>persistence>application-assurance location)

Full Context configure system persistence application-assurance location

Description This command instructs the system where to write the file. The name of the file is: appassure.db. On boot the system scans the file systems looking for appassure.db, if it finds it, it starts to load it.

The **no** form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

Default no location

Parameters *cflash-id* — Specifies the compact flash type.

Values cf1:, cf2:, cf3:

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

location

Syntax **location** *remote-url*
no location

Context **[Tree]** (config>service>nat>deterministic-script location)

Full Context configure service nat deterministic-script location

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the remote location where the Python script will be exported. The Python script is then used off-line to perform reverse query. If this command is configured, the Python script generation is triggered by any modification of the deterministic NAT configuration. The new script reflects the change in mappings caused by configuration change. However, the script must be manually exported to the outside location with the **admin nat save-deterministic-nat** command. The script cannot be stored locally on the system.

The script allows two forms of queries:

- Forward – input is NAT inside parameters, output is NAT outside parameters.
- Backward – input is NAT outside parameters, output is NAT inside parameters.

Forward Query:

```
user@external-server:/home/ftp/pub/det-nat-script$ ./
det-nat.py -f -s 10 -a 10.0.5.10
```

output:

```
subscriber has public ip address 198.51.100.1 from service 0 and is using ports [132
4 - 1353]
```

Reverse Query:

```
user@external-server:/home/ftp/pub/det-nat-script$./
det-nat.py -b -s 0 -a 198.51.100.1 -p 3020
```

output:

```
subscriber has private ip address 10.0.5.66 from service 10
```

Default no location

Parameters *remote-url* — A remote location where the script is stored: [{ftp:// | tftp:// }<login>:<pswd>@ <remote-locn>/][<file-path>] Maximum length is 180 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

location

Syntax **location** *location*
no location

Context **[Tree]** (config>system location)

Full Context configure system location

Description This command creates a text string that identifies the system location for the device.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Only one location can be configured. If multiple locations are configured, the last one entered overwrites the previous entry.

The **no** form of the command reverts to the default value.

Parameters *location* — Specifies the location as a character string. The string may be up to 80 characters. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

Platforms All

location

Syntax **location** *file-url*
no location

Context **[Tree]** (config>system>script-control>script location)

Full Context configure system script-control script location

Description This command is used to identify the location of a script to be scheduled.

The **no** form of the command removes the location.

Default no location

Parameters *file-url* — Specifies the location to search for scripts.

Values *local-url* | *remote-url*

local-url — [*cflash-id/*] [*file-path*] 200 chars max, including *cflash-id*directory length 99 characters max each

remote url — [{ftp:// | tftp://}*login*:*password*@*remote-location*/][*file-path*] 255 characters max directory length 99 characters max each

remote-location — [*hostname* | *ipv4-address* | *ipv6-address*]

ipv4-address — *a.b.c.d*

ipv6-address — x:x:x:x:x:x:x:x[-*interface*]
x:x:x:x:x:x:d.d.d.d[-*interface*] x — [0 to FFFF]H d — [0 to 255]D
interface — 32 characters max, for link local addresses

cflash-id — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

no location

Context [Tree] (config>log>file>file-id location)

Full Context configure log file file-id location

Description This command specifies the primary and optional backup location where the log or billing file will be created.

The **location** command is optional. If the location command not explicitly configured, log files will be created on cf1: and accounting files will be created on cf2: without overflow onto other devices. Generally, cf3: is reserved for system files (configurations, images, and so on).

When multiple location commands are entered in a single file ID context, the last command overwrites the previous command.

When the location of a file ID that is associated with an active log ID is changed, the log events are not immediately written to the new location. The new location does not take effect until the log is rolled over either because the rollover period has expired or a **clear log log-id** command is entered to manually rollover the log file.

When creating files, the primary location is used as long as there is available space. If no space is available, an attempt is made to delete unnecessary files that are past their retention date.

If sufficient space is not available an attempt is made to remove the oldest to newest closed log or accounting files. After each file is deleted, the system attempts to create the new file.

A medium severity trap is issued to indicate that a compact flash is either not available or that no space is available on the specified flash and that the backup location is being used.

A high priority alarm condition is raised if none of the configured compact flash devices for this file ID are present or if there is insufficient space available. If space does becomes available, then the alarm condition will be cleared.

Log files are created on cf1: and accounting files are created on cf2.

Use the **no** form of this command to revert to default settings.

Default no location

Parameters *cflash-id* — Specify the primary location.

Values cflash-id:cf1:, cf2:, cf3:

backup-cflash-id — Specify the secondary location.

Values cflash-id: cf1:, cf2:, cf3:

location

Syntax **location** *location-id* [**primary-ip-address** *ipv4-address*] [**secondary-ip-address**

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-address] [**tertiary-ip-address** *ipv4-address*]

Context **[Tree]** (config>router>bgp>optimal-route-reflection location)

Full Context configure router bgp optimal-route-reflection location

Description This command configures the location ID for the for the route reflector. A BGP neighbor can be associated with a location if it is a route-reflector client.

Parameters *location-id* — Specifies an optimal-route-reflection location.

Values 1 to 255

ipv4-address — Specifies the primary, secondary, or tertiary IP address.

Values primary ipv4-address, secondary ipv4-address, tertiary ipv4-address

Platforms All

16.209 locator

locator

Syntax [**no**] **locator** *locator-name*

Context **[Tree]** (config>router>segment-routing>srv6 locator)

Full Context configure router segment-routing segment-routing-v6 locator

Description This command configures the name of an SRv6 locator to be used by the routing protocols and services. This also creates the context to configure the locator block, locator node, function and argument lengths.

A limit of 16 locators per system is enforced.

The **no** form of this command removes the specified locator name.

Parameters *locator-name* — Specifies a locator name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Syntax [**no**] **locator** *locator-name*

Context **[Tree]** (config>router>segment-routing>srv6>inst locator)

Full Context configure router segment-routing segment-routing-v6 base-routing-instance locator

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command refers to a locator name defined under the **config**>**router**>**segment-routing**>**srv6** context. This command assigns a locator to BGP for use with base router routes.

The **no** form of this command removes the reference to a locator name locator.

Parameters *locator-name* — Specifies a locator name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Syntax [**no**] **locator** *locator-name*

Context **[Tree]** (config>router>isis>srv6 locator)

Full Context configure router isis segment-routing-v6 locator

Description This command refers to a locator name defined under the **config**>**router**>**segment-routing**>**srv6** context.

This command assigns a locator to each algorithm in an IS-IS instance. The same locator of a specific algorithm number can be shared with other IGP instances and BGP instances in IP-VPN or EVPN.

The locator block, locator node, function and argument lengths are defined under the **config**>**router**>**segment-routing**>**srv6** context.

The **no** form of this command removes the reference to a locator name.

Parameters *locator-name* — Specifies a locator name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Syntax [**no**] **locator** *locator-name*

Context **[Tree]** (config>service>vprn>srv6 locator)
[Tree] (config>service>epipe>srv6 locator)

Full Context configure service epipe segment-routing-v6 locator
configure service vprn segment-routing-v6 locator

Description This command refers to a locator name defined under the **config**>**router**>**segment-routing**>**srv6** context.

This command assigns a locator to the SRv6 instance in the service. The same locator can be referenced in multiple BGP instances used by IPVPN or EVPN.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The locator block, locator node, function and argument lengths are defined under the **config**>**router**>**segment-routing**>**srv6** context.

The **no** form of this command removes the reference to a locator name.

Parameters *locator-name* — Specifies a locator name, up to 64 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

16.210 lock

lock

Syntax [**no**] **lock**

Context **[Tree]** (configure>system>security>profile>netconf>base-op-authorization lock)

Full Context configure system security profile netconf base-op-authorization lock

Description This command authorizes a user associated with the profile to send a NETCONF <lock> operation. This lock operation allows a NETCONF client to lock a configuration datastore.

The **no** form of the command denies the user from requesting a lock.

Default no lock

Platforms All

16.211 lock-override

lock-override

Syntax [**no**] **lock-override**

Context **[Tree]** (config>system>script-control>script-policy lock-override)

Full Context configure system script-control script-policy lock-override

Description This command allows a triggered EHS/CRON script to execute while there is a datastore lock, started by an MD interface, in place.

A triggered EHS/CRON script queues until an **ongoing commit** (or **confirmed-commit**) is done. When an EHS/CRON script is triggered while the **lock-override** CLI knob is on, SR OS behaves as follows.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When an exclusive session is in place:

- Keep if it is an MD-CLI session. Disconnect if it is a NETCONF session
- Lose the exclusive lock
- Lose any uncommitted configuration changes

When a global session is in place:

- Keep the MD-CLI or NETCONF session
- Keep the uncommitted configuration changes
- An update may be required after committing the EHS/CRON script configuration changes

The **no** form of this command does not allow the script to execute while there is a datastore lock in place.

Default lock-override

Platforms All

16.212 lockout

lockout

Syntax **lockout failed-attempts** *count* **duration** *duration-minutes* **block** *block-minutes* [**max-port-per-ip** *number-of-ports*]
no lockout

Context **[Tree]** (config>ipsec>ike-policy lockout)

Full Context configure ipsec ike-policy lockout

Description This command enables the lockout mechanism for the IPsec tunnel. The system will lock out an IPsec client for the configured time interval if the number of failed authentications exceeds the configured value within the specified duration. This command only applies when the system acts as a tunnel responder.

A client is defined as the tunnel IP address plus the port.

Optionally, the **max-port-per-ip** parameter can be configured as the maximum number of ports allowed behind the same IP address. If this threshold is exceeded, then all ports behind the IP address are blocked.

The **no** form of this command disables the lockout mechanism.

Default no lockout

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *count* — Specifies the maximum number of failed authentications allowed during the *duration-minutes* interval.

Values 1 to 64

Default 3

duration-minutes — Specifies the interval of time, in minutes, during which the configured failed authentication count must be exceeded in order to trigger a lockout.

Values 1 to 60

Default 5

block-minutes — Specifies the number of minutes that the client is blocked if the configured failed authentication count is exceeded.

Values 1 to 1440, infinite

Default 10

number-of-ports — Specifies the maximum number of ports allowed behind the same IP address.

Values 1 to 32000

Default 16

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lockout

Syntax **clear lockout** {**user** *user-name* | **all**}

Context **[Tree]** (admin>clear lockout)

Full Context admin clear lockout

Description This command is used to clear any lockouts for a specific user, or for all users.

Parameters *user-name* — Clears the locked username.

all — Clears all locked usernames.

Platforms All

16.213 lockout-reset-time

lockout-reset-time

Syntax **lockout-reset-time** *seconds*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

no lockout-reset-time

Context [Tree] (config>subscr-mgmt>host-lockout-plcy lockout-reset-time)

Full Context configure subscriber-mgmt host-lockout-policy lockout-reset-time

Description This command configures the time that needs to elapse from the point a client enters lockout to when the client's lockout time can be reset to the configured minimum value. The range is 1 second.

The **no** form of this command reverts to the default value.

Default lockout-reset-time 60

Parameters *seconds* — Specifies the lockout reset time, in seconds.

Values 1 to 86400

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.214 lockout-time

lockout-time

Syntax **lockout-time** [**min** *seconds*] [**max** *seconds*]
no lockout-time

Context [Tree] (config>subscr-mgmt>host-lockout-plcy lockout-time)

Full Context configure subscriber-mgmt host-lockout-policy lockout-time

Description This command configures the time for which a client stays in the lockout state during which authentication and ESM host creation is suppressed.

The **no** form of this command reverts to the default value.

Default lockout-time min 10 max 3600

Parameters **min** *seconds* — Specifies the minimum lockout-time for this host lockout policy.

Values 1 to 86400

Default 10 seconds

max *seconds* — Specifies the maximum lockout-time for this host lockout policy.

Values 1 to 86400

Default 3600 seconds

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.215 log

log

Syntax **log**

Context **[Tree]** (config log)

Full Context configure log

Description Commands in this context are used to configure both event logs and accounting logs. Event logs control the generation, dissemination and recording of system events for monitoring status and troubleshooting faults within the system. Event logging configuration includes syslog, snmp notifications (traps), NETCONF notifications and other types of event log outputs.Accounting logs collect comprehensive accounting statistics and write them to XML files on the compact flash in order to support a variety of billing models.

Platforms All

log

Syntax [**no**] **log**

Context **[Tree]** (config>service>vprn>static-route-entry>indirect>cpe-check log)
[Tree] (config>service>vprn>static-route-entry>next-hop>cpe-check log)

Full Context configure service vprn static-route-entry indirect cpe-check log
configure service vprn static-route-entry next-hop cpe-check log

Description This optional parameter enables the ability to log transitions between active and in-active based on the CPE connectivity check. Events will be sent to the system log, syslog and SNMP traps.

Default no log

Platforms All

log

Syntax **log**

Context **[Tree]** (config>service>vprn log)
[Tree] (config>service>vprn>log-id log)

Full Context configure service vprn log
configure service vprn log-id log

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description Commands in this context configure event logging within a specific VPRN.

By default, the log events in a VPRN log are a subset of the complete set of possible log events in SR OS. See the **config**>**log**>**services-all-events** command for more details.

Platforms All

log

Syntax **log**

Context **[Tree]** (config>li log)

Full Context configure li log

Description Commands in this context configure an event log for LI.

Platforms All

log

Syntax **log** *log-id*
no log

Context **[Tree]** (config>filter>ip-filter>entry log)
[Tree] (config>filter>ipv6-filter>entry log)
[Tree] (config>filter>mac-filter>entry log)

Full Context configure filter ip-filter entry log
configure filter ipv6-filter entry log
configure filter mac-filter entry log

Description This command associates a filter log to the current filter policy entry and therefore enables logging for that filter entry.

The filter log must exist before a filter entry can be enabled to use the filter log.

The **no** form of the command disables logging for the filter entry.

Default no log

Parameters *log-id* — Specifies the filter log ID expressed as a decimal integer.

Values 101 to 199

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

log

Syntax **log** *log-id* [**create**]
no log *log-id*

Context **[Tree]** (config>filter log)

Full Context configure filter log

Description This command, creates a configuration context for the specified filter log if it does not exist, and enables the context to configure the specified filter log.

The **no** form of the command deletes the filter log. The log cannot be deleted if there are filter entries configured to write to the log. All filter entry logging associations need to be removed before the log can be deleted.

Default log 101

Special Cases **Filter log 101 —** Filter log 101 is the default log and is automatically created by the system. Filter log 101 is always a memory filter log and cannot be changed to a Syslog filter log. The log size defaults to 1000 entries, the filter log description is set to "Default filter log". The number of entries and **wrap-around** behavior can be modified.

Parameters *log-id* — Specifies the filter log ID expressed as a decimal integer.

Values 101 to 199

create — This keyword is required to create the configuration context. After it is created, the context can be enabled with or without the **create** keyword.

Platforms All

log

Syntax [**no**] **log**

Context **[Tree]** (config>router>static-route-entry>indirect>cpe-check log)
[Tree] (config>router>static-route-entry>next-hop>cpe-check log)

Full Context configure router static-route-entry indirect cpe-check log
configure router static-route-entry next-hop cpe-check log

Description This optional parameter enables the ability to log transitions between active and in-active based on the CPE connectivity check. Events will be sent to the system log, syslog and SNMP traps.

Default no log

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry log)
[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry log)

Full Context configure system security management-access-filter ip-filter entry log
configure system security management-access-filter ipv6-filter entry log
configure system security management-access-filter mac-filter entry log

Description This command enables match logging. When enabled, matches on this entry will cause the Security event mafEntryMatch to be raised.

Default no log

Platforms All

log

Syntax **log** *log-id*

Context **[Tree]** (config>sys>security>cpm-filter>ip-filter>entry log)
[Tree] (config>sys>security>cpm-filter>ipv6-filter>entry log)
[Tree] (config>sys>security>cpm-filter>mac-filter>entry log)

Full Context configure system security cpm-filter ip-filter entry log
configure system security cpm-filter ipv6-filter entry log
configure system security cpm-filter mac-filter entry log

Description This command specifies the log in which packets matching this entry should be entered. The value zero indicates that logging is disabled.

The **no** form of this command deletes the log ID.

Parameters *log-id* — Specifies the log ID where packets matching this entry should be entered.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.216 log-anno-interval

log-anno-interval

Syntax **log-anno-interval** *log-interval*
no log-anno-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>system>ptp log-anno-interval)

Full Context configure system ptp log-anno-interval

Description This command configures the announce message interval used for both unicast and multicast messages.

For unicast messages, it defines the announce message interval that is requested during unicast negotiation to any peer. This controls the announce message rate sent from remote peers to the local node. It does not affect the announce message rate that may be sent from the local node to remote peers. Remote peers may request an announce message rate anywhere within the acceptable grant range.

For multicast messages, used on PTP Ethernet ports, this configures the message interval used for Announce messages transmitted by the local node.

This value also defines the interval between executions of the BMCA within the node.

The announce-interval cannot be changed unless the PTP is shut down.

Note: In order to minimize BMCA driven reconfigurations, the IEEE recommends that the announce-interval should be consistent across the entire 1588 network.

Default log-anno-interval 1 (1 packet every 2 seconds) for ieee1588-2008

log-anno-interval 1 (1 packet every 2 seconds) for g8265dot1-2010

log-anno-interval -3 (8 packets per second) for g8275dot1-2014

Parameters *log-interval* — Specifies the announce packet interval, in log form.

Values -3 to 4

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.217 log-delay-interval

log-delay-interval

Syntax **log-delay-interval** *log-interval*
no log-delay-interval

Context [Tree] (config>system>ptp>port log-delay-interval)

Full Context configure system ptp port log-delay-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the minimum interval used for multicast Delay_Req messages. This parameter is applied on a per-port basis. For ports in a slave state, it shall be the interval used, unless the parent port indicates a longer interval. For a port in master state, it shall be the interval advertised to external slave ports as the minimum acceptable interval for Delay_Req messages from those slave ports.

It is a requirement of the 1588 standard that a port in Slave state shall check the logMessageInterval field of received multicast Delay_Resp messages. If the value of the logMessageInterval field of those messages is greater than the value programmed locally for the generation of Delay_Req messages, then the Slave must change to use the greater value (i.e. longer interval) for the generation of Delay_Req messages. This requirement is supported in the router.

The parameter is only applicable to ports and not to peers.

Default log-delay-interval -6 for ieee1588-2008

log-delay-interval -6 for g8265dot1-2010

log-delay-interval -4 for g8275dot1-2014

Parameters *log-interval* — Specifies the Delay_Req message interval, in log form.

Values -6 to 0

Default -6

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.218 log-events

log-events

Syntax **log-events** [**verbose**]
no log-events

Context **[Tree]** (config>sys>security>dist-cpu-protection>policy>local-monitoring-policer log-events)

Full Context configure system security dist-cpu-protection policy local-monitoring-policer log-events

Description This command controls the creation of log events related to **local-monitoring-policer** status and activity.

Default log-events

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **verbose** — Sends the same events as just “log-events” plus DcpLocMonExcd, DcpLocMonExcdAllDynAlloc, and DcpLocMonExcdAllDynFreed. The optional “verbose” includes some events that are more likely used during debug/tuning/ investigations

Platforms All

log-events

Syntax [**no**] **log-events** [**verbose**]
no log-events

Context **[Tree]** (config>sys>security>dist-cpu-protection>policy>protocol>dyn-para log-events)

Full Context configure system security dist-cpu-protection policy protocol dynamic-parameters log-events

Description This command controls the creation of log events related to dynamic enforcement policer status and activity.

Default log-events

Parameters **verbose** — This parameter sends the same events as just “log-events” plus Hold Down Start, Hold Down End, DcpDynamicEnforceAlloc and DcpDynamicEnforceFreed events. This includes the allocation/de-allocation events (typically used for debug/ tuning only – could be very noisy even when there is nothing much of concern).

Platforms All

log-events

Syntax **log-events** [**verbose**]
no log-events

Context **[Tree]** (config>sys>security>dist-cpu-protection>policy>static-policer log-events)

Full Context configure system security dist-cpu-protection policy static-policer log-events

Description This command controls the creation of log events related to static-policer status and activity.

Default log-events

Parameters **verbose** — Sends the same events as just “log-events” plus Hold Down Start and Down End events. The optional “verbose” includes some events that are more likely used during debug/tuning/investigations.

Platforms All

Use subject to Terms available at: www.nokia.com

16.219 log-filter

log-filter

Syntax **log-filter** *filter-id*
no log-filter

Context **[Tree]** (config>log>event-trigger>event>trigger-entry log-filter)

Full Context configure log event-trigger event trigger-entry log-filter

Description This command configures the log filter to be used for this trigger entry. The log filter defines the matching criteria that must be met in order for the log event to trigger the handler execution. The log filter is applied to the log event and, if the filtering decision results in a forward action, then the handler is triggered.

It is typically unnecessary to configure match criteria for the application or number in the log filter used for EHS since the particular filter is only applied for a specific log event application and number, as configured under the **config**>**log**>**event-trigger** context.

The **no** form of this command removes the log filter configuration.

Parameters *filter-id* — Specifies the identifier of the filter.

Values 1 to 1500

Platforms All

16.220 log-id

log-id

Syntax **log-id** *log-id* [**name** *log-name*]
no log-id *log-id*

Context **[Tree]** (config>service>vprn>log log-id)

Full Context configure service vprn log log-id

Description This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information to respective destinations.

A maximum of 30 logs can be configured.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Before an event can be associated with this log-id, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, Syslog, or file.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

By default, the log events in a VPRN log are a subset of the complete set of possible log events in SR OS. See the **config**>**log**>**services-all-events** command for more details.

The **no** form of this command deletes the log destination ID from the configuration.

Default No log destinations are defined.

Parameters *log-id* — Specifies the log ID number, expressed as a decimal integer.

Values 1 to 100

name *log-name* — Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

Platforms All

log-id

Syntax **log-id** *log-id* [**name** *li-log-name*]
no log-id *log-id*

Context **[Tree]** (config>li>log log-id)

Full Context configure li log log-id

Description This command configures an LI event log destination. The *log-id* is used to direct events, alarms or traps, and debug information for specific destinations.

Parameters *log-id* — Specifies the log ID, expressed as a decimal number.

Values 1 to 100

name *li-log-name* — Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

Platforms All

Use subject to Terms available at: www.nokia.com

log-id

Syntax **log-id** *log-id* [**name** *log-name*]
no log-id *log-id*

Context **[Tree]** (config>log log-id)

Full Context configure log log-id

Description This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information for specific destinations.

A maximum of 30 logs can be configured.

Before an event can be associated with this log ID, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, syslog, or file.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

Log-IDs 99 and 100 are created by the agent. Log-ID 99 captures all log messages. Log-ID 100 captures log messages with a severity level of major and above.

Note: Log-ID 99 provides valuable information for the admin-tech file. Removing or changing the log configuration may hinder debugging capabilities. It is strongly recommended not to alter the configuration for Log-ID 99.

The **no** form of this command deletes the log destination ID from the configuration.

Parameters *log-id* — Specifies the log ID, expressed as a decimal integer.

Values 1 to 101

name *log-name* — Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

16.221 log-prefix

log-prefix

Syntax **log-prefix** *log-prefix-string*
no log-prefix

Context **[Tree]** (config>service>vprn>log>syslog log-prefix)

Full Context configure service vprn log syslog log-prefix

Description This command adds the string prepended to every syslog message sent to the syslog host.

RFC3164, *The BSD syslog Protocol,* allows an alphanumeric string (tag) to be prepended to the content of every log message sent to the syslog host. This alphanumeric string can, for example, be used to identify the node that generates the log entry. The software appends a colon (:) and a space to the string and it is inserted in the syslog message after the date stamp and before the syslog message content.

Only one string can be entered. If multiple strings are entered, the last string overwrites the previous string. The alphanumeric string can contain lowercase (a-z), uppercase (A-Z) and numeric (0-9) characters.

The **no** form of this command removes the log prefix string.

Default log-prefix "TMNX".

Parameters *log-prefix-string* — Specifies the alphanumeric string of up to 32 characters. Spaces and colons (:) cannot be used in the string.

Platforms All

log-prefix

Syntax **log-prefix** *prefix-text*

Context **[Tree]** (config>service>nat>syslog>syslog-export-policy log-prefix)

Full Context configure service nat syslog syslog-export-policy log-prefix

Description This command configures the syslog log prefix. For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*. The **config>log>syslog>level** hierarchy also applies to this context.

Default log-prefix “TMNX”

Parameters *prefix-text* — Specifies an alphanumeric string, up to 32 characters. Spaces and colons (:) cannot be used in the string.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

log-prefix

Syntax **log-prefix** *log-prefix-string*
no log-prefix

Context **[Tree]** (config>log>syslog log-prefix)

Full Context configure log syslog log-prefix

Description This command adds the string prepended to every syslog message sent to the syslog host.

RFC 3164, allows an alphanumeric string (tag) to be prepended to the content of every log message sent to the syslog host. This alphanumeric string can, for example, be used to identify the node that generates the log entry. The software appends a colon (:) and a space to the string and it is inserted in the syslog message after the date stamp and before the syslog message content.

Only one string can be entered. If multiple strings are entered, the last string overwrites the previous string. The alphanumeric string can contain lowercase (a-z), uppercase (A-Z) and numeric (0 to 9) characters.

The **no** form of this command removes the log prefix string.

Default no log-prefix

Parameters *log-prefix-string* — Specifies an alphanumeric string up to 32 characters in length. Spaces and colons (:) cannot be used in the string.

16.222 log-sync-interval

log-sync-interval

Syntax **log-sync-interval** *log-interval*
no log-sync-interval

Context **[Tree]** (config>service>vprn>ptp>peer log-sync-interval)

Full Context configure service vprn ptp peer log-sync-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay_Resp messages that are requested during unicast negotiation to the specific peer. This controls the Sync and Delay_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

This command only applies to the 7450 ESS and 7750 SR.

Default -6 (64 packets per second) for 1588-2008 or

-6 (64 packets per second) for g8265dot1-2010 or

-4 (16 packets per second) for g8275dot1-2014

Parameters *log-interval* — Specifies the sync message interval, in log form.

Values -6 to 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

log-sync-interval

Syntax **log-sync-interval** *log-interval*
no log-sync-interval

Context **[Tree]** (config>system>ptp>peer log-sync-interval)

Full Context configure system ptp peer log-sync-interval

Description This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay_Resp messages that are requested during unicast negotiation to the specific peer. This controls the Sync and Delay_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

Default log-sync-interval -6 (64 packets per second) for 1588-2008

log-sync-interval -6 (64 packets per second) for g8265dot1-2010

log-sync-interval -4 (16 packets per second) for g8275dot1-2014

Parameters *log-interval* — Specifies the sync message interval, in log form.

Values -6 to 0

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

log-sync-interval

Syntax **log-sync-interval** *log-interval*
no log-sync-interval

Context **[Tree]** (config>system>ptp>port log-sync-interval)

Full Context configure system ptp port log-sync-interval

Description This command configures the message interval used for transmission of multicast Sync messages.

For multicast messages used on PTP Ethernet ports, this configures the message interval used for Sync messages transmitted by the local node when the port is in Master state.

Default log-sync-interval -6 (64 packets per second) for ieee1588-2008 or

log-sync-interval -6 (64 packets per second) for g8265dot1-2010 or

log-sync-interval -4 (16 packets per second) for g8275dot1-2014

Parameters *log-interval* — Specifies the message interval, in log form.

Values -6 to 0 (This corresponds to a maximum rate of 64 packets per second, and a minimum rate of 1 packet per second.)

Default -6

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.223 logger-event-bundling

logger-event-bundling

Syntax [**no**] **logger-event-bundling**

Context **[Tree]** (config>router>mpls logger-event-bundling)

Full Context configure router mpls logger-event-bundling

Description This feature merges two of the most commonly generated MPLS traps, vRtrMplsXCCreate and vRtrMplsXCDelete, which can be generated at both LER and LSR into a new specific trap vRtrMplsSessionsModified. In addition, this feature perform bundling of traps of multiple RSVP sessions, that is LSPs, into this new specific trap.

The intent is to provide a tool for the user to minimize trap generation in an MPLS network. Note that the MPLS trap throttling will not be applied to this new trap.

The **no** version of this command disables the merging and bundling of the above MPLS traps.

16.224 logical-access-id

logical-access-id

Syntax [**no**] **logical-access-id**

Context **[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>include-avp logical-access-id)

Full Context configure subscriber-mgmt diameter-application-policy gx include-avp logical-access-id

Description This command includes the logical-access-id.

The **no** form of this command reverts to the default.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

16.225 logical-port-status

logical-port-status

Syntax **logical-port-status** {**rsvp-te** | **mpls-tp** | **sr-te**}
no logical-port-status [{**rsvp-te** | **mpls-tp** | **sr-te**}]

Context **[Tree]** (config>open-flow>of-switch logical-port-status)

Full Context configure open-flow of-switch logical-port-status

Description This command enables status change reporting to the OpenFlow controller for the specified logical port type. To report on multiple logical port types, the command needs to be executed multiple times with different logical port specified as required.

The **no** form of this command disables status reporting for specified or all (no argument) logical ports.

Default no logical-port-status

Parameters **rsvp-te** — Enables reporting on RSVP-TE LSP logical ports.

mpls-te — Enables reporting on MPLS-TE logical ports.

sr-te — Enables reporting on SR-TE logical ports.

Platforms All

16.226 login-banner

login-banner

Syntax [**no**] **login-banner**

Context **[Tree]** (config>system>login-control login-banner)

Full Context configure system login-control login-banner

Description This command enables or disables the display of a login banner. The login banner contains the SR OS copyright and build date information for a console login attempt.

The **no** form of this command causes only the configured pre-login-message and a generic login prompt to display.

Platforms All

16.227 login-control

login-control

Syntax **login-control**

Context **[Tree]** (config>system login-control)

Full Context configure system login-control

Description This command creates the context to configure the session control for console, Telnet, SSH, and FTP sessions.

Platforms All

16.228 login-exec

login-exec

Syntax **login-exec** *url-prefix*: *source-url*
no login-exec

Context **[Tree]** (config>system>security>user>console login-exec)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

[Tree] (config>system>security>user-template>console login-exec)

Full Context configure system security user console login-exec
configure system security user-template console login-exec

Description This command configures a user's login exec file which executes whenever the user successfully logs in to a console session.

Only one exec file can be configured. If multiple **login-exec** commands are entered for the same user, each subsequent entry overwrites the previous entry.

The **no** form of this command disables the login exec file for the user.

Default no login-exec

Parameters *url-prefix: source-url* — Specifies either a local or remote URL, up to 200 characters, that identifies the exec file that is executed after the user successfully logs in.

Platforms All

16.229 login-scripts

login-scripts

Syntax **login-scripts**

Context **[Tree]** (config>system>login-control login-scripts)

Full Context configure system login-control login-scripts

Description Commands in this context configure CLI scripts that execute when a user (authenticated via any method including local user database, TACACS+, or RADIUS) first logs into a CLI session.

Platforms All

16.230 logout

logout

Syntax **logout**

Context **[Tree]** (global logout)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context global logout

Description This command logs out of the router session.

When the **logout** command is issued from the console, the login prompt is displayed, and any log IDs directed to the console are discarded. When the console session resumes (regardless of the user), the log output to the console resumes.

When a Telnet session is terminated from a **logout** command, all log IDs directed to the session are removed. When a user logs back in, the log IDs must be re-created.

16.231 long-duration-flow-count

long-duration-flow-count

Syntax [**no**] **long-duration-flow-count**

Context **[Tree]** (config>log>acct-policy>cr>aa>aa-sub-cntr long-duration-flow-count)

Full Context configure log accounting-policy custom-record aa-specific aa-sub-counters long-duration-flow-count

Description This command includes the long duration flow count. This command only applies to the 7750 SR.

The **no** form of this command excludes the long duration flow count in the AA subscriber's custom record.

Default no long-duration-flow-count

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.232 long-lived

long-lived

Syntax [**no**] **long-lived**

Context **[Tree]** (config>service>vprn>bgp>graceful-restart long-lived)
[Tree] (config>service>vprn>bgp>group>graceful-restart long-lived)
[Tree] (config>service>vprn>bgp>group>neighbor>graceful-restart long-lived)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

configure service vprn bgp group graceful-restart long-lived
configure service vprn bgp group neighbor graceful-restart long-lived

Description Commands in this context configure BGP Long-Lived Graceful-Restart (LLGR) procedures.

LLGR, known informally as BGP persistence, is an extension of BGP graceful restart that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort.

The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.

Default no long-lived

Platforms All

long-lived

Syntax [**no**] **long-lived**

Context **[Tree]** (config>router>bgp>graceful-restart long-lived)
[Tree] (config>router>bgp>group>graceful-restart long-lived)
[Tree] (config>router>bgp>group>neighbor>graceful-restart long-lived)

Full Context configure router bgp graceful-restart long-lived
configure router bgp group graceful-restart long-lived
configure router bgp group neighbor graceful-restart long-lived

Description Commands in this context enter commands related to BGP Long-Lived Graceful-Restart (LLGR) procedures.

LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort.

The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.

16.233 loop-detect

loop-detect

Syntax **loop-detect** {**drop-peer** | **discard-route** | **ignore-loop** | **off**}
no loop-detect

Context **[Tree]** (config>subscr-mgmt>bgp-prng-plcy loop-detect)

Full Context configure subscriber-mgmt bgp-peering-policy loop-detect

Description This command configures how the BGP peer session handles loop detection in the AS path.

Note: Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

Parameters **drop-peer** — Sends a notification to the remote peer and drops the session.

discard-route — Discards routes received with loops in the AS path.

ignore-loop — Ignores routes with loops in the AS path but maintains peering.

off — Disables loop detection.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

loop-detect

Syntax **loop-detect** {**drop-peer** | **discard-route** | **ignore-loop** | **off**}
no loop-detect

Context **[Tree]** (config>service>vprn>bgp loop-detect)
[Tree] (config>service>vprn>bgp>group loop-detect)
[Tree] (config>service>vprn>bgp>group>neighbor loop-detect)

Full Context configure service vprn bgp group loop-detect
configure service vprn bgp group neighbor loop-detect
configure service vprn bgp loop-detect

Description This command configures how the BGP peer session handles loop detection in the AS path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default loop-detect ignore-loop

Parameters **drop-peer** — Sends a notification to the remote peer and drops the session.

discard-route — Discards routes received with loops in the AS path.

ignore-loop — ignores routes with loops in the AS path but maintains peering.

off — Disables loop detection.

Platforms All

loop-detect

Syntax **loop-detect** {**drop-peer** | **discard-route** | **ignore-loop** | **off**}
no loop-detect

Context **[Tree]** (config>router>bgp loop-detect)
[Tree] (config>router>bgp>group loop-detect)
[Tree] (config>router>bgp>group>neighbor loop-detect)

Full Context configure router bgp group loop-detect
configure router bgp group neighbor loop-detect
configure router bgp loop-detect

Description This command configures how the BGP peer session handles loop detection in the AS path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

Note: Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default loop-detect ignore-loop

Parameters **drop-peer** — Sends a notification to the remote peer and drops the session.

discard-route — Discards routes received from a peer with the same AS number as the router itself. This option prevents routes looped back to the router from being added to the routing information base and consuming memory. When this option is changed, the change will not be active for an established peer until the connection is re-established for the peer.

ignore-loop — Ignores routes with loops in the AS path but maintains peering.

off — Disables loop detection.

Platforms All

16.234 loop-detect-threshold

loop-detect-threshold

Syntax **loop-detect-threshold** *loop-detect-threshold*
no loop-detect-threshold

Context **[Tree]** (config>service>vprn>bgp loop-detect-threshold)
[Tree] (config>service>vprn>bgp>group loop-detect-threshold)
[Tree] (config>service>vprn>bgp>group>neighbor loop-detect-threshold)

Full Context configure service vprn bgp group loop-detect-threshold
configure service vprn bgp group neighbor loop-detect-threshold
configure service vprn bgp loop-detect-threshold

Description This command provides additional control over the behavior enabled by the **loop-detect** command. If this command specifies a threshold value of *n,* then a route received by the local BGP speaker with an AS path that contains up to *n* occurrences of the local speaker's AS number is considered valid and not treated as an AS path loop. An AS loop is considered to occur only when the received AS path has more than *n* occurrences of the local speaker's AS number.

The **no** form of this command removes the configuration and sets the value to 0. One or more occurrence of the local speaker's AS number in the received AS path triggers the **loop-detect** behavior.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default no loop-detect-threshold

Parameters *loop-detect-threshold* — The maximum number of occurrences of the local speaker's AS number in the received AS path before the AS path is considered to be a loop.

Values 0 to 15

Default 0

Platforms All

loop-detect-threshold

Syntax **loop-detect-threshold** *loop-detect-threshold*
no loop-detect-threshold

Context **[Tree]** (config>router>bgp loop-detect-threshold)
[Tree] (config>router>bgp>group loop-detect-threshold)
[Tree] (config>router>bgp>group>neighbor loop-detect-threshold)

Full Context configure router bgp group loop-detect-threshold
configure router bgp group neighbor loop-detect-threshold
configure router bgp loop-detect-threshold

Description This command provides additional control over the behavior enabled by the **loop-detect** command. If this command specifies a threshold value of *n*, then a route received by the local BGP speaker with an AS path that contains up to *n* occurrences of the local speaker's AS number is considered valid and not treated as an AS path loop. An AS loop is considered to occur only when the received AS path has more than *n* occurrences of the local speaker's AS number.

The **no** form of this command removes the configuration and sets the value to 0. One or more occurrence of the local speaker's AS number in the received AS path triggers the **loop-detect** behavior.

Default no loop-detect-threshold

Parameters *loop-detect-threshold* — The maximum number of occurrences of the local speaker's AS number in the received AS path before the AS path is considered to be a loop.

Values 0 to 15

Default 0

16.235 loopback

loopback

Syntax [**no**] **loopback**

Context **[Tree]** (config>service>ies>if loopback)
[Tree] (config>service>vprn>if loopback)

Full Context configure service ies interface loopback
configure service vprn interface loopback

Description This command specifies that the associated interface is a loopback interface that has no associated physical interface. As a result, the associated IES/VPRN interface cannot be bound to a SAP.

Note: Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap** *sap-id* command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command reverts to the default.

Platforms All

loopback

Syntax [**no**] **loopback**

Context **[Tree]** (config>service>vprn>nw-if loopback)

Full Context configure service vprn network-interface loopback

Description This command specifies that the associated interface is a loopback interface that has no associated physical interface. As a result, the associated interface cannot be bound to a SAP.

When using mtrace/mstat in a Layer 3 VPN context then the configuration for the VPRN should have a loopback address configured which has the same address as the core instance's system address (BGP next-hop).

Default no loopback

Platforms All

loopback

Syntax **loopback** {**line** | **internal**}
no loopback

Context **[Tree]** (config>port>sonet-sdh loopback)

Full Context configure port sonet-sdh loopback

Description This command activates a loopback on the SONET/SDH port.

The SONET port must be in a shut down state to activate any type of loopback. The loopback setting is never saved to the generated/saved configuration file.

Note that loopback mode changes on a SONET/SDH port can affect traffic on the remaining ports.

This command is supported by TDM satellite.

Default no loopback

Parameters **line** — Set the port into line loopback state.

internal — Set the port into internal loopback state.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

loopback

Syntax **loopback** {**line** | **internal** | **fdl-ansi** | **fdl-bellcore** | **payload-ansi** | **inband-ansi** | **inband-bellcore**}
no loopback

Context **[Tree]** (config>port>tdm>ds1 loopback)

Full Context configure port tdm ds1 loopback

Description This command puts the specified port or channel into a loopback mode.

The corresponding port or channel must be in a shutdown state in order for the loopback mode to be enabled. The upper level port or channel or parallel channels should not be affected by the loopback mode.

Note that this command is not saved in the router configuration between boots.

The **no** form of this command disables the specified type of loopback.

Default no loopback

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **line** — Places the associated port or channel into a line loopback mode. A line loopback loops frames received on the corresponding port or channels back to the remote router.

internal — Places the associated port or channel into an internal loopback mode. An internal loopback loops the frames from the local router back at the framer.

fdl-ansi — Requests FDL line loopback according to ANSI T1.403.

fdl-bellcore — Requests FDL line loopback according to Bellcore TR-TSY-000312.

payload-ansi — Requests payload loopback using ANSI signaling.

inband-ansi — Requests inband line loopback according to ANSI T1.403.

inband-bellcore — Requests inband line loopback according to Bellcore signaling.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

loopback

Syntax **loopback** {**line** | **internal** | **remote**}
no loopback

Context **[Tree]** (config>port>tdm>ds3 loopback)

Full Context configure port tdm ds3 loopback

Description This command puts the specified port or channel into a loopback mode.

The corresponding port or channel must be in a shutdown state in order for the loopback mode to be enabled. The upper level port or channel or parallel channels should not be affected by the loopback mode.

Note that this command is not saved in the router configuration between boots.

The **no** form of this command disables the specified type of loopback.

Default no loopback

Parameters **line** — Places the associated port or channel into a line loopback mode. A line loopback loops frames received on the corresponding port or channels back to the remote router.

internal — Places the associated port or channel into an internal loopback mode. A internal loopback loops the frames from the local router back at the framer.

remote — Sends a signal to the remote device to provide a line loopback.

loopback

Syntax **loopback** {**line** | **internal**}
no loopback

Context **[Tree]** (config>port>tdm>e1 loopback)
[Tree] (config>port>tdm>e3 loopback)

Full Context configure port tdm e1 loopback
configure port tdm e3 loopback

Description This command puts the specified port or channel into a loopback mode.

The corresponding port or channel must be in a shutdown state in order for the loopback mode to be enabled. The upper level port or channel or parallel channels should not be affected by the loopback mode

Note that this command is not saved in the router configuration between boots.

The **no** form of this command disables the specified type of loopback.

Default no loopback

Parameters **line** — Places the associated port or channel into a line loopback mode. A line loopback loops frames received on the corresponding port or channels back to the remote router.

internal — Places the associated port or channel into an internal loopback mode. An internal loopback loops the frames from the local router back at the framer.

Platforms 7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

loopback

Syntax **loopback** {*mac-address* | **multicast** | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**send-count** *send-count*] [**size** *data-size*] [**priority** *priority*] [**lbm-padding** *padding-size*] [**timeout** *timeout-time*] [**interval** *interval-time*]

Context **[Tree]** (oam>eth-cfm loopback)

Full Context oam eth-cfm loopback

Description The command initiates a loopback test.

Parameters *mac-address* — Specifies a unicast MAC address or multicast MAC address. The last nibble of the multicast address must match the level of the local MEP, or the command fails and the test is not instantiated.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or multicast

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

multicast — Builds the class one destination multicast address based on the level of the local MEP. The last nibble of the multicast address must match the level of the local MEP or the command fails and the test is not instantiated.

remote-mepid *mep-id* — Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id* — Specifies the local MEP ID.

Values 1 to 8191

md-index — Specifies the MD index.

Values 1 to 4294967295

ma-index — Specifies the MA index.

Values 1 to 4294967295

send-count — Specifies the number of messages to send, expressed as a decimal integer. Loopback messages are sent back-to-back, with no delay between the transmissions.

Values 1 to 1024

Default 1

data-size — Specifies the size of the variable data pattern only of the data TLV. This value does not include the 1 Byte Type, 2 Byte Length. This means that the total size of the data TLV is the configured value plus the 3 addition bytes to accommodate the type and length fields. If 0 is specified, no data TLV is added to the packet. This parameter and **lbm-padding** are mutually exclusive.

Values 0 to 1500

Default 0

priority — Specifies a 3-bit value to be used in the VLAN tag, if present, in the transmitted frame.

Values 0 to 7

Default The CCM and LTM priority of the MEP

padding-size — Specifies the complete size of the data TLV, which includes the 1 Byte Type, 2 Byte Length, and the variable data pad. If 0 is specified, no data TLV is added to the packet. MSDU is not processed when **lbm-padding** is in use. This parameter and **size** are mutually exclusive.

Values 0, 3 to 9000

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

timeout-time — Specifies the time, in seconds, used to override the default *timeout-time* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

interval-time — Specifies the time, in deciseconds (100 ms), to configure the spacing between probes within the test run. A value of 0 means probes are sent with no enforced delay. This value is only applicable to tests where the **send-count** is 5 or less.

Values 0 to 600

Default 0 or 10 depending on the **send-count**

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

loopback

Syntax [**no**] **loopback**

Context **[Tree]** (config>router>if loopback)

Full Context configure router interface loopback

Description This command configures the interface as a loopback interface. The **vas-if-type** and **loopback** commands are mutually exclusive.

Default Not enabled

Platforms All

loopback

Syntax **loopback** *loopback-id* [**create**]
no loopback *loopback-id*

Context **[Tree]** (config>card>mda>xconnect>mac loopback)
[Tree] (config>card>xiom>mda>xcon>mac loopback)

Full Context configure card mda xconnect mac loopback
configure card xiom mda xconnect mac loopback

Description This command configures a MAC loopback on a MAC chip. The system and services can start using the loopback only when a port is associated with it (for example, port 1/1/m1/1, where m1 represents the MAC ID).

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command removes the loopback ID from the configuration.

Parameters *loopback-id* — Specifies the loopback ID for the MDA cross-connect.

Values 1, 2

create — Keyword used to create a new loopback. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure card mda xconnect mac loopback

7750 SR-s

- configure card xiom mda xconnect mac loopback

configure router isis level loopfree-alternate-exclude
configure service vprn isis interface loopfree-alternate-exclude
configure service vprn isis level loopfree-alternate-exclude

Description This command instructs IGP to not include a specific interface or all interfaces participating in a specific IS-IS level or OSPF area in the SPF LFA computation. This provides a way of reducing the LFA SPF calculation where it is not needed.

When an interface is excluded from the LFA SPF in IS-IS, it is excluded in both level 1 and level 2. When it is excluded from the LFA SPF in OSPF, it is excluded in all areas. However, the above OSPF command can only be executed under the area in which the specified interface is primary and once enabled, the interface is excluded in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command will fail.

The **no** form of this command re-instates the default value for this command.

[Tree] (config>router>ospf3 loopfree-alternate-exclude)

Full Context configure router ospf loopfree-alternate-exclude
configure router ospf3 loopfree-alternate-exclude

Description This command excludes from the LFA SPF calculation those prefixes that match a prefix entry or a tag entry in a prefix policy. If a prefix is excluded from LFA, it is not included in LFA calculations regardless of its priority. The prefix tag will, however, be used in the main SPF.

The implementation also allows the user to exclude a specific interface in IS-IS or OSPF, a or all interfaces in an OSPF area or IS-IS level from the LFA SPF.

Note: Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **loopfree-alternate-exclude** command, when not explicitly specified by the user in the prefix policy, is “reject”. Therefore, regardless of whether the user explicitly added the statement “default-action reject” to the prefix policy, a prefix that does not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default no loopfree-alternate-exclude

Description This command enables the advertisement of flexible-algorithm aware loop free alternates (LFAs).

The flexible algorithm LFA configuration (for example, LFA, remote-LFA or TI-LFA) inherits the LFA configuration for base SPF algorithm 0.

LFAs are administratively disabled for flexible algorithms in which IS-IS is participating. LFAs must be explicitly enabled using the **loopfree-alternates** command.

The **no** form of this command disables LFAs for the specific flexible algorithm in which the router is participating.

Default no loopfree-alternates

Platforms All

loopfree-alternates

Syntax [**no**] **loopfree-alternates**

Context **[Tree]** (config>router>isis loopfree-alternates)

Full Context configure router isis loopfree-alternates

Description This command enables Loop-Free Alternate (LFA) computation by SPF for the IS-IS routing protocol.

When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary nexthop and an LFA next-hop for every learned prefix. When found, the LFA next-hop is populated into the routing table along with the primary next-hop for the prefix.

The user enables the remote LFA next-hop calculation by the IGP LFA SPF by appending the remote-lfa option. When this option is enabled in an IGP instance, SPF performs the remote LFA additional computation following the regular LFA next-hop calculation when the latter resulted in no protection for one or more prefixes which are resolved to a given interface.

Remote LFA extends the protection coverage of LFA-FRR to any topology by automatically computing and establishing/tearing-down shortcut tunnels, also referred to as repair tunnels, to a remote LFA node which puts the packets back into the shortest without looping them back to the node which forwarded them over the repair tunnel. The remote LFA node is referred to as PQ node. A repair tunnel can in theory be an RSVP LSP, a LDP-in-LDP tunnel, or a SR tunnel. In this feature, it is restricted to use SR repair tunnel to the remote LFA node.

The remote LFA algorithm is a per-link LFA SPF calculation and not a per-prefix like the regular LFA one. So, it provides protection for all destination prefixes which share the protected link by using the neighbor on the other side of the protected link as a proxy for all these destinations.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The Topology-Independent LFA (TI-LFA) further improves the protection coverage of a network topology by computing and automatically instantiating a repair tunnel to a Q node which is not in shortest path from the computing node. The repair tunnel uses shortest path to the P node and a source routed path from the P node to the Q node.

In addition, the TI-LFA algorithm selects the backup path which matches the post-convergence path. This helps the capacity planning in the network since traffic will always flow on the same path when transitioning to the FRR next-hop and then onto the new primary next-hop.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in IS-IS, it provides TI-LFA node-protect or link-protect backup path in IS-IS MT=0 for an SR-ISIS IPV4/IPv6 tunnel (node SID and adjacency SID), for an IPv4 SR-TE LSP, and for LDP IPv4 FEC when the LDP **fast-reroute backup-sr-tunnel** option is enabled.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next-hop:

a. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next-hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
b. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
c. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in OSPF, it provides TI-LFA node-protect or link-protect backup path for a SR-OSPF IPV4 tunnel (node SID and adjacency SID), and for a IPv4 SR-TE LSP.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next hop:

a. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
b. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
c. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

The TI-LFA repair tunnel can have a maximum of three labels pushed in addition to the label of the destination node or prefix. The user can set a lower maximum value for the additional FRR labels by configuring the CLI option **max-sr-frr-labels** *labels*. The default value is 2.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

The **no** form of this command disables the LFA computation by the IGP SPF.

16.239 loss

loss

Syntax **loss**

Context **[Tree]** (config>oam-pm>session>ip>twamp-light loss)

Full Context configure oam-pm session ip twamp-light loss

Description Commands in this context configure loss parameters for the TWAMP-Light test.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.240 loss-event

loss-event

Syntax **loss-event rising-threshold** *threshold* [**falling-threshold** *threshold*] [*direction*]
no loss-event

Context **[Tree]** (config>saa>test loss-event)

Full Context configure saa test loss-event

Description Specifies that at the termination of an SAA test run, the calculated loss event value is evaluated against the configured rising and falling loss event thresholds. SAA threshold events are generated as required.

The configuration of loss event thresholds is optional.

The **no** form of this command disables the loss-event test run.

Parameters **rising-threshold** *threshold* — Specifies a rising threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event rising threshold. If the test run loss event value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483647

Default 0

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

falling-threshold *threshold* — Specifies a falling threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event falling threshold. If the test run loss event value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

Values 0 to 2147483647

Default 0

direction — Specifies the direction for OAM ping responses received for an OAM ping test run.

Values **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

outbound — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

roundtrip — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

Default roundtrip

loss-events

Syntax [**no**] **loss-events**

Context **[Tree]** (config>oam-pm>session>measurement-interval>event-mon loss-events)

Full Context configure oam-pm session measurement-interval event-mon loss-events

Description This enables the monitoring of all configured loss events. Adding this functionality starts the monitoring of the configured loss events at the start of the next measurement interval. If the function is removed using the **no** command, all monitoring of configured loss events, logging, and recording of new events for that session are suspended. Any existing events at the time of the shut down are maintained until the active measurement window in which the removal was performed has completed. The state of this monitoring function can be changed without having to shut down all the tests in the session.

The **no** form of this command disables the monitoring of all configured loss events.

16.243 low-burst-max-class

low-burst-max-class

Syntax **low-burst-max-class** *class*
no low-burst-max-class

Context **[Tree]** (config>port>ethernet>egress>hs-sec-shaper>agg low-burst-max-class)

Full Context configure port ethernet egress hs-secondary-shaper aggregate low-burst-max-class

Description This command specifies which scheduling classes map to the low burst-limit threshold of an egress HS secondary shaper. Egress SAPs can be configured to use an HS secondary shaper that manages their maximum burst limit over a specified aggregate shaping rate. Each HS secondary shaper supports two thresholds, a low burst limit threshold and a high burst limit threshold.

By default, all scheduling classes are mapped to the low burst limit threshold. It is important to note that when mapping scheduling classes to the high burst limit threshold an adequate value for the **card>fp>egress>hs-fixed-high-thresh-delta** must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. The **hs-fixed-high-thresh-delta** value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** context to the aggregate's low burst limit threshold value.

The low-burst-max-class value can be changed at any time for an HS secondary shaper.

The **no** form of this command restores the HS secondary shaper's aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the hs-secondary-shaper secondary-shaper-name to have all scheduling classes mapped to the low burst limit threshold.

Default low-burst-max-class 6

Parameters *class* — Specifies the low burst maximum class. This parameter is required when executing the **low-burst-max-class** command. The parameter reflects the highest scheduling class that will be associated with the low burst limit threshold associated with the HS secondary aggregate shaper. Scheduling classes higher than scheduling class ID will be associated with the high burst limit threshold.

Values 1 to 6

Platforms 7750 SR-7/12/12e

low-burst-max-class

Syntax **low-burst-max-class** *class*
no low-burst-max-class

Context **[Tree]** (config>qos>hs-attachment-policy low-burst-max-class)

Full Context configure qos hs-attachment-policy low-burst-max-class

Description This command specifies which scheduling classes map to the low burst-limit threshold of the queue-level aggregate shaper. Each egress SAP or subscriber SLA profile instance (SPI), per port set of network interface queues and egress queue group template instance has an aggregate shaper that manages the maximum burst limit over a specified shaping rate. Each aggregate shaper supports two thresholds. As the scheduling rate for the set of queues increases, eventually the aggregate rate exceeds the rate limit and the aggregate burst limit starts to be consumed. If this continues, the low burst limit threshold is exceeded and the queues mapped to the scheduling classes associated with low threshold are removed from the scheduler. If the remaining aggregate rate (from the higher scheduling classes) continues to exceed the shaping rate, then the burst limit continues to be consumed and eventually the high burst limit threshold is exceeded. This causes the queues for all scheduling classes to be removed from the scheduler.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The second (high) threshold exists to allow the higher priority classes to continue to forward, thereby mitigating the effects of low priority bursts beyond the aggregate shaping rate. Typically, the higher scheduling class queues are either individually rate-limited so their aggregate allowed throughput is less than the aggregate rate or the expected aggregate unshaped traffic from the individual higher scheduling classes does not exceed the aggregate shaping rate. Determining the value of **low-burst-max-class** class involves anticipating the proper dividing line between the low and high scheduling classes by evaluating the forwarding behavior and SLA enforcement of each class.

By default, all scheduling classes are mapped to the low burst limit threshold. When mapping scheduling classes to the high burst limit threshold, an adequate value for the **card>fp>egress>hs-fixed-high-thresh-delta** must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. Set the **hs-fixed-highthresh-delta** value to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** CLI context to the aggregate's low burst limit threshold value.

The **low-burst-max-class** value can be changed at any time in the HS attachment policy. Modifying the setting causes all queue aggregate shapers to reconfigure the scheduling class mappings to the low and high burst limit thresholds to reflect the new value for scheduling class ID.

Scheduling Classes — As described in the **queue** and **wrr-group** attachment commands, each queue is either directly or indirectly (through a WRR group) mapped to a scheduling class. Each scheduling class has an inherent priority at the port scheduler. The inherent descending priority is as follows:

- Scheduling Class 6 (Highest)
- Scheduling Class 5
- Scheduling Class 4
- Scheduling Class 3
- Scheduling Class 2
- Scheduling Class 1 (lowest)

Placing scheduling classes into the port level WRR group causes those classes to compete for scheduling opportunities based on their associated weights instead of inherent priority. If higher weights are given to higher scheduling class IDs, then the relative proportional scheduling priority may continue to exhibit the priority level indicated by the class ID.

Setting Low and High Burst Limit Threshold Association — Table 76 demonstrates the effect of the **low-burst-max-class** command parameters on scheduling class mappings to the low and high burst limit thresholds.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 76 **Low and High Burst Limit Threshold Association**

low-burst-max-class *sched-class*	**Scheduling Classes on Low Threshold**	**Scheduling Classes on High Threshold**
1	1	2, 3, 4, 5, and 6
2	1 and 2	3, 4, 5, and 6
3	1, 2, and 3	4, 5, and 6
4	1, 2, 3, and 4	5 and 6
5	1, 2, 3, 4, and 5	6
6	1, 2, 3, 4, 5, and 6	—

The **no** form of the command restores the queue aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the specified **hs-attachment-policy** *policy-name* to have all scheduling classes mapped to the low burst limit threshold.

Default low-burst-max-class 6

Parameters *class* — Specifies the low burst maximum class. This parameter is required when executing the **low-burst max-class** command. The parameter reflects the highest scheduling class that is associated with the low burst limit threshold associated with the queue aggregate shaper. Scheduling classes higher than the scheduling class ID are associated with the high burst limit threshold.

low-priority-defect

Syntax **low-priority-defect** {**allDef** | **macRemErrXcon**}

Context **[Tree]** (config>lag>eth-cfm>mep>ais low-priority-defect)

Full Context configure lag eth-cfm mep ais-enable low-priority-defect

Description This command specifies the lowest priority defect that is allowed to generate a fault alarm.

Default low-priority-defect remErrXcon

Parameters **allDef** | **macRemErrXcon** — Specifies the lowest priority defect.

Values

allDef	DefRDICCM, DefMACstatus, DefRemoteCCM, DefErrorCCM
macRemErrXcon	Only DefMACstatus, DefRemoteCCM, DefErrorCCM, and DefXconCCM
remErrXcon	Only DefRemoteCCM, DefErrorCCM, and DefXconCCM
errXcon	Only DefErrorCCM and DefXconCCM
xcon	Only DefXconCCM; or
noXcon	No defects DefXcon or lower are to be reported

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect

Syntax **low-priority-defect** {**allDef** | **macRemErrXcon** | **remErrXcon** | **errXcon** | **xcon** | **noXcon**}

Context **[Tree]** (config>lag>eth-cfm>mep>eth-test low-priority-defect)
[Tree] (config>port>ethernet>eth-cfm>mep>eth-test low-priority-defect)

Full Context configure lag eth-cfm mep eth-test low-priority-defect
configure port ethernet eth-cfm mep eth-test low-priority-defect

Description This command specifies the lowest priority defect that is allowed to generate a fault alarm. This setting is also used to determine the fault state of the MEP which, when enabled to do so, causes a network reaction.

Default low-priority-defect macRemErrXcon

© 2022 Nokia.

configure port ethernet eth-cfm mep ais-enable low-priority-defect
configure service epipe sap eth-cfm mep ais-enable low-priority-defect
configure service epipe spoke-sdp eth-cfm mep ais-enable low-priority-defect

Description This command allows the operator to include all CCM Defect conditions or exclude the Remote Defect Indication CCM (DefRDICCM) as a trigger for generating AIS. AIS generation can only occur when the client-meg-level configuration option has been included. Changing this parameter will evaluate the MEP for AIS triggers based on the new criteria.

Parameters **allDef** — Keyword that includes any CCM defect condition to trigger AIS generation.

macRemErrXcon — Keyword that excludes RDI CCM Defect condition to trigger AIS generation.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context configure service vprn interface sap eth-cfm mep low-priority-defect
configure service vprn interface spoke-sdp eth-cfm mep low-priority-defect
configure service vprn subscriber-interface group-interface sap eth-cfm low-priority-defect

Description This command specifies the lowest priority defect that is allowed to generate a fault alarm.

Default low-priority-defect macRemErrXcon

Parameters *parameters* — Specifies the lowest priority defect.

Values

allDef	DefRDICCM, DefMACstatus, DefRemoteCCM, DefErrorCCM, and DefXconCCM
macRemErrXcon	Only DefMACstatus, DefRemoteCCM, DefErrorCCM, and DefXconCCM
remErrXcon	Only DefRemoteCCM, DefErrorCCM, and DefXconCCM
errXcon	Only DefErrorCCM and DefXconCCM
xcon	Only DefXconCCM; or
noXcon	No defects DefXcon or lower are to be reported

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect

Syntax **low-priority-defect** *low-priority-defect*

Context **[Tree]** (config>router>if>eth-cfm>mep low-priority-defect)

Full Context configure router interface eth-cfm mep low-priority-defect

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the lowest priority defect that generates a fault alarm. This setting is also used to determine the fault state of the MEP which, when enabled to do so, causes a network reaction.

Default low-priority-defect macRemErrXcon

Parameters *low-priority-defect* — Specifies the lowest priority defect.

Values allDef, macRemErrXcon, remErrXcon, errXcon, xcon, noXcon

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.249 low-slope

low-slope

Syntax [**no**] **low-slope**

Context **[Tree]** (config>qos>slope-policy low-slope)

Full Context configure qos slope-policy low-slope

Description The **low-slope** context contains the commands and parameters for defining the low Random Early Detection (RED) slope graph. Each buffer pool supports a low RED slope for managing access to the shared portion of the buffer pool for low out-of-profile packets.

The **low-slope** parameters can be changed at any time and the affected buffer pool low RED slopes must be adjusted appropriately.

The **no** form of this command restores the low slope configuration commands to the default values. If the leaf commands within **low-slope** are set to the default parameters, the **low-slope** node will not appear in save config and show config output unless the detail parameter is present.

Platforms All

16.250 low-wmark

low-wmark

Syntax **low-wmark** *percent*

Context **[Tree]** (config>app-assure>group>dns-ip-cache>ip-cache low-wmark)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure application-assurance group dns-ip-cache ip-cache low-wmark

Description This command configures the low watermark value for the dns-ip-cache. If the dns-ip-cache has previously crossed the high-watermark value, the system will clear the trap in case the number of IP addresses stored in the cache crosses below the low watermark value.

Default low-wmark 80

Parameters *percent* — Specifies the low watermark value, in percent.

Values 0 to 100

Default 80

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.251 lower-bound

lower-bound

Syntax **lower-bound** *microseconds*
no lower-bound

Context **[Tree]** (config>oam-pm>bin-group>bin-type>bin lower-bound)

Full Context configure oam-pm bin-group bin-type bin lower-bound

Description This command allows the operator specify the individual floors thresholds for the bins. The operator does not have to specific a lower threshold for every bin that was previously defined by the bin-count for the specific type. By default, each bin is the bin-number times 5000 microseconds. Lower thresholds in the previous adjacent bin must be lower than the threshold of the next higher bin threshold. A separate line per bin is required to configure an operator-specific threshold. An error prevents the bin from entering the active state if this is not maintained, at the time the **no shutdown** is issued. Bin 0 is the result of the difference between 0 and the configured lower-threshold of bin 1. The highest bin in the bin-count captures every result above the threshold. Any negative delay metric result is treated as zero and placed in bin 0.

The **no** form of this command removes the user configured threshold value and applies the default for the bin.

Parameters *microseconds* — Specifies the threshold that defines the floor of the bin. The bin range is the difference between its configured threshold and the threshold of the next higher bin in microsecond threshold value.

Values 1 to 4294967295

Default bin-number * 5000

16.252 lsa-accumulate

lsa-accumulate

Syntax **lsa-accumulate** *lsa-accumulate*
no lsa-accumulate

Context **[Tree]** (config>router>ospf>timers lsa-accumulate)
[Tree] (config>router>ospf3>timers lsa-accumulate)

Full Context configure router ospf timers lsa-accumulate
configure router ospf3 timers lsa-accumulate

Description This command sets the internal OSPF delay to allow for the accumulation of multiple LSA so OSPF messages can be sent as efficiently as possible. The **lsa-accumulate** timer applies to all LSAs except Type 1 and Type 2 LSAs, which are sent immediately. LSAs are accumulated and then sent when:

- its size reaches the MTU size of the interface
- a new LSA is received on the interface
- the **lsa-accumulate** timer expires

Shorting this delay can speed up the advertisement of LSAs to OSPF neighbors but may increase the number of OSPF messages sent.

The **no** form of this command reverts to the default value.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default lsa-accumulate 1000

Parameters *lsa-accumulate* — Specifies the LSA accumulation delay in milliseconds.

Values 0 to 1000

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.253 lsa-arrival

lsa-arrival

Syntax **lsa-arrival** *lsa-arrival-time*
no lsa-arrival

Context **[Tree]** (config>service>vprn>ospf>timers lsa-arrival)
[Tree] (config>service>vprn>ospf3>timers lsa-arrival)

Full Context configure service vprn ospf timers lsa-arrival
configure service vprn ospf3 timers lsa-arrival

Description This parameter defines the minimum delay that must pass between receipt of the same Link State Advertisements (LSAs) arriving from neighbors.

It is recommended that the neighbor's configured **lsa-generate** *lsa-second-wait* interval is equal to or greater than the **lsa-arrival** timer configured here.

Use the **no** form of this command to return to the default.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is ≥ 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default lsa-arrival 1000

Parameters *lsa-arrival-time* — Specifies the timer in milliseconds.

Values 0 to 600000

Platforms All

lsa-arrival

Syntax **lsa-arrival** *lsa-arrival-time*
no lsa-arrival

Context **[Tree]** (config>router>ospf>timers lsa-arrival)
[Tree] (config>router>ospf3>timers lsa-arrival)

Full Context configure router ospf timers lsa-arrival
configure router ospf3 timers lsa-arrival

Description This parameter defines the minimum delay that must pass between receipt of the same Link State Advertisements (LSAs) arriving from neighbors.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

It is recommended that the neighbors configured **lsa-generate** *lsa-second-wait* interval is equal or greater than the **lsa-arrival** timer configured here.

The **no** form of this command reverts to the default.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default lsa-arrival 1000

Parameters *lsa-arrival-time* — Specifies the timer, in milliseconds.

Values 0 to 600000

Platforms All

16.254 lsa-filter-out

lsa-filter-out

Syntax **lsa-filter-out** [**all** | **except-own-rtrlsa** | **except-own-rtrlsa-and-defaults**]
no lsa-filter-out

Context **[Tree]** (config>router>ospf>area>if lsa-filter-out)
[Tree] (config>router>ospf3>area>if lsa-filter-out)
[Tree] (config>service>vprn>ospf>area>if lsa-filter-out)
[Tree] (config>service>vprn>ospf3>area>if lsa-filter-out)

Full Context configure router ospf area interface lsa-filter-out
configure router ospf3 area interface lsa-filter-out
configure service vprn ospf area interface lsa-filter-out
configure service vprn ospf3 area interface lsa-filter-out

Description This command enables filtering of outgoing OSPF LSAs on the selected OSPFv2 or OSPFv3 interface. Three filtering options are provided:

- Do not flood any LSAs out the interface. This option is suitable if the neighbor is simply-connected and has a statically configured default route with the address of this interface as next-hop.
- Flood the router's own router-LSA out the interface and suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and has a statically configured default route with a loopback or system interface address (contained in the router-LSA) as next-hop.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- Flood the router's own router-LSA and all self-generated type-3, type-5 and type-7 LSAs advertising a default route (0/0) out the interface; suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and does not have a statically configured default route.

The **no** form of this command disables OSPF LSA filtering (normal operation).

Default no lsa-filter-out

Platforms All

16.255 lsa-generate

lsa-generate

Syntax **lsa-generate** *max-lsa-wait* [lsa-initial-wait *lsa-initial-wait* [*lsa-second-wait lsa-second-wait*]]
no lsa-generate-interval

Context **[Tree]** (config>service>vprn>ospf>timers lsa-generate)
[Tree] (config>service>vprn>ospf3>timers lsa-generate)

Full Context configure service vprn ospf timers lsa-generate
configure service vprn ospf3 timers lsa-generate

Description This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the *lsa-second-wait* timer until a maximum value is reached.

Configuring the **lsa-arrival** interval to equal or less than the *lsa-second-wait* interval configured in the **lsa-generate** command is recommended.

The **no** form of this command reverts to the default.

Note: The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is ≥ 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Parameters *max-lsa-wait* — Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSA being generated.

Values 10 to 600000

Default 5000

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

lsa-initial-wait — Specifies the first waiting period between link-state advertisements (LSA) originate(s), in milliseconds. When the LSA exceeds the **lsa-initial-wait** timer value and the topology changes, there is no wait period and the LSA is immediately generated.

When an LSA is generated, the initial wait period commences. If, within the specified **lsa-initial-wait** period and another topology change occurs, then the **lsa-initial-wait** timer applies.

Values 10 to 600000

Default 5000

lsa-second-wait — Specifies the hold time in milliseconds between the first and second LSA generation. The next topology change is subject to this second wait period. With each subsequent topology change, the wait time doubles (this is 2x the previous wait time). This assumes that each failure occurs within the relevant wait period.

Values 10 to 600000

Default 5000

Platforms All

lsdb

Syntax **lsdb** [*type*] [*ls-id*] [*adv-rtr-id*] [**area** *area-id*]
no lsdb

Context **[Tree]** (debug>router>ospf lsdb)
[Tree] (debug>router>ospf3 lsdb)

Full Context debug router ospf lsdb
debug router ospf3 lsdb

Description This command enables debugging for an OSPF link-state database (LSDB).

Parameters *type* — Specifies the OSPF link-state database (LSDB) type.

Values in the **ospf** context — router, network, summary, asbr, extern, nssa, area-opaque, as-opaque, link-opaque
in the **ospf3** context — router, network, inter-area-pfx, inter-area-rtr, external, nssa, intra-area-pfx, rtr-info-link, rtr-info-area, rtr-info-as

ls-id — Specifies an LSA type specific field containing either a router ID or an IP address. It identifies the piece of the routing domain being described by the advertisement.

adv-rtr-id — Specifies the router identifier of the router advertising the LSA.

area *area-id* — Specifies a 32-bit integer uniquely identifying an area.

Values ip-address — a.b.c.d
area — 0 to 4294967295

Context **[Tree]** (config>service>nat>fwd lsn)

Full Context configure service nat port-forwarding lsn

Description This command creates NAT static port forwards for LSN44, Ds-Lite and NAT64. Static port forwards (SPF) are static mappings created so that certain applications on the inside (private side) can be reached from host that are on the outside of the NAT. SPF statically map the subscriber (inside IP address in LSN44, CPE IPv6 address/prefix in DS-Lite and IPv6 prefix in NAT64), inside port and protocol to an outside IPv4 address, port and the same protocol.

If only the inside router, the inside IPv4/v6 address/prefix and the protocol are configured as parameters in the SPF request, the remaining fields in the mapping (outside port and outside IPv4 address) will be selected automatically by the node and reported in CLI once the command execution is completed.

Specifying the outside IPv4 address in the SPF request, mandates that all other, otherwise optional, parameters be also specified in the request (inside port and outside port). This creates a fully specified SPF request. Fully specified SPF request can be used in multi-chassis NAT redundancy deployments where the SPF is manually replicated between the SR OS nodes. In single chassis NAT deployments, fully specified SPF request is guaranteed to work only in the system with a single MS-ISA in it. Otherwise (multiple MS-ISAs in the system) a conflict may arise where two distinct inside IP addresses that may reside on separate MS-ISAs are requested to be mapped to the same outside IPv4 address. This will not be possible since the outside IPv4 address cannot be split across the MS-ISAs (each IP address, inside or outside, is tied to a single MS-ISA).

In non-fully specified SPF requests (missing the inside port and/or outside port and the outside IPv4 address within the SPF request), the outside IPv4 address selection will depend on the configuration of the outside port in the SPF request:

- If the outside port is not specified or is specified from the configured **port-forwarding-range** [1024..port-forwarding-range], then the outside IPv4 address will be the same as the outside IPv4 address in an existing dynamic mapping for the same subscriber. If the subscriber does not exist (no dynamic mappings exist at the time of SPF creation request), then the subscriber will be automatically created and an outside IPv4 address will be assigned. In case that the outside ports are not available from the outside IPv4 address of the corresponding dynamic mapping, then the SPF request will fail. In other words, the dynamic and static mappings (created in this manner) for the same subscriber must use the same outside IPv4 address.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

- If the outside port from the well-known port range [0 to 1023] is requested, then the outside IPv4 address does not have to match the outside IPv4 address of an existing dynamic mapping for the same subscriber, but can instead be any outside IPv4 address.

If multiple NAT policies per inside routing context are used, then the NAT policy must be specified in the SPF creation request. This is needed so the SPF be created in the correct pool.

SPFs are disabled by default and they must be explicitly enabled by the **port-limits forwarding** command within the NAT policy.

Configured SPFs, unlike SPFs created with the **tools** commands, are preserved across reboots without having to configure persistency (**config>system>persistence>nat-port-forwarding**) since they are part of the configuration. When the pool is shutdown the SPFs are deactivated. When the pool is enabled (no shutdown), the SPFs (as created by the **tools** command or by configuration) are activated.

To avoid possible persistency related conflicts, SPFs can only be created using one method on a given node: either as configuration (the CLI **configure** branch) or using the **tools** command. For example: if a first SPF entry is created via CLI **tools** commands, the node prevents SPF creation via configuration (the CLI **configure** branch) and vice versa.

The **no** form of the command deletes NAT static port forwards for LSN44, Ds-Lite and NAT64.

Default none

Parameters **router** *router-instance* — This mandatory parameter specifies the inside routing instance; router name or service-id.

Values router-name, service-id

b4 *ipv6-address* — This optional parameter specifies the IPv6 address of the B4 element in DS-Lite.

Values <ipv6-address> : ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D

aftr *ipv6-address* — This optional parameter specifies IPv6 address of the AFTR element in DS-Lite.

Values <ip-address> : ipv4-address - a.b.c.d
ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0..FFFF]H
d - [0..255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

protocol {**tcp** | **udp**} — This mandatory parameter specifies the protocol to use, either TCP or UDP.

port *port* — This optional parameter specifies a source port.

Values 1 to 65535

outside-ip *ipv4-address* — This mandatory parameter specifies the outside IPv4 address. If the outside IPv4 address is specified, then all other optional parameters become mandatory.

outside-port *port* — This optional parameter specifies the outside port.

nat-policy *policy-name* — If multiple NAT policies are used inside the routing context, then the NAT policy should be specified in the SPF request so the SPF is created in the correct NAT pool. Otherwise, the default NAT policy from the inside routing context will be used.

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.258 lsp

lsp

Syntax [**no**] **lsp** *lsp-name*

Context **[Tree]** (config>router>gmpls lsp)

Full Context configure router gmpls lsp

Description This command creates a GMPLS LSP that is signaled dynamically by the router.

When the LSP is created, the egress router must be specified using the **to** command and a **working-path** must be specified.

GMPLS LSPs are created in the administratively down (**shutdown**) state.

The **no** form of this command deletes the GMPLS LSP. All configuration information associated with this GMPLS LSP is lost. The GMPLS LSP must be administratively shut down before it can be deleted.

Parameters *lsp-name* — Specifies the identifier for the GMPLS LSP, up to 32 characters.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Syntax [**no**] **lsp** *lsp-name*

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Context [Tree] (config>router>ldp>targ-session>peer>tunneling lsp)

Full Context configure router ldp targeted-session peer tunneling lsp

Description This command configures a specific LSP destined to this peer and to be used for tunneling of LDP FEC over RSVP. A maximum of 4 RSVP LSPs can be explicitly used for tunneling LDP FECs to the T-LDP peer.

It is not necessary to specify any RSVP LSP in this context unless there is a need to restrict the tunneling to selected LSPs. All RSVP LSPs with a to address matching that of the T-LDP peer are eligible by default. The user can also exclude specific LSP names by using the ldp-over-rsvp exclude command in the **configure->router->mpls->lsp** *lsp-name* context.

Platforms All

lsp

Syntax [**no**] **lsp** *lsp-name*

Context [Tree] (config>router>ldp>targ-session>peer>mcast-tunneling lsp)

Full Context configure router ldp targeted-session peer mcast-tunneling lsp

Description This command configures a specific LSP destined to this peer and to be used for tunneling of multicast LDP FEC over RSVP.

Parameters *lsp-name* — Specifies the LSP name, up to 64 characters in length.

Platforms All

lsp

Syntax [**no**] **lsp** *lsp-name* **sender** *sender-address*

Context [Tree] (config>router>mpls>ingress-statistics lsp)

Full Context configure router mpls ingress-statistics lsp

Description This command configures statistics in the ingress data path of a terminating RSVP LSP at an egress LER. The LSP name must correspond to the name configured by the operator at the ingress LER. It must not contain the special character ":" which is used as a field separator by the ingress LER for encoding the LSP and path names into the RSVP session name field in the session_attribute object. The operator must execute the **no shutdown** for this command to effectively enable statistics.

The same set of counters is updated for packets received over any path of this LSP and over the lifetime of the LSP. In steady-state, the counters are updated for packets received over the active path of the LSP. The active path can be the primary path, one of the secondary paths, the FRR detour path, or the FRR bypass path when the tail-end node is also the MP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

When a hierarchy of LSPs is in use, statistics collection on the outermost label corresponding to the tunneling LSP and on the inner labels, corresponding to the tunneled LSPs are mutually exclusive. A consequence of this is that when the operator enables statistics collection on an RSVP LSP which is also used for tunneling LDP FECs with the LDP over RSVP feature, then statistics will be collected on the RSVP LSP only. There will be no statistics collected for an LDP FEC tunneled over this RSVP LSP and also egressing on the same node regardless if the operator enabled statistics collection on this FEC. When, the operator disables statistics collection on the RSVP LSP, then statistics collection, if enabled, will be performed on a tunneled LDP FEC.

The operator can enable statistics collection on a manual bypass terminating on the egress LER. However all LSPs which primary path is protected by the manual bypass will not collect statistics when they activate forwarding over the manual bypass. When, the operator disables statistics collection on the manual bypass LSP, then statistics collection on the protected LSP, if enabled, will continue when the bypass LSP is activated.

The **no** form of this command disables statistics for this RSVP LSP in the ingress data path and removes the accounting policy association from the LSP.

Parameters **sender-address** *ip-address* — Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

lsp-name — Specifies the LSP name, up to 64 characters in length, as configured at the ingress LER.

Platforms All

lsp

Syntax [**no**] **lsp** *lsp-name* [**bypass-only** | **p2mp-lsp** | **mpls-tp** *src-tunnel-num* | **sr-te**]

Context **[Tree]** (config>router>mpls lsp)

Full Context configure router mpls lsp

Description This command creates an LSP that is either signaled dynamically by the router, or a statically provisioned MPLS-TP LSP.

When the LSP is created, the egress router must be specified using the **to** command and at least one **primary** or **secondary** path must be specified for signaled LSPs, or at least one working path for MPLS-TP LSPs. All other statements under the LSP hierarchy are optional.

LSPs are created in the administratively down (**shutdown**) state.

The **no** form of this command deletes the LSP. All configuration information associated with this LSP is lost. The LSP must be administratively shutdown before it can be deleted. The LSP must also be unbound from all SDPs before it can be deleted.

Parameters *lsp-name* — Specifies the name that identifies the LSP. The LSP name can be up to 64 characters long and must be unique.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

bypass-only — Defines an LSP as a manual bypass LSP exclusively. When a path message for a new LSP requests bypass protection, the PLR first checks if a manual bypass tunnel satisfying the path constraints exists. If one if found, the router selects it. If no manual bypass tunnel is found, the router dynamically signals a bypass LSP in the default behavior. The CLI for this feature includes a knob that provides the user with the option to disable dynamic bypass creation on a per node basis.

p2mp-lsp — Defines an LSP as a point-to-multipoint LSP. The following parameters can be used with a P2MP LSP: adaptive, adspec, cspf, exclude, fast-reroute, from, hop-limit, include, metric, retry-limit, retry-timer, resignal-timer. The following parameters cannot be used with a P2MP LSP: primary, secondary, to, dest-global-id, dest-tunnel-number, working-tp-path, protect-tp-path.

This option is not supported on the 7450 ESS.

mpls-tp *src-tunnel-num* — Defines an LSP as an MPLS-TP LSP. The *src-tunnel-num* is a mandatory create time parameter for mpls-tp LSPs, and has to be assigned by the user based on the configured range of tunnel IDs. The following parameters can only be used with an MPLS-TP LSP: to, dest-global-id, dest-tunnel-number, working-tp-path, protect-tp-path. Other parameters defined for the above LSP types cannot be used.

sr-te — Defines an LSP of type Segment Routing Traffic Engineering (SR-TE) LSP. The user can associate an empty path or a path with strict or loose explicit hops with the primary path of the SR-TE LSP. A hop which corresponds to an adjacency SID must be identified with its far-end host IP address (next-hop) on the subnet. If the local end host IP address is provided, this hop is ignored since this router can have multiple adjacencies (next-hops) on the same subnet. A hop which corresponds to a node SID is identified by the prefix address. The user is only allowed to configure a primary path for the SR-TE LSP.

Platforms All

lsp

Syntax [**no**] **lsp**

Context **[Tree]** (config>oam-pm>session>mpls lsp)

Full Context configure oam-pm session mpls lsp

Description Commands in this context define the type of label switched path and the identification of the LSP for which packets traverse. Only a single LSP can be configured per session. Once an LSP has been configured, other LSP types under this context is blocked.

The **no** form of this command deletes the configured LSP under the context, when there are no active tests are executing under this session.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter>sr-te lsp)

Full Context configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te lsp
configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te lsp

Description This command restricts the search for a resolving LSP to a specific set of named LSPs. Only those LSPs named in the associated name list will be searched for a match to resolve the associated static route.

Parameters *lsp-name* — Specifies the name of the LSP to be searched for a valid resolving tunnel for the static route's next-hop.

Platforms All

lsp

Syntax [**no**] **lsp** *lsp-name*

Context **[Tree]** (config>service>sdp lsp)

Full Context configure service sdp lsp

Description This command creates associations between one or more label switched paths (LSPs) and an Multi-Protocol Label Switching (MPLS) Service Distribution Point (SDP). This command is implemented *only* on MPLS-type encapsulated SDPs.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In MPLS SDP configurations *either* one or more LSP names can be specified *or* LDP can be enabled. The SDP **ldp** and **lsp** commands are mutually exclusive except if the mixed-lsp-mode option is also enabled. If an LSP is specified on an MPLS SDP, then LDP cannot be enabled on the SDP. To enable LDP on the SDP when an LSP is already specified, the LSP must be removed from the configuration using the **no lsp lsp-name** command.

Alternatively, if LDP is already enabled on an MPLS SDP, then an LSP cannot be specified on the SDP. To specify an LSP on the SDP, the LDP must be disabled or the mixed-lsp-mode option is also enabled. The LSP must have already been created in the **config>router>mpls** context. with a valid far-end IP address. RSVP must be enabled.

If no LSP is associated with an MPLS SDP, the SDP cannot enter the operationally up state. The SDP can be administratively enabled (**no shutdown)** with no LSP associations. The *lsp-name* may be shutdown, causing the association with the SDP to be operationally down (the LSP will not be used by the SDP).

Up to 16 LSP names can be entered on a single command line.

The **no** form of this command deletes one or more LSP associations from an SDP. If the *lsp-name* does not exist as an association or as a configured LSP, no error is returned. An *lsp-name* must be removed from all SDP associations before the *lsp-name* can be deleted from the system. The SDP must be administratively disabled (**shutdown)** before the last *lsp-name* association with the SDP is deleted.

Parameters *lsp-name* — Specifies the name of the LSP to associate with the SDP. An LSP name is case sensitive and is limited to 32 ASCII 7-bit printable characters with no spaces. If an exact match of *lsp-name* does not already exist as a defined LSP, an error message is generated. If the *lsp-name* does exist and the LSP **to** IP address matches the SDP **far-end** IP address, the association is created.

Platforms All

16.259 lsp-bfd

lsp-bfd

Syntax **lsp-bfd** *prefix-list-name*
no lsp-bfd *prefix-list-name*

Context **[Tree]** (config>router>ldp lsp-bfd)

Full Context configure router ldp lsp-bfd

Description Commands in this context configure LSP BFD for a set of LDP LSPs with FECs matching those defined in the specified prefix list.

Up to 16 LSP BFD instances can be configured for LDP.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If a prefix corresponding to an LDP FEC appears in more than one prefix list, then the system will apply the LSP BFD configuration to the LSP only once. A prefix list may contain a longest match corresponding to one or more LDP FECs, in which case the BFD configuration is applied to all of those LDP LSPs.

The **no** form of the command removes LSP BFD. Specifying a prefix list name will remove LSP BFD for all LDP FECs that match the specified prefix list, except those LDP FECs that also match another LSP BFD prefix list.

Default no lsp-bfd

Parameters *prefix-list-name* — Specifies the name of the prefix list configured using the **config**>**router**>**policy-options**>**prefix-list** *name* command, up to 32 characters maximum. The prefix list name can be specified by the **lsp-bfd** command prior to the prefix list being defined in the **config**>**router**>**policy-options** context.

Platforms All

lsp-bfd

Syntax **lsp-bfd**

Context **[Tree]** (config>router lsp-bfd)

16.260 lsp-exp

lsp-exp

Syntax **lsp-exp** *lsp-exp-value* [**fc** *fc-name*] [**priority** {**low** | **high**}]
no lsp-exp *lsp-exp-value*

Context **[Tree]** (config>qos>sap-ingress lsp-exp)

Full Context configure qos sap-ingress lsp-exp

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command explicitly sets the forwarding class or subclass enqueuing priority when a packet is marked with a MPLS EXP bits specified. Adding a lsp-exp rule on the policy forces packets that match the MPLS LSP EXP specified to override the forwarding class and enqueuing priority based on the parameters included in the lsp-exp rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *lsp-exp-value* is derived from the MPLS LSP EXP bits of the top label.

Multiple commands can be entered to define the association of some or all eight LSP EX bit values to the forwarding class.

The **no** form of this command removes the explicit lsp-exp classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

This command applies to Ethernet Layer 2 SAPs only.

Parameters *lsp-exp-value* — This value is a required parameter that specifies the unique MPLS LSP EXP value that will match the lsp-exp rule. If the command is executed multiple times with the same *lsp-exp-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight lsp-exp rules are allowed on a single policy.

Values 0 to 7

fc *fc-name* — The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (dot). If *subclass-name* does not exist in the context of *fc -name*, an error will occur.

Values *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

priority — The **priority** parameter is used to override the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the **priority** parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

high — The **high** parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low — The **low** parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Default no override

Platforms All

lsp-exp

Syntax **lsp-exp** *lsp-exp-value* **fc** *fc-name* **profile** {**in** | **out**}
no lsp-exp

Context **[Tree]** (config>qos>network>ingress lsp-exp)

Full Context configure qos network ingress lsp-exp

Description This command creates a mapping between the LSP EXP bits of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified LSP EXP bits will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all eight LSP EXP bit values to the forwarding class. For undefined values, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the association of the LSP EXP bit value to the forwarding class. The **default-action** then applies to that LSP EXP bit pattern.

Default no lsp-exp

Parameters *lsp-exp-value* — Specify the LSP EXP values to be associated with the forwarding class.

Values 0 to 8 (Decimal representation of three EXP bit field)

fc *fc-name* — Enter this required parameter to specify the fc-name that the EXP bit pattern will be associated with.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out} — Enter this required parameter to indicate whether the LSP EXP value is the in-profile or out-of-profile value.

Values in, out

16.261 lsp-exp-in-profile

lsp-exp-in-profile

Syntax **lsp-exp-in-profile** *lsp-exp-value*
no lsp-exp-in-profile

Context **[Tree]** (config>qos>network>egress>fc lsp-exp-in-profile)

Full Context configure qos network egress fc lsp-exp-in-profile

Description This command specifies the in-profile LSP EXP value for the forwarding class. The EXP value will be used for all LSP labeled packets requiring marking that require marking at egress on this forwarding class queue, and that are in-profile. The inplus-profile traffic is marked with the same value as in-profile traffic.

When multiple EXP values are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default in-profile EXP setting.

Default

Policy-id 1:	Factory setting
Policy-id 2 to 65535:	Policy-id setting

Parameters *lsp-exp-value* — The 3-bit LSP EXP bit value, expressed as a decimal integer.

Values 0 to 7

16.263 lsp-hold-timer

lsp-hold-timer

Syntax [**no**] **lsp-hold-timer** *hold-time*

Context **[Tree]** (config>router>gmpls>peer lsp-hold-timer)

Full Context configure router gmpls peer lsp-hold-timer

Description This command specifies the amount of time that the ingress node holds before programming its data plane and declaring a GMPLS LSP up. This occurs anytime the ingress UNI-C node brings up a GMPLS LSP path or reroutes a GMPLS LSP. The *hold-time* value should be configured to reflect the data path programming time for the optical technology used between the ingress and egress UNI-N nodes.

The **no** form of the command resets the configuration to the default value.

Default lsp-hold-timer 60

Parameters *hold-timer* — Specifies the ingress node hold time, in seconds.

Values 5 to 300

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

16.264 lsp-init-retry-timeout

lsp-init-retry-timeout

Syntax **lsp-init-retry-timeout** *seconds*
no lsp-init-retry-timeout

Context **[Tree]** (config>router>gmpls lsp-init-retry-timeout)

Full Context configure router gmpls lsp-init-retry-timeout

Description This command configures the initial GMPLS LSP path retry timer.

The new GMPLS LSP path initial retry timer is used instead of the retry-timer to abort the retry cycle when no RESV is received. The retry-timer exclusively governs the time between two retry cycles and to handle retrying of a GMPLS LSP path in a failure case with PATH errors or RESVTear.

The **no** form of this command returns the timer to the default value.

Default lsp-init-retry-timeout 30

Parameters *seconds* — Specifies the time (in seconds), between retry cycles.

Values 10 to 600

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-init-retry-timeout

Syntax **lsp-init-retry-timeout** *seconds*
no lsp-init-retry-timeout

Context **[Tree]** (config>router>mpls lsp-init-retry-timeout)

Full Context configure router mpls lsp-init-retry-timeout

Description This command configures the initial LSP path retry-timer.

The new LSP path initial retry-timer is used instead of the retry-timer to abort the retry cycle when no RESV is received. The retry-timer exclusively governs the time between two retry cycles and to handle retrying of an LSP path in a failure case with PATH errors or RESVTear.

The intent is that the user can now control how many refreshes of the pending PATH state can be performed before starting a new retry-cycle with a new LSP ID. This is all done without affecting the ability to react faster to failures of the LSP path, which will continue to be governed by the retry-timer.

The **no** form of this command returns the timer to the default value.

Default lsp-init-retry-timeout 30

Parameters *seconds* — Specifies the value (in s), used as the fast retry timer for a secondary path.

Values 10 to 600

Default 30

Platforms All

16.265 lsp-lifetime

lsp-lifetime

Syntax **lsp-lifetime** *seconds*
no lsp-lifetime

Context **[Tree]** (config>service>vpls>spb lsp-lifetime)

Full Context configure service vpls spb lsp-lifetime

Description This command sets the time, in seconds, SPB wants the LSPs it originates to be considered valid by other routers in the domain. This is a control B-VPLS command.

Each LSP received is maintained in an LSP database until the lsp-lifetime expires unless the originating router refreshes the LSP. By default, each router refreshes its LSPs every 20 minutes (1200 seconds) so other routers will not age out the LSP.

The LSP refresh timer is derived from this formula: lsp-lifetime/2.

The **no** form of this command reverts to the default value.

Default lsp-lifetime 1200 — LSPs originated by SPB should be valid for 1200 seconds (20 minutes).

Parameters *seconds* — The time, in seconds, that SPB wants the LSPs it originates to be considered valid by other routers in the domain.

Values 350 to 65535

Platforms All

16.266 lsp-minimum-remaining-lifetime

lsp-minimum-remaining-lifetime

Syntax **lsp-minimum-remaining-lifetime** *seconds*
no lsp-minimum-remaining-lifetime

Context **[Tree]** (config>service>vprn>isis lsp-minimum-remaining-lifetime)

Full Context configure service vprn isis lsp-minimum-remaining-lifetime

Description This command configures the minimum value to which the remaining lifetime of the LSP is set. The value is a counter that decrements, in seconds, starting from the value in the received LSP (if not self-originated) or from **lsp-lifetime** *seconds* (if self-originated). When the remaining lifetime becomes zero, the contents of the LSP is purged. The remaining lifetime of an LSP is not changed when there is no **lsp-minimum-remaining-lifetime** value configured.

The configured value must be greater than or equal to the **lsp-lifetime** value.

The **no** form of this command removes the *seconds* value from the configuration.

Default no lsp-minimum-remaining-lifetime

Parameters *seconds* — Specifies the decrementing counter, in seconds. The configured value must be greater than or equal to the locally configured value of lsp-lifetime (MaxAge).

Values 350 to 65535

Platforms All

lsp-minimum-remaining-lifetime

16.269 lsp-pacing-interval

lsp-pacing-interval

Syntax **lsp-pacing-interval** *milli-seconds*
no lsp-pacing-interval

Context **[Tree]** (config>service>vpls>sap>spb lsp-pacing-interval)
[Tree] (config>service>vpls>spoke-sdp>spb lsp-pacing-interval)

Full Context configure service vpls sap spb lsp-pacing-interval
configure service vpls spoke-sdp spb lsp-pacing-interval

Description This command configures the interval during which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent during an interval. LSPs may be sent in bursts during the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

The **no** form of this command reverts to the default value.

Note: The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default lsp-pacing-interval 100 — LSPs are sent in 100 millisecond intervals.

Parameters *milli-seconds* — The interval in milliseconds during which IS-IS LSPs are sent from the interface, expressed as a decimal integer.
0 to 65535

Platforms All

lsp-pacing-interval

no lsp-pacing-interval

Context **[Tree]** (config>service>vprn>isis>if lsp-pacing-interval)

Full Context configure service vprn isis interface lsp-pacing-interval

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

The **no** form of this command reverts to the default value.

Note: The IS-IS LSP pacing interval is 100 milliseconds for values < 100 milliseconds, and 1 second for values ≥ 100 milliseconds. For example, a pacing interval of 2 milliseconds means that a maximum of 50 LSPs are sent in a burst at 100 millisecond intervals. The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst at 1 second intervals.

Default lsp-pacing-interval 100 — the pacing interval is 100 milliseconds.

Parameters *milliseconds* — Specifies the pacing interval in milliseconds at which IS-IS LSPs are sent from the interface at each interval expressed as a decimal integer.

Values 0 to 65535

Platforms All

lsp-pacing-interval

Syntax **lsp-pacing-interval** *milliseconds*
no lsp-pacing-interval

Context **[Tree]** (config>router>isis>interface lsp-pacing-interval)

Full Context configure router isis interface lsp-pacing-interval

Description This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface. The interval applies to all LSPs: LSPs generated by the router, and LSPs received from other routers.

The **no** form of this command reverts to the default value.

Context [Tree] (oam lsp-ping)
[Tree] (config>saa>test>type lsp-ping)

Full Context configure saa test type lsp-ping
oam lsp-ping

Description This command performs in-band LSP connectivity tests.

This command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

The LSP ping operation is modeled after the IP ping utility which uses ICMP echo request and reply packets to determine IP connectivity.

In an LSP ping, the originating device creates an MPLS echo request packet for the LSP and path to be tested. The MPLS echo request packet is sent through the data plane and awaits an MPLS echo reply packet from the device terminating the LSP. The status of the LSP is displayed when the MPLS echo reply packet is received.

This command, when used with the **static** option, performs in-band on-demand LSP connectivity verification tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-ping static** command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*, as extended by RFC 6426, *MPLS On-Demand Connectivity Verification and Route Tracing*.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Default The active LSP path

Values: Any path name associated with the LSP

Parameters *lsp-name* — Specifies the name of the target RSVP-TE LSP, up to 64 characters.

rsvp-te *lsp-name* — Specifies the name of the target RSVP-TE LSP, up to 64 characters.

Note: The **rsvp-te** explicit target FEC type is not supported under the SAA context.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path-name — Specifies the LSP path name, up to 32 characters, to which to send the LSP ping request.

Values Any path name associated with the LSP.

Default The active LSP path.

bgp-label prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target BGP IPv6 /128 label route.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

path-destination *ip-address* — Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

interface *if-name* — Specifies the name of an IP interface, up to 32 characters, to send the MPLS echo request message to. The name must already exist in the **config>router>interface** context.

next-hop *ip-address* — Specifies the next-hop address to send the MPLS echo request message to.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target LDP FEC.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

ldp prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target LDP FEC.

Values
<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix a.b.c.d
ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

sr-isis prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-IS-IS tunnel.

Values
<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix a.b.c.d
ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

igp-instance — Specifies the IGP instance of the node SID prefix.

Values isis-inst: 0 to 127
ospf3-inst: 0 to 31, 64 to 95
ospf-inst: 0 to 31

sr-ospf prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

Values
<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix - a.b.c.d
ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sr-ospf3 prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Note that only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

Values

ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

sr-policy color *color-id* **endpoint** *ip-address* **segment-list** *segment-list-id* — Specifies the name of the target IPv4 or IPv6 SR policy.

Note: The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

color *color-id* — Specifies the color ID.

Values 0 to 4294967295

endpoint *ip-address* — Specifies the endpoint address.

Values

ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

segment-list *segment-list-id* — Specifies the segment list ID.

Values 1 to 32

detail — Displays detailed information.

sr-te *lsp-name* — Specifies the name of the target SR-TE LSP, up to 64 characters.

static — Specifies the target FEC stack sub-type “Static LSP”.

assoc-channel {ipv4 | non-ip | none} — Specifies the launched echo request’s usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

Values **ipv4** — Use an Associated Channel with IP encapsulation, as described in RFC 6426, Section 3.2.

non-ip — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

none — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

Default non-ip

global-id — Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

Values 0 to 4294967295

Default 0

node-id — Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

Values a.b.c.d, 1 to 4294967295

Default 0

force — Allows LSP ping to test a path that is operationally down, including cases where MPLS-TP BFD CC/V is enabled and has taken a path down. This parameter is only allowed in the OAM context; it is not allowed for a test configured as a part of an SAA.

Default disabled

path-type {active | working | protect} — The LSP path to test.

Values **active** — The currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

working — The working path of the MPLS-TP LSP.

protect — The protect path of the MPLS-TP LSP.

Default active

fc-name — Specifies the FC and profile parameters that are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified fc and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 77 summarizes this behavior.

Table 77 **lsp-ping Request Packet and Behavior**

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • packet queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet{tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • packet queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router**.**

Values be, l2, af, l1, h2, ef, h1, nc

Default be

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

profile {in | out} — Specifies the profile state of the MPLS echo request packet.

Default out

interval — Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 1

send-count — Specifies the number of messages to send, expressed as a decimal integer. The **send-count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

Values 1 to 100

Default 1

octets — Specifies the MPLS echo request packet size in octets, expressed as a decimal integer. The request payload is padded with zeros to the specified size.

Values 1 to 9786

Default 1

src-ip-address *ip-address* — Specifies the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. An example is when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next-hop is set to an address other than the system interface address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

timeout — Specifies number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

Values 1 to 10

Default 5

label-ttl — Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 255

Default 255

Full Context configure saa test type-multi-line lsp-ping

Description Commands in this context configure the lsp-ping OAM probe type.

Platforms All

16.271 lsp-ping-interval

lsp-ping-interval

Syntax **lsp-ping-interval** *seconds*
no lsp-ping-interval

Context **[Tree]** (config>router>ldp>lsp-bfd lsp-ping-interval)

Full Context configure router ldp lsp-bfd lsp-ping-interval

Description This command configures the interval between periodic LSP ping messages for LSPs on which **bfd-enable** is configured. The LSP ping messages are used to bootstrap and maintain the LSP BFD session.

Configuring an interval of 0 seconds disables periodic LSP ping. An LSP ping message containing a bootstrap TLV will only be sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer intervals to reduce congestion and common resource loading. Unless required, the interval should not be set lower than 300 s.

The **no** form of this command restores the default interval.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Default lsp-ping-interval 60

Parameters *seconds* — Specifies the interval between periodic LSP ping messages, in seconds.

Values 0, 60 to 300

Platforms All

lsp-ping-interval

Syntax **lsp-ping-interval** *seconds*
no lsp-ping-interval

Context **[Tree]** (config>router>mpls>lsp>bfd lsp-ping-interval)
[Tree] (config>router>mpls>lsp>primary>bfd lsp-ping-interval)
[Tree] (config>router>mpls>lsp>secondary>bfd lsp-ping-interval)
[Tree] (config>router>mpls>lsp-template>bfd lsp-ping-interval)

Full Context configure router mpls lsp bfd lsp-ping-interval
configure router mpls lsp primary bfd lsp-ping-interval
configure router mpls lsp secondary bfd lsp-ping-interval
configure router mpls lsp-template bfd lsp-ping-interval

Description This command configures the interval for the periodic LSP ping for RSVP LSPs on which **bfd-enable** has been configured. This interval is used to bootstrap and maintain the LSP BFD session. A value of 0 disables periodic LSP Ping, such that an LSP Ping containing a bootstrap TLV is only sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer timers to reduce the chance of congestion and loading of common resources. Unless required, the **lsp-ping-interva**l should not be set lower than 300 seconds.

The **no** form of this command reverts to the default value.

Default no lsp-ping-interval

Parameters *seconds* — Sets the periodic LSP Ping interval in seconds.

Values 0, 60 to 300

Default 60

16.272 lsp-ping-trace

lsp-ping-trace

Syntax **lsp-ping-trace** [{**tx** | **rx** | **both**}] [{**raw** | **detail**}]
no lsp-ping-trace

Context **[Tree]** (debug>oam lsp-ping-trace)

Full Context debug oam lsp-ping-trace

Description This command enables debugging for lsp-ping.

Parameters **tx | rx | both** — Specifies to enable LSP ping debugging for TX, RX, or both RX and TX for the for debug direction.

raw | detail — Displays output for the for debug mode.

Platforms All

16.273 lsp-refresh-interval

lsp-refresh-interval

Syntax **lsp-refresh-interval** [*seconds*] [**half-lifetime** [**enable** | **disable**]
no lsp-refresh-interval

Context **[Tree]** (config>service>vpls>spb lsp-refresh-interval)

Full Context configure service vpls spb lsp-refresh-interval

Description This command configures the LSP refresh timer interval. When configuring the LSP refresh interval, the value that is specified for **lsp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The no form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the **no lsp-refresh-interval** command will be rejected.

Default lsp-refresh-interval 600 half-lifetime enable

Parameters *seconds* — Specifies the refresh interval.

Values 150 to 65535

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

half-lifetime — Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

Values enable, disable

Platforms All

lsp-refresh-interval

Syntax **lsp-refresh-interval** [*seconds*] [**half-lifetime** {**enable** | **disable**}]
no lsp-refresh-interval

Context **[Tree]** (config>service>vprn>isis lsp-refresh-interval)

Full Context configure service vprn isis lsp-refresh-interval

Description This command configures the IS-IS LSP refresh timer interval for the VPRN instance. When configuring the LSP refresh interval, the value that is specified for **lsp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The **no** form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the no lsp-refresh-interval command will be rejected.

Default lsp-refresh-interval 600 half-lifetime enable

Parameters *seconds* — Specifies the refresh interval.

Values 150 to 65535

half-lifetime — Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

Values enable, disable

Platforms All

The **no** form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the no lsp-refresh-interval command will be rejected.

Default lsp-refresh-interval 600 half-lifetime enable

Parameters *seconds* — Specifies the refresh interval.

Values 150 to 65535

half-lifetime — Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

Values enable, disable

Platforms All

16.274 lsp-self-ping

lsp-self-ping

Syntax [**no**] **lsp-self-ping**

Context **[Tree]** (config>router>mpls lsp-self-ping)

Full Context configure router mpls lsp-self-ping

Description Commands in this context configure LSP self-ping parameters.

LSP Self-ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self-ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self-ping reply is received from the far-end LER.

When configured under the MPLS context, LSP Self-ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.

The **no** form of this command disables the system check for LSP Self-ping.

Default no lsp-self-ping

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.

lsp-self-ping

Syntax **lsp-self-ping** {**enable** | **disable** | **inherit**}
no lsp-self-ping

Context **[Tree]** (config>router>mpls>lsp lsp-self-ping)
[Tree] (config>router>mpls>lsp-template lsp-self-ping)

Full Context configure router mpls lsp lsp-self-ping
configure router mpls lsp-template lsp-self-ping

Description This command enables LSP Self-ping on a given RSVP-TE LSP or LSP template. If set to **disable**, then LSP Self-ping is disabled irrespective of the setting of **lsp-self-ping**>**rsvp-te** under the **mpls** context. By default, each LSP and LSP template inherits this value.

The **no** form of this command reverts to the default.

Default lsp-self-ping inherit

Parameters **enable** — Enables LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template.

disable — Disables LSP Self-ping on this RSVP LSP or RSVP LSPs using this LSP template.

inherit — Inherits the value configured under **config**>**router**>**mpls**>**lsp-self-ping**>**rsvp-te**.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp lsp-self-ping

16.275 lsp-setup

lsp-setup

Syntax [**no**] **lsp-setup**

Context **[Tree]** (debug>router>gmpls>event lsp-setup)

Full Context debug router gmpls event lsp-setup

Description This command enables and disables debugging for GMPLS LSP Setup events.

Platforms 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

lsp-setup

Syntax **lsp-setup** [**detail**]
no lsp-setup

Context **[Tree]** (debug>router>mpls>event lsp-setup)

Full Context debug router mpls event lsp-setup

Description This command debugs LSP setup events.

The **no** form of the command disables the debugging.

Parameters **detail** — Displays detailed information about LSP setup events.

Platforms All

16.276 lsp-template

lsp-template

Syntax **lsp-template** *p2mp-lsp-template-name*
no lsp-template

Context **[Tree]** (config>service>vpls>provider-tunnel>inclusive>rsvp lsp-template)

Full Context configure service vpls provider-tunnel inclusive rsvp lsp-template

Description This command specifies the template name of the RSVP P2MP LSP instance to be used by the leaf node or the root-and-leaf node that participates in BGP-AD VPLS. The P2MP LSP is referred to as the Inclusive Provider Multicast Service Interface (I-PMSI).

After the user performs a **no shutdown** under the context of the inclusive node and the delay timer expires, BUM packets will be forwarded over an automatically signaled instance of the RSVP P2MP LSP specified in the LSP template.

The **no** version of this command removes the P2MP LSP template from the I-PMSI configuration.

Parameters *p2mp-lsp-template-name* — Specifies the name of the P2MP LSP template up to 32 characters in length.

Platforms All

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

lsp-template

Syntax **lsp-template**
no lsp-template

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive>rsvp lsp-template)

Full Context configure service vprn mvpn provider-tunnel inclusive rsvp lsp-template

Description This command specifies the use of automatically created P2MP LSP as the provider tunnel. The P2MP LSP will be signaled using the parameters specified in the template, such as bandwidth constraints, and so on.

Default no lsp-template

Platforms All

lsp-template

Syntax **lsp-template** *name*
no lsp-template

Context **[Tree]** (config>service>vprn>mvpn>pt>selective>multistream-spmsi lsp-template)

Full Context configure service vprn mvpn provider-tunnel selective multistream-spmsi lsp-template

Description This command creates a RSVP-TE LSP template for S-PMSI. Multi-stream S-PMSIs can share a single template or can each use their own template.

Parameters *name* — Specifies the LSP template name, up to 32 characters.

Platforms All

lsp-template

Syntax **lsp-template** *lsp-template*
no lsp-template

Context **[Tree]** (config>service>vprn>mvpn>pt>inclusive lsp-template)
[Tree] (config>service>vprn>mvpn>pt>selective>rsvp lsp-template)

Full Context configure service vprn mvpn pt inclusive lsp-template
configure service vprn mvpn provider-tunnel selective rsvp lsp-template

Description This command specifies the use of automatically created P2MP LSP as the inclusive or selective provider tunnel. The P2MP LSP will be signaled using the parameters specified in the template, such as bandwidth constraints, and so on

Default no lsp-template

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *lsp-template* — Specifies the LSP template name, up to 32 characters.

Platforms All

lsp-template

Syntax **lsp-template** *template-name* [**mesh-p2p** | **mesh-p2p-srte** | **one-hop-p2p** | **on-demand-p2p-srte** | **one-hop-p2p-srte** | **p2mp** | **pce-init-p2p-srte template-id** {**default** | *template-id*}]
no lsp-template *template-name*

Context **[Tree]** (config>router>mpls lsp-template)

Full Context configure router mpls lsp-template

Description This command creates a template that can be referenced by a client application where dynamic LSP creation is required. The LSP template type (**p2mp**, **one-hop-p2p**, **mesh-p2p**, **one-hop-p2p-srte**, **mesh-p2p-srte**, **pce-init-p2p-srte**, or **on-demand-p2p-srte**) is mandatory.

The **no** form of this command deletes the LSP template. An LSP template cannot be deleted if a client application is using it.

Parameters *template-name* — Specifies the name of the LSP template, up to 32 characters. An LSP template name and LSP name must not be the same.

mesh-p2p | **mesh-p2p-srte** | **one-hop-p2p** | **one-hop-p2p-srte** | **p2mp** | **pce-init-p2p-srte** | **on-demand-p2p-srte** — Identifies the type of LSP this template will signal.

The **p2mp** option is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

default — Sets the template to be the default LSP template for PCE-initiated SR-TE LSPs.

template-id — Specifies the value that is signaled in the PCE to identify the LSP template.

Platforms All

lsp-template

Syntax **lsp-template** *lsp-template*
no lsp-template

Context **[Tree]** (config>router>gtm>provider-tunnel>inclusive>rsvp lsp-template)
[Tree] (config>router>gtm>provider-tunnel>selective>rsvp lsp-template)

Full Context configure router gtm provider-tunnel inclusive rsvp lsp-template
configure router gtm provider-tunnel selective rsvp lsp-template

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command specifies the use of automatically created P2MP LSP as the provider tunnel. The P2MP LSP will be signaled using the parameters specified in the template, such as bandwidth constraints.

The **no** form of this command removes the lsp-template name from this configuration.

Default no lsp-template

Parameters *lsp-template* — Specifies the name of the LSP template, up to 32 characters.

Platforms All

lsp-template

Syntax **lsp-template** *template-name*
no lsp-template

Context **[Tree]** (config>oam-pm>session>mpls>lsp>rsvp-auto lsp-template)

Full Context configure oam-pm session mpls lsp rsvp-auto lsp-template

Description This command specifies the LSP template used to identify the LSP for testing.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, created using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions.

The **lsp-template** *template-name* must match the name of **config>router>mpls>lsp-template** used to dynamically create the RSVP LSP. This is a lose reference and does not impede the manipulation of the **config>router>mpls>lsp-template**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

The **no** form of this command deletes the *template-name* reference from the configuration.

Parameters *template-name* — Specifies the name of the LSP template, up to 32 characters.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

oam lsp-trace

Description This command performs an LSP traceroute using the protocol and data structures defined in IETF RFC 8029.

The LSP trace operation is modeled after the IP traceroute utility which uses ICMP echo request and reply packets with increasing TTL values to determine the hop-by-hop route to a destination IP.

In an LSP trace, the originating device creates an MPLS echo request packet for the LSP to be tested with increasing values of the TTL in the outermost label. The MPLS echo request packet is sent through the data plane and awaits a TTL exceeded response or the MPLS echo reply packet from the device terminating the LSP. The devices that reply to the MPLS echo request packets with the TTL exceeded and the MPLS echo reply are displayed.

The downstream mapping TLV is used in **lsp-trace** to provide a mechanism for the sender and responder nodes to exchange and validate interface and label stack information for each downstream hop in the path of the LDP FEC an RSVP LSP, or a BGP IPv4 label route.

Two downstream mapping TLVs are supported. The original Downstream Mapping (DSMAP) TLV defined in RFC 4379 (obsoleted by RFC 8029) and the new Downstream Detailed Mapping (DDMAP) TLV defined in RFC 6424 AND RFC 8029. More details are provided in the DDMAP TLV sub-section below.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

In addition, when the responder node has multiple equal cost next hops for an LDP FEC, a BGP label IPv4 prefix, an SR-ISIS node SID, an SR-OSPF node SID, or an SR-TE LSP, it replies in the Downstream Mapping TLV with the downstream information for each outgoing interface which is part of the ECMP next-hop set for the prefix. The downstream mapping TLV can further be used to exercise a specific path of the ECMP set using the **path-destination** option.

This command, when used with the **static** option, performs in-band on-demand LSP traceroute tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-trace static** command performs an LSP trace using the protocol and data structures defined in the RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures, as extended by RFC 6426, MPLS On-Demand Connectivity Verification and Route Tracing.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

Parameters *lsp-name* — Specifies the name of the target RSVP-TE LSP, up to 64 characters.

rsvp-te *lsp-name* — Specifies the name of the target RSVP-TE LSP, up to 64 characters.

Note: The **rsvp-te** explicit target FEC type is not supported under the SAA context.

path-name — Specifies the LSP path name along which to send the LSP trace request.

Values Any path name associated with the LSP.

Default The active LSP path.

bgp-label prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target IPv6 /128 label route.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix a.b.c.d

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

path-destination *ip-address* — Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

if-name — Specifies the name of an IP interface, up 32 characters, to send the MPLS echo request to. The name must already exist in the **config>router>interface** context.

next-hop *ip-address* — Specifies the next-hop to send the MPLS echo request message to.

Values

ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target LDP FEC.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix - a.b.c.d
ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

ldp prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target LDP FEC.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix a.b.c.d
ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

sr-isis prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-ISIS tunnel.

Values

<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix a.b.c.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

igp-instance — Specifies the IGP instance of the node SID prefix.

Values isis-inst: 0 to 127
ospf3-inst: 0 to 31, 64 to 95
ospf-inst: 0 to 31

sr-ospf prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

Values
<ipv4-prefix>/32 | <ipv6-prefix>/128
ipv4-prefix - a.b.c.d
ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

sr-ospf3 prefix *ip-prefix/prefix-length* — Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Note that only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

Values
ipv6-prefix - x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

sr-policy color *color-id* **endpoint** *ip-address* **segment-list** *segment-list-id* — Specifies the name of the target IPv4 or IPv6 SR policy.

Note: The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

color *color-id* — Specifies the color ID.

Values 0 to 4294967295

endpoint *ip-address* — Specifies the endpoint address.

Values

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

segment-list *segment-list-id* — Specifies the segment list ID.

Values 1 to 32

detail — Displays detailed information.

sr-te *lsp-name* — Specifies the name of the target SR-TE LSP, up to 64 characters.

static — Specifies to select the target FEC Stack sub-type 'Static LSP'.

assoc-channel {ipv4 | non-ip | none} — Specifies the launched echo request's usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

Values **ipv4** — Use the Associated Channel mechanism with IP encapsulation, as described in RFC 6426, Section 3.2.

non-ip — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.

none — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

path-type {active | working | protect} — Specifies the LSP path to test.

Values **active** — Specifies the currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

working — Specifies the working path of the MPLS-TP LSP.

protect — Specifies the protect path of the MPLS-TP LSP.

Default active

downstream-map-tlv — Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424 and RFC 8029. The user can also choose not to include the downstream mapping TLV by entering the value none. When lsp-trace is used on a MPLS-TP LSP (static option), it can only be executed if the control-channel is set to none. In addition, the DSMAP/DDMAP TLV is only included in the echo request message if the egress interface is either a numbered IP interface, or an unnumbered IP interface. The TLV is not included if the egress interface is of type **unnumbered-mpls-tp**.

Values ddmap: Sends a detailed downstream mapping TLV.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

dsmap: Sends a downstream mapping TLV.

none: No mapping TLV is sent.

Default Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map {dsmap | ddmap}**.

fc-name — Specifies the FC and profile parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the fc and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. Table 78 summarizes this behavior.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Table 78 **lsp-trace Request Packet and Behavior**

CPM (sender node)	Echo request packet: • packet {tos=1, fc1, profile1} • fc1 and profile1 are as entered by user in OAM command or default values • tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface
Outgoing interface (sender node)	Echo request packet: • pkt queued as {fc1, profile1} • ToS field=tos1 not remarked • EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface
Incoming interface (responder node)	Echo request packet: • packet {tos1, exp1} • exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface
CPM (responder node)	Echo reply packet: • packet {tos=1, fc2, profile2}
Outgoing interface (responder node)	Echo reply packet: • pkt queued as {fc2, profile2} • ToS filed= tos1 not remarked (reply inband or out-of-band) • EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface
Incoming interface (sender node)	Echo reply packet: • packet {tos1, exp2} • exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | **out}** — Specifies the profile state of the MPLS echo request packet.

Default out

interval — Specifies the number of seconds to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default **1**

no-response-count — Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

Values 1 to 255

Default 5

max-label-ttl — Specifies the maximum TTL value in the MPLS label for the LDP treetrace test, expressed as a decimal integer.

Values 1 to 255

Default 30

min-label-ttl — Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

Values 1 to 255

Default 1

probes-per-hop — Specifies the probes per hop.

Values 1 to 10

Default 1

octets — Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request payload is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

Values 1 to 9786

Default 1

src-ip-address *ip-address* — Specifies the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. An example is when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next-hop is set to an address other than the system interface address.

Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

x - [0 to FFFF]H
d - [0 to 255]D

timeout — Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 60

Default 3

Platforms All

lsp-trace

Syntax **lsp-trace**

Context **[Tree]** (config>saa>test>type-multi-line lsp-trace)

Full Context configure saa test type-multi-line lsp-trace

Description This command creates the context to perform an LSP traceroute using the protocol and data structures defined in IETF RFC 4379 (obsoleted by RFC 8029).

Platforms All

16.278 lsp-wait

lsp-wait

Syntax **lsp-wait** *lsp-wait* [**lsp-initial-wait** *lsp-initial-wait*] [**lsp-second-wait** *lsp-second-wait*]
no lsp-wait

Context **[Tree]** (config>service>vpls>spb>timers lsp-wait)

Full Context configure service vpls spb timers lsp-wait

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command is used to customize LSP generation throttling. Timers that determine when to generate the first, second and subsequent LSPs can be controlled with this command. Subsequent LSPs are generated at increasing intervals of the second **lsp-wait** timer until a maximum value is reached.

Note: The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Parameters *lsp-wait* — Specifies the maximum interval in milliseconds between two consecutive occurrences of an LSP being generated.

Values 10 to 120000

Default 5000

lsp-initial-wait — Specifies the initial LSP generation delay in milliseconds. Values < 100 ms are internally rounded down to 0, so that there is no added initial LSP generation delay.

Values 10 to 100000

Default 10

lsp-second-wait — Specifies the hold time in milliseconds between the first and second LSP generation.

Values 10 to 100000

Default 1000

Platforms All

second-wait — Specifies the hold time in milliseconds between the first and second LSP generation.

Values 10 to 100000

Platforms All

16.279 lsr-label-route

lsr-label-route

Syntax **lsr-label-route** [{**none** | **all**}]

Context **[Tree]** (config>router>ttl-propagate lsr-label-route)

Full Context configure router ttl-propagate lsr-label-route

Description This command configures the TTL propagation for transit packets at a router acting as an LSR for a BGP label route.

When an LSR swaps the BGP label for a ipv4 prefix packet, therefore acting as a ABR, ASBR, or data-path Route-Reflector (RR) in the base routing instance, or swaps the BGP label for a vpn-ipv4 or vpn-ipv6 prefix packet, therefore acting as an inter-AS Option B VPRN ASBR or VPRN data path Route-Reflector (RR), the all value of this command enables TTL propagation of the decremented TTL of the swapped BGP label into all outgoing LDP or RSVP transport labels.

When an LSR swaps a label or stitches a label, it always writes the decremented TTL value into the outgoing swapped or stitched label. What this feature controls is whether this decremented TTL value is also propagated to the transport label stack pushed on top of the swapped or stitched label.

The none value reverts to the default mode which disables TTL propagation. This changes the existing default behavior which propagates the TTL to the transport label stack. When a customer upgrades, the new default becomes in effect. This command does not have a no version.

This feature also controls the TTL propagation at an LDP-BGP stitching LSR in the LDP to BGP stitching direction. It also controls the TTL propagation in Carrier Supporting Carrier (CsC) VPRN at both the CsC CE and CsC PE.

SR OS does not support ASBR or data path RR functionality for labeled IPv6 routes in the global routing instance (6PE). As such the CLI command of this feature has no impact on prefix packets forwarded in this context.

Default lsr-label-route none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters **none** — Specifies that the TTL of the swapped label is not propagated into the transport label stack.

all — Specifies that the TTL of the swapped label is propagated into all labels of the transport label stack.

Platforms All

16.280 lsr-load-balancing

lsr-load-balancing

Syntax **lsr-load-balancing** *hashing-algorithm*
no lsr-load-balancing

Context **[Tree]** (config>service>vprn>nw-if>load-balancing lsr-load-balancing)

Full Context configure service vprn network-interface load-balancing lsr-load-balancing

Description This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.

Default no lsr-load-balancing

Parameters **lbl-only** — Only the label is used in the hashing algorithm.

lbl-ip — The IP header is included in the hashing algorithm.

ip-only — The IP header is used exclusively in the hashing algorithm.

eth-encap-ip — The hash algorithm parses down the label stack and once it hits the bottom, the stack assumes Ethernet II non-tagged/dot1q or qinq header follows. At the expected Ethertype offset location, algorithm checks whether the value present is IPv4/v6 (0x0800 or 0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/0x0110). If the secondary check passes, the hash is performed using IP SA/DA fields in the expected IP header; otherwise (if any of the checks failed) label-stack hash is performed.

Platforms All

lsr-load-balancing

Syntax **lsr-load-balancing** {**lbl-only** | **lbl-ip** | **ip-only** | **eth-encap-ip** | **lbl-ip-l4-teid**}
no lsr-load-balancing

Context **[Tree]** (config>router>if>load-balancing lsr-load-balancing)

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Full Context configure router interface load-balancing lsr-load-balancing

Description This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per interface setting.

Default no lsr-load-balancing

Parameters **lbl-only** — Specifies that only the label is used in the hashing algorithm

lbl-ip — Specifies that only the IP header is included in the hashing algorithm.

ip-only — Specifies that only the IP header is used exclusively in the hashing algorithm

eth-encap-ip — Specifies that the hash algorithm parses down the label stack and once it hits the bottom, the stack assumes Ethernet II non-tagged/dot1q or qinq header follows. At the expected Ethertype offset location, algorithm checks whether the value present is IPv4/v6 (0x0800 or0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/ 0x0110). If the secondary check passes, the hash is performed using IP SA/DA fields in the expected IP header; otherwise (any of the check failed) label-stack hash is performed.

lbl-ip-l4-teid — Specifies that this hashing algorithm hashes based on label, IP header, Layer 4 header and GTP header (TEID) in order. The algorithm uses all the supported headers that are found in the header fragment of incoming traffic.

Platforms All

lsr-load-balancing

Syntax **lsr-load-balancing** *hashing-algorithm*
no lsr-load-balancing

Context **[Tree]** (config>system>load-balancing lsr-load-balancing)

Full Context configure system load-balancing lsr-load-balancing

Description This command configures system-wide LSR load balancing. Hashing can be enabled on the label stack and/or IP header at an LSR for spraying labeled IP packets over multiple equal cost paths and/or over multiple links of a LAG group.

The LSR hash routine operates on the label stack and the IP header if a packet is IPv4. An LSR will consider a packet to be IPv4 if the first nibble following the bottom of the label stack is 4. The hash on label and IPv4 and IPv6 headers can be enabled or disabled at the system level or incoming network IP interface level.

Default no lsr-load-balancing

Parameters **lbl-only** — Specifies that only the label is used in the hashing algorithm

lbl-ip — Specifies that the IP header is included in the hashing algorithm

ip-only — Specifies that the IP header is used exclusively in the hashing algorithm

© 2022 Nokia.

Syntax [**no**] **lub-init-min-pir**

Context **[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution lub-init-min-pir)

Full Context configure qos adv-config-policy child-control bandwidth-distribution lub-init-min-pir

Description This command enables new queues associated with a LUB context to use a minimum PIR similar to the effect of the **limit-pir-zero-drain** command. When a queue is initially created in a LUB context, it defaults to a zero value PIR until H-QoS has an opportunity to configure an offered rate based operational PIR. Enabling this command forces a minimum rate operational PIR to be applied to the queue for use by enqueued packets prior to an H-QoS iteration.

The **no** form of this command reverts to default behavior.

Default no lub-init-min-pir

17 m Commands

17.1 ma-index-range

ma-index-range

Syntax **ma-index-range start** *ma-index* **end** *ma-index*
no ma-index-range

Context **[Tree]** (config>eth-cfm>md-auto-id ma-index-range)

Full Context configure eth-cfm md-auto-id ma-index-range

Description This command specifies the range of indexes used by SR OS to automatically assign an index to ETH-CFM associations that are created in model-driven interfaces without an index explicitly specified by the user or client.

An association created with an explicitly-specified index cannot use an index in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **md-auto-id** command for further details.

Parameters **start** *ma-index* — Specifies the lower value of the index range. The value must be less than or equal to the **end** value.

Values 1 to 4294967295

end *ma-index* — Specifies the upper value of the index range. The value must be greater than or equal to the **start** value.

Values 1 to 4294967295

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no mac

Context [Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident mac)
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>host-ident mac)

Full Context configure subscriber-mgmt local-user-db ipoe host host-identification mac
configure subscriber-mgmt local-user-db ppp host host-identification mac

Description This command specifies the MAC address to match for a host lookup.

Note: This command is only used when **mac** is configured as one of the **match-list** parameters.

The **no** form of this command removes the MAC address from the configuration.

Parameters *ieee-address* — Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn interface mac
configure service vprn interface sap eth-cfm mep mac
configure service vprn interface vrrp mac
configure service vprn network-interface mac
configure service vprn subscriber-interface group-interface mac

Description This command assigns a specific MAC address to a VPRN IP interface.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

The **no** form of this command returns the MAC address of the IP interface to the default value.

Default The physical MAC address associated with the Ethernet interface on which the SAP is configured.

Parameters *ieee-mac-address* — Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac

Syntax [**no**] **mac** *ieee-address*

Context **[Tree]** (config>service>vpls>mac-protect mac)

Full Context configure service vpls mac-protect mac

Description This command specifies the 48-bit IEEE 802.3 MAC address.

The **no** form of the command reverts to the default.

Default none

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ieee-address* — Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers.

Platforms All

mac

Syntax **mac** *ieee-address*
no mac [*ieee-address*]

Context **[Tree]** (config>service>ies>if mac)
[Tree] (config>service>ies>sub-if>grp-if mac)

Full Context configure service ies interface mac
configure service ies subscriber-interface group-interface mac

Description This command assigns a specific MAC address to an IES IP interface.

For Routed Central Office (CO), a group interface has no IP address explicitly configured but inherits an address from the parent subscriber interface when needed. For example, a MAC will respond to an ARP request when an ARP is requested for one of the IPs associated with the subscriber interface through the group interface.

The **no** form of this command returns the MAC address of the IP interface to the default value.

Default The physical MAC address associated with the Ethernet interface that the SAP is configured on (the default MAC address assigned to the interface, assigned by the system).

Parameters *ieee-address* — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

- configure service ies subscriber-interface group-interface mac

All

- configure service ies interface mac

mac

Syntax **mac** *ieee-address*
no mac

Context **[Tree]** (config>service>vpls>mcr-default-gtw mac)

Full Context configure service vpls mcr-default-gtw mac

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Description This command relates to a system configured for Dual Homing in L2-TPSDA. It defines the MAC address used when the system sends out a gratuitous ARP on an active SAP after a ring heals or fails in order to attract traffic from subscribers on the ring with connectivity to that SAP.

The **no** form of this command reverts to the default.

Default no mac

Parameters *ieee-address* — Specifies the address in xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format (cannot be all zeros).

Platforms All

mac

Syntax **mac** *ieee-address*
no mac

Context **[Tree]** (config>eth-tunnel mac)
[Tree] (config>lag mac)
[Tree] (config>port>ethernet mac)
[Tree] (config>port>sonet-sdh>path mac)
[Tree] (config>port>tdm>ds1>channel-group mac)
[Tree] (config>port>tdm>ds3 mac)
[Tree] (config>port>tdm>e1>channel-group mac)
[Tree] (config>port>tdm>e3 mac)

Full Context configure eth-tunnel mac
configure lag mac
configure port ethernet mac
configure port sonet-sdh path mac
configure port tdm ds1 channel-group mac
configure port tdm ds3 mac
configure port tdm e1 channel-group mac
configure port tdm e3 mac

Description This command assigns a specific MAC address to an Ethernet port, Link Aggregation Group (LAG), Ethernet tunnel, or BCP-enabled port or sub-port.

Only one MAC address can be assigned to a port. When multiple **mac** commands are entered, the last command overwrites the previous command. When the command is issued while the port is operational, IP will issue an ARP, if appropriate, and BPDUs are sent with the new MAC address.

The **no** form of this command returns the MAC address to the default value.

By default, a MAC address is assigned by the system from the chassis MAC address pool. The use of an all-zeroes MAC address indicates that an operational MAC address should be assigned from the chassis MAC address pool.

Syntax **mac** *ieee-address* [**create**] **black-holemac** *ieee-address* [**create**] **sap** *sap-id* **monitor** {**fwd-status**}
mac *ieee-address* [**create**] **spoke-sdp** *sdp-id:vc-id* **monitor** {**fwd-status**}
no mac ieee-address

Context **[Tree]** (config>service>vpls>static-mac mac)

Full Context configure service vpls static-mac mac

Description This command assigns a conditional static MAC address entry to an SPBM B-VPLS SAP/spoke-SDP allowing external MACs for single and multi-homed operation.

For the 7450 ESS or 7750 SR, this command also assigns a conditional static MAC address entry to an EVPN VPLS SAP/spoke-SDP.

Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Parameters *ieee-address* — Specifies the static MAC address to an SPBM/sdp-binding interface

Values 6-byte mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) Cannot be all zeros.

sap-id — Specifies the SAP identifier

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

sdp-id — Specifies the SDP identifier

Values 1 to 17407

vc-id — Specifies the virtual circuit identifier

Values 1 to 4294967295

create — This keyword is mandatory while creating a static MAC

fwd-status — Specifies that this static mac is based on the forwarding status of the SAP or spoke-SDP for multi-homed operation.

black-hole — Specifies for TLS FDB entries defined on a local SAP the value 'sap', remote entries defined on an SDP have the value 'sdp'.

Platforms All

mac

Syntax [**no**] **mac** *ieee-address*

Context **[Tree]** (config>service>ipipe>sap mac)

Full Context configure service ipipe sap mac

Description This command assigns a specific MAC address to an Ipipe SAP.

The **no** form of this command returns the MAC address of the SAP to the default value.

Default The physical MAC address associated with the Ethernet interface where the SAP is configured.

Parameters *ieee-address* — Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers.

Platforms All

mac

Syntax **mac** *mac-filter-id*
no mac

Context **[Tree]** (config>service>template>epipe-sap-template>egress>filter mac)
[Tree] (config>service>template>epipe-sap-template>ingress>filter mac)

Full Context configure service template epipe-sap-template egress filter mac
configure service template epipe-sap-template ingress filter mac

Description This command associates an existing MAC filter policy with the template.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

Parameters *mac-filter-id* — Specifies the MAC filter policy. The specified filter ID must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters.

Values 1 to 65535

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mac

Syntax **mac** *name*
no mac

Context **[Tree]** (config>service>template>epipe-sap-template>egress>filter-name mac)
[Tree] (config>service>template>epipe-sap-template>ingress>filter-name mac)

Full Context configure service template epipe-sap-template egress filter-name mac
configure service template epipe-sap-template ingress filter-name mac

Description This command associates an existing IP filter policy with the template.

Parameters *name* — Specifies the MAC filter policy name, up to 64 characters.

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mac

Syntax **mac** *ieee-address* [**mask** *six-byte-mask*]
no mac *ieee-address*

Context **[Tree]** (config>service>mac-list mac)

Full Context configure service mac-list mac

Description This command adds a protected MAC address entry.

The **no** form of this command removes the protected MAC address entry.

Parameters *ieee-address* — Specifies the address in xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format (cannot be all zeros), up to 30 characters.

six-byte-mask — Specifies the mask address in xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format (cannot be all zeros), up to 30 characters.

no mac

Context **[Tree]** (config>router>if>vrrp mac)
[Tree] (config>router>if>ipv6>vrrp mac)

Full Context configure router interface ipv6 vrrp mac
configure router interface vrrp mac

Description This command sets an explicit MAC address used by the virtual router instance overriding the VRRP default derived from the VRID.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts using the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

The **mac** command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *mac-address* as the destination MAC is also enabled. The **mac** setting must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts will result. All VRRP advertisement messages are transmitted with *mac-address* as the source MAC.

The command can be configured in both non-owner and owner **vrrp** nodal contexts.

The **mac** command can be executed at any time and takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as backup, the gratuitous ARP and VRRP advertisement message is not sent.

The **no** form of the command restores the default VRRP MAC address to the virtual router instance.

Default no mac — The virtual router instance uses the default VRRP MAC address derived from the VRID.

Parameters *mac-address* — The 48-bit MAC address for the virtual router instance in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC, and non-IEEE reserved MAC addresses.

Context **[Tree]** (config>card>mda>xconnect mac)
[Tree] (config>card>xiom>mda>xconnect mac)

Full Context configure card mda xconnect mac
configure card xiom mda xconnect mac

Description This command creates a loopback in the MAC chip. It does not require the allocation of a faceplate. After the loopback is instantiated, a PXC can be configured on top of it.

For a list of MAC chip IDs per forwarding complex (datapath), use the **show datapath datapath-id** *datapath-id* command.

When considering loopback creation, the operation should consider the MAC chip's bandwidth capacity and the bandwidth utilization of all the faceplate ports connected to it.The selection of MAC chips for loopback creation should be taken into consideration.

The **no** form of this command removes the MAC ID from the configuration.

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *mac-id* — Specifies the MAC ID.

Values 1 to 12

create — Keyword used to create the MAC ID instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

The **no** form of this command disables the generation of the client MAC address RADIUS attribute.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac-address

Syntax **mac-address** *ieee-address*
no mac-address

Context **[Tree]** (config>subscr-mgmt>wlan-gw>ue-query mac-address)

Full Context configure subscriber-mgmt wlan-gw ue-query mac-address

Description This command enables matching on UEs with the specified MAC address.

The **no** form of this command disables matching on the MAC address.

Default no mac-address

© 2022 Nokia.
Use subject to Terms available at: www.nokia.com

Parameters *ieee-address* — Specifies the ethernet MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mac-address

Syntax **mac-address** *mac-address*
no mac-address

Context **[Tree]** (config>eth-ring>path>eth-cfm>mep mac-address)
[Tree] (config>eth-tunnel>path>eth-cfm>mep mac-address)

Full Context configure eth-ring path eth-cfm mep mac-address
configure eth-tunnel path eth-cfm mep mac-address

Description This command specifies the MAC address of the MEP.

The **no** form of this command reverts the MAC address of the MEP back to that of the port (if the MEP is on a SAP) or the bridge (if the MEP is on a spoke SDP).

Parameters *mac-address* — Specifies the MAC address of the MEP.

Values 6-byte unicast mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) of the MEP. Using the all zeros address is equivalent to the **no** form of this command.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address

Syntax **mac-address** *mac-address*
no mac-address

Context **[Tree]** (config>lag>eth-cfm>mep mac-address)
[Tree] (config>port>ethernet>eth-cfm>mep mac-address)
[Tree] (config>router>if>eth-cfm>mep mac-address)

Full Context configure lag eth-cfm mep mac-address
configure port ethernet eth-cfm mep mac-address
configure router interface eth-cfm mep mac-address

Description This command specifies the MAC address of the MEP.

The **no** form of this command reverts to the MAC address of the MEP back to the default, that of the port, since this is SAP based.

Default no mac-address

Parameters *mac-address* — Specifies the MAC address of the MEP.

Values 6-byte unicast mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) of the MEP. Using the all zeros address is equivalent to the no form of this command.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address

Syntax **mac-address** *mac-address*
no mac-address

Context **[Tree]** (config>service>epipe>spoke-sdp>eth-cfm>mep mac-address)

Full Context configure service epipe spoke-sdp eth-cfm mep mac-address

Description This command specifies the MAC address of the MEP.

The **no** form of this command reverts the MAC address of the MEP back to that of the port (if the MEP is on a SAP) or the bridge (if the MEP is on a spoke).

Parameters *mac-address* — Specifies the MAC address of the MEP.

Values 6-byte mac-address in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx of the MEP. Must be unicast. Using the all zeros address is equivalent to the no form of this command.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address

Syntax **mac-address** *mac-address*
no mac-address

Parameters *mac-address* — Specifies the MAC address of the MEP

Values 6-byte mac-address in the form of xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx of the MEP. Must be unicast. Using the all zeros address is equivalent to the no form of this command.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address

Syntax **mac-address** *mac-address*

Context **[Tree]** (config>service>vprn>if>sap>eth-cfm>mep mac-address)
[Tree] (config>service>vprn>if>spoke-sdp>eth-cfm>mep mac-address)
[Tree] (config>service>vprn>sub-if>grp-if>sap>eth-cfm mac-address)

Full Context configure service vprn interface sap eth-cfm mep mac-address
configure service vprn interface spoke-sdp eth-cfm mep mac-address
configure service vprn subscriber-interface group-interface sap eth-cfm mac-address

Description This command assigns a specific MAC address to an IP interface.

The **no** form of this command returns the MAC address of the IP interface to the default value.

Default The physical MAC address associated with the Ethernet interface that the SAP is configured on.

Parameters *mac-address* — Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd*:*ee*:*ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address

Syntax [**no**] **mac-address**

Context **[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes mac-address)
[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes mac-address)

Full Context configure aaa isa-radius-policy acct-include-attributes mac-address
configure aaa isa-radius-policy auth-include-attributes mac-address

Description This command enables the generation of the client MAC address RADIUS attribute.

Default no mac-address

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mac-address

Syntax **mac-address** *mac-address*
no mac-address

Context **[Tree]** (config>system>satellite>eth-sat mac-address)
[Tree] (config>system>satellite>tdm-sat mac-address)

Full Context configure system satellite eth-sat mac-address
configure system satellite tdm-sat mac-address

Description This command configures the MAC address for the associated satellite chassis. This MAC address is used to validate the identity of an satellite that attempts to associate with the local host.

The **no** form of the command deletes the MAC address for the associated satellite.

Parameters *mac-address* — Specifies the MAC address of the associated satellite chassis; do not use a broadcast or multicast MAC. Enter the MAC address in either of the following formats: xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat mac-address

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat mac-address

mac-address

Syntax **mac-address** *ieee-address*
no mac-address *ieee-address*

Context **[Tree]** (config>port>ethernet>dot1x>per-host-authentication>allowed-source-macs mac-address)

Full Context configure port ethernet dot1x per-host-authentication allowed-source-macs mac-address

Description This command configures the host MAC address on the allowed MAC list.

The **no** form of the command deletes the MAC address from the list.

Default no mac

Parameters *ieee-address* — Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx

Platforms All
