About This Guide

This guide describes system concepts and provides configuration explanations and examples to configure 7750 SR-Series boot option file (BOF), file system and system management functions.

This document is organized into functional chapters and provides concepts and descriptions of the implementation flow, as well as Command Line Interface (CLI) syntax and command usage.

Audience

This manual is intended for network administrators who are responsible for configuring the 7750 SR-Series routers. It is assumed that the network administrators have an understanding of networking principles and configurations. Protocols, standards, and processes described in this manual include the following:

- CLI concepts
- File system concepts
- Boot option, configuration, image loading, and initialization procedures
- Basic system management functions such as the system name, router location and coordinates, and CLLI code, time zones, Network Time Protocol (NTP), Simple Network Time Protocol (SNTP), and synchronization properties
List of Technical Publications

The 7750 SR documentation set is composed of the following books:

- 7750 SR OS Basic System Configuration Guide
  This guide describes basic system configurations and operations.

- 7750 SR OS System Management Guide
  This guide describes system security and access configurations as well as event logging and accounting logs.

- 7750 SR OS Interface Configuration Guide
  This guide describes card, Media Dependent Adapter (MDA), and port provisioning.

- 7750 SR OS Router Configuration Guide
  This guide describes logical IP routing interfaces and associated attributes such as an IP address, port, link aggregation group (LAG) as well as IP and MAC-based filtering, VRRP, and Cflowd.

- 7750 SR OS Routing Protocols Guide
  This guide provides an overview of routing concepts and provides configuration examples for RIP, OSPF, IS-IS, Multicast, BGP, and route policies.

- 7750 SR OS MPLS Guide
  This guide describes how to configure Multiprotocol Label Switching (MPLS) and Label Distribution Protocol (LDP).

- 7750 SR OS Services Guide
  This guide describes how to configure service parameters such as service distribution points (SDPs), customer information, and user services.

- 7750 SR OS OAM and Diagnostic Guide
  This guide describes how to configure features such as service mirroring and Operations, Administration and Management (OAM) tools.

- 7750 SR OS Triple Play Guide
  This guide describes Triple Play services and support provided by the 7750 SR and presents examples to configure and implement various protocols and services.

- 7750 SR Quality of Service Guide
  This guide describes how to configure Quality of Service (QoS) policy management.

- OS Multi-Service ISA Guide
  This guide describes services provided by integrated service adapters such as Application Assurance, IPSec, ad insertion (ADI) and Network Address Translation (NAT).
Technical Support

If you purchased a service agreement for your 7750 SR router and related products from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance. If you purchased an Alcatel-Lucent service agreement, contact your welcome center:

Web:  http://www1.alcatel-lucent.com/comps/pages/carrier_support.jhtml
In This Chapter

This chapter provides process flow information to configure basic router and system parameters, perform operational functions with directory and file management, and boot option tasks.

Alcatel-Lucent 7750 SR-Series System Configuration Process

Table 1 lists the tasks necessary to configure boot option files (BOF) and system and file management functions. Each chapter in this book is presented in an overall logical configuration flow. Each section describes a software area and provides CLI syntax and command usage to configure parameters for a functional area. After the hardware installation has been properly completed, proceed with the 7750 SR-Series router configuration tasks in the following order:

In This Chapter

This chapter provides information about using the command-line interface (CLI).

Topics in this chapter include:

- CLI Structure on page 20
- Navigating in the CLI on page 23
- Basic CLI Commands on page 25
- CLI Environment Commands on page 28
- CLI Monitor Commands on page 29
- Getting Help in the CLI on page 30
- The CLI Command Prompt on page 32
- Displaying Configuration Contexts on page 33
- EXEC Files on page 34
- Entering CLI Commands on page 35
- VI Editor on page 47
- Configuration Rollback on page 55
CLI Structure

Alcatel-Lucent’s SR-Series Operating System (OS) CLI is a command-driven interface accessible through the console, Telnet and secure shell (SSH). The CLI can be used for configuration and management of 7750 SR-Series routers.

The 7750 SR OS CLI command tree is a hierarchical inverted tree. At the highest level is the ROOT level. Below this level are other tree levels with the major command groups; for example, configuration commands and show commands are levels below ROOT.

The CLI is organized so related commands with the same scope are at the same level or in the same context. Sublevels or subcontexts have related commands with a more refined scope.

Figure 1 and Figure 2 display the major contexts for router configuration.
Figure 1: Root Commands
Figure 2: Operational Root Commands
Navigating in the CLI

The following sections describe additional navigational and syntax information.

- CLI Contexts on page 23
- Basic CLI Commands on page 25
- CLI Environment Commands on page 28
- CLI Monitor Commands on page 29
- Entering Numerical Ranges on page 40

CLI Contexts

Use the CLI to access, configure, and manage Alcatel-Lucent’s SR-Series routers. CLI commands are entered at the command line prompt. Access to specific CLI commands is controlled by the permissions set by your system administrator. Entering a CLI command makes navigation possible from one command context (or level) to another.

When you initially enter a CLI session, you are in the ROOT context. Navigate to another level by entering the name of successively lower contexts. For example, enter either the `configure` or `show` commands at the ROOT context to navigate to the `config` or `show` context, respectively. For example, at the command prompt, enter `config`. The active context displays in the command prompt.

```
A:ALA-12# config
A:ALA-12>config#
```

In a given CLI context, you can enter commands at that context level by simply entering the text. It is also possible to include a command in a lower context as long as the command is formatted in the proper command and parameter syntax.

The following example shows two methods to navigate to a service SDP ingress level:

Method 1:

```
A:ALA-12# configure service epipe 6 spoke-sdp 2:6 ingress
*A:ALA-12>config>service>epipe>spoke-sdp>ingress#
```

Method 2:

```
A:ALA-12>config# service
A:ALA-12>config>service# epipe 6
*A:ALA-12>config>service>epipe# spoke-sdp 2:6
*A:ALA-12>config>service>epipe>spoke-sdp# ingress
*A:ALA-12>config>service>epipe>spoke-sdp>ingress#
```
The CLI returns an error message when the syntax is incorrect.

*A:ALA-12>config# rooter
   Error: Bad command.
Basic CLI Commands

The console control commands are the commands that are used for navigating within the CLI and displaying information about the console session. Most of these commands are implemented as global commands. They can be entered at any level in the CLI hierarchy with the exception of the password command which must be entered at the ROOT level. The console control commands are listed in Table 2.

Table 2: Console Control Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Ctrl-c&gt;</td>
<td>Aborts the pending command.</td>
<td>72</td>
</tr>
<tr>
<td>&lt;Ctrl-z&gt;</td>
<td>Terminates the pending command line and returns to the ROOT context.</td>
<td>72</td>
</tr>
<tr>
<td>back</td>
<td>Navigates the user to the parent context.</td>
<td>72</td>
</tr>
<tr>
<td>clear</td>
<td>Clears statistics for a specified entity or clears and resets the entity.</td>
<td>73</td>
</tr>
<tr>
<td>echo</td>
<td>Echos the text that is typed in. Primary use is to display messages to the screen within an exec file.</td>
<td>73</td>
</tr>
<tr>
<td>exec</td>
<td>Executes the contents of a text file as if they were CLI commands entered at the console.</td>
<td>73</td>
</tr>
<tr>
<td>exit</td>
<td>Returns the user to the previous higher context.</td>
<td>73</td>
</tr>
<tr>
<td>exit all</td>
<td>Returns the user to the ROOT context.</td>
<td>74</td>
</tr>
<tr>
<td>help</td>
<td>Displays help in the CLI.</td>

<tr>
<td>tree</td>
<td>Displays a list of all commands at the current level and all sublevels.</td>
<td>87</td>
</tr>
<tr>
<td>write</td>
<td>Sends a console message to a specific user or to all users with active console sessions.</td>
<td>87</td>
</tr>
</tbody>
</table>

The list of all system global commands is displayed by entering `help globals` in the CLI. For example:

```
*A:ALA-12>config>service# help globals
back             - Go back a level in the command tree
echo             - Echo the text that is typed in
enable-admin     - Enable the user to become a system administrator
exec             - Execute a file - use -echo to show the commands and prompts on the screen
exit             - Exit to intermediate mode - use option all to exit to root prompt
help             - Display help
history          - Show command history
info             - Display configuration for the present node
logout           - Log off this system
mrinfo           - Request multicast router information
mstat            - Trace multicast path from a source to a receiver and display multicast packet rate and loss information
mtrace           - Trace multicast path from a source to a receiver
oam              + OAM Test Suite
ping             - Verify the reachability of a remote host
pwc               - Show the present working context
sleep            - Sleep for specified number of seconds
ssh              - SSH to a host
telnet           - Telnet to a host
traceroute       - Determine the route to a destination address
tree             - Display command tree structure from the context of execution
write            - Write text to another user
*A:ALA-12>config>service#
```
Table 3 lists describes command syntax symbols.

</table>
CLI Monitor Commands

Monitor commands display specified statistical information related to the monitor subject (such as filter, port, QoS, router, service, and VRRP) at a configurable interval until a count is reached. The CLI monitor commands are found in the root>monitor context of the CLI tree.

The monitor command output displays a snapshot of the current statistics. The output display refreshes with subsequent statistical information at each configured interval and is displayed as a delta to the previous display.

The <Ctrl-c> keystroke interrupts a monitoring process. Monitor command configurations cannot be saved. You must enter the command for each monitoring session. Note that if the maximum limits are configured, you can monitor the statistical information for a maximum of 60 * 999 sec ~ 1000 minutes.

The CLI monitor command contexts are listed in Table 5.

### Table 5: CLI Monitor Command Contexts

<table>

The CLI Command Prompt

By default, the CLI command prompt indicates the device being accessed and the current CLI context. For example, the prompt: **A:ALA-1>config>router>if#** indicates the active context, the user is on the device with hostname ALA-1 in the **configure>router>interface** context. In the prompt, the separator used between contexts is the “>” symbol.

At the end of the prompt, there is either a pound sign (“#”) or a dollar sign (“$”). A “#” at the end of the prompt indicates the context is an existing context. A “$” at the end of the prompt indicates the context has been newly created. New contexts are newly created for logical entities when the user first navigates into the context.

Since there can be a large number of sublevels in the CLI, the **environment** command **reduced-prompt no of nodes in prompt** allows the user to control the number of levels displayed in the prompt.

All special characters (#, $, etc.) must be enclosed within double quotes, otherwise it is seen as a comment character and all characters on the command line following the # are ignored. For example:

*A:ALA-1>config>router# interface "primary#1"

When changes are made to the configuration file a “*” appears in the prompt string (*A:ALA-1) indicating that the changes have not been saved. When an admin save command is executed the “*” disappears. This behavior is controlled in the **saved-ind-prompt** command in the **environment** context.
Displaying Configuration Contexts

The `info` and `info detail` commands display configuration for the current level. The `info` command displays non-default configurations. The `info detail` command displays the entire configuration for the current level, including defaults. The following example shows the output that displays using the `info` command and the output that displays using the `info detail` command.

*ALA-1(config-router)# interface system
*ALA-1(config-router)# if# info
----------------------------------------------
address 10.10.0.1/32
----------------------------------------------
*ALA-1(config-router)# if#

*ALA-1(config-router)# if# info detail

no proxy-arp
icmp
  mask-reply
  redirects 100 10
  unreachable 100 10
  ttl-expired 100 10
exit
no mac
no ntp-broadcast
no cflowd
no shutdown
----------------------------------------------
*ALA-1(config-router)# if#
The `exec` command allows you to execute a text file of CLI commands as if it were typed at a console device.

The `exec` command and the associated exec files can be used to conveniently execute a number of commands that are always executed together in the same order. For example, an `exec` command can be used by a user to define a set of commonly used standard command aliases.

The `echo` command can be used within an `exec` command file to display messages on screen while the file executes.
Entering CLI Commands

Command Completion

The CLI supports both command abbreviation and command completion. If the keystrokes entered are enough to match a valid command, the CLI displays the remainder of the command syntax when the <Tab> key or space bar is pressed. When typing a command, the <Tab> key or space bar invokes auto-completion. If the keystrokes entered are definite, auto-completion will complete the command. If the letters are not sufficient to identify a specific command, pressing the <Tab> key or space bar will display commands matching the letters entered. System commands are available in all CLI context levels.

Unordered Parameters

In a given context, the CLI accepts command parameters in any order as long as the command is formatted in the proper command keyword and parameter syntax. Command completion will still work as long as enough recognizable characters of the command are entered.

The following output shows different **static-route** command syntax and an example of the command usage.

```
*A:ALA-12>config>router# static-route ?
- [no] static-route {<ip-prefix/mask>|<ip-prefix> <netmask>} [preference <preference>]
   [metric <metric>] [tag <tag>] [enable|disable] next-hop <ip-address|ip-int-name>
- [no] static-route {<ip-prefix/mask>|<ip-prefix> <netmask>} [preference <preference>]
   [metric <metric>] [tag <tag>] [enable|disable] indirect <ip-address> [ldp
   [disallow-igp]]
- [no] static-route {<ip-prefix/mask>|<ip-prefix> <netmask>} [preference <preference>]
   [metric <metric>] [tag <tag>] [enable|disable] black-hole
*A:ALA-12>config>router# static-route preference 1 10.1.0.0/16 metric
```
# Editing Keystrokes

When entering a command, special keystrokes allow for editing of the command. Table 7 lists the command editing keystrokes.

<table>
<thead>
<tr>
<th>Editing Action</th>
<th>Keystrokes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete current character</td>
<td>&lt;Ctrl-d&gt;</td>

<td>Enter command and return to root prompt</td>
<td>&lt;Ctrl-z&gt;</td>
</tr>
<tr>
<td>Refresh input line</td>
<td>&lt;Ctrl-l&gt;</td>
</tr>
</tbody>
</table>
Absolute Paths

CLI commands can be executed in any context by specifying the full path from the CLI root. To execute an out-of-context command enter a forward slash “/” or backward slash “\” at the beginning of the command line. The forward slash “/” or backward slash “\” cannot be used with the environment alias command. The commands are interpreted as absolute path. Spaces between the slash and the first command will return an error. Commands that are already global (such as ping, telnet, exit, back, etc.) cannot be executed with a forward slash “/” or backward slash “\” at the beginning of the command line.

*A:ALA-12# configure router
A:ALA-12>config>router# interface system address 1.2.3.4
*A:ALA-12>config>router# /admin save
*A:ALA-12>config>router# \clear router interface
*A:ALA-12>config>router#

The command may or may not change the current context depending on whether or not it is a leaf command. This is the same behavior the CLI performs when CLI commands are entered individually, for example:

*A:ALA-12# admin
*A:ALA-12>admin# save
or
*A:ALA-12# admin save
*A:ALA-12#

Note that an absolute path command behaves the same as manually entering a series of command line instructions and parameters.

For example, beginning in an IES context service ID 4 (IES 4),

**CLI Syntax:** config>service>ies> /clear card 1

behaves the same as the following series of commands.

**Example:**

```
cfg>service>ies>exit all
clear card 1
configure service ies 4 (returns you to your starting point)
```

```python
cfg>service>ies
```
If the command takes you to a different context, the following occurs:

**CLI Syntax:** config>service>ies>/configure service ies 5 create

becomes

**Example:**
- config>service>ies>exit all
- configure service vpls 5 create
- config>service>vpls>
History

The CLI maintains a history of the most recently entered commands. The history command displays the most recently entered CLI commands.

*A:ALA-1# history

Entering Numerical Ranges

The 7750 SR OS CLI allows the use of a single numerical range as an argument in the command line. A range in a CLI command is limited to positive integers and is denoted with two numbers enclosed in square brackets with two periods (“..”) between the numbers:

\[x..y]\]

where \(x\) and \(y\) are positive integers and \(y-x\) is less than 1000.

For example, it is possible to shut down ports 1 through 10 in Slot 1 on MDA 1. A port is denoted with “slot/mda/port”, where slot is the slot number, mda is the MDA number and port is the port number. To shut down ports 1 through 10 on Slot 1 and MDA 1, the command is entered as follows:

```
configure port 1/1/[1..10] shutdown
```

<Ctrl-C> can be used to abort the execution of a range command.

Specifying a range in the CLI does have limitations. These limitations are summarized in Table 8.

<table>
<thead>
<tr>
<th>Limitation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only a single range can be specified.</td>
<td>It is not possible to shut down ports 1 through 10 on MDA 1 and MDA 2, as the command would look like <code>configure port 1/[1..2]/[1..10]</code> and requires two ranges in the command, [1..2] for the MDA and [1..10] for the port number.</td>
</tr>
<tr>
<td>Ranges within quotation marks are</td>
<td>In the CLI, enclosing a string in quotation marks (&quot;string&quot;) causes the string to be treated literally and as a single parameter. For example, several commands in the CLI allow the configuration of a descriptive string. If the string is more than one word and includes spaces, it must be enclosed in quotation marks. A range that is enclosed in quotes is also treated literally. For example, <code>configure router interface &quot;A[1..10]&quot; no shutdown</code> creates a single router interface with the name “A[1..10]”. However, a command such as: <code>configure router interface A[1..10] no shutdown</code> creates 10 interfaces with names A1, A2 .. A10.</td>
</tr>
</tbody>
</table>
Table 8: CLI Range Use Limitations  (Continued)

<table>
<thead>
<tr>
<th>Limitation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The range cannot cause a change in contexts.</td>
<td>Commands should be formed in such a way that there is no context change upon command completion. For example, <code>configure port 1/1/[1..10]</code> will attempt to change ten different contexts. When a range is specified in the CLI, the commands are executed in a loop. On the first loop execution, the command changes contexts, but the new context is no longer valid for the second iteration of the range loop. A “Bad Command” error is reported and the command aborts.</td>
</tr>
<tr>
<td>Command completion may cease to work when entering a range.</td>
<td>After entering a range in a CLI command, command and key completion, which normally occurs by pressing the &lt;Tab&gt; or spacebar, may cease to work. If the command line entered is correct and unambiguous, the command works properly; otherwise, an error is returned.</td>
</tr>
</tbody>
</table>
Pipe/Match

The 7750 SR OS supports the pipe feature to search one or more files for a given character string or pattern.

**Note:** When using the pipe/match command the variables and attributes must be spelled correctly. The attributes following the command and must come before the expression/pattern. The following displays examples of the pipe/match command to complete different tasks:

- Task: Capture all the lines that include “echo” and redirect the output to a file on the compact flash:

  `admin display-config | match “echo” > cf3cf1:\echo_list.txt`

- Task: Display all the lines that do not include “echo”:

  `admin display-config | match invert-match “echo”`

- Task: Display the first match of “vpls” in the configuration file:

  `admin display-config | match max-count 1 “vpls”`

- Task: Display everything in the configuration after finding the first instance of “interface”:

  `admin display-config | match post-lines 999999 interface`

Command syntax:

```
match pattern context {parents | children | all} [ignore-case] [max-count lines-count] [expression]

match pattern [ignore-case] [invert-match] [pre-lines pre-lines] [post-lines lines-count] [max-count lines-count] [expression]
```

where:

- **pattern**: string or regular expression
- **context**: display context associated with the matching line
- **parents**: display parent context information
- **children**: display child context information
- **all**: display both parent and child context information
- **ignore-case**: keyword
- **max-count**: display only a specific number of instances of matching lines
- **lines-count**: 1 — 2147483647
- **expression**: pattern is interpreted as a regular expression
- **invert-match**: keyword
- **pre-lines**: display some lines prior to the matching line
- **pre-lines**: 0 — 100
- **post-lines**: display some lines after the matching line
- **post-lines**: 1 — 2147483647
For example:

```
A:Dut-C# show log log-id 98 | match ignore-case "sdp bind"
"Status of SDP Bind 101:1002 in service 1001 (customer 1) changed to admin=up oper=up flags="
"Processing of a SDP state change event is finished and the status of all affected SDP Bindings on SDP 101 has been updated."

A:Dut-C# show log log-id 98 | match max-count 1 "service 1001"
"Status of service 1001 (customer 1) changed to administrative state: up, operational state: up"

A:Dut-C# admin display-config | match post-lines 5 max-count 2 expression "OSPF.*Config"
echo "OSPFv2 Configuration"
#--------------------------------------------------
    ospf
    timers
        spf-wait 1000 1000 1000
    exit

Redirection

The 7750 SR OS supports redirection (”>”) which allows the operator to store the output of a CLI command as a local or remote file. Redirection of output can be used to automatically store results of commands in files (both local and remote).

'ping <customer_ip> > cf3cf1:/ping/result.txt'
'ping <customer_ip> > ftp://ron@ftp.alcatel.com/ping/result.txt'

In some cases only part of the output might be applicable. The pipe/match and redirection commands can be combined:

ping 10.0.0.1 | match expression "time.\d+" > cf3cf1:/ping/time.txt

This records only the RTT portion (including the word “time”).
**VI Editor**

Note that “vi”ual editor (vi) is a file editor that can edit any ASCII file. This includes configuration, exec files, BOF and any other ASCII file on the system.

VT100 terminal mode is supported. However, if a different terminal mode is configured there will no noticeable negative effect.

When a configuration file is changed, a validation check is executed to see if the user is allowed to view or perform configuration changes. When a user is modifying the configuration file using the vi editor these checks do not occur. Because of this, the vi editor is only available to a user with administrator privileges. Should others require access to the vi editor, their profile must be modified allow the access. Access permission for the file directory where the file resides must be performed before a user can opens, read, or write a file processing command. If a user does not have permission to access the directory then the operation must be denied.

When opening a file, a resource check verifies that sufficient resources are available to process that file. If there are not enough resources, then the operation is denied and the operator is informed of that event.

Multiple sessions are allowed and are limited only by the memory resources available on the node.

---

**Summary of vi Commands**

The vi editor operates in two modes:

- **Command mode** — This mode causes actions to be taken on the file.
  
  In the this mode, each character entered is a command that does something to the text file being edited; a character typed in the command mode may even cause the vi editor to enter the insert mode.

- **Insert mode** — Entered text is inserted into the file.
  
  In the insert mode, every character typed is added to the text in the file. Hitting the Esc (Escape) key turns off the insert mode.
Using the vi Commands

Use the following commands to start and end vi edit sessions, move around in a file, enter new text, modify, move, and delete old text, as well as read from and write to files other files. Although there are numerous vi commands, only a few are usually sufficient to vi users. The following tables list vi commands.

• Cutting and Pasting/Deleting Text in vi on page 48
• Inserting New Text on page 49
• Moving the Cursor Within the File on page 49
• Moving the Cursor Around the Screen on page 51
• Replacing Text on page 51
• Searching for Text or Characters on page 52
• Manipulating Character/Line Formatting on page 53
• Saving and Quitting on page 53
• Miscellaneous on page 53

Table 11: Cutting and Pasting/Deleting Text in vi

<table>
<thead>
<tr>
<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;</td>
<td>Specify a buffer to be used any of the commands using buffers. Follow the &quot; character with a letter or a number, which corresponds to a buffer.</td>
</tr>
<tr>
<td>d</td>
<td>Deletes text. “dd” deletes the current line. A count deletes that many lines. Whatever is deleted is placed into the buffer specified with the &quot; command. If no buffer is specified, then the general buffer is used.</td>
</tr>
<tr>
<td>D</td>
<td>Delete to the end of the line from the current cursor position.</td>
</tr>
<tr>
<td>p</td>
<td>Paste the specified buffer after the current cursor position or line. If no buffer is specified (with the &quot; command.) then 'p' uses the general buffer.</td>
</tr>
<tr>
<td>P</td>
<td>Paste the specified buffer before the current cursor position or line. If no buffer is specified (with the &quot; command.) then P uses the general buffer.</td>
</tr>
<tr>
<td>x</td>
<td>Delete character under the cursor. A count tells how many characters to delete. The characters will be deleted after the cursor.</td>
</tr>
<tr>
<td>X</td>
<td>Delete the character before the cursor.</td>
</tr>
<tr>
<td>y</td>
<td>Yank text, putting the result into a buffer. yy yanks the current line. Entering a number yanks that many lines. The buffer can be specified with the &quot; command. If no buffer is specified, then the general buffer is used.</td>
</tr>

<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>,</td>
<td>Repeat the last f, F, t or T command in the reverse direction.</td>
</tr>
</tbody>
</table>
| /          | Search the file downwards for the string specified after the /.
| ;          | Repeat the last f, F, t or T command. |
| ?          | Search the file upwards for the string specified after the ?.
| F          | Search the current line backwards for the character specified after the 'F' command. If found, move the cursor to the position. |
| N          | Repeat the last search given by / or ?, except in the reverse direction. |
| T          | Search the current line backwards for the character specified after the 'T' command, and move to the column after the if it's found. |
| f          | Search the current line for the character specified after the 'f' command. If found, move the cursor to the position. |
| n          | Repeat last search given by / or ?. |
| t          | Search the current line for the character specified after the 't' command, and move to the column before the character if it's found. |
### Table 17: Manipulating Character/Line Formatting

<table>
<thead>
<tr>
<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>~</td>
<td>Switch the case of the character under the cursor.</td>
</tr>
<tr>
<td>&lt;</td>
<td>Shift the lines up to where to the left by one shiftwidth. <code>&lt;&lt;</code> shifts the current line to the left, and can be specified with a count.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Shift the lines up to where to the right by one shiftwidth. <code>&gt;&gt;</code> shifts the current line to the right, and can be specified with a count.</td>
</tr>
<tr>
<td>J</td>
<td>Join the current line with the next one. A count joins that many lines.</td>
</tr>
</tbody>
</table>

### Table 18: Saving and Quitting

<table>
<thead>
<tr>
<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZZ</td>
<td>Exit the editor, saving if any changes were made.</td>
</tr>
</tbody>
</table>

### Table 19: Miscellaneous

<table>
<thead>
<tr>
<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^G</td>
<td>Show the current filename and the status.</td>
</tr>
<tr>
<td>^L</td>
<td>Clear and redraw the screen.</td>
</tr>
<tr>
<td>^R</td>
<td>Redraw the screen removing false lines.</td>
</tr>
<tr>
<td>^[</td>
<td>Escape key. Cancels partially formed command.</td>
</tr>
<tr>
<td>^^</td>
<td>Go back to the last file edited.</td>
</tr>
<tr>
<td>!</td>
<td>Execute a shell. Not supported</td>
</tr>
<tr>
<td>&amp;</td>
<td>Repeat the previous <code>:s</code> command.</td>
</tr>
<tr>
<td>.</td>
<td>Repeat the last command that modified the file.</td>
</tr>
<tr>
<td>:</td>
<td>Begin typing an EX editor command. The command is executed once the user types return.</td>
</tr>
<tr>
<td>@</td>
<td>Type the command stored in the specified buffer.</td>
</tr>
<tr>
<td>U</td>
<td>Restore the current line to the previous state before the cursor entered the line.</td>
</tr>
<tr>
<td>m</td>
<td>Mark the current position with the character specified after the 'm' command.</td>
</tr>
<tr>
<td>u</td>
<td>Undo the last change to the file. Typing 'u' again will re-do the change.</td>
</tr>
</tbody>
</table>
EX Commands

The vi editor is built upon another editor, called EX. The EX editor only edits by line. From the
vi editor you use the : command to start entering an EX command. This list given here is not
complete, but the commands given are the more commonly used. If more than one line is to be
modified by certain commands (such as :s and :w) the range must be specified before the
command. For example, to substitute lines 3 through 15, the command is :3,15s/from/this/g.

Table 20: EX commands

<table>
<thead>
<tr>
<th>vi Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>:ab string strings</td>
<td>Abbreviation. If a word is typed in vi corresponding to string1, the editor automatically inserts the corresponding words. For example, the abbreviation :ab usa United States of America would insert the words, United States of America whenever the word usa is typed in.</td>
</tr>
<tr>
<td>:map keys</td>
<td>Mapping. This lets you map a key or a sequence of keys to another key or a sequence of keys.</td>
</tr>
<tr>
<td>:q</td>
<td>Quit vi. If there have been changes made, the editor will issue a warning message.</td>
</tr>
<tr>
<td>:q!</td>
<td>Quit vi without saving changes.</td>
</tr>
<tr>
<td>:s/pattern/to_pattern/options</td>
<td>Substitute. This substitutes the specified pattern with the string in the to_pattern. Without options, it only substitutes the first occurrence of the pattern. If a 'g' is specified, then all occurrences are substituted. For example, the command :1,$s/Alcatel/Alcatel-Lucent/g substitutes all occurrences of Alcatel to Alcatel-Lucent.</td>
</tr>
<tr>
<td>:set [all]</td>
<td>Sets some customizing options to vi and EX. The :set all command gives all the possible options.</td>
</tr>
<tr>
<td>:una string</td>
<td>Removes the abbreviation previously defined by :ab.</td>
</tr>
<tr>
<td>:unm keys</td>
<td>Removes the remove mapping defined by :map.</td>
</tr>
<tr>
<td>:vi filename</td>
<td>Starts editing a new file. If changes have not been saved, the editor will give you a warning.</td>
</tr>
<tr>
<td>:w</td>
<td>Write out the current file.</td>
</tr>
<tr>
<td>:w filename</td>
<td>Write the buffer to the filename specified.</td>
</tr>
<tr>
<td>:w &gt;&gt; filename</td>
<td>Append the contents of the buffer to the filename.</td>
</tr>
<tr>
<td>:wq</td>
<td>Write the buffer and quit.</td>
</tr>
</tbody>
</table>
Configuration Rollback

The Configuration Rollback feature provides the ability to “undo” configuration and reverts back to previous router configuration states while minimizing impacts to services.

This feature gives the operator better control and visibility over the router configurations and reduces operational risk while increasing flexibility and providing powerful recovery options.

Configuration Rollback is useful in cases where configuration changes are made but the operator later decides to not keep the changes (for example, experimentation or when problems are identified in the configuration during actual network operation).

The advantage of this feature are the following:

- Changes made to router configuration is performed with minimal impact on services being provided by the SR by not having to reboot the router.
- No impact in areas of configuration that did not change.

With this rollback feature, the operator can smoothly revert to previous configurations.

Configuration parameters that changed (or items that changed configuration have dependencies on) are first removed (revert to default), and the previous values are then restored (can be briefly service impacting in changed areas).

A history of changes is preserved (checkpoint ids) that allows rollback to different points, as well as examination of changes made as shown in Figure 3.

![Figure 3: Rollback Operation](image-url)
Feature Behavior

The following list describes detailed behavior and CLI usage of the rollback feature:

- The user can create a rollback checkpoint, and later, revert to this checkpoint with minimal impacts to services:
  
  ```
  admin>rollback# save [comment <comment-string>]
  comment-string: an 255 char comment associated with the checkpoint
  ```

- Rollback checkpoints include all current operationally active configuration:
  - Changes from direct CLI commands in the configuration branch.
  - SNMP sets

- Rollback checkpoints do not include bof configuration. The BOF file (and bof config) is not part of a rollback-save or rollback. A rollback does not change any of the bof configuration. The BOF contains basic information for the node and does not change frequently (mostly during initial commissioning of the node).

- A rollback save feature can be automatically executed (scheduled, for example, monthly) using the cron facility of SR-OS.

- The latest rollback checkpoint file uses a suffix of “.rb”. The next latest rollback checkpoint file has a suffix of “.rb.1”, the next oldest has a suffix of “.rb.2” etc:
  
  ```
  file-url.rb ---- latest rollback file
  file-url.rb.1
  ...
  file-url.rb.9 ---- oldest rollback file
  ```

- When a `rollback save [no “-”]` is executed, the system shifts the file suffix of all the previous checkpoints by 1 (new id = old id + 1). If there are already as many checkpoint files as the maximum number supported then the last checkpoint file is deleted.

- The maximum number of rollback checkpoints is configurable and defaults to 10 (“latest” and 1 through 9, where checkpoint file 9 is deleted during the next rollback-save).

- The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The `file-url` must not contain a suffix (just a path/directory + filename). The suffix for rollback checkpoint files is “.rb” and is automatically appended to rollback checkpoint files.

  ```
  config>system>rollback# rollback-location <file-url>
  ```

- There is no default rollback-location. If one is not specified (or it is cleared using “no rollback-location”) and a rollback save is attempted, the rollback save will fail and return an error message.

- The entire set of rollback checkpoint files can be copied from the active CPM CF to the inactive CPM CF. This synchronization is done via the following command:

  ```
  admin>redundancy# rollback-sync
  ```
• The operator can enable automatic synchronization of rollback checkpoint files between the active CPM and inactive CPM. When this automatic synchronization is enabled, a rollback save will cause the new checkpoint file to be saved to both the active and standby. The suffixes of the old checkpoint files on both active and standby CPMs are incremented.

Note: The automatic sync only causes the ONE new checkpoint file to be copied to both CFs (the other 9 checkpoints are not automatically copied from active to standby but that can be done manually with admin red rollback-sync).

```
config>redundancy# [no] rollback-sync
```

• “config red sync {boot-env|config}” and “admin red sync {boot-env|config}” do not apply to rollback checkpoint files. These commands do not manually or automatically sync rollback checkpoint files. The dedicated rollback-sync commands must be used to sync rollback checkpoint files.

• Rollback files can be deleted using a dedicated rollback checkpoint deletion command.

```
admin>rollback# delete {latest-rb|<checkpoint-id>}
```

− Deleting a rollback checkpoint causes the suffixes to be adjusted (decremented) for all checkpoints older that the one that was deleted (to close the “hole” in the list of checkpoint files and create room to create another checkpoint)

− If “config redundancy rollback-sync” is enabled, a rollback delete will also delete the equivalent checkpoint on the standby CF and shuffle the suffixes on the standby CF.

− If an operator manually deletes a rollback checkpoint file (using file delete) then the suffixes of the checkpoint files are NOT shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a “hole” in the checkpoint file list until enough new checkpoints have been created to roll the “hole” off the end of the list.

• As shown in Figure 4, support for rolling back to a previous configuration (a saved rollback checkpoint) with minimal impact on services. The previous configuration will be loaded and take operational effect:

```
admin>rollback# revert [latest-rb|<checkpoint-id>]
```
A rollback revert does not affect the currently stored rollback checkpoint files (no deletions or renumbering). This means that if an operator issues a “rollback revert 3” and then issues a “rollback-save”. The resulting rollback checkpoint files “file-url.rb” and “file-url.rb.4” will contain the same rollback state/configuration.

• The **boot-good-exec** or **bad-exec** are not automatically executed after a rollback.
• impacts to the running services are minimized during a rollback:
  – no impact in areas of configuration that did not change
  – configuration parameters that changed (or items that changed config have dependencies on) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas). Some examples are the following:
    – If the currently active config contains “configure port 5/1/1 dwdm tdcm dispersion -1000” and the rollback checkpoint contains “configure port 5/1/1 dwdm tdcm dispersion -1010”, then the operational dispersion will transition from -1000, to 0 and then back to -1010 for port 5/1/1 which will cause a traffic interruption.
    – Changing the neighbor of a MC-APS port will start with neighbor 1, then be configured as no neighbor, and then will be configured with neighbor 2. Moving through the ‘no neighbor’ intermediate state requires the working and protect circuits to be torn down and then rebuilt.
• A rollback will undo any SNMP sets or direct CLI config commands that occurred since the last checkpoint creation.
• During the period when an SR-OS node is processing a rollback revert, both CLI commands (from other users) and SNMP commands will continue to be processed. The only commands that are blocked during a rollback revert are other rollback commands including revert, save, and compare (only one rollback command can be executing at a time in one node).
• Commands are available to view and compare the various rollback checkpoints to current operating and candidate configurations.
• Rollback checkpoint files are not guaranteed to be in any particular format. They are not interchangeable with normal config files or exec scripts. A normal config file (from an admin save) cannot be renamed as a rollback checkpoint and then referenced for a rollback revert operation. Only rollback checkpoint files generated with rollback save can be used to rollback revert.
• If a hardware change is made after a rollback-save then:
  – a rollback can be executed as long as the hardware change was an addition of hardware to the node (for example, added a new IOM into a previously empty slot).
  – a rollback is not guaranteed to work if hardware was removed or changed (for example, IOM was removed, or MDA was swapped for a different MDA type).
• Rollback across a change to the following parameters is not supported:
  – chassis-mode
  – mixed-mode
  – the sr|ess capability of a card (‘configure card capability sr|ess’).
• Rollback is supported even after an admin reboot is performed (or changes the primary config in the bof is changed and an admin reboot is performed). Admin reboot does not “break the chain” for rollback.

• Lawful Intercept configuration under the config>li branch is not affected by a rollback or rescue. LI configuration is not saved in the rollback checkpoint or rescue file, and a rollback revert does not touch any config under the config>li branch.

• Any configuration or state change performed under the debug branch of CLI is not saved in the rollback checkpoint file nor impacted by a rollback.

• Rollbacks to a checkpoint created in a more recent release is not supported (for example, node running in 9.0r5 can not rollback to a checkpoint created in 9.0r7).

• The following list captures some side effects and specific behaviors of a Rollback revert. Some of these side effects are not related purely to configuration (that is, in the CLI config branch) and may have interactions with tools commands, RADIUS, etc.

  – SAA jobs that are running when a rollback revert is initiated, and need configuration changes due to the rollback, will be stopped. If the SAA job is a continuous type then it will be re-started as part of the rollback revert after the config changes have been applied (just as if the operator had typed “no shutdown” for the continuos SAA job). Non-continuous SAA jobs that were modified by the rollback would need to be manually restarted if they need to be run again.

  – If max-nbr-mac-addr is reduced as part of the revert and the number of mac addresses in the forwarding database is greater than the max-nbr-mac-addr, then the rollback is aborted (before any actions are taken) and an informative error message is provided. The operator must take actions to remove the mac addresses if they wish to proceed with the rollback.

  – If active subscribers and/or subscriber hosts and/or DHCP lease state are present in the system then some associated configuration changes may be blocked (just as those same changes would be blocked if an operator tried to make them via CLI – e.g. trying to delete an sla-profile being used by active subscriber hosts, or trying to change a nat-policy in a sub-profile). If certain configuration changes associated with the hosts or lease states are required as part of the rollback but those changes are blocked, then for each blocked configuration item a warning will be printed, that particular configuration item will not be changed and the rollback will continue.

  – If a force-switchover command (for example, tools perform service id 1 endpoint "x" force-switchover spoke-sdp-fec 1) has been applied to a spoke-sdp-fec of a dynamic multi-segment pseudo wire, and a rollback revert needs to change the admin state of the spoke-sdp-fec (for example, to modify spoke-sdp-fec parameters that may be
dependant on admin state), then the rollback revert will automatically remove the force-switchover and the node will revert to whatever is the best spoke-sdp in the redundant set.

- Configuration changes that require a **shutdown** command and then **no-shutdown** command to be done by an operator in order to take operational effect also need this manual shut/no-shut to be performed by the operator in order to take operational effect after a rollback if the rollback changes those configuration items. Some examples include:
  - changes to Autonomous System or Confederation value require a BGP shut/no-shut
  - changes to VPRN Max-routes requires a shut/no-shut on the VPRN service
  - changes to OSPF/ISIS export-limit require a shut/no-shut on OSPF/ISIS.

- Any uncommitted changes (that is, the **begin** command was entered, some changes made, but the **commit** command was never entered) in the following areas will be lost/cleared when a rollback revert is initiated:
  - configure>application-assurance>group policy
  - configure>router>policy-options
  - configure>system>sync-if-timing

- Some **card** and **mda** commands require a reboot, remove or rebuild of an entire card or MDA. When these commands need to be executed as part of a rollback, the impacted cards/mdas will be listed in a warning and the operator will be prompted with a single y/n prompt to decide whether to proceed or not. This prompting will not occur for a rollback initiated via SNMP, nor if the operator uses the ‘now’ keyword with the rollback revert command. Some examples of card and mda commands that may cause a prompt are:
  - configure>card>card-type
  - configure>card>named-pool-mode
  - configure>card>mda
  - configure>card>mda>mda-type

- Although the use of the Control-C key combination is not recommended during a rollback revert, it is supported (via CLI or SNMP). Interrupting a rollback revert may leave the router in a state that is not necessarily something between the old active config and the rollback checkpoint since the rollback processing may have been in the middle of tearing things down or rebuilding configurations. A strong warning is issued in this case to indicate that the operator must examine the config and potentially issue another rollback revert to return to a known (and coherent) configuration.

- An HA CPM switchover during a rollback revert will cause the rollback operation to abort. The newly active CPM will have an indeterminate configuration. When an HA switchover occurs during a rollback (or within a few seconds of a rollback completing), the operator is advised to repeat the rollback revert operation to the same checkpoint.
MIB Requirements

The Table 21 lists events and traps that are supported for 9.0r4 release:

Table 21: Supported Events and Traps

<table>
<thead>
<tr>
<th>Event/Traps</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tmnxSysRollbackStarted</td>
<td>A rollback revert was initiated</td>
</tr>
<tr>
<td>tmnxSysRollbackStatusChange</td>
<td>A rollback revert has finished</td>
</tr>
<tr>
<td>tmnxSysRollbackSaveStatusChange</td>
<td>A rollback save has finished</td>
</tr>
</tbody>
</table>

The following operations are supported via SNMP:

- initiate a rollback save
- initiate a rollback revert <latest-b | checkpoint-id >
- configure the rollback save locations
- obtain rollback save status
- obtain rollback revert status
- configure rollback-sync and do an admin red rollback-sync
- read the list of rollback files (like in show system rollback)

Additional notes on interactions between the 7x50 and SAM:

- When the node is doing a rollback revert, SAM will see a tmnxSysRollbackStarted trap, then a rapid set of “config change” traps, and then finally, the tmnxSysRollbackStatusChange trap.
- During the period when an SR-OS node is processing a rollback revert, both CLI commands (from other users) and SNMP commands will continue to be processed.
Rescue Configuration

A special rescue configuration checkpoint can be created that an operator can rollback revert to at any time. The rescue configuration has its own keyword (“rescue”) and does not use the same rolling suffix indices as the normal rollback checkpoints. This allows the operator to easily return to the rescue configuration state without having to consider a checkpoint index, and ensures that the rescue checkpoint is always available (doesn’t roll off the bottom of the list of checkpoints).

The operator should define a basic rescue configuration that is known to work and give correct management access to the node.

The location and filename of the rescue file are configurable. SR-OS appends an “.rc” suffix to the specified rescue filename.
Operational Guidelines

The following points offer some operational guidance on the usage of rollback.

- Both “admin save” and “rollback save” should be done periodically:
  - “admin save” to backup a complete config file that can be used during router reboot.
    - Used with a reboot as a last resort.
    - Do an admin save after any major h/w changes or major service changes.
    - should be done after any s/w upgrade.
  - “rollback-save” to create a rollback checkpoint.
    - used for intermediate checkpoints that can be recovered with minimal impacts to services.
    - should be done each time that a moderate amount configuration changes have been made.
    - should be done after any h/w changes.
    - should be done after any s/w upgrade.
    - could also be scheduled with cron (for example, once every 1 or 2 weeks).
- A new rescue-save must be created when h/w is changed.
- Rollback-checkpoint files are not editable nor compatible/interchangeable with config files (generated with “admin save”).
- Don’t just keep doing rollback save, rollback save, rollback save over the course of weeks/months without also doing an occasional admin save. If you really get into a bad situation you may have to use one of your admin save configs as the primary config for an admin reboot.
- Software Upgrade: It is recommended to create a Rollback Checkpoint (admin rollback save), in addition to saving the configuration (admin save), after an upgrade has been performed and the system is operating as expected. This will ensure a good checkpoint fully compatible with the new release is available at a point shortly after the upgrade.
- An operator could create a set of rollback checkpoints to support busy/quiet days or weekend/weekday and use cron to shift between them.
- It may be a good idea to create a rollback checkpoint before a rollback revert is initiated (especially if there have been significant config changes since the last checkpoint was created). If the rollback is especially significant (a lot of major changes) it is also a good practice to do an “admin save” just in case a full reboot is required to recover from an issue.
- A rollback failure may occur in some limited cases where the node needs a long time to complete one of the resulting configuration changes. Some examples include X and Y. If a rollback (for example, rollback revert 5) fails during execution, it should be attempted
again. The second attempt will typically complete the remaining configuration changes required to fully revert to the desired checkpoint.

- When a new backup CPM is commissioned, the user should do an “admin redundancy rollback-sync” to copy the entire set of rollback files from the active CPM cf to the new standby CPM cf. If the operator wants the system to automatically copy new rollback checkpoints to both cfs whenever a new checkpoint is created, then the “config redundancy rollback-sync” should be configured.

- An HA CPM switchover during a rollback revert will cause the rollback operation to abort. The newly active CPM will have an indeterminate configuration. A log event is created in this case to warn the operator. When an HA switchover occurs during a rollback (or within a few seconds of a rollback completing), the operator is advised to repeat the rollback revert operation to the same checkpoint.

- A rollback checkpoint stores the rollback-location and the local/remote-max-checkpoint values, and as such a rollback revert operation can change those values. If an operator changes the local/remote-max-checkpoint values it is recommended to delete all the existing checkpoints (otherwise a subsequent rollback revert could change the max back to a previous value).

- If a warning prompt (y/n) is displayed when a rollback revert is initiated, it is highly suggested to respond ‘no’ to the warning prompt the first time, save a rollback checkpoint before attempting this rollback revert, and then executing the revert again and responding ‘yes’. If the rollback encounters problems then a revert to the saved checkpoint can be used to go back to the initial configuration state.
Basic Command Reference

Command Hierarchies

- Basic CLI Commands
- Environment Commands
- Monitor Commands

Basic CLI Commands

- back
- clear
- echo [text-to-echo] [extra-text-to-echo] [more-text]
- enable-admin
- exec [-echo] [-syntax] filename
- exit [all]
- help
- history
- info [detail]
- logout
- mrinfo [ip-address | dns-name] [router router-instance]
- mstat source [ip-address | dns-name] [group grp-ip-address] [destination dst-ip-address] [hop hop] [router router-instance] [wait-time wait-time]
- mtrace source [ip-address | dns-name] [group grp-ip-address] [destination dst-ip-address] [hop hop] [router router-instance] [wait-time wait-time]
- password
- ping [ip-address | dns-name] [rapid | detail] [ttl time-to-live] [tos type-of-service] [size bytes] [pattern pattern] [source ip-address] [interval seconds] [next-hop ip-address] [interface interface-name] [bypass-routing] [count requests] [do-not-fragment] [router [router-instance]] [timeout timeout]
- pwc [previous]
- sleep [seconds]
- ssh [ip-addr | dns-name [username@ip-addr] [-1 username] [-v SSH-version] [router router-instance] service-name service-name]
- telnet [ip-address] dns-name [port] [router router-instance]
- traceroute [ip-address | dns-name] [ttl value] [wait milliseconds] [no-dns] [source ip-address] [tos type-of-service]
- tree [detail]
- write {user | broadcast} message-string
Monitor Commands

```
monitor
  - cag cag-id [path {a | b}] [type {sap-sap | sap-net | net-sap}] [interval seconds] [repeat repeat]
    [absolute | rate]
  - cpm-filter
    - ip entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
    - ipv6 entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
  - filter
    - ip ip-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
    - ipv6 ipv6-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]
    - mac mac-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

    — sdp sdp-id [far-end] ip-address [interval seconds] [repeat repeat] [absolute | rate]
  — subscriber sub-ident-string sap sap-id sla-profile sla-profile-name [base] ingress-queue-id ingress-queue-id | egress-queue-id egress-queue-id [interval seconds] [repeat repeat]
    [absolute | rate]
Environment Commands

```plaintext
<root>
  — environment
    — alias alias-name alias-command-name
    — no alias alias-name
    — [no] create
    — [no] more
    — reduced-prompt [no. of nodes in prompt]
    — no reduced-prompt
    — [no] saved-ind-prompt
    — terminal
      — length lines
      — width width
    — time-display [local | utc]
```
Basic CLI Commands

Global Commands

enable-admin

Syntax    

Context    
<global>

Description

**NOTE:** See the description for the `admin-password` command. If the `admin-password` is configured in the `config>system>security>password` context, then any user can enter a special administrative mode by entering the `enable-admin` command.

`enable-admin` is in the default profile. By default, all users are given access to this command.

Once the `enable-admin` command is entered, the user is prompted for a password. If the password matches, the user is given unrestricted access to all the commands.

The minimum length of the password is determined by the `minimum-length` command. The complexity requirements for the password is determined by the `complexity` command.

The following displays a password configuration example:

```
A:ALA-1>config>system>security# info
----------------------------------------------
... 
password
   aging 365
   minimum-length 8
   attempts 5 time 5 lockout 20
   admin-password "rUYUz9XM6I" hash
exit
... 
----------------------------------------------
A:ALA-1>config>system>security# 
```
There are two ways to verify that a user is in the enable-admin mode:

- **show users** — Administrator can know which users are in this mode.
- Enter the `enable-admin` command again at the root prompt and an error message will be returned.

```
A:ALA-1# show users
===============================================================================
User Type From Login time Idle time
===============================================================================
admin Telnet 10.20.30.93 09AUG2004 08:35:23 0d 00:00:00 A
-------------------------------------------------------------------------------
Number of users : 2
'A' indicates user is in admin mode
===============================================================================
A:ALA-1#
A:ALA-1# enable-admin
MINOR: CLI Already in admin mode.
A:ALA-1#
```

### back

**Syntax**
```
back
```

**Context**

```
<GLOBAL>
```

**Description**

This command moves the context back one level of the command hierarchy. For example, if the current level is the `config router ospf` context, the `back` command moves the cursor to the `config router` context level.

### clear

**Syntax**
```
clear
```

**Context**

```
<GLOBAL>
```

**Description**

This command clears statistics for a specified entity or clears and resets the entity.

**Parameters**

- `card` — Reinitializes a I/O module in the specified slot.
- `cflowd` — Clears cflowd.
- `cpm-filter` — Clears IP filter entry IDs.
- `cron` — Clears CRON history.
- `filter` — Clears IP, MAC, and log filter counters.
- `lag` — Clears LAG-related entities.
- `log` — Closes and reinitializes the log specified by log-id.
- `mda` — Reinitializes the specified MDA in a particular slot.
- `port` — Clears port statistics.
qos — Clears QoS statistics.

radius — Clears the RADIUS server state.

router — Clears router commands affecting the router instance in which they are entered.

Values

arp, authentication, bgp, bfd, dhcp, dhcpv6, forwarding-table, icmp-redirect-route, icmpv6, igmp, interface, isis, ldp, mpls, neighbor, ospf, ospfv3, pim, rip, router-advertisement, rsvp

saa — Clears the SAA test results.

screen — Clears the console or telnet screen.

service — Clears service ID and statistical entities.

subscriber-mgmt — Clears subscriber management data.

system — Clears (re-enables) a previously failed reference.

tacplus — Clears the TACACS+ server state.

trace — Clears the trace log.

vrrp — Clears and resets the VRRP interface and statistical entities.

echo

**Syntax**

```bash
echo [text-to-echo] [extra-text-to-echo] [more-text]
```

**Context**

<GLOBAL>

**Description**

This command echoes arguments on the command line. The primary use of this command is to allow messages to be displayed to the screen in files executed with the `exec` command.

**Parameters**

- `text-to-echo` — Specifies a text string to be echoed up to 256 characters.
- `extra-text-to-echo` — Specifies more text to be echoed up to 256 characters.
- `more-text` — Specifies more text to be echoed up to 256 characters.

eexec

**Syntax**

```bash
eexec [-echo] [-syntax] {filename | <<[eof_string]}
```

**Context**

<GLOBAL>

**Description**

This command executes the contents of a text file as if they were CLI commands entered at the console. Exec commands do not have `no` versions.

**Parameters**

- `-echo` — Echo the contents of the `exec` file to the session screen as it executes.

  **Default**

  Echo disabled.

- `-syntax` — Perform a syntax check of the file without executing the commands. Syntax checking will be able to find invalid commands and keywords, but it will not be able to validate erroneous user-supplied parameters.
Global Commands

**Default**
Execute file commands.

**filename** — The text file with CLI commands to execute.

<< — Stdin can be used as the source of commands for the exec command. When stdin is used as the exec command input, the command list is terminated with <Ctrl-C>, “EOF<Return>” or “eof_string<Return>”.

If an error occurs entering an exec file sourced from stdin, all commands after the command returning the error will be silently ignored. The exec command will indicate the command error line number when the stdin input is terminated with an end-of-file input.

**eof_string** — The ASCII printable string used to indicate the end of the exec file when stdin is used as the exec file source. <Ctrl-C> and “EOF” can always be used to terminate an exec file sourced from stdin.

**Default**

<table>
<thead>
<tr>
<th><strong>Related Commands</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>boot-bad-exec command on page 355 — Use this command to configure a URL for a CLI script to exec following a failed configuration boot.</td>
</tr>
<tr>
<td>boot-good-exec command on page 355 — Use this command to configure a URL for a CLI script to exec following a successful configuration boot.</td>
</tr>
</tbody>
</table>

**exit**

**Syntax**
exit [all]

**Context**
<GLOBAL>

**Description**
This command returns to the context from which the current level was entered. For example, if you navigated to the current level on a context by context basis, then the **exit** command only moves the cursor back one level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1>config>router# exit
A:ALA-1>config# exit
```

If you navigated to the current level by entering a command string, then the **exit** command returns the cursor to the context in which the command was initially entered.

```
A:ALA-1# configure router ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1#
```

The **exit all** command moves the cursor all the way back to the root level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit all
A:ALA-1#
```

**Parameters**

| all — Exits back to the root CLI context. |
help

Syntax
help
help edit
help global
help special-characters

<GLOBAL>

Description
This command provides a brief description of the help system. The following information displays:

Help may be requested at any point by hitting a question mark '?'.
In case of an executable node, the syntax for that node will be displayed with an explanation of all parameters.
In case of sub-commands, a brief description is provided.

Global Commands:
Help on global commands can be observed by issuing "help globals" at any time.

Editing Commands:
Help on editing commands can be observed by issuing "help edit" at any time.

Parameters
help — Displays a brief description of the help system.
help edit — Displays help on editing.

Available editing keystrokes:
Delete current character.....................Ctrl-d
Delete text up to cursor......................Ctrl-u
Delete text after cursor.....................Ctrl-k
Move to beginning of line....................Ctrl-a
Move to end of line.........................Ctrl-e
Get prior command from history.............Ctrl-p
Get next command from history..............Ctrl-n
Move cursor left............................Ctrl-b
Move cursor right...........................Ctrl-f
Move back one word.........................Esc-b
Move forward one word.......................Esc-f
Convert rest of word to uppercase.........Esc-c
Convert rest of word to lowercase.........Esc-l
Delete remainder of word...................Esc-d
Delete word up to cursor...................Ctrl-w
Transpose current and previous character...Ctrl-t
Enter command and return to root prompt...Ctrl-z
Refresh input line.........................Ctrl-l

help global — Displays help on global commands.

Available global commands:
back - Go back a level in the command tree
echo - Echo the text that is typed in
exec - Execute a file - use -echo to show the commands and prompts on the screen
exit - Exit to intermediate mode - use option all to exit to root prompt
help - Display help
history - Show command history
info - Display configuration for the present node
logout - Log off this system
oam - + OAM Test Suite
ping - Verify the reachability of a remote host
pwc - Show the present working context
Global Commands

sleep           - Sleep for specified number of seconds
ssh             - SSH to a host
telnet          - Telnet to a host
traceroute      - Determine the route to a destination address
tree            - Display command tree structure from the context of execution
write           - Write text to another user

help special-characters — Displays help on special characters.

Use the following CLI commands to display more information about commands and command syntax:

?  — Lists all commands in the current context.

string? — Lists all commands available in the current context that start with the string.

command ? — Display command’s syntax and associated keywords.

string<Tab> or string<Space> — Complete a partial command name (auto-completion) or list available commands that match the string.

history

Syntax  history
Context  <GLOBAL>

Description  This command lists the last 30 commands entered in this session.

Re-execute a command in the history with the !n command, where n is the line number associated with the command in the history output.

For example:

A:ALA-1# history
  68 info
  69 exit
  70 info
  71 filter
  72 exit all
  73 configure
  74 router
  75 info

  82 exit all
  83 reduced-prompt
  84 configure router
  85 interface
  86 info
  87 interface "test"
  88 info
  89 reduced-prompt
  90 exit all
  91 configure
  92 card 1
info

Syntax  info [detail]

Context  <GLOBAL>

Description  This command displays the running configuration for the configuration context.

The output of this command is similar to the output of a show config command. This command, however, lists the configuration of the context where it is entered and all branches below that context level.

By default, the command only enters the configuration parameters that vary from the default values. The detail keyword causes all configuration parameters to be displayed.

For example,

A:ALA-48>config>router>mpls# info
----------------------------------------------
admin-group "green" 15
admin-group "red" 25
admin-group "yellow" 20
interface "system"

Parameters
detail — Displays all configuration parameters including parameters at their default values.

logout

Syntax logout

Context <GLOBAL>

Description This command logs out of the router session.

When the logout command is issued from the console, the login prompt is displayed, and any log IDs directed to the console are discarded. When the console session resumes (regardless of the user), the log output to the console resumes.

When a Telnet session is terminated from a logout command, all log IDs directed to the session are removed. When a user logs back in, the log IDs must be re-created.
mrinfo

Syntax  mrinfo [ip-address | dns-name] [router router-instance]

Context  <GLOBAL>

Description  This command is used to print relevant multicast information from the target multicast router. Information displayed includes adjacency information, protocol, metrics, thresholds, and flags from the target multicast route.

Parameters  

- **ip-address** — Specify the ip-address of the multicast capable target router.
- **dns-name** — Specify the DNS name (if DNS name resolution is configured).

Values  63 characters maximum

- **router router-instance** — Specify the router name or service ID.

Values  

- **router-name**: Base, management
- **service-id**: 1 — 2147483647

Default  Base

mstat

Syntax  mstat source [ip-address | dns-name] [group grp-ip-address] [destination dst-ip-address] [hop hop] [router router-instance] [wait-time wait-time]

Context  <GLOBAL>

Description  This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information.

Parameters  

- **source ip-address** — Specify the IP address of the multicast-capable source.
- **ip-address** — Specify the ip-address of the multicast capable target router.
- **dns-name** — Specify the DNS name (if DNS name resolution is configured).

Values  63 characters maximum

- **group group-ip-address** — Specify the multicast address of the group to be displayed.

- **destination dst-ip-address** — Specify the unicast destination address.

- **hop count** — Specify the maximum number of hops that will be traced from the receiver back toward the source.

Values  1 — 255

Default  32 hops (infinity for the DVMRP routing protocol).

- **router router-instance** — Specify the router name or service ID.

Values  

- **router-name**: Base, management
- **service-id**: 1 — 2147483647
Root Commands

Default  Base

wait-time  
— Specify the number of seconds to wait for the response.

Values  1 — 60

mtrace

Syntax  mtrace source [ip-address | dns-name] [group grp-ip-address] [destination dst-ip-address] [hop hop] [router router-instance] [wait-time wait-time]

Context  <GLOBAL>

Description  This command traces a multicast path from a source to a receiver.

Parameters  
ip-address — Specify the ip-address of the multicast capable target router.

dns-name — Specify the DNS name (if DNS name resolution is configured).

Values  63 characters maximum

group  group-ip-address — Specify the multicast address or DNS name of the group that resolves to the multicast group address that will be used. If the group is not specified, address 224.2.0.1 (the MBone audio) will be used. This will suffice if packet loss statistics for a particular multicast group are not needed.

destination  dst-p-address — Specify either the IP address or the DNS name of the unicast destination. If this parameter is omitted the IP address of the system where the command is entered will be used. The receiver parameter can also be used to specify a local interface address as the destination address for sending the trace query. The response will also be returned to the address specified as the receiver.

hop  hop — Specify the maximum number of hops that will be traced from the receiver back toward the source.

Values  1 — 255

Default  32 hops (infinity for the DVMRP routing protocol).

router-instance — Specify the router name or service ID.

Values  router-name:  Base, management

service-id:  1 — 2147483647

Default  Base

wait-time  
— Specify the number of seconds to wait for the response.

Values  1 — 60

password

Syntax  password

Context  <ROOT>

Description  This command changes a user CLI login password.
When a user logs in after the administrator forces a **new-password-at-login**, or the password has expired (**aging**), then this command is automatically invoked.

When invoked, the user is prompted to enter the old password, the new password, and then the new password again to verify the correct input.

If a user fails to create a new password after the administrator forces a **new-password-at-login** or after the password has expired, the user is not allowed access to the CLI.

### ping

**Syntax**

```
ping {ip-address | ipv6-address | dns-name} [rapid | detail] [ttl time-to-live] [tos type-of-service] [size bytes] [pattern pattern] [source ip-address] [interval seconds] [(next-hop ip-address) | {interface interface-name} | bypass-routing] [count requests] [do-not-fragment] [router {router-instance} | timeout timeout]
```

**Context**

`<GLOBAL>`

**Description**

This command is the TCP/IP utility to verify IP reachability.

**Parameters**

- `ip-address | dns-name` — The remote host to ping. The IP address or the DNS name (if DNS name resolution is configured) can be specified.
- `ipv6-address` — The IPv6 IP address.

**Values**

- `x:x:x:x:x:x:x:x` (eight 16-bit pieces)
- `x:x:x:x:x:d.d.d`
- `x: 0 — FFFF H`
- `d: 0 — 255 D`

- `rapid | detail` — The `rapid` parameter specifies to send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the `count` option.

  The `detail` parameter includes in the output the interface on which the ping reply was received.

**Example output:**

```
A:ALA-1# ping 192.168.xx.xx4 detail
PING 192.168.xx.xx4: 56 data bytes
64 bytes from 192.168.xx.xx4 via fei0: icmp_seq=0 ttl=64 time=0.000 ms.
64 bytes from 192.168.xx.xx4 via fei0: icmp_seq=1 ttl=64 time=0.000 ms.
64 bytes from 192.168.xx.xx4 via fei0: icmp_seq=2 ttl=64 time=0.000 ms.
64 bytes from 192.168.xx.xx4 via fei0: icmp_seq=3 ttl=64 time=0.000 ms.
64 bytes from 192.168.xx.xx4 via fei0: icmp_seq=4 ttl=64 time=0.000 ms.

--- 192.168.xx.xx4 PING Statistics ---
5 packets transmitted, 5 packets received, 0.00% packet loss
round-trip min/avg/max/stddev = 0.000/0.000/0.000/0.000 ms
A:ALA-1#
```

- `ttl time-to-live` — The IP Time To Live (TTL) value to include in the ping request, expressed as a decimal integer.

  **Values**

  - `0 — 128`
tos type-of-service — The type-of-service (TOS) bits in the IP header of the ping packets, expressed as a decimal integer.

Values 0 — 255

size bytes — The size in bytes of the ping request packets.

Default 56 bytes (actually 64 bytes because 8 bytes of ICMP header data are added to the packet)

Values 0 — 65507

pattern pattern — A 16-bit pattern string to include in the ping packet, expressed as a decimal integer.

Values 0 — 65535

source ip-address — The source IP address to use in the ping requests in dotted decimal notation.

Default The IP address of the egress IP interface.

Values 0.0.0.0 — 255.255.255.255

interval seconds — The interval in seconds between consecutive ping requests, expressed as a decimal integer.

Default 1

Values 1 — 10000

next-hop ip-address — This option disregards the routing table and will send this packet to the specified next hop address. This address must be on an adjacent router that is attached to a subnet that is common between this and the next-hop router.

Default Per the routing table.

Values A valid IP next hop IP address.

interface interface-name — Specify the interface name.

bypass-routing — Send the ping request to a host on a directly attached network bypassing the routing table. The host must be on a directly attached network or an error is returned.

count requests — The number of ping requests to send to the remote host, expressed as a decimal integer.

Default 5

Values 1 — 10000

do-not-fragment — Specifies that the request frame should not be fragmented. This option is particularly useful in combination with the size parameter for maximum MTU determination.

router router-instance — Specify the router name or service ID.

Default Base

Values router-name: Base, management
    service-id: 1 — 2147483647

timeout timeout — Specify the timeout in seconds.

Default 5

Values 1 — 10
Global Commands

pwc

Syntax    pwc [previous]

Context    <GLOBAL>

Description    This command displays the present or previous working context of the CLI session. The pwc command provides a user who is in the process of dynamically configuring a chassis a way to display the current or previous working context of the CLI session. The pwc command displays a list of the CLI nodes that hierarchically define the current context of the CLI instance of the user.

For example,
A:ALA-1>config>router>bgp>group# pwc

Present Working Context:
<root>
    configure
    router Base
    bgp
    group test
    ospf
    area 1

A:ALA-1>config>router>bgp>group#

For example,
A:ALA-1>config>router>bgp>group# pwc previous

Previous Working Context:
<root>
    configure
    router Base
    bgp
    ospf

A:ALA-1>config>router>bgp>group#

Parameters

    previous — Specifies to display the previous present working context.

sleep

Syntax    sleep [seconds]

Context    <GLOBAL>

Description    This command causes the console session to pause operation (sleep) for 1 second (default) or for the specified number of seconds.

Parameters

    seconds — The number of seconds for the console session to sleep, expressed as a decimal integer.
ssh

Syntax

ssh [ip-addr | dns-name |username@ip-addr -l username [-v SSH-version] [router router-instance] service-name service-name]

Context <GLOBAL>

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot) assuming the "~" is the default escape character for SSH session.

Parameters

ip-address | host-name — The remote host to which to open an SSH session. The IP address or the DNS name (providing DNS name resolution is configured) can be specified.

-l user — The user name to use when opening the SSH session.

router router-instance — Specify the router name or service ID.

Values router-name: Base, management

service-id: 1 — 2147483647

Default Base

telnet

Syntax
telnet [ip-address | dns-name] [port] [router router-instance]

Context <GLOBAL>

Description

This command opens a Telnet session to a remote host. Telnet servers in 7750 SRnetworks limit a Telnet clients to three retries to login. The Telnet server disconnects the Telnet client session after three retries. The number of retry attempts for a Telnet client session is not user-configurable.

Parameters

ip-address — The IP address or the DNS name (providing DNS name resolution is configured) can be specified.

Values ipv4-address a.b.c.d

ipv6-address x:x:x:x:x:x:[interface]

x:x:x:x:d.d.d.d:[interface]

x: [0 — FFFF]H

d: [0 — 255]Dipv6-address

dns-name — Specify the DNS name (if DNS name resolution is configured).

Values 128 characters maximum

port — The TCP port number to use to Telnet to the remote host, expressed as a decimal integer.
Global Commands

```
Default  23
Values   1 — 65535

**router router-instance** — Specify the router name or service ID.

Values  
```
router-name:  Base, management
service-id:    1 — 2147483647
```

Default  Base

---

**traceroute**

**Syntax**  
```  
traceroute {ip-address | dns-name} [ttl ttl] [wait milliseconds] [no-dns] [source ip-address] [tos type-of-service] [router router-instance]
```

**Context**  <GLOBAL>

**Description**  
The TCP/IP traceroute utility determines the route to a destination address. Note that aborting a traceroute with the <Ctrl-C> command could require issuing a second <Ctrl-C> command before the prompt is returned.

```
A:ALA-1# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
  1  192.168.xx.xx4 0.000 ms 0.000 ms 0.000 ms
A:ALA-1#
```

**Parameters**  
```
ip-address | dns-name — The remote address to traceroute. The IP address or the DNS name (if DNS name resolution is configured) can be specified.
```

**Values**  
```
ipv4-address  a.b.c.d
ipv6-address  x:x:x:x:x:x:x:x[-interface]
x:x:x:x:x:d.d.d.d[-interface]
x:  [0 — FFFF]H
d:  [0 — 255]Dipv6-address
dns-name  128 characters maximum
```

```
ttl ttl — The maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.
```

**Values**  
```
1 — 255
```

```
wait milliseconds — The time in milliseconds to wait for a response to a probe, expressed as a decimal integer.
```

**Default**  5000

**Values**  
```
1 — 60000
```

**no-dns —** When the **no-dns** keyword is specified, a DNS lookup for the specified host name will not be performed.

**Default**  DNS lookups are performed

**source ip-address** — The source IP address to use as the source of the probe packets in dotted decimal notation. If the IP address is not one of the device’s interfaces, an error is returned.
tos type-of-service — The type-of-service (TOS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 — 255

router router-instance — Specifies the router name or service ID.

Values router-name: Base, management

service-id: 1 — 2147483647

Default Base

tree

Syntax tree [detail]

Context <GLOBAL>

Description This command displays the command hierarchy structure from the present working context.

Parameters detail — Includes parameter information for each command displayed in the tree output.

write

Syntax write {user | broadcast} message-string

Context <GLOBAL>

Description This command sends a console message to a specific user or to all users with active console sessions.

Parameters user — The name of a user with an active console session to which to send a console message.

Values Any valid CLI username

broadcast — Specifies that the message-string is to be sent to all users logged into the router.

message-string — The message string to send. Allowed values are any string up to 250 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.
CLI Environment Commands

alias

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>alias alias-name alias-command-line</td>
</tr>
<tr>
<td></td>
<td>no alias alias-name</td>
</tr>
</tbody>
</table>

Context

<table>
<thead>
<tr>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>environment</td>
</tr>
</tbody>
</table>

Description

This command enables the substitution of a command line by an alias. Use the `alias` command to create alternative or easier to remember/understand names for an entity or command string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes. Only a single command can be present in the command string. The `alias` command can be entered in any context but must be created in the `root>environment` context.

For example, to create an alias named `soi` to display OSPF interfaces, enter:

```
alias soi "show router ospf interface"
```

Parameters

- **alias-name** — The alias name. Do not use a valid command string for the alias. If the alias specified is an actual command, this causes the command to be replaced by the alias.

- **alias-command-line** — The command line to be associated.

create

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>[no] create</td>
</tr>
</tbody>
</table>

Context

<table>
<thead>
<tr>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>environment</td>
</tr>
</tbody>
</table>

Description

By default, the `create` command is required to create a new OS entity.

The `no` form of the command disables requiring the `create` keyword.

Default

`create` — The create keyword is required.

more

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>[no] more</td>
</tr>
</tbody>
</table>

Context

<table>
<thead>
<tr>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>environment</td>
</tr>
</tbody>
</table>

Description

This command enables per-screen CLI output, meaning that the output is displayed on a screen-by-screen basis. The terminal screen length can be modified with the `terminal` command.

The following prompt appears at the end of each screen of paginated output:

```
Press any key to continue (Q to quit)
```

The `no` form of the command displays the output all at once. If the output length is longer than one screen, the entire output will be displayed, which may scroll the screen.
Default more — CLI output pauses at the end of each screen waiting for the user input to continue.

reduced-prompt

Syntax reduced-prompt [number of nodes in prompt]
no reduced-prompt

Context environment

Description This command configures the maximum number of higher CLI context levels to display in the CLI prompt for the current CLI session. This command is useful when configuring features that are several node levels deep, causing the CLI prompt to become too long.

By default, the CLI prompt displays the system name and the complete context in the CLI.

The number of nodes specified indicates the number of higher-level contexts that can be displayed in the prompt. For example, if reduced prompt is set to 2, the two highest contexts from the present working context are displayed by name with the hidden (reduced) contexts compressed into a ellipsis (“…”).

A:ALA-1>environment# reduced-prompt 2
A:ALA-1>vonfig>router# interface to-103
A:ALA-1>...router>if#

Note that the setting is not saved in the configuration. It must be reset for each CLI session or stored in an exec script file.

The no form of the command reverts to the default.

Default no reduced-prompt — Displays all context nodes in the CLI prompt.

Parameters number of nodes in prompt — The maximum number of higher-level nodes displayed by name in the prompt, expressed as a decimal integer.

  Default 2
  Values 0 — 15

saved-ind-prompt

Syntax [no] saved-ind-prompt

Context environment

Description This command enables saved indicator in the prompt. When changes are made to the configuration file a “*” appears in the prompt string indicating that the changes have not been saved. When an admin save command is executed the “*” disappears.

*A:ALA-48# admin save
Writing file to ftp://128.251.10.43//sim48/sim48-config.cfg
Saving configuration .... Completed.
A:ALA-48#
terminal

Syntax  terminal
        no terminal

Context  environment

Description  This command enables the context to configure the terminal screen length for the current CLI session.

length

Syntax  length lines

Context  environment > terminal

Description  This command sets the number of lines on a screen.

Default  24 — Terminal dimensions are set to 24 lines long by 80 characters wide.

Parameters  lines — The number of lines for the terminal screen length, expressed as a decimal integer.

Values  1 — 512

width

Syntax  width width

Context  environment > terminal

Description  This command determines display terminal width.

Default  80 — Terminal dimensions are set to 24 lines long by 80 characters wide.

Parameters  width — Sets the width of the display terminal.

Values  1 — 512

time-display

Syntax  time-display {local | utc}

Context  environment

Description  This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.
This configuration command is only valid for times displayed in the current CLI session. This includes displays of event logs, traps and all other places where a time stamp is displayed.

In general all time stamps are shown in the time selected. This includes log entries destined for console/session, memory, or SNMP logs. Log files on compact flash are maintained and displayed in UTC format.

**Default**  
`time-display local` — Displays time stamps based on the local time.
Monitor CLI Commands

ccag

Syntax      ccag ccag-id [path {a | b}] [type {sap-sap | sap-net | net-sap}] [interval seconds] [repeat repeat] [absolute | rate]

Context     monitor

Description Displays monitor command output of traffic statistics for Cross Connect Aggregation Groups (CCAGs) ports.

Parameters  

ccag-id — Specifies the CCAG instance to monitor.

path — Specifies the CCA path nodal context where the CCA path bandwidth, buffer and accounting parameters are maintained. The path context must be specified with either the a or b keyword specifying the CCA path context to be entered.

type — Specify cross connect type.

Values      sap-sap, sap-net, net-sap

interval — Configures the interval for each display in seconds.

Default     5 seconds

Values      3 — 60

repeat repeat — Configures how many times the command is repeated.

Default     10

Values      1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

cpm-filter

Syntax      cpm-filter

Context     monitor

Description Displays monitor command output for CPM filters.
ip

Syntax  
ip entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  
monitor>cpm-filter

Description  
This command displays monitor command statistics for IP filter entries.

Parameters  
entry entry-id — Displays information on the specified filter entry ID for the specified filter ID only.

Values  
1 — 65535

interval seconds — Configures the interval for each display in seconds.

Default  
5 seconds

Values  
3 — 60

repeat repeat — Configures how many times the command is repeated.

Default  
10

Values  
1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

ipv6

Syntax  
ip entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  
monitor>cpm-filter

Description  
This command displays monitor command statistics for IPv6 filter entries.

Parameters  
entry entry-id — Displays information on the specified filter entry ID for the specified filter ID only.

Values  
1 — 65535

interval seconds — Configures the interval for each display in seconds.

Default  
5 seconds

Values  
3 — 60

repeat repeat — Configures how many times the command is repeated.

Default  
10

Values  
1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
Monitor CLI Commands

mac

Syntax  mac entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>cpm-filter

Description  This command displays monitor command statistics for MAC filter entries.

Parameters  entry entry-id — Displays information on the specified filter entry ID for the specified filter ID only.
   Values  1 — 65535

interval seconds — Configures the interval for each display in seconds.
   Default  5 seconds
   Values  3 — 60

repeat repeat — Configures how many times the command is repeated.
   Default  10
   Values  1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the "rate per second" for each statistic is displayed instead of the delta.

filter

Syntax  filter

Context  monitor

Description  This command enables the context to configure criteria to monitor IP and MAC filter statistics.

ip

Syntax  ip ip-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>filter

Description  This command enables IP filter monitoring. The statistical information for the specified IP filter entry displays at the configured interval until the configured count is reached. The first screen displays the current statistics related to the specified IP filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword rate is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to show commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.
Parameters

**ip-filter-id** — Displays detailed information for the specified filter ID and its filter entries.

Values

1 — 65535

**entry entry-id** — Displays information on the specified filter entry ID for the specified filter ID only.

Values

1 — 65535

**interval seconds** — Configures the interval for each display in seconds.

Default

5 seconds

Values

3 — 60

**repeat repeat** — Configures how many times the command is repeated.

Default

10

Values

1 — 999

**absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample Output

A:ALA-1# monitor filter ip 10 entry 1 interval 3 repeat 3 absolute

Monitor statistics for IP filter 10 entry 1

At time t = 0 sec (Base Statistics)

<table>
<thead>
<tr>

</tbody>
</table>

At time t = 3 sec (Mode: Rate)
ipv6

Syntax  ipv6 ipv6-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>filter

Description  This command enables IPv6 filter monitoring. The statistical information for the specified IPv6 filter entry displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified IPv6 filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword rate is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to show commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters  ipv6-filter-id — Displays detailed information for the specified IPv6 filter ID and its filter entries.

Values  1 — 65535

entry entry-id — Displays information on the specified IPv6 filter entry ID for the specified filter ID only.

Values  1 — 65535

interval seconds — Configures the interval for each display in seconds.

Default  5 seconds

Values  3 — 60

repeat repeat — Configures how many times the command is repeated.

Default  10

Values  1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample Output

A:ALA-48#

mac

Syntax  
mac mac-filter-id entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context  
monitor>filter

Description  
This command enables MAC filter monitoring. The statistical information for the specified MAC filter entry displays at the configured interval until the configured count is reached. The first screen displays the current statistics related to the specified MAC filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword rate is specified, the "rate per second" for each statistic is displayed instead of the delta.
Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- `mac-filter-id` — The MAC filter policy ID.
  - **Values** 1 — 65535
- `entry entry-id` — Displays information on the specified filter entry ID for the specified filter ID only.
  - **Values** 1 — 65535
- `interval seconds` — Configures the interval for each display in seconds.
  - **Default** 5 seconds
  - **Values** 3 — 60
- `repeat repeat` — Configures how many times the command is repeated.
  - **Default** 10
  - **Values** 1 — 999
- `absolute` — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- `rate` — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

```
A:ALA-1>monitor>filter# mac 50 entry 10 interval 3 repeat 3 absolute

### lag

**Syntax**

```
lag lag-id [lag-id...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]
```  

**Context**

monitor

**Description**

This command monitors traffic statistics for Link Aggregation Group (LAG) ports. Statistical information for the specified LAG ID(s) displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LAG ID. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the “rate per second” for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **lag-id** — The number of the LAG.
  
  - **Default** none — The LAG ID value must be specified.
  
  - **Values** 1 — 200

- **interval seconds** — Configures the interval for each display in seconds.
  
  - **Default** 5 seconds
  
  - **Values** 3 — 60

- **repeat repeat** — Configures how many times the command is repeated.
  
  - **Default** 10
  
  - **Values** 1 — 999

- **absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- **rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

```
A:ALA-12# monitor lag 12
Monitor statistics for LAG ID 12
```

```
lsp-egress-stats

Syntax lsp-egress-stats
lsp-ingress-stats lsp-name

Context show>router>mpls

Description This command displays MPLS LSP egress statistics information.
```

```
lsp-ingress-stats

Syntax lsp-ingress-stats
lsp-ingress-stats ip-address lsp lsp-name

Context show>router>mpls

Description This command displays MPLS LSP ingress statistics information.
```

```
management-access-filter

Syntax   management-access-filter

Context  monitor

Description This command enables the context to monitor management-access filters. These filters are configured in the config>system>security>mgmt-access-filter context.
```
ip

Syntax

ip entry entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context

monitor>management-access-filter

Description

This command monitors statistics for the MAF IP filter entry.

Parameters

ten entry entry-id — Specifies an existing IP MAF entry ID.

Values

1 — 9999

interval seconds — Configures the interval for each display in seconds.

Default

10

Values

3 — 60

repeat repeat — Configures how many times the command is repeated.

Default

10

Values

1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

ipv6

Syntax

ipv6 entry-id [interval seconds] [repeat repeat] [absolute | rate]

Context

monitor>management-access-filter

Description

This command monitors statistics for the MAF IPv6 filter entry.

Parameters

ten entry entry-id — Specifies an existing IP MAF entry ID.

Values

1 — 9999

interval seconds — Configures the interval for each display in seconds.

Default

10

Values

3 — 60

repeat repeat — Configures how many times the command is repeated.

Default

10

Values

1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
Monitor CLI Commands

mac

Syntax
```
mac entry-id [interval seconds] [repeat repeat] [absolute | rate]
```

Context
monitor>management-access-filter

Description
This command monitors statistics for the MAF MAC filter entry.

Parameters
```
entry entry-id — Specifies an existing IP MAF entry ID.
```

Values
```
1 — 9999
```

interval seconds — Configures the interval for each display in seconds.
```
Default 10
Values 3 — 60
```

repeat repeat — Configures how many times the command is repeated.
```
Default 10
Values 1 — 999
```

absolute — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

port

Syntax
```
port port-id [port-id...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]
```

Context
monitor

Description
This command enables port traffic monitoring. The specified port(s) statistical information displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified port(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters
```
port port-id — Specify up to 5 port IDs.
```

Syntax:
```
port-id slot/mda/port.[.channel]
aps-id aps-group-id.[.channel]
aps keyword
group-id 1 — 64
bundle ID bundle-type-slot/mda.bundle-num
bundle keyword
type ima, ppp
bundle-num 1 — 128
```
interval seconds — Configures the interval for each display in seconds.

Default 5 seconds
Values 3 — 60

repeat repeat — Configures how many times the command is repeated.

Default 10
Values 1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

A:ALA-12>monitor#

atm

**Syntax**

```
atm [interval seconds] [repeat repeat] [absolute|rate]
```

**Context**

monitor>port

**Description**

This command enables ATM port traffic monitoring.

**Parameters**

- **interval seconds** — Configures the interval for each display in seconds.
  
  **Default** 5 seconds
  
  **Values** 3 — 60

- **repeat repeat** — Configures how many times the command is repeated.
  
  **Default** 10
  
  **Values** 1 — 999

- **absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- **rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

port
Syntax

```
port port-id atm [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm aal-5 [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm ilmi [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm interface-connection [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm pvc [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm pvp [interval seconds] [repeat repeat] [absolute | rate]
port port-id atm pvt [interval seconds] [repeat repeat] [absolute | rate]
```

Context

```
monitor
```

Description

This command monitors ATM port traffic statistics.

Parameters

```
port-id — Specify up to 5 port IDs.
```

Syntax:

```
Syntax:  port-id  slot/mda/port[].channel
         aps-id  aps-group-id[,channel]
         aps      keyword
         group-id 1 — 64
         bundle ID bundle-type-slot/mda.bundle-num
         bundle    keyword
         type  ima, ppp
         bundle-num 1 — 128
```

```
atm — keyword specifying ATM information.

interface-connection — Monitors ATM interface statistics.

interval seconds — Configures the interval for each display in seconds.

    Default  5 seconds
    Values   3 — 60

repeat repeat — Configures how many times the command is repeated.

    Default  10
    Values   1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

    Default  Default mode delta

rate  — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

    Default  Default mode delta

aal-5 — Displays ATM Adaptation Layer 5 (AAL5) information.

ilmi — Monitors ATM ILMI statistics.

pvc — Identifies the port by the PVC identifier (vpi/vci).

pvp — Identifies the port by the permanent virtual path.

pvt — Identifies the port by the permanent virtual tunnel.

oam — Identifies the port by the OAM test suite ID.
Monitor CLI Commands

qos

Syntax  qos

Context  monitor

Description  This command enables the context to configure criteria to monitor QoS scheduler statistics for specific customers and SAPs.

arbiter-stats

Syntax  arbiter-stats

Context  monitor>qos

Description  This command enables the context to configure monitor commands for arbiter statistics.

sap

Syntax  sap sap-id [arbiter name | root] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>qos>arbiter-stats

Description  This command monitors arbiter statistics for a SAP.

Parameters  sap-id — Specify the physical port identifier portion of the SAP definition.

arbiter name — Specify the name of the policer control policy arbiter.

Values  An existing scheduler-name in the form of a string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

root — Specify the scheduler to which this queue would be feeding.

ingress — Displays scheduler-name statistics applied on the ingress SAP.

egress — Displays scheduler-name statistics applied on the egress SAP.

interval seconds — Configures the interval for each display in seconds.

Default  11 seconds

Values  11 — 60

repeat repeat — Configures how many times the command is repeated.

Default  10

Values  1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
rate — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

`subscriber`

**Syntax**
```
subscriber sub-ident-string [arbiter name | root] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**
```
monitor>qos>arbiter-stats
```

**Description**
This command monitors arbiter statistics for a subscriber.

**Parameters**
- `sub-ident-string` — Specifies an existing subscriber a identification policy name.
- `arbiter name` — Specify the name of the policer control policy arbiter.
  - **Values**
    - An existing `scheduler-name` in the form of a string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.
- `root` — Specify the scheduler to which this queue would be feeding.
- `ingress` — Displays `scheduler-name` statistics applied on the ingress SAP.
- `egress` — Displays `scheduler-name` statistics applied on the egress SAP.
- `interval seconds` — Configures the interval for each display in seconds.
  - **Default**
    - 11 seconds
  - **Values**
    - 11 — 60
- `repeat repeat` — Configures how many times the command is repeated.
  - **Default**
    - 10
  - **Values**
    - 1 — 999
- `absolute` — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- `rate` — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

`customer`

**Syntax**
```
customer customer-id site customer-site-name [scheduler scheduler-name] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**
```
monitor>qos>scheduler-stats
```

**Description**
Use this command to monitor scheduler statistics per customer multi-service-site. The first screen displays the current statistics related to the specified customer ID and customer site name. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.
Monitor CLI Commands

Monitor commands are similar to `show` commands but only statistical information displays. These commands display selected statistics per the configured number of times at the interval specified.

**Parameters**

- **customer-id** — Specifies the ID number to be associated with the customer, expressed as an integer.
  - **Values** 1 — 2147483647
- **site** customer-site-name — Specify the customer site which is an anchor point for ingress and egress virtual scheduler hierarchy.
- **scheduler** scheduler-name — Specify an existing `scheduler-name`. Scheduler names are configured in the `config>qos>scheduler-policy>tier level` context.
  - **Values** An existing `scheduler-name` is in the form of a string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.
- **ingress** — Displays the customer’s multi-service-site ingress scheduler policy.
- **egress** — Displays the customer’s multi-service-site egress scheduler policy.
- **interval seconds** — Configures the interval for each display in seconds.
  - **Default** 11 seconds
  - **Values** 11 — 60
- **repeat repeat** — Configures how many times the command is repeated.
  - **Default** 10
  - **Values** 1 — 999
- **absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- **rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**sap**

**Syntax**

```
sap sap-id [scheduler scheduler-name] [ingress | egress] [interval seconds] [repeat repeat]
[absolute | rate]
```

**Context**

`monitor>qos>scheduler-stats`

**Description**

Use this command to monitor scheduler statistics for a SAP at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **sap-id** — Specifies the physical port identifier portion of the SAP definition.
**scheduler** scheduler-name — Specify an existing scheduler-name. Scheduler names are configured in the config>qos>scheduler-policy>tier level context.

**Values** An existing scheduler-name in the form of a string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

**ingress** — Displays scheduler-name statistics applied on the ingress SAP.

**egress** — Displays scheduler-name statistics applied on the egress SAP.

**interval** seconds — Configures the interval for each display in seconds.

- **Default** 11 seconds
- **Values** 11 — 60

**repeat** repeat — Configures how many times the command is repeated.

- **Default** 10
- **Values** 1 — 999

**absolute** — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

---

**subscriber**

**Syntax**

```
subscriber sub-ident-string [scheduler scheduler-name] [ingress | egress] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context** monitor>qos>scheduler-stats

**Description** This command monitors scheduler statistics for a subscriber.

**Parameters**

- **sub-ident-string** — Specifies an existing subscriber a identification policy name.
- **scheduler** scheduler-name — Specify an existing QoS scheduler policy name. Scheduler names are configured in the config>qos>scheduler-policy>tier level context.

**Values** An existing scheduler-name in the form of a string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

**ingress** — Displays scheduler-name statistics applied on the ingress SAP.

**egress** — Displays scheduler-name statistics applied on the egress SAP.

**interval** seconds — Configures the interval for each display in seconds.

- **Default** 11 seconds
- **Values** 11 — 60

**repeat** repeat — Configures how many times the command is repeated.
Monitor CLI Commands

**Default** 10  
**Values** 1 — 999

**absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

---

**router**

**Syntax** `router router-instance`

**Context** monitor

**Description** This command enables the context to configure criteria to monitor statistical information for BGP, LDP, MPLS, OSPF, OSPF3, PIM, RIP, and RSVP protocols.

**Parameters** `router-instance` — Specify the router name or service ID.

**Values**

- **router-name**: Base, management
- **service-id**: 1 — 2147483647

**Default** Base

---

**neighbor**

**Syntax** `neighbor ip-address [ip-address...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]`

**Context** monitor>router>bgp

**Description** This command displays statistical BGP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **neighbor ip-address** — Displays damping information for entries received from the BGP neighbor. Up to 5 IP addresses can be specified.
- `interval seconds` — Configures the interval for each display in seconds.
  
  **Default** 5 seconds
  
  **Values** 3 — 60

- **repeat repeat** — Configures how many times the command is repeated.
Default  10

Values  1 — 999

**absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

### Sample Output

```

```
Monitor CLI Commands

**statistics**

**Syntax**

```
statistics [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

```
monitor>router>isis
```

**Description**

This command displays statistical IS-IS traffic information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified router statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **interval seconds** — Configures the interval for each display in seconds.
  - **Default**: 5 seconds
  - **Values**: 3 — 60
- **repeat repeat** — Configures how many times the command is repeated.
  - **Default**: 10
  - **Values**: 1 — 999
- **absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- **rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

```
A:ALA-12>monitor>router>isis# statistics interval 3 repeat 2 absolute
FULLYPACKED: IS-IS (IP version 1) statistics

A:ALA-12>monitor>router>isis#

**session**

**Syntax**  
`session ldp-id [ldp-id...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]

**Context**  
monitor>router>ldp

**Description**  
This command displays statistical information for LDP sessions at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LDP session(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.
Parameters

*ldp-id* — Specify the IP address of the LDP session to display.

**Values**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ld-addr</td>

</tr>
<tr>
<td></td>
<td>ip-address — a.b.c.d</td>
</tr>
<tr>
<td></td>
<td>label-space — [0..65535]</td>
</tr>
</tbody>
</table>

*interval seconds* — Configures the interval for each display in seconds.

**Default** 5 seconds

**Values** 3 — 60

*repeat repeat* — Configures how many times the command is repeated.

**Default** 10

**Values** 1 — 999

*absolute* — When the *absolute* keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

*rate* — When the *rate* keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

A:ALA-12>monitor>router>ldp#

### statistics

**Syntax**  
`statistics [interval seconds] [repeat repeat] [absolute | rate]`

**Context**  
`monitor>router>ldp`

**Description**  
Monitor statistics for LDP instance at the configured interval until the configured count is reached. The first screen displays the current statistics related to the LDP statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta. Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.
**Monitor CLI Commands**

**Parameters**

- **interval** *seconds* — Configures the interval for each display in seconds.
  - **Default** 5 seconds
  - **Values** 3 — 60

- **repeat** *repeat* — Configures how many times the command is repeated.
  - **Default** 10
  - **Values** 1 — 999

- **absolute** — When the *absolute* keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- **rate** — When the *rate* keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

interface

Syntax  interface interface [interface...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>router>mpls

Description  This command displays statistics for MPLS interfaces at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the MPLS interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword rate is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to show commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

interface — Specify the interface's IP address (ip-address) or interface name (ip-int-name). Up to 5 interfaces can be specified. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

interval seconds — Configures the interval for each display in seconds.

Default  11 seconds

Values  11 — 60

repeat repeat — Configures how many times the command is repeated.

Default  10

Values  1 — 999

absolute — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample Output

A:ALA-12>monitor>router>mpls#

**lsp-egress-statistics**

**Syntax**  
```
  lsp-egress-stats lsp-name [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**  
```
  monitor>router>mpls
```

**Description**  
This command displays egress statistics for LSP interfaces at the configured interval until the configured count is reached.
Default

**no lsp-egress-statistics**

Parameters

- **repeat repeat** — Specifies how many times the command is repeated.
  - **Values**
    - 10
  - **Values**
    - 1 — 999

- **interval seconds** — Specifies the interval for each display, in seconds.
  - **Values**
    - 10
  - **Values**
    - 3 — 60

- **absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- **rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample

```
B:Dut-C-cpm2# monitor router mpls lsp-egress-stats sample repeat 3 interval 10 absolute

Monitor egress statistics for MPLS LSP "sample"

At time t = 0 sec (Base Statistics)

### lsp-ingress-statistics

**Syntax**

```
lspt-ingress-stats lsp lsp-name sender sender-address [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

monitor>router>mpls

**Description**

This command displays ingress statistics for LSP interfaces at the configured interval until the configured count is reached.

**Parameters**

- **repeat repeat** — Specifies how many times the command is repeated.
  - **Values**
    - 10
    - 1 — 999

- **interval seconds** — Specifies the interval for each display, in seconds.
  - **Values**
    - 10
    - 3 — 60

**absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
Sample Output

===============================================================================
B:Dut-C-cpm2#

ospf

Syntax ospf [ospf-instance]
Context monitor>router>ospf
Description This command enables the context to configure monitor commands for the OSPF instance.
Parameters ospf-instance — Specifies the OSPF instance.

Values 1 — 31

ospf3

Syntax ospf3
Context monitor>router
Description This command enables the context to configure monitor commands for the OSPF3 instance.

interface

Syntax interface interface [interface...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]
Context monitor>router>ospf
monitor>router>ospf3
Description This command displays statistics for OSPF interfaces at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the OSPF interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword rate is specified, the “rate per second” for each statistic is displayed instead of the delta.
Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **interface** — Specify the interface's IP address (ip-address) or interface name (ip-int-name). Up to 5 interfaces can be specified. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

- **interval seconds** — Configures the interval for each display in seconds.
  - **Default**  5 seconds
  - **Values**  3 — 60

- **repeat repeat** — Configures how many times the command is repeated.
  - **Default**  10
  - **Values**  1 — 999

- **absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- **rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

```
A:ALA-12>monitor>router>ospf# interface to-104 interval 3 repeat 3 absolute

A:ALA-12>monitor>router>ospf#
Monitor CLI Commands

**neighbor**

**Syntax**

```
neighbor ip-address [ip-address...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

```monitor>router>ospf```

**Description**

This command displays statistical OSPF or OSPF3 neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta. Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- **neighbor ip-address** — The IP address to display information for entries received from the specified OSPF neighbor. Up to 5 IP addresses can be specified.
  - **interval seconds** — Configures the interval for each display in seconds.
    - **Default** 5 seconds
    - **Values** 3 — 60
  - **repeat repeat** — Configures how many times the command is repeated.
    - **Default** 10
    - **Values** 1 — 999
  - **absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
  - **rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**Sample Output**

```
A:ALA-12>monitor>router# ospf neighbor 10.0.0.104 interval 3 repeat 3 absolute
===============================================================================
Monitor statistics for OSPF Neighbor 10.0.0.104

A:ALA-12>monitor>router#
neighbor

**Syntax**
```
neighbor [router-id] [interface-name] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**
monitor>router>ospf3

**Description**
This command displays statistical OSPF or OSPF3 neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**
- `neighbor ip-address` — The IP address to display information for entries received from the specified OSPF neighbor. Up to 5 IP addresses can be specified.
- `interval seconds` — Configures the interval for each display in seconds.
  
  **Default**
  5 seconds

  **Values**
  3 — 60

- `repeat repeat` — Configures how many times the command is repeated.
  
  **Default**
  10

  **Values**
  1 — 999

- `absolute` — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- `rate` — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

- `router-id` — The router ID for an existing IP interface.

virtual-link

**Syntax**
```
virtual-link nbr-rtr-id area area-id [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**
monitor>router>ospf
monitor>router>ospf3

**Description**
This command displays statistical OSPF virtual link information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.
Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- `nbr-rtr-id` — The IP address to uniquely identify a neighboring router in the autonomous system.
- `area area-id` — The OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.
- `interval seconds` — Configures the interval for each display in seconds.
  
  Default: 5 seconds

  Values: 3 — 60

- `repeat repeat` — Configures how many times the command is repeated.
  
  Default: 10

  Values: 1 — 999

- `absolute` — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

- `rate` — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

---

**virtual-neighbor**

**Syntax**

```
virtual-neighbor nbr-rtr-id area area-id [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

```
monitor>router>ospf
monitor>router>ospf3
```

**Description**

This command displays statistical OSPF virtual neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF virtual neighbor router. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- `nbr-rtr-id` — The IP address to uniquely identify a neighboring router in the autonomous system.
- `area area-id` — The OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.
- `interval seconds` — Configures the interval for each display in seconds.
  
  Default: 5 seconds

  Values: 3 — 60

- `repeat repeat` — Configures how many times the command is repeated.
  
  Default: 10

  Values: 1 — 999
Monitor CLI Commands

**group**

**Syntax**
```
group grp-ip-address [source ip-address] [interval interval] [repeat repeat] [absolute | rate]
```

**Context**
monitor>router>pim

**Description**
This command monitors statistics for a PIM source group.

**Parameters**
- **grp-ip-address** — The IP address of an multicast group that identifies a set of recipients that are interested in a particular data stream.
  - **Default** The IP address of the egress IP interface.
  - **Values** 0.0.0.0 — 255.255.255.255
- **source ip-address** — The source IP address to use in the ping requests in dotted decimal notation.
  - **Default** The IP address of the egress IP interface.
  - **Values** 0.0.0.0 — 255.255.255.255
- **interval interval** — Configures the interval for each display in seconds.
  - **Default** 10 seconds
  - **Values** 10|20|30|40|50|60
- **repeat repeat** — Configures how many times the command is repeated.
  - **Default** 10
  - **Values** 1 — 999
- **absolute** — When the absolute keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- **rate** — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**neighbor**

**Syntax**
```
neighbor [neighbor...(up to 5 max)] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**
monitor>router>rip

**Description**
This command displays statistical RIP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified RIP neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword rate is specified, the "rate per second" for each statistic is displayed instead of the delta.
Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>neighbor ip-address</strong></td>
<td>The IP address to display information for entries received from the specified RIP neighbor. Up to 5 IP addresses can be displayed.</td>
</tr>
<tr>
<td><strong>interval seconds</strong></td>
<td>Configures the interval for each display in seconds.</td>
</tr>
<tr>
<td><strong>repeat repeat</strong></td>
<td>Configures how many times the command is repeated.</td>
</tr>
<tr>
<td><strong>absolute</strong></td>
<td>When the <code>absolute</code> keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.</td>
</tr>
<tr>
<td><strong>rate</strong></td>
<td>When the <code>rate</code> keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.</td>
</tr>
</tbody>
</table>

### interface

**Syntax**

```
interface interface [interface...(up to 5 max)][interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

```
monitor>router>rsvp
```

**Description**

This command displays statistics for RSVP interfaces at the configured interval until the configured count is reached.

- The first screen displays the current statistics related to the RSVP interface(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.
- Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>interface</strong></td>
<td>Specify the interface's IP address (<code>ip-address</code>) or interface name (<code>ip-int-name</code>). Up to 5 interfaces can be specified. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.</td>
</tr>
<tr>
<td><strong>interval seconds</strong></td>
<td>Configures the interval for each display in seconds.</td>
</tr>
<tr>
<td><strong>repeat repeat</strong></td>
<td>Configures how many times the command is repeated.</td>
</tr>
</tbody>
</table>
Monitor CLI Commands

**absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

**rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

**service**

**Syntax**

```
service
```

**Context**

`monitor`

**Description**

This command enables the context to configure criteria to monitor specific service SAP criteria.

**id**

**Syntax**

```
id service-id
```

**Context**

`monitor>service`

**Description**

This command displays statistics for a specific service, specified by the `service-id`, at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the `service-id`. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- `service-id` — The unique service identification number which identifies the service in the service domain.

**sap**

**Syntax**

```
sap sap-id [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

`monitor>service>id service-id`

**Description**

This command monitors statistics for a SAP associated with this service.

This command displays statistics for a specific SAP, identified by the `port-id` and encapsulation value, at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword `rate` is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to `show` commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

**Parameters**

- `sap-id` — Specifies the physical port identifier portion of the SAP definition.

</tbody>
</table>

**port-id** — Specifies the physical port ID in the slot/mda/port format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the **port-id** must be in the slot_number/MDA_number/port_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The **port-id** must reference a valid port type. When the **port-id** parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period “.” separates the physical port from the channel-id. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

**bundle-id** — Specifies the multilink bundle to be associated with this IP interface. The **bundle** keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

```
bundle-id: bundle-type-slot-id/mda-slot.bundle-num
bundle-id value range: 1 — 128
```
Monitor CLI Commands

For example:

*A:ALA-12>config# port bundle-ppp-5/1.1
*A:ALA-12>config>port# multilink-bundle

dgrp-id — Specifies the bundle protection group ID to be associated with this IP interface. The bpgrp keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

\textbf{bpgrp-id:} \textbf{bpgrp-type-bpgrp-num}

\textbf{type:} \textbf{ima}

\textbf{bpgrp-num} value range: 1 — 1280

For example:

*A:ALA-12>config# port bpgrp-ima-1
*A:ALA-12>config>service>vpls$ sap bpgrp-ima-1

qtag1, qtag2 — Specifies the encapsulation value used to identify the SAP on the port or sub-port. If this parameter is not specifically defined, the default value is 0.

\textbf{Values} qtag1: 0 — 4094
qtag2: * | 0 — 4094

The values depends on the encapsulation type configured for the interface. The following table describes the allowed values for the port and encapsulation types.

<table>
<thead>
<tr>
<th>Port Type</th>
<th>Encap-Type</th>
<th>Allowed Values</th>

<td>vpi (NNI) 0 — 4095 vpi (UNI) 0 — 255 vci 1, 2, 5 — 65535</td>
<td>The SAP is identified by port or by PVPC or PVCC identifier (vpi, vpi/vci, or vpi range)</td>
</tr>
</tbody>
</table>
interval seconds — Configures the interval for each display in seconds.

Default  11 seconds
Values  11 — 60

repeat repeat — Configures how many times the command is repeated.

Default  10
Values  1 — 999

absolute — When the absolute keyword is specified, the absolute rate-per-second value for each statistic is displayed.

rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample Output

*A:cses-A13# monitor service id 88  sap 1/1/2:0

Monitor statistics for Service 88 SAP 1/1/2:0

sdp

Syntax  sdp {sdp-id | far-end ip-address} [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>service>id service-id

Description  This command monitors statistics for a SDP binding associated with this service.

Parameters  

  sdp-id — Specify the SDP identifier.
    Values  1 — 17407

  far-end ip-address — The system address of the far-end 7750 SR-Series for the SDP in dotted decimal notation.

  interval seconds — Configures the interval for each display in seconds.
    Default  11 seconds
    Values  11 — 60

  repeat repeat — Configures how many times the command is repeated.
    Default  10
    Values  1 — 999

  absolute — When the absolute keyword is specified, the absolute rate-per-second value for each statistic is displayed.

  rate — When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Sample Output

vrrp

Syntax  vrrp

Context  monitor>router

Description  This command enables the context to configure criteria to monitor VRRP statistical information for a VRRP enabled on a specific interface.

instance

Syntax  instance interface interface-name vr-id virtual-router-id [interval seconds] [repeat repeat] [absolute | rate]

Context  monitor>router>vrrp

Description  Monitor statistics for a VRRP instance.

Parameters

- **interface-name** — The name of the existing IP interface on which VRRP is configured.
- **vr-id virtual-router-id** — The virtual router ID for the existing IP interface, expressed as a decimal integer.
- **interval seconds** — Configures the interval for each display in seconds.
  - Default 5 seconds
  - Values 3 — 60
- **repeat repeat** — Configures how many times the command is repeated.
  - Default 10
  - Values 1 — 999
- **absolute** — When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.
- **rate** — When the **rate** keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
**subscriber**

**Syntax**

```
subscriber sub-ident-string sap sap-id sla-profile sla-profile-name [base | ingress-queue-id ingress-queue-id | egress-queue-id egress-queue-id] [interval seconds] [repeat repeat] [absolute | rate]
```

**Context**

monitor>service

**Description**

This command monitors statistics for a subscriber.

**Parameters**

- **sub-ident-string** — Specifies an existing subscriber identification profile to monitor.
  - **sap sap-id** — Specifies the physical port identifier portion of the SAP definition.
    - **Values**
      - `dlci 16 — 1022`
  - **sla-profile sla-profile-name** — Specifies an existing SLA profile.
  - **interval seconds** — Configures the interval for each display in seconds
    - **Default**
      - `11`
    - **Values**
      - `11 — 60`
  - **repeat repeat** — Configures how many times the command is repeated.
    - **Default**
      - `10`
    - **Values**
      - `1 — 999`
  - **absolute** — When the `absolute` keyword is specified, the raw statistics are displayed, without processing.
    - No calculations are performed on the delta or rate statistics.
    - **Default**
      - `mode delta`
  - **rate** — When the `rate` keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.
  - **base** — Monitor base statistics.
  - **ingress-queue-id ingress-queue-id** — Monitors statistics for this queue.
    - **Values**
      - `1 — 32`
  - **egress-queue-id egress-queue-id** — Monitors statistics for this queue.
    - **Values**
      - `1 — 8`

**Sample Output**

```

File System Management

In This Chapter

This chapter provides information about file system management.

Topics in this chapter include:

- The File System on page 148
  - Compact Flash Devices on page 148
  - URLs on page 149
  - Wildcards on page 151
- File Management Tasks on page 153
  - Modifying File Attributes on page 153
  - Creating Directories on page 154
  - Copying Files on page 155
  - Moving Files on page 156
  - Removing Files and Deleting Directories on page 156
  - Displaying Directory and File Information on page 157
The File System

The 7750 SR OS file system is used to store files used and generated by the system, for example, image files, configuration files, logging files and accounting files.

The file commands allow you to copy, create, move, and delete files and directories, navigate to a different directory, display file or directory contents and the image version.

Compact Flash Devices

The file system is based on a DOS file system. In the 7750 SR-Series, each control processor can have up to three compact flash devices numbered one through three. The names for these devices are:

- cf1:
- cf2:
- cf3:

The above device names are relative device names as they refer to the devices local to the control processor with the current console session. As in the DOS file system, the colon (":" ) at the end of the name indicates it is a device.

The compact flash devices on the 7750 SR-Series routers are removable and have an administrative state (shutdown/no shutdown).

NOTE: To prevent corrupting open files in the file system, you should only remove a compact flash that is administratively shutdown. 7750 SR OS gracefully closes any open files on the device, so it can be safely removed.
URLs

The arguments for the 7750 SR OS file commands are modeled after standard universal resource locator (URL). A URL refers to a file (a file-url) or a directory (a directory-url).

7750 SR OS supports operations on both the local file system and on remote files. For the purposes of categorizing the applicability of commands to local and remote file operations, URLs are divided into three types of URLs: local, ftp and tftp. The syntax for each of the URL types are listed in Table 23.

Table 23: URL Types and Syntax

<table>
<thead>
<tr>
<th>URL Type</th>
<th>Syntax</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>local-url</td>
<td>[cflash-id:]\path</td>
<td>cflash-id is the compact flash device name. Values: cf1:, cf2:, cf3:</td>
</tr>
<tr>
<td>ftp-url</td>
<td>ftp://[username[:password]@]host/path</td>
<td>An absolute ftp path from the root of the remote file system. username is the ftp user name password is the ftp user password host is the remote host path is the path to the directory or file</td>
</tr>
<tr>
<td>ftp-url</td>
<td>ftp://[username[:password]@]host/./path</td>
<td>A relative ftp path from the user’s home directory. Note the period and slash (“/”) in this syntax compared to the absolute path.</td>
</tr>
<tr>
<td>tftp-url</td>
<td>tftp://host[/path]/filename</td>
<td>tftp is only supported for operations on file-urls.</td>
</tr>
</tbody>
</table>

Note that if the host portion of the URL is an IPv6 address, then the address should be enclosed in square brackets. For example:

```
ftp://user:passw@[3ffe::97]/./testfile.txt
```

The system accepts either forward slash (“/”) or backslash (“\”) characters to delimit directory and/or filenames in URLs. Similarly, the 7750 SR OS SCP client application can use either slash or backslash characters, but not all SCP clients treat backslash characters as equivalent to slash characters. In particular, UNIX systems will often times interpret the backslash character as an “escape” character. This can cause problems when using an external SCP client application to send files to the SCP server. If the external system treats the backslash like an escape character, the backslash delimiter will get stripped by the parser and will not be transmitted to the SCP server.

For example, a destination directory specified as “cf1:\dir1\file1” will be transmitted to the SCP server as “cf1:dir1file1” where the backslash escape characters are stripped by the SCP client.
system before transmission. On systems where the client treats the backslash like an “escape” character, a double backslash “\" or the forward slash “/" can typically be used to properly delimit directories and the filename.
Wildcards

7750 SR OS supports the standard DOS wildcard characters. The asterisk (*) can represent zero or more characters in a string of characters, and the question mark (?) can represent any one character.

**Example:** A:ALA-1>file cf3:\ # copy test*.cfg siliconvalley
cf1:\testfile.cfg
1 file(s) copied.
A:ALA-1>file cf3:\ # cd siliconvalley
A:ALA-1>file cf3:\siliconvalley\ # dir
Volume in drive cf1 on slot A has no label.
Directory of cf3:\siliconvalley\
05/10/2006 11:32p <DIR> .
05/10/2006 11:14p <DIR> ..
05/10/2006 11:32p 7597 testfile.cfg
  1 File(s) 7597 bytes.
  2 Dir(s) 1082368 bytes free.
A:ALA-1>file cf3:\siliconvalley\ #

As in a DOS file system, the wildcard characters can only be used in some of the file commands.

Another example of wildcard usage:

A:21# show router mpls lsp l-63-8*
===============================================================================
MPLS LSPs (Originating)
===============================================================================
LSP Name To Fastfail
Adm Opr Config
-------------------------------------------------------------------------------

File Management Tasks

The following sections are basic system tasks that can be performed.

Note that when a file system operation is performed with the copy, delete, move, rd, or scp commands that can potentially delete or overwrite a file system entry, a prompt appears to confirm the action. The force keyword performs the copy, delete, move, rd, and scp actions without displaying the confirmation prompt.

- Modifying File Attributes on page 153
- Creating Directories on page 154
- Copying Files on page 155
- Moving Files on page 156
- Removing Files and Deleting Directories on page 156
- Displaying Directory and File Information on page 157
- Repairing the File System on page 159

Modifying File Attributes

The system administrator can change the read-only attribute in the local file. Enter the attrib command with no options to display the contents of the directory and the file attributes. Use the CLI syntax displayed below to modify file attributes:

**CLI Syntax:**
```
file>
attrib [+r | -r] file-url
```

The following displays an example of the command syntax:

**Example:**
```
# file
file cf3:\ # attrib
file cf3:\ # attrib +r BOF.SAV
file cf3:\ # attrib
```
The following displays the file configuration:

```
A:ALA-1>file cf3:\ # attrib
   cf3:\bootlog.txt
   cf3:\bof.cfg
   cf3:\boot.ldr
   cf3:\bootlog_prev.txt
   cf3:\BOF.SAV
A:ALA-1>file cf3:\ # attrib +r BOF.SAV
A:ALA-1>file cf3:\ # attrib
   cf3:\bootlog.txt
   cf3:\bof.cfg
   cf3:\boot.ldr
   cf3:\bootlog_prev.txt
   cf3:\BOF.SAV
```

----------------------------------

**Creating Directories**

Use the `md` command to create a new directory in the local file system, one level at a time.

Enter the `cd` command to navigate to different directories.

Use the CLI syntax displayed below to modify file attributes:

**CLI Syntax:**
```
file>
md file-url
```

The following displays an example of the command syntax:

**Example:**
```
file cf1:\ # md test1
file cf1:\ # cd test1
file cf1:\test1\ # md test2
file cf1:\test1\ # cd test2
file cf1:\test1\test2\ # md test3
file cf1:\test1\test2\ # cd test3
file cf1:\test1\test2\test3 #
```
Copying Files

Use the `copy` command to upload or download an image file, configuration file, or other file types to or from a flash card or a TFTP server.

The `scp` command copies files between hosts on a network. It uses SSH for data transfer, and uses the same authentication and provides the same security as SSH.

The source file for the `scp` command must be local. The file must reside on the 7750 SR-Series router. The destination file has to be of the format: `user@host:file-name`. The destination does not need to be local.

Use the CLI syntax displayed below to copy files:

**CLI Syntax:**
```
copy source-file-url dest-file-url [force]
scp local-file-url destination-file-url [router router name | service-id] [force]
```

The following displays an example of the copy command syntax:

**Example:**
```
A:ALA-1>file cf1:\ # copy 104.cfg cf1:\test1\test2\test3\test.cfg
A:ALA-1>file cf1:\ # scp file1 admin@192.168.x.x:cf1:\file1
A:ALA-1>file cf1:\ # scp file2 user2@192.168.x.x:/user2/file2
A:ALA-1>file cf1:\ # scp cf2:/file3 admin@192.168.x.x:cf1:\file3
```
Moving Files

Use the `move` command to move a file or directory from one location to another.

Use the CLI syntax displayed below to move files:

**CLI Syntax:**
```plaintext
file> move old-file-url new-file-url [force]
```

The following displays an example of the command syntax:

**Example:**
```
A:ALA-1>file cf1:\test1\test2\test3\ # move test.cfg cf1:\test1\test2\test3\test.cfg
A:ALA-1>file cf1:\test1\test2\test3\ # cd..
A:ALA-1>file cf1:\test1\ # cd..
A:ALA-1>file cf1:\test1\ # dir
```

```
Directory of cf1:\test1\  05/04/2006 07:58a <DIR> .
05/04/2006 07:06a <DIR> ..
05/04/2006 07:06a <DIR> test2
05/04/2006 07:58a               25278 test.cfg
1 File(s)                  25278 bytes.
3 Dir(s)                 1056256 bytes free.
A:ALA-1>file cf1:\test1\ #
```

Removing Files and Deleting Directories

Use the `delete` and `rd` commands to delete files and remove directories. Directories must be empty in order to delete them. When file or directories are deleted they cannot be recovered.

Use the CLI syntax displayed below to delete files and remove directories:

**CLI Syntax:**
```plaintext
file>
  delete file-url [force]
  rd file-url [force]
```

The following displays an example of the command syntax:

```
A:ALA-1>file cf1:\test1\ # delete test.cfg
A:ALA-1>file cf1:\test1\ # delete abc.cfg
A:ALA-1>file cf1:\test1\test2\ # cd test3
A:ALA-1>file cf1:\test1\test2\test3\ # cd..
A:ALA-1>file cf1:\test1\test2\ # rd test3
A:ALA-1>file cf1:\test1\ # cd..
A:ALA-1>file cf1:\test1\ # rd test2
A:ALA-1>file cf1:\test1\ # cd..
A:ALA-1>file cf1:\ # rd test1
A:ALA-1>file cf1:\ #
```

Displaying Directory and File Information

Use the `dir` command to display a list of files on a file system. The `type` command displays the contents of a file. The `version` command displays the version of a cpm.tim or iom.tim file.

Use the CLI syntax displayed below to display directory and file information:

**CLI Syntax:**
```
file>
   dir [file-url]
     type file-url
     version file-url
```

The following displays an example of the command syntax:

```
A:ALA-1>file cf1: \ # dir
   Directory of cf1:
   01/01/1980  12:00a                7597 test.cfg
   01/01/1980  12:00a                 957 b.
   08/19/2001  02:14p              230110 BOOTROM.SYS

Repairing the File System

Use the repair command to check a compact flash device for errors and repair any errors found.

Use the CLI syntax displayed below to check and repair a compact flash device:

**CLI Syntax:**

```
file
    repair [cflash-id]
```

The following displays an example of the command syntax:

```
A:ALA-1>xfile cf3:\ # repair
    Checking drive cf3: on slot A for errors...
    Drive cf31: on slot A is OK.
```
File Command Reference

  -- version file-url [check]
  -- vi local-url
```
## Configuration Commands

### File System Commands

#### shutdown

**Syntax**

```plaintext
[no] shutdown [active] [standby]
[no] shutdown [cflash-id]
```

**Context**

file

**Description**

This command shuts down (unmounts) the specified CPM(s).

Use the `no shutdown [active] [standby]` command to enable one or both CPM.

Use the `no shutdown [cflash-id]` command to enable a compact flash (cf1:, cf2:, or cf3:) on the SF/CPM card. The `no shutdown` command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the `no shutdown` command on cf3: on both SF/CPM cards in order to facilitate synchronization. See the `synchronize` command on page 431.

**NOTE:** The `shutdown` command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

**LED Status Indicators** — The following states are possible for the compact flash:

- **Operational:**
  - If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed.
  - **NOTE:** Do not remove the compact flash during a read/write operation.
  - State: admin = up, operational = up, equipped

- **Flash defective:**
  - If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
  - State: admin = up/down, operational = faulty, equipped = no

- **Flash drive shut down:**
  - When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
  - State: admin = down, operational = down, equipped = yes

- **No compact flash present, drive shut down:**
  - If no compact flash is present and the drive is shut down the LED is unlit.
  - State: admin = down, operational = down, equipped = no
File System Commands

No compact flash present, drive enabled:

If no compact flash is present and the drive is not shut down the LED is unlit.

State: admin = up, operational = down, equipped = no

Ejecting a compact flash:

The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card.

If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

State: admin = down, operational = down, equipped = yes

The shutdown or no shutdown state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default no shutdown — compact flash device administratively enabled

Parameters cflash-id — Enter the compact flash slot ID to be shut down or enabled. When a specific cflash-id is specified, then that drive is shutdown. If no cflash-id is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Default The current compact flash device

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

active — If active is selected, then all drives on the active CPM are shutdown or enabled.

standby — If standby is selected, then all drives on the standby CPM are shutdown or enabled.

Note: When both active and standby keywords are specified, then all drives on both CPM are shut-down.
**File Commands**

**attrib**

**Syntax**
```
 attrib [+r | -r] file-url
 attrib
```

**Context**
file

**Description**
This command sets or clears/resets the read-only attribute for a file in the local file system. To list all files and their current attributes enter `attrib` or `attrib x` where `x` is either the filename or a wildcard (*).

When an `attrib` command is entered to list a specific file or all files in a directory, the file’s attributes are displayed with or without an “R” preceding the filename. The “R” implies that the +r is set and that the file is read-only. Files without the “R” designation implies that the -r is set and that the file is read-write-all. For example:

```
ALA-1>file cf3:\ # attrib
   cf3:\bootlog.txt
   cf3:\bof.cfg
   cf3:\boot.ldr
   cf3:\url.cfg
   cf3:\test
   cf3:\bootlog_prev.txt
   R cf3:\BOF.SAV
```

**Parameters**
- **file-url** — The URL for the local file.

**Values**
- `local-url | remote-url`: 255 chars max
  - `local-url`: `[cflash-id][file-path]`
  - `remote-url`: `[ftp://login:pswd@remote-locn][file-path]`

**<none>** — Displays the current working directory.

```
+r — Sets the read-only attribute on the specified file.
-r — Clears/resets the read-only attribute on the specified file.
```

**cd**

**Syntax**
```
 cd [file-url]
```

**Context**
file

**Description**
This command displays or changes the current working directory in the local file system.

**Parameters**
- **file-url** — Syntax: `[local-url | remote-url] (255 chars max)`
  - `local-url`: `[cflash-id][file-path]`
  - `remote-url`: `[ftp://login:pswd@remote-locn][file-path]`

**<none>** — Displays the current working directory.
File Commands

.. — Signifies the parent directory. This can be used in place of an actual directory name in a directory-url.
directory-url — The destination directory.

copy

Syntax    copy source-file-url dest-file-url [force]

Context   file

Description This command copies a file or all files in a directory from a source URL to a destination URL. At least one of the specified URLs should be a local URL. The optional wildcard (*) can be used to copy multiple files that share a common (partial) prefix and/or (partial) suffix.

When a file is copied to a destination with the same file name, the original file is overwritten by the new file specified in the operation. The following prompt appears if the destination file already exists:

“Overwrite destination file (y/n)?”

For example:

To copy a file named srcfile in a directory called test on cf2 in slot B to a file called destfile in a directory called production on cf1 in slot A, the syntax is:

```
sr1>file cf2:\ # copy cf2-B/test/srcfile cf1-A/production/destfile
```

To FTP a file named 121201.cfg in directory mydir stored on cf1 in slot A to a network FTP server with IP address 131.12.31.79 in a directory called backup with a destination file name of 121201.cfg, the FTP syntax is:

```
copy cf1-A/mydir/121201.cfg 131.12.31.79/backup/121201.cfg
```

Parameters

source-file-url — The location of the source file or directory to be copied.
dest-file-url — The destination of the copied file or directory.
force — Forces an immediate copy of the specified file(s).

file copy force executes the command without displaying a user prompt message.

delete

Syntax    delete file-url [force]

Context   file

Description This command deletes the specified file.

The optional wildcard “*” can be used to delete multiple files that share a common (partial) prefix and/or (partial) suffix. When the wildcard is entered, the following prompt displays for each file that matches the wildcard:

“Delete file <filename> (y/n)?”
file-url — The file name to delete.

**Values**

- `local-url` | `remote-url`: 255 chars max
- `local-url`: `[cflash-id]/[file-path]`
- `remote-url`: `[ftp://login:pswd@remote-locn]/[file-path]`

`cf1:,cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:

force — Forces an immediate deletion of the specified file(s).

file delete * force deletes all the wildcard matching files without displaying a user prompt message.

dir

**Syntax**

`dir [file-url] [sort-order { d | n | s}] [reverse]`

**Context**

file

**Description**

This command displays a list of files and subdirectories in a directory.

**Parameters**

- `file-url` — The path or directory name.

  Use the `file-url` with the optional wildcard (*) to reduce the number of files to list.

**Default**

Lists all files in the present working directory

**sort-order**

- `{ d | n | s}` — Specifies the sort order.

**Values**

- `d` — date
- `n` — name
- `s` — size

**reverse** — Specifies to reverse the sort order.

**Sample Output**

```
A:\cse\E12>file cf3:\ # dir
- dir [<file-url>] [sort-order { d | n | s}] [reverse]
  <file-url> : <local-url>|<remote-url>
  local-url  - [cflash-id]/[file-path]
               200 chars max, including cflash-id
               directory length 99 chars max each
  remote-url - [ftp://<login>:<pswd>@<remote-locn>/
               [file-path]
               255 chars max
               directory length 99 chars max each
  remote-locn - [ <hostname> | <ipv4-address> | 
               "[<ipv6-address>]*"
               ipv4-address - a.b.c.d
               ipv6-address - x:x:x:x:x:x:x[-interface]
               x:x:x:x:x:d.d.d.d[-interface]
               x - [0..FFFF]H
               d - [0..255]D
               interface - 32 chars max, for link
               local addresses
```
File Commands

```
cflash-id      - cf1:|cf1-A:|cf1-B:|cf2:|cf2-A:|
cf2-B:|cf3:|cf3-A:|cf3-B:
< d | n | s>         : Sort order: d - date, n - name, s - size
<reverse>            : keyword - reverse order
A:cses-K12>file cf3:\ # dir
```

file

**Syntax**
```
file
```

**Context** root

**Description**
The context to enter and perform file system operations. When entering the file context, the prompt changes to reflect the present working directory. Navigating the file system with the cd .. command results in a changed prompt.

The exit all command leaves the file system/file operation context and returns to the <ROOT> CLI context. The state of the present working directory is maintained for the CLI session. Entering the file command returns the cursor to the working directory where the exit command was issued.

format

**Syntax**
```
format cflash cfash-id [reliable]
```

**Context** root>file

**Description** This command formats the compact flash. The compact flash must be shutdown before starting the format.

**Parameters**
- `cflash-id` — The compact flash type.
  - **Values** cf1:, cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:
  - `reliable` — Enables the reliance file system and disables the default DOS file system. This option is valid only on compact flashes 1 and 2.

http-download

**Syntax**
```
http-download http-url to local-url router {base | management} [force]
```

**Context** file

**Description** This command downloads a file from a web server to local CF card via HTTP protocol.

Note that this command is supports both IPv4 and IPv6 and does not support HTTPS.

**Default** none
**Parameters**

*local-url* — Specifies the local CF card path and filename to save.

**Values**

- [cflash-id/] file-path
  - cflash-id: cf1:, cf2:, cf3:

*http-url* — Specifies an HTTP URL that could include username and password. It is the HTTP URL to download file from, in the format of http://username:password@remote-url. The username and password are used when HTTP server require basic or digest access authentication.

**Values**

- *http-url*: http://login:pswd@remote-locn/file-path
  - 255 chars max
  - directory length 99 chars max each
  - remote-locn: [ hostname | ipv4-address | ipv6-address ]
    - ipv4-address: a.b.c.d
    - ipv6-address: x:x:x:x:x:x:x:x[-interface]
    - x: x:[0..FFFF]H
    - d: [0..255]D
    - interface: 32 chars max, for link local addresses

*router* — Specifies the router instance that is applicable for the HTTP download.

*force* — When the *force* parameter is specified, the existing local file will be overwritten without confirmation; otherwise system will promote for confirmation if a local file with the same path/name already exists.

### md

**Syntax**

```
md file-url
```

**Context**

`file`

**Description**

This command creates a new directory in a file system.

Directories can only be created one level at a time.

**Parameters**

*file-url* — The directory name to be created.

**Values**

- *local-url | remote-url*: 255 chars max
  - *local-url*: [cflash-id/] [file-path]
  - *remote-url*: [ftp://login:pswd@remote-locn/] [file-path]
  - cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

### move

**Syntax**

```
move old-file-url new-file-url [force]
```

**Context**

`file`

**Description**

This command moves a local file, system file, or a directory. If the target already exists, the command fails and an error message displays.
File Commands

The following prompt appears if the destination file already exists:

“Overwrite destination file (y/n)?”

Parameters

old-file-url — The file or directory to be moved.

Values

<table>
<thead>
<tr>
<th>local-url</th>
<th>remote-url</th>
<th>255 chars max</th>
</tr>
</thead>
<tbody>
<tr>
<td>local-url</td>
<td></td>
<td>[cflash-id][file-path]</td>
</tr>
<tr>
<td>remote-url</td>
<td></td>
<td>[ftp://login:pswd@remote-locn][file-path]</td>
</tr>
<tr>
<td>cf1:, cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

new-file-url — The new destination to place the old-file-url.

Values

<table>
<thead>
<tr>
<th>local-url</th>
<th>remote-url</th>
<th>255 chars max</th>
</tr>
</thead>
<tbody>
<tr>
<td>local-url</td>
<td></td>
<td>[cflash-id][file-path]</td>
</tr>
<tr>
<td>remote-url</td>
<td></td>
<td>[ftp://login:pswd@remote-locn][file-path]</td>
</tr>
<tr>
<td>cf1:, cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

force — Forces an immediate move of the specified file(s).

file move force executes the command without displaying a user prompt message.

rd

Syntax

`rd file-url rf`
```
rd file-url [force]
```

Context file

Description

The `rd` command is used to delete a directory.

If a directory has files and no sub-directories, the `force` option must be used to force delete the directory and files it contains.

If a directory has sub-directories, then the `force` option will fail and the `rf` parameter should be used instead to force delete that directory including the sub-directories.

Example:

```
A:nE1>file cf1:\ # rd alcateltest
Are you sure (y/n)? y
Deleting directory cf1:\alcateltest ..MINOR: CLI Cannot delete cf1:\alcateltest.
A:nE1>file cf1:\ # rd alcateltest force
Deleting directory cf1:\alcateltest ..MINOR: CLI Cannot delete cf1:\alcateltest.
A:nE1>file cf1:\ # rd hussein rf
Deleting all subdirectories and files in specified directory. y/n ?y
Deleting directory cf1:\hussein\hussein1 ..OK
Deleting directory cf1:\alcateltest .OK
```

Parameters

file-url — The directory to be removed.

Values

<table>
<thead>
<tr>
<th>local-url</th>
<th>remote-url</th>
<th>255 chars max</th>
</tr>
</thead>
<tbody>
<tr>
<td>local-url</td>
<td></td>
<td>[cflash-id][file-path]</td>
</tr>
<tr>
<td>remote-url</td>
<td></td>
<td>[ftp://login:pswd@remote-locn][file-path]</td>
</tr>
<tr>
<td>cf1:, cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
rf — The parameter forces a recursive delete.

force — Forces an immediate deletion of the specified directory.

For example, `rd file-url force` executes the command without displaying a user prompt message.

repair

**Syntax**

`repair [cflash-id]`

**Context**

file

**Description**

This command checks a compact flash device for errors and repairs any errors found.

**Parameters**

cflash-id — Specify the compact flash slot ID to be shut down or enabled. When a specific cflash-id is specified, then that drive is shutdown. If no cflash-id is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active SF/CPMCFM is assumed.

**Default**

The current compact flash device

**Values**

cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

scp

**Syntax**

`scp local-file-url destination-file-url [router router-instance] [force]`

**Context**

file

**Description**

This command copies a local file to a remote host file system. It uses `ssh` for data transfer, and uses the same authentication and provides the same security as `ssh`. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

**Parameters**

local-file-url — The local source file or directory.

**Values**

[cflash-id]/[file-path]: Up to 256 characters.

destination-file-url — The destination file.

**Values**

user@hostname:destination-file

user — The SSH user.

host — The remote host IP address of DNS name.

file-path — The destination path.

router-instance — Specify the router name or service ID.

**Values**

router-name: Base, management

service-id: 1 — 2147483647

**Default**

Base

force — Forces an immediate copy of the specified file.
File Commands

**file scp local-file-url destination-file-url [router] force** executes the command without displaying a user prompt message.

### type

**Syntax**  
`type file-url`

**Context**  
file

**Description**  
Displays the contents of a text file.

**Parameters**  
`file-url` — The file contents to display.

**Values**  
- **local-url**  
  `<local-url>|<cflash-id>/|<file-path>`  
  200 chars max, including cflash-id directory length 99 chars max each

- **remote-url**  
  `{ftp://|tftp://}<login>:<pswd>@<remote-locn>/|<file-path>`  
  255 chars max directory length 99 chars max each

- **remote-locn**  
  `<hostname> | <ipv4-address> | <ipv6-address>`
  ipv4-address a.b.c.d
  ipv6-address x:x:x:x:x:x:x:[-interface]
  x - [0..FFFF]H
  d - [0..255]D
  interface - 32 chars max, for link local addresses

- **cflash-id**  
  cf1:, cf1-A:, cf1-B:

### version

**Syntax**  
`version file-url [check]`

**Context**  
file

**Description**  
This command displays the version of a TiMOS cpm.tim or iom.tim file.

**Parameters**  
`file-url` — The file name of the target file.

**Values**  
- **local-url | remote-url**  
  255 characters maximum

- **local-url**  
  `<cflash-id>|<file-path>`

- **remote-url**  
  `{ftp://|tftp://}<login>:<pswd>@<remote-locn>/|<file-path>`

- **cflash-id**  
  cf1:, cf1-A:, cf1-B:

**check** — Validates the .tim file.
Sample Output

TiMOS-C-6.1.R4 for 7750
TiMOS-C-6.1.R4 for 7750
Validation successful
A:Redundancy>file cf3:\ #

vi

Syntax        vi local-url
Context        file
Description    Edit files using the vi editor. Refer to VI Editor on page 47.
Parameters    local-url — Specifies the local source file or directory.

Values       [cflash-id=][/file-path
cflash-id: cf1:, cf2:, cf3:
File Commands
In This Chapter

This chapter provides information about configuring boot option parameters.

Topics in this chapter include:

- System Initialization on page 176
  - Configuration and Image Loading on page 181
    - Persistence on page 183
- Initial System Startup Process Flow on page 185
- Configuration Notes on page 186
The primary copy of SR OS software is located on a compact flash card. The removable media is shipped with each 7750 SR-Series router and contains a copy of the OS image.

Notes:

- The CPM modules contain three slots for removable compact flash cards. The drives are named Compact Flash Slot #1 (cf1), Compact Flash Slot #2 (cf2), and Compact Flash Slot #3 (cf3). Configurations and executable images can be stored on flash cards or an FTP file location. There are six Compact Flash slots on the 7750 SR-c12, three for CFM-A and three for CFM-B.
- The flash card containing the bootstrap and boot option files must be installed in Compact Flash Slot #3 (cf3) on the CPM.
- You must have a console connection.

Starting a 7750 SR-Series router begins with hardware initialization (a reset or power cycle). By default, the system searches Compact Flash Slot #3 (cf3) for the boot.ldr file (also known as the bootstrap file). The boot.ldr file is the image that reads and executes the system initialization commands configured in the boot option file (BOF). The default value to initially search for the boot.ldr file on cf3 cannot be modified.

The following is an example of console display output when the boot.ldr file cannot be located on cf3.

...  
(memory test messages)
(serial number information)
Searching for boot.ldr on local drives:
No disk in cf3
No disk in cf3
No disk in cf3
Error - file boot.ldr not found on any drive
Please insert CF containing boot.ldr. Rebooting in 5 seconds.
(5 second wait)
Rebooting...
(memory test messages)
(user presses '2')
Skipping CF power on diagnostics, boot from CF2
(serial number information)
Searching for boot.ldr on local drives:
Searching cf2 for boot.ldr...
***********************
(normal boot continues)

When the bootstrap image is loaded, the BOF is read to obtain the location of the image and configuration files. The BOF must be located on the same compact flash drive as the boot.ldr file.
Figure 5 displays the system initialization sequence.

![System Initialization Flowchart]

Figure 5: System Initialization - Part 1
Figure 6 displays the compact flash directory structure and file names for the redundant chassis models.

**Figure 6: Files on the Compact Flash**

Files on the compact flash are:

- **bof.cfg** — Boot option file
- **boot.ldr** — Bootstrap image
- **config.cfg** — Default configuration file
- **TIMOS-n.m.Yz**:
  - m — Major release number
  - n — minor release number
  - Y: A — Alpha release
    - B — Beta release
    - M — Maintenance release
    - R — Released software
  - z — Version number
  - → **cpm.tim** — CPM image file
  - → **iom.tim** — IOM image file
Figure 7 displays the compact flash directory structure and file names for the 1-slot models (non-redundant).

Files on the compact flash are:

- bof.cfg — Boot option file
- boot.ldr — Bootstrap image
- config.cfg — Default configuration file
- TIMOS-m.n.Yz:
  - m — Major release number
  - n — Minor release number
  - Y: A — Alpha release
    - B — Beta release
    - M — Maintenance release
    - R — Released software
  - z — Version number
  → both.tim — CPM and IOM image file
Configuration and Image Loading

When the system executes the `boot.ldr` file, the initialization parameters from the BOF are processed. Three locations can be configured for the system to search for the files that contain the runtime image. The locations can be local or remote. The first location searched is the primary image location. If not found, the secondary image location is searched, and lastly, the tertiary image location is searched.

If the BOF cannot be found or loaded, then the system enters a console message dialog session prompting the user to enter alternate file locations and file names.

When the runtime image is successfully loaded, control is passed from the bootstrap loader to the image. The runtime image attempts to locate the configuration file as configured in the BOF. Like the runtime image, three locations can be configured for the system to search for the configuration file. The locations can be local or remote. The first location searched is the primary configuration location. If not found, the secondary configuration location is searched, and lastly, the tertiary configuration location is searched. The configuration file include chassis, IOM, MDA, and port configurations, as well as system, routing, and service configurations.

Figure 8 displays the boot sequence.
The following displays an example of BOF output.

A:ALA-1>bof# show bof
==================================================================
Memory BOF
==================================================================
no autonegotiate
duplex full
speed 100
address 10.10.xx.xx/20 active
wait 3
primary-image cf3:\both.tim
primary-config cf3:\test123.cfg
primary-dns 192.168.xx.xx
persist on
dns-domain test.alcatel.com
==================================================================
A:ALA-1>bof#
Persistence

Optionally, the BOF `persist` parameter can specify whether the system should preserve system indexes when a `save` command is executed. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, etc. If persistence is not required and the configuration file is successfully processed, then the system becomes operational. If `persist` is required, then a matching `x.ndx` file must be located and successfully processed before the system can become operational. Matching files (configuration and index files) must have the same filename prefix such as `test123.cfg` and `test123.ndx` and are created at the same time when a `save` command is executed. Note that the persistence option must be enabled to deploy the Network Management System (NMS). The default is off.

Traps, logs, and console messages are generated if problems occur and SNMP shuts down for all SNMP gets and sets, however, traps are issued.
Lawful Intercept

Lawful Intercept (LI) describes a process to intercept telecommunications by which law enforcement authorities can un-obtrusively monitor voice and data communications to combat crime and terrorism with higher security standards of lawful intercept capabilities in accordance with local law and after following due process and receiving proper authorization from competent authorities. The interception capabilities are sought by various telecommunications providers.

As lawful interception is subject to national regulation, requirements vary from one country to another. Alcatel-Lucent’s implementation satisfies most national standard’s requirements. LI is configurable for all service types.
Initial System Startup Process Flow

Figure 9 displays the process start your system. Note that this example assumes that the boot loader and BOF image and configuration files are successfully located.
Configuration Notes

This section describes BOF configuration caveats.

- For router initialization, the compact flash card must be installed in the Compact Flash #3 slot.
- The loading sequence is based on the order in which it is placed in the configuration file. It is loaded as it is read in at boot time.

For example, for services, if a VPRN service, service-id 272, is created first and then an Apipe service, service-id 2, created next, the VPRN 272 will be loaded first because it was created first.
Configuring Boot File Options with CLI

This section provides information to configure BOF parameters with CLI.

Topics in this section include:

- Configuring Boot File Options with CLI on page 187
- BOF Configuration Overview on page 188
- Basic BOF Configuration on page 189
- Common Configuration Tasks on page 190
- Configuring BOF Parameters on page 195
- Service Management Tasks on page 196
  -> Viewing the Current Configuration on page 196
  -> Modifying and Saving a Configuration on page 198
  -> Saving a Configuration to a Different Filename on page 200
  -> Rebooting on page 200
BOF Configuration Overview

Alcatel-Lucent 7750 SR-Series routers do not contain a boot EEPROM. The boot loader code is loaded from the boot.ldr file. The BOF file performs the following tasks:

1. Sets up the CPM Ethernet port (speed, duplex, auto).
2. Assigns the IP address for the CPM Ethernet port.
3. Creates static routes for the CPM Ethernet port.
4. Sets the console port speed.
5. Configures the Domain Name System (DNS) name and DNS servers.
6. Configures the primary, secondary, tertiary configuration source.
7. Configures the primary, secondary, and tertiary image source.
8. Configures operational parameters.
Basic BOF Configuration

The parameters which specify location of the image filename that the router will try to boot from and the configuration file are in the BOF.

The most basic BOF configuration should have the following:

- Primary address
- Primary image location
- Primary configuration location

Following is a sample of a basic BOF configuration.

```
A:SR-45# show bof
===============================================================================
BOF (Memory)
===============================================================================
    primary-image          cf3:/4.0.R20
    primary-config          cf3:/ospf_default.cfg
    address                138.120.189.53/24 active
    static-route            138.120.0.0/16 next-hop 138.120.189.1
    static-route            172.0.0.0/8 next-hop 138.120.189.1
    autonegotiate           
    duplex                 full
    speed                   100
    wait                    3
    persist                 on
    console-speed           115200
===============================================================================
A:SR-45#
```
Common Configuration Tasks

The following sections are basic system tasks that must be performed.

- Searching for the BOF on page 191
  → Accessing the CLI on page 193
    - Console Connection on page 193
- Configuring BOF Parameters on page 195

For details about hardware installation and initial router connections, refer to the specific 7750 SR-Series hardware installation guide.
Searching for the BOF

The BOF should be on the same drive as the boot loader file. If the system cannot load or cannot find the BOF, then the system checks whether the boot sequence was manually interrupted. The system prompts for a different image and configuration location.

The following example displays an example of the output when the boot sequence is interrupted.

...  

Hit a key within 3 seconds to change boot params...

You must supply some required Boot Options. At any prompt, you can type:
- "restart" - restart the query mode.
- "reboot" - reboot.
- "exit" - boot with with existing values.

Press ENTER to begin, or 'flash' to enter firmware update...

Software Location
------------------
You must enter the URL of the TiMOS software.  
The location can be on a Compact Flash device,  
or on the network.

Here are some examples  
cf3:/timos1.0R1  
ftp://user:passwd@192.168.xx.xxx/./timos1.0R1  
tftp://192.168.xx.xxx./timos1.0R1

The existing Image URL is 'ftp://vxworks:vxw0rks@192.168.xx.xxx/.rel/0.0/xx'
Press ENTER to keep it.
Software Image URL:  
Using: 'ftp://vxworks:vxw0rks@192.168.xx.xxx/.rel/0.0/xx'

Configuration File Location
--------------------------
You must enter the location of configuration  
file to be used by TiMOS. The file can be on  
a Compact Flash device, or on the network.

Here are some examples  
cf1:/config.cfg  
ftp://user:passwd@192.168.xx.xxx/./config.cfg  
tftp://192.168.xx.xxx./config.cfg

The existing Config URL is 'cf3:/config.cfg'
Press ENTER to keep it, or the word 'none' for no Config URL.
Config File URL:  
Using: 'cf3:/config.cfg'

Network Configuration
----------------------
You specified a network location for either the  
software or the configuration file. You need to
assign an IP address for this system.

The IP address should be entered in standard
dotted decimal form with a network length.
example:  192.168.xx.xxx/24

The existing IP address is 192.168.xx.xxx/20. Press ENTER to keep it.
Enter IP Address:

The existing **Active** IP address is 192.168.xx.xxx/20. Press ENTER to keep it.
Enter Active IP Address:

The existing **Standby** IP address is 192.168.xx.xxx/20. Press ENTER to keep it.
Enter Standby IP Address (Type 0 if no desired):

Would you like to add a static route? (yes/no) y

Static Routes
-------------
You specified network locations which require
static routes to reach. You will be asked to
enter static routes until all the locations become
reachable.

Static routes should be entered in the following format:
prefix/mask next-hop ip-address
example:  192.168.xx.xxx/16 next-hop 192.168.xx.xxx

Enter route: 1.x.x.0/24 next-hop 192.168.xx.xxx
OK

Would you like to add another static route? (yes/no) n

New Settings
------------
primary-image    ftp://vxworks:vxw0rks@192.168.xx.xx/./rel/0.0/xx
primary-config   cf3:/config.cfg
address          192.168.xx.xx/20 active
primary-dns      192.168.xx.xx
dns-domain       xxx.xxx.com
static-route     1.x.x.0/24 next-hop 192.168.xx.xxx
autonegotiate    full
speed            100
wait             3
persist          off

Do you want to overwrite cf3:/bof.cfg with the new settings? (yes/no): y
Successfully saved the new settings in cf3:/bof.cfg
Accessing the CLI

To access the CLI to configure the software for the first time, follow these steps:

- When the SF/CPM is installed and power to the chassis is turned on, the 7750 SR OS software automatically begins the boot sequence.
- When the boot loader and BOF image and configuration files are successfully located, establish a router connection (console session).

Console Connection

To establish a console connection, you will need the following:

- An ASCII terminal or a PC running terminal emulation software set to the parameters shown in the table below.
- A standard serial cable with a male DB9.

Table 25: Console Configuration Parameter Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud Rate</td>
<td>115,200</td>
</tr>
<tr>
<td>Data Bits</td>
<td>8</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bits</td>
<td>1</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
</tbody>
</table>
Figure 10 displays an example of the Console port on a 7750 SR-1 front panel.

![Console Port on 7750 SR-1 Front Panel](image_url)

**Figure 10: 7750 SR-1 Front Panel Console Port**

To establish a console connection:

**Step 1** Connect the terminal to the Console port on the front panel using the serial cable.

**Step 2** Power on the terminal.

**Step 3** Establish the connection by pressing the <Enter> key a few times on your terminal keyboard.

**Step 4** At the router prompt, enter the login and password.
   - The default login is `admin`.
   - The default password is `admin`.

**Common Configuration Tasks**

---

**Page 194**

**7750 SR OS Basic System Configuration Guide**
Configuring BOF Parameters

The following output displays a BOF configuration:

```
A:ALA-1>bof# show bof
==================================================================
Memory BOF
==================================================================
no autonegotiate
duplex      full
speed      100
address    10.10.xx.xx/20 active
wait    3
primary-image cf3:\both.tim
primary-config cf3:\test123.cfg
primary-dns 192.168.xx.xx
persist on
dns-domain test.alcatel.com
==================================================================
A:ALA-1>bof#
```
Service Management Tasks

This section discusses the following service management tasks:

- **System Administration Commands on page 196**
  - Viewing the Current Configuration on page 196
  - Modifying and Saving a Configuration on page 198
  - Deleting BOF Parameters on page 199
  - Saving a Configuration to a Different Filename on page 200

System Administration Commands

Use the following administrative commands to perform management tasks.

**CLI Syntax:**

```
A:ALA-1# admin
display-config
reboot [active|standby] [now]
save [file-url] [detail] [index]
```

Viewing the Current Configuration

Use one of the following CLI commands to display the current configuration. The `detail` option displays all default values. The `index` option displays only the persistent indices. The `info` command displays context-level information.

**CLI Syntax:**

```
admin# display-config [detail|index]
info detail
```

The following displays an example of a configuration file:

```
A:7750-3>admin# display-config

Modifying and Saving a Configuration

If you modify a configuration file, the changes remain in effect only during the current power cycle unless a `save` command is executed. Changes are lost if the system is powered down or the router is rebooted without saving.

- Specify the file URL location to save the running configuration. If a destination is not specified, the files are saved to the location where the files were found for that boot sequence. The same configuration can be saved with different file names to the same location or to different locations.
- The `detail` option adds the default parameters to the saved configuration.
- The `index` option forces a save of the index file.
- Changing the active and standby addresses without reboot standby CPM may cause a boot-env sync to fail.

The following command saves a configuration:

**CLI Syntax:** `bof# save [cflash-id]`

**Example:**

```
A:ALA-1# bof
A:ALA-1>bof# save cf3:
A:ALA-1>bof#
```

The following command saves the system configuration:

**CLI Syntax:** `admin# save [file-url] [detail] [index]`

**Example:**

```
A:ALA-1# admin save cf3:\test123.cfg
Saving config.# Saved to cf3:\test123.cfg
... complete
A:ALA-1#
```

**NOTE:** If the `persist` option is enabled and the `admin save file-url` command is executed with an FTP path used as the `file-url` parameter, two FTP sessions simultaneously open to the FTP server. The FTP server must be configured to allow multiple sessions from the same login, otherwise, the configuration and index files will not be saved correctly.
Deleting BOF Parameters

You can delete specific BOF parameters. The **no** form of these commands removes the parameter from configuration. The changes remain in effect only during the current power cycle unless a **save** command is executed. Changes are lost if the system is powered down or the router is rebooted without saving.

Deleting a BOF address entry is not allowed from a Telnet session.

Use the following CLI syntax to save and remove BOF configuration parameters:

CLI Syntax:  `bof# save [cflash-id]`

**Example:**

```
A:ALA-1# bof
A:ALA-1>bof# save cf3:
A:ALA-1>bof#
```

CLI Syntax:  `bof#
  no address ip-address/mask [active | standby]
  no autonegotiate
  no console-speed
  no dns-domain

Saving a Configuration to a Different Filename

Save the current configuration with a unique filename to have additional backup copies and to edit parameters with a text editor. You can save your current configuration to an ASCII file.

Use either of the following CLI syntax to save a configuration to a different location:

**CLI Syntax:** `bof# save [cflash-id]`

**Example:**
```
A:ALA-1# bof
A:ALA-1>bof# save cf3:
A:ALA-1>bof#
```

or

**CLI Syntax:** `admin# save [file-url] [detail] [index]`

**Example:**
```
A:ALA-1>admin# save cf3:\testABC.cfg
Saving config.# Saved to cf3:\testABC.cfg
... complete
A:ALA-1#
```

Rebooting

When an `admin>reboot` command is issued, routers with redundant CPM are rebooted as well as the IOMs. Changes are lost unless the configuration is saved. Use the `admin>save file-url` command to save the current configuration. If no command line options are specified, the user is prompted to confirm the reboot operation.

Use the following CLI syntax to reboot:

**CLI Syntax:** `admin# reboot [active|standby] [now]`

**Example:**
```
A:ALA-1>admin# reboot
A:DutA>admin# reboot
Are you sure you want to reboot (y/n)? y
Resetting...OK
All rights reserved. All use is subject to applicable license agreements.
....
```

Configuration Commands

File Management Commands

bof

Syntax  bof
Context  <ROOT>
Description  This command creates or edits the boot option file (BOF) for the specified local storage device. A BOF file specifies where the system searches for runtime images, configuration files, and other operational parameters during system initialization.

BOF parameters can be modified. Changes can be saved to a specified compact flash. The BOF must be located in the root directory of either an internal or external compact flash local to the system and have the mandatory filename of bof.cfg.

When modifications are made to in-memory parameters that are currently in use or operating, the changes are effective immediately. For example, if the IP address of the management port is changed, the change takes place immediately.

Only one entry of the BOF configuration command statement can be saved once the statement has been found to be syntactically correct.

When opening an existing BOF that is not the BOF used in the most recent boot, a message is issued notifying the user that the parameters will not affect the operation of the node.

No default boot option file exists. The router boots with the factory default boot sequence and options.

Default  none

save

Syntax  save [cflash-id]
Context  bof
Description  This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of bof.cfg.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase “A” or “B”.

Command usage:
File Management Commands

- **bof save** — Saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B).
- **bof save cf3:** — Saves the BOF to cf3: on the active CPM (either in slot A or B).

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify -A or -B option.

Command usage:

- **bof save cf3-A:** — Saves the BOF to cf3: on CPM in in slot A whether it is active or standby.
- **bof save cf3-B:** — Saves the BOF to cf3: on CPM in in slot B whether it is active or standby.

The slot name is not case-sensitive. You can use upper or lowercase “A” or “B”.

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

**Default**

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

**Parameters**

- **flash-id** — The compact flash ID where the **bof.cfg** is to be saved.

  **Values**
  - cf1:; cf1-A:; cf1-B:; cf2:; cf2-A:; cf2-B:; cf3:; cf3-A:; cf3-B:

  **Default**
  - cf3:
## BOF Processing Control

### wait

<table>
<thead>
<tr>
<th>Syntax</th>
<th>wait seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Context</td>
<td>bof</td>
</tr>
<tr>
<td>Description</td>
<td>This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console. When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF). Only one <code>wait</code> command can be defined in the BOF.</td>
</tr>
<tr>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>Parameters</td>
<td><code>seconds</code> — The time to pause at the start of the boot process, in seconds.</td>
</tr>
<tr>
<td>Values</td>
<td>1 — 10</td>
</tr>
</tbody>
</table>
Console Port Configuration

console-speed

Syntax  
```
console-speed baud-rate
no console-speed
```

Context  
bof

Description  
This command configures the console port baud rate.

When this command is issued while editing the BOF file used for the most recent boot, both the BOF file
and the active configuration are changed immediately.

The `no` form of the command reverts to the default value.

Default  
115200 — console configured for 115,200 bps operation

Parameters  
`baud-rate` — The console port baud rate, expressed as a decimal integer.

Values  
9600, 19200, 38400, 57600, 115200
Image and Configuration Management

Persist

Syntax persist \{on | off\}

Context bof

Description This command specifies whether the system will preserve system indexes when a save command is executed. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, etc. This reduces resynchronizations of the Network Management System (NMS) with the affected network element.

In the event that persist is on and the reboot with the appropriate index file fails, SNMP is operationally shut down to prevent the management system from accessing and possibly synchronizing with a partially booted or incomplete network element. To enable SNMP access, enter the \texttt{config>system>snmp>no shutdown} command.

If persist is enabled and the \texttt{admin save <url>} command is executed with an FTP path used as the \texttt{<url>} parameter, two FTP sessions simultaneously open to the FTP server. The FTP server must be configured to allow multiple sessions from the same login, otherwise, the configuration and index files will not be saved correctly.

Notes:

- Persistency files (.ndx) are saved on the same disk as the configuration files and the image files.
- When an operator sets the location for the persistency file, the system will check to ensure that the disk has enough free space. If this there is not enough free space, the persistency will not become active and a trap will be generated. Then, it is up to the operator to free adequate disk space. In the meantime, the system will perform a space availability check every 30 seconds. As soon as the space is available the persistency will become active on the next (30 second) check.

Default off

Parameters

- \texttt{on} — Create when saving the configuration.
- \texttt{off} — Disables the system index saves between reboots.
primary-config

Syntax

primary-config file-url
no primary-config

Context

bof

Description

This command specifies the name and location of the primary configuration file.
The system attempts to use the configuration specified in primary-config. If the specified file cannot be located, the system automatically attempts to obtain the configuration from the location specified in secondary-config and then the tertiary-config.

Note that if an error in the configuration file is encountered, the boot process aborts.
The no form of the command removes the primary-config configuration.

Default

none

Parameters

file-url — The primary configuration file location, expressed as a file URL.

Values

file-url file-url | local-url | remote-url] (up to 180 characters)
local-url [cflash-id][]file-path
remote-url [{ftp://|tftp://} login:pswd@remote-locn][file-path]
cflash-id cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

primary-image

Syntax

primary-image file-url
no primary-image

Context

bof

Description

This command specifies the primary directory location for runtime image file loading.
The system attempts to load all runtime image files configured in the primary-image first. If this fails, the system attempts to load the runtime images from the location configured in the secondary-image. If the secondary image load fails, the tertiary image specified in tertiary-image is used.

All runtime image files (cpm.tim & iom.tim) must be located in the same directory.
The no form of the command removes the primary-image configuration.

Default

none

Parameters

file-url — The location-url can be either local (this CPM) or a remote FTP server.

Values

file-url file-url | local-url | remote-url] (up to 180 characters)
local-url [cflash-id][]file-path
remote-url [{ftp://|tftp://} login:pswd@remote-locn][file-path]
cflash-id cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:
secondary-config

**Syntax**

```
secondary-config file-url
no secondary-config
```

**Context**

bof

**Description**

This command specifies the name and location of the secondary configuration file.

The system attempts to use the configuration as specified in `secondary-config` if the primary config cannot be located. If the `secondary-config` file cannot be located, the system attempts to obtain the configuration from the location specified in the `tertiary-config`.

Note that if an error in the configuration file is encountered, the boot process aborts.

The no form of the command removes the `secondary-config` configuration.

**Default**

none

**Parameters**

`file-url` — The secondary configuration file location, expressed as a file URL.

**Values**

- `file-url`
- `local-url`
- `remote-url`
- `cflash-id`

**secondary-image**

**Syntax**

```
secondary-image file-url
no secondary-image
```

**Context**

bof

**Description**

This command specifies the secondary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the `primary-image` first. If this fails, the system attempts to load the runtime images from the location configured in the `secondary-image`. If the secondary image load fails, the tertiary image specified in `tertiary-image` is used.

All runtime image files (cpm.tim & iom.tim) must be located in the same directory.

The no form of the command removes the `secondary-image` configuration.

**Default**

none

**Parameters**

`file-url` — The `file-url` can be either local (this CPM) or a remote FTP server.

**Values**

- `file-url`
- `local-url`
- `remote-url`
- `cflash-id`
tertiary-config

Syntax

```plaintext
tertiary-config file-url
no tertiary-config
```

Context bof

Description

This command specifies the name and location of the tertiary configuration file.

The system attempts to use the configuration specified in `tertiary-config` if both the primary and secondary config files cannot be located. If this file cannot be located, the system boots with the factory default configuration.

Note that if an error in the configuration file is encountered, the boot process aborts.

The `no` form of the command removes the `tertiary-config` configuration.

Default none

Parameters

- `file-url` — The tertiary configuration file location, expressed as a file URL.

  Values

  - `local-url` — [cflash-id][file-path]
  - `cflash-id` — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:
  - `remote-url` — [ftp://|tftp:// login:pswd@remote-locn][file-path]

tertiary-image

Syntax

```plaintext
tertiary-image file-url
no tertiary-image
```

Context bof

Description

This command specifies the tertiary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the `primary-image` first. If this fails, the system attempts to load the runtime images from the location configured in the `secondary-image`. If the secondary image load fails, the tertiary image specified in `tertiary-image` is used.

All runtime image files (cpm.tim & iom.tim) must be located in the same directory.

The `no` form of the command removes the `tertiary-image` configuration.

Default none

Parameters

- `file-url` — The location-url can be either local (this CPM) or a remote FTP server.

  Values

  - `file-url` — [local-url | remote-url] (up to 180 characters)
  - `local-url` — [cflash-id][file-path]
  - `remote-url` — [ftp:// | tftp:// login:pswd@remote-locn][file-path]
  - `cflash-id` — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:
Management Ethernet Configuration

**address**

**Syntax**

```
[no] address ip-prefix/ip-prefix-length [active | standby]
```

**Context**

`bof`

**Description**

This command assigns an IP address to the management Ethernet port on the active CPM in the running configuration and the Boot Option File (BOF) or the standby CPM for systems using redundant CPMs. Deleting a BOF address entry is not allowed from a Telnet session.

Note that changing the active and standby addresses without reboot standby CPM may cause a boot-env sync to fail.

An IPv4 address in the BOF is required when configuring an IPv6 address in this same BOF for use on the management port.

The `no` form of the command deletes the IP address from the CPM Ethernet port.

**Default**

`no address` — There are no IP addresses assigned to Ethernet ports.

**Parameters**

`ip-prefix/ip-prefix-length` — The destination address of the aggregate route in dotted decimal notation.

- **Values**
  - `ipv4-prefix` a.b.c.d (host bits must be 0)
  - `ipv4-prefix-length` 0 — 32
  - `ipv6-prefix` x:x:x:x:x:x:x (eight 16-bit pieces)
  - `ipv6-prefix-length` 0 — 128

- **active | standby** — Specifies which CPM Ethernet address is being configured: the active CPM Ethernet or the standby CPM Ethernet.

**Default**

`active`

**autonegotiate**

**Syntax**

```
[no] autonegotiate [limited]
```

**Context**

`bof`

**Description**

This command enables speed and duplex autonegotiation on the management Ethernet port in the running configuration and the Boot Option File (BOF).

When autonegotiation is enabled, the link attempts to automatically negotiate the link speed and duplex parameters. If autonegotiation is enabled, then the configured duplex and speed parameters are ignored.

The `no` form of the command disables the autonegotiate feature on this port.

**Default**

`active`
Parameters

limited — Specifies ethernet ports to be configurable to use link autonegotiation but with only a single speed/duplex combination advertised. This allows a specific speed/duplex to be guaranteed without having to turn off autonegotiation, which is not allowed for 1000BASE-T.

duplex

Syntax
duplex {full | half}

Context
bof

Description
This command configures the duplex mode of the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).

This configuration command allows for the configuration of the duplex mode of the CPM Ethernet interface. If the port is configured to autonegotiate this parameter will be ignored.

Default
duplex full — Full duplex operation.

Parameters
full — Sets the link to full duplex mode.

half — Sets the link to half duplex mode.

li-local-save

Syntax
[no] li-local-save

Context
bof

Description
This command enables the lawful intercept (LI) configuration to be saved locally.

li-separate

Syntax
[no] li-separate

Context
bof

Description
This command enables separate access to lawful intercept (LI) information.

speed

Syntax
speed speed

Context
bof

Description
This command configures the speed for the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).
If the port is configured to autonegotiate this parameter is ignored.

**Default**

speed 100 — 100 M/bps operation.

**Parameters**

10 — Sets the link to 10 M/bps speed.

100 — Sets the link to 100 M/bps speed.

---

### static-route

**Syntax**

```
[no] static-route ip-prefix/ip-prefix-length next-hop ip-address
```

**Context**

bof

**Description**

This command creates a static route entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A static default (0.0.0.0/0 or ::/0) route cannot be configured on the CPM Ethernet port. A maximum of 10 static routes can be configured on the CPM port.

The no form of the command deletes the static route.

**Default**

No default routes are configured.

**Parameters**

*ip-prefix/ip-prefix-length* — The destination address of the static route in dotted decimal notation.

**Values**

*ip-prefix/ip-prefix-length:*

- ipv4-prefix a.b.c.d (host bits must be 0)
- ipv4-prefix-le 0 — 32
- ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)
- ipv6-prefix-le 0 — 128
- ip-address: a.b.c.d
- ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)
- ipv6-address-le 0 — 128
- mask — The subnet mask, expressed as an integer or in dotted decimal notation.

**Values**

- 1 — 32 (mask length), 128.0.0.0 — 255.255.255.255 (dotted decimal)

*next-hop ip-address* — The next hop IP address used to reach the destination.
DNS Configuration Commands

dns-domain

Syntax  
dns-domain  dns-name  
no  dns-domain

Context  bof

Description  This command configures the domain name used when performing DNS address resolution. This is a required parameter if DNS address resolution is required. Only a single domain name can be configured. If multiple domain statements are configured, the last one encountered is used.

The no form of the command removes the domain name from the configuration.

Default  no dns-domain  — No DNS domain name is configured.

Parameters  dns-name  — Specifies the DNS domain name up to 32 characters in length.

primary-dns

Syntax  primary-dns  ip-address  
no  primary-dns

Context  bof

Description  This command configures the primary DNS server used for DNS name resolution. DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The no form of the command removes the primary DNS server from the configuration.

Default  no primary-dns  — No primary DNS server is configured.

Parameters  ip-address  — The IP or IPv6 address of the primary DNS server.

Values  
ipv4-address  -  a.b.c.d
ipv6-address:  x:x:x:x:x:[-interface]
x:x:x:x:d.d.d:[-interface]
x:  [0..FFFF]H
d:  [0..255]D
interface  -  32  chars  max,  for  link  local  addresses
secondary-dns

```
[no] secondary-dns ip-address
```

**Context** bof

**Description** This command configures the secondary DNS server for DNS name resolution. The secondary DNS server is used only if the primary DNS server does not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of the command removes the secondary DNS server from the configuration.

**Default** *no secondary-dns* — No secondary DNS server is configured.

**Parameters**

- **ip-address** — The IP or IPv6 address of the secondary DNS server.

**Values**

- ipv4-address - a.b.c.d
- ipv6-address: x:x:x:x:x:[-interface]
  x:x:x:x:x:d.d.d[-interface]
  x: [0..FFFF]H
  d: [0..255]D
  interface - 32 chars max, for link local addresses

---

tertiary-dns

```
[no] tertiary-dns ip-address
```

**Syntax**

```
[no] tertiary-dns ip-address
```

**Context** bof

**Description** This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of the command removes the tertiary DNS server from the configuration.

**Default** *no tertiary-dns* — No tertiary DNS server is configured.

**Parameters**

- **ip-address** — The IP or IPv6 address of the tertiary DNS server.

**Values**

- ipv4-address - a.b.c.d
- ipv6-address: x:x:x:x:x:[-interface]
  x:x:x:x:x:d.d.d[-interface]
  x: [0..FFFF]H
  d: [0..255]D
  interface - 32 chars max, for link local addresses
This page left intentionally blank.
Show Commands

bof

Syntax bof [cflash-id | booted]

Context show

Description This command displays the Boot Option File (BOF) executed on last system boot or on the specified device. If no device is specified, the BOF used in the last system boot displays. If the BOF has been modified since the system boot, a message displays.

Parameters cflash-id. The cflash directory name. The slot name is not case-sensitive. Use upper or lowercase “A” or “B” for the slot name.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

booted — Displays the boot option file used to boot the system.

Output Show BOF Fields — The following table describes BOF output fields.

Show Commands

**boot-messages**

**Syntax**

```
boot-messages
```

**Context**

```
show
```

**Description**

This command displays boot messages generated during the last system boot.

**Output**

**Show Boot Messages Fields** — The following output shows boot message output fields.

**Sample Output**

```bash
ALA-## show boot-messages

System Management Parameters

System management commands allow you to configure basic system management functions such as the system name, the router’s location and coordinates, and CLLI code as well as time zones, Network Time Protocol (NTP), Simple Network Time Protocol (SNTP) properties, CRON and synchronization properties.

It is possible to query the DNS server for IPv6 addresses. By default the DNS names are queried for A-records only (address-preference is IPv4-only). If the address-preference is set to IPv6 first, the DNS server will be queried for AAAA-records first, and if there is no successful reply, then A-records.

System Information

System information components include:

- System Name on page 225
- System Contact on page 225
- System Location on page 226
- System Coordinates on page 226
- Naming Objects on page 226

System Name

The system name is the MIB II (RFC 1907, Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)) sysName object. By convention, this text string is the node’s fully-qualified domain name. The system name can be any ASCII printable text string of up to 32 characters.

System Contact

The system contact is the MIB II sysContact object. By convention, this text string is a textual identification of the contact person for this managed node, together with information on how to contact this person. The system contact can be any ASCII printable text string of up to 80 characters.
System Location

The system location is the MIB II sysLocation object which is a text string conventionally used to describe the node’s physical location, for example, “Bldg MV-11, 1st Floor, Room 101”. The system location can be any ASCII printable text string of up to 80 characters.

System Coordinates

The system coordinates is the Alcatel-Lucent Chassis MIB tmnxChassisCoordinates object. This text string indicates the Global Positioning System (GPS) coordinates of the location of the chassis.

Two-dimensional GPS positioning offers latitude and longitude information as a four dimensional vector:

\[ \langle \text{direction}, \text{hours}, \text{minutes}, \text{seconds} \rangle \]

where \textit{direction} is one of the four basic values: N, S, W, E, \textit{hours} ranges from 0 to 180 (for latitude) and 0 to 90 for longitude, and minutes and seconds range from 0 to 60.

\(<W, 122, 56, 89>\) is an example of longitude and \(<N, 85, 66, 43>\) is an example of latitude.

System coordinates can be expressed in different notations, examples include:

- N 45 58 23, W 34 56 12
- N37 37' 00 latitude, W122 22' 00 longitude
- N36*39.246' W121*40.121

The system coordinates can be any ASCII printable text string up to 80 characters.

Naming Objects

It is discouraged to configure named objects with a name that starts with “\_tmnx\_” and with “\_” in general.
Common Language Location Identifier

A Common Language Location Identifier (CLLI) code string for the device is an 11-character standardized geographic identifier that uniquely identifies the geographic location of places and certain functional categories of equipment unique to the telecommunications industry. The CLLI code is stored in the Alcatel-Lucent Chassis MIB tmnxChassisCLLICode object.

The CLLI code can be any ASCII printable text string of up to 11 characters.
System Time

7750 SR-Series routers are equipped with a real-time system clock for time keeping purposes. When set, the system clock always operates on Coordinated Universal Time (UTC), but the 7750 SR OS software has options for local time translation as well as system clock synchronization.

System time parameters include:

- Time Zones on page 228
- Network Time Protocol (NTP) on page 230
- SNTP Time Synchronization on page 231
- CRON on page 232

Time Zones

Setting a time zone in 7750 SR OS allows for times to be displayed in the local time rather than in UTC. The 7750 SR OS has both user-defined and system defined time zones.

A user-defined time zone has a user assigned name of up to four printable ASCII characters in length and unique from the system-defined time zones. For user-defined time zones, the offset from UTC is configured as well as any summer time adjustment for the time zone.

The 7750 SR OS system-defined time zones are listed in Table 27 which includes both time zones with and without summer time correction.

</table>
Network Time Protocol (NTP)

NTP is the Network Time Protocol defined in RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*. It allows for the participating network nodes to keep time more accurately and more importantly they can maintain time in a more synchronized fashion between all participating network nodes.

NTP uses stratum levels to define the number of hops from a reference clock. The reference clock is considered to be a stratum-0 device that is assumed to be accurate with little or no delay. Stratum-0 servers cannot be used in a network. However, they can be directly connected to devices that operate as stratum-1 servers. A stratum-1 server is an NTP server with a directly-connected device that provides Coordinated Universal Time (UTC), such as a GPS or atomic clock. The 7750 SR-7 and 7750 SR-12 devices cannot act as stratum-1 servers but can act as stratum-2 devices as a network connection to an NTP server is required.

The higher stratum levels are separated from the stratum-1 server over a network path, thus, a stratum-2 server receives its time over a network link from a stratum-1 server. A stratum-3 server receives its time over a network link from a stratum-2 server.

The following NTP elements are supported:

- **Server mode** — In this mode, the node advertises the ability to act as a clock source for other network elements. In this mode, the node will, by default, transmit NTP packets in NTP version 4 mode.
- **Authentication keys** — Increased security support in carrier and other network has been implemented. Both DES and MD5 authentication are supported as well as multiple keys.
- **Operation in symmetric active mode** — This capability requires that NTP be synchronized with a specific node that is considered more trustworthy or accurate than other nodes carrying NTP in the system. This mode requires that a specific peer is set.
- **Broadcast or multicast modes** — When operating in these modes, the node will receive or send using either a multicast (default 224.0.1.1) or a broadcast address. Multicast is supported on the MGMT port.
- **Alert when NTP server is not available** — When none of the configured servers are reachable on the node, the system reverts to manual timekeeping and issues a critical alarm. When a server becomes available, a trap is issued indicating that standard operation has resumed.
- **NTP and SNTP** — If both NTP and SNTP are enabled on the node, then SNTP transitions to an operationally down state. If NTP is removed from the configuration or shut down, then SNTP resumes an operationally up state.
- **Gradual clock adjustment** — As several applications (such as Service Assurance Agent (SAA)) can use the clock, and if determined that a major (128 ms or more) adjustment needs to be performed, the adjustment is performed by programmatically stepping the clock. If a minor (less than 128 ms) adjustment must be performed, then the adjustment is
performed by either speeding up or slowing down the clock.

- In order to facilitate proper operation once the standby CPM takes over from the active CPM it is required that the time on the secondary CPM is synchronized with the clock of the active CPM.
- In order to avoid the generation of too many events/trap the NTP module will rate limit the generation of events/traps to three per second. At that point a single trap will be generated that indicates that event/trap squashing is taking place.

---

**SNTP Time Synchronization**

For synchronizing the system clock with outside time sources, the 7750 SR OS includes a Simple Network Time Protocol (SNTP) client. As defined in RFC 2030, SNTP Version 4 is an adaptation of the Network Time Protocol (NTP). SNTP typically provides time accuracy within 100 milliseconds of the time source. SNTP can only receive the time from NTP servers; it cannot be used to provide time services to other systems. SNTP is a compact, client-only version of NTP. SNTP does not authenticate traffic.

SNTP can be configured in both unicast client modes (point-to-point) and broadcast client modes (point-to-multipoint). SNTP should be used only at the extremities of the synchronization subnet. SNTP clients should operate only at the highest stratum (leaves) of the subnet and in configurations where no NTP or SNTP client is dependent on another SNTP client for synchronization. SNTP time servers should operate only at the root (stratum 1) of the subnet and then only in configurations where no other source of synchronization other than a reliable radio clock is available.

In the 7750 SR OS, the SNTP client can be configured for either broadcast or unicast client mode.
CRON

The CRON feature supports the Service Assurance Agent (SAA) functions as well as the ability to schedule turning on and off policies to meet “Time of Day” requirements. CRON functionality includes the ability to specify the commands that need to be run, when they will be scheduled, including one-time only functionality (oneshot), interval and calendar functions, as well as where to store the output of the results. In addition, CRON can specify the relationship between input, output and schedule. Scheduled reboots, peer turn ups, service assurance agent tests and more can all be scheduled with Cron, as well as OAM events, such as connectivity checks, or troubleshooting runs.

CRON features are saved to the configuration file on both primary and backup control modules. If a control module switchover occurs, CRON events are restored when the new configuration is loaded. If a control module switchover occurs during the execution of a cron script, the failover behavior will be determined by the contents of the script.

CRON features run serially with at least 255 separate schedules and scripts. Each instance can support a schedule where the event is executed any number of times.

The following CRON elements are supported:

- **Action** — Parameters for a script including the maximum amount of time to keep the results from a script run, the maximum amount of time a script may run, the maximum number of script runs to store and the location to store the results.

- **Schedule** — The schedule function configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds).

- **Script** — The script command opens a new nodal context which contains information on a script.

- **Time Range** — ACLs and QoS policy configurations may be enhanced to support time based matching. CRON configuration includes time matching with the 'schedule' sub-command. Schedules are based on events; time-range defines an end-time used as a match criteria.

- **Time of Day** — Time of Day (TOD) suites are useful when configuring many types of time-based policies or when a large number of subscribers or SAPs require the same type of TOD changes. The TOD suite may be configured while using specific ingress or egress ACLs or QoS policies, and is an enhancement of the ingress and egress CLI trees.
High Availability

This section discusses the high availability (HA) routing options and features available to service providers that help diminish vulnerability at the network or service provider edge and alleviate the effect of a lengthy outage on IP networks.

High availability is an important feature in service provider routing systems. High availability is gaining momentum due to the unprecedented growth of IP services and applications in service provider networks driven by the demand from the enterprise and residential communities. Downtime can be very costly, and, in addition to lost revenue, customer information and business-critical communications can be lost. High availability is the combination of continuous uptime over long periods (Mean Time Between Failures (MTBF)) and the speed at which failover or recovery occurs (Mean Time To Repair (MTTR)).

The popularity of high availability routing is evident at the network or service provider edge where thousands of connections are hosted and rerouting options around a failed piece of equipment can often be limiting. Or, a single access link exists to a customer because of additional costs for redundant links. As service providers converge business-critical services such as real-time voice (VoIP), video, and VPN applications over their IP networks, high availability becomes much more stringent compared to the requirements for best-effort data. Network and service availability become critical aspects when offering advanced IP services which dictates that IP routers that are used to construct the foundations of these networks be resilient to component and software outages.

For high availability configuration information, refer to Synchronization and Redundancy on page 241.

HA Features

As more and more critical commercial applications move onto the IP/MPLS networks, providing high availability services becomes increasingly important. This section describes high availability features for routers. Most of these features only apply to routers with two Control Processor Modules (CPM), currently the 7750 SR-7, SR-12, and SR-c12 models.

- Redundancy on page 234
  - Software Redundancy on page 234
  - Configuration Redundancy on page 235
  - Component Redundancy on page 235
  - Service Redundancy on page 236
  - Accounting Configuration Redundancy on page 236
- Nonstop Forwarding on page 237
Redundancy

The redundancy features enable the duplication of data elements and software functionality to maintain service continuation in case of outages or component failure.

Refer to the 7750 SR-Series OS Integrated Services Adapter Guide for information about redundancy for the Integrated Service Adapter (ISA).

Software Redundancy

Software outages are challenging even when baseline hardware redundancy is in place. There should be a balance to provide high availability routing otherwise router problems typically propagate not only throughout the service provider network, but also externally to other connected networks possibly belonging to other service providers. This could affect customers on a broad scale. Presently, there are several software availability features that contribute to the percentage of time that a router is available to process and forward traffic.

To fully appreciate high availability you should realize that all routing protocols specify minimum time intervals in which the peer device must receive an acknowledgement before it disconnects the session.

- OSPF default session timeout is approximately 40 seconds. The timeout intervals are configurable.
- BGP default session timeout is approximately 120 seconds. The timeout intervals are configurable.

Therefore, router software has to recover faster than the specified time interval to maintain uptime.
Configuration Redundancy

Features configured on the active device CPM are saved on the standby CPM as well. When the active device CPM fails, these features are brought up on the standby device CPM that takes over the mastership.

Even with modern modular and stable software, the failure of route processor hardware or software can cause the router to reboot or cause other service impacting events. In the best circumstances, failure leads to the initialization of a redundant route processor, which hosts the standby software configuration, to become the active processor. The following options are available.

- Warm standby — The router image and configuration is already loaded on the standby route processor. However, the standby could still take a few minutes to become effective since it must first re-initialize connections by bringing up Layer 2 connections and Layer 3 routing protocols and then rebuild routing tables.
- Hot standby — The router image, configuration, and network state is already loaded on the standby and it receives continual updates from the active route processor and the swapover is immediate. However, hot standby affects conventional router performance as more frequent synchronization increases consumption of system resources. Newer generation service routers, like the 7750 SR-Series7450 ESS-Series7710 SR-Series7750 SR MG routers, address this issue because they already have extra processing built into the system.

Component Redundancy

7750 SR-Series component redundancy is critical to reduce MTTR for the system and primarily consists of the following router features:

- Dual route processor modules — For a highly available architecture, redundant route processors (RPs) or Control Processor Modules(CPM) are essential. The route processor calculates the most efficient route to an Internet destination and communicates the best path information to peer routers. Rapid information synchronization between the primary and secondary route processor is crucial to minimize recovery time.
- Dual switch fabric — Failover to the backup switch fabric within a minimum time interval, preferably with no loss of traffic.
- Redundant line cards — Failover to the backup within a minimum time interval, preferably with no loss of traffic.
- Redundant power supply — A power module can be removed without impact on traffic.
- Redundant fan — Failure of a fan module without impacting traffic.
- Hot swap — Components in a live system can be replaced or become active without taking the system down or affecting traffic flow to/from other modules.
Router hardware architecture plays a key role in the availability of the system. The principle router architecture styles are centralized and distributed. In these architectures, both active and standby route processors, I/O modules (IOMs) (also called line cards), fans, and power supplies maintain a low MTTR for the routing system.

However, in a centralized architecture, packet processing and forwarding is performed in a central shared route processor and the individual IOMs (line cards) are relatively simple. The cards rely solely on the route processor for routing and forwarding intelligence and, should the centralized route processor fail, there is greater impact to the system overall, as all routing and packet forwarding will stop.

In a distributed system, the packet forwarding functionality is situated on each IOM. Distributing the forwarding engines off the central route processor and positioning one on each IOM lowers the impact of route processor failure as the line cards can continue to forward traffic during an outage.

The distributed system is better suited to enable the convergence of business critical services such as real-time voice (VoIP), Video, and VPN applications over IP networks with superior performance and scalability. The centralized architecture can be prone to performance bottleneck issues and limits service offerings through poor scalability which may lead to customer and service SLA violations.

---

**Service Redundancy**

All service-related statistics are kept during a switchover. Services, SDPs, and SAPs will remain up with a minimum loss of forwarded traffic during a CPM switchover.

---

**Accounting Configuration Redundancy**

When there is a switchover and the standby CPM becomes active, the accounting servers will be checked and if they are administratively up and capable of coming online (media present, etc.), the standby will be brought online and new accounting files will be created at that point. Users must manually copy the accounting records from the failed CPM.
Nonstop Forwarding

In a control plane failure or a forced switchover event, the router continues to forward packets using the existing stale forwarding information. Nonstop forwarding requires clean control plane and data plane separation. Usually the forwarding information is distributed to the IOMs.

Nonstop forwarding is used to notify peer routers to continue forwarding and receiving packets, even if the route processor (control plane) is not working or is in a switch-over state. Nonstop forwarding requires clean control plane and data plane separation and usually the forwarding information is distributed to the line cards. This method of availability has both advantages and disadvantages. Nonstop forwarding continues to forward packets using the existing stale forwarding information during a failure. This may cause routing loops and black holes, and also requires that surrounding routers adhere to separate extension standards for each protocol. Every router vendor must support protocol extensions for interoperability.
Nonstop Routing (NSR)

With NSR on the 7750 SR-Series routers devices, routing neighbors are unaware of a routing process fault. If a fault occurs, a reliable and deterministic activity switch to the inactive control complex occurs such that routing topology and reachability are not affected, even in the presence of routing updates. NSR achieves high availability through parallelization by maintaining up to date routing state information, at all times, on the standby route processor. This capability is achieved independently of protocols or protocol extensions, providing a more robust solution than graceful restart protocols between network routers.

The NSR implementation on the 7750 SR-Series routers supports all routing protocols. NSR makes it possible to keep the existing sessions (BGP, LDP, OSPF, etc.) during a CPM switchover, including support for MPLS signaling protocols. Peers will not see any change.

Protocol extensions are not required. There are no interoperability issues and there is no need to define protocol extensions for every protocol. Unlike nonstop forwarding and graceful restart, the forwarding information in NSR is always up to date, which eliminates possible blackholes or forwarding loops. This is also called the Alcatel-Lucent Carrier Environment Internet System (ACEIS). NSR is a relatively new high availability technique. However, it is regarded the most promising to ensure IP packets continue to forward once a route processor fails and allows for in-service software upgrades.

Traditionally, addressing high availability issues have been patched through non-stop forwarding solutions. With the implementation of NSR, these limitations are overcome by delivering an intelligent hitless failover solution. This enables a carrier-class foundation for transparent networks, required to support business IP services backed by stringent SLAs. This level of high availability poses a major issue for conventional routers whose architectural design limits or prevents them from implementing NSR.

The following NSR entities remain intact after a switchover:

- BGP sessions — BGP peers should not see any change after the switchover. NSR supports all the address families, including IPv4 unicast, VPN-IPv4 unicast, and IPv6 and supports BGP sessions on network ports as well as on the access ports (i.e., VPRN).
- OSPF adjacencies — OSPF neighbors do not see any change after the switchover.
- IS-IS adjacencies — IS-IS neighbors do not see any change after the switchover.
- RIP session — RIP neighbors do not see any change after the switchover.
- Frame Relay data-link connection identifiers.
- ATM VPs/VCs.
- PPP and MLPPP sessions.
CPM Switchover

During a switchover, system control and routing protocol execution are transferred from the active to the standby CPM.

An automatic switchover may occur under the following conditions:

- A fault condition that causes the active CPM to crash or reboot.
- The active CPM is declared down (not responding).
- Online removal of the active CPM.

A manual switchover can occur under the following conditions:

- To force a switchover from an active CPM to a standby, use the `admin redundancy force-switchover` command. You can configure a batch file that executes after failover by using the `config system switchover-exec` and `admin redundancy force-switchover now` CLI commands.

  Note that with the 7750 SR-1 the `admin reboot[now]` CLI command does not cause a switchover but a reboot of the entire system.
Synchronization

Synchronization between the CPMs includes the following:

- Configuration and boot-env Synchronization on page 240
- State Database Synchronization on page 240

Configuration and boot-env Synchronization

Configuration and boot-env synchronization are supported in `admin>redundancy> synchronize` and `config>redundancy> synchronize` contexts.

State Database Synchronization

If a new standby CPM is inserted into the system, it synchronizes with the active CPM upon a successful boot process.

If the standby CPM is rebooted, it synchronizes with the active CPM upon a successful boot process.

When configuration or state changes occur, an incremental synchronization is conducted from the active CPM to the standby CPM.

If the synchronization fails, the standby does not reboot automatically. The `show redundancy synchronization` command displays synchronization output information.

If the active and standby are not synchronized for some reason, users can manually synchronize the standby CPM by rebooting the standby by issuing the `admin reboot standby` command on the active or the standby CPM.
Synchronization and Redundancy

7750 SR-Series routers supporting redundancy (such as the SR-12 and SR-e12 models) use a 1:1 redundancy scheme. Redundancy methods facilitate system synchronization between the active and standby Control Processor Modules (CPMs) so they maintain identical operational parameters to prevent inconsistencies in the event of a CPM failure.

When automatic system synchronization is enabled for an entity, any save or delete file operations configured on the primary, secondary or tertiary choices on the active CPM file system are mirrored in the standby CPM file system.

Although software configurations and images can be copied or downloaded from remote locations, synchronization can only occur locally between compact flash drives (cf1:, cf2:, and cf3:).

Synchronization can occur either:

- Automatically — Automatic synchronization is disabled by default. To enable automatic synchronization, the `config>redundancy>synchronization` command must be specified with either the `boot-env` parameter or the `config` parameter.
  
  When the `boot-env` parameter is specified, the BOF, boot.ldr, config, and image files are automatically synchronized. When the `config` parameter is specified, only the config files are automatically synchronized.

  Automatic synchronization also occurs whenever the BOF is modified and when an `admin>save` command is entered with no filename specified.

- Manually — To execute synchronization manually, the `admin>redundancy>synchronization` command must be entered with the `boot-env` parameter or the `config` parameter.

  When the `boot-env` parameter is specified, the BOF, boot.ldr, config, and image files are synchronized. When the `config` parameter is specified, only the config files are synchronized.

  The following shows the output displayed during a manual synchronization of configuration files.

```
A:ALA-12>admin>redundancy# synchronize config
Syncing configuration......
Syncing configuration......Completed.
A:ALA-12#
```
Active and Standby Designations

Typically, the first Switch Fabric (SF)/CPM card installed in a redundant 7750 SR-Series chassis assumes the role as active, regardless of being inserted in Slot A or B. The next CPM installed in the same chassis then assumes the role as the standby CPM. If two CPM are inserted simultaneously (or almost simultaneously) and are booting at the same time, then preference is given to the CPM installed in Slot A.

If only one CPM is installed in a redundant routerdevice, then it becomes the active CPM regardless of the slot it is installed in.

To visually determine the active and standby designations, the Status LED on the faceplate is lit green (steady) to indicate the active designation. The Status LED on the second CPM faceplate is lit amber to indicate the standby designation.

The following output shows that the CPM installed in Slot A is acting as the active CPM and the CPM installed in Slot B is acting as the standby.

```
ALA-12# show card
===============================================================================
Card Summary
===============================================================================
 slot card allowed provisioned equipped admin state operational state
-------------------------------------------------------------------------------
 2 all supported iom-20g iom-20g up up
 A all supported sfm-400g sfm-400g up up/active
 B all supported sfm-400g sfm-400g up up/standby
===============================================================================
ALA-12#
```

The following console message displays when a CPM boots, sees an active CPM, and becomes the standby CPM.

```
... Slot A contains the Active CPM
This CPM (Slot B) is the Standby CPM
```
When the Active CPM Goes Offline

When an active CPM goes offline (due to reboot, removal, or failure), the standby CPM takes control without rebooting or initializing itself. It is assumed that the CPMs are synchronized, therefore, there is no delay in operability. When the CPM that went offline boots and then comes back online, it becomes the standby CPM.

When the standby CPM comes online, the following output displays:

Active CPM in Slot A has stopped
Slot B is now active CPM

Attempting to exec configuration file:
'cf3:/config.cfg' ...

... 

Executed 49,588 lines in 8.0 seconds from file cf3:\config.cfg
Persistence

The persistence feature allows information learned through DHCP snooping across reboots to be kept. This information can include data such as the IP address, MAC binding information, lease-length information, and ingress sap information (required for VPLS snooping to identify the ingress interface). This information is referred to as the DHCP lease-state information.

When a DHCP message is snooped, there are steps that make the data persistent in a system with dual CPMs. In systems with only one CPM, only Step 1 applies. In systems with dual CPMs, all steps apply.

1. When a DHCP ACK is received from a DHCP server, the entry information is written to the active CPM Compact Flash. If writing was successful, the ACK is forwarded to the DHCP client. If persistency fails completely (bad cflash), a trap is generated indicating that persistency can no longer be guaranteed. If the complete persistency system fails the DHCP ACKs are still forwarded to the DHCP clients. Only during small persistency interruptions or in overload conditions of the Compact Flash, DHCP ACKs may get dropped and not forwarded to the DHCP clients.
2. DHCP message information is sent to the standby CPM and also there the DHCP information is logged on the Compact Flash. If persistency fails on the standby also, a trap is generated.
Network Synchronization

This section describes network synchronization capabilities available on SR and ESS product platforms. These capabilities involve multiple approaches to network timing; namely SDH/SONET, Synchronous Ethernet, and Adaptive clocking. These features address barriers to entry by:

- Providing synchronization quality required by the mobile space; such as radio operations and circuit emulation services (CES) transport.
- Augmenting and potentially replacing the existing (SONET/SDH) timing infrastructure and delivering high quality network timing for time sensitive applications in the wireline space.

Network synchronization is commonly distributed in a hierarchical master-slave topology at the physical layer as shown in Figure 11.

---

**Figure 11: Conventional Network Timing Architecture (North American Nomenclature)**

The architecture shown in Figure 11 provides the following benefits:

- Limits the need for high quality clocks at each network element and only requires that they reliably replicate input to remain traceable to its reference.
- Uses reliable physical media to provide transport of the timing signal; it doesn't consume any bandwidth and requires limited additional processing.
The synchronization network is designed so a clock always receives timing from a clock of equal or higher stratum or quality level. This ensures that if an upstream clock has a fault condition (for example, loses its reference and enters a holdover or free-run state) and begins to drift in frequency, the downstream clock will be able to follow it. For greater reliability and robustness, most offices and nodes have at least two synchronization references that can be selected in priority order (such as primary and secondary).

Further levels of resiliency can be provided by designing a capability in the node clock that will operate within prescribed network performance specifications without any reference for a specified timeframe. A clock operating in this mode is said to hold the last known state over (or holdover) until the reference lock is once again achieved. Each level in the timing hierarchy is associated with minimum levels of network performance.

Each synchronization capable port can be independently configured to transmit data using the node reference timing or loop timing. In addition, some TDM channels can use adaptive timing.

Transmission of a reference clock through a chain of Ethernet equipment requires that all equipment supports Synchronous Ethernet. A single piece of equipment that is not capable of performing Synchronous Ethernet breaks the chain. Ethernet frames will still get through but downstream devices should not use the recovered line timing as it will not be traceable to an acceptable stratum source.
Central Synchronization Sub-System

The timing subsystem for the SR/ESS platforms has a central clock located on the CPM (motherboard). The timing subsystem performs many of the duties of the network element clock as defined by Telcordia (GR-1244-CORE) and ITU-T G.781.

The system can select from up to four timing inputs to train the local oscillator. The priority order of these references must be specified. This is a simple ordered list of inputs: \{bits, ref1, ref2, ptp\}. The CPM clock output shall have the ability to drive the clocking for all line cards in the system. The routers support selection of the node reference using Quality Level (QL) indications. See Figure 12 for a description of synchronization reference selection.

The recovered clock will be able to derive its timing from any of the following:

- OC3/STM1, OC12/STM4, OC48/STM16, OC192/STM64 ports
- T1/E1 CES channel (adaptive clocking)
- Synchronous Ethernet ports
- T1/E1 port
- BITS port on a Channelized OC3/STM1 CES CMA (7710 SR-c4, 7710 SR-c12, and the 7750 SR-c12)
- BITS port on the CPM or CFM module
- 1588 Slave Clock (ptp)

On 7750 SR-12 and 7750 SR-7 systems with redundant CPMs, the system will have two BITS input ports (one per CPM). On the 7750 SRc-4 systems, there are two BITS input ports on the chassis front plate. These BITS input ports provide redundant synchronization inputs from an external BITS/SSU.
All settings of the signal characteristics for the BITS input applies to both ports. When the active CPM considers the BITS input as a possible reference, it will consider first the BITS input port on the active CPM followed the BITS input port on the standby CPM in that relative priority order. This relative priority order is in addition to the user definable ref-order. For example, a ref-order of ‘bits-ref1-ref2’ would actually be BITS in (active CPM) followed by BITS in (standby CPM) followed by ref1 followed by ref2. When ql-selection is enabled, then the QL of each BITS input port shall be viewed independently. The higher QL source shall be chosen.

The 7750 SR-c4 platform has a new CFM, there are two BITS input ports and two BITS output ports on this one module. These two ports are provided for BITS redundancy for the chassis. All settings of the signal characteristics for the BITS input applies to both ports. This includes the ql-override setting. When the CFM considers the BITS input as a possible reference, it will consider first the BITS input port “bits1” followed the BITS input port “bits2” in that relative priority order. This relative priority order is in addition to the user definable ref-order. For example, a ref-order of ‘bits-ref1-ref2’ would actually be “bits1” followed by “bits2” followed by ref1 followed by ref2. When ql-selection is enabled, then the QL of each BITS input port shall be viewed independently. The higher QL source shall be chosen.

The BITS output ports is provided to deliver a unfiltered recovered line clock from a SR/ESS port directly to dedicated timing device in the facility (BITS or SASE device). The signal selected will be one of ref1 or ref2. It cannot be the BITS input port signal nor can it be the output of the central clock.

When QL selection mode is disabled, then the reversion setting controls when the central clock can re-select a previously failed reference.

The Table 28 shows the selection followed for two reference in both revertive and non-revertive modes:

**Synchronization Status Messages (SSM)**

SSM provides a mechanism to allow the synchronization distribution network to both determine the quality level of the clock sourcing a given synchronization trail and to allow a network element to select the best of multiple input synchronization trails. Synchronization Status messages have been defined for various transport protocols including SONET/SDH, T1/E1, and Synchronous Ethernet, for interaction with office clocks, such as BITS or SSUs and embedded network element clocks.

SSM allows equipment to autonomously provision and reconfigure (by reference switching) their synchronization references, while helping to avoid the creation of timing loops. These messages are particularly useful to allow synchronization reconfigurations when timing is distributed in both directions around a ring.

**DS1 Signals**

DS1 signals can carry an indication of the quality level of the source generating the timing information using the SSM transported within the 1544 Kbit/s signal's Extended Super Frame (ESF) Data Link (DL) as specified in Recommendation G.704. No such provision is extended to SF formatted DS1 signals.

The format of the data link messages in ESF frame format is "0xxx xxx0 1111 1111", transmitted rightmost bit first. The six bits denoted "xxx xxx" contain the actual message; some of these messages are reserved for synchronization messaging. It takes 32 frames (such as 4 ms) to transmit all 16 bits of a complete DL.

**E1 Signals**

E1 signals can carry an indication of the quality level of the source generating the timing information using the SSM as specified in Recommendation G.704.

One of the Sa4 to Sa8 bits, (the actual Sa bit is for operator selection), is allocated for Synchronization Status Messages. To prevent ambiguities in pattern recognition, it is necessary to align the first bit (San1) with frame 1 of a G.704 E1 multiframe.

The numbering of the San (n = 4, 5, 6, 7, 8) bits. A San bit is organized as a 4-bit nibble San1 to San4. San1 is the most significant bit; San4 is the least significant bit.

The message set in San1 to San4 is a copy of the set defined in SDH bits 5 to 8 of byte S1.
SONET/SDH Signals

The SSM of SDH and SONET interfaces is carried in the S1 byte of the frame overhead. Each frame contains the four bit value of the QL.

DS3/E3

These signals are not required to be synchronous. However, it is acceptable for their clocking to be generated from a synchronization source. The SR/ESS shall permit E3/DS3 physical ports to be specified as a central clock input reference.

DS3/E3 signals do not support an SSM channel. QL-override should be used for these ports if ql-selection is enabled.
Synchronous Ethernet

Traditionally, Ethernet-based networks employ the physical layer transmitter clock to be derived from an inexpensive +/-100ppm crystal oscillator and the receiver locks onto it. There is no need for long term frequency stability because the data is packetized and can be buffered. For the same reason there is no need for consistency between the frequencies of different links. However, you can derive the physical layer transmitter clock from a high quality frequency reference by replacing the crystal with a frequency source traceable to a primary reference clock. This would not effect the operation of any of the Ethernet layers, for which this change would be transparent. The receiver at the far end of the link would lock onto the physical layer clock of the received signal, and thus itself gain access to a highly accurate and stable frequency reference. Then, in a manner analogous to conventional hierarchical master-slave network synchronization, this receiver could lock the transmission clock of its other ports to this frequency reference and a fully time synchronous network could be established.

The advantage of using Synchronous Ethernet, compared with methods that rely on sending timing information in packets over an unclocked physical layer, is that it is not influenced by impairments introduced by the higher levels of the networking technology (packet loss, packet delay variation). Hence, the frequency accuracy and stability may be expected to exceed those of networks with unsynchronized physical layers.

Synchronous Ethernet allows operators to gracefully integrate existing systems and future deployments into conventional industry-standard synchronization hierarchy. The concept behind synchronous Ethernet is analogous to SONET/SDH system timing capabilities. It allows the operator to select any (optical) Ethernet port as a candidate timing reference. The recovered timing from this port will then be used to time the system (for example, the CPM will lock to this provisioned reference selection). The operator then could ensure that any of system output would be locked to a stable traceable frequency source.

The SSM of Synchronous Ethernet uses an Ethernet OAM PDU that uses the slow protocol subtype. For a complete description of the format and processing see ITU-T G.8264
Clock Source Quality Level Definitions

The following clock source quality levels have been identified for the purpose of tracking network timing flow. These levels make up all of the defined network deployment options given in Recommendation G.803 and G.781. The Option I network is a network developed on the original European SDH model; whereas, the Option II network is a network developed on the North American SONET model. See Table 29 and Table 30 for descriptions of the synchronization message coding and source priorities.

In addition to the QL values received over SSM of an interface, the standards also define additional codes for internal use. These include the following:

- QL INVx is generated internally by the system if and when an unallocated SSM value is received, where x represents the binary value of this SSM. Within the SR/ESS all these independent values are assigned as the singled value of QL-INVALID.
- QL FAILED is generated internally by the system if and when the terminated network synchronization distribution trail is in the signal fail state.

Within the SR/ESS, there is also an internal quality level of QL-UNKNOWN. This is used to differentiate from a received QL-STU code but is equivalent for the purposes of QL selection.

Table 30: Synchronization Message Coding and Source Priorities (Transmitted by Interface of Type)
IEEE 1588v2 PTP

Precision Time Protocol (PTP) is a timing-over-packet protocol defined in the IEEE 1588v2 standard 1588 PTP 2008.

PTP may be deployed as an alternative timing-over-packet option to ACR. PTP provides the capability to synchronize network elements to a Stratum-1 clock or primary reference clock (PRC) traceable source over a network that may or may not be PTP-aware. PTP has several advantages over ACR. It is a standards-based protocol, has lower bandwidth requirements, can transport both frequency and time, and can potentially provide better performance.

There are five basic types of PTP devices, as listed below:

- ordinary clock
- boundary clock
- end-to-end transparent clock
- peer-to-peer transparent clock
- management node

The 7750 SR supports the ordinary clock in slave or master mode for frequency recovery. The implementation aligns with the ITU-T architecture for 1588 frequency distribution using only grandmaster and slave clocks documented in G.8265.

The 1588v2 standard includes the concept of PTP profiles. These profiles are to be defined by industry groups or standards bodies to define how 1588v2 is to be used for a particular application. The standard includes a default profile. ITU-T has defined a profile relevant to the carriers within mobile backhaul and traditional telecom carrier networks (recommendation G.8265.1). The 7750 currently only supports the profile of G.8265.1.

The 7750 SR PTP slave clock can be configured to receive timing from up to two PTP master clocks in the network (peers). IP messaging between the PTP master clock and PTP slave clock is done using IPv4 unicast mode. The 7750 SR master clock can support up to 50 simultaneous external peers as slaves. These slaves use the Unicast Negotiation procedures to request service from the 7750 SR master clock. These types of external peers do not need to be pre-configured into the 7750 SR.

As per G.8265.1, the slave will select between the two available master clocks using a precedence as follows:

- clock class
- peer priority

Figure 13 on page 256 shows the Unicast Negotiation procedure performed between a slave and a peer clock that is selected to be the master clock. The slave clock will request Announce
messages from all peer clocks but only request Sync and Delay_Resp messages from the clock selected to be the master clock.

Figure 13: Messaging Sequence Between the PTP Slave Clock and PTP Master Clock
PTP Clock Synchronization

The IEEE 1588v2 standard synchronizes the frequency and time from a master clock to one or more slave clocks over a packet stream. This packet-based synchronization can be over UDP/IP or Ethernet and can be multicast or unicast. Only IPv4 unicast mode with unicast negotiation is supported.

As part of the basic synchronization timing computation, a number of event messages are defined for synchronization messaging between the PTP slave clock and PTP master clock. A one-step or two-step synchronization operation can be used, with the two-step operation requiring a follow-up message after each synchronization message. Currently, only one-step operation is supported on the 7750 SR.

When using 1588 for distribution of a frequency reference, the slave calculates a message delay from the master to the slave based on the timestamps exchanged. A sequence of these calculated delays will contain information of the relative frequencies of the master clock and slave clock but will have noise component related to the packet delay variation (PDV) experienced across the network. The slave must filter the PDV effects so as to extract the relative frequency data and then adjust the slave frequency to align with the master frequency.

PTP Capabilities

PTP messages are supported via IPv4 unicast with a fixed IP header size. Table 31 describes the support message rates for slave and master states. The ordinary clock can be either in the slave or master state.

<table>
<thead>
<tr>
<th>Support Message</th>
<th>Slave Clock Request Rate</th>
<th>Master Clock Grant Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Min</td>
<td>Max</td>
</tr>
<tr>
<td>Announce</td>
<td>1 every 2 seconds</td>
<td>1 every 2 seconds</td>
</tr>
<tr>
<td>Sync</td>
<td>64/seconds</td>
<td>32/seconds</td>
</tr>
<tr>
<td>Delay Resp</td>
<td>64/seconds</td>
<td>32/seconds</td>
</tr>
<tr>
<td>(Duration)</td>
<td>300 seconds</td>
<td>1 second</td>
</tr>
</tbody>
</table>

State and statistics data for each master clock are available to assist in the detection of failures or unusual situations.
The PTP algorithm is able to recover the clock using both the upstream and downstream directions. The ability to perform bidirectional clock recovery will improve the performance of networks where the upstream and downstream load is not symmetrical.

PTP Clock Redundancy

Each PTP slave clock can be configured to receive timing from up to two PTP master clocks. If two PTP master clocks are configured, and if communication to the best master is lost or if the BMCA determines that the other PTP master clock is better, then the PTP slave clock switches to the other PTP master clock.
System-Wide ATM Parameters

The atm-ping OAM loopback feature can be enabled on an ATM SAP for a period of time configured through the interval and the send-count parameters. When the ATM SAP terminates on IES or VPRN services, a failure of the loopback state machine does not bring down the Layer 3 interface. Only receiving AIS/RDI OAM cells or entering the AIS/RDI state brings down the Layer 3 interface.

The atm-ping OAM loopback feature can be also be enabled on a continuous basis on an ATM SAP terminating on IES or VPRN services. When the loopback state machine fails, the Layer 3 interface is brought down.

The ATM OAM loopback parameters must be first enabled and configured in the config>system>atm>oam context and then enabled in the IES or VPRN service interface SAP atm oam context.

Refer to the IES and VPRN sections of the 7750 SR OS Services Guide for further information.
The IEEE 802.1ab Link Layer Discovery Protocol (LLDP) is a uni-directional protocol that uses the MAC layer to transmit specific information related to the capabilities and status of the local device. Separately from the transmit direction, the LLDP agent can also receive the same kind of information for a remote device which is stored in the related MIB(s).

LLDP itself does not contain a mechanism for soliciting specific information from other LLDP agents, nor does it provide a specific means of confirming the receipt of information. LLDP allows the transmitter and the receiver to be separately enabled, making it possible to configure an implementation so the local LLDP agent can either transmit only or receive only, or can transmit and receive LLDP information.

The information fields in each LLDP frame are contained in a LLDP Data Unit (LLDPDU) as a sequence of variable length information elements, that each include type, length, and value fields (known as TLVs), where:

- Type identifies what kind of information is being sent.
- Length indicates the length of the information string in octets.
- Value is the actual information that needs to be sent (for example, a binary bit map or an alphanumeric string that can contain one or more fields).

Each LLDPDU contains four mandatory TLVs and can contain optional TLVs as selected by network management:

- Chassis ID TLV
- Port ID TLV
- Time To Live TLV
- Zero or more optional TLVs, as allowed by the maximum size of the LLDPDU
- End Of LLDPDU TLV

The chassis ID and the port ID values are concatenated to form a logical identifier that is used by the recipient to identify the sending LLDP agent/port. Both the chassis ID and port ID values can be defined in a number of convenient forms. Once selected however, the chassis ID/port ID value combination remains the same as long as the particular port remains operable.

A non-zero value in the TTL field of the time-to-live TLV tells the receiving LLDP agent how long all information pertaining to this LLDPDU’s identifier will be valid so that all the associated information can later be automatically discarded by the receiving LLDP agent if the sender fails to update it in a timely manner. A zero value indicates that any information pertaining to this LLDPDU’s identifier is to be discarded immediately.

Note that a TTL value of zero can be used, for example, to signal that the sending port has initiated a port shutdown procedure.
The end of a LLDPDU TLV marks the end of the LLDPDU.

The IEEE 802.1ab standard defines a protocol that:

- Advertises connectivity and management information about the local station to adjacent stations on the same IEEE 802 LAN.
- Receives network management information from adjacent stations on the same IEEE 802 LAN.
- Operates with all IEEE 802 access protocols and network media.
- Establishes a network management information schema and object definitions that are suitable for storing connection information about adjacent stations.
- Provides compatibility with a number of MIBs as depicted in Figure 14.

Network operators must be able to discover the topology information in order to detect and address network problems and inconsistencies in the configuration. Moreover, standard-based tools can address the complex network scenarios where multiple devices from different vendors are interconnected using Ethernet interfaces.
The example displayed in Figure 15 depicts a MPLS network that uses Ethernet interfaces in the core or as an access/handoff interfaces to connect to different kind of Ethernet enabled devices such as service gateway/routers, QinQ switches, DSLAMs or customer equipment.

IEEE 802.1ab LLDP running on each Ethernet interfaces in between all the above network elements may be used to discover the topology information.
Administrative Tasks

This section contains information to perform administrative tasks.

- Configuring the Chassis Mode on page 263
- Saving Configurations on page 266
- Specifying Post-Boot Configuration Files on page 267
- Network Timing on page 268
- Power Supplies on page 268

Configuring the Chassis Mode

 Depending on the chassis type and IOM type, the following modes can be configured:

**NOTE:** Chassis modes are not available on the 7750 SRc12 router.

- a: This mode corresponds to scaling and feature set associated with iom-20g.
- b: This mode corresponds to scaling and feature set associated with iom-20g-b.
- c: This mode corresponds to scaling and feature set associated with iom2-20g.
- d: This mode corresponds to scaling and feature set associated with iom3-xp.

If the chassis mode is not explicitly provisioned in the configuration file, the chassis will come up in chassis mode a by default. The behavior for the IOMs is described in the following table:

**Table 32: Provisioned IOM Card Behavior**

<table>
<thead>
<tr>
<th>IOM</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>iom-20g-b</td>
<td>Comes online if provisioned as iom-20g or iom-20g-b.</td>
</tr>
<tr>
<td>iom2-20g</td>
<td>Comes online if provisioned as iom-20g, iom-20g-b or iom2-20g.</td>
</tr>
<tr>
<td>iom3-xp</td>
<td>Comes online if provisioned as iom3-xp.</td>
</tr>
</tbody>
</table>

To support a particular chassis-mode, all provisioned IOMs must meet the corresponding IOM level.

The chassis Mode corresponds to scaling and feature sets associated with a given card. The base mode is chassis mode A which supports all IOM card types.
IOM cards that are not compatible with more recent chassis modes will be put into an operationally failed state if the configuration chassis mode “force” option is used.

- Chassis mode A corresponds to iom-20g, chassis mode backwards compatible for iom-20g-b, iom2-20g, iom3-xp
- Chassis mode B corresponds to iom-20g-b, chassis mode backwards compatible for iom2-20g, iom3-xp
- Chassis mode C corresponds to iom2-20g, chassis mode backwards compatible for iom3-xp
- Chassis mode D corresponds to iom3-xp

The **force** keyword forces an upgrade either from mode **a** to mode **b** or **d** with cards provisioned as iom-20g or from mode **b** to mode **c** with cards provisioned as iom-20g-b.

The ASAP MDA can only be configured if the IOM2-20g and IOM3-XP is provisioned.

Note that, if you are in chassis-mode **d** and configure an IOM type as iom2-20g and then downgrade to chassis-mode **a** or **b** (must specify **force** keyword), a warning appears about the IOM downgrade. In this case, the IOM’s provisioned type will downgrade to iom-20g-b. Once this is done, the ASAP MDA cannot be configured. The following message appears:

```
*A:138.120.214.68>config>system# chassis-mode b
MINOR: CHMGR #1009 Mode change requires force - card-type iom2-20g in slot 1 would change to iom-20g-b
*A:138.120.214.68>config>system# chassis-mode b force
MINOR: CHMGR #1010 Can not change mode - mda m1-choc12-as-sfp in 10/1 not supported when card changes to iom-20g-b
```

If this is the desired behavior, for example, chassis-mode **d** is configured and IPv6 is running, you can then downgrade to chassis-mode **a** or **b** if you want to disable IPv6.

```

Saving Configurations

Whenever configuration changes are made, the modified configuration must be saved so they will not be lost when the system is rebooted.

Configuration files are saved by executing explicit command syntax which includes the file URL location to save the configuration file as well as options to save both default and non-default configuration parameters. Boot option file (BOF) parameters specify where the system should search for configuration and image files as well as other operational parameters during system initialization.

For more information about boot option files, refer to the Boot Option Files section of this manual.
Specifying Post-Boot Configuration Files

Two post-boot configuration extension files are supported and are triggered when either a successful or failed boot configuration file is processed. The `boot-bad-exec` and `boot-good-exec` commands specify URLs for the CLI scripts to be run following the completion of the boot-up configuration. A URL must be specified or no action is taken.

For example, after a configuration file is successfully loaded, the specified URL can contain a nearly identical configuration file with certain commands enabled or disabled, or particular parameters specified and according to the script which loads that file.
Network Timing

In Time Domain Multiplexed (TDM)-based networks (for example, SONET or SDH circuit-switched networks), the concept of network timing is used to prevent over-run or under-run issues where circuits are groomed (rebundled) and switched. Hardware exists in each node that takes a common clock derived from an internal oscillator, a specific receive interface or special BITS interface and provides it to each synchronous interface in the system. Usually, each synchronous interface is allowed to choose between using the chassis-provided clock or the clocking recovered from the received signal on the interface. The clocking is used to drive the transmit side of the interface. The appropriate configuration at each node which defines how interface clocking is handled must be considered when designing a network that has a centralized timing source so each interface is operating in a synchronous manner.

The effect of timing on a network is dependent on the nature of the type of traffic carried on the network. With bit-wise synchronous traffic (traditional circuit-based voice or video), non-synchronous transmissions cause a loss of information in the streams affecting performance. With packet-based traffic, the applications expect and handle jitter and latency inherent to packet-based networks. When a packet-based network is used to carry voice or video traffic, the applications use data compression and elasticity buffering to compensate for jitter and latency. The network itself relies on appropriate Quality of Service (QoS) definitions and network provisioning to further minimize the jitter and latency the application may experience.

Power Supplies

7750 SR OS supports a power-supply command to configure the type and number of power supplies present in the chassis. The operational status of a power source is always displayed by the LEDs on the Control Processor/Switch Fabric Module (CP/SFM) front panel, but the power supply information must be explicitly configured in order for a power supply alarm to be generated if a power source becomes operationally disabled.
Automatic Synchronization

Use the CLI syntax displayed below to configure synchronization components relating to active-to-standby CPM switchover. In redundant systems, synchronization ensures that the active and standby CPMs have identical operational parameters, including the active configuration, CPM, and IOM images in the event of a failure or reset of the active CPM. The force-switchover command forces a switchover to the standby CPM card.

To enable automatic synchronization, either the boot-env parameter or the config parameter must be specified. The synchronization occurs when the admin save or bof save commands are executed.

When the boot-env parameter of the synchronize command is specified, the bof.cfg, primary/secondary/tertiary configuration files (.cfg and .ndx), li, and ssh files are automatically synchronized. When the config parameter is specified, only the configuration files are automatically synchronized.

Synchronization also occurs whenever the BOF is modified and when an admin>save command is entered with no filename specified.

Boot-Env Option

The boot-env option enables a synchronization of all the files used in system initialization.

When configuring the system to perform this synchronization, the following occurs:

1. The BOF used during system initialization is copied to the same compact flash on the standby CPM (in redundant systems).
   Note: The synchronization parameters on the standby CPM are preserved.
2. The primary, secondary, and tertiary images, (provided they are locally stored on the active CPM) are copied to the same compact flash on the standby CPM.
3. The primary, secondary, and tertiary configuration files, (provided they are locally stored on the active CPM) are copied to the same compact flash on the standby CPM.

Config Option

The config option synchronizes configuration files by copying the files specified in the active CPM BOF file to the same compact flash on the standby CPM.
Manual Synchronization

The `admin redundancy synchronize` command performs manual CPM synchronizations. The `boot-env` parameter synchronizes the BOF, image, and configuration files in redundant systems. The `config` parameter synchronizes only the configuration files in redundant systems.

Forcing a Switchover

The `force-switchover now` command forces an immediate switchover to the standby CPM card.

If the active and standby are not synchronized for some reason, users can manually synchronize the standby CPM by rebooting the standby by issuing the `admin reboot standby` command on the active or the standby CPM.

System Management

Saving Configurations

Whenever configuration changes are made, the modified configuration must be saved so the changes will not be lost when the system is rebooted. The system uses the configuration and image files, as well as other operational parameters necessary for system initialization, according to the locations specified in the boot option file (BOF) parameters. For more information about boot option files, refer to the Boot Option Files section of this manual.

Configuration files are saved by executing *implicit* or *explicit* command syntax.

- An *explicit* save writes the configuration to the location specified in the `save` command syntax (the `file-url` option).
- An *implicit* save writes the configuration to the file specified in the primary configuration location.

  If the `file-url` option is not specified in the `save` command syntax, the system attempts to save the current configuration to the current BOF primary configuration source. If the primary configuration source (path and/or filename) changed since the last boot, the new configuration source is used.

The `save` command includes an option to save both default and non-default configuration parameters (the `detail` option).

The `index` option specifies that the system preserves system indexes when a save command is executed, regardless of the persistent status in the BOF file. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, etc. This reduces resynchronizations of the Network Management System (NMS) with the affected network element.

If the save attempt fails at the destination, an error occurs and is logged. The system does not try to save the file to the secondary or tertiary configuration sources unless the path and filename are explicitly named with the `save` command.
Basic System Configuration

This section provides information to configure system parameters and provides configuration examples of common configuration tasks. The minimal system parameters that should be configured are:

- System Information Parameters on page 279
- System Time Elements on page 282

The following example displays a basic system configuration:

A:ALA-12>config>system# info
#------------------------------------------
  echo "System Configuration "
#------------------------------------------
    name "ALA-12"
    coordinates "Unknown"

System Information

This section covers the basic system information parameters to configure the physical location of the SR-Series, contact information, location information such as the place the router is located such as an address, floor, room number, etc., global positioning system (GPS) coordinates, and system name.

Use the CLI syntax displayed below to configure the following system components:

- System Information Parameters on page 279
- System Time Elements on page 282

General system parameters include:

- Name on page 279
- Contact on page 279
- Location on page 280
- CLLI Code on page 280
- Coordinates on page 281
System Information Parameters

Name

Use the `system` command to configure a name for the device. The name is used in the prompt string. Only one system name can be configured, if multiple system names are configured the last one encountered overwrites the previous entry. Use the following CLI syntax to configure the system name:

**CLI Syntax:**
```
config>system
    name system-name
```

**Example:**
alcatel>config>system# name ALA-12

The following example displays the system name:

```
sysName@domain>config>system# info
#------------------------------------------
echo "System Configuration 
#------------------------------------------
    name "ALA-12"
    . . .
    exit
--------------------------------------------
sysName@domain>config>system#
```

Contact

Use the `contact` command to specify the name of a system administrator, IT staff member, or other administrative entity.

**CLI Syntax:**
```
config>system
    contact contact-name
```

**Example:**
config>system# contact “Fred Information Technology”
Location

Use the `location` command to specify the system location of the device. For example, enter the city, building address, floor, room number, etc., where the router is located.

Use the following CLI syntax to configure the location:

**CLI Syntax:**
```
config>system
location location
```

**Example:**
```
config>system# location "Bldg.1-floor 2-Room 201"
```

CLLI Code

The Common Language Location Code (CLLI code) is an 11-character standardized geographic identifier that is used to uniquely identify the geographic location of a 7750 SR-Series router.

Use the following CLI command syntax to define the CLLI code:

**CLI Syntax:**
```
config>system
clli-code clli-code
```

**Example:**
```
config>system# clli-code abcdefg1234
```
Coordinates

Use the optional *coordinates* command to specify the GPS location of the device. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Use the following CLI syntax to configure the location:

**CLI Syntax:**
```
config>system
coordinates coordinates
```

**Example:**
```
config>system# coordinates "N 45 58 23, W 34 56 12"
```

The following example displays the configuration output of the general system commands:

```
sysName@domain>config>system# info
#------------------------------------------
echo "System Configuration "
#------------------------------------------
   name "ALA-12"
   contact "Fred Information Technology"
   location "Bldg.1-floor 2-Room 201"
   clli-code "abcdefg1234"
   coordinates "N 45 58 23, W 34 56 12"

... exit
----------------------------------------------
```

A:ALA-12>config>system#
System Time Elements

The system clock maintains time according to Coordinated Universal Time (UTC). Configure information time zone and summer time (daylight savings time) parameters to correctly display time according to the local time zone.

Time elements include:

- Zone on page 282
- Summer Time Conditions on page 284
- NTP on page 285
- SNTP on page 291
- CRON on page 293
  - Time Range on page 296
  - Time of Day on page 300

Zone

The `zone` command sets the time zone and/or time zone offset for the router. The router supports system-defined and user-defined time zones. The system-defined time zones are listed in Table 33.

**CLI Syntax:**

```
config>system>time
    zone std-zone-name|non-std-zone-name [hh [:mm]]
```

**Example:**

```
config>system>time#
config>system>time# zone GMT
```

The following example displays the zone output:

```
A:ALA-12>config>system>time# info
----------------------------------------------
    ntp
    server 192.168.15.221
    no shutdown
  exit
    sntp
    shutdown
  exit
    zone UTC
----------------------------------------------
A:ALA-12>config>system>time#
```

</table>
Summer Time Conditions

The `config>system>time>dst-zone` context configures the start and end dates and offset for summer time or daylight savings time to override system defaults or for user defined time zones.

When configured, the time will be adjusted by adding the configured offset when summer time starts and subtracting the configured offset when summer time ends.

**CLI Syntax:**
```plaintext
cfg>system>time
  dst-zone zone-name
    end {end-week} {end-day} {end-month} [hours-minutes]
    offset offset
  start {start-week} {start-day} {start-month} [hours-minutes]
```

**Example:**
```
cfg>system>time
  dst-zone pt
  start second sunday april 02:00
  end first sunday october 02:00
  offset 0
```

If the time zone configured is listed in Table 33, then the starting and ending parameters and offset do not need to be configured with this command unless there is a need to override the system defaults. The command will return an error if the start and ending dates and times are not available either in Table 33 or entered as optional parameters in this command.

The following example displays the configured parameters.

```
A:ALA-48>config>system>time>dst-zone# info
----------------------------------------------
  start second sunday april 02:00
  end first sunday october 02:00
  offset 0
----------------------------------------------
A:ALA-48>config>system>time>dst-zone# offset 0
```
NTP

Network Time Protocol (NTP) is defined in RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*. It allows for participating network nodes to keep time more accurately and maintain time in a synchronized manner between all participating network nodes.

NTP time elements include:

- Authentication-check on page 285
- Authentication-key on page 286
- Broadcast on page 286
- Broadcastclient on page 287
- Multicast on page 288
- Multicastclient on page 288
- NTP-Server on page 289
- Peer on page 289
- Server on page 290

**Authentication-check**

The authentication-check command provides for the option to skip the rejection of NTP PDUs that do not match the authentication key or authentication type requirements. The default behavior when authentication is configured is to reject all NTP protocol PDUs that have a mismatch in either the authentication key-id, type, or key.

When authentication-check is configured, NTP PDUs are authenticated on receipt. However, mismatches cause a counter to be increased, one counter for key-id, one for type, and one for key value mismatches.

**CLI Syntax:**
```
config>system>time>ntp
    authentication-check
```

**Example:**
```
config>system>time>ntp#
  config>system>time>ntp#  authentication-check
  config>system>time>ntp#  no shutdown
```
**Authentication-key**

This command configures an authentication key-id, key type, and key used to authenticate NTP PDUs sent to and received from other network elements participating in the NTP protocol. For authentication to work, the authentication key-id, authentication type and authentication key value must match.

**CLI Syntax:**
```
cfg>system>time>ntp
  authentication-key key-id {key key} [hash | hash2] type
  {des|message-digest}
```

**Example:**
```
cfg>system>time>ntp#
  authentication-key 1 key A type des
  no shutdown
```

The following example shows NTP disabled with the `authentication-key` parameter enabled.
```
A: sim1>config>system>time>ntp# info
-------------------------------------------------------
  shutdown
  authentication-key 1 key "OAwgNULbzgI" hash2 type des
-------------------------------------------------------
A: sim1>config>system>time>ntp#
```

**Broadcast**

The `broadcast` command is used to transmit broadcast packets on a given subnet.

**CLI Syntax:**
```
cfg>system>time>ntp
  broadcast [router router-name] {interface
    ip-int-name> [key-id key-id] [version version]
    [ttl ttl]}
```

**Example:**
```
cfg>system>time>ntp#
  broadcast interface int11 version 4
  ttl 127
  no shutdown
```

The following example in the `system>time` context shows NTP enabled with the `broadcast` command configured.
```
A: sim1>config>system>time# info detail
-----------------------------------------------
  ntp
    no shutdown
    authentication-check
    ntp-server
    broadcast interface int11 version 4 ttl 127
  exit
```
A:sim1>config>system>time#

The following example in the config context shows NTP enabled with the broadcast command configured. At this level, the NTP broadcast commands are displayed at the end of the output after the router interfaces are shown.

A:sim1>config info

....

#--------------------------------------------------
echo "System Time NTP Configuration"
#--------------------------------------------------
system
time
ntp
  broadcast interface toboth
exit
exit
exit
A:sim1>config

Broadcastclient

The broadcastclient command enables listening to NTP broadcast messages on the specified interface.

**CLI Syntax:**
```
config>system>time>ntp
broadcastclient[router router-name] {interface ip-int-name} [authenticate]
```

**Example:**
```
config>system>time>ntp#
config>system>time>ntp# broadcastclient interface int11
config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the broadcastclient parameter enabled.

A:ALA-12>config>system>time# info
```
ntp
  broadcastclient interface int11
  no shutdown
exit
dst-zone PT
  start second sunday april 02:00
  end first sunday october 02:00
  offset 0
exit
zone UTC
```

A:ALA-12>config>system>time#
Multicast

When configuring NTP the node can be configured to transmit or receive multicast packets on the CPM MGMT port. Broadcast & Multicast messages can easily be spoofed, therefore, authentication is strongly recommended. Multicast is used to configure the transmission of NTP multicast messages. The no construct of this command removes the transmission of multicast address from the configuration.

When transmitting multicast NTP messages the default address of 224.0.1.1 is used.

**CLI Syntax:**
```
config>system>time>ntp
multicast [version version] [key-id key-id]
```

**Example:**
```
config>system>time>ntp#
config>system>time>ntp# multicast
config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the `multicast` command configured.
```
A:ALA-12>config>system>time# info
----------------------------------------------
server 192.168.15.221
multicast
no shutdown
----------------------------------------------
A:ALA-12>config>system>time#
```

Multicastclient

This command is used to configure an address to receive multicast NTP messages on the CPM MGMT port. The no construct of this command removes the multicast client.

If multicastclient is not configured, all NTP multicast traffic will be ignored.

**CLI Syntax:**
```
config>system>time>ntp
multicastclient [authenticate]
```

**Example:**
```
config>system>time>ntp#
config>system>time>ntp# multicastclient authenticate
config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the `multicastclient` command configured.
```
A:ALA-12>config>system>time# info
----------------------------------------------
server 192.168.15.221
multicastclient
no shutdown
----------------------------------------------
A:ALA-12>config>system>time##
```
NTP-Server

This command configures the node to assume the role of an NTP server. Unless the server command is used this node will function as an NTP client only and will not distribute the time to downstream network elements. If an authentication key-id is specified in this command, the NTP server requires client packets to be authenticated.

**CLI Syntax:**
```
config>system>time>ntp
    ntp-server [transmit key-id]
```

**Example:**
```
config>system>time>ntp#
    config>system>time>ntp# ntp-server transmit 1
    config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the `ntp-server` command configured.
```
A: sim1>config>system>time>ntp# info
----------------------------------------------
    no shutdown
    ntp-server
----------------------------------------------
A: sim1>config>system>time>ntp#
```

Peer

Configuration of an NTP peer configures symmetric active mode for the configured peer. Although any system can be configured to peer with any other NTP node, it is recommended to configure authentication and to configure known time servers as their peers. Use the `no` form of the command to remove the configured peer.

**CLI Syntax:**
```
config>system>time>ntp
    peer ip-address [version version] [key-id key-id] [prefer]
```

**Example:**
```
config>system>time>ntp#
    config>system>time>ntp# peer 192.168.1.1 key-id 1
    config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the `peer` command configured.
```
A: sim1>config>system>time>ntp# info
----------------------------------------------
    no shutdown
    peer 192.168.1.1 key-id 1
----------------------------------------------
A: sim1>config>system>time>ntp#
```
Server

The Server command is used when the node should operate in client mode with the NTP server specified in the address field. Use the `no` form of this command to remove the server with the specified address from the configuration.

Up to five NTP servers can be configured.

**CLI Syntax:**
```
config>system>time>ntp
    server ip-address [key-id key-id] [version version] [prefer]
```

**Example:**
```
config>system>time>ntp#
config>system>time>ntp# server 192.168.1.1 key-id 1
config>system>time>ntp# no shutdown
```

The following example shows NTP enabled with the `server` command configured.

```
A:sim1>config>system>time>ntp# info
----------------------------------------------
no shutdown
server 192.168.1.1 key 1
----------------------------------------------
A:sim1>config>system>time>ntp#
```
SNTP

SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers; it cannot be used to provide time services to other systems. SNTP can be configured in either broadcast or unicast client mode.

SNTP time elements include:

- Broadcast-client on page 291
- Server-address on page 292

---

CLI Syntax:  
```plaintext
config>system
time
   sntp
      broadcast-client
      server-address ip-address [version version-number]
                  [normal|preferred] [interval seconds]
      no shutdown
```

---

Broadcast-client

The **broadcast-client** command enables listening at the global device level to SNTP broadcast messages on interfaces with broadcast client enabled.

CLI Syntax:  
```plaintext
config>system>time>sntp
   broadcast-client
```

Example:

```plaintext
config>system>time>sntp#
config>system>time>sntp# broadcast-client
config>system>time>sntp# no shutdown
```

The following example shows SNTP enabled with the **broadcast-client** command enabled.

```
A:ALA-12>config>system>time# info
----------------------------------------------
sntp
   broadcast-client
   no shutdown
   exit
dst-zone PT
   start second sunday april 02:00
   end first sunday october 02:00
   offset 0
   exit
   zone GMT
----------------------------------------------
A:ALA-12>config>system>time#
```
Server-address

The **server-address** command configures an SNTP server for SNTP unicast client mode.

**CLI Syntax:**
```
config>system>time>sntp#
    config>system>time>sntp# server-address ip-address version version-number [normal|preferred] [interval seconds]
```

**Example:**
```
config>system>time>sntp#
    config>system>time# server-address 10.10.0.94 version 1 preferred interval 100
```

The following example shows SNTP enabled with the **server-address** command configured.

```
A:ALA-12>config>system>time# info
----------------------------------------------
    sntp
        server-address 10.10.0.94 version 1 preferred interval 100
        no shutdown
        exit
        dst-zone PT start-date 2006/04/04 12:00 end-date 2006/10/25 12:00
        zone GMT
----------------------------------------------
A:ALA-12>config>system>time#
```
CRON

The CRON command supports the Service Assurance Agent (SAA) functions as well as the ability to schedule turning on and off policies to meet “Time of Day” requirements. CRON functionality includes the ability to specify the commands that need to be run, when they will be scheduled, including one-time only functionality (oneshot), interval and calendar functions, as well as where to store the output of the results. In addition, CRON can specify the relationship between input, output and schedule. Scheduled reboots, peer turn ups, service assurance agent tests and more can all be scheduled with Cron, as well as OAM events, such as connectivity checks, or troubleshooting runs.

CRON elements include:

- Action
- Schedule
- Script
- Time Range
- Time of Day

Action

Parameters for a script including the maximum amount of time to keep the results from a script run, the maximum amount of time a script may run, the maximum number of script runs to store and the location to store the results.

CLI Syntax: config>cron

```bash
action action-name [owner action-owner]
expire-time {seconds|forever}
lifetime {seconds|forever}
max-completed unsigned
results file-url
script script-name [owner script-owner]
shutdown
```

Example: config>cron# action test

config>cron>action# results ftp://172.22.184.249=./sim1/test-results

config>cron>action# no shut

The following example shows a script named “test” receiving an action to store its results in a file called “test-results”:

```
A:sim1>config>cron# info
script "test"
```
Common Configuration Tasks

location "ftp://172.22.184.249/./sim1/test.cfg"
no shutdown
exit
action "test"
  results "ftp://172.22.184.249/./sim1/test-results"
no shutdown
exit

----------------------------------------------
A:sim1>config>cron# script

Schedule

The schedule function configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds). If end-time and interval are both configured, whichever condition is reached first is applied.

**CLI Syntax:**
```
config>cron
  schedule schedule-name [owner schedule-owner]
  action action-name [owner owner-name]
  count number
  day-of-month {day-number [..day-number]|all}
  description description-string
  end-time [date|day-name] time
  hour {hour-number [..hour-number] | all}
  interval seconds
  minute {minute-number [..minute-number]|all}
  month {month-number [..month-number]|month-name
  {[..month-name]|all}
  no shutdown
  type {periodic|calendar|oneshot}
  weekday {weekday-number [..weekday-number]|day-name
  {[..day-name]|all}
  shutdown
```

**Example:**
```
config>cron# schedule test2
config>cron> sched# day-of-month 17
config>cron> sched# end-time 2007/07/17 12:00
config>cron> sched# minute 0 15 30 45
config>cron> sched# weekday friday
config>cron> sched# shut
```

The following example schedules a script named “test2” to run every 15 minutes on the 17th of each month and every Friday until noon on July 17, 2007:

*A:SR-3>config>cron# info*
```
--------------------------------------------
schedule "test2"
  shutdown
  day-of-month 17
  minute 0 15 30 45
```
Script

The script command opens a new nodal context which contains information on a script.

**CLI Syntax:**
```
config>cron
    script script-name [owner script-owner]
    description description-string
    location file-url
    shutdown
```

**Example:**
```
config>cron# script test
config>cron>script#
```

The following example names a script “test”:
```
A:sim1>config>cron# info
----------------------------------------------
script "test"
    location "ftp://172.22.184.249/./sim1/test.cfg"
    no shutdown
    exit
----------------------------------------------
A:sim1>config>cron#
```
Time Range

7750 SR ACLs and QoS policy configurations may be enhanced to support time based matching. CRON configuration includes time matching with the 'schedule' sub-command. Schedules are based on events; time-range defines an end-time and will be used as a match criteria.

Time range elements include:

- Create on page 296
- Absolute on page 296
- Daily on page 297
- Weekdays on page 298
- Weekend on page 298
- Weekly on page 299

Create

Use this command to enable the time-range context.

The following example creates a time-range called test1.

CLI Syntax:  config> cron>
            time-range name create

Example:  config> cron# time-range test1 create
          config> cron> time-range$  

Absolute

The absolute command configures a start and end time that will not repeat.

CLI Syntax:  config> cron> time-range$
            absolute absolute-time end absolute-time

Example:  config> cron> time-range$ absolute start 2006/05/05,11:00 end 2006/05/06,11:01
          config> cron> time-range$
The following example shows an absolute time range beginning on May 5, 2006 at 11:00 and ending May 6, 2006 at 11:01:

A:sim1>config>cron>time-range# show cron time-range detail
===============================================================================
Cron time-range details
===============================================================================
Name        : test1
Triggers    : 0
Status      : Inactive
Absolute    : start 2006/05/05,11:00 end 2006/05/06,11:01
===============================================================================
A:sim1>config>cron>time-range#

Daily

The daily command configures the start and end of a periodic schedule for every day of the week (Sunday through Saturday).

**CLI Syntax:**
```
config>cron>time-range$
daily start time-of-day end time-of-day
```

**Example:**
```
config>cron>time-range$ daily start 11:00 end 12:00
config>cron>time-range$
```

The following example shows a daily time range beginning at 11:00 and ending at 12:00.

A:sim1>config>cron>time-range# show cron time-range detail
===============================================================================
Cron time-range details
===============================================================================
Name        : 1
Triggers    : 0
Status      : Inactive
Periodic    : daily Start 11:00 End 12:00
===============================================================================
A:sim1>config>cron>time-range#
Weekdays

The weekdays command configures the start and end of a periodic schedule for weekdays (Monday through Friday).

**CLI Syntax:**
```
config>cron>time-range$
  weekdays start time-of-day end time-of-day
```

**Example:**
```
config>cron>time-range$ weekdays start 11:00 end 12:00
config>cron>time-range$
```

The following command shows a time range beginning at 11:00 and ending at 12:00. This schedule runs all weekdays during this time period.

```
A:sim1>config>cron>time-range# show cron time-range detail
```

---

Weekend

The weekend command configures the start and end of a periodic schedule for weekends (Saturday and Sunday). The resolution must be at least one minute apart, for example, start at 11:00 and end at 11:01. A start time and end time of 11:00 is invalid.

**CLI Syntax:**
```
config>cron>time-range$
  weekend start time-of-day end time-of-day
```

**Example:**
```
config>cron>time-range$ weekend start 11:00 end 12:00
config>cron>time-range$
```

The following command shows a weekend time range beginning at 11:00am and ending at 12:00pm, both Saturday and Sunday.

To specify 11:00am to 12:00pm on Saturday or Sunday only, use the Absolute parameter for one day, or the Weekly parameter for every Saturday or Sunday accordingly. In addition, see the Schedule parameter to schedule oneshot or periodic events in the `config>cron>` context.

```
A:sim1>config>cron>time-range# show cron time-range detail
```

---
Weekly

The weekly command configures the start and end of a periodic schedule for the same day every week, for example, every Friday. The start and end dates must be the same. The resolution must be at least one minute apart, for example, start at 11:00 and end at 11:01. A start time and end time of 11:00 is invalid.

CLI Syntax: config>crontime-range$
weekly start time-in-week end time-in-week

Example: config>crontime-range$ start fri,01:01 end fri,01:02
config>crontime-range$

The following command shows a weekly time range beginning on Friday at 1:01am ending Friday at 1:02am.

A:sim1>config>crontime-range$ info
--------------------------------------------------------------
weekly start fri,01:01 end fri,01:02
--------------------------------------------------------------
A:sim1>config>crontime-range$
Time of Day

Time of Day (TOD) suites are useful when configuring many types of time-based policies or when a large number of subscribers or SAPs require the same type of TOD changes. The TOD suite may be configured while using specific ingress or egress ACLs or QoS policies, and is an enhancement of the ingress and egress CLI trees.

SAPs

- If a TOD Suite is assigned to a SAP, statistics collection are not collected for that SAP and scheduler overrides cannot be collected on the SAP. If the SAP has an egress aggregate rate limit configured, an egress scheduler policy assignment cannot be applied.
- When an item is configured both on SAP level and in the TOD suite assigned to the SAP, the TOD-suite defined value takes precedence. If a SAP belongs to an IES Interface, TOD Suites are allowed only with generic interfaces (no subscriber, group, redundant, etc.).
- A policy or filter assignment configured directly on a SAP has a lower priority than any assignment in a TOD Suite. Hence, it is possible that a new direct configuration has no immediate effect. If the configuration is made by CLI, a warning is given.

Multiservice Site

When applying a TOD Suite to a multi-service-site, only the scheduler policy assignment is active. If the multi-service-site has an egress aggregate rate limit configured, any egress scheduler policy assignment cannot be applied. While a TOD Suite is assigned to a multi-service-site, it is not possible to configure a scheduler to override it.
ANCP (Access Node Control Protocol)

Static ANCP string mapping and TOD suites must be configured on separate SAPs or multiservice sites.

Time of day elements include:
- Egress on page 301
- Ingress on page 304

Egress

This command is an enhancement for specific egress policies including filter lists, schedulers and QoS. Use this command to create time-range based associations of previously created filter lists, QoS and scheduler policies. Multiple policies may be included and each must be assigned a different priority; in case time-ranges overlap, the priority will be used to determine the prevailing policy. Only a single reference to a policy may be included without a time-range.

Egress Aggregate Rate Limit

Having an egress aggregate rate limit is incompatible with having a scheduler policy. If a SAP or multi-service-site has a configured egress aggregate rate limit, and the TOD suite assigns a scheduler policy to it, that assignment cannot be applied: the configured aggregate rate limit takes precedence over the TOD suite's scheduler policy assignment.

Egress Multicast Group

SAPs may not have a TOD suite while belonging to an egress multicast group (EMG). Since all SAPs that belong to the same EMG must have the same egress filter, it is imperative to ensure that the TOD Suite does not modify the egress filter assignment.
Filters

In a TOD suite, filters that have entries with time-ranges may not be selected. Similarly, filter entries with a time-range may not be created while a TOD suite refers to that filter. QoS policies and filters referred to by a TOD suite must have scope “template” (default). The following syntax is used to configure TOD-suite egress parameters.

CLI Syntax:

```
cfg> cron
  tod-suite tod-suite-name create
  egress
    filter ip ip-filter-id [time-range time-range-name] [priority priority]
    filter ipv6 ipv6-filter-id [time-range time-range-name] [priority priority]
    filter mac mac-filter-id [time-range time-range-name] [priority priority]
    qos policy-id [time-range time-range-name] [priority priority]
    scheduler-policy scheduler-policy-name [time-range time-range-name]
```

Example:
```
cfg> cron>tod-suite$ egress filter ip 100
```

The following command shows an egress IP filter association with filter ID 100.

```
sim1>filter# ip-filter 100 create
A:sim1>filter>ip-filter$ entry 10 create
A:sim1>filter>ip-filter>entry$
A:sim1>config>cron>tod-suite# egress filter ip 100
A:sim1>config>cron>tod-suite# info detail
----------------------------------------------
no description
egress
    filter ip 100
exit
----------------------------------------------
A:sim1>config>cron>tod-suite#
```

Example:
```
cfg> cron>tod-suite$ egress qos 101
```

The following command shows an association with egress QoS-SAP policy 101.

A:sim1>config>qos# sap-egress 101 create
...
A:sim1>config>cron>tod-suite# egress qos 101
A:sim1>config>cron>tod-suite# info detail
----------------------------------------------
     no description
     egress
     qos 101
     exit
----------------------------------------------
A:sim1>config>cron>tod-suite#

Example:  config>cron>tod-suite$ egress scheduler-policy test1
config>cron>tod-suite$

The following command shows an association with an egress scheduler-policy called test1.

A:sim1>config# qos scheduler-policy test1 create
A:sim1>config>qos>scheduler-policy#
...

A:sim1>config>cron>tod-suite# egress scheduler-policy test1
A:sim1>config>cron>tod-suite# info detail
----------------------------------------------
     no description
     egress
     scheduler-policy test1
     exit
----------------------------------------------
A:sim1>config>cron>tod-suite$
Ingress

This command is an enhancement for specific ingress policies including filter lists, schedulers and QoS policies. Use this command to create time-range based associations of previously created filter lists QoS and scheduler policies. Multiple policies may be included and each must be assigned a different priority; in case time-ranges overlap, the priority will be used to determine the prevailing policy. Only a single reference to a policy may be included without a time-range. To configure a daily time-range across midnight, use a combination of two entries. An entry that starts at hour zero will take over from an entry that ends at hour 24.

**CLI Syntax:**

```
config>system
cron
tod-suite tod-suite-name create
  ingress
    filter ip ip-filter-id [time-range time-range-name]
    [priority priority]
    filter ipv6 ipv6-filter-id [time-range time-range-name]
    [priority priority]
    filter mac mac-filter-id [time-range time-range-name]
    [priority priority]
    qos policy-id [time-range time-range-name]
    [priority priority]
    scheduler-policy scheduler-policy-name [time-range time-range-name]
```

**Example:**

```
config>cron>tod-suite$ ingress filter ip 100
config>cron>tod-suite$
```

The following command shows an ingress IP filter association with filter ID 100.

```
sim1>config>filter# ip-filter 100 create
A:sim1>config>filter>ip-filter$ entry 10 create
A:sim1>config>filter>ip-filter>entry$

... 
A:sim1>config>cron>tod-suite# ingress filter ip 100
A:sim1>config>cron>tod-suite# info detail
-------------------------------
  no description
  ingress
    filter ip 100
  exit
-------------------------------
A:sim1>config>cron>tod-suite#
```

**Example:**

```
config>cron>tod-suite$ ingress qos 101
config>cron>tod-suite$
```
The following command shows an association with ingress QoS-SAP policy 101.

```
A:sim1>config>qos# sap-egress 101 create
A:sim1>config>cron> tod-suite# ingress qos 101
A:sim1>config>cron> tod-suite# info detail
----------------------------------------------
            no description
            ingress
            qos 101
            exit
----------------------------------------------
A:sim1>config>cron> tod-suite#

Example:    config>cron> tod-suite$ ingress scheduler-policy test1
            config>cron> tod-suite$
```

The following command shows an association with an ingress scheduler-policy named test1.

```
A:sim1>config# qos scheduler-policy test1 create
A:sim1>config>qos> scheduler-policy#
...
A:sim1# configure cron tod-suite test1 create
A:sim1>config>cron> tod-suite# ingress scheduler-policy test1
A:sim1>config>cron> tod-suite# info detail
----------------------------------------------
            no description
            ingress
            scheduler-policy test1
            exit
----------------------------------------------
A:sim1>config> cron> tod-suite#
```
Configuring Synchronization and Redundancy

- Configuring Persistence on page 306
- Configuring Synchronization on page 306
- Configuring Manual Synchronization on page 307
- Forcing a Switchover on page 307
- Configuring Synchronization Options on page 308
- Configuring Multi-Chassis Redundancy on page 309

Configuring Persistence

The following example displays subscriber management system persistence command usage:

**Example:**
```
config>system# persistence
config>system>persistence# subscriber-mgmt
cfgmgmt>sub-mgmt# description "cf3:SubMgmt-Test"
cfgmgmt>sub-mgmt# location cf3:
cfgmgmt>sub-mgmt# exit
```

```
A:ALA-12>config>system>persistence# info
----------------------------------------------
subscriber-mgmt
description "cf3:SubMgmt-Test"
location cf3:
exit
----------------------------------------------
A:ALA-12>config>system>persistence#
```

Configuring Synchronization

The **switchover-exec** command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card.

**CLI Syntax:**
```
admin>redundancy
  synchronize {boot-env|config}
```

**CLI Syntax:**
```
config>system
  switchover-exec file-url
```
Configuring Manual Synchronization

Note that automatic synchronization can be configured in the `config>system> synchronization` context.

**CLI Syntax:**
```
admin
redundancy
  synchronize {boot-env|config}
```

**Example:**
```
admin>redundancy# synchronize config
```

The following shows the output which displays during a manual synchronization:

```
A:ALA-12>admin# synchronize config
Syncing configuration......
Syncing configuration.....Completed.
A:ALA-12#
```

Forcing a Switchover

The `force-switchover now` command forces an immediate switchover to the standby CPM card.

**CLI Syntax:**
```
admin>redundancy
  force-switchover [now]
```

**Example:**
```
admin>redundancy# force-switchover now
```

```
A:ALA-12# admin redundancy force-switchover now
A:ALA-12#
Resetting...
?
```

If the active and standby are not synchronized for some reason, users can manually synchronize the standby CPM by rebooting the standby by issuing the `admin reboot standby` command on the active or the standby CPM.
Configuring Synchronization Options

Network operators can specify the type of synchronization operation to perform between the primary and secondary CPMs after a change has been made to the configuration files or the boot environment information contained in the boot options file (BOF).

Use the following CLI to configure the boot-env option:

CLI Syntax:  
```
config>system
    synchronize {boot-env|config}
```

Example:  
```
config>system# synchronize boot-env
```

The following displays the configuration:

```
A:ALA-12>config>system# synchronize boot-env
A:ALA-12>config>system# show system synchronization
=================================================================
Synchronization Information
=================================================================
Synchronize Mode        : Boot Environment
Synchronize Status      : No synchronization
Last Config Sync Time   : 2006/06/27 06:19:47
Last Boot Env Sync Time : 2006/06/27 06:19:47
=================================================================
A:ALA-12>config>system#
```

Use the following CLI to configure the config option:

CLI Syntax:  
```
config>system
    synchronize {boot-env|config}
```

Example:  
```
config>system# synchronize config
```

The following example displays the configuration.

```
A:ALA-12>config>system# synchronize config
A:ALA-12>config>system# show system synchronization
=================================================================
Synchronization Information
=================================================================
Synchronize Mode        : Configuration
Synchronize Status      : No synchronization
Last Config Sync Time   : 2006/06/27 09:17:15
Last Boot Env Sync Time : 2006/06/24 07:16:37
=================================================================
A:ALA-12>config>system#
```
Configuring Multi-Chassis Redundancy

Note: When configuring associated LAG ID parameters, the LAG must be in access mode and LACP must be enabled.

Use the CLI syntax displayed below to configure multi-chassis redundancy features.

CLI Syntax:

```
admin>redundancy
    multi-chassis
        peer ip-address
            authentication-key [authentication-key | hash-key]
                [hash | hash2]
            description description-string
        mc-lag
            hold-on-neighbor-failure duration
            keep-alive-interval interval
            lag lag-id lacp-key admin-key system-id system-id [remote-
            lag lag-id] system-priority system-priority
            no shutdown
            no shutdown
            source-address ip-address
            sync
            igmp
            igmp-snooping
            port [port-id | lag-id] [sync-tag]
            range encap-range sync-tag
            no shutdown
            srrp
            sub-mgmt
```

Example:

```
admin>redundancy#
config>redundancy# multi-chassis
config>redundancy>multi-chassis# peer 10.10.10.2 create
config>redundancy>multi-chassis>peer# description "Mc-Lag peer 10.10.10.2"
config>redundancy>multi-chassis>peer# mc-lag
config>redundancy>multi-chassis>peer>mc-lag# lag 1 lacp-key 32666 system-id 00:00:00:33:33:33 system-priority 32888
config>redundancy>multi-chassis>peer>mc-lag# no shutdown
config>redundancy>multi-chassis>peer>mc-lag# exit
config>redundancy>multi-chassis>peer# no shutdown
config>redundancy>multi-chassis>peer# exit
config>redundancy>multi-chassis# exit
config>redundancy#
```

The following displays the configuration:

```
A:ALA-48#config>redundancy# info
-----------------------------------------------------------------
```
multi-chassis
    peer 10.10.10.2 create
description "Mc-Lag peer 10.10.10.2"
mc-lag
    no shutdown
    exit
    no shutdown
    exit
    exit
---------------------------------------------
A:ALA-48>config>redundancy#
Configuring Mixed Mode

The 7450 mixed mode feature allows a 7450 ESS-7 or ESS-12 chassis to utilize 7750 IOM3-XPs, MDAs, and IMMs to enable 7750 SR capabilities on the associated slots. This allows features such as multicast routing, VPRN and IPv6 support as well as others to be enabled on existing 7450 systems.

The following are mixed-mode requirements:

- SR capabilities (for example, IP-VPNs, IPv6 routing and multicast routing) can only be associated with interfaces on 7750 IOM3-XPs, MDAs, and IMMs
- Network interface ports must be located 7750 IOM3-XPs or IMMs
- Only 7750 IOM3-XPs, 7750 MDAs, or 7750 IMMs can be used in 7450 slots with SR capabilities enabled.

Notes:

- The 7x50 SR supports mixed mode, specifically to run IPv6 services in a router that also contains IOM-20G-Bs (chassis mode A).
- ESM for IPv6 must run on IOM-3 or IMM hardware only, not on IOM or IOM-2, because the IOM and IOM2 data planes are not capable of routing incoming traffic to the IPv6 ESM hosts.
- The scaling limits are still defined by the chassis mode. That means only 16k IPv6 ESM subscribers (limited by the ARP scale of chassis mode A).

Enabling Mixed Mode on a 7450 System

To configure mixed mode support, 7750 IOM3-XPs, 7750 MDAs, or 7750 IMMs must be installed in a 7450 ESS-7 or ESS-12 router that is running OS 8.0 or later. All network interfaces must be migrated to ports on the 7750 cards.

The mixed mode state is then enabled by using the mixed-mode-upgrade command:

**CLI Syntax:** mixed-mode-upgrade slot-list

This tool will take a list of slots that should have 7750 cards installed. The command then checks to ensure that all network interfaces are located on ports on these slots and that they are all 7750 cards. It then enables the mixed-mode state at the system level and changes the capability setting for the specified slots to sr.

At this point the 7450 system is operating in a mixed mode state and supported features and services can now be configured on the slots with SR capabilities enabled.
Once in mixed mode use the `capability` command to configure slots for SR capabilities:

**CLI Syntax:** config>card>capability sr|ess

Slots using 7750-capable cards will have to have SR capability enabled on all slots with 7750 IOM3s and IMMs, as well as `mixed-mode` at the system level.

See Table 34 for a description of mixed-mode support.

### Table 34: Mixed-Mode Support

<table>
<thead>
<tr>

</table>
Configuring Power Supply Parameters

By default, 7750 SR-Series routers are configured as DC-input devices. Traps and alarms are automatically sent if DC power supplies are installed in the power supply slots. In order to generate traps and alarms when AC power supplies are installed in 7750 SR-Series models (except the non-redundant models) the **power-supply** command must be modified. In the non-redundant models, the power supply parameters cannot be modified.

Configuring an existing power supply to **none** prior to powering off the unit will prevent an alarm from being generated.

There are two power supply positions on the 7750 SR-c12. See the SR-Series-XX Hardware Installation Guides for instructions to install power supplies.

Use the CLI syntax displayed below to modify power supply parameters.

**CLI Syntax:**

```plaintext
config>system
power-supply {1|2} {dc|ac {single|multiple}|none}
```

**Example:**

```plaintext
config>system# power-supply 1 dc
config>system# power-supply 2 dc
```

The following example displays the **power-supply** command configuration:

```plaintext
A:ALA-12>config>system# info

---

7750 SR OS Basic System Configuration Guide   Page 313
Configuring ATM System Parameters

The ATM context configures system-wide ATM parameters.

**CLI Syntax:**
```
cfg-system# atm
    atm-location-id location-id
    oam
        loopback-period period
        retry-down retries
        retry-up retries
```

**Example:**
```
cfg-system# atm
cfg-system>atm# atm-location-id 03:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00

cfg-system>atm# oam
    loopback-period 30
    retry-down 5
    retry-up 3

cfg-system>atm# exit
```

The following example shows the ATM configuration.

```
A:ALA-12>cfg-system>atm# info
----------------------------------------------
    atm-location-id 03:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00
    oam
        retry-up 3
        retry-down 5
        loopback-period 30
    exit
----------------------------------------------
A:ALA-12>cfg-system>atm#
```
Configuring Backup Copies

The `config-backup` command allows you to specify the maximum number of backup versions of configuration and index files kept in the primary location.

For example, assume the `config-backup count` is set to 5 and the configuration file is called `xyz.cfg`. When a `save` command is executed, the file `xyz.cfg` is saved with a .1 extension. Each subsequent `config-backup` command increments the numeric extension until the maximum count is reached. The oldest file (5) is deleted as more recent files are saved.

```
xyz.cfg
xyz.cfg.1
xyz.cfg.2
xyz.cfg.3
xyz.cfg.4
xyz.cfg.5
xyz.ndx
```

Each persistent index file is updated at the same time as the associated configuration file. When the index file is updated, then the save is performed to `xyz.cfg` and the index file is created as `xyz.ndx`. Synchronization between the active and standby SF/CPM is performed for all configurations and their associated persistent index files.

**CLI Syntax:**
```
config>system
   config-backup count
```

**Example:**
```
config>system#
   config>system# config-backup 7
```

The following example shows the `config-backup` configuration.

```
A:ALA-12>config>system# info
#------------------------------------------
echo "System Configuration"
#------------------------------------------
   name "ALA-12"
   contact "Fred Information Technology"
   location "Bldg.1-floor 2-Room 201"
   clli-code "abcdefg1234"
   coordinates "N 45 58 23, W 34 56 12"
   config-backup 7
...
```

A:ALA-12>config>system#
System Administration Parameters

Use the CLI syntax displayed below to configure various system administration parameters.

Administrative parameters include:

- Disconnect on page 316
- Set-time on page 317
- Display-config on page 317
- Save on page 319
- Reboot on page 320
- Post-Boot Configuration Extension Files on page 321

---

Disconnect

The **disconnect** command immediately disconnects a user from a console, Telnet, FTP, or SSH session.

**Note:** Configuration modifications are saved to the primary image file.

**CLI Syntax:**

```
admin
disconnect [address ip-address | username user-name | {console|telnet|ftp|ssh}]
```

**Example:**

```
admin# disconnect
```

The following example displays the disconnect command results.

```
ALA-1>admin# disconnect
ALA-1>admin# Logged out by the administrator
Connection to host lost.

C:\>
```
Set-time

Use the **set-time** command to set the system date and time. The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. If SNTP or NTP is enabled (no shutdown) then this command cannot be used. The set-time command does not take into account any daylight saving offset if defined.

**CLI Syntax:**
```
admin
  set-time date time
```

**Example:**
```
admin# set-time 2007/02/06 04:10:00
```

The following example displays the **set-time** command results.
```
ALA-2# admin set-time 2007/02/06 04:10:00
ALA-2# show time
Thu Feb 2 04:10:04 GMT 2007
ALA-2#
```

Display-config

The **display-config** command displays the system’s running configuration.

**CLI Syntax:**
```
admin
display-config [detail] [index]
```

**Example:**
```
admin# display-config detail
```

The following example displays a portion of the **display-config detail** command results.
```
A:ALA-12>admin# display-config detail

**Tech-support**

The `tech-support` command creates a system core dump. **NOTE:** This command should only be used with explicit authorization and direction from Alcatel-Lucent’s Technical Assistance Center (TAC).

---

**Save**

The `save` command saves the running configuration to a configuration file. When the `debug-save` parameter is specified, debug configurations are saved in the config file. If this parameter is not specified, debug configurations are not saved between reboots.

**CLI Syntax:**

```
admin
  save [file-url] [detail] [index]
  debug-save [file-url]
```

**Example:**

```
admin# save ftp://test:test@192.168.x.xx/./1.cfg
admin# debug-save debugsave.txt
```

The following example displays the `save` command results.

```
A:ALA-1>admin# save ftp://test:test@192.168.x.xx/./1x.cfg
Writing file to ftp://test:test@192.168.x.xx/./1x.cfg
Saving configuration ...Completed.
A:ALA-1>admin# debug-save ftp://test:test@192.168.x.xx/./debugsave.txt
Writing file to ftp://julie:julie@192.168.x.xx/./debugsave.txt
Saving debug configuration .....Completed.
A:ALA-1>admin#
```
Reboot

The `reboot` command reboots the router including redundant CPMs and all IOMs in redundant systems. If the `now` option is not specified, you are prompted to confirm the reboot operation. The `reboot upgrade` command forces an upgrade of the boot ROM and reboot.

**CLI Syntax:**
```
admin
reboot [active | standby] | [upgrade] [now]
```

**Example:**
```
admin# reboot now
```

The following example displays the `reboot` command results.

```
A:ALA-1>admin# reboot now
Are you sure you want to reboot (y/n)? y
Rebooting...
Using preloaded VxWorks boot loader.
...
```

If synchronization fails, the standby does not reboot automatically. The `show redundancy synchronization` command displays synchronization output information.
Post-Boot Configuration Extension Files

Two post-boot configuration extension files are supported and are triggered when either a successful or failed boot configuration file is processed. The commands specify URLs for the CLI scripts to be run following the completion of the boot-up configuration. A URL must be specified or no action is taken. The commands are persistent between router (re)boots and are included in the configuration saves (admin>save).

**CLI Syntax:**

```
config>system
  boot-bad-exec file-url
  boot-good-exec file-url
```

**Example:**

```
config>system# boot-bad-exec ftp://test:test@192.168.xx.xxx/./fail.cfg
config>system# boot-good-exec ftp://test:test@192.168.xx.xxx/./ok.cfg
```

The following example displays the command output:

```
A:ALA-12>config>system# info
#------------------------------------------
echo "System Configuration"
#------------------------------------------
name "ALA-12"
  contact "Fred Information Technology"
  location "Bldg.1-floor 2-Room 201"
  clli-code "abcdefg1234"
  coordinates "N 45 58 23, W 34 56 12"
  config-backup 7
  boot-good-exec "ftp://test:test@192.168.xx.xxx/./ok.cfg"
  boot-bad-exec "ftp://test:test@192.168.xx.xxx/./fail.cfg"
  power-supply 1 dc
  power-supply 2 dc
  lacp-system-priority 1
  sync-if-timing
  begin
  ref-order refl ref2 bits
  ...
#------------------------------------------
A:ALA-12>config>system#
```
Show Command Output and Console Messages

The `show>system>information` command displays the current value of the bad/good exec URLs and indicates whether a post-boot configuration extension file was executed when the system was booted. If an extension file was executed, the `show>system>information` command also indicates if it completed successfully or not.

```
ALA-12>config>system# show system information

ALA-12>config>system#
```
When executing a post-boot configuration extension file, status messages are output to the CONSOLE screen prior to the “Login” prompt.

Following is an example of a failed boot-up configuration that caused a boot-bad-exec file containing another error to be executed:

Attempting to exec configuration file:
‘ftp://test:test@192.168.xx.xxx/./12.cfg’ ...

System Configuration
Log Configuration
CRITICAL: CLI #1002 An error occurred while processing the configuration file. The system configuration is missing or incomplete.
MAJOR: CLI #1008 The SNMP daemon is disabled.
If desired, enable SNMP with the 'config>system>snmp no shutdown' command.

Attempting to exec configuration failure extension file:
‘ftp://test:test@192.168.xx.xxx/./fail.cfg’ ...

Config fail extension
Enabling SNMP daemon

System Timing

When synchronous Ethernet is enabled, the operator can select an Ethernet port as a candidate for timing reference. The timing information recovered from this port is used to time the system.

Note: In the current release the derived time is distributed only through other Ethernet ports.

CLI Syntax:
```
config>system>sync-if-timing
abort
begin
commit
ref-order first second
ref1
    source-port port-id
    no shutdown
ref2
    source-port port-id
    no shutdown
no revert
```

In the event that network timing is required for the synchronous interfaces in the router, a timing subsystem is utilized to provide a clock to all synchronous interfaces within the system.

This section describes the commands used to configure and control the timing subsystem.

Use the CLI syntax displayed below to:

- Edit Mode on page 325
- Configuring Timing References on page 326
- Using the Revert Command on page 327
- Other Editing Commands on page 328
- Forcing a Specific Reference on page 329
Edit Mode

To enter the mode to edit timing references, you must enter the **begin** keyword at the **config>system>sync-if-timing#** prompt.

Use the following CLI syntax to enter the edit mode:

**CLI Syntax:**
```
config>system>sync-if-timing
begin
```

The following error message displays when you try to modify **sync-if-timing** parameters without entering the keyword **begin**.

A:ALA-12>config>system>sync-if-timing>ref1# source-port 2/1/1
MINOR: CLI The sync-if-timing must be in edit mode by calling begin before any changes can be made.
MINOR: CLI Unable to set source port for ref1 to 2/1/1
A:ALA-12>config>system>sync-if-timing>ref1#
Configuring Timing References

Use the following CLI syntax to configure timing reference parameters. Note that the source port specified for ref1 and ref2 is dependent on the 7750 SR-Series model type and chassis slot.

Note: For the SR-c12 and SR-c4, the ref1 and ref2 cannot both be from the same slot.

<table>
<thead>
<tr>
<th>7750 Model</th>
<th>Ref1/Slots</th>
<th>Ref2/Slots</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR-1</td>
<td>Not enabled</td>
<td>Not enabled</td>
</tr>
<tr>
<td>SR-7</td>
<td>1 — 2</td>
<td>3 — 5</td>
</tr>
<tr>
<td>SR-12</td>
<td>1 — 5</td>
<td>6 — 10</td>
</tr>
<tr>
<td>SR-c12</td>
<td>No restriction</td>
<td>No restriction</td>
</tr>
<tr>
<td>SR-c4</td>
<td>No restriction</td>
<td>No restriction</td>
</tr>
</tbody>
</table>

Note that the SR-c12 and SR-c4, ref1 and ref2 cannot be from the same slot.

The following displays a timing reference configuration example:

```
ALA-12>config>system>sync-if-timing# info
----------------------------------------------
ref-order ref2 ref1 bits
ref1
     source-port 3/1/1
     no shutdown
     exit
ref2
     source-port 6/1/2
     no shutdown
     exit
     bits
     interface-type ds1 esf
     no shutdown
     exit
----------------------------------------------
ALA-12>config>system>sync-if-timing#
```
Using the Revert Command

The **revert** command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection.

When mode is non-revertive, a failed clock source is not selected again. If a node would enter holdover due to the references being in previous failed state, then the node will select one of the previously failed references rather than going into holdover.

**CLI Syntax:**
```
config>system>sync-if-timing
    revert
```

If the current reference goes offline or becomes unstable the revert command allows the clock to **revert** to a higher-priority reference.

When revert is switching enabled a valid timing reference of the highest priority is used. If a reference with a higher priority becomes valid, a reference switch over to that reference is initiated. If a failure on the current reference occurs, the next highest reference takes over.

If non-revertive switching is enabled, the valid active reference always remains selected even if a higher priority reference becomes available. If the active reference becomes invalid, a reference switch over to a valid reference with the highest priority is initiated. The failed reference is eligible for selection once it becomes operational.

**CLI Syntax:**
```
config>system>sync-if-timing
    no revert
```
Other Editing Commands

Other editing commands include:

- **commit** — This command saves changes made to the timing references during a session. Modifications are not persistent across system boots unless this command is entered.
- **abort** — This command discards changes that have been made to the timing references during a session.

**CLI Syntax:**
```
cfg>system>sync-if-timing
abort
commit
```
Forcing a Specific Reference

Note: The debug sync-if-timing force-reference command should only be used to test and debug problems. Network synchronization problems may appear if network elements are left with this manual override setting. Once the system timing reference input has been forced, it may be cleared using the no force-reference command.

You can force the CPM clock to use a specific input reference using the force-reference command.

When the command is executed, the CPM clock on the active CPM immediately switches its input reference to that specified by the command. If the specified input is not available (shutdown), or in a disqualified state, the CPM clock shall use the next qualified input reference based on the selection rules.

This command also affects the BITS output port. If the BITS output port selection is set to line-reference and the reference being forced is not the BITS input port, then the system uses the forced reference to generate the signal out the BITS output port. If the BITS output port selection is set to internal-clock, then the system uses the output of the CPM clock to generate the signal for the BITS output port.

On a CPM activity switch, the force command is cleared and normal reference selection is determined.

Debug configurations are not saved between reboots.

**CLI Syntax:**
```
debug>sync-if-timing
force-reference {ref1 | ref2 | bits}
```

**Example:**
```
debug>sync-if-timing# force-reference
```

The 7750 SR-c4 has two BITS input ports on the CFM. The force reference command on this system allows the selection of the specific port.

**CLI Syntax:**
```
debug>sync-if-timing
force-reference {ref1 | ref2 | bits1 | bits2}
```
Creating Events

The `event` command controls the generation and notification of threshold crossing events configured with the `alarm` command. When a threshold crossing event is triggered, the `rmon event` configuration optionally specifies whether an entry in the RMON-MIB log table be created to record the occurrence of the event. It can also specify whether an SNMP notification (trap) be generated for the event. There are two notifications for threshold crossing events, a rising alarm and a falling alarm.

Creating an event entry in the RMON-MIB log table does not create a corresponding entry in the event logs. However, when the event is set to trap the generation of a rising alarm or falling alarm notification creates an entry in the event logs and that is distributed to whatever log destinations are configured: console, session, memory, file, syslog, or SNMP trap destination. The logger message includes a rising or falling threshold crossing event indicator, the sample type (absolute or delta), the sampled value, the threshold value, the `rmon-alarm-id`, the associated `rmon-event-id` and the sampled SNMP object identifier.

The `alarm` command configures an entry in the RMON-MIB alarm table. The `alarm` command controls the monitoring and triggering of threshold crossing events. In order for notification or logging of a threshold crossing event to occur there must be at least one associated `rmon event` configured.

The agent periodically takes statistical sample values from the MIB variable specified for monitoring and compares them to thresholds that have been configured with the `alarm` command. The `alarm` command configures the MIB variable to be monitored, the polling period (interval), sampling type (absolute or delta value), and rising and falling threshold parameters. If a sample has crossed a threshold value, the associated ‘event’ is generated.

Preconfigured CLI threshold commands are available. Preconfigured commands hide some of the complexities of configuring RMON alarm and event commands and perform the same function. In particular, the preconfigured commands do not require the user to know the SNMP object identifier to be sampled. The preconfigured threshold configurations include memory warnings and alarms and compact flash usage warnings and alarms.

To create events, use the following CLI:

**Example:**
```
config>system>thresholds# cflash-cap-warn cf1-B: rising-threshold 2000000 falling-threshold 1999900 interval 240 trap startup-alarm either
```
**Example:** config>system>thresholds# memory-use-alarm rising-threshold 50000000 falling-threshold 45999999 interval 500 both startup-alarm either

**Example:** config>system>thresh# rmon

**Example:** config>system>thresh>rmon# event 5 both description "alarm testing" owner "Timos CLI"

The following example displays the command output:

```
A:ALA-49>config>system>thresholds# info
----------------------------------------------
 rmon
  event 5 description "alarm testing" owner "Timos CLI"
  exit
  cflash-cap-warn cf1-B: rising-threshold 2000000 falling-threshold 19999000
  interval 240 trap
  memory-use-alarm rising-threshold 50000000 falling-threshold 45999999 interval 500
----------------------------------------------
A:ALA-49>config>system>thresholds#
```
System Alarm Contact Inputs

The hardware supports alarm contact inputs that allow an operator to monitor and report changes in the external environmental conditions. In a remote or outdoor deployment, alarm contact inputs allow an operator to detect conditions, for example, air conditioner fault, open door.

An operator can configure generation of events when alarm contact inputs transition between the open and close states. For each generated event, the operator can specify the:

- Action associated with each state transition.
- Severity associated with each state transition.
- Log message associated with each state transition.
Configuring LLDP

The following output displays LLDP defaults:

```
A:testSr1>config>system>lldp# info detail
----------------------------------------------
no tx-interval
no tx-hold-multiplier
no reinit-delay
no notification-interval
no tx-credit-max
no message-fast-tx
no message-fast-tx-init
no shutdown
----------------------------------------------
A:testSr1>config>system>lldp#
```

The following example shows an LLDP port configuration.

```
*A:ALA-48>config>port>ethernet>lldp# info
----------------------------------------------
dest-mac nearest-bridge
admin-status tx-rx
tx-tlvs port-desc sys-cap
tx-mgmt-address system
exit
----------------------------------------------
*A:ALA-48>config>port>ethernet>lldp#
```

The following example shows a global system LLDP configuration.

```
A:ALA-48>config>system>lldp# info
----------------------------------------------
tx-interval 10
tx-hold-multiplier 2
reinit-delay 5
notification-interval 10
----------------------------------------------
A:ALA-48>config>system>lldp#
```

config>redundancy>multi-chassis>peer>mc-sync
config>redundancy>mc>peer>mcr>node>cv
config>system>lldp
config>redundancy>multi-chassis>peer>mc-ep

**Description**

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The `no` form of this command places the entity into an administratively enabled state.

**Default**

no shutdown

description

**Syntax**

description description-string
no description

**Context**

config>cron>sched
config>redundancy>multi-chassis>peer

**Description**

This command creates a text description stored in the configuration file for a configuration context.

The `description` command associates a text string with a configuration context to help identify the content in the configuration file.
Generic Commands

The no form of this command removes the string from the configuration.

<table>
<thead>
<tr>
<th>Default</th>
<th>No description associated with the configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters</td>
<td><code>string</code> — The description character string. Allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.</td>
</tr>
</tbody>
</table>
System Information Commands

atm

Syntax atm
Context config>system
Description This command enables the context to configure system-wide ATM parameters.

atm-location-id

Syntax atm-location-id location-id
Context config>system
Description This command indicates the location ID for ATM OAM.
Refer to the 7750 SR OS Services Guide for information about ATM QoS policies and ATM-related service parameters.
Default no atm-location-id
Parameters

<table>
<thead>
<tr>
<th>location-id</th>
<th>Specify the 16 octets that identifies the system loopback location ID as required by the ATM OAM Loopback capability. This textual convention is defined in ITU-T standard I.610.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Invalid values include a location ID where the first octet is: 00, FF, 6A</td>
</tr>
<tr>
<td></td>
<td>Acceptable location-ids include values where the first octet is: 01, 03</td>
</tr>
<tr>
<td></td>
<td>Other values are not accepted.</td>
</tr>
</tbody>
</table>

Values 01:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00

oam

Syntax oam
Context config>system>atm
Description This command configures system-wide ATM parameters.
System Information Commands

**loopback-period**

**Syntax**  
`loopback-period period`  
`no loopback-period`

**Context**  
`config>system>atm>oam`

**Description**  
This command specifies the number of seconds between periodic loopback attempts on an ATM endpoint that has periodic loopback enabled.

**Parameters**  
`period` — Specify the time, in seconds, between periodic loopback attempts.

**Values**  
1 — 40

**Default**  
10

**retry-down**

**Syntax**  
`retry-down retries`  
`no retry-down`

**Context**  
`config>system>atm>oam`

**Description**  
Specifies the number of OAM loopback attempts that must fail after the periodic attempt before the endpoint will transition to AIS-LOC state.

The retry values are configured on a system wide basis and are affective on the next period cycle of any ATM VC SAP using `periodic-loopback`, if changed. The timeout for receiving a loopback response from the remote peer and declaring the loopack failed is 1 second and is not configurable.

**Parameters**  
`retries` — Specify the number of failed loopback attempts before an ATM VC goes down.

**Values**  
0 — 10 (A zero value means that the endpoint will transition to AIS-LOC state immediately if the periodic loopback attempt fails.)

**Default**  
4

**retry-up**

**Syntax**  
`retry-up retries`  
`no retry-up`

**Context**  
`config>system>atm>oam`

**Description**  
This command specifies the number of consecutive OAM loopback attempts that must succeed after the periodic attempt before the endpoint will transition the state to up.

**Parameters**  
`retries` — Specify the number of successful loopback replies before an ATM VC goes up.
**Values**

0 — 10 (A zero value means that the endpoint will transition to the up state immediately if the periodic loopback attempt succeeds.)

**Default**

2

### boot-bad-exec

**Syntax**

```
boot-bad-exec file-url
no boot-bad-exec
```

**Context**

cfg>system

**Description**

Use this command to configure a URL for a CLI script to exec following a failure of a boot-up configuration. The command specifies a URL for the CLI scripts to be run following the completion of the boot-up configuration. A URL must be specified or no action is taken.

The commands are persistent between router (re)boots and are included in the configuration saves (admin>save).

**Default**

no boot-bad-exec

**Parameters**

`file-url` — Specifies the location and name of the CLI script file executed following failure of the boot-up configuration file execution. When this parameter is not specified, no CLI script file is executed.

**Values**

- `file-url`: local-url | remote-url: 255 chars max
- `local-url`: `[cflash-id/][file-path]`
- `remote-url`: `[[ftp://] login:pswd@remote-locn/][file-path]`
- `remote-locn`: `hostname` | `ipv4-address` | `[ipv6-address]`
- `ipv4-address`: `a.b.c.d`
- `ipv6-address`: `- x:x:x:x:x:x:[interface]`
- `cflash-id`: `cf1:, cf1-A:,cf1-B:,cf2: ,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:`

**Related Commands**

exec command on page 73 — This command executes the contents of a text file as if they were CLI commands entered at the console.

### boot-good-exec

**Syntax**

```
boot-good-exec file-url
no boot-good-exec
```

**Context**

cfg>system

**Description**

Use this command to configure a URL for a CLI script to exec following the success of a boot-up configuration.
System Information Commands

Default

`no boot-good-exec`

Parameters

`file-url` — Specifies the location and name of the file executed following successful completion of the boot-up configuration file execution. When this parameter is not specified, no CLI script file is executed.

**Values**

- **file url**: local-url | remote-url: 255 chars max
  - local-url: `[cflash-id][file-path]`
  - remote-url: `[ftp://login:pswd@remote-locn][file-path]`
- **ipv4-address**
  - `a.b.c.d`
- **ipv6-address**
  - `x:x:x:x:x:x[-interface]`
  - `x:x:x:x:x:d.d.d.d[-interface]`
  - `x - [0..FFFF]H`
  - `d - [0..255]D`
- **interface**
  - `32 chars max, for link local addresses`
- **cflash-id**
  - `cf1:, cf1-A:,cf1-B:,cf2:, cf2-A:,cf2-B:,cf3:, cf3-A:,cf3-B:`

Related Command

exec command on page 73 — This command executes the contents of a text file as if they were CLI commands entered at the console.

**chassis-mode**

Syntax

`chassis-mode [chassis-mode] [force]`

Context

`config>system`

Description

This command configures the chassis scaling and feature set.

Note that, if you are in chassis-mode d and configure an IOM type as iom2-20g and then downgrade to chassis-mode a or b (must specify `force` keyword), a warning appears about the IOM downgrade. In this case, the IOM’s provisioned type will downgrade to iom-20g-b. Once this is done, the ASAP MDA cannot be configured.

The ASAP MDA can only be configured if the iom2-20g IOM type is provisioned and equipped and the chassis mode is configured as a or b.

If this is the desired behavior, for example, chassis-mode d is configured and IPv6 is running, you can then downgrade to chassis-mode a or b if you want to disable IPv6.

For chassis mode d, the default must be changed from the default mode a which assumes the least available features. Mode d enables the new feature sets available with newer generations of IOMs. Chassis mode d supports the P2/Q2/T2-based IOMs products and the extensive queuing/policing/bandwidth. Mode d assumes that the iom3-xp is installed.

Default

a

Parameters

`chassis-mode` — Specify the one of the following chassis modes:

- **a**: This mode corresponds to scaling and feature set associated with iom-20g.
- **b**: This mode corresponds to scaling and feature set associated with iom-20g-b.
- **c**: This mode corresponds to scaling and feature set associated with iom2-20g.
d: This mode corresponds to scaling and feature set associated with iom3-xp.

If the chassis mode is not explicitly provisioned in the configuration file, the chassis will come up in chassis mode a by default. The behavior for the IOMs is described in the following table:

Table 35: Chassis Mode Behavior

<table>
<thead>
<tr>
<th>IOM</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>iom-20g-b</td>
<td>Comes online if provisioned as iom-20g or iom-20g-b.</td>
</tr>
<tr>
<td>iom2-20g</td>
<td>Comes online if provisioned as iom-20g, iom-20g-b or iom2-20g.</td>
</tr>
<tr>
<td>iom-10g</td>
<td>Comes online if provisioned as iom-10g.</td>
</tr>
<tr>
<td>iom3-xp</td>
<td>Comes online if provisioned as iom3-xp.</td>
</tr>
</tbody>
</table>

**force** — Forces an upgrade from mode a to mode b or d, or an upgrade from mode b to mode d.

clli-code

**Syntax**
clli-code clli-code

**no clli-code**

**Context**
config>system

**Description**
This command creates a Common Language Location Identifier (CLLI) code string for the 7750 SR-Series router. A CLLI code is an 11-character standardized geographic identifier that uniquely identifies geographic locations and certain functional categories of equipment unique to the telecommunications industry.

No CLLI validity checks other than truncating or padding the string to eleven characters are performed.

Only one CLLI code can be configured, if multiple CLLI codes are configured the last one entered overwrites the previous entry.

The **no** form of the command removes the CLLI code.

**Default**
none — No CLLI codes are configured.

**Parameters**
clli-code — The 11 character string CLLI code. Any printable, seven bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes. If more than 11 characters are entered, the string is truncated. If less than 11 characters are entered the string is padded with spaces.
config-backup

**Syntax**

```
config-backup count
no config-backup
```

**Context**

 `config>system`

**Description**

This command configures the maximum number of backup versions maintained for configuration files and BOF.

For example, assume the `config-backup count` is set to 5 and the configuration file is called `xyz.cfg`. When a `save` command is executed, the file `xyz.cfg` is saved with a .1 extension. Each subsequent `config-backup` command increments the numeric extension until the maximum count is reached.

```
xyz.cfg
xyz.cfg.1
xyz.cfg.2
xyz.cfg.3
xyz.cfg.4
xyz.cfg.5
xyz.ndx
```

Each persistent index file is updated at the same time as the associated configuration file. When the index file is updated, then the save is performed to `xyz.cfg` and the index file is created as `xyz.ndx`. Synchronization between the active and standby CPM is performed for all configurations and their associated persistent index files.

The `no` form of the command returns the configuration to the default value.

**Default**

5

**Parameters**

`count` — The maximum number of backup revisions.

**Values**

1 — 9

contact

**Syntax**

```
contact contact-name
no contact
```

**Context**

`config>system`

**Description**

This command creates a text string that identifies the contact name for the device.

Only one contact can be configured, if multiple contacts are configured the last one entered will overwrite the previous entry.

The `no` form of the command reverts to default.

**Default**

none — No contact name is configured.
Parameters  

*contact-name* — The contact name character string. The string can be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

**coordinates**

**Syntax**  

coordinates coordinates  
no coordinates

**Context**  

config>system

**Description**  

This command creates a text string that identifies the system coordinates for the device location. For example, the command *coordinates* “37.390 -122.0550” is read as latitude 37.390 north and longitude 122.0550 west.

Only one set of coordinates can be configured. If multiple coordinates are configured, the last one entered overwrites the previous entry.

The *no* form of the command reverts to the default value.

**Default**  

none — No coordinates are configured.

**Parameters**  

*coordinates* — The coordinates describing the device location character string. The string may be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes. If the coordinates are subsequently used by an algorithm that locates the exact position of this node then the string must match the requirements of the algorithm.

**dns**

**Syntax**  

dns

**Context**  

config>system

**Description**  

This command configures DNS settings.

**address-pref**

**Syntax**  

address-pref {ipv4-only | ipv6-first}

no address-pref

**Context**  

config>system>dns

**Description**  

This command configures the DNS address resolving order preference. By default DNS names are queried for A-records only (address-preference is IPv4-only).

If the address-preference is set to IPv6-first, the DNS server will be queried for AAAA-records (IPv6) first and if a successful replied is not received, then the DNS server is queried for A-records.
enable-icmp-vse

Syntax  
[no] enable-icmp-vse

Context  config>system

Description  This command enables vendor specific extensions to ICMP.

l4-load-balancing

Syntax  [no] l4-load-balancing

Context  config>system

Description  This command configures system-wide Layer 4 load balancing. The configuration at system level can enable or disable load balancing based on Layer 4 fields. If enabled, Layer 4 source and destination port fields will be included in hashing calculation for TCP/UDP packets.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network.

To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account L4 information (i.e., src/dst L4-protocol port).

The hashing index can be calculated according to the following algorithm:

- If [(TCP or UDP traffic) & enabled]
  hash (<TCP/UDP ports>, <IP addresses>)
- else if (IP traffic)
  hash (<IP addresses>)
- else
  hash (<MAC addresses>)
endif

This algorithm will be used in all cases where IP information in per-packet hashing is included (see LAG and ECMP Hashing in the Interfaces Guide). However, the Layer 4 information (TCP/UDP ports) will not be used in the following cases:

- Fragmented packets

Default  no l4-load-balancing

lsr-load-balancing

Syntax  lsr-load-balancing {lbl-only | lbl-ip | ip-only}

no lsr-load-balancing

Context  config>system

Description  This command configures system-wide LSR load balancing. Hashing can be enabled on IP header at an LSR for spraying labeled IP packets over multiple equal cost paths in ECMP in an LDP LSP and/or over multiple links of a LAG group in all types of LSPs.
In previous releases, the LSR hash routine operated on the label stack only. However, this lacked the granularity to provide hashing on the IP header if a packet is IPv4. An LSR will consider a packet to be IPv4 if the first nibble following the bottom of the label stack is 4. This feature is supported for IPv4 support only and on IOM-3 and IMMs only. IPv6 packets are hashed on label stack only. The hash on label and IPv4 header can be enabled or disabled at the system level only.

Default: disabled

**lACP-system-priority**

**Syntax**
```
lacp-system-priority
no lacp-system-priority
```

**Context**
```
config>system
```

**Description**
This command configures the Link Aggregation Control Protocol (LACP) system priority on aggregated Ethernet interfaces. LACP allows the operator to aggregate multiple physical interfaces to form one logical interface.

**Default**
32768

**Parameters**
- `lacp-system-priority` — Specifies the LACP system priority.
  - **Values**
  - 1 — 65535

**location**

**Syntax**
```
location location
no location
```

**Context**
```
config>system
```

**Description**
This command creates a text string that identifies the system location for the device.

Only one location can be configured. If multiple locations are configured, the last one entered overwrites the previous entry.

The `no` form of the command reverts to the default value.

**Default**
`none` — No system location is configured.

**Parameters**
- `location` — Enter the location as a character string. The string may be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

**name**
System Information Commands

Syntax  name system-name
        no name

Context config>system

Description This command creates a system name string for the device.
For example, system-name parameter ALA-1 for the name command configures the device name as ALA-1.
ABC>config>system# name "ALA-1"
ALA-1>config>system#

Only one system name can be configured. If multiple system names are configured, the last one encountered
overwrites the previous entry.
The no form of the command reverts to the default value.

Default The default system name is set to the chassis serial number which is read from the backplane EEPROM.

Parameters system-name — Enter the system name as a character string. The string may be up to 32 characters long.
Any printable, seven-bit ASCII characters can be used within the string. If the string contains special
caracters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

system-ip-load-balancing

Syntax  system-ip-load-balancing
        no system-ip-load-balancing

Context config>system

Description This command enables the use of the system IP address in the ECMP hash algorithm to add a per system
variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to
the same ECMP/LAG path.
This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing
algorithm, they will continue to use the default algorithm.
The no form of the command resets the system wide algorithm to default.

Default no system-ip-load-balancing

switchover-exec

Syntax  switchover-exec file-url
        no switchover-exec

Context config>system

Description This command specifies the location and name of the CLI script file executed following a redundancy
switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by
manual action.
The CLI script file can contain commands for environment settings, debug (excluding mirroring settings), and other commands not maintained by the configuration redundancy.”

When the file-url parameter is not specified, no CLI script file is executed.

**Default**

none

**Parameters**

file-url — Specifies the location and name of the CLI script file.

**Values**

- file-url: local-url | remote-url: 255 chars max
- local-url: [cflash-id][file-path]
- remote-url: [{ftp://|tftp://} login:pswd@remote-locn][file-path]
- cflash-id: cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:
System Alarm Commands

alarm

Syntax

```plaintext
alarm rmon-alarm-id variable-oid oid-string interval seconds [sample-type] [startup-alarm
alarm-type] [rising-event rmon-event-id rising-threshold threshold] [falling-event rmon-event-id
falling threshold threshold] [owner owner-string]
```

no alarm rmon-alarm-id

Context config>system>thresholds>rmon

Description

The alarm command configures an entry in the RMON-MIB alarmTable. The alarm command controls the monitoring and triggering of threshold crossing events. In order for notification or logging of a threshold crossing event to occur there must be at least one associated rmon>event configured.

The agent periodically takes statistical sample values from the MIB variable specified for monitoring and compares them to thresholds that have been configured with the alarm command. The alarm command configures the MIB variable to be monitored, the polling period (interval), sampling type (absolute or delta value), and rising and falling threshold parameters. If a sample has crossed a threshold value, the associated event is generated.

Use the `no` form of this command to remove an rmon-alarm-id from the configuration.

Parameters

- **rmon-alarm-id** — The rmon-alarm-id is a numerical identifier for the alarm being configured. The number of alarms that can be created is limited to 1200.
  - **Default** None
  - **Values** 1 — 65535

- **variable-oid oid-string** — The oid-string is the SNMP object identifier of the particular variable to be sampled. Only SNMP variables that resolve to an ASN.1 primitive type of integer (integer, Integer32, Counter32, Counter64, Gauge, or TimeTicks) may be sampled. The oid-string may be expressed using either the dotted string notation or as object name plus dotted instance identifier. For example, "1.3.6.1.2.1.2.2.1.10.184582144" or "ifInOctets.184582144".
  - **Default** None

- **interval seconds** — The interval in seconds specifies the polling period over which the data is sampled and compared with the rising and falling thresholds. When setting this interval value, care should be taken in the case of ‘delta’ type sampling - the interval should be set short enough that the sampled variable is very unlikely to increase or decrease by more than 2147483647 - 1 during a single sampling interval. Care should also be taken not to set the interval value too low to avoid creating unnecessary processing overhead.
  - **Default** None
  - **Values** 1 — 2147483647
**sample-type** — Specifies the method of sampling the selected variable and calculating the value to be compared against the thresholds.

**Default** Absolute

**Values**

- **absolute** — Specifies that the value of the selected variable will be compared directly with the thresholds at the end of the sampling interval.
- **delta** — Specifies that the value of the selected variable at the last sample will be subtracted from the current value, and the difference compared with the thresholds.

**startup-alarm alarm-type** — Specifies the alarm that may be sent when this alarm is first created.

If the first sample is greater than or equal to the rising threshold value and ‘startup-alarm’ is equal to ‘rising’ or ‘either’, then a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and ‘startup-alarm’ is equal to ‘falling’ or ‘either’, a single falling threshold crossing event is generated.

**Default** either

**Values** rising, falling, either

**rising-event rmon-event-id** — The identifier of the the rmon>event that specifies the action to be taken when a rising threshold crossing event occurs.

If there is no corresponding ‘event’ configured for the specified rmon-event-id, then no association exists and no action is taken.

If the ‘rising-event rmon-event-id’ has a value of zero (0), no associated event exists.

If a ‘rising event’ is configured, the CLI requires a ‘rising-threshold’ to also be configured.

**Default** 0

**Values** 0 — 65535

**rising-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the ‘falling-threshold’ value.

**Default** 0

**Values** -2147483648 — 2147483647

**falling-event rmon-event-id** — The identifier of the rmon>event that specifies the action to be taken when a falling threshold crossing event occurs. If there is no corresponding event configured for the specified rmon-event-id, then no association exists and no action is taken. If the falling-event has a value of zero (0), no associated event exists.

If a ‘falling event’ is configured, the CLI requires a ‘falling-threshold’ to also be configured.

**Default** 0

**Values** -2147483648 — 2147483647

**falling-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than
this threshold, a single threshold crossing event will be generated. A single threshold crossing event
will also be generated if the first sample taken is less than or equal to this threshold and the associated
'startup-alarm' is equal to 'falling' or 'either'.

After a rising threshold crossing event is generated, another such event will not be generated until the
sampled value rises above this threshold and reaches greater than or equal the rising-threshold
threshold value.

Default 0
Values -2147483648 — 2147483647

owner owner — The owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This
parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by
remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not
normally be configured by CLI users and can be a maximum of 80 characters long.

Default TiMOS CLI

Configuration example:
alarm 3 variable-oid ifInOctets.184582144 interval 20 sample-type delta start-alarm either
rising-event 5 rising-threshold 10000 falling-event 5 falling-threshold 9000 owner "TiMOS
CLI"

cflash-cap-alarm

Syntax cflash-cap-alarm cflash-id rising-threshold threshold [falling-threshold threshold] interval
seconds [rmon-event-type] [startup-alarm alarm-type]
no cflash-cap-alarm cflash-id

Context config>system>thresholds

Description This command enables capacity monitoring of the compact flash specified in this command. The severity
level is alarm. Both a rising and falling threshold can be specified.

The no form of this command removes the configured compact flash threshold alarm.

Parameters cflash-id — The cflash-id specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold threshold — Specifies a threshold for the sampled statistic. When the current sampled
value is greater than or equal to this threshold, and the value at the last sampling interval was less than
this threshold, a single threshold crossing event will be generated. A single threshold crossing event
will also be generated if the first sample taken is greater than or equal to this threshold and the
associated 'startup-alarm' is equal to 'rising' or 'either'.

After a rising threshold crossing event is generated, another such event will not be generated until the
sampled value falls below this threshold and reaches less than or equal the 'falling-threshold' value.

Default 0
Values -2147483648 — 2147483647
**falling-threshold** *threshold* — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value raises above this threshold and reaches greater than or equal the rising-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**interval seconds** — Specifies the polling period, in seconds, over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 — 2147483647

**rmon-event-type** — Specifies the type of notification action to be taken when this event occurs.

**Values**
- *log* — An entry is made in the RMON-MIB log table for each event occurrence. This does not create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the `show>system>thresholds` CLI command.
- *trap* — A TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.
- *both* — Both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.
- *none* — No action is taken.

**Default** both

**startup-alarm** *alarm-type* — Specifies the alarm that may be sent when this alarm is first created.

If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Default** either

**Values** rising, falling, either

Configuration example:

```
cflash-cap-alarm cf1-A: rising-threshold 50000000 falling-threshold 49999900 interval 120 rmon-event-type both start-alarm rising.
```

cflash-cap-warn
**System Alarm Commands**

**Syntax**
```
cflash-cap-warn cflash-id rising-threshold threshold [falling-threshold threshold] interval seconds [rmon-event-type] [startup-alarm alarm-type]
no cflash-cap-warn cflash-id
```

**Context**
```
config>system>thresholds
```

**Description**
This command enables capacity monitoring of the compact flash specified in this command. The severity level is warning. Both a rising and falling threshold can be specified. The no form of this command removes the configured compact flash threshold warning.

**Parameters**
- **cflash-id** — The cflash-id specifies the name of the cflash device to be monitored.
  - **Values**
    - cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

- **rising-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.
  - **Default** 0
  - **Values** -2147483648 — 2147483647

- **falling-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.
  - **Default** 0
  - **Values** -2147483648 — 2147483647

- **interval seconds** — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.
  - **Values** 1 — 2147483647

- **rmon-event-type** — Specifies the type of notification action to be taken when this event occurs.
  - **Values**
    - log — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the show>system>thresholds CLI command.
    - trap — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.
    - both — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.
none — In the case of none, no action is taken.

**Default** both

**startup-alarm alarm-type** — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Values** rising, falling, either

**Default** either

Configuration example:

```
cflash-cap-warn cf1-B: rising-threshold 2000000 falling-threshold 1999900 interval 240 rmon-event-type trap start-alarm either
```

**kb-memory-use-alarm**

**Syntax** `kb-memory-use-alarm rising-threshold threshold [falling-threshold threshold] interval seconds [rmon-event-type] [startup-alarm alarm-type]`

**Context** `config>system>thresholds`

**Description** This command configures memory use, in kilobytes, alarm thresholds. The `no` form of the command removes the parameters from the configuration.

**Default** none

**Parameters**

- **rising-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

  After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

  **Default** 0

  **Values** -2147483648 — 2147483647

- **falling-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.
After a rising threshold crossing event is generated, another such event will not be generated until the sampled value raises above this threshold and reaches greater than or equal the rising-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**interval seconds** — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 — 2147483647

**rmon-event-type** — Specifies the type of notification action to be taken when this event occurs.

**Values**
- **log** — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the `show>system>thresholds` CLI command.
- **trap** — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.
- **both** — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.
- **none** — In the case of none, no action is taken.

**Default** both

**startup-alarm alarm-type** — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Values** rising, falling, either

**Default** either

### kb-memory-use-warn

**Syntax**
```
kb-memory-use-warn rising-threshold threshold [falling-threshold threshold] interval seconds [rmon-event-type] [startup-alarm alarm-type]
no kb-memory-use-warn
```

**Context** config>system>thresholds

**Description** This command configures memory usage, in kilobytes, for warning thresholds

**Default** none

**Parameters**
- **rising-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event
will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**falling-threshold threshold** — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value raises above this threshold and reaches greater than or equal the rising-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**interval seconds** — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 — 2147483647

**rmon-event-type** — Specifies the type of notification action to be taken when this event occurs.

**Values** log — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the show>system>thresholds CLI command.

trap — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.

none — In the case of none, no action is taken.

**Default** both

**startup-alarm alarm-type** — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Values** rising, falling, either

**Default** either
event

Syntax

```
event rmon-event-id [event-type] [description description-string] [owner owner-string]
no event rmon-event-id
```

Context

```
config>system>thresholds>rmon
```

Description

The event command configures an entry in the RMON-MIB event table. The event command controls the generation and notification of threshold crossing events configured with the alarm command. When a threshold crossing event is triggered, the `rmon-event` configuration optionally specifies if an entry in the RMON-MIB log table should be created to record the occurrence of the event. It may also specify that an SNMP notification (trap) should be generated for the event. The RMON-MIB defines two notifications for threshold crossing events: Rising Alarm and Falling Alarm.

Creating an event entry in the RMON-MIB log table does not create a corresponding entry in the TiMOS event logs. However, when the `event-type` is set to `trap`, the generation of a Rising Alarm or Falling Alarm notification creates an entry in the TiMOS event logs and that is distributed to whatever TiMOS log destinations are configured: CONSOLE, session, memory, file, syslog, or SNMP trap destination.

The TiMOS logger message includes a rising or falling threshold crossing event indicator, the sample type (absolute or delta), the sampled value, the threshold value, the RMON-alarm-id, the associated RMON-event-id and the sampled SNMP object identifier.

Use the `no` form of this command to remove an rmon-event-id from the configuration.

Parameters

**rmon-event-type** — The rmon-event-type specifies the type of notification action to be taken when this event occurs.

- **Values**
  - `log` — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence.
    
    This does **not** create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the `show>system>thresholds` CLI command.
  
  - `trap` — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.
    
    - `both` — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.
    
    - `none` — In the case of none, no action is taken.

- **Default**
  - `both`

**description** — The description is a user configurable string that can be used to identify the purpose of this event. This is an optional parameter and can be 80 characters long. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

- **Default**
  - An empty string.

**owner owner** — The owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by
remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not normally be configured by CLI users and can be a maximum of 80 characters long.

Default TiMOS CLI

Configuration example:

Default event 5 rmon-event-type both description "alarm testing" owner "TiMOS CLI"

memory-use-alarm

Syntax memory-use-alarm rising-threshold threshold [falling-threshold threshold] interval seconds [rmon-event-type] [startup-alarm alarm-type]

no memory-use-alarm

Context config>system>thresholds

Description The memory thresholds are based on monitoring the TIMETRA-SYSTEM-MIB sgiMemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm. The absolute sample type method is used.

The no form of this command removes the configured memory threshold warning.

Parameters rising-threshold threshold — Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

Default 0

Values -2147483648 — 2147483647

falling-threshold threshold — Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value raises above this threshold and reaches greater than or equal the rising-threshold threshold value.

Default 0

Values -2147483648 — 2147483647

interval seconds — Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 — 2147483647
rmon-event-type — Specifies the type of notification action to be taken when this event occurs.

Values

log — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create an OS logger entry. The RMON-MIB log table entries can be viewed using the CLI command.

trap — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.

none — In the case of none, no action is taken.

Default both

startup-alarm alarm-type — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example:

memory-use-alarm rising-threshold 50000000 falling-threshold 45999999 interval 500 rmon-event-type both start-alarm either

memory-use-warn

Syntax memory-use-warn rising-threshold threshold [falling-threshold threshold] interval seconds [rmon-event-type] [startup-alarm alarm-type] no memory-use-warn

Context config>system>thresholds

Description The memory thresholds are based on monitoring MemoryUsed object. This object contains the amount of memory currently used by the system. The severity level is Alarm.

The absolute sample type method is used.

The no form of this command removes the configured compact flash threshold warning.

Parameters rising-threshold threshold — The rising-threshold specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.
After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**falling-threshold** *threshold* — The falling-threshold specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value raises above this threshold and reaches greater than or equal the rising-threshold value.

**Default** 0

**Values** -2147483648 — 2147483647

**interval seconds** — The interval in seconds specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 — 2147483647

**rmon-event-type** — Specifies the type of notification action to be taken when this event occurs.

**Values**

- **log** — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence.

  This does not create a TiMOS logger entry. The RMON-MIB log table entries can be viewed using the `show>system>thresholds` CLI command.

- **trap** — In the case of trap, a TiMOS logger event is generated. The TiMOS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

- **both** — In the case of both, both a entry in the RMON-MIB logTable and a TiMOS logger event are generated.

- **none** — In the case of none, no action is taken.

**Default** both

**Values** log, trap, both, none

**startup-alarm** *alarm-type* — Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Default** either

**Values** rising, falling, either

Configuration example:
memory-use-warn rising-threshold 500000 falling-threshold 400000 interval 800 rmon-event-type log start-alarm falling

rmon

Syntax rmon
Context config>system>thresholds
Description This command creates the context to configure generic RMON alarms and events.
Generic RMON alarms can be created on any SNMP object-ID that is valid for RMON monitoring (for example, an integer-based datatype).
The configuration of an event controls the generation and notification of threshold crossing events configured with the alarm command.

thresholds

Syntax thresholds
Context config>system
Description This command enables the context to configure monitoring thresholds.
Hardware Configuration Commands

power-supply

Syntax  

```
power-supply [power-supply-id] [type]
```

Context  
config>system

Description  
This command specifies the power supply slot ID and the power type. This allows for the proper generation of traps and LED management.

Specify the **none** keyword when a power supply unit is removed from an 7750 SR-Series chassis or if a power supply slot will not be populated.

If this command is not configured the LEDs will indicate the installed power supplies but traps will not be issued and alarms will not raised because the desired behavior is not known.

If this command is not modified to reflect the current power configuration when a unit is removed or the power type is changed, alarms will be generated.

Parameters

- **power-supply-id** — Specifies the identifier for a power supply tray in the chassis.
  - **Values**
    - 1 | 2 — Specifies the power supply slot ID.

- **type** — Specifies the type of power supply for a platform. Based on the value assigned to this object, various power supply monitoring signals are interpreted. For example, if a platform is provisioned to use DC power supplies, then the signal that indicates an AC power supply is missing can be ignored. This is required for proper generation of traps and LED management.
  - **Values**
    - **dc** — Specifies that the power supply slot is DC.
    - **ac** — Specifies that the power supply slot is AC.
    - **none** — Specifies that no power supply unit is installed in the given power supply slot.
    - **single** — Specifies that one AC power supply unit is installed in the power supply slot.
    - **multiple** — Specifies that more than one AC power supply unit is installed in the power supply slot.
Date and Time Commands

set-time

Syntax  set-time [date] [time]

Context  admin

Description  This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

Parameters  

date  — The local date and time accurate to the minute in the YYYY/MM/DD format.

Values  

YYYY is the four-digit year

MM is the two-digit month

DD is the two-digit date

time  — The time (accurate to the second) in the hh:mm:ss format. If no seconds value is entered, the seconds are reset to :00.

Values  

hh is the two-digit hour in 24 hour format (00=midnight, 12=noon)

mm is the two-digit minute

time

Syntax  time

Context  config>system

Description  This command enables the context to configure the system time zone and time synchronization parameters.
Network Time Protocol Commands

**ntp**

**Syntax**  
[no] ntp

**Context**  
config>system>time

**Description**  
This command enables the context to configure Network Time Protocol (NTP) and its operation. This protocol defines a method to accurately distribute and maintain time for network elements. Furthermore this capability allows for the synchronization of clocks between the various network elements. Use the no form of the command to stop the execution of NTP and remove its configuration.

**Default**  
none

**authentication-check**

**Syntax**  
[no] authentication-check

**Context**  
config>system>time>ntp

**Description**  
This command provides the option to skip the rejection of NTP PDUs that do not match the authentication key-id, type or key requirements. The default behavior when authentication is configured is to reject all NTP protocol PDUs that have a mismatch in either the authentication key-id, type or key.

When `authentication-check` is enabled, NTP PDUs are authenticated on receipt. However, mismatches cause a counter to be increased, one counter for type and one for key-id, one for type, value mismatches. These counters are visible in a show command.

The no form of this command allows authentication mismatches to be accepted; the counters however are maintained.

**Default**  
authentication-check — Rejects authentication mismatches.

**authentication-key**

**Syntax**  
authentication-key key-id {key key} [hash | hash2] type {des | message-digest}

no authentication-key key-id

**Context**  
config>system>time>ntp

**Description**  
This command sets the authentication key-id, type and key used to authenticate NTP PDUs sent to or received by other network elements participating in the NTP protocol. For authentication to work, the authentication key-id, type and key value must match.

The no form of the command removes the authentication key.

**Default**  
none
Network Time Protocol Commands

**Parameters**

key-id — Configure the authentication key-id that will be used by the node when transmitting or receiving Network Time Protocol packets.

Entering the authentication-key command with a key-id value that matches an existing configuration key will result in overriding the existing entry.

Recipients of the NTP packets must have the same authentication key-id, type, and key value in order to use the data transmitted by this node. This is an optional parameter.

**Default**

None

**Values**

1 — 255

key — The authentication key associated with the configured key-id, the value configured in this parameter is the actual value used by other network elements to authenticate the NTP packet.

The key can be any combination of ASCII characters up to 32 characters in length for message-digest (md5) or 8 characters in length for des (length limits are unencrypted lengths). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

hash — Specifies the key is entered in an encrypted form. If the hash or hash2 parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash or hash2 parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form that involves more variables then the key value alone, this means that hash2 encrypted variable can’t be copied and pasted. If the hash or hash2 parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash or hash2 parameter specified.

type — This parameter determines if DES or message-digest authentication is used.

This is a required parameter; either DES or message-digest must be configured.

**Values**

des — Specifies that DES authentication is used for this key

message-digest — Specifies that MD5 authentication in accordance with RFC 2104 is used for this key.

---

**broadcast**

**Syntax**

broadcast [router router-name] [interface ip-int-name] [key-id key-id] [version version] [ttl ttl]

no broadcast [router router-name] [interface ip-int-name]

**Context**

config>system>time>ntp

**Description**

This command configures the node to transmit NTP packets on a given interface. Broadcast and multicast messages can easily be spoofed, thus, authentication is strongly recommended.

The no form of this command removes the address from the configuration.

**Parameters**

router — Specifies the router name used to transmit NTP packets. Base is the default. Select management to use the management port (Ethernet port on the CPM).
Values Base, management
Default Base

ip-int-name — Specifies the local interface on which to transmit NTP broadcast packets. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Values 32 character maximum
Default Base

key-id key-id — Identifies the configured authentication key and authentication type used by this node to receive and transmit NTP packets to and from an NTP server and peers. If an NTP packet is received by this node both authentication key and authentication type must be valid otherwise the packet will be rejected and an event/trap generated.

Values 1 — 255
Default none

version version — Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all versions will be accepted.

Values 1 — 4
Default 4

ttl ttl — Specifies the IP Time To Live (TTL) value.

Values 1 — 255
Default none

broadcastclient

Syntax broadcastclient [router router-name] {interface ip-int-name} [authenticate] no broadcastclient [router router-name] {interface ip-int-name}

Context config>system>time>ntp

Description When configuring NTP, the node can be configured to receive broadcast packets on a given subnet. Broadcast and multicast messages can easily be spoofed, thus, authentication is strongly recommended. If broadcast is not configured then received NTP broadcast traffic will be ignored. Use the show command to view the state of the configuration.

The no form of this command removes the address from the configuration.

Parameters router router-name — Specifies the router name used to receive NTP packets.

Values Base, management
Default Base

interface ip-int-name — Specifies the local interface on which to receive NTP broadcast packets. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Values 32 character maximum
authenticate — Specifies whether or not to require authentication of NTP PDUs. When enabled, NTP PDUs are authenticated upon receipt.

multicast

Syntax multicast [version version] [key-id key-id]
no multicast

Context config>system>time>ntp

Description This command configures NTP the node to transmit multicast packets on the CPMCCM MGMT port. Broadcast and multicast messages can easily be spoofed; authentication is strongly recommended.

The no form of this command removes the multicast address from the configuration.

Parameters version version — Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all three versions are accepted.

Values 2 — 4
Default 4

key-id key-id — Specifies the configured authentication key and authentication type used by this version to transmit NTP packets. If this command is omitted from the configuration, packets are sent unencrypted.

Values 1 — 255
Default None

multicastclient

Syntax multicastclient [authenticate]
no multicastclient

Context config>system>time>ntp

Description This command configures the node to receive multicast NTP messages on the CPM MGMT port. If multicastclient is not configured, received NTP multicast traffic will be ignored. Use the show command to view the state of the configuration.

The no construct of this message removes the multicast client for the specified interface from the configuration.

Parameters authenticate — This optional parameter makes authentication a requirement. If authentication is required, the authentication key-id received must have been configured in the “authentication-key” command, and that key-id’s type and key value must also match.

ntp-server
Syntax  ntp-server [transmit key-id]
        no ntp-server

Context  config>system>time>ntp

Description  This command configures the node to assume the role of an NTP server. Unless the server command is used, this node will function as an NTP client only and will not distribute the time to downstream network elements.

Default  no ntp-server

Parameters  key-id — If specified, requires client packets to be authenticated.

   Values  1 — 255
   Default  None

peer

Syntax  peer ip-address [key-id key-id] [version version] [prefer]
        no peer ip-address

Context  config>system>time>ntp

Description  Configuration of an NTP peer configures symmetric active mode for the configured peer. Although any system can be configured to peer with any other NTP node it is recommended to configure authentication and to configure known time servers as their peers.

The no form of the command removes the configured peer.

Parameters  ip-address — Configure the IP address of the peer that requires a peering relationship to be set up. This is a required parameter.

   Default  None
   Values  Any valid IP-address

key-id key-id — Successful authentication requires that both peers must have configured the same authentication key-id, type and key value.

Specify the key-id that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP peer. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid otherwise the packet will be rejected and an event/trap generated.

   Default  None
   Values  1 — 255

version version — Specify the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all three nodes are accepted.

   Default  4
   Values  2 — 4
prefer — When configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, then the new entry overrides the old entry.

server

Syntax

```
server ip address [key-id key-id] [version version] [prefer]
no server ip address
```

Context

```
config>system>time>ntp
```

Description

This command is used when the node should operate in client mode with the ntp server specified in the address field of this command. The no construct of this command removes the server with the specified address from the configuration.

Up to five NTP servers can be configured.

Parameters

- `ip-address` — Configure the IP address of a node that acts as an NTP server to this network element. This is a required parameter.

  Values

  Any valid IP address

- `key-id key-id` — Enter the key-id that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid otherwise the packet will be rejected and an event/trap generated. This is an optional parameter.

  Values

  1 — 255

- `version version` — Use this command to configure the NTP version number that is expected by this node. This is an optional parameter

  Default

  4

  Values

  2 — 4

prefer — When configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, then the new entry overrides the old entry.
SNTP Commands

sntp

Syntax [no] sntp
Context config>system>time
Description This command creates the context to edit the Simple Network Time Protocol (SNTP).
SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.
The system clock is automatically adjusted at system initialization time or when the protocol first starts up.
When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.
SNTP is created in an administratively enabled state (no shutdown).
The no form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.
Default no sntp

broadcast-client

Syntax [no] broadcast-client
Context config>system>time>sntp
Description This command enables listening to SNTP/NTP broadcast messages on interfaces with broadcast client enabled at global device level.
When this global parameter is configured then the ntp-broadcast parameter must be configured on selected interfaces on which NTP broadcasts are transmitted.
SNTP must be shutdown prior to changing either to or from broadcast mode.
The no form of the command disables broadcast client mode.
Default no broadcast-client
server-address

Syntax  
server-address ip-address [version version-number] [normal | preferred] [interval seconds]  
no server-address

Context  
config>system>time>sntp

Description  
This command creates an SNTP server for unicast client mode.

Parameters  
ip-address — Specifies the IP address of the SNTP server.

  version version-number — Specifies the SNTP version supported by this server.

    Values  1 — 3
    Default 3

  normal | preferred — Specifies the preference value for this SNTP server. When more than one time-
  server is configured, one server can have preference over others. The value for that server should be set
to preferred. Only one server in the table can be a preferred server.

    Default normal

  interval seconds — Specifies the frequency at which this server is queried.

    Values  64 — 1024
    Default 64
CRON Commands

cron

Syntax  cron
Context  config
Description  This command creates the context to create scripts, script parameters and schedules which support the Service Assurance Agent (SAA) functions.

CRON features are saved to the configuration file on both primary and backup control modules. If a control module switchover occurs, CRON events are restored when the new configuration is loaded. If a control module switchover occurs during the execution of a cron script, the failover behavior will be determined by the contents of the script.

action

Syntax  [no] action action-name [owner action-owner]
Context  config>cron
         config>cron>action
Description  This command configures action parameters for a script.
Default  none
Parameters  action action-name — Specifies the action name.

Values  Maximum 32 characters.

owner action-owner — Specifies the owner name.

Default  TiMOS CLI

expire-time

Syntax  expire-time {seconds | forever}
Context  config>cron>action
Description  This command configures the maximum amount of time to keep the results from a script run.
Parameters  seconds — Specifies the maximum amount of time to keep the results from a script run.

Values  1 — 21474836

Default  3600 (1 hour)

forever — Specifies to keep the results from a script run forever.
Network Time Protocol Commands

**lifetime**

**Syntax**  
lifetime (seconds | forever)

**Context**  
config>cron>action

**Description**  
This command configures the maximum amount of time the script may run.

**Parameters**  
seconds — Specifies the maximum amount of time to keep the results from a script run.

- **Values**  
  1 — 21474836

- **Default**  
  3600 (1 hour)

forever — Specifies to keep the results from a script run forever.

**max-completed**

**Syntax**  
max-completed unsigned

**Context**  
config>cron>action

**Description**  
This command specifies the maximum number of completed sessions to keep in the event execution log. If a new event execution record exceeds the number of records specified this command, the oldest record is deleted.

The **no** form of this command resets the value to the default.

**Parameters**  
unsigned — Specifies the maximum number of completed sessions to keep in the event execution log.

- **Values**  
  0 — 255

- **Default**  
  1

**results**

**Syntax**  
[no] results file-url

**Context**  
config>cron>action

**Description**  
This command specifies the location where the system writes the output of an event script’s execution.

The **no** form of this command removes the file location from the configuration.

**Parameters**  
file-url! — Specifies the location where the system writes the output of an event script’s execution.

- **Values**  
  file-url: local-url | remote-url: 255 chars max
  local-url: [cflash-id][file-path]
  remote-url: [{ftp://} login:pswd@remote-locn][file-path]
  remote-locn [ hostname | ipv4-address | [ipv6-address] ]
  ipv4-address a.b.c.d
  ipv6-address - x:x:x:x:x:x:x:[-interface]
  x:x:x:x:d.d.d.d:[-interface]
script

Syntax    [no] script script-name [owner owner-name]
Context   config>cron>action
Description This command creates action parameters for a script including the maximum amount of time to keep the results from a script run, the maximum amount of time a script may run, the maximum number of script runs to store and the location to store the results.

The no form of this command removes the script parameters from the configuration.

Default    none — No server-address is configured.

Parameters

- script script-name — The script command in the action context connects an event to the script which will run when the event is triggered.
  - Default    TiMOS CLI

The no form of this command removes the script entry from the action context.

schedule

Syntax    [no] schedule schedule-name [owner owner-name]
Context   config>cron
Description This command configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds).

The no form of this command removes the context from the configuration.

Default    none

Parameters

- schedule-name — Name of the schedule.
  - owner owner-name — Owner name of the schedule.
Network Time Protocol Commands

**Syntax**  count number
**Context**  config>cron>sched
**Description**  This command configures the total number of times a CRON “interval” schedule is run. For example, if the interval is set to 600 and the count is set to 4, the schedule runs 4 times at 600 second intervals.

**Parameters**  
- **number** — The number of times the schedule is run.
  - **Values**  1 — 65535
  - **Default**  65535

**day-of-month**

**Syntax**  [no] day-of-month {day-number [..day-number] all}
**Context**  config>cron>sched
**Description**  This command specifies which days of the month that the schedule will occur. Multiple days of the month can be specified. When multiple days are configured, each of them will cause the schedule to trigger. If a day-of-month is configured without configuring month, weekday, hour and minute, the event will not execute.

Using the `weekday` command as well as the `day-of-month` command will cause the script to run twice. For example, consider that “today” is Monday January 1. If “Tuesday January 5” is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified day-of-month from the list.

**Parameters**  
- **day-number** — The positive integers specify the day of the month counting from the first of the month. The negative integers specify the day of the month counting from the last day of the month. For example, configuring `day-of-month -5, 5` in a month that has 31 days will specify the schedule to occur on the 27th and 5th of that month.
  - **Values**  1 — 31, -31 — -1 (maximum 62 day-numbers)
  - **all** — Specifies all days of the month.

**end-time**

**Syntax**  [no] end-time [date | day-name] time
**Context**  config>cron>sched
**Description**  This command is used concurrently with type `periodic` or `calendar`. Using the type of `periodic`, end-time determines at which interval the schedule will end. Using the type of `calendar`, end-time determines on which date the schedule will end.

When **no end-time** is specified, the schedule runs forever.
Parameters

- **date** — Specifies the date to schedule a command.
  - **Values**  YYYY:MM:DD in year:month:day number format

- **day-name** — Specifies the day of the week to schedule a command.
  - **Values**  sunday|monday|tuesday|wednesday|thursday|friday|saturday

- **time** — Specifies the time of day to schedule a command.
  - **Values**  hh:mm in hour:minute format

**hour**

**Syntax**  
```
[no] hour {..hour-number [..hour-number]|all}
```

**Context**  config>cron>sched

**Description**  
This command specifies which hour to schedule a command. Multiple hours of the day can be specified. When multiple hours are configured, each of them will cause the schedule to trigger. Day-of-month or weekday must also be specified. All days of the month or weekdays can be specified. If an hour is configured without configuring month, weekday, day-of-month, and minute, the event will not execute.

The `no` form of this command removes the specified hour from the configuration.

**Parameters**  
- **hour-number** — Specifies the hour to schedule a command.
  - **Values**  0 — 23 (maximum 24 hour-numbers)
- **all** — Specifies all hours.

**interval**

**Syntax**  
```
[no] interval seconds
```

**Context**  config>cron>sched

**Description**  
This command specifies the interval between runs of an event.

**Parameters**  
- **seconds** — The interval, in seconds, between runs of an event.
  - **Values**  30 — 4,294,967,295

**minute**

**Syntax**  
```
[no] minute {minute-number [..minute-number]|all}
```

**Context**  config>cron>sched

**Description**  
This command specifies the minute to schedule a command. Multiple minutes of the hour can be specified. When multiple minutes are configured, each of them will cause the schedule to occur. If a minute is
configured, but no hour or day is configured, the event will not execute. If a minute is configured without configuring month, weekday, day-of-month, and hour, the event will not execute.

The no form of this command removes the specified minute from the configuration.

**Parameters**

*minute-number* — Specifies the minute to schedule a command.

**Values**

- 0 — 59 (maximum 60 minutes)
- all — Specifies all minutes.

### month

**Syntax**

[no] month {month-number [..month-number]|month-name [..month-name]| all}

**Context**

config>cron>sched

**Description**

This command specifies the month when the event should be executed. Multiple months can be specified. When multiple months are configured, each of them will cause the schedule to trigger. If a month is configured without configuring weekday, day-of-month, hour and minute, the event will not execute.

The no form of this command removes the specified month from the configuration.

**Parameters**

*month-number* — Specifies a month number.

**Values**

- 1 — 12 (maximum 12 month-numbers)
- all — Specifies all months.

*month-name* — Specifies a month by name

**Values**

- january, february, march, april, may, june, july, august, september, october, november, december (maximum 12 month names)
type

Syntax: type {schedule-type}

Context: config>cron>sched

Description: This command specifies how the system should interpret the commands contained within the schedule node.

Parameters: schedule-type — Specify the type of schedule for the system to interpret the commands contained within the schedule node.

Values:
- periodic — Specifies a schedule which runs at a given interval. interval must be specified for this feature to run successfully.
- calendar — Specifies a schedule which runs based on a calendar. weekday, month, day-of-month, hour and minute must be specified for this feature to run successfully.
- oneshot — Specifies a schedule which runs one time only. As soon as the first event specified in these parameters takes place and the associated event occurs, the schedule enters a shutdown state. month, weekday, day-of-month, hour and minute must be specified for this feature to run successfully.

Default: periodic

weekday

Syntax: [no] weekday {weekday-number [..weekday-number]|day-name [..day-name]|all}

Context: config>cron>sched

Description: This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring month, day-of-month, hour and minute, the event will not execute.

Using the weekday command as well as the day-of-month command will cause the script to run twice. For example, consider that “today” is Monday January 1. If “Tuesday January 5” is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The no form of this command removes the specified weekday from the configuration.

Parameters:
- day-number — Specifies a weekday number.
  Values: 1 — 7 (maximum 7 week-day-numbers)
- day-name — Specifies a day by name
  Values: sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)
- all — Specifies all days of the week.
Syntax  

\[\text{[no] script script-name [owner owner-name]}\]

Context  

config>cron>script

Description  

This command configures the name associated with this script.

Parameters  

\textit{script-name} — Specifies the script name.

Syntax  

\[\text{[no] location file-url}\]

Context  

config>cron>script

Description  

This command configures the location of script to be scheduled.

Parameters  

\textit{file-url} — Specifies the location where the system writes the output of an event script’s execution.

Values  

\begin{itemize}
\item \textit{file-url:} local-url | remote-url: 255 chars max
\item \textit{local-url:} \texttt{[cflash-id]/[file-path]}
\item \textit{remote-url:} \texttt{[{ftp://} login:pswd@remote-locn/[file-path]}
\item \textit{remote-locn [ hostname | ipv4-address | ipv6-address ]}
\item \textit{ipv4-address} a.b.c.d
\item \textit{ipv6-address} - x:x:x:x:x:x:-interface
\item \textit{x} - [0..FFFF]H
\item \textit{d} - [0..255]D
\item \textit{interface} - 32 chars max, for link local addresses
\item \textit{cflash-id:} cf1:, cf1-A:,cf1-B:,cf2:,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:
\end{itemize}
Time Range Commands

time-range

Syntax  [no] time-range name

Context  config>cron

Description  This command configures a time range.
The no form of the command removes the name from the configuration.

Default  none

Parameters  name — Configures a name for the time range up to 32 characters in length.

absolute

Syntax  absolute start start-absolute-time end end-absolute-time
       no absolute start absolute-time

Context  config>cron>time-range

Description  This command configures an absolute time interval that will not repeat.
The no form of the command removes the absolute time range from the configuration.

Parameters  start absolute-time — Specifies starting parameters for the absolute time-range.

Values  absolute-time: year/month/day,hh:mm
        year: 2005 — 2099
        month: 1 — 12
        day: 1 — 31
        hh: 0 — 23
        mm: [ 0 — 59

end absolute-time — Specifies end parameters for the absolute time-range.

Values  absolute-time: year/month/day,hh:mm
        year: 2005 — 2099
        month: 1 — 12
        day: 1 — 31
        hh: 0 — 23
        mm: [ 0 — 59

Network Time Protocol Commands

daily

Syntax  

**daily start** start-time-of-day **end** end-time-of-day  
**no daily start** start-time-of-day

Context  

config>cron>time-range

Description  

This command configures the start and end of a schedule for every day of the week. To configure a daily time-range across midnight, use a combination of two entries. An entry that starts at hour zero will take over from an entry that ends at hour 24.

The no form of the command removes the daily time parameters from the configuration.

Parameters  

**start-time-of-day** — Specifies the starting time for the time range.

<table>
<thead>
<tr>
<th>Values</th>
<th>Syntax:</th>
<th>hh:mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hh</td>
<td>0 — 23</td>
</tr>
<tr>
<td></td>
<td>mm</td>
<td>0 — 59</td>
</tr>
</tbody>
</table>

**end-time-of-day** — Specifies the ending time for the time range.

<table>
<thead>
<tr>
<th>Values</th>
<th>Syntax:</th>
<th>hh:mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hh</td>
<td>0 — 24</td>
</tr>
<tr>
<td></td>
<td>mm</td>
<td>0 — 59</td>
</tr>
</tbody>
</table>

weekdays

Syntax  

**weekdays start** start-time-of-day **end** end-time-of-day  
**no weekdays start** start-time-of-day

Context  

config>cron>time-range

Description  

This command configures the start and end of a weekday schedule. The no form of the command removes the weekday parameters from the configuration.

Parameters  

**start-time-of-day** — Specifies the starting time for the time range.

<table>
<thead>
<tr>
<th>Values</th>
<th>Syntax:</th>
<th>hh:mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hh</td>
<td>0 — 23</td>
</tr>
<tr>
<td></td>
<td>mm</td>
<td>0 — 59</td>
</tr>
</tbody>
</table>

**end-time-of-day** — Specifies the ending time for the time range.

<table>
<thead>
<tr>
<th>Values</th>
<th>Syntax:</th>
<th>hh:mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hh</td>
<td>0 — 24</td>
</tr>
<tr>
<td></td>
<td>mm</td>
<td>0 — 59</td>
</tr>
</tbody>
</table>
weekend

Syntax  weekend start start-time-of-day end end-time-of-day
no weekend start start-time-of-day

Context  config>cron>time-range

Description  This command configures a time interval for every weekend day in the time range.
The resolution must be at least one minute apart, for example, start at 11:00 and end at 11:01. An 11:00 start
and end time is invalid. This example configures a start at 11:00 and an end at 11:01 on both Saturday and
Sunday.
The no form of the command removes the weekend parameters from the configuration.

Parameters  start-time-of-day — Specifies the starting time for the time range.

Values  Syntax: hh:mm
hh  0 — 23
mm  0 — 59

day
end-time-of-day — Specifies the ending time for the time range.

Values  Syntax: hh:mm
hh  0 — 24
mm  0 — 59

weekly

Syntax  weekly start start-time-in-week end end-time-in-week
no weekly start start-time-in-week

Context  config>cron>time-range

Description  This command configures a weekly periodic interval in the time range.
The no form of the command removes the weekly parameters from the configuration.

Parameters  start-time-in-week — Specifies the start day and time of the week.

Values  Syntax: day,hh:mm
day  sun, mon, tue, wed, thu, fri, sat
     sunday, monday, tuesday, wednesday, thursday, friday, saturday
hh  0 — 23
mm  0 — 59

day
end-time-in-week — Specifies the end day and time of the week.

Values  Syntax: day,hh:mm
day  sun, mon, tue, wed, thu, fri, sat
     sunday, monday, tuesday, wednesday, thursday, friday, saturday
Network Time Protocol Commands

hh  0 — 24
mm  0 — 59

weekly start time-in-week end time-in-week — This parameter configures the start and end of a schedule for the same day every week, for example, every Friday. The start and end dates must be the same. The resolution must be at least one minute apart, for example, start at 11:00 and end at 11:01. A start time and end time of 11:00 is invalid.

Values  00 — 23, 00 — 59

Default  no time-range
Time of Day Commands

tod-suite

**Syntax**  
[no] tod-suite tod-suite name create

**Context**  
config>cron

**Description**  
This command creates the tod-suite context.

**Default**  
no tod-suite

egress

**Syntax**  
egress

**Context**  
config>cron>tod-suite

**Description**  
This command enables the TOD suite egress parameters.

ingress

**Syntax**  
ingress

**Context**  
config>cron>tod-suite

**Description**  
This command enables the TOD suite ingress parameters.

filter

**Syntax**  
filter ip ip-filter-id [time-range time-range-name] [priority priority]
filter ipv6 ipv6-filter-id [time-range time-range-name] [priority priority]
filter mac mac-filter-id [time-range time-range-name] [priority priority]
no ip ip-filter-id [time-range time-range-name]
no filter ipv6 ipv6-filter-id [time-range time-range-name]
no filter mac mac-filter-id [time-range time-range-name]

**Context**  
config>cron>tod-suite>egress
config>cron>tod-suite>ingress

**Description**  
This command creates time-range based associations of previously created filter policies. Multiple policies may be included and each must be assigned a different priority; in case time-ranges overlap, the priority will be used to determine the prevailing policy. Only a single reference to a policy may be included without a time-range.
Network Time Protocol Commands

**Parameters**

- `ip-filter ip-filter-id` — Specifies an IP filter for this tod-suite.
  
  **Values**
  
  1 — 65535

- `ipv6-filter ipv6-filter-id` — Specifies an IPv6 filter for this tod-suite.
  
  **Values**
  
  1 — 65535

- `time-range time-range-name` — Name for the specified time-range. If the time-range is not populated the system will assume the assignment to mean “all times”. Only one entry without a time-range is allowed for every type of policy. The system does not allow the user to specify more than one policy with the same time-range and priority.
  
  **Values**
  
  Up to 32 characters

- `priority priority` — Priority of the time-range. Only one time-range assignment of the same type and priority is allowed.
  
  **Values**
  
  1 — 10

- `mac mac-filter-id` — Specifies a MAC filter for this tod-suite.
  
  **Values**
  
  1 — 65535

**QoS**

**Syntax**

```
qos policy-id [time-range time-range-name] [priority priority]
no qos policy-id [time-range time-range-name] [
```

**Context**

```
config>cron>tod-suite>egress
config>cron>tod-suite>ingress
```

**Description**

This command creates time-range based associations of previously created QoS policies. Multiple policies may be included and each must be assigned a different priority; in case time-ranges overlap, the priority will be used to determine the prevailing policy. Only a single reference to a policy may be included without a time-range.

The no form of the command reverts to the default.

**Parameters**

- `policy-id` — Specifies an egress QoS policy for this tod-suite.
  
  **Values**
  
  1 — 65535

- `time-range time-range-name` — Name for the specified time-range. If the time-range is not populated the system will assume the assignment to mean “all times”. Only one entry without a time-range is allowed for every type of policy. The system does not allow the user to specify more than one policy with the same time-range and priority.
  
  **Values**
  
  Up to 32 characters

  **Default**

  “NO-TIME-RANGE” policy

- `priority priority` — Priority of the time-range. Only one time-range assignment of the same type and priority is allowed.
Values  1 — 10
Default  5

scheduler-policy

Syntax  

[no] scheduler-policy scheduler-policy-name [time-range time-range-name] [priority priority]

Context  config>cron>tod-suite>egress
        config>cron>tod-suite>ingress

Description  This command creates time-range based associations of previously created scheduler policies. Multiple policies may be included and each must be assigned a different priority; in case time-ranges overlap, the priority will be used to determine the prevailing policy. Only a single reference to a policy may be included without a time-range.

Parameters  

scheduler-policy-name — Specifies a scheduler policy for this tod-suite.
Values  Up to 32 characters

time-range time-range-name — Specifies the name for a time-range. If the time-range is not populated the system will assume the assignment to mean “all times”. Only one entry without a time-range is allowed for every type of policy. The system does not allow the user to specify more than one policy and the same time-range and priority.
Values  Up to 32 characters

priority priority — Specifies the time-range priority. Only one time-range assignment of the same type and priority is allowed.
Values  1 — 10
System Time Commands

dst-zone

Syntax  
\[no\] dst-zone [std-zone-name | non-std-zone-name]

Context  
config>system>time

Description  
This command configures the start and end dates and offset for summer time or daylight savings time to override system defaults or for user defined time zones.

When configured, the time is adjusted by adding the configured offset when summer time starts and subtracting the configured offset when summer time ends.

If the time zone configured is listed in Table 27, System-defined Time Zones, on page 228, then the starting and ending parameters and offset do not need to be configured with this command unless it is necessary to override the system defaults. The command returns an error if the start and ending dates and times are not available either in Table 27 or entered as optional parameters in this command.

Up to five summer time zones may be configured, for example, for five successive years or for five different time zones. Configuring a sixth entry will return an error message. If no summer (daylight savings) time is supplied, it is assumed no summer time adjustment is required.

The no form of the command removes a configured summer (daylight savings) time entry.

Default  
none — No summer time is configured.

Parameters  
std-zone-name — The standard time zone name. The standard name must be a system-defined zone in Table 27. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining start-date, end-date and offset parameters need to be provided unless it is necessary to override the system defaults for the time zone.

Values  
std-zone-name ADT, AKDT, CDT, CEST, EDT, EEST, MDT, PDT, WEST

non-std-zone-name — The non-standard time zone name. Create a user-defined name created using the zone command on page 405

Values  
5 characters maximum

end

Syntax  
end {end-week} {end-day} {end-month} [hours-minutes]

Context  
config>system>time>dst-zone

Description  
This command configures start of summer time settings.

Parameters  
end-week — Specifies the starting week of the month when the summer time will end.

Values  
first, second, third, fourth, last

Default  
first
**end-day** — Specifies the starting day of the week when the summer time will end.

**Values**
- sunday, monday, tuesday, wednesday, thursday, friday, saturday

**Default**
- sunday

**end-month** — The starting month of the year when the summer time will take effect.

**Values**
- january, february, march, april, may, june, july, august, september, october, november, december

**Default**
- january

**hours** — Specifies the hour at which the summer time will end.

**Values**
- 0 — 24

**Default**
- 0

**minutes** — Specifies the number of minutes, after the hours defined by the **hours** parameter, when the summer time will end.

**Values**
- 0 — 59

**Default**
- 0

**offset**

**Syntax**
- offset offset

**Context**
- config>system>time>dst-zone

**Description**
This command specifies the number of minutes that will be added to the time when summer time takes effect. The same number of minutes will be subtracted from the time when the summer time ends.

**Parameters**
- offset — The number of minutes added to the time at the beginning of summer time and subtracted at the end of summer time, expressed as an integer.

**Default**
- 60

**Values**
- 0 — 60

**start**

**Syntax**
- start {start-week} {start-day} {start-month} [hours-minutes]

**Context**
- config>system>time>dst-zone

**Description**
This command configures start of summer time settings.

**Parameters**
- start-week — Specifies the starting week of the month when the summer time will take effect.

**Values**
- first, second, third, fourth, last

**Default**
- first
Network Time Protocol Commands

*Start-day* — Specifies the starting day of the week when the summer time will take effect.

**Default**
- sunday

**Values**
- sunday, monday, tuesday, wednesday, thursday, friday, saturday

*Start-month* — The starting month of the year when the summer time will take effect.

**Values**
- january, february, march, april, may, june, july, august, september, october, november, december

**Default**
- january

*Hours* — Specifies the hour at which the summer time will take effect.

**Default**
- 0

*Minutes* — Specifies the number of minutes, after the hours defined by the *hours* parameter, when the summer time will take effect.

**Default**
- 0
zone

Syntax  

```
zone [std-zone-name | non-std-zone-name] [hh [:mm]]
no zone
```

Context  
config>system>time

Description  
This command sets the time zone and/or time zone offset for the device.  

7750 SR OS supports system-defined and user-defined time zones. The system-defined time zones are listed in Table 27, System-defined Time Zones, on page 228. For user-defined time zones, the zone and the UTC offset must be specified. The no form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a dst-zone command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.  

Default  
zone utc - The time zone is set for Coordinated Universal Time (UTC).

Parameters  

```
std-zone-name — The standard time zone name. The standard name must be a system-defined zone in Table 27. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining start-date, end-date and offset parameters need to be provided unless it is necessary to override the system defaults for the time zone.  

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the switchover to summer time to occur automatically; configuring the dst-zone parameter is not required.  

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.
```

```
non-std-zone-name — The non-standard time zone name.
```

Values  

```
A user-defined value can be up to 4 characters or one of the following values: GMT, BST, IST, WET, WEST, CET, CEST, EET, EEST, MSK, MSD, AST, ADT, EST, EDT, ET, CST, CDT, CT, MST, MDT, MT, PST, PDT, PT, HST, AKST, AKDT, WAST, CAST, EAST
```

```
nh [:mm] — The hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the minutes-offset must be specified. For example, the time zone in Pirlanngimi, Australia UTC + 9.5 hours.
```

Default  
hours: 0
minutes: 0

Values  

```
hours: -11 — 11
minutes: 0 — 59
```
**System Synchronization Configuration Commands**

**sync-if-timing**

**Syntax**  
sync-if-timing

**Context**  
config>system

**Description**  
This command creates or edits the context to create or modify timing reference parameters. This command is not enabled in the 7750 SR-1.

**Default**  
Disabled (The ref-order must be specified in order for this command to be enabled.)

**abort**

**Syntax**  
abort

**Context**  
config>system>sync-if-timing

**Description**  
This command is required to discard changes that have been made to the synchronous interface timing configuration during a session.

**Default**  
No default

**begin**

**Syntax**  
begin

**Context**  
config>system>sync-if-timing

**Description**  
This command is required in order to enter the mode to create or edit the system synchronous interface timing configuration.

**Default**  
No default

**bits**

**Syntax**  
bits

**Context**  
config>system>sync-if-timing

**Description**  
This command enables the context to configure parameters for the Building Integrated Timing Supply (BITS). The settings specified under this context apply to both the BITS input and BITS output ports and to both the bits1 and bits2 ports on the 7750 SR-c4.
Default  disabled

commit

Syntax  commit
Context  config>system>sync-if-timing
Description  This command saves changes made to the system synchronous interface timing configuration.
Default  No default

interface-type

Syntax  interface-type {ds1 [(esf | sf)] | e1 [(pcm30crc | pcm31crc)]}
no interface-type
Context  config>system>sync-if-timing>ref1
config>system>sync-if-timing>ref2
Description  This command configures the Building Integrated Timing Source (BITS) timing reference.
The no form of the command reverts to the default configuration.
Default  ds1 esf
Parameters  

- **ds1 esf** — Specifies Extended Super Frame (ESF). This is a framing type used on DS1 circuits that consists of 24 192-bit frames, The 193rd bit provides timing and other functions.

- **ds1 sf** — Specifies Super Frame (SF), also called D4 framing. This is a common framing type used on DS1 circuits. SF consists of 12 192-bit frames. The 193rd bit provides error checking and other functions. ESF supersedes SF.

- **e1 pcm30crc** — Specifies the pulse code modulation (PCM) type. PCM30CRC uses PCM to separate the signal into 30 user channels with CRC protection.

- **e1 pcm31crc** — Specifies the pulse code modulation (PCM) type. PCM31CRC uses PCM to separate the signal into 31 user channels with CRC protection.

bits-interface-type

Syntax  bits-interface-type {ds1 [(esf | sf)] | e1 [(pcm30crc | pcm31crc)]}
no bits-interface-type
Context  config>system>sync-if-timing>bits
Description  This command configures the Building Integrated Timing Source (BITS) timing reference.
The no form of the command reverts to the default configuration.

#### line-length

| Syntax     | line-length {110,220,330,440,550,660} |
| Context    | config>system>sync-if-timing>bits |
| Description| This command configures the line-length parameter of the BITS output. This is the distance in feet between the network element and the office clock (BITS/SSU). There are two possible BITS-out interfaces, one for |
each CPM. They are configured together, but they are displayed separately in the show command. This command is only applicable when the interface-type is DS1.

**Default** 110

**Parameters**

- **110** — Distance is from 0 to 110 feet
- **220** — Distance is from 110 to 220 feet
- **330** — Distance is from 220 to 330 feet
- **440** — Distance is from 330 to 440 feet
- **550** — Distance is from 440 to 550 feet
- **660** — Distance is from 550 to 660 feet

**source**

**Syntax** `source (line-ref|internal-clock)`

**Context** `config>system>sync-if-timing>bits>output`

**Description** This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output.

**Parameters**

- **line-ref** — Specifies that the BITS output timing is selected from either the first or second line reference input's timing, without any filtering.
- **internal-clock** — Specifies that the BITS output timing is driven from the system timing.

**ssm-bit**

**Syntax** `ssm-bit sa-bit`

**Context** `config>system>sync-if-timing>bits`  
`config>system>sync-if-timing>ref1`  
`config>system>sync-if-timing>ref2`

**Description** This command configures which sa-bit to use for conveying SSM information when the interface-type is E1.

**Default** 8

**Parameters**

- **sa-bit** — Specifies the sa-bit value.

  **Values** 4–8

**ql-override**
System Synchronization Configuration Commands

**Syntax**

```
ql-override {prs|stu|st2|tnc|st3e|st3|eec1|sec|prc|ssu-a|ssu-b|eec2}
no ql-override
```

**Context**

```
config>system>sync-if-timing>bits
config>system>sync-if-timing>ptp
config>system>sync-if-timing>ref1
config>system>sync-if-timing>ref2
```

**Description**

This command configures the QL value to be used for the reference for SETS input selection and BITS output. This value overrides any value received by that reference's SSM process.

**Default**

no ql-override

**Parameters**

- **prs** — SONET Primary Reference Source Traceable
- **stu** — SONET Synchronous Traceability Unknown
- **st2** — SONET Stratum 2 Traceable
- **tnc** — SONET Transit Node Clock Traceable
- **st3e** — SONET Stratum 3E Traceable
- **st3** — SONET Stratum 3 Traceable
- **eec1** — Ethernet Equipment Clock Option 1 Traceable (sdh)
- **eec2** — Ethernet Equipment Clock Option 2 Traceable (sonet)
- **prc** — SDH Primary Reference Clock Traceable
- **ssu-a** — SDH Primary Level Synchronization Supply Unit Traceable
- **ssu-b** — SDH Second Level Synchronization Supply Unit Traceable
- **sec** — SDH Synchronous Equipment Clock Traceable

**ql-selection**

**Syntax**

```
[no] ql-selection
```

**Context**

```
config>system>sync-if-timing
```

**Description**

When enabled the selection of system timing reference and BITS output timing reference takes into account quality level. This command turns -on or turns-off SSM encoding as a means of timing reference selection.

**Default**

no ql-selection

**ptp**
Syntax     ptp
Context     config>system>sync-if-timing

Description This command enables the context to configure parameters for system timing via IEEE 1588-2008, Precision Time Protocol.

This command is only available on the systems supporting the 1588-2008 frequency recovery engine. The PTP timing reference can only be 'no shutdown' if the PTP protocol is 'no shutdown'.

ref-order

Syntax     ref-order first second [third [fourth]]
            no ref-order

Context     config>system>sync-if-timing

Description The synchronous equipment timing subsystem can lock to different timing reference inputs, those specified in the ref1, ref2, bits and ptp command configuration. This command organizes the priority order of the timing references.

If a reference source is disabled, then the clock from the next reference source as defined by ref-order is used. If all reference sources are disabled, then clocking is derived from a local oscillator.

Note that if a sync-if-timing reference is linked to a source port that is operationally down, the port is no longer qualified as a valid reference.

For 7750 SR systems with two SF/CPM modules, the system distinguishes between the BITS inputs on the active and standby CPMs. The active CPM will use its BITS input port providing that port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the standby CPM as the next priority reference. For example, the normal ref-order of “bits ref1 ref2” will actually be bits (active CPM), followed by bits (standby CPM), followed by ref1, followed by ref2.

For 7750 SR-c4 systems, the system distinguishes between the two BITS inputs on the CFM. The CFM will use its BITS input port “bits1” providing that port is qualified. If port “bits1” is not qualified, then the CFM will use the BITS input port “bits2” as the next priority reference. For example, the normal ref-order of “bits ref1 ref2” will actually be bits1 followed by bits2, followed by ref1, followed by ref2.

The no form of the command resets the reference order to the default values.

The bits option is not supported on the 7750 SR-c12 chassis.

Default     bits ref1 ref2 ptp

first — Specifies the first timing reference to use in the reference order sequence.

Values      ref1, ref2, bits, ptp

second — Specifies the second timing reference to use in the reference order sequence.

Values      ref1, ref2, bits, ptp

third — Specifies the third timing reference to use in the reference order sequence.

Values      ref1, ref2, bits, ptp

fourth — Specifies the fourth timing reference to use in the reference order sequence.

Values      ref1, ref2, bits, ptp
Values ref1, ref2, bits, ptp

ref1

Syntax ref1

Context config>system>sync-if-timing

Description This command enables the context to configure parameters for the first timing reference.

Parameters source-port — Configure the source port for the first timing reference.

ref2

Syntax ref2

Context config>system>sync-if-timing

Description This command enables the context to configure parameters for the second timing reference.

Parameters source-port — Configure the source port for the first timing reference.

Note: ref1 and ref2 cannot be configured on the same MDA/CMA for the SR-c12 nor the SR-c4.

7750 Model Ref1/Slots

<table>
<thead>
<tr>
<th>7750 Model</th>
<th>Ref1/Slots</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR-1</td>
<td>Not enabled</td>
</tr>
<tr>
<td>SR-7</td>
<td>1 — 2</td>
</tr>
<tr>
<td>SR-12</td>
<td>1 — 5</td>
</tr>
<tr>
<td>SR-c12</td>
<td>No restriction</td>
</tr>
<tr>
<td>SR-c4</td>
<td>No restriction</td>
</tr>
</tbody>
</table>

Note: ref1 and ref2 cannot be configured on the same MDA/CMA for the SR-c12 nor the SR-c4.
**Syntax**  
ref2

**Context**  
config>system>sync-if-timing

**Description**  
This command enables the context to configure parameters for the second timing reference. The timing reference for ref2 must be specified for the following chassis slots.

Note: For the SR-c12 and SR-c4, the ref1 and ref2 cannot both be from the same slot.

<table>
<thead>
<tr>
<th>7750 Model</th>
<th>Ref2/Slots</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR-1</td>
<td>Not enabled</td>
</tr>
<tr>
<td>SR-7</td>
<td>3 — 5</td>
</tr>
<tr>
<td>SR-12</td>
<td>6 — 10</td>
</tr>
<tr>
<td>SR-c12</td>
<td>No restriction</td>
</tr>
<tr>
<td>SR-c4</td>
<td>No restriction</td>
</tr>
</tbody>
</table>

Note: ref1 and ref2 cannot be configured on the same MDA/CMA for the SR-c12 nor the SR-c4.
**revert**

**Syntax**

[no] revert

**Context**

config>system>sync-if-timing

**Description**

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

**Default**

no revert

---

**source-bits**

**Syntax**

source-bits slot/mda

no source-bits

**Context**

config>system>sync-if-timing>ref1
cfg>system>sync-if-timing>ref2

**Description**

This command configures the source bits for the first (ref1) or second (ref2) timing reference. Note that this command is only applicable to the 7750 SR-c12 chassis.

**Parameters**

*slot/mda* — Specifies the chassis slot and MDA containing the BITS port to be used as one of the two timing reference sources in the system timing subsystem.

**Values**

- **slot:** 1
- **mda:** 1 — 12

---

**source-port**
Syntax  
source-port  *port-id*
no source-port

Context  
config>system>sync-if-timing>ref1
config>system>sync-if-timing>ref2

Description  
This command configures the source port for timing reference *ref1* or *ref2*. If the port is unavailable or the link is down, then the reference sources are re-evaluated according to the reference order configured in the *ref-order* command.

In addition to physical port, T1 or E1 channels on a Channelized OC3/OC12/STM1/STM4 Circuit Emulation Service port can be specified if they are using adaptive timing.

The timing reference for *ref1* and *ref2* must be specified for ports in the following chassis slots:

<table>
<thead>
<tr>
<th>7750 Model</th>
<th>Ref1/Slots</th>
<th>Ref2/Slots</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR-1</td>
<td>Not enabled</td>
<td>Not enabled</td>
</tr>
<tr>
<td>SR-7</td>
<td>1 — 2</td>
<td>3 — 5</td>
</tr>
<tr>
<td>SR-12</td>
<td>1 — 5</td>
<td>6 — 10</td>
</tr>
<tr>
<td>SR-c12</td>
<td>No restriction</td>
<td>No restriction</td>
</tr>
<tr>
<td>SR-c4</td>
<td>No restriction</td>
<td>No restriction</td>
</tr>
</tbody>
</table>

Note that *ref1* and *ref2* cannot be configured on the same MDA/CMA for the SR-c12 nor the SR-c4.

Parameters  
*port-id* — Identify the physical port in the *slot/mda/port* format.
**Generic Commands**

**shutdown**

**Syntax**  
[no] shutdown

**Context**  
config>system>time>sntp  
config>system>sync-if-timing>ref1  
config>system>sync-if-timing>ref2  
config>system>sync-if-timing>bits  
config>system>sync-if-timing>ptp  
config>system>sync-if-timing>bits<input>  
config>system>sync-if-timing>bits>output

**Description**  
This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The no form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the shutdown and no shutdown states are always indicated in system generated configuration files.

The no form of the command places an entity in an administratively enabled state.

**description**

**Syntax**  
description description-string  
no description

**Context**  
config>system>persistence>sub-mgmt  
config>system>persistence>dhcp-server

**Description**  
The command allows the user to configure a string that can be used to identify the purpose of this event. This is an optional parameter and can be 80 characters long. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.
System Administration Commands

admin

Syntax admin
Context <ROOT>
Description The context to configure administrative system commands. Only authorized users can execute the commands in the admin context.
Default none

application-assurance

Syntax application-assurance
Context admin
Description This command enables the context to perform application-assurance operations.

upgrade

Syntax upgrade
Context admin>app-assure
Description This command loads a new protocol list from the isa-aa.tim file into the CPM. Note that an ISA-AA reboot is required.

debug-save

Syntax debug-save file-url
Context admin
Description This command saves existing debug configuration. Debug configurations are not preserved in configuration saves.
Default none
Parameters

Values

file-url: local-url | remote-url: 255 chars max
local-url: [cflash-id][file-path], 200 chars max, including the cflash-id
System Administration Commands

remote-url: \{ftp://|login:pswd@remote-locn/\}[[file-path]
remote-locn [ hostname | ipv4-address | [ipv6-address]]
ipv4-address: a.b.c.d
ipv6-address: - x:x:x:x:x:x:x:x[-interface]
           x:x:x:x:x:d.d.d.d[-interface]
x - [0..FFFF]H
d - [0..255]D
interface - 32 chars max, for link local addresses
255 chars max, directory length 99 chars max each
cflash-id: cf1:, cf1-A:,cf1-B:,cf2: ,cf2-A:,cf2-B:,cf3:,cf3-A:,cf3-B:

disconnect

Syntax disconnect {address ip-address | username user-name | console | telnet | ftp | ssh}

Context admin

Description This command disconnects a user from a console, Telnet, FTP, or SSH session.

If any of the console, Telnet, FTP, or SSH options are specified, then only the respective console, Telnet,
FTP, or SSH sessions are affected.

If no console, Telnet, FTP, or SSH options are specified, then all sessions from the IP address or from the
specified user are disconnected.

Any task that the user is executing is terminated. FTP files accessed by the user will not be removed.

A major severity security log event is created specifying what was terminated and by whom.

Default none — No disconnect options are configured.

Parameters address ip-address — The IP address to disconnect, specified in dotted decimal notation.

Values ipv4-address: a.b.c.d
ipv6-address: - x:x:x:x:x:x:x:x[-interface]
            x:x:x:x:x:d.d.d.d[-interface]
x - [0..FFFF]H
d - [0..255]D

username user-name — The name of the user.

console — Disconnects the console session.

telnet — Disconnects the Telnet session.

ftp — Disconnects the FTP session.

ssh — Disconnects the SSH session.

display-config
### Syntax
```plaintext
display-config [detail | index]
```

### Context
admin

### Description
This command displays the system’s running configuration.

By default, only non-default settings are displayed.

Specifying the `detail` option displays all default and non-default configuration parameters.

### Parameters
- **detail** — Displays default and non-default configuration parameters.
- **index** — Displays only persistent-indices.

---

### Syntax
```plaintext
reboot [active | standby | upgrade] [now]
```

### Context
admin

### Description
This command reboots the router including redundant CPMs and all IOMs or upgrades the boot ROMs.

If no options are specified, the user is prompted to confirm the reboot operation. For example:

```
ALA-1>admin# reboot
Are you sure you want to reboot (y/n)?
```

If the `now` option is specified, boot confirmation messages appear.

### Parameters
- **active** — Keyword to reboot the active CPM.
  - **Default** active
- **standby** — Keyword to reboot the standby CPM.
  - **Default** active
- **upgrade** — Enables card firmware to be upgraded during chassis reboot. The 7750 SR OS and the boot.ldr support functionality to perform automatic firmware upgrades on CPMs and IOM cards. The automatic upgrade must be enabled in the 7750 SR OS Command Line Interface (CLI) when rebooting the system.
  
  When the `upgrade` keyword is specified, a chassis flag is set for the BOOT Loader (boot.ldr) and on the subsequent boot of the 7750 SR OS on the chassis, any firmware images on CPMs or IOMs requiring upgrading will be upgraded automatically.

  If an 7750 SR is rebooted with the `admin reboot` command (without the `upgrade` keyword), the firmware images are left intact.

  Any CPMs that are installed in the chassis will be upgraded automatically. For example, if a card is inserted with down revision firmware as a result of a card hot swap with the latest OS version running, the firmware on the card will be automatically upgraded before the card is brought online.

  If the card firmware is upgraded automatically, a chassis cardUpgraded (event 2032) log event is generated. The corresponding SNMP trap for this log event is tmnxEqCardFirmwareUpgraded.

  During any firmware upgrade, automatic or manual, it is imperative that during the upgrade procedure:
  - Power must NOT be switched off or interrupted.
• The system must NOT be reset.
• No cards are inserted or removed.

Any of the above conditions may render cards inoperable requiring a return of the card for resolution.

The time required to upgrade the firmware on the cards in the chassis depends on the number of cards to be upgraded. On system reboot, the firmware upgrades can take from approximately 3 minutes for a minimally loaded 7750 SR-Series to 8 minutes for a fully loaded 7750 SR-12 chassis after which the configuration file will be loaded. The progress of the firmware upgrades can be monitored at the console. Inserting a single card requiring a firmware upgrade in a running system generally takes less than 2 minutes before the card becomes operationally up.

**now** — Forces a reboot of the router immediately without an interactive confirmation.

### save

**Syntax**

```
save [file-url] [detail] [index]
```

**Context**

```
admin
```

**Description**

This command saves the running configuration to a configuration file. For example:

```
A:AL-A-1>admin# save ftp://test:test@192.168.x.xx/.100.cfg
Saving configuration .............Completed.
```

By default, the running configuration is saved to the primary configuration file.

**Parameters**

- **file-url** — The file URL location to save the configuration file.

  **Default**
  
  The primary configuration file location.

  **Values**
  
  file-url:
  
  - local-url: 255 chars max
  
  - remote-url: $ftp://login:pswd@remote-locn/[file-path]$

  - remote-locn: $hostname$ | ipv4-address | [ipv6-address]

  - ipv4-address a.b.c.d

  - ipv6-address x:x:x:x:x:x:x[-interface]

  - x: [0..FFFF]H

  - d: [0..255]D

  - interface - 32 chars max, for link local addresses

  - 255 chars max, directory length 99 chars max each

  - cflash-id: cf1:, cf1-A:, cf1-B:, cf2: , cf2-A:, cf2-B:, cf3: , cf3-A:, cf3-B:

- **detail** — Saves both default and non-default configuration parameters.

- **index** — Forces a save of the persistent index file regardless of the persistent status in the BOF file. The index option can also be used to avoid an additional boot required while changing your system to use the persistence indices.
enable-tech

Syntax  [no] enable-tech
Context   admin
Description  This command enables the shell and kernel commands.
            NOTE: This command should only be used with authorized direction from the Alcatel-Lucent Technical Assistance Center (TAC).

radius-discovery

Syntax   radius-discovery
Context   admin
Description  This command performs RADIUS discovery operations.

force-discover

Syntax   force-discover [svc-id service-id]
Context   admin>radius-discovery
Description  When enabled, the server is immediately contacted to attempt discovery.
Parameters  svc-id service-id — Specifies an existing service ID.
            Values  1 — 2147483648 | svc-name, up to 64 char max

tech-support

Syntax   tech-support file-url
Context   admin
Description  This command creates a system core dump.
            NOTE: This command should only be used with authorized direction from the Alcatel-Lucent Technical Assistance Center (TAC).
            file-url — The file URL location to save the binary file.
            file url:  local-url | remote-url: 255 chars max
            local-url:  [cflash-id][file-path], 200 chars max, including the cflash-id directory length, 99 chars max each
            remote-url:  [{ftp://} login:pswd@remote-locn][file-path]
            remote-locn [ hostname | ipv4-address | [ipv6-address] ]
view

Syntax  view {bootup-cfg|active-cfg|candidate-cfg|latest-rb|<checkpoint-id>|rescue}

Context  <ROOT>

Description  The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the admin context.

Default  none

Parameters  bootup-cfg — Specifies the bootup configuration.
active-cfg — Specifies current running configuration.
candidate-cfg — Specifies candidate configuration.
latest-rb — Specifies the latest configuration.
checkpoint-id — Specifies a specific checkpoint file configuration.
rescue — Specifies a rescue checkpoint configuration.
Persistence Commands

persistence

Syntax  [no] persistence
Context  config>system
Description  This command enables the context to configure persistence parameters on the system.

The persistence feature enables state on information learned through DHCP snooping across reboots to be retained. This information includes data such as the IP address and MAC binding information, lease-length information, and ingress sap information (required for VPLS snooping to identify the ingress interface).

If persistence is enabled when there are no DHCP relay or snooping commands enabled, it will simply create an empty file.

Default  no persistence

dhcp-server

Syntax  dhcp-server
Context  config>system>persistence
Description  This command configures DHCP server persistence parameters.

subscriber-mgmt

Syntax  subscriber-mgmt
Context  config>system>persistence
Description  This command configures subscriber management persistence parameters.
### location

**Syntax**

```plaintext
location [cf1: | cf2: | cf3:]
no location
```

**Context**

```plaintext
config>system>persistence>sub-mgmt
config>system>persistence>dhcp-server
```

**Description**

This command instructs the system where to write the file. The name of the file is: dhcp-persistence.db. On boot the system scans the file systems looking for dhcp-persistence.db, if it finds it it starts to load it.

In the subscriber management context, the location specifies the flash device on a CPM card where the data for handling subscriber management persistency is stored.

The `no` form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

**Default**

no location
PTP Commands

ptp

Syntax  ptp
Context  config>system

Description  This command enables the context to configure parameters for IEEE 1588-2008, Precision Time Protocol. This command is only available on the control assemblies that support 1588.

shutdown

Syntax  [no] shutdown
Context  config>system>ptp

Description  This command disables or enables the PTP protocol. If PTP is disabled, the router will not transmit any PTP packets, and will ignore all received PTP packets. If the user attempts execute a no shutdown command on hardware that does not support PTP, an alarm will be raised to indicate limited capabilities.

When ptp is shutdown, the PTP slave port is not operational. It shall not be considered as a source for system timing.

Default  shutdown

clock-type

Syntax  clock-type ordinary (master | slave)
Context  config>system>ptp

Description  This command configures the type of clock. The clock-type can only be changed when ptp is shutdown. The clock-type cannot be changed to master-only if PTP reference is no shutdown. In addition, clock-type cannot be changed to master-only if there are peers configured.

Default  ordinary slave

Parameters  ordinary master — The system is a grandmaster clock in the master-slave hierarchy. The system provides timing to multiple slave clocks in the network.

ordinary slave — The system is always a slave clock in the master-slave hierarchy. The system derives its timing from one or more master clocks in the network.
PTP Commands

**domain**

Syntax: `[no] domain domain`

Context: config>system>ptp

Description: This command configures the PTP domain.

The `no` form of the command reverts to the default configuration. Note some profiles may require a domain number in a restricted range. It is up to the operator to ensure the value aligns with what is expected within the profile.

Domain cannot be changed unless PTP is shutdown.

Default: 4

Parameters:

- `domain` — The PTP domain.

Values: 0 — 255

**network-type**

Syntax: network-type {sdh | sonet}

Context: config>system>ptp

Description: This command configures the codeset to be used for the encoding of QL values into PTP clockClass values when the profile is configured for G.8265.1. The codeset is defined in Table 1/G.8265.1. This setting only applies to the range of values observed in the clockClass values transmitted out of the node in Announce messages. The 7750 will support the reception of any valid value in Table 1/G.8265.1

Default: sdh

Parameters:

- `sdh` — Specifies the values used on a G.781 Option 1 compliant network.
- `sonet` — Specifies the values used on a G.781 Option 2 compliant network

**priority1**

Syntax: `[no] priority1 priority`

Context: config>system>ptp

This command configures the priority1 value of the local clock.

Note: This value is used for the value to advertise in the Announce messages.

The `no` form of the command reverts to the default configuration.

Default: 128

Parameters:

- `priority` — Specifies the value of the priority1 field.

Values: 0 — 255
priority2

**Syntax**  
`[no] priority2 priority`

**Context**  
`config>system>ptp`

This command configures the priority2 value of the local clock.

Note: This value is used for the value to advertise in the Announce messages.

The no form of the command reverts to the default configuration.

**Default**  
128

**Parameters**  
`priority` — Specifies the value of the priority2 field.

- **Values**  
  - `0 — 255`

peer

**Syntax**  
`peer ip-address`

**Context**  
`config>system>ptp`

This command configures a remote PTP peer. It provides the context to configure parameters for the remote PTP peer.

Up to two remote PTP peers may be configured.

The no form of the command deletes the specified peer.

If the clock-type is ordinary slave, and PTP is no shutdown, the last peer cannot be deleted. This prevents the user from having PTP enabled without any peer configured & enabled.

Peers cannot be created when the clock-type is ordinary master.

**Default**  
none

**Parameters**  
`ip-address` — The IP address of the remote peer.

- **Values**  
  - `ipv4-address a.b.c.d`

priority

**Syntax**  
`priority local_priority`

**Context**  
`configure>system>ptp>peer`

This command configures the local priority used to choose between PTP masters in the best master clock algorithm (BMCA). The value 1 is the highest priority and 255 is the lowest priority.

**Default**  
128

**Parameters**  
`local_priority` — Specifies the value of the local priority.
shutdown

Syntax  [no] shutdown

Context  configure>system>ptp>peer

This command disables or enables a specific PTP peer. Shutting down a peer sends cancel unicast negotiation messages on any established unicast sessions. When shutdown, all received packets from the peer are ignored.

If the clock-type is ordinary slave, and PTP is no shutdown, the last enabled peer cannot be shutdown. This prevents the user from having PTP enabled without any peer configured & enabled

Default  no shutdown
Redundancy Commands

redundancy

Syntax redundancy
Context admin
    config
Description This command enters the context to allow the user to perform redundancy operations.

cert-sync

Syntax [no] cert-sync
Context admin>redundancy
Description This command automatically synchronizes the certificate/CRL/key automatically when importing or generating (for the key); also, if there is new CF card inserted into slot3 into backup CPM, the system will sync the whole system-pki directory from the active CPM.
Default none

rollback-sync

Syntax no rollback-sync
Context admin>redundancy
Description This command copies the entire set of rollback checkpoint files from the active CPM CF to the inactive CPM CF.
Default None.

synchronize

Syntax synchronize {boot-env|config}
    no synchronize
Context admin>redundancy
Description This command performs a synchronization of the standby CPM’s images and/or configuration files to the active CPM. Either the boot-env or config parameter must be specified.
In the `admin>redundancy` context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

Certificate synchronization is supported. With the `cert` parameter configured, the system will sync the `system-pki` directory from active CPM to the backup CPM.

The `no` form of the command removes the parameter from the configuration.

**Default** none  
**Parameters**  
- `boot-env` — Synchronizes all files required for the boot process (loader, BOF, images, and config).  
- `config` — Synchronizes only the primary, secondary, and tertiary configuration files.

**Syntax** `force-switchover [now]`  
**Context** `admin>redundancy`  
**Description** This command forces a switchover to the standby CPM card. The primary CPM reloads its software image and becomes the secondary CPM.

**Parameters**  
- `now` — Forces the switchover to the redundant CPM card immediately.

**Syntax** `bgp-multi-homing`  
**Context** `config>redundancy`  
**Description** This command configures BGP multi-homing parameters.

**Syntax** `boot-timer`
Syntax boot-timer seconds
no boot-timer

Context config>redundancy>bgp-multi-homing

Description This command configures the time the service manager waits after a node reboot before running the DF election algorithm. The boot-timer value should be configured to allow for the BGP sessions to come up and for the NLRI information to be refreshed/exchanged.

The no form of the command reverts the default.

Default no boot-timer

Parameters seconds — Specifies the BGP multi-homing boot-timer in seconds.

Values 1 — 100

site-activation-timer

Syntax site-activation-timer seconds
no site-activation-timer

Context config>redundancy>bgp-multi-homing

Description This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following events occurs if the site is operationally up:

• Manual site activation using the no shutdown command at site-id level or at member object(s) level (SAP(s) or PW(s))
• Site activation after a failure

Default no site-activation-timer

Parameters seconds — Specifies the standby status in seconds.

Values 1 — 100

Default 2

synchronize

Syntax synchronize {boot-env | config}

Context config>redundancy

Description This command performs a synchronization of the standby CPM’s images and/or config files to the active CPM. Either the boot-env or config parameter must be specified.

In the config>redundancy context, this command performs an automatically triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active
CPM, it is important to ensure that the active and standby CPMs have identical operational parameters. This includes the saved configuration, CPM and IOM images. The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

### Default

**enabled**

### Parameters

- **boot-env** — Synchronizes all files required for the boot process (loader, BOF, images, and config).
- **config** — Synchronize only the primary, secondary, and tertiary configuration files.

### Default

**config**

### synchronize

#### Syntax

```
synchronize {boot-env | config}
```

#### Context

```
admin>redundancy
```

#### Description

This command performs a synchronization of the standby CPM’s images and/or config files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

#### Default

**none**

### Parameters

- **boot-env** — Synchronizes all files required for the boot process (loader, BOF, images, and configuration files).
- **config** — Synchronize only the primary, secondary, and tertiary configuration files.
multi-chassis

Syntax  multi-chassis
Context  config>redundancy
Description  This command enables the context to configure multi-chassis parameters.

peer-name

Syntax  peer-name name
        no peer-name
Context  config>redundancy>multi-chassis>peer
Description  This command specifies a peer name.
Parameters  name — The string may be up to 32 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

rollback-sync

Syntax  [no] rollback-sync
Context  config>redundancy
Description  The operator can enable automatic synchronization of rollback checkpoint files between the active CPM and inactive CPM. When this automatic synchronization is enabled, a rollback save will cause the new checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the ONE new checkpoint file to be copied to both CFs (the other 9 checkpoints are not automatically copied from active to standby but that can be done manually with "admin red rollback-sync").

Automatic synchronization of rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback"). Synchronization is not done if the rollback-location is remote.

Note that “config red sync {boot-env|config}" and “admin red sync {boot-env|config}" do not apply to rollback checkpoint files. These commands do not manually or automatically sync rollback checkpoint files. The dedicated rollback-sync commands must be used to sync rollback checkpoint files.

source-address
Redundancy Commands

Syntax   source-address ip-address
        no source-address

Context  config>redundancy>multi-chassis>peer

Description  This command specifies the source address used to communicate with the multi-chassis peer.

Parameters  ip-address — Specifies the source address used to communicate with the multi-chassis peer.

sync

Syntax   [no] sync

Context  config>redundancy>multi-chassis>peer

Description  This command enables the context to configure synchronization parameters.

igmp

Syntax   [no] igmp

Context  config>redundancy>multi-chassis>peer>sync

Description  This command specifies whether IGMP protocol information should be synchronized with the multi-chassis peer.

Default  no igmp

igmp-snooping

Syntax   [no] igmp-snooping

Context  config>redundancy>multi-chassis>peer>sync

Description  This command specifies whether IGMP snooping information should be synchronized with the multi-chassis peer.

Default  no igmp-snooping

local-dhcp-server
Syntax | `no local-dhcp-server`  
Context | `config>redundancy>multi-chassis>peer>sync`  
Description | This command synchronizes DHCP server information.

**mld-snooping**

Syntax | `[no] mld-snooping`  
Context | `config>redundancy>multi-chassis>peer>sync`  
Description | This command synchronizes MLD Snooping information.

**port**

Syntax | `port [port-id | lag-id] [sync-tag sync-tag]`  
`no port [port-id | lag-id]`  
Context | `config>redundancy>multi-chassis>peer>sync`  
Description | This command specifies the port to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing this port with the multi-chassis peer.
Parameters | `port-id` — Specifies the port to be synchronized with the multi-chassis peer.  
`lag-id` — Specifies the LAG ID to be synchronized with the multi-chassis peer.  
`sync-tag sync-tag` — Specifies a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

**range**

Syntax | `range encap-range sync-tag sync-tag`  
`no range encap-range`  
Context | `config>redundancy>multi-chassis>peer>sync>port`  
Description | This command configures a range of encapsulation values.
Parameters | `encap-range` — Specifies a range of encapsulation values on a port to be synchronized with a multi-chassis peer.  
Values | Dot1Q start-vlan-end-vlan  
QinQ Q1.start-vlan-Q1.end-vlan  
 sync-tag sync-tag — Specifies a synchronization tag up to 32 characters in length to be used while synchronizing this encapsulation value range with the multi-chassis peer.
Redundancy Commands

srrp

Syntax  [no] srrp
Context config>redundancy>multi-chassis>peer>sync
Description This command specifies whether subscriber routed redundancy protocol (SRRP) information should be synchronized with the multi-chassis peer.
Default no srrp

sub-mgmt

Syntax  [no] sub-mgmt
Context config>redundancy>multi-chassis>peer>sync
Description This command specifies whether subscriber management information should be synchronized with the multi-chassis peer.
Default no sub-mgmt
Peer Commands

**peer**

Syntax:  
```
[no] peer ip-address
```

Context:  
```
config>redundancy>multi-chassis
```

Description:  
This command configures a multi-chassis redundancy peer.

Parameters:  
- `ip-address` — Specifies a peer IP address. Multicast address are not allowed.

**authentication-key**

Syntax:  
```
authentication-key [authentication-key | hash-key] [hash | hash2]
```

Context:  
```
config>redundancy>multi-chassis>peer
```

Description:  
This command configures the authentication key used between this node and the multi-chassis peer. The authentication key can be any combination of letters or numbers.

Parameters:  
- `authentication-key` — Specifies the authentication key. Allowed values are any string up to 20 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.
- `hash-key` — The hash key. The key can be any combination of ASCII characters up to 33 (hash1-key) or 55 (hash2-key) characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).
- `hash` — Specifies the key is entered in an encrypted form. If the hash or hash2 parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash or hash2 parameter specified.
- `hash2` — Specifies the key is entered in a more complex encrypted form that involves more variables then the key value alone, this means that hash2 encrypted variable cannot be copied and pasted. If the hash or hash2 parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash or hash2 parameter specified.
**MC Endpoint Commands**

**mc-endpoint**

**Syntax**  
[no] mc-endpoint

**Context**  
config>redundancy>multi-chassis>peer

**Description**  
This command specifies that the endpoint is multi-chassis. This value should be the same on both MC-EP peers for the pseudowires that must be part of the same group. The no form of this command removes the endpoint from the MC-EP. Single chassis behavior applies.

**bfd-enable**

**Syntax**  
[no] bfd-enable

**Context**  
config>redundancy>multi-chassis>peer>mc-ep  
config>router>rsdp  
config>router:bgp  
config>router:bgp>group  
config>router:bgp>group>neighbor  
config>redundancy>multi-chassis>peer>mc-ep

**Description**  
This command enables the use of bi-directional forwarding (BFD) to control the state of the associated protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface.

The no form of this command disables BFD.

**Default**  
no bfd-enable

**boot-timer**

**Syntax**  
boot-timer interval  
no boot-timer

**Context**  
config>redundancy>multi-chassis>peer>mc-ep

**Description**  
This command configures the boot timer interval. This command applies only when the node reboots. It specifies the time the MC-EP protocol keeps trying to establish a connection before assuming a failure of the remote peer. This is different from the keep-alives mechanism which is used just after the peer-peer communication was established. After this time interval passed all the mc-endpoints configured under services will revert to single chassis behavior, activating the best local PW.

The no form of this command sets the interval to default.
Default 300

Parameters

interval — Specifies the boot timer interval.

Values 1 — 600

hold-on-neighbor-failure

Syntax

hold-on-neighbor-failure multiplier
no hold-on-neighbor-failure

Context

config>redundancy>multi-chassis>peer>mc-ep

Description

This command specifies the number of keep-alive intervals that the local node will wait for packets from the MC-EP peer before assuming failure. After this time interval passed the all the mc-endpoints configured under services will revert to single chassis behavior, activating the best local pseudowire.

The no form of this command sets the multiplier to default value

Default 3

Parameters

multiplier — Specifies the hold time applied on neighbor failure.

Values 2 — 25

keep-alive-interval

Syntax

keep-alive-interval interval
no keep-alive-interval

Context

config>redundancy>multi-chassis>peer>mc-ep

Description

This command sets the interval at which keep-alive messages are exchanged between two systems participating in MC-EP when bfd is not enabled or is down. These fast keep-alive messages are used to determine remote-node failure and the interval is set in deci-seconds.

The no form of this command sets the interval to default value

Default 5 (0.5s)

Parameters

interval — The time interval expressed in deci-seconds.

Values 5 — 500 (tenths of a second)
passive-mode

Syntax  
[no] passive-mode

Context  
config>redundancy>multi-chassis>peer>mc-ep

Description  
This command configures the passive mode behavior for the MC-EP protocol. When in passive mode the MC-EP pair will be dormant until two of the pseudowires in a MC-EP will be signaled as active by the remote PEs, being assumed that the remote pair is configured with regular MC-EP. As soon as more than one pseudowire is active, dormant MC-EP pair will activate. It will use the regular exchange to select the best pseudowire between the active ones and it will block the Rx and Tx directions of the other pseudowires.

The no form of this command will disable the passive mode behavior.

Default  
no passive-mode

system-priority

Syntax  
system-priority value
no system-priority

Context  
config>redundancy>multi-chassis>peer>mc-ep

Description  
This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The no form of this command sets the system priority to default

Default  
no system-priority

Parameters  
value — Specifies the priority assigned to the local MC-EP peer.

Values  
1 — 255
MC-LAG Commands

mc-lag

Syntax:  [no] mc-lag

Context:  config>redundancy>multi-chassis>peer>mc-lag

Description:  This command enables the context to configure multi-chassis LAG operations and related parameters. The no form of this command administratively disables multi-chassis LAG. MC-LAG can only be issued only when mc-lag is shutdown.

hold-on-neighbor-failure

Syntax:  hold-on-neighbor-failure multiplier
           no hold-on-neighbor-failure

Context:  config>redundancy>multi-chassis>peer>mc-lag

Description:  This command specifies the interval that the standby node will wait for packets from the active node before assuming a redundant-neighbor node failure. This delay in switch-over operation is required to accommodate different factors influencing node failure detection rate, such as IGP convergence, or HA switch-over times and to prevent the standby node to take action prematurely. The no form of this command sets this parameter to default value.

Default:  3

Parameters:  multiplier — The time interval that the standby node will wait for packets from the active node before assuming a redundant-neighbor node failure.

Values:  2 — 25

keep-alive-interval

Syntax:  keep-alive-interval interval
           no keep-alive-interval

Context:  config>redundancy>multi-chassis>peer>mc-lag

Description:  This command sets the interval at which keep-alive messages are exchanged between two systems participating in MC-LAG. These keep-alive messages are used to determine remote-node failure and the interval is set in deci-seconds. The no form of this command sets the interval to default value

Default:  1s (10 hundreds of milliseconds means interval value of 10)
Redundancy Commands

Parameters  

**interval** — The time interval expressed in deci-seconds

**Values**  
5 — 500

**lag**

**Syntax**  

lag lag-id lACP-key admin-key system-id system-id [remote-lag lag-id] system-priority system-priority  
no lag lag-id

**Context**  
config>redundancy>multi-chassis>peer>mc-lag

**Description**  
This command defines a LAG which is forming a redundant-pair for MC-LAG with a LAG configured on the given peer. The same LAG group can be defined only in the scope of 1 peer.

The same lACP-key, system-id, and system-priority must be configured on both nodes of the redundant pair in order to MC-LAG to become operational. In order MC-LAG to become operational, all parameters (lACP-key, system-id, system-priority) must be configured the same on both nodes of the same redundant pair.

The partner system (the system connected to all links forming MC-LAG) will consider all ports using the same lACP-key, system-id, system-priority as the part of the same LAG. In order to achieve this in MC operation, both redundant-pair nodes have to be configured with the same values. In case of the mismatch, MC-LAG is kept operationally down.

**Default** none

**Parameters**  

*lag-id* — The LAG identifier, expressed as a decimal integer. Specifying the lag-id allows the mismatch between lag-id on redundant-pair. If no lag-id is specified it is assumed that neighbor system uses the same lag-id as a part of the given MC-LAG. If no matching MC-LAG group can be found between neighbor systems, the individual LAGs will operate as usual (no MC-LAG operation is established.).

**Values**  
1 — 200

lACP-key admin-key — Specifies a 16 bit key that needs to be configured in the same manner on both sides of the MC-LAG in order for the MC-LAG to come up.

**Values**  
1 — 65535

system-id system-id — Specifies a 6 byte value expressed in the same notation as MAC address

**Values**  

remote-lag lag-id — Specifies the LAG ID on the remote system.

**Values**  
1 — 200

system-priority system-priority — Specifies the system priority to be used in the context of the MC-LAG. The partner system will consider all ports using the same lACP-key, system-id, and system-priority as part of the same LAG.

**Values**  
1 — 65535
Multi-Chassis Ring Commands

mc-ring

Syntax
mc-ring

Context
config>redundancy>mc>peer
config>redundancy>multi-chassis>peer>sync

Description
This command enables the context to configure the multi-chassis ring parameters.

ring

Syntax
ring sync-tag
no ring sync-tag

Context
config>redundancy>mc>peer>mcr

Description
This command configures a multi-chassis ring.

Parameters
sync-tag — Specifies a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

in-band-control-path

Syntax
in-band-control-path

Context
config>redundancy>mc>peer>mcr>ring

Description
This command enables the context to configure multi-chassis ring inband control path parameters.

dst-ip

Syntax
dst-ip ip-address
no dst-ip

Context
config>redundancy>mc>peer>mcr>ring>in-band-control-path

Description
This command specifies the destination IP address used in the inband control connection. If the address is not configured, the ring cannot become operational.

Parameters
ip-address — Specifies the destination IP address.
interface

Syntax

```
interface ip-int-name
no interface
```

Context config>redundancy>mc>peer>mcr>ring>in-band-control-path

Description This command specifies the name of the IP interface used for the inband control connection. If the name is not configured, the ring cannot become operational.

service-id

Syntax

```
service-id service-id
no service-id
```

Context config>redundancy>mc>peer>mcr>ring>ibc

Description This command specifies the service ID if the interface used for the inband control connection belongs to a VPRN service. If not specified, the `service-id` is zero and the interface must belong to the Base router. The `no` form of the command removes the service-id from the IBC configuration.

Parameters `service-id` — Specifies the service ID if the interface.

path-b

Syntax

```
[no] path-b
```

Context config>redundancy>mc>peer>mcr>ring

Description This command specifies the set of upper-VLAN IDs associated with the SAPs that belong to path B with respect to load-sharing. All other SAPs belong to path A.

Default If not specified, the default is an empty set.

range

Syntax

```
[no] range vlan-range
```

Context config>redundancy>mc>peer>mcr>ring>path-b
    config>redundancy>mc>peer>mcr>ring>path-excl

Description This command configures a MCR b-path VLAN range.

Parameters `vla-range` — Specifies the VLAN range.

Values 1 to 4094 — 1 to 4094
path-excl

Syntax  [no] path-excl
Context  config>redundancy>mc>peer>mcr>ring
Description  This command specifies the set of upper-VLAN IDs associated with the SAPs that are to be excluded from control by the multi-chassis ring.
Default  If not specified, the default is an empty set.

ring-node

Syntax  ring-node ring-node-name [create]
        no ring-node ring-node-name
Context  config>redundancy>mc>peer>mcr>ring
Description  This command specifies the unique name of a multi-chassis ring access node.
Parameters  ring-node-name — Specifies the unique name of a multi-chassis ring access node.
            create — Keyword used to create the ring node instance. The create keyword requirement can be enabled/disabled in the environment>create context.

connectivity-verify

Syntax  connectivity-verify
Context  config>redundancy>mc>peer>mcr>ring>ring-node
Description  This command enables the context to configure node connectivity check parameters.

dst-ip

Syntax  dst-ip ip-address
        no dst-ip
Context  config>redundancy>mc>peer>mcr>ring>ring-node>connectivity-verify
Description  This command configures the node cc destination IP address.
Default  no dst-ip
Parameters  ip-address — Specifies the destination IP address used in the inband control connection.
Redundancy Commands

interval

Syntax  
interval  interval
no interval

Context  
config>redundancy>mc>peer>mcr>ring>ring-node>connectivity-verify

Description  
This command specifies the polling interval of the ring-node connectivity verification of this ring node.

Default  
5

Parameters  
interval — Specifies the polling interval, in minutes.
   Values  1 — 6000

service-id

Syntax  
service-id  service-id
no service-id

Context  
config>redundancy>mc>peer>mcr>ring>ring-node>connectivity-verify

Description  
This command specifies the service ID of the SAP used for the ring-node connectivity verification of this ring node.

Default  
no service-id

Parameters  
service-id — Specifies the service ID of the SAP.
   Values  1 — 2147483647

src-ip

Syntax  
src-ip  ip-address
no src-ip

Context  
config>redundancy>mc>peer>mcr>ring>ring-node>connectivity-verify

This command specifies the source IP address used in the ring-node connectivity verification of this ring node.

Default  
no src-ip

Parameters  
ip-address — Specifies the address of the multi-chassis peer.
**src-mac**

**Syntax**  
src-mac  *ieee-address*  
no src-mac  

**Context**  
config>redundancy>mc>peer>mcr>node>cv  

**Description**  
This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeroes (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

**Default**  
no src-mac  

**Parameters**  
*ieee-address* — Specifies the source MAC address.

**vlan**

**Syntax**  
vlan [0..4094]  
no vlan  

**Context**  
config>redundancy>mc>peer>mcr>node>cv  

**Description**  
This command specifies the VLAN tag of the SAP used for the ring-node connectivity verification of this ring node. It is only meaningful if the value of service ID is not zero. A zero value means that no VLAN tag is configured.

**Default**  
no vlan  

**Parameters**  
[0..4094] — Specifies the set of VLAN IDs associated with the SAPs that are to be controlled by the slave peer.
Rollback Commands

**compare**

**Syntax**

```
compare [to source2]
compare source1 to source2
```

**Context**

```
admin
admin>rollback
```

**Description**

This command displays the differences between rollback checkpoints and the active operational configuration, with source1 as the base/first file to which source2 is compared.

**Parameters**

`source1, source2` — Specifies comparison information.

**Values**

- `active-cfg` — The currently operational configuration that is active in the node.
- `latest-rb` — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with “*.rb” as the suffix).
- `rescue` — The rescue configuration (at the configured rescue-location).
- `checkpoint-id` — An id from [1 ..max] indicating a specific rollback checkpoint (where max is the highest checkpoint allowed/configured). A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with “*.rb.1” as the suffix, 2 for file “*.rb.2”, etc.

**Default**

The defaults for source1 and source2 are context aware and differ based on the branch in which the command is executed. In general, the default for source1 matches the context from which the command is issued.

- In the admin node: No defaults. source1 and source2 must be specified.
- In the admin>rollback node:
  
  source1 default = active-cfg, source2 default = lastest-rb
  
  compare: Equivalent to “compare active-cfg to lastest-rb”
  
  compare to source2: Equivalent to “compare active-cfg to source2”

**delete**

**Syntax**

```
delete {latest-rb| checkpoint-id | rescue}
```

**Context**

```
admin>rollback
```

**Description**

This command deletes a rollback checkpoint and causes the suffixes to be adjusted (decremented) for all checkpoints older that the one that was deleted (to close the “hole” in the list of checkpoint files and create room to create another checkpoint).
If “config redundancy rollback-sync” is enabled, a rollback delete will also delete the equivalent checkpoint on the standby CF and shuffle the suffixes on the standby CF.

It is not advised to manually delete a rollback checkpoint (for example, using a "file delete" command). If a rollback checkpoint file is manually deleted without using the "admin rollback delete" command then the suffixes of the checkpoint files are NOT shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a “hole” in the checkpoint file list until enough new checkpoints have been created to roll the “hole” off the end of the list.

**Default** none

**Parameters**

- latest-rb — Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).
- checkpoint-id — An id from [1 ..max] indicating a specific rollback checkpoint (where max is the highest checkpoint allowed/configured). A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with “*.rb.1” as the suffix, 2 for file “*.rb.2”, etc.
- rescue — Deletes the rescue checkpoint. No checkpoint suffix numbers are changed.

**rollback-location**

**Syntax** no rollback-location file-url

**Context** config>system>rollback

**Description** The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The file-url must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are “.rb”, ”.rb.1“, ..., ”.rb.9“ and are automatically appended to rollback checkpoint files.

**Default** None. A valid rollback-location must be configured before a rollback save is executed.

**rescue-location**

**Syntax** no rescue-location file-url

**Context** config>system>rollback

**Description** The location and filename of the rescue configuration is configurable to be local (on compact flash) or remote. The suffix ”.rc“ will be automatically appended to the filename when a rescue configuration file is saved. Trivial FTP (tftp) is not supported for remote locations.

**Default** None. A valid rescue-location must be configured before a rescue configuration is saved.

**remote-max-checkpoints**
Rollback Commands

**remote-max-checkpoints**

**Syntax**

remote-max-checkpoints <1..200>

**Context**

config>system>rollback

**Description**

Configures the maximum number of rollback checkpoint files when the rollback-location is remote (e.g. ftp).

**Default**

10

**local-max-checkpoints**

**Syntax**

local-max-checkpoints <1..50>

**Context**

config>system>rollback

**Description**

Configures the maximum number of rollback checkpoint files when the rollback-location is on local compact flash.

**Default**

10

**save**

**Syntax**

save [rescue] [comment comment-string]

**Context**

admin>rollback

**Description**

If the optional “rescue” keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of ".rb". The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, etc). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the “rescue” keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue-location. The filename will have the suffix “.rc” appended.

**Default**

none

**Parameters**

*comment-string* — A comment of up to 255 characters in length that is associated with the checkpoint.

*rescue* — Save the rescue checkpoint instead of a normal rollback checkpoint.

**revert**

**Syntax**

revert [latest-rb] checkpoint-id | rescue] [now]

**Context**

admin>rollback

**Description**

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services.
There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

**Parameters**  
- **latest-rb** — Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).
- **checkpoint-id** — Indicates the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of “1” corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.
- **Values**  
  1—max, where max is the number of configured checkpoints minus 1 (since, for example, the 10th checkpoint has an id of 9)

- **rescue** — Revert to the rescue checkpoint.
- **now** — Forces a rollback revert without any interactive confirmations (assumes ‘y’ for any confirmations that would have occurred).

**view**

**Syntax**  
view [latest-rb | checkpoint-id | rescue]

**Context**  
admin>rollback

**Description**  
This command displays checkpoint.

**Default**  
none

**Parameters**  
- **latest-rb** — Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).
- **checkpoint-id** — Indicates rollback checkpoint file to be viewed. Checkpoint-id of “1” corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.
- **Values**  
  1..max

- **rescue** — View the rescue configuration.
LLDP System Commands

lldp

Syntax:  lldp

Context:  config>system

Description:  This command enables the context to configure system-wide Link Layer Discovery Protocol parameters.

message-fast-tx

Syntax:  message-fast-tx time
           no message-fast-tx

Context:  config>system>lldp

Description:  This command configures the duration of the fast transmission period.

Parameters:

Parameter:  time — Specifies the fast transmission period in seconds.

Values:

1 — 3600

Default:  1

message-fast-tx-init

Syntax:  message-fast-tx-init count
           no message-fast-tx-init

Context:  config>system>lldp

Description:  This command configures the number of LLDPDUs to send during the fast transmission period.

Parameters:

Parameter:  count — Specifies the number of LLDPDUs to send during the fast transmission period.

Values:

1 — 8

Default:  4
notification-interval

Syntax  notification-interval  time
       no  notification-interval

Context  config>system>lldp

Description  This command configures the minimum time between change notifications.

Parameters  time — Specifies the minimum time, in seconds, between change notifications.

Values  5 — 3600

Default  5

reinit-delay

Syntax  reinit-delay  time
       no  reinit-delay

Context  config>system>lldp

Description  This command configures the time before re-initializing LLDP on a port.

Parameters  time — Specifies the time, in seconds, before re-initializing LLDP on a port.

Values  1 — 10

Default  2

tx-credit-max

Syntax  tx-credit-max  count
       no  tx-credit-max

Context  config>system>lldp

Description  This command configures the maximum consecutive LLDPDUs transmitted.

Parameters  count — Specifies the maximum consecutive LLDPDUs transmitted.

Values  1 — 100

Default  5
LLDP System Commands

tx-hold-multiplier

Syntax  
```plaintext
tax-hold-multiplier multiplier
no tx-hold-multiplier
```

Context  config>system>lldp

Description  This command configures the multiplier of the tx-interval.

Parameters  
- `multiplier` — Specifies the multiplier of the tx-interval.
  - Values  
    - 2 — 10
  - Default  4

tx-interval

Syntax  
```plaintext
tx-interval interval
no tx-interval
```

Context  config>system>lldp

Description  This command configures the LLDP transmit interval time.

Parameters  
- `interval` — Specifies the LLDP transmit interval time.
  - Values  
    - 1 — 100
  - Default  5
LLDP Ethernet Port Commands

Refer to the 7750 SR OS Interface Guide for command descriptions and CLI usage.

lldp

Syntax lldp

Context config>port>ethernet

Description This command enables the context to configure Link Layer Discovery Protocol (LLDP) parameters on the specified port.

dest-mac

Syntax dest-mac {bridge-mac}

Context config>port>ethernet>lldp

Description This command configures destination MAC address parameters.

Parameters bridge-mac — Specifies destination bridge MAC type to use by LLDP.

Values

nearest-bridge — Specifies to use the nearest bridge.

nearest-non-tpmr — Specifies to use the nearest non-Two-Port MAC Relay (TPMR).

nearest-customer — Specifies to use the nearest customer.

admin-status

Syntax admin-status {rx | tx | tx-rx | disabled}

Context config>port>ethernet>lldp>dstmac

Description This command specifies the administratively desired status of the local LLDP agent.

Parameters

rx — Specifies the LLDP agent will receive, but will not transmit LLDP frames on this port.

tx — Specifies that the LLDP agent will transmit LLDP frames on this port and will not store any information about the remote systems connected.

tx-rx — Specifies that the LLDP agent will transmit and receive LLDP frames on this port.

disabled — Specifies that the LLDP agent will not transmit or receive LLDP frames on this port. If there is remote systems information which is received on this port and stored in other tables, before the port's admin status becomes disabled, then the information will naturally age out.
notification

**Syntax**

```
[no] notification
```

**Context**

`config>port>ethernet>lldp>dstmac`

**Description**

This command enables LLDP notifications. The no form of the command disables LLDP notifications.

**tx-mgmt-address**

**Syntax**

```
.tx-mgmt-address [system]
no tx-mgmt-address
```

**Context**

`config>port>ethernet>lldp>dstmac`

**Description**

This command specifies which management address to transmit. The no form of the command resets value to the default.

**Default**

no tx-mgmt-address

**Parameters**

- **system** — Specifies to use the system IP address. Note that the system address will only be transmitted once it has been configured if this parameter is specified.

**tx-tlvs**

**Syntax**

```
.tx-tlvs [port-desc] [sys-name] [sys-desc] [sys-cap]
no tx-tlvs
```

**Context**

`config>port>ethernet>lldp>dstmac`

**Description**

This command specifies which LLDP TLVs to transmit. The no form of the command resets the value to the default.

**Default**

no tx-tlvs

**Parameters**

- **port-desc** — Indicates that the LLDP agent should transmit port description TLVs.
- **sys-name** — Indicates that the LLDP agent should transmit system name TLVs.
- **sys-desc** — Indicates that the LLDP agent should transmit system description TLVs.
- **sys-cap** — Indicates that the LLDP agent should transmit system capabilities TLVs.
Show Commands

SYSTEM COMMANDS

connections

Syntax  connections [address ip-address [interface interface-name]] [port port-number] [detail]
Context  show>system
Description  This command displays UDP and TCP connection information. If no command line options are specified, a summary of the TCP and UDP connections displays.
Parameters  ip-address — Displays only the connection information for the specified IP address.

Values  ipv4-address:  a.b.c.d (host bits must be 0)
ipv6-address:  x:x:x:x:x:x:x:x[-interface]
               x:x:x:x:d.d.d.d[-interface]
               x:  [0 — FFFF]H
               d:  [0 — 255]D
               interface: 32 characters maximum, mandatory for link local addresses

port-number — Displays only the connection information for the specified port number.

Values  0 — 65535

detail — Appends TCP statistics to the display output.

Output  Standard Connection Output — The following table describes the system connections output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proto</td>
<td>Displays the socket protocol, either TCP or UDP.</td>
</tr>
<tr>
<td>RecvQ</td>
<td>Displays the number of input packets received by the protocol.</td>
</tr>
<tr>
<td>TxmtQ</td>
<td>Displays the number of output packets sent by the application.</td>
</tr>
<tr>
<td>Local Address</td>
<td>Displays the local address of the socket. The socket port is separated by a period.</td>
</tr>
<tr>
<td>Remote Address</td>
<td>Displays the remote address of the socket. The socket port is separated by a period.</td>
</tr>
<tr>
<td>State</td>
<td>Listen — The protocol state is in the listen mode.</td>
</tr>
<tr>
<td></td>
<td>Established — The protocol state is established.</td>
</tr>
</tbody>
</table>

cron

Syntax  cron

Context  show>cron

Description  This command enters the show CRON context.

action

Syntax  action [action-name] [owner action-owner] run-history run-state

Context  show>cron#

Description  This command displays cron action parameters.

Parameters  action action-name — Specifies the action name.

Values  maximum 32 characters

owner action-owner — Specifies the owner name.

Default  TiMOS CLI

run-history run-state — Specifies the state of the test to be run.

Values  executing, initializing, terminated

Output  The following table describes the show cron action output fields.

*A:Redundancy#
schedule

**Syntax**

```
schedule [schedule-name] [owner schedule-owner]
```

**Context**

`show>cron#`

**Description**

This command displays cron schedule parameters.

**Parameters**

- `schedule-name` — Displays information for the specified scheduler name.
- `owner schedule-owner` — Displays information for the specified scheduler owner.

**Output**

The following table describes the show cron schedule output fields.

```bash
A:sim1>show>cron schedule test
```

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule name</td>
<td>Displays the schedule name.</td>
</tr>
<tr>
<td>Schedule owner</td>
<td>Displays the owner name of the action.</td>
</tr>
<tr>
<td>Description</td>
<td>Displays the schedule’s description.</td>
</tr>
<tr>
<td>Administrative status</td>
<td>Enabled – The administrative status is enabled.</td>
</tr>
<tr>
<td></td>
<td>Disabled – Administratively disabled.</td>
</tr>
<tr>
<td>Operational status</td>
<td>Enabled – The operational status is enabled.</td>
</tr>
<tr>
<td></td>
<td>Disabled – Operationally disabled.</td>
</tr>
<tr>
<td>Action</td>
<td>Displays the action name</td>
</tr>
<tr>
<td>Action owner</td>
<td>Displays the name of action owner.</td>
</tr>
<tr>
<td>Script</td>
<td>Displays the name of the script.</td>
</tr>
<tr>
<td>Script owner</td>
<td>Displays the name of the script.</td>
</tr>
<tr>
<td>Script owner</td>
<td>Displays the name of the of script owner.</td>
</tr>
<tr>
<td>Script source location</td>
<td>Displays the location of scheduled script.</td>
</tr>
<tr>
<td>Script results location</td>
<td>Displays the location where the script results have been sent.</td>
</tr>
<tr>
<td>Schedule type</td>
<td>Periodic – Displays a schedule which ran at a given interval.</td>
</tr>
<tr>
<td></td>
<td>Calendar – Displays a schedule which ran based on a calendar.</td>
</tr>
<tr>
<td></td>
<td>Oneshot – Displays a schedule which ran one time only.</td>
</tr>
<tr>
<td>Interval</td>
<td>Displays the interval between runs of an event.</td>
</tr>
<tr>
<td>Next scheduled run</td>
<td>Displays the time for the next scheduled run.</td>
</tr>
</tbody>
</table>

System Commands

**script**

**Syntax**
script [script-name] [owner script-owner]

**Context**
show>cron#

**Description**
This command displays cron script parameters.

**Parameters**
schedule-name — Displays information for the specified script.

owner schedule-owner — Displays information for the specified script owner.

**Output**
The following table describes the show cron script output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Displays the name of the script.</td>
</tr>
<tr>
<td>Script owner</td>
<td>Displays the owner name of script.</td>
</tr>
<tr>
<td>Administrative status</td>
<td>Enabled — Administrative status is enabled.</td>
</tr>
<tr>
<td></td>
<td>Disabled — Administratively abled.</td>
</tr>
<tr>
<td>Operational status</td>
<td>Enabled — Operational status is enabled.</td>
</tr>
<tr>
<td></td>
<td>Disabled — Operationally disabled.</td>
</tr>
<tr>
<td>Script source location</td>
<td>Displays the location of scheduled script.</td>
</tr>
<tr>
<td>Last script error</td>
<td>Displays the system time of the last error.</td>
</tr>
<tr>
<td>Last change</td>
<td>Displays the system time of the last change.</td>
</tr>
</tbody>
</table>

A:sim1>show>cron#
Syntax  information

Context  show>system

Description  This command displays general system information including basic system, SNMP server, last boot and DNS client information.

Output  System Information Output — The following table describes the system information output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Name</td>
<td>The configured system name.</td>
</tr>
<tr>
<td>System Contact</td>
<td>A text string that describes the system contact information.</td>
</tr>
<tr>
<td>System Location</td>
<td>A text string that describes the system location.</td>
</tr>
<tr>
<td>System Coordinates</td>
<td>A text string that describes the system coordinates.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>The time since the last boot.</td>
</tr>
<tr>
<td>SNMP Port</td>
<td>The port number used by this node to receive SNMP request messages and to send replies.</td>
</tr>
<tr>
<td>SNMP Engine ID</td>
<td>The SNMP engineID to uniquely identify the SNMPv3 node.</td>
</tr>
<tr>
<td>SNMP Max Message Size</td>
<td>The maximum SNMP packet size generated by this node.</td>
</tr>
<tr>
<td>SNMP Admin State</td>
<td>Enabled – SNMP is administratively enabled and running.</td>
</tr>
<tr>
<td></td>
<td>Disabled – SNMP is administratively shutdown and not running.</td>
</tr>
<tr>
<td>SNMP Oper State</td>
<td>Enabled – SNMP is operationally enabled.</td>
</tr>
<tr>
<td></td>
<td>Disabled – SNMP is operationally disabled.</td>
</tr>
<tr>
<td>SNMP Index Boot Status</td>
<td>Persistent – System indexes are saved between reboots.</td>
</tr>
<tr>
<td></td>
<td>Not Persistent – System indexes are not saved between reboots.</td>
</tr>
<tr>
<td>Telnet/SSH/FTP Admin</td>
<td>Displays the administrative state of the Telnet, SSH, and FTP sessions.</td>
</tr>
<tr>
<td>Telnet/SSH/FTP Oper</td>
<td>Displays the operational state of the Telnet, SSH, and FTP sessions.</td>
</tr>
<tr>
<td>BOF Source</td>
<td>The location of the BOF.</td>
</tr>
<tr>
<td>Image Source</td>
<td>Primary – Indicates that the directory location for runtime image file was loaded from the primary source.</td>
</tr>
<tr>
<td>Label</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Secondary</strong> —</td>
<td>Indicates that the directory location for runtime image file was loaded from the secondary source.</td>
</tr>
<tr>
<td><strong>Tertiary</strong> —</td>
<td>Indicates that the directory location for runtime image file was loaded from the tertiary source.</td>
</tr>
</tbody>
</table>
| **Config Source**           | **Primary** — Indicates that the directory location for configuration file was loaded from the primary source.  
**Secondary** — Indicates that the directory location for configuration file was loaded from the secondary source.  
**Tertiary** — Indicates that the directory location for configuration file was loaded from the tertiary source. |
| **DNS Resolve Preference**  | **ipv4-only** — Dns-names are queried for A-records only.  
**ipv6-first** — Dns-server will be queried for AAAA-records first and a successful reply is not received, the dns-server is queried for A-records. |
| **Last Booted Config File** | The URL and filename of the last loaded configuration file. |
| **Last Boot Cfg Version**   | The date and time of the last boot. |
| **Last Boot Config Header** | Displays header information such as image version, date built, date generated. |
| **Last Boot Index Version** | The version of the persistence index file read when this card was last rebooted. |
| **Last Boot Index Header**  | The header of the persistence index file read when this card was last rebooted. |
| **Last Saved Config**       | The location and filename of the last saved configuration file. |
| **Time Last Saved**         | The date and time of the last time configuration file was saved. |
| **Changes Since Last Save** | **Yes** — There are unsaved configuration file changes.  
**No** — There are no unsaved configuration file changes. |
| **Time Last Modified**      | The date and time of the last modification. |
| **Max Cfg/BOF Backup Rev**  | The maximum number of backup revisions maintained for a configuration file. This value also applies to the number of revisions maintained for the BOF file. |
| **Cfg-OK Script**           | **URL** — The location and name of the CLI script file executed following successful completion of the boot-up configuration file execution. |
| **Cfg-OK Script Status**    | **Successful/Failed** — The results from the execution of the CLI script file specified in the Cfg-OK Script location.  
**Not used** — No CLI script file was executed. |

ntp

Syntax ntp

Context show>system

Description This command displays NTP protocol configuration and state.

Output Show NTP Output — The following table describes NTP output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>yes — NTP is enabled.</td>
</tr>
<tr>
<td></td>
<td>no — NTP is disabled.</td>
</tr>
<tr>
<td>Admin Status</td>
<td>yes — Administrative state is enabled.</td>
</tr>
<tr>
<td></td>
<td>no — Administrative state is disabled.</td>
</tr>
<tr>
<td>NTP Server</td>
<td>Displays NTP server state of this node.</td>
</tr>
<tr>
<td>Stratum</td>
<td>Displays stratum level of this node.</td>
</tr>
<tr>
<td>Oper Status</td>
<td>yes — The operational state is enabled.</td>
</tr>
<tr>
<td></td>
<td>no — The operational state is disabled.</td>
</tr>
<tr>
<td>Auth Check</td>
<td>Displays the authentication requirement</td>
</tr>
<tr>
<td>System Ref. ID</td>
<td>IP address of this node or a 4-character ASCII code showing the state.</td>
</tr>
<tr>
<td>Auth Error</td>
<td>Displays the number of authentication errors.</td>
</tr>
<tr>
<td>Auth Errors Ignored</td>
<td>Displays the number of authentication errors ignored.</td>
</tr>
<tr>
<td>Auth key ID Errors</td>
<td>Displays the number of key identification errors.</td>
</tr>
<tr>
<td>Auth Key Type Errors</td>
<td>Displays the number of authentication key type errors.</td>
</tr>
<tr>
<td>Reject</td>
<td>The peer is rejected and will not be used for synchronization. Rejection reasons could be the peer is unreachable, the peer is synchronized to this local server so synchronizing with it would create a sync loop, or the synchronization distance is too large. This is the normal startup state.</td>
</tr>
<tr>
<td>Invalid</td>
<td>The peer is not maintaining an accurate clock. This peer will not be used for synchronization.</td>
</tr>
<tr>
<td>Label</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Excess</td>
<td>The peer's synchronization distance is greater than ten other peers. This peer will not be used for synchronization.</td>
</tr>
<tr>
<td>Outlyer</td>
<td>The peer is discarded as an outlyer. This peer will not be used for synchronization.</td>
</tr>
<tr>
<td>Candidate</td>
<td>The peer is accepted as a possible source of synchronization.</td>
</tr>
<tr>
<td>Selected</td>
<td>The peer is an acceptable source of synchronization, but its synchronization distance is greater than six other peers.</td>
</tr>
<tr>
<td>Chosen</td>
<td>The peer is chosen as the source of synchronization.</td>
</tr>
<tr>
<td>ChosenPPS</td>
<td>The peer is chosen as the source of synchronization, but the actual synchronization is occurring from a pulse-per-second (PPS) signal.</td>
</tr>
<tr>
<td>Remote</td>
<td>The IP address of the remote NTP server or peer with which this local host is exchanging NTP packets.</td>
</tr>
<tr>
<td>Reference ID</td>
<td>When stratum is between 0 and 15 this field shows the IP address of the remote NTP server or peer with which the remote is exchanging NTP packets. For reference clocks, this field shows the identification assigned to the clock, such as, “.GPS.” For an NTP server or peer, if the client has not yet synchronized to a server/peer, the status cannot be determined and displays the following codes:</td>
</tr>
<tr>
<td></td>
<td>Peer Codes:</td>
</tr>
<tr>
<td></td>
<td>ACST — The association belongs to any cast server.</td>
</tr>
<tr>
<td></td>
<td>AUTH — Server authentication failed. Please wait while the association is restarted.</td>
</tr>
<tr>
<td></td>
<td>AUTO — Autokey sequence failed. Please wait while the association is restarted.</td>
</tr>
<tr>
<td></td>
<td>BCST — The association belongs to a broadcast server.</td>
</tr>
<tr>
<td></td>
<td>CRPT — Cryptographic authentication or identification failed. The details should be in the system log file or the cryptostats statistics file, if configured. No further messages will be sent to the server.</td>
</tr>
<tr>
<td></td>
<td>DENY — Access denied by remote server. No further messages will be sent to the server.</td>
</tr>
</tbody>
</table>

</table>

System Codes

| INIT —        | The system clock has not yet synchronized for the first time. |
| STEP —        | A step change in system time has occurred, but the system clock has not yet resynchronized. |

St
Stratum level of this node.

Auth
yes — Authentication is enabled.
no — Authentication is disabled.

Poll
Polling interval in seconds.

R
Yes — The NTP peer or server has been reached at least once in the last 8 polls.
No — The NTP peer or server has not been reached at least once in the last 8 polls.

Offset
The time between the local and remote UTC time, in milliseconds.

This checkpoint was saved after the 3 VPLS services were created
John's checkpoint on Sunday
A long checkpoint comment that an operator is using to summarize various some of the changes that were made. They may even have so much to say that they use the maximum comment size. Notice that words are not chopped.
No comment
VPLS services 1000-2000 created
--------------------------------------------------------------------------------

ptp

Context show>system
Description This command displays Precision Time Protocol (PTP) configuration and state.
Output  Show PTP Output — The following table describes PTP output fields.

Table 38: Show System PTP Output Fields

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>When the SR/ESS has initiated a request to a peer but has not yet received a response.</td>
</tr>
<tr>
<td>Granted</td>
<td>When the SrSR/ESS has initiated a request to a peer and it was granted OR a peer has made a request of the SR/ESS and it was granted.</td>
</tr>
<tr>
<td>Rejected</td>
<td>When the SR/ESS has initiated a request to a peer but it was rejected.</td>
</tr>
<tr>
<td>Canceled</td>
<td>When a cancel message has been received from or transmitted toward a peer.</td>
</tr>
<tr>
<td>Expired</td>
<td>When a unicast session between the SR/ESS and the peer has expired without being renewed.</td>
</tr>
</tbody>
</table>

Sample Output

B:NS082761964# show system ptp

snntp

Syntax  snntp
Context  show>system
Description  This command displays SNTP protocol configuration and state.
Output  Show SNTP Output — The following table describes SNTP output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNTP Server</td>
<td>The SNTP server address for SNTP unicast client mode.</td>
</tr>
<tr>
<td>Version</td>
<td>The SNTP version number, expressed as an integer.</td>
</tr>
<tr>
<td>Preference</td>
<td>Normal — When more than one time server is configured, one server can be configured to have preference over another. Preferred — Indicates that this server has preference over another.</td>
</tr>
<tr>
<td>Interval</td>
<td>The frequency, in seconds, that the server is queried.</td>
</tr>
</tbody>
</table>

mc-endpoint

Syntax

- `mc-endpoint statistics`
- `mc-endpoint peer [ip-address] statistics`
- `mc-endpoint endpoint [mcep-id] statistics`
- `mc-endpoint peer [ip-address]`

Context

- `show>redundancy>multi-chassis`

Description

This command displays multi-chassis endpoint information.

Parameters

- `statistics` — Displays the global statistics for the MC endpoint.
- `peer ip-address` — Specifies the IP address of multi-chassis end-point peer.
- `endpoint mcep-id` — Specifies the multi-chassis endpoint.

Values

- `1` — 4294967295

Sample Output

* A:Dut-B# show redundancy multi-chassis mc-endpoint statistics

---

Multi-Chassis Endpoint Global Statistics

---

* A:Dut-B# show redundancy multi-chassis mc-endpoint peer 3.1.1.3 statistics
Multi-Chassis MC-Endpoint Statistics

mc-lag

**Syntax**

```
mc-lag [lag lag-id]
```

**Context**

```
show>redundancy>multi-chassis
```

**Description**

This command displays multi-chassis LAG information.

**Parameters**

```
lag lag-id — Shows information for the specified LAG identifier.
```

**Values**

```
1 — 20020064
```
peer

Syntax peer ip-address [lag lag-id]

Context show>redundancy>multi-chassis>mc-lag

Description This command enables the context to display mc-lag peer-related redundancy information.

Parameters

- **ip-address** — Shows peer information about the specified IP address.
- **lag lag-id** — Shows information for the specified LAG identifier.

Values 1 — 20020064

Output Show Redundancy Multi-chassis MC-Lag Peer Output — The following table describes show redundancy multi-chassis mc-lag peer output fields:

Table 43: Show Redundancy Multi-chassis MC-Lag Peer Output Fields

<table>

statistics

Syntax  
statistics mc-lag [peer ip-address [lag lag-id]]

Context  
show>redundancy>multi-chassis>mc-lag

Description  
This command displays multi-chassis statistics.

Parameters  
mc-lag — Displays multi-chassis LAG statistics.
peer ip-address — Shows the specified address of the multi-chassis peer.
lag lag-id — Shows information for the specified LAG identifier.

Values  
1 — 200

Output  
Show Redundancy Multi-chassis MC-Lag Peer Statistics Output — The following table describes show redundancy multi-chassis mc-lag peer output fields:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets Rx</td>
<td>Indicates the number of MC-Lag packets received from the peer.</td>
</tr>
<tr>
<td>Packets Rx Keepalive</td>
<td>Indicates the number of MC-Lag keepalive packets received from the peer.</td>
</tr>
<tr>
<td>Packets Rx Config</td>
<td>Indicates the number of received MC-Lag configured packets from the peer.</td>
</tr>
<tr>
<td>Packets Rx Peer Config</td>
<td>Indicates the number of received MC-Lag packets configured by the peer.</td>
</tr>
<tr>
<td>Packets Rx State</td>
<td>Indicates the number of MC-Lag “lag” state packets received from the peer.</td>
</tr>
<tr>
<td>Packets Dropped State Disabled</td>
<td>Indicates the number of packets that were dropped because the peer was administratively disabled.</td>
</tr>
<tr>
<td>Packets Dropped</td>
<td>Indicates the number of packets that were dropped because the packet was too short.</td>
</tr>
</tbody>
</table>
### Label | Description
--- | ---
Packets Dropped Tlv Invalid Size | Indicates the number of packets that were dropped because the packet size was invalid.
Packets Dropped Tlv Invalid LagId | Indicates the number of packets that were dropped because the packet referred to an invalid or non multi-chassis lag.
Packets Dropped Out of Seq | Indicates the number of packets that were dropped because the packet size was out of sequence.
Packets Dropped Unknown Tlv | Indicates the number of packets that were dropped because the packet contained an unknown TLV.
Packets Dropped MD5 | Indicates the number of packets that were dropped because the packet failed MD5 authentication.
Packets Tx | Indicates the number of packets transmitted from this system to the peer.
Packets Tx Keepalive | Indicates the number of keepalive packets transmitted from this system to the peer.
Packets Tx Peer Config | Indicates the number of configured packets transmitted from this system to the peer.
Packets Tx Failed | Indicates the number of packets that failed to be transmitted from this system to the peer.

B:Dut-B#

**mc-ring**

**Syntax**

- `mc-ring peer ip-address statistics`
- `mc-ring peer ip-address [ring sync-tag [detail|statistics]]`
- `mc-ring peer ip-address ring sync-tag ring-node [ring-node-name [detail|statistics]]`
- `mc-ring global-statistics`

**Context**

`show>redundancy>multi-chassis`

**Description**

This command displays multi-chassis ring information.

**Parameters**

- `ip-address` — Specifies the address of the multi-chassis peer to display.
- `ring sync-tag` — Specifies a synchronization tag to be displayed that was used while synchronizing this port with the multi-chassis peer.
- `node ring-node-name` — Specifies a ring-node name.
- `detail` — Displays detailed peer information for the multi-chassis ring.

**Output**

- **Show mc-ring peer ip-address ring Output** — The following table describes `mc-ring peer ip-address ring` output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sync Tag</td>
<td>Displays the synchronization tag that was used while synchronizing this port with the multi-chassis peer.</td>

*A:ALA-48>show>redundancy>multi-chassis#
Parameters

port port-id — Shows the specified port ID of the multi-chassis peer.

lag lag-id — Shows information for the specified LAG identifier.

Values

1 — 20020064

Output

Show Redundancy Multi-chassis Sync Output — The following table describes show redundancy multi-chassis sync output fields:

Table 45: Show Redundancy Multi-chassis Sync Output Fields

<table>

A:ALA-48>show>redundancy#
```

time-range

**Syntax**  
`time-range name associations [detail]`

**Context**  
`show>cron`

**Description**  
This command displays information on the configured time ranges.

**Output**  
**Time Range Output** — The following table displays system time range output fields:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associations</td>
<td>Shows the time-range as it is associated with the TOD suites and ACL entries as well as the SAPs using them.</td>
</tr>
<tr>
<td>Detail</td>
<td>Shows the details of this time-range.</td>
</tr>
</tbody>
</table>

**Sample Output**

The following example shows time-range detail output.

```
A:ala# show cron time-range time-range2 detail
===============================================================================
Cron time-range
===============================================================================
Name     : time-range1
Periodic : Start * * * * End * * * *
Absolute : Start * * * * End * * * *
```

The following example shows output for time-range associations with previously created IP and MAC filters.

```
A:ala# show cron time-range day associations
```

### uptime

**Syntax**

```plaintext
time
```

**Context**

date

**Description**

This command displays the time since the system started.

**Output**

**Uptime Output** — The following table describes uptime output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Up Time</td>
<td>Displays the length of time the system has been up in days, hr:min:sec format.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
A:ALA-1# show uptime
System Up Time : 11 days, 18:32:02.22 (hr:min:sec)
```

### switch-fabric

**Syntax**

```plaintext
switch-fabric
```

**Context**

date

**Description**

This command displays the time since the system started.

**Output**

**Switch-Fabric Output** — The following table describes switch-fabric output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch-Fabric</td>
<td>Displays the length of time the system has been up in days, hr:min:sec format.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
A:ALA-1# show switch-fabric
Switch-Fabric : 11 days, 18:32:02.22 (hr:min:sec)
```

---

7750 SR OS Basic System Configuration Guide
This command displays switch fabric information.

**Switch fabric output** — The following table describes switch-fabric output fields for 12-slot and 7-slot chassis models:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot/MDA</td>
<td>Displays the fabric slot within a chassis in the system. The CPM cards and IOM cards cannot be physically inserted into the switch fabric card slots.</td>
</tr>
<tr>
<td>Min. Forwarding Capacity</td>
<td>Displays the minimum forwarding capacity of the slot and MDA as a percentage.</td>
</tr>
<tr>
<td>Max. Forwarding Capacity</td>
<td>Displays the maximum forwarding capacity of the slot and MDA as a percentage.</td>
</tr>
</tbody>
</table>

**Sample Output**

```
A:ALA-7# show system switch-fabric
Switch Fabric
Slot/Mda Min. Forwarding Capacity Max. Forwarding Capacity
1/1 100% 100%
1/2 100% 100%

```
sync-if-timing

**Syntax**  
sync-if-timing

**Context**  
show>system

**Description**  
This command displays synchronous interface timing operational information.

**Output**  
**System Timing Output** — The following table describes sync-if-timing output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| System Status CPM A/B | Indicates the present status of the synchronous timing equipment subsystem (SETS).  
  not-present  
  master-freerun  
  master-holdover  
  master-locked  
  slave  
  acquiring |
| Reference Input Mode | Revertive — Indicates that for a re-validated or a newly validated reference source which has a higher priority than the currently selected reference has reverted to the new reference source.  
  Non-revertive — The clock cannot revert to a higher priority clock if the current clock goes offline. |
<p>| Quality Level Selection | Indicates whether the ql-selection command has been enabled or disabled. If this command is enabled, then the reference is selected first using the QL value, then by the priority reference order. If this command is not enabled, then the reference is selected by the priority reference order. |</p>
<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference Selected</td>
<td>Indicates which reference has been selected:</td>
</tr>
<tr>
<td></td>
<td>• ref1, ref2 - (for all chassis)</td>
</tr>
<tr>
<td></td>
<td>• BITS A, BITS B - (7750 SR-7/12)</td>
</tr>
<tr>
<td></td>
<td>• Mate CPM (BITS A), Mate CPM (BITS B) - (7750 SR-7/12 on the active CPM)</td>
</tr>
<tr>
<td></td>
<td>• Mate CPM (none) - show&gt;system&gt;sync-if-timing&gt;standby when standby locked to active which is freerun or holdover - (7750 SR-7/12)</td>
</tr>
<tr>
<td></td>
<td>• Mate CPM (ref1), Mate CPM (ref2) - show&gt;system&gt;sync-if-timing&gt;standby when standby locked to active which is locked to ref1 or ref2 - (7750 SR-7/12)</td>
</tr>
<tr>
<td></td>
<td>• BITS 1, BITS2 - (7750 SR-c4 only)</td>
</tr>
<tr>
<td>System Quality Level</td>
<td>Indicates the quality level being generated by the system clock.</td>
</tr>
<tr>
<td>Current Frequency Offset</td>
<td>(value) — The frequency offset of the currently selected timing reference in parts per million.</td>
</tr>
<tr>
<td>Reference Order</td>
<td>ref1, ref2, bits — Indicates that the priority order of the timing references.</td>
</tr>
<tr>
<td>Reference Mate CPM</td>
<td>Data within this block represents the status of the timing reference provided by the Mate CPM. This will be the BITS input from the standby CPM.</td>
</tr>
<tr>
<td>Admin Status</td>
<td>down — The ref1 or ref2 configuration is administratively shutdown.</td>
</tr>
<tr>
<td></td>
<td>up — The ref1 or ref2 configuration is administratively enabled.</td>
</tr>
<tr>
<td></td>
<td>diag — Indicates the reference has been forced using the force-reference command.</td>
</tr>
<tr>
<td>Quality Level Override</td>
<td>Indicates whether the QL value used to determine the reference was configured directly by the user.</td>
</tr>
<tr>
<td>Rx Quality Level</td>
<td>Indicates the QL value received on the interface.</td>
</tr>
<tr>
<td></td>
<td>• inv - SSM received on the interface indicates an invalid code for the interface type.</td>
</tr>
<tr>
<td></td>
<td>• unknown - No QL value was received on the interface.</td>
</tr>
<tr>
<td>Qualified for Use</td>
<td>Indicates whether the reference has been qualified to be used as a source of timing for the node.</td>
</tr>
</tbody>
</table>
The following example is for a node locked to the active BITS input and directing the signal on ref1 to the BITS output:

Sample Output

chassis

**Syntax**    chassis [environment] [power-supply]

**Context**    show

**Description** This command displays general chassis status information.

**Parameters**

- **environment** — Displays chassis environmental status information.
  - **Default** Display all chassis information.
**System Commands**

**power-supply** — Displays chassis power supply status information.

**Default**
Display all chassis information.

**Output**
**Chassis Output** — The following table describes chassis output fields.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The system name for the router.</td>
</tr>
<tr>
<td>Type</td>
<td>The router series model number.</td>
</tr>
<tr>
<td>Location</td>
<td>The system location for the device.</td>
</tr>
<tr>
<td>Coordinates</td>
<td>A user-configurable string that indicates the Global Positioning System (GPS) coordinates for the location of the chassis. For example: N 45 58 23, W 34 56 12 N37 37’ 00 latitude, W122 22’ 00 longitude N36<em>39.246’ W121</em>40.121’</td>
</tr>
<tr>
<td>CLLI Code</td>
<td>The Common Language Location Identifier (CLLI) that uniquely identifies the geographic location of places and certain functional categories of equipment unique to the telecommunications industry.</td>
</tr>
<tr>
<td>Number of slots</td>
<td>The number of slots in this chassis that are available for plug-in cards.</td>
</tr>
<tr>
<td></td>
<td>The total number includes the IOM slots and the CPM slots.</td>
</tr>
<tr>
<td>Number of ports</td>
<td>The total number of ports currently installed in this chassis.</td>
</tr>
<tr>
<td></td>
<td>This count does not include the Ethernet ports on the CPMCCMs that are used for management access.</td>
</tr>
<tr>
<td>Critical LED state</td>
<td>The current state of the Critical LED in this chassis.</td>
</tr>
<tr>
<td>Major LED state</td>
<td>The current state of the Major LED in this chassis.</td>
</tr>
<tr>
<td>Minor LED state</td>
<td>The current state of the Minor LED in this chassis.</td>
</tr>
<tr>
<td>Base MAC address</td>
<td>The base chassis Ethernet MAC address.</td>
</tr>
<tr>
<td>Part number</td>
<td>The SF/CPM part number.</td>
</tr>
<tr>
<td>CLEI code</td>
<td>The code used to identify the router.</td>
</tr>
<tr>
<td>Serial number</td>
<td>The SF/CPM part number. Not user modifiable.</td>
</tr>
<tr>
<td>Manufacture date</td>
<td>The chassis manufacture date. Not user modifiable.</td>
</tr>
<tr>
<td>Manufacturing string</td>
<td>Factory-inputted manufacturing text string. Not user modifiable.</td>
</tr>
<tr>
<td>Time of last boot</td>
<td>The date and time the most recent boot occurred.</td>
</tr>
<tr>
<td>Current alarm state</td>
<td>Displays the alarm conditions for the specific board.</td>
</tr>
</tbody>
</table>

synchronization
Syntax synchronization

Context show>redundancy>synchronization

Description This command displays redundancy synchronization times.

Output Synchronization Output — The following table describes redundancy synchronization output fields.

Table 51: Show Synchronization Output Fields

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standby Status</td>
<td>Displays the status of the standby CPM.</td>
</tr>
<tr>
<td>Last Standby Failure</td>
<td>Displays the timestamp of the last standby failure.</td>
</tr>
<tr>
<td>Standby Up Time</td>
<td>Displays the length of time the standby CPM has been up.</td>
</tr>
<tr>
<td>Failover Time</td>
<td>Displays the timestamp when the last redundancy failover occurred causing a switchover from active to standby CPM. If there is no redundant CPM card in this system or no failover has occurred since the system last booted, the value will be 0.</td>
</tr>
<tr>
<td>Failover Reason</td>
<td>Displays a text string giving an explanation of the cause of the last redundancy failover. If no failover has occurred, an empty string displays.</td>
</tr>
<tr>
<td>Boot/Config Sync Mode</td>
<td>Displays the type of synchronization operation to perform between the primary and secondary CPMs after a change has been made to the configuration files or the boot environment information contained in the boot options file (BOF).</td>
</tr>
<tr>
<td>Boot/Config Sync Status</td>
<td>Displays the results of the last synchronization operation between the primary and secondary CPMs.</td>
</tr>
<tr>
<td>Last Config File Sync Time</td>
<td>Displays the timestamp of the last successful synchronization of the configuration files.</td>
</tr>
<tr>
<td>Last Boot Env Sync Time</td>
<td>Displays the timestamp of the last successful synchronization of the boot environment files.</td>

System Commands

Last Boot Env Sync Time : Never

A:ALA-1>show>redundancy#
Debug Commands

**sync-if-timing**

Syntax: `sync-if-timing`  
Context: `debug`  
Description: The context to debug synchronous interface timing references.

**force-reference**

Syntax: 
```
force-reference {ref1 | ref2 | bits }
no force-reference
```
Context: `debug>sync-if-timing`  
Description: This command allows an operator to force the system synchronous timing output to use a specific reference.  
**NOTE:** This command should be used for testing and debugging purposes only. Once the system timing reference input has been forced, it will not revert back to another reference at anytime. The state of this command is not persistent between system boots.  
When the `debug force-reference` command is executed, the current system synchronous timing output is immediately referenced from the specified reference input. If the specified input is not available (shutdown), or in a disqualified state, the timing output will enter the holdover state based on the previous input reference.

Parameters:
- `ref1` — The clock will use the first timing reference.  
- `ref2` — The clock will use the second timing reference.  
- `bits` — The clock will use the external network interface on the active CPM to be the highest priority input.

**system**

Syntax: `[no] system`  
Context: `debug`  
Description: This command displays system debug information.

**http-connections**

Syntax: `http-connections [host-ip-address/mask]
http-connections`
System Commands

Context debug>system
Description This command displays HTTP connections debug information.
Parameters host-ip-address/mask — Displays information for the specified host IP address and mask.

ntp

Syntax [no] router router-name interface ip-int-name
Context debug>system
Description This command enables and configures debugging for NTP. The no form of the command disables debugging for NTP.
Parameters router-name — Base, management
   Default Base
   ip-int-name — maximum 32 characters; must begin with a letter. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

persistence

Syntax [no] persistence
Context debug>system
Description This command displays persistence debug information.
Tools Commands

redundancy

Syntax redundancy

Context tools>dump

Description This command enables the context to dump redundancy parameters.

multi-chassis

Syntax multi-chassis

Context tools>dump>redundancy

Description This command enables the context to dump multi-chassis parameters.

mc-endpoint

Syntax mc-endpoint peer ip-address

Context tools>dump>redundancy>multi-chassis

Description This command dumps multi-chassis endpoint information.

Parameters peer ip-address — Specifies the peer’s IP address.

Sample Output

### mc-ring

**Syntax**

```
mc-ring
mc-ring peer ip-address [ring sync-tag]
```

**Context**

tools>dump>redundancy>multi-chassis

**Description**

This command dumps multi-chassis ring information.

*peer ip-address* — Specifies the peer’s IP address.

*ring sync-tag* — Specifies the ring’s sync-tag created in the config>redundancy>mc>peer>mcr> ring context.
sync-database

Syntax

\[ \text{sync-database} \ [\text{peer} \ \text{ip-address}] \ [\text{port} \ \text{port-id} \mid \text{lag-id}] \ [\text{sync-tag} \ \text{sync-tag}] \ [\text{application} \ \text{application}] \ [\text{detail}] \ [\text{type} \ \text{type}] \]

Context

tools>dump>redundancy>multi-chassis

Description

This command dumps MCS database information.

\text{peer} \ \text{ip-address} — Specifies the peer’s IP address.

\text{port} \ \text{port-id} \mid \text{lag-id} — Indicates the port or LAG ID to be synchronized with the multi-chassis peer.

\text{sync-tag} \ \text{sync-tag} — Specifies a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

\text{application} \ \text{application} — Specifies a particular multi-chassis peer synchronization protocol application.

Values

dhcp-server: local dhcp server
igmp: Internet group management protocol
igmp-snooping: igmp-snooping
mc-ring: multi-chassis ring
mld-snooping: multicast listener discovery-snooping
srrp: simple router redundancy protocol
sub-host-trk: subscriber host tracking
sub-mgmt: subscriber management

type \ \text{type} — Indicates the locally deleted or alarmed deleted entries in the MCS database per multi-chassis peer.

Values

alarm-deleted, local-deleted

detail — Displays detailed information.

srrp-sync-data

Syntax

\[ \text{srrp-sync-database} \ [\text{instance} \ \text{instance-id}] \ [\text{peer} \ \text{ip-address}] \]

Context

tools>dump>redundancy>multi-chassis

Description

This command dumps SRRP database information.

\text{peer} \ \text{ip-address} — Specifies the peer’s IP address.

\text{instance} \ \text{instance-id} — Dumps information for the specified Subscriber Router Redundancy Protocol instance configured on this system.

Values

1 — 4294967295
Clear Commands

application-assurance

Syntax  application-assurance
Context clear
Description This command clears application assurance commands.

Parameters
isa-aa-group-id — Specifies the ISA-AA group index.
Values 1
status — Specifies that application assurance system statistics are cleared.
statistics — Specifies that application assurance statistics are cleared.

group

Syntax group isa-aa-group-id statistics
group isa-aa-group-id status
Context clear>app-assure
Description This command clears application assurance group data.
Parameters isa-aa-group-id — Specifies the ISA-AA group index.
Values 1
status — Specifies that application assurance system statistics are cleared.
statistics — Specifies that application assurance statistics are cleared.

cron

Syntax cron action completed [action-name] [owner action-owner]
Context clear
Description This command clears completed CRON action run history entries.
Parameters action-name — Specifies the action name.
Values maximum 32 characters
owner action-owner — Specifies the owner name.
Default TiMOS CLI

redundancy

Syntax redundancy
Context clear
Description This command enables the context to clear redundancy parameters.

multi-chassis

Syntax multi-chassis
Context clear>redundancy
Description This command enables the context to clear multi-chassis parameters.

mc-endpoint

Syntax mc-endpoint endpoint \[mcep-id\] statistics
mc-endpoint statistics
mc-endpoint peer \[ip-address\] statistics
Context clear>redundancy>multi-chassis
Description This command clears multi-chassis endpoint statistics.

endpoint mcep-id — Clears information for the specified multi-chassis endpoint ID.

Values 1 — 4294967295
peer ip-address — Clears information for the specified peer IP address.
statistics — Clears statistics for this multi-chassis endpoint.

mc-lag

Syntax mc-lag peer ip-address \[lag lag-id\]
Context clear>redundancy>multi-chassis
Description This command clears multi-chassis Link Aggregation Group (LAG) information.

peer ip-address — Clears the specified address of the multi-chassis peer.

Parameters lag lag-id — Clears the specified LAG on this system.

Values 1 — 100

mc-ring

Syntax mc-ring
Context clear>redundancy>multi-chassis
System Commands

**Description**  This command clears multi-chassis ring data.

**debounce**

**Syntax**  `debounce peer ip-address ring sync-tag`

**Context**  `clear>redundancy>multi-chassis`

**Description**  This command clears multi-chassis ring operational state debounce history.

**Parameters**
- `ip-address` — Clears debounce history for the specified IP address.
- `ring sync-tag` — Clears debounce history for the specified sync tag.

**ring-nodes**

**Syntax**  `ring-nodes peer ip-address ring sync-tag`

**Context**  `clear>redundancy>multi-chassis>mcr`

**Description**  This command clears multi-chassis ring unreferenced ring nodes.

**Parameters**
- `ip-address` — Clears ring statistics for the specified IP address.
- `ring sync-tag` — Clears ring statistics for the specified sync tag.

**statistics**

**Syntax**  `statistics`

**Context**  `clear>redundancy>multi-chassis>mcr`

**Description**  This command clears multi-chassis ring

**global**

**Syntax**  `global`

**Context**  `clear>redundancy>multi-chassis>mcr>statistics`

**Description**  This command clears multi-chassis ring global statistics.

**peer**

**Syntax**  `peer ip-address`
Context: clear>redundancy>multi-chassis>mcr>statistics

Description: This command clears multi-chassis ring peer statistics.

Parameters:

- ip-address — Clears ring peer statistics for the specified IP address.

ring peer

Syntax: ring peer ip-address ring sync-tag

Context: clear>redundancy>multi-chassis>mcr>statistics

Description: This command clears multi-chassis ring statistics.

Parameters:

- ip-address — Clears ring statistics for the specified IP address.
- ring sync-tag — Clears ring statistics for the specified sync tag.

ring-node

Syntax: ring-node peer ip-address ring sync-tag node ring-node-name

Context: clear>redundancy>multi-chassis>mcr>statistics

Description: This command clears multi-chassis ring statistics.

Parameters:

- peer ip-address — Clears ring-node peer statistics for the specified IP address.
- ring sync-tag — Clears ring-node peer statistics for the specified sync tag.
- node ring-node-name — Clears ring-node peer statistics for the specified ring node name.

ptp

Syntax: ptp inactive-peers
      ptp statistics
      ptp peer ip_address statistics

Context: clear>system

Description: This command clears PTP statistics.

Parameters:

- inactive-peers statistics — Clears statistics for inactive peers.
- peer ip-address statistics — Clears statistics for the specified peer.
- statistics — Clears all ptp statistics.

sync-database
System Commands

Syntax  
```
sync-database peer ip-address all application application  
sync-database peer ip-address { port port-id | lag-id | sync-tag sync-tag } application  
sync-database peer ip-address port port-id | lag-id sync-tag sync-tag application application  
```

Context  
```
Context clear>redundancy>multi-chassis  
```

Description  
This command clears multi-chassis sync database information.

Parameters  
- **peer ip-address** — Clears the specified address of the multi-chassis peer.
- **port port-id** — Clears the specified port ID of the multi-chassis peer.
- **port lag-id** — Clears the specified Link Aggregation Group (LAG) on this system.
- **all** — Clears all ports and/or sync tags.
- **sync-tag sync-tag** — Clears the synchronization tag used while synchronizing this port with the multi-chassis peer.
- **application** — Clears the specified application information that was synchronized with the multi-chassis peer.

Values  
- **all**: All supported applications
- **dhcp-server**: local dhcp server
- **igmp**: internet group management protocol
- **igmp-snooping**: igmp-snooping
- **mc-ring**: multi-chassis ring
- **mld-snooping**: multicast listener discovery-snooping
- **srp**: simple router redundancy protocol
- **sub-host-trk**: subscriber host tracking
- **sub-mgmt**: subscriber management

screen

Syntax  
```
screen  
```

Context  
```
Context clear  
```

Description  
This command allows an operator to clear the Telnet or console screen.

system

Syntax  
```
system sync-if-timing {ref1 | ref2 | bits}  
```

Context  
```
Context clear  
```

Description  
This command allows an operator to individually clear (re-enable) a previously failed reference. As long as the reference is one of the valid options, this command is always executed. An inherent behavior enables the revertive mode which causes a re-evaluation of all available references.
sync-if-timing

**Syntax**

`system sync-if-timing {ref1 | ref2}`

**Context**

clear

**Description**

This command allows an operator to individually clear (re-enable) a previously failed reference. As long as the reference is one of the valid options, this command is always executed. An inherent behavior enables the revertive mode which causes a re-evaluation of all available references.

**Parameters**

- **ref1** — clears the first timing reference
- **ref2** — clears the second timing reference

trace

**Syntax**

`trace log`

**Context**

clear

**Description**

This command allows an operator to clear the trace log.

RFC 3948 UDP Encapsulation of IPsec ESP Packets
draft-ietf-ipsec-isakmp-xauth-06.txt – Extended Authentication within ISAKMP/Oakley (XAUTH)
draft-ietf-ipsec-isakmp-modecfg-05.txt – The ISAKMP Configuration Method
RFC 1981 Path MTU Discovery for IPv6
RFC 2375 IPv6 Multicast Address Assignments
RFC 2460 Internet Protocol, Version 6 (IPv6) Specification
RFC 2461 Neighbor Discovery for IPv6
RFC 2462 IPv6 Stateless Address Auto configuration
RFC 2463 Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 Specification
RFC 2464 Transmission of IPv6 Packets over Ethernet Networks
RFC 2529 Transmission of IPv6 over IPv4 Domains without Explicit Tunnels
RFC 2545 Use of BGP-4 Multiprotocol Extension for IPv6 Inter-Domain Routing
RFC 2710 Multicast Listener Discovery (MLD) for IPv6
RFC 3306 Unicast-Prefix-based IPv6 Multicast Addresses
RFC 3315 Dynamic Host Configuration Protocol for IPv6
RFC 3587 IPv6 Global Unicast Address Format
RFC 3590 Source Address Selection for the Multicast Listener Discovery (MLD) Protocol
RFC 3810 Multicast Listener Discovery Version 2 (MLDv2) for IPv6
RFC 4007 IPv6 Scoped Address Architecture
RFC 4193 Unique Local IPv6 Unicast Addresses
RFC 4291 IPv6 Addressing Architecture
RFC 4552 Authentication/Confidentiality for OSPFv3
RFC 4659 BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN
RFC 5072 IP Version 6 over PPP
RFC 5095 Deprecation of Type 0 Routing Headers in IPv6
draft-ietf-isis-igp-p2p-over-lan-05.txt
draft-ietf-isis-igp-p2p-over-lan-05.txt
Multicast
RFC 1112 Host Extensions for IP Multicasting (Snooping)
RFC 2236 Internet Group Management Protocol, (Snooping)
RFC 3376 Internet Group Management Protocol, Version 3 (Snooping)
RFC 2362 Protocol Independent Multicast-Sparse Mode (PIM-SM)
RFC 3618 Multicast Source Discovery Protocol (MSDP)
RFC 3446 Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)
RFC 4604 Using IGMPv3 and MLDv2 for Source-Specific Multicast
RFC 4607 Source-Specific Multicast for IP
RFC 4608 Source-Specific Protocol Independent Multicast in 232/8
RFC 4610 Anycast-RP Using Protocol Independent Multicast (PIM)
RFC 5186, Internet Group Management Protocol Version 3 (IGMPv3)/ Multicast Listener Discovery Version 2 (MLDv2) and Multicast Routing Protocol Interaction
draft-ietf-pim-sm-bsr-06.txt
draft-rosen-vpn-mcast-15.txt Multicast in MPLS/BGP IP VPNs
draft-ietf-tvdoc-vrf-03.txt
RFC 2430 A Provider Architecture DiffServ & TE
RFC 2474 Definition of the DS Field the IPv4 and IPv6 Headers (Rev)
RFC 2597 Assured Forwarding PHB Group (rev3260)
RFC 2598 An Expedited Forwarding PHB
RFC 3031 MPLS Architecture
RFC 3032 MPLS Label Stack Encoding
RFC 3443 Time To Live (TTL) Processing in Multi-Protocol Label Switching (MPLS) Networks
RFC 4182 Removing a Restriction on the use of MPLS Explicit NULL
RFC 3140 Per-Hop Behavior Identification Codes
RFC 4905, Encapsulation methods for transport of layer 2 frames over MPLS
RFC 5332 MPLS Multicast Encapsulations
MPLS — General
RFC 2430 A Provider Architecture
RFC 2474 Definition of the DS Field the IPv4 and IPv6 Headers (Rev)
RFC 2597 Assured Forwarding PHB Group (rev3260)
RFC 2598 An Expedited Forwarding PHB
RFC 3031 MPLS Architecture
RFC 3032 MPLS Label Stack Encoding

RFC 4182 Removing a Restriction on the use of MPLS Explicit NULL
RFC 3140 Per-Hop Behavior Identification Codes
RFC 4905, Encapsulation methods for transport of layer 2 frames over MPLS
RFC 5332 MPLS Multicast Encapsulations
MPLS — LDP
RFC 3037 LDP Applicability
Standards and Protocols

RFC 3478 Graceful Restart Mechanism for LDP – GR helper
RFC 5036 LDP Specification
RFC 5283 LDP extension for Inter-Area LSP
RFC 5443 LDP IGP Synchronization
draft-ietf-mpls-ldp-p2mp-05 LDP Extensions for Point-to-Multipoint and Multipoint-to-Multipoint LSP

MPLS — OAM
RFC 4379 Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures
draft-ietf-mpls-p2mp-lsp-06 Detecting Data Plane Failures in Point-to-Multipoint Multiprotocol Label Switching (MPLS) - Extensions to LSP Ping

RIP
RFC 1058 RIP Version 1
RFC 2082 RIP-2 MD5 Authentication
RFC 2453 RIP Version 2

TCP/IP
RFC 676 UDP
RFC 1350 The TFTP Protocol (Rev. RFC 791 IP
RFC 792 ICMP
RFC 793 TCP
RFC 826 ARP
RFC 854 Telnet
RFC 951 BootP (rev)
RFC 1519 CIDR
RFC 1542 Clarifications and Extensions for the Bootstrap Protocol
RFC 1812 Requirements for IPv4 Routers
RFC 2347 TFTP option Extension
RFC 2328 TFTP Blocksize Option
RFC 2349 TFTP Timeout Interval and Transfer Size option
RFC 2401 Security Architecture for Internet Protocol
RFC 2428 FTP Extensions for IPv6 and NATs
RFC 3596 DNS Extensions to Support IP version 6
draft-ietf-bfd-mib-00.txt Bidirectional Forwarding Detection Management Information Base
RFC 5080 Bidirectional Forwarding Detection

VRRP
RFC 2787 Definitions of Managed Objects for the Virtual Router Redundancy Protocol
RFC 3768 Virtual Router Redundancy Protocol
RFC 5798, Virtual Router Redundancy Protocol Version 3 for IPv4 and IPv6

PPP
RFC 1332 PPP IPCP
RFC 1377 PPP OSINLCP
RFC 1638/2878PPP BCP
RFC 1661 PPP (rev RFC2151)
RFC 1662 PPP in HDLC-like Framing
RFC 1877 PPP Internet Protocol Control Protocol Extensions for Name Server Addresses
RFC 1989 PPP Link Quality Monitoring
RFC 1990 The PPP Multilink Protocol (MP)
RFC 1994 PPP Challenge Handshake Authentication Protocol (CHAP)
RFC 2615 PPP over SONET/SDH
RFC 2516 A Method for Transmitting PPP Over Ethernet
RFC 2686 The Multi-Class Extension to Multi-Link PPP

Frame Relay
FRF.1.2 - PVC User-to-Network Interface (UNI) Implementation Agreement
FRF.5 - Frame Relay/ATM PVC Network Interworking Implementation
FRF.2.2 - PVC Network-to- Network Interface (NNI) Implementation Agreement.
FRF.12 Frame Relay Fragmentation Implementation Agreement
FRF.16.1 Multilink Frame Relay UNI/NNI Implementation Agreement
ITU-T Q.933 Annex A - Additional procedures for Permanent Virtual Connection (PVC) status management
Standards and Protocols

ATM
RFC 1626 Default IP MTU for use over ATM AAL5
RFC 2514 Definitions of Textual Conventions and OBJECT IDENTITIES for ATM Management
RFC 2515 Definition of Managed Objects for ATM Management RFC 2684 Multiprotocol Encapsulation over ATM Adaptation Layer 5
AF-TM-0121.000 Traffic Management Principles and Functions version 4.1
GR-1248-CORE - Generic Requirements for Operations of ATM Network Elements (NEs). Issue 3
GR-1113-CORE - Bellcore, Asynchronous Transfer Mode (ATM) and ATM Adaptation Layer (AAL) Protocols Generic Requirements, Issue 1
AF-ILMI-0065.000 Integrated Local Management Interface (ILMI) Version 4.0
AF-TM-0150.00 Addendum to Traffic Management v4.1 optional minimum desired cell rate indication for UBR
AF-PHY-0086.001, Inverse Multiplexing for ATM (IMA) Specification Version 1.1

DHCP
RFC 2131 Dynamic Host Configuration Protocol (REV)
RFC 3046 DHCP Relay Agent Information Option (Option 82)
RFC 1354 Interoperation between DHCP and BOOTP

VPLS
RFC 4762 Virtual Private LAN Services Using LDP
RFC5501: Requirements for Multicast Support in Virtual Private LAN

PSEUDOWIRE
RFC 3985 Pseudo Wire Emulation Edge-to-Edge (PWE3)
RFC 4385 Pseudo Wire Emulation Edge-to-Edge (PWE3) Control Word for Use over an MPLS PSN
RFC 3916 Requirements for Pseudo-Wire Emulation Edge-to-Edge (PWE3)
RFC 4717 Encapsulation Methods for Transport ATM over MPLS Networks (draft-ietf-pwe3-atm-encap-10.txt)
RFC 4816 PWE3 ATM Transparent Cell Transport Service (draft-ietf-pwe3-cell-transport-04.txt)
RFC 4448 Encapsulation Methods for Transport of Ethernet over MPLS Networks (draft-ietf-pwe3-ethernet-encap-11.txt)
RFC 4619 Encapsulation Methods for Transport of Frame Relay over MPLS Networks (draft-ietf-pwe3-frame-relay-07.txt)
RFC 4446 IANA Allocations for PWE3
RFC 4447 Pseudowire Setup and Maintenance Using LDP (draft-ietf-pwe3-control-protocol-17.txt)
RFC 5085, Pseudowire Virtual Circuit Connectivity Verification (VCCV): A Control Channel for Pseudowires
RFC 5659 An Architecture for Multi-Segment Pseudowire Emulation Edge-to-Edge
draft-ietf-12vpn-vpls-mcast-requets-04, Pseudowire Preferential Forwarding Status bit definition
draft-ietf-12vpn-vpls-mcast-requets-04, Pseudowire (PW) Redundancy
RFC3691 Flow Aware Transport of Pseudowires over an MPLS PSN
MFA Forum 9.0.0 The Use of Virtual trunks for ATM/MPLS Control Plane Interworking
MFA Forum 12.0.0 Multiservice Interworking - Ethernet over MPLS
MFA forum 13.0.0 - Fault Management for Multiservice Interworking v1.0
MFA Forum 16.0.0 – Multiservice Interworking - IP over MPLS

ANCP/L2CP
RFC5851 ANCP framework
draft-ietf-ancp-protocol-02.txt ANCP Protocol

Voice/Video Performance
ITU-T Rec. P.564 - Conformance testing for voice over IP transmission quality assessment models
ITU-T G.1020 - Appendix I - Performance Parameter Definitions for Quality of Speech and other Voiceband Applications Utilizing IP Networks- Mean Absolute Packet Delay Variation & Markov Models.

CIRCUIT EMULATION
RFC 4553 Structure-Agnostic Time Division Multiplexing (TDM) over Packet (SAToP)
RFC 5086 Structure-Aware Time Division Multiplexed (TDM) Circuit Emulation Service over Packet Switched Network (CESoPSN)
Standards and Protocols

MEF-8 Implementation Agreement for the Emulation of PDH Circuits over Metro Ethernet Networks, October 2004

RFC 5287 Control Protocol Extensions for the Setup of Time-Division Multiplexing (TDM) Pseudowires in MPLS Networks

SONET/SDH
ITU-G841 Telecommunication Standardization Section of ITU, Types and Characteristics of SDH Networks Protection Architecture, issued in October 1998 and as augmented by Corrigendum 1 issued in July 2002

RADIUS
RFC 2865 Remote Authentication Dial In User Service
RFC 2866 RADIUS Accounting

SSH
RFC 4250 The Secure Shell (SSH) Protocol
draft-ietf-seesh-architecture.txt SSH Protocol Architecture
draft-ietf-seesh-userauth.txt SSH Authentication Protocol
draft-ietf-seesh-transport.txt SSH Transport Layer Protocol
draft-ietf-seesh-connection.txt SSH Connection Protocol
draft-ietf-seesh-newmodes.txt SSH Transport Layer Encryption Modes

TACACS+
draft-grant-tacacs-02.txt

Timing
ITU-T G.781 Telecommunication Standardization Section of ITU, Synchronization layer functions, issued 09/2008
ITU-T G.813 Telecommunication Standardization Section of ITU, Timing characteristics of SDH equipment slave clocks (SEC), issued 03/2003.

NETWORK MANAGEMENT
