| <b>Context</b>     | config>service>vprn>ospf>area>interface<br>config>service>vprn>ospf3>area>interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b> | <p>This command configures the interface type to be either broadcast or point-to-point.</p> <p>Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided the link is used as a point-to-point.</p> <p>If the interface type is not known at the time the interface is added to OSPF and subsequently the IP interface is bound (or moved) to a different interface type, this command must be entered manually.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>     | <b>point-to-point</b> — If the physical interface is SONET.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**broadcast** — If the physical interface is Ethernet or unknown.

**Special Cases** **Virtual-Link** — A virtual link is always regarded as a point-to-point interface and not configurable.

**Parameters** **broadcast** — Configures the interface to maintain this link as a broadcast network. To significantly improve adjacency forming and network convergence, a network should be configured as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

**point-to-point** — Configures the interface to maintain this link as a point-to-point link.

## message-digest-key

**Syntax** **message-digest-key** *keyid* **md5** [*key* | *hash-key*] [**hash**]  
**no message-digest-key** *keyid*

**Context** config>service>vprn>ospf>area>interface  
 config>service>vprn>ospf>area>virtual-link  
 config>service>vprn>ospf>area>sham-link

**Description** This command configures a message digest key when MD5 authentication is enabled on the interface, virtual-link or sham-link. Multiple message digest keys can be configured.

Note that this command is not valid in the OSPF3 context.

The **no** form of the command removes the message digest key identified by the *key-id*.

**Default** No message digest keys are defined.

**Parameters** **keyid** — The *keyid* is expressed as a decimal integer.

**Values** 1 — 255

**md5** *key* — The MD5 key. The *key* can be any alphanumeric string up to 16 characters in length.

**md5** *hash-key* — The MD5 hash key. The *key* can be any combination of ASCII characters up to 32 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

**hash** — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

## metric

| <b>Context</b>     | config>service>vprn>ospf>area>interface<br>config>service>vprn>ospf3>area>interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>This command configures the OSPF packet size used on this interface. If this parameter is not configured OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:</p> <pre>config&gt;port&gt;ethernet config&gt;port&gt;sonet-sdh&gt;path config&gt;port&gt;tdm&gt;t3-e3 config&gt;port&gt;tdm&gt;t1-e1&gt;channel-group</pre> <p>If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned context is used.</p> <p>To determine the actual packet size add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.</p> <p>Use the <b>no</b> form of this command to revert to default.</p> |
| <b>Default</b>     | <b>no mtu</b> — Uses the value derived from the MTU configured in the <b>config&gt;port</b> context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b>  | <i>bytes</i> — The MTU to be used by OSPF for this logical interface in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b> | <p>This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.</p> <p>The value should be longer than the expected round trip delay between any two routers on the attached network. Once the retransmit-interval expires and no acknowledgement has been received, the LSA will be retransmitted.</p> <p>The <b>no</b> form of this command reverts to the default interval.</p> |
| <b>Default</b>     | <b>retransmit-interval 5</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b> | <p>This command creates the context to configure an OSPF Not So Stubby Area (NSSA) and adds/removes the NSSA designation from the area.</p> <p>NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF domain.</p> <p>Existing virtual links of a non-stub or NSSA area will be removed when the designation is changed to NSSA or stub.</p> <p>An area can be designated as stub or NSSA but never both at the same time.</p> <p>By default, an area is not configured as an NSSA area.</p> <p>The <b>no</b> form of the command removes the NSSA designation and configuration context from the area.</p> |
| <b>Default</b>     | <b>no nssa</b> — The OSPF area is not an NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b> | <p>This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.</p> <p>NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an Area Border Router to the entire OSPF domain.</p> <p>The <b>no</b> form of the command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.</p> |
| <b>Default</b>     | <b>redistribute-external</b> — External routes are redistributed into the NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b> | <p>This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.</p> <p>The <b>no</b> form of the command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.</p> |
| <b>Default</b>     | <b>summaries</b> — Summary routes are advertised by the ABR into the stub area or NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## stub

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Context</b>     | config>service>vprn>ospf>area<br>config>service>vprn>ospf3>area                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command enables access to the context to configure an OSPF stub area and adds/removes the stub designation from the area. External routing information is not flooded into stub areas. All routers in the stub area must be configured with the <b>stub</b> command. An OSPF area cannot be both an NSSA and a stub area. Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.</p> <p>By default, an area is not a stub area.</p> |

The **no** form of the command removes the stub designation and configuration context from the area.

**Default** **no stub** — The area is not configured as a stub area.

## default-metric

**Syntax** **default-metric** *metric*  
**no default-metric**

**Context** config>service>vprn>ospf>area>stub  
config>service>vprn>ospf3>area>stub

**Description** This command configures the metric used by the area border router (ABR) for the default route into a stub area. The default metric should only be configured on an ABR of a stub area. An ABR generates a default route if the area is a **stub** area.

The **no** form of the command reverts to the default value.

**Default** default-metric 1

**Parameters** *metric* — The metric expressed as a decimal integer for the default route cost to be advertised into the stub area.

**Values** 1 — 16777215

## virtual-link

**Syntax** [**no**] **virtual-link** *router-id* **transit-area** *area-id*

**Context** config>service>vprn>ospf>area  
config>service>vprn>ospf3>area

**Description** This command configures a virtual link to connect area border routers to the backbone via a virtual link. The backbone area (area 0.0.0.0) must be contiguous and all other areas must be connected to the backbone area. If it is not practical to connect an area to the backbone (see area 0.0.0.2 in the picture below) then the area border routers (routers 1 and 2 in the picture below) must be connected via a virtual link. The two area border routers will form a point-to-point like adjacency across the transit area (area 0.0.0.1 in the picture below). A virtual link can only be configured while in the area 0.0.0.0 context.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of the command deletes the virtual link.

**Default** No virtual link is defined.

**Parameters** *router-id* — The router ID of the virtual neighbor in IP address dotted decimal notation.

**transit-area** *area-id* — The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

The OSPF backbone area, area 0.0.0.0, must be contiguous and all other areas must be connected to the backbone area. The backbone distributes routing information between areas. If it is not practical to connect an area to the backbone (see Area 0.0.0.5 in [Figure 139](#)) then the area border routers (such as routers Y and Z) must be connected via a virtual link. The two area border routers form a point-to-point-like adjacency across the transit area (see Area 0.0.0.4).

**Figure 139: OSPF Areas**

| <b>Description</b> | <p>This command associates export route policies to determine which routes are exported from the route table to OSPF. Export policies are only in effect if OSPF is configured as an ASBR.</p> <p>If no export policy is specified, non-OSPF routes are not exported from the routing table manager to OSPF.</p> <p>If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.</p> <p>The <b>no</b> form of the command removes all policies from the configuration.</p> |
| <b>Default</b>     | <b>no export</b> — No export route policies specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <p><i>policy-name</i> — The export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.</p> <p>The specified name(s) must already be defined.</p>                                                                                                                                                                                                                                                                                                                                                                   |

## external-db-overflow

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b> | <p>This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.</p> <p>The <i>limit</i> value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the <i>limit</i>, the table is in an overflow state. When in an overflow state, the router will not originate any new AS-external-LSAs. In fact, it withdraws all the self-originated non-default external LSAs.</p> <p>The <i>interval</i> specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period preventing the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.</p> <p>The <b>external-db-overflow</b> must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.</p> <p>The <b>no</b> form of the command disables limiting the number of non-default AS-external-LSA entries.</p> |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | <b>no external-db-overflow</b> — No limit on non-default AS-external-LSA entries.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b> | <p><i>limit</i> — The maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer.</p> <p><b>Values</b>      -1 — 2147483647</p> <p><i>interval</i> — The number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer.</p> <p><b>Values</b>      0 — 2147483647</p> |

| <b>Description</b> | <p>This command configures the preference for OSPF external routes.</p> <p>A route can be learned by the router from different protocols in which case the costs are not comparable; when this occurs the preference is used to decide which route will be used.</p> <p>Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the following table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.</p> <p>If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the <b>ecmp</b> in the config&gt;router context.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>     | <b>external-preference 150</b> — OSPF external routes have a default preference of 150.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <i>preference</i> — The preference for external routes expressed as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Route Type             | Preference | Configurable     |

| <b>Description</b> | <p>This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined to directly attached interfaces continue to reach the router.</p> <p>To put the IGP in an overload state enter a timeout value. The IGP will enter the overload state until the timeout timer expires or a <b>no overload</b> command is executed.</p> <p>If the <b>overload</b> command is encountered during the execution of an <b>overload-on-boot</b> command then this command takes precedence. This could occur as a result of a saved configuration file where both parameters are saved. When the file is saved by the system the <b>overload-on-boot</b> command is saved after the <b>overload</b> command.</p> <p>Use the <b>no</b> form of this command to return to the default. When the <b>no overload</b> command is executed, the overload state is terminated regardless the reason the protocol entered overload state.</p> |
| <b>Default</b>     | no overload                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b> | This command is used to to determine if the OSPF stub networks should be advertised with a maximum metric value when the system goes into overload state for any reason. When enabled, the system uses the maximum metric value. When this command is enabled and the router is in overload, all stub interfaces, including loopback and system interfaces, will be advertised at the maximum metric. |
| <b>Default</b>     | no overload-include-stub                                                                                                                                                                                                                                                                                                                                                                              |

## preference

|                |                                                                  |
|----------------|------------------------------------------------------------------|
| <b>Syntax</b>  | <b>preference preference</b><br><b>no preference</b>             |
| <b>Context</b> | config>service>vprn>ospf<br>config>service>vprn>ospf3            |
|                | This command configures the preference for OSPF internal routes. |

A route can be learned by the router from different protocols in which case the costs are not comparable, when this occurs the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the following table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the `config>router` context.

The **no** form of the command reverts to the default value.

|                   |                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | <b>preference 10</b> — OSPF internal routes have a preference of 10.                                                                                         |
| <b>Parameters</b> | <i>preference</i> — The preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in the following table. |

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>a</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes              |
| IS-IS level 2 external | 165        | Yes              |
| BGP                    | 170        | Yes              |

a. Preference for OSPF internal routes is configured with the **preference** command.

**Values** 1 — 255

## reference-bandwidth

|                    |                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>reference-bandwidth</b> <i>reference-bandwidth</i><br><b>no reference-bandwidth</b>                                                                                                |
| <b>Context</b>     | <code>config&gt;service&gt;vprn&gt;ospf</code><br><code>config&gt;service&gt;vprn&gt;ospf3</code>                                                                                     |
| <b>Description</b> | This command configures the reference bandwidth in kilobits per second (Kbps) that provides the reference for the default costing of interfaces based on their underlying link speed. |

The default interface cost is calculated as follows:

$$\text{cost} = \text{reference-bandwidth} \div \text{bandwidth}$$

The default *reference-bandwidth* is 100,000,000 Kbps or 100 Gbps, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mbs link default cost of 10000
- 100 Mbs link default cost of 1000
- 1 Gbps link default cost of 100
- 10 Gbps link default cost of 10

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command in the `config>router>ospf>area>interface ip-int-name` context.

The **no** form of the command reverts the reference-bandwidth to the default value.

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | <b>reference-bandwidth 100000000</b> — Reference bandwidth of 100 Gbps.                                     |
| <b>Parameters</b> | <i>reference-bandwidth</i> — The reference bandwidth in kilobits per second expressed as a decimal integer. |
| <b>Values</b>     | 1 — 10000000000                                                                                             |

| <b>Description</b> | This command specifies whether to suppress the setting of the DN bit for OSPF LSA packets generated by this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets generated by this instance of the OSPF router will not be set. When disabled, this instance of the OSPF router will follow the normal procedure to determine whether to set the DN bit. |
| <b>Default</b>     | no suppress-dn-bit                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b> | <p>This command enables the context that allows for the configuration of OSPF timers. Timers control the delay between receipt of a link state advertisement (LSA) requiring a Dijkstra (Shortest Path First (SPF)) calculation and the minimum time between successive SPF calculations.</p> <p>Changing the timers affect CPU utilization and network reconvergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase reconvergence time.</p> |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b> | <p>This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs can be controlled with this command. Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the <i>spf-second-wait</i> interval. For example, if the <i>spf-second-wait</i> interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the <b>spf-wait</b> value. The SPF interval will stay at the <b>spf-wait</b> value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to <i>spf-initial-wait</i>.</p> <p>The timer must be entered in increments of 100 milliseconds. Values entered that do not match this requirement will be rejected.</p> <p>Use the <b>no</b> form of this command to return to the default.</p> |
| <b>Default</b>     | no spf-wait                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><i>max-spf-wait</i> — Specifies the maximum interval in milliseconds between two consecutive SPF calculations.</p> <p><b>Values</b> 1 — 120000</p> <p><b>Default</b> 1000</p> <p><i>spf-initial-wait</i> — Specifies the initial SPF calculation delay in milliseconds after a topology change.</p> <p><b>Values</b> 10 — 100000</p> <p><b>Default</b> 1000</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## VPRN Service Configuration Commands

*spf-second-wait* — Specifies the hold time in milliseconds between the first and second SPF calculation.

**Values** 10 — 100000

**Default** 1000

### vpn-domain

**Syntax** **vpn-domain** [*type* {0005 | 0105 | 0205 | 8005}] **id** *id*  
**no vpn-domain**

**Context** config>service>vpn>ospf

**Description** This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vpn>ospf3** context.

**Default** no vpn-domain

**Parameters** *id* — Specifies the OSPF VPN domain in the “xxxx.xxxx.xxxx” format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

*type* — Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

**Values** 0005, 0105, 0205, 8005

### vpn-tag

**Syntax** **vpn-tag** *vpn-tag*  
**no vpn-tag**

**Context** config>service>vpn>ospf

**Description** This command specifies the route tag for an OSPF VPN on a PE router. This field is set in the tag field of the OSPF external LSAs generated by the PE. This is mainly used to prevent routing loops. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance.

**Default** vpn-tag 0

## lsa-arrival

|                    |                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>lsa-arrival</b> <i>lsa-arrival-time</i><br><b>no lsa-arrival</b>                                                                                                                                                                                                                                                                                                                              |
| <b>Context</b>     | config>service>vprn>ospf>timers<br>config>service>vprn>ospf3>timers                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | This parameter defines the minimum delay that must pass between receipt of the same Link State Advertisements (LSAs) arriving from neighbors. It is recommended that the neighbors configured ( <b>lsa-generate</b> ) <i>lsa-second-wait</i> interval is equal or greater than the <b>lsa-arrival</b> timer configured here.<br>Use the <b>no</b> form of this command to return to the default. |
| <b>Default</b>     | no lsa-arrival                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <i>lsa-arrival-time</i> — Specifies the timer in milliseconds. Values entered that do not match this requirement will be rejected.<br><br><b>Values</b> 0 — 600000                                                                                                                                                                                                                               |

## lsa-generate

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>lsa-generate</b> <i>max-lsa-wait</i> [ <i>lsa-initial-wait</i> [ <i>lsa-second-wait</i> ]]<br><b>no lsa-generate-interval</b>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Context</b>     | config>service>vprn>ospf>timers<br>config>service>vprn>ospf3>timers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the <i>lsa-second-wait</i> timer until a maximum value is reached. Configuring the <b>lsa-arrival</b> interval to equal or less than the <i>lsa-second-wait</i> interval configured in the <b>lsa-generate</b> command is recommended.<br>Use the <b>no</b> form of this command to return to the default. |
| <b>Default</b>     | no lsa-generate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <i>max-lsa-wait</i> — Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSA being generated.<br><br>The timer must be entered as either 1 or in millisecond increments. Values entered that do not match this requirement will be rejected.<br><br><b>Values</b> 1 — 600000                                                                                                                                                                                                                                    |

| <b>Description</b> | This command sets the authentication password to be passed between RIP neighbors.<br>The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.<br>The <b>no</b> form of the command removes the authentication password from the configuration and disables authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>     | <b>no authentication-key</b> — Authentication is disabled and the authentication password is empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <i>authentication-key</i> — The authentication key. The key can be any combination of ASCII characters up to 16 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).<br><i>hash-key</i> — The hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).<br>This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.<br><b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> parameter specified.<br><b>hash2</b> — Specifies the key is entered in a more complex encrypted form. If the <b>hash2</b> parameter is not used, the less encrypted <b>hash</b> form is assumed. |

## authentication-type

|                    |                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>authentication-type</b> { <b>none</b>   <b>password</b>   <b>message-digest</b> }<br><b>no authentication-type</b>                                                                                                                                                                                                             |
| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor                                                                                                                                                                                                                                |
| <b>Description</b> | This command defines the type of authentication to be used between RIP neighbors. The type and password must match exactly for the RIP message to be considered authentic and processed.<br><br>The <b>no</b> form of the command removes the authentication type from the configuration and effectively disables authentication. |
| <b>Default</b>     | no authentication-type                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <i>none</i> — No authentication is used.<br><br><i>simple</i> — A simple clear-text password is sent.<br><br><i>md5</i> — MD5 authentication is used.                                                                                                                                                                             |

## check-zero

|                    |                                                                                                                                                                                                                                                                                    |

| <b>Description</b> | <p>This command enables the use of split-horizon. RIP uses split-horizon with poison-reverse to protect from such problems as “counting to infinity”. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).</p> <p>The <b>split-horizon disable</b> command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.</p> <p>This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (<b>no split-horizon</b>), the setting from the less specific level is inherited by the lower level.</p> <p>The <b>no</b> form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.</p> |
| <b>Default</b>     | enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b> | This command specifies the import policies to be used to control routes advertised from RIP neighbors. By default, RIP accepts all routes from configured RIP neighbors. Import policies can be used to limit or modify the routes accepted and their corresponding parameters and metrics.<br><br>The <b>no</b> form of the command removes all route policy names from the import list. |
| <b>Default</b>     | no import                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <i>policy</i> — A route policy statement name.                                                                                                                                                                                                                                                                                                                                            |

## message-size

|                    |                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>message-size</b> <i>max-num-of-routes</i><br><b>no message-size</b>                             |
| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor |
| <b>Description</b> | This command sets the maximum number of routes per RIP update message.                             |

## VPNRN Service Configuration Commands

The **no** form of the command resets the maximum number of routes back to the default of 25.

|                   |                        |
|-------------------|------------------------|
| <b>Default</b>    | no message-size        |
| <b>Parameters</b> | <i>size</i> — Integer. |
| <b>Default</b>    | 25                     |
| <b>Values</b>     | 25 — 255               |

### metric-in

|                    |                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>metric-in</b> <i>metric</i><br><b>no metric-in</b>                                                                                                                          |
| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor                                                                             |
| <b>Description</b> | This command sets the metric added to routes that were received from a RIP neighbor.<br>The <b>no</b> form of the command reverts the <i>metric</i> value back to the default. |
| <b>Default</b>     | no metric-in                                                                                                                                                                   |
| <b>Parameters</b>  | <i>metric</i> — The value added to the metric of routes received from a RIP neighbor, expressed as a decimal integer.                                                          |
| <b>Values</b>      | 1 — 16                                                                                                                                                                         |

### metric-out

|                    |                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>metric-out</b> <i>metric</i><br><b>no metric-out</b>                                                                                                                                                                                |
| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor                                                                                                                                     |
| <b>Description</b> | This command sets the metric added to routes that were exported into RIP and advertised to RIP neighbors.<br>The <b>no</b> form of the command removes the command from the config and resets the metric-in value back to the default. |
| <b>Default</b>     | no metric-out                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <i>metric</i> — The value added to the metric for routes exported into RIP and advertised to RIP neighbors, expressed as a decimal integer.                                                                                            |
| <b>Values</b>      | 1 — 16                                                                                                                                                                                                                                 |

## preference

|                    |                                                                                                                                                                                                      |               |         |                |     |

| <b>Description</b> | This command allows the RIP metric to be used to set the MP-BGP MED attribute when RIP is used as the CE-PE routing protocols for VPRNs. This is similar to the way the OSPF metric can be used to set the MP-BGP metric when OSPF is used as the CE-PE protocol.<br><br>MP-BGP will use the RIP metric to set the MED attribute, this attribute gets flooded through out the MP-BGP peers and will then be used to set the RIP metric at the other end and re-advertise the RIP metric to the far-end RIP neighbors. |

## receive

|                    |                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b> | This command configures the type(s) of RIP updates that will be accepted and processed.<br><br>If <b>both</b> or <b>version-2</b> is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.<br><br>If <b>version-1</b> is specified, the router only listens for and accepts packets sent to the broadcast address. |

This control can be issued at the global, group or interface level. The default behavior accepts and processes both RIPv1 and RIPv2 messages.

The **no** form of the command resets the type of messages accepted to both.

|                   |                                                                                                                                                                                                                                                                                              |

| <b>Description</b> | <p>This command specifies the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.</p> <p>If <b>version-1</b> is specified, the router only listens for and accepts packets sent to the broadcast address.</p> <p>The <b>no</b> form of this command resets the type of messages sent back to the default value.</p> |
| <b>Default</b>     | <b>no send</b> — Sends RIPv2 to the broadcast address.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <b>broadcast</b> — Send RIPv2 formatted messages to the broadcast address.<br><b>multicast</b> — Send RIPv2 formatted messages to the multicast address.<br><b>none</b> — Do not send any RIP messages (i.e. silent listener).<br><b>version-1</b> — Send RIPv1 formatted messages to the broadcast address.<br><b>both</b> — Send both RIP v1 & RIP v2 updates to the broadcast address.                                                                                     |

## timers

|                    |                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>timers update timeout flush</b><br><b>no timers</b>                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor                                                                                         |
| <b>Description</b> | <p>This command sets the values for the update, timeout, and flush timers.</p> <ul style="list-style-type: none"> <li>Update timer — Determines how often RIP updates are sent.</li> </ul> |

- Timeout timer — If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.
- Flush timer — Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of the command resets all timers to their default values of 30, 180, and 120 seconds respectively.

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| <b>Default</b>    | no timers                                                |
| <b>Parameters</b> | <i>update</i> — The RIP update timer value in seconds.   |
| <b>Values</b>     | 1 — 600                                                  |

| <b>Context</b>     | config>service>vprn>rip                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b> | <p>This command creates a context for configuring a RIP group of neighbors. RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.</p> <p>The <b>no</b> form of the command deletes the RIP neighbor interface group. Deleting the group will also remove the RIP configuration of all the neighbor interfaces currently assigned to this group.</p> |
| <b>Default</b>     | <b>no group</b> — No group of RIP neighbor interfaces defined                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <i>group-name</i> — The RIP group name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.                                                                                                                                                      |

## neighbor

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Syntax</b>      | <b>[no] neighbor</b> <i>ip-int-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>rip>group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>This command creates a context for configuring a RIP neighbor interface. By default, interfaces are not activated in any interior gateway protocol such as RIP unless explicitly configured.</p> <p>The <b>no</b> form of the command deletes the RIP interface configuration for this interface. The <b>shutdown</b> command in the <b>config&gt;router&gt;rip&gt;group group-name&gt;neighbor ip-int-name</b> context can be used to disable an interface without removing the configuration for the interface.</p>                                                                                                                    |
| <b>Default</b>     | <b>no neighbor</b> — No RIP interfaces defined                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b>  | <p><i>ip-int-name</i> — The IP interface name. Interface names must be unique within the group of defined IP interfaces for <b>config router interface</b> and <b>config service vprn interface</b> commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.</p> <p>If the IP interface name does not exist or does not have an IP address configured an error message will be returned.</p> |

## IPSec Configuration Commands

### ipsec

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>Syntax</b>      | <b>ipsec</b>                                                  |
| <b>Context</b>     | config>service>vpn>ipsec                                      |
| <b>Description</b> | This command enables the context to configure IPSec policies. |
| <b>Default</b>     | none                                                          |

### security-policy

|                    |                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <b>security-policy</b> <i>security-policy-id</i> [ <b>create</b> ]<br><b>no security-policy</b> <i>security-policy-id</i>                                                                                                                                                                       |
| <b>Context</b>     | config>service>vpn>ipsec                                                                                                                                                                                                                                                                        |
| <b>Description</b> | This command configures a security policy to use for an IPSec tunnel.                                                                                                                                                                                                                           |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <i>security-policy-id</i> — specifies a value to be assigned to a security policy.<br><b>Values</b> 1 — 8192<br><b>create</b> — Keyword used to create the security policy instance. The <b>create</b> keyword requirement can be enabled/disabled in the <b>environment&gt;create</b> context. |

## ipsec-interface

|                    |                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>ipsec-interface</b> <i>ip-int-name</i> [create]<br><b>no ipsec-interface</b> <i>ip-int-name</i> |
| <b>Context</b>     | config>service>vpn                                                                                 |
| <b>Description</b> | This command configures an IPSec interface.                                                        |

- Parameters** *ip-int-name* — Specifies the name of the IP interface. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.
- Values** 1 — 32 characters maximum
- create** — Keyword used to create the IPSec interface instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## address

- Syntax** **[no] address** {*ip-address/mask* | *ip-address netmasks*}
- Context** config>service>vprn>ipsec-if
- Description** This command assigns an IP address/IP subnet to the interface
- Parameters** *ip-address* — Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).
- mask* — The subnet mask in dotted decimal notation. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.252. Note that a mask of 255.255.255.255 is reserved for system IP addresses.
- netmask* — Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

## ip-mtu

- Syntax** **ip-mtu** *octets*  
**no ip-mtu**
- Context** config>service>vprn>ipsec-if
- Description** This command configures the IP maximum transmit unit (packet) for this interface. The **no** form of the command returns the default value.
- Default** no ip-mtu
- Parameters** *octets* — Specifies the MTU size for this interface.
- Values** 512 — 9000

## tunnel

|                    |                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>tunnel</b> <i>ipsec-tunnel-name</i> [ <b>create</b> ]<br><b>no tunnel</b> <i>ipsec-tunnel-name</i>                                                                                                                                                                                                                                                                                                  |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command specifies an IPsec tunnel name. An IPsec client sets up the encrypted tunnel across public network. The 7750-SR IPsec MDA acts as a concentrator gathering, and terminating these IPsec tunnels into an IES or VPRN service. This mechanism allows as service provider to offer a global VPRN service even if node of the VPRN are on an uncontrolled or insecure portion of the network. |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <i>ipsec-tunnel-name</i> — Specifies an IPsec tunnel name up to 32 characters in length.<br><b>create</b> — Keyword used to create the IPsec tunnel instance. The <b>create</b> keyword requirement can be enabled/disabled in the <b>environment&gt;create</b> context.                                                                                                                               |

## bfd-designate

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] <b>bfd-designate</b>                                                      |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                 |
| <b>Description</b> | This command specifies whether this IPsec tunnel is the BFD designated tunnel. |
| <b>Default</b>     | none                                                                           |

## bfd-enable

|                    |                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] <b>bfd-enable service</b> <i>service-id</i> <b>interface</b> <i>interface-name</i> <b>dst-ip</b> <i>ip-address</i>                                                                                                                                                                                                                                                        |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | This command assign a BFD session provide heart-beat mechanism for given IPsec tunnel. There can be only one BFD session assigned to any given IPsec tunnel, but there can be multiple IPsec tunnels using same BFD session. BFD control the state of the associated tunnel, if BFD session goes down, system will also bring down the associated non-designated IPsec tunnel. |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <b>service</b> <i>service-id</i> — Specifies where the service-id that the BFD session resides.<br><b>interface</b> <i>interface-name</i> — Specifies the name of the interface used by the BFD session.<br><b>dst-ip</b> <i>ip-address</i> — Specifies the destination address to be used for the BFD session.                                                                |

## dynamic-keying

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] dynamic-keying</b>                                |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel            |
| <b>Description</b> | This command enables dynamic keying for the IPsec tunnel. |
| <b>Default</b>     | none                                                      |

## auto-establish

|                    |                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] auto-establish</b>                                                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                                                                                                                                 |
| <b>Description</b> | This command specifies whether to attempt to establish a phase 1 exchange automatically.<br>The <b>no</b> form of the command disables the automatic attempts to establish a phase 1 exchange. |
| <b>Default</b>     | no auto-establish                                                                                                                                                                              |

## transform

|                    |                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>transform</b> <i>transform-id</i> [ <i>transform-id...</i> (up to 4 max)]<br><b>no transform</b>                                                                                                                                   |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel>dynamic-keying                                                                                                                                                                         |
| <b>Description</b> | This command associates the IPSec transform sets allowed for this tunnel. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred). |
| <b>Default</b>     | none                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <i>transform-id</i> — Specifies the value used for transforms for dynamic keying.<br><b>Values</b> 1 — 2048                                                                                                                           |

## local-gateway-address

|                    |                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>local-gateway-address</b> <i>ip-address</i> <b>peer</b> <i>ip-address</i> <b>delivery-service</b> <i>service-id</i><br><b>no local-gateway-address</b>                        |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                                                                                                                   |
| <b>Description</b> | This command specifies the local gateway address used for the tunnel and the address of the remote security gateway at the other end of the tunnelremote peer IP address to use. |
| <b>Default</b>     | The base routing context is used if the delivery-router option is not specified.                                                                                                 |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><i>ip-address</i> — IP address of the local end of the tunnel.</p> <p><b>delivery-service</b> <i>service-id</i> — The ID of the IES or VPRN (front-door) delivery service of this tunnel. Use this service-id to find the VPRN used for delivery.</p> <p><b>Values</b>      <i>service-id</i>: 1 — 2147483648</p> <p>                 <i>svc-name</i>: Specifies an existing service name up to 64 characters in length.</p> |

| <b>Description</b> | This command configures the information required for manual keying SA creation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>     | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>security-entry-id</i> — Specifies the ID of an SA entry.</p> <p><b>Values</b>      1 — 16</p> <p><b>encryption-key</b> <i>encryption-key</i> — specifies the key used for the encryption algorithm.</p> <p><b>Values</b>      none or 0x0..0xFFFFFFFF...(max 64 hex nibbles)</p> <p><b>authentication-key</b> <i>authentication-key</i> —</p> <p><b>Values</b>      none or 0x0..0xFFFFFFFF...(max 40 hex nibbles)</p> <p><b>spi</b> <i>spi</i> — Specifies the SPI (Security Parameter Index) used to look up the instruction to verify and decrypt the incoming IPSec packets when the direction is inbound. When the direction is outbound, the SPI that will be used in the encoding of the outgoing packets. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.</p> <p><b>Values</b>      256 — 16383</p> <p><b>transform</b> <i>transform-id</i> — specifies the transform entry that will be used by this SA entry. This object should be specified for all the entries created which are manual SAs. If the value is dynamic, then this value is irrelevant and will be zero.</p> |

**Values** 1 — 2048

**direction** {**inbound** | **outbound**} — Specifies the direction of an IPsec tunnel.

## replay-window

|                    |                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>replay-window</b> { <b>32</b>   <b>64</b>   <b>128</b>   <b>256</b>   <b>512</b> }<br><b>no replay-window</b>                                                                                                              |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                                                                                                                                                                |
| <b>Description</b> | This command specifies the size of the anti-replay window. The anti-replay window protocol secures IP against an entity that can inject messages in a message stream from a source to a destination computer on the Internet. |
| <b>Default</b>     | none                                                                                                                                                                                                                          |
| <b>Parameters</b>  | { <b>32</b>   <b>64</b>   <b>128</b>   <b>256</b>   <b>512</b> } — Specifies the size of the SA anti-replay window.                                                                                                           |

## security-policy

|                    |                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>security-policy</b> <i>security-policy-id</i><br><b>no security-policy</b>                                                 |
| <b>Context</b>     | config>service>vprn>ipsec-interface>sap>tunnel                                                                                |
| <b>Description</b> | This command configures an IPSec security policy. The policy may then be associated with tunnels defined in the same context. |
| <b>Default</b>     | none                                                                                                                          |

# Versatile Service Module

---

## In This Chapter

This chapter provides information about configuring Versatile Service Module (VSM) parameters.

Topics in this chapter include:

- [VSM Overview on page 1430](#)
  - [Multiple System Solution on page 1430](#)
  - [Hybrid Service Solution on page 1430](#)
  - [Single System Multiple Interface Solution on page 1431](#)
  - [Full Feature Internal Service Cross Connect Solution on page 1431](#)
- [Functional Components on page 1432](#)
  - [Service Cross Connect Adapter \(CCA\) on page 1432](#)
  - [Internal Service CCAG on page 1433](#)
  - [Internal Service Cross Connect Identifier \(CCID\) on page 1433](#)
  - [CCAG Bandwidth and Resiliency on page 1434](#)
  - [CCAG SAP QoS on page 1435](#)

## VSM Overview

In many instances, it is desirable to process a stream of packets from one or more subscribers through multiple features that, for one reason or another, are mutually exclusive in the 7750 SR forwarding planes. For example, multiple subscriber sites could be bridged together through a VPLS instance while requiring in-service high speed Internet access (IES). Functionality of this type can be handled several ways:

- [Multiple System Solution on page 1430](#)
- [Hybrid Service Solution on page 1430](#)
- [Single System Multiple Interface Solution on page 1431](#)
- [Full Feature Internal Service Cross Connect Solution on page 1431](#)

For the purpose exploring each of these solutions, the VPLS and IES service interconnection scenario is examined.

---

### Multiple System Solution

The multiple system (meaning multiple boxes) solution splits the functionality between two distinct nodes. The first node performs the VPLS bridging functions while maintaining per site QoS and accounting functions. The second node connects to the first node as a destination in the VPLS service. This connection could be configured as a SAP to SAP or a pseudo-wire spoke connection.

---

### Hybrid Service Solution

The hybrid solution merges the two services into a single, common service. This can be accomplished for our example service interconnect by either supporting a virtual IP interface in the context of a VPLS service or providing an IP-only solution that provides for multiple SAPs on a single IES IP interface.

The hybrid solution does not provide for separate accounting and QoS for packets forwarded (or routed) between the subscriber sites and the packets routed to next-hops outside the subscriber domain.

## Single System Multiple Interface Solution

The single system solution retains the same SLA enforcement and accounting capabilities as the multiple system solution but with the advantage of only requiring a single chassis. This is accomplished by defining the VPLS and IES services on different physical interfaces of the same type. Both interfaces are defined as access types and use the same encapsulation type (i.e., Dot1q). The services are configured with the same encapsulation values and the physical interfaces are interconnected using an external jumper cable. To avoid single point of failure issues, Link Aggregation Groups (LAG) can be used to provide an N-to-1 redundancy mechanism (as well as adding more interconnect bandwidth).

---

## Full Feature Internal Service Cross Connect Solution

The internal service cross connect solution provides similar functionality as the single system multiple interface solution while attempting to minimize the cost, density and provisioning issues inherent to the external port jumper method. The internal service cross connection feature uses new service provisioning objects and a new type of hardware adapter to manage internal service cross connections. The remainder of this document describes the internal service cross connection feature.

## Functional Components

The internal service cross connection feature uses a new adapter designed to fit within an IOM (Input Output Module) MDA (Media Dependant Adapter) slot. One or more adapters are placed into a cross connect aggregation group (CCAG). To cross connect two services, each service is bound to the same cross connect aggregation group using the same cross connection identifier. This section introduces each object and gives a brief explanation of its function.

---

### Service Cross Connect Adapter (CCA)

The VSM Cross Connect Adapter (CCA) is a type of MDA for 7750 SR platforms designed to provide an egress to ingress forwarding plane interconnection. When a CCA is installed in an MDA slot, a set of virtual ports is available to the system providing the ability to extend packet processing through an extra set of egress and ingress forwarding paths that CCA interfaces.

Unlike external port connections which utilize two TX-RX paths, a CCA interconnects the egress forwarding path on the IOM directly to the ingress forwarding path. This eliminates the need for the physical port MAC, PHY, cable and other MDA-specific components producing a less costly and more reliable adapter. The complete 10G+ forwarding path is available allowing single conversations up to 10G.

Bandwidth is utilized more efficiently than with externally cabled ports. Typically, the offered load presented to each side of the cross-connect port-pair is asymmetric in nature. When physical ports are used to cross connect services, each service is egress bandwidth-limited to the link speed of the TX-RX path.

If one TX-RX path is under-utilized, egress services on the other path cannot make use of the available bandwidth. Since the CCA is forwarding all services over the same path, all the available bandwidth can be used.

The forwarding plane that the CCA interconnects maintains the complete egress and ingress features of the services it is interconnecting. This includes the ability to remap QoS, enforce policing and shaping, and provide ingress and egress accounting for each service.

## Internal Service CCAG

VSM CCAs are placed in a CCAG. A CCAG provides a mechanism to aggregate multiple CCAs into a single forwarding group. The CCAG uses conversation hashing to dynamically distribute cross-connect traffic to the active CCAs in the aggregation group. In the event that an active CCA fails or is removed from the group, the conversation hashing function redistributes the traffic over the remaining active CCAs within the group.

The conversation hashing mechanism performed for a CCAG is identical to the hashing functions performed for Ethernet LAGs (Link Aggregation Groups).

## Internal Service Cross Connect Identifier (CCID)

Services and IP interfaces are bound to a CCAG through a CCID (Cross Connect Identifier). When two services or a service and an IP interface are assigned the same CCID the CCAG attempts to provide a cross connection path between the objects. The CCID enables multiple pairs of cross connected services to share the same CCAG.

OSSG212

**Figure 140: Internal Service Interconnection Using CCID**

From a service perspective, a CCID is an object that not only binds two services together, but also provides the attachment point for the ingress and egress QoS, filtering, and accounting parameters. When considered in conjunction with the CCAG, it allows the actual cross connection path (through the CCAs) to be indirectly associated with the services using the CCAG and maintains a simplified provisioning model over port level cross connected services.

## CCAG Bandwidth and Resiliency

A CCAG is an intermediate object between cross-connected objects (SAPs and network IP interfaces) and the CCAs. A CCAG is similar to a Link Aggregation Group (LAG) of Ethernet ports and uses the same underlying mechanisms to distribute conversations over multiple CCAs and converge when a CCA becomes active or inactive in the group.

When a CCAG is created, the system allocates six Ethernet LAGs for the virtual ports on the CCAs placed into the group. Each virtual port is placed into a respective LAG. For instance, each time a CCA is placed into the CCAG, virtual port 1 on that CCA is placed into the first LAG allocated to that CCAG. Virtual port 2 is placed into the second LAG on the CCAG. Virtual ports 3 through 6 are placed into their respective LAGs as well.

Using the set of LAGs provides a mechanism for conversation hashing or service mapping over all member CCAs in the CCAG. In the unlikely event that a CCA fails or is removed from the CCAG, the system will automatically modify the conversation hashing or service mapping on the CCAG to represent the available active CCAs.

---

## CCAG LAG Attributes

Unlike a user-provisioned LAG, the internal LAGs do not use a primary member to control the typical port level configuration parameters. Instead, the parameters usually found at the port level are implemented directly on the CCAG internal LAG representative objects (**sap-sap**, **sap-net** and **net-sap**) for each path. These commands perform functions such as MTU definition and locally administering the MAC address.

The default unique MAC addresses used each internal LAG within the CCAG are automatically assigned from the chassis MAC pool. These MAC addresses are assigned from the pool based on an offset relative to the CCAG-ID. The same set of default MAC addresses are assigned each time a specific CCAG-ID is created.

Although a CCAG uses internal LAG mechanisms, the LACP protocol is not supported or required. LAG resources used for CCAG purposes are not exposed to the user.

---

## CCAG Traffic Distribution

A CCAG uses both direct object mapping and conversation hashing to distribute traffic over multiple CCAs. To understand how each object type's ingress traffic is distributed over the active CCAs in a CCAG, refer to the LAG and ECMP Hashing section of the 7750 SR OS Interface Configuration Guide.

## CCAG SAP QoS

When a SAP is created on a CCAG, the service queues defined by the ingress and egress QoS policy are created on each CCA member in the CCAG. Packets are forwarded to the egress queues based on the hashing or service mapping enforced by the LAG functions internal to the system. Packets are received on a CCA ingress queue based on which CCA handled the egress processing. Each ingress and egress hardware queue buffering and rate parameters are managed by the system based on one of two models governed by the state of the LAG QoS adaptation setting. The adaptation state also governs the application of hierarchical virtual schedulers associated with the SAP queues.

---

### Link Level CCAG SAP QoS Adaptation

Link level QoS adaptation is set when the CCA access QoS adaptation flag is set to **link**. Link-level distribution informs the system that a service queue's buffering and rate parameters should be applied directly to each hardware queue representing the service queue. For example, when a service queue is configured with a rate equal to 10Mbps, each corresponding CCA hardware queue will be configured with a rate of 10Mbps. Given many flows conversation hashing to different CCAs, the maximum forwarded rate will be the 10Mbps multiplied by the number of active CCAs.

When a link-level adaptation service queue is a child to a parent virtual scheduler, the parent scheduler and the rest of the scheduler hierarchy is implemented per CCA. An instance of the scheduler policy is maintained per CCA.

When a CCAG SAP is a member of a Multi-Service Site (MSS), all SAPs in the MSS must be CCAG SAPs created on the same CCAG-ID.

---

### Distributed CCAG SAP QoS Adaptation

Distributed QoS adaptation is set when the CCA access QoS adaptation flag is set to **distribute**. The distributed QoS parameter setting informs the system that a service queue's buffering and rate parameters should be distributed between the active CCAs in the CCAG. For example, when a service queue is configured with a rate equal to 10Mbps and two CCAs are active in the CCAG, each corresponding CCA hardware queue will be configured with a rate of 5Mbps (1/2 of the provisioned service queue parameters). Given many flows conversation hashing to different CCAs, the maximum forwarded rate will be limited to 10Mbps.

When a distributed adaptation service queue is a child to a parent virtual scheduler, the parent scheduler and the rest of the scheduler hierarchy is implemented on each IOM with an active member CCA from the CCAG. The scheduler parameters are divided amongst the IOMs with active CCAs based on the total number of active CCAs. If there are three active CCAs in the

CCAG, each CCA represents 1/3 of rate and CIR defined for each scheduler in the policy. If two of the active CCAs are on one IOM and one active CCA is on a second IOM, the first IOM would receive 2/3 of the rate and CIR for each scheduler and the second IOM would receive 1/3. The overall distribution is based on the following equation:

$$\text{IOM Scheduler Rate} = \text{Policy Scheduler Rate} * (\text{Number Active CCAs on IOM} / \text{Total Active CCAs})$$
$$\text{IOM Scheduler CIR} = \text{Policy Scheduler CIR} * (\text{Number Active CCAs on IOM} / \text{Total Active CCAs})$$

When a CCAG SAP is a member of a multi-service site, all SAPs in the multi-service site must be CCAG SAPs created on the same CCAG-ID.

# Configuration Process Overview

Figure 141 displays the process to provision VSM parameters.

Figure 141: VSM/CCAG Configuration and Implementation Flow

## Configuration Notes

The following information describes provisioning caveats:

- Services can only be provisioned on Ethernet SAPs.
- The cross connections supported are:
  - IP to all Layer 2 SAPs
  - SAP to SAP of all types with the exception of:
    - A cross connection within the same service.
    - An IES service to another IES service.

## Configuring VSM and CCAG with CLI

This section provides information to configure cards, MDAs, and ports.

Topics in this section include:

- [Configuring VSM and CCAG with CLI on page 1439](#)
- [Basic Configuration on page 1440](#)
- [Common Configuration Tasks on page 1443](#)
- [Service Management Tasks on page 1453](#)

## Basic Configuration

The following fields require specific input (there are no defaults) to configure VSM:

- CCAG ID
- For a local service, two SAPs must be configured specifying the source and destination nodes and ports
- For a distributed service, one SAP and one SDP must be specified

The following example displays VSM defaults when a *ccag-id* is created.

```
A:ALA-48>config>vsm# info detail
#-----
echo "Versatile Services Module Configuration"
#-----

 no shutdown
 exit
exit

A:ALA-48>config>vsm#
```

## Common Configuration Tasks

This section provides a brief overview of the tasks that should be performed to configure VSM on an MDA, router, router interface, and services.

- Provision one or more CCA as MDAs in the system.
  - Create VSM CCAGs on the system.
  - Provision CCAG path bandwidth, path weighting, and overall bandwidth parameters.
  - Provision member CCAs into a CCAG.
  - Provision service SAPs using a CCAG, path, and CCID for cross connect purposes.
  - Bind routed network IP interfaces to a CCAG, path, and CCID for cross connect purposes.
- 

## Configure VSM CCAG Components

Use the CLI syntax displayed below to configure the following entities:

- [Provision VSM on an MDA on page 1443](#)
  - [Cross Connecting Network IP Interfaces on page 1448](#)
  - [Provision CCAG Parameters on page 1445](#)
  - [Configure Path Components on page 1446](#)
  - [Cross Connecting Services on page 1449](#)
- 

## Provision VSM on an MDA

Before a CCA module may be utilized in the system, the CCA must be provisioned into an MDA slot. The MDA provisioning command must be modified to support provisioning a CCA adaptor type. Up to 8 member CCAs can be configured per CCAG.

**CLI Syntax:** `config>card# mda mda-number mda-type {other-MDA-type|cca}`

The following example displays the command usage to provision CCA on an MDA:

**Example:**

```
config# card 10
config>card# mda 1
config>card>mda# mda-type vsm-cca
config>card>mda# exit
config>card#
```

The following example displays the configuration:

```
A:ALA-48>config>card# info

card-type iom-20g
mda 1
 mda-type vsm-cca
exit
mda 2
 mda-type m20-1gb-tx
exit

A:ALA-48>config>card#
```

## Provision CCAG Parameters

Once a CCA is provisioned into the system, it must be placed in a Cross Connect Aggregation Group (CCAG) to be used by cross connect objects. Besides CCA membership, the CCAG also supports bandwidth control parameters (see [Configure Path Components on page 1446](#)) used to manipulate forwarding distribution between objects in the alpha and beta path groups and the aggregate rate allowed on the CCA.

Use the following CLI syntax to provision CCAG components.

**CLI Syntax:**

```
config>vsm#
 ccag ccag-id [create]
 cca-rate kilobits-per-second
 description description-string
 member-cca card-slot/mda-number
 path {a|b}
 no shutdown
```

The following example displays the command usage to provision CCAG components:

**Example:**

```
config>vsm# ccag 1
config>vsm>ccag# description "VSM test"
config>vsm>ccag# cca-rate 1000000
config>vsm>ccag# member-cca 10/1
```

The following example displays the configuration:

```
A:ALA-48>config>vsm# info

 ccag 1 create
 description "VSM test"
 cca-rate 1000000
 member-cca 10/1
 exit
...

A:ALA-48>config>vsm#
```

## Configure Path Components

Each CCA is divided into two distinct paths for bandwidth management purposes. One path is identified as alpha (a) and the other beta (b). The significance of each path for bandwidth distribution is dependent on the relative path weights each path is given in relationship to the other. A maximum path rate may also be defined allowing the provisioning of a maximum cap on the aggregate bandwidth allowed to the SAP or IP interface queues associated with the path.

Each path is separated into three other contexts; SAP-2-SAP (sap-sap), SAP-2-Net (sap-net) and Net-2-SAP (net-sap). Each path context allows for the definition of the features that are usually associated with physical ports on other MDAs in the system. These include buffer pool management, ingress network queue definitions and accounting policy control.

Use the following CLI syntax to provision path components.

- Net SAP
- SAP net
- SAP SAP

Use the following CLI syntax to provision CCAG path components.

**CLI Syntax:**

```
config>vsm>ccag#
 path {a|b}
 net-sap
 accounting-policy policy-id
 collect-stats
 egress
 pool
 resv-cbs percent-or-default
 slope-policy slope-policy-name
 mac ieee-address
 mtu mtu-bytes
 queue-policy queue-policy-name
 rate kilo-bits-per-second [aggregate|cca]
 sap-net
 egress
 pool
 resv-cbs percent-or-default
 slope-policy slope-policy-name
 ingress
 pool
 resv-cbs percent-or-default
 slope-policy slope-policy-name
 mac ieee-address
 mtu mtu-bytes
 sap-sap
```

```

 egress
 pool
 resv-cbs percent-or-default
 slope-policy slope-policy-name
 ingress
 pool
 resv-cbs percent-or-default
 slope-policy slope-policy-name
 mac ieee-address
 mtu mtu-bytes
 weight path-weight

```

The following displays a CCAG path configuration example:

```

A:ALA-48>config>vsm# info

 ccag 1 create
 description "VSM test"
 member-cca 10/1
 path a
 weight 100
 exit
 path b
 weight 100
 rate 99999999
 exit
 no shutdown
 exit
...

A:ALA-48>config>vsm#

```

## Cross Connecting Network IP Interfaces

To support cross connection between services and network IP interfaces, the network interface port command has been augmented to allow the binding of the IP interface to a **ccag** *cc-id*. Similar to service CCAG SAPs, the network IP interface port binding command must reference the ccag-id, the CCA path (.a or .b) and the *cc-id* used by the service CCAG SAP on the other CCA path.

Use the following CLI syntax to configure CCAG a network IP interface.

**CLI Syntax:**

```
config# router [router-name]
 interface interface-name
 port ccag-ccag-id.{a|b} [.net-sap]:cc-id
 address {ip-address/mask | ip-address netmask} [broadcast
 all-ones|host-ones]
 mac ieee-address
```

The following displays CCAG network IP interface configuration examples:

```
A:ALA-48>config>router# info
#-----
echo "IP Configuration"
#-----
...
 interface "ccanet"
 address 2.1.1.1/24
 port ccag-1.a.net-sap:200
 mac 00:00:00:00:00:ff
 exit
 interface "ccanet2"
 address 4.1.1.1/24
 port ccag-1.b.net-sap:300
 static-arp 4.1.1.2 00:00:00:00:00:aa
 exit
...
#-----
A:ALA-48>config>router#
```

## Cross Connecting Services

Services are provisioned onto a CCAG using a special CCAG SAP definition. CCAG SAPs must reference a *ccag-id*, a CCA path (a or b), a pairing type (sap-sap or sap-net) and a unique *cc-id*. The *ccag-id* identifies the group of CCAs that will be used for forwarding packets associated with the SAP. The path identifies the bandwidth control grouping used to manage CCA egress bandwidth. The pairing type helps the system identify which buffering resources will be used to manage egress queuing of packets. Finally, the *cc-id* is used to explicitly cross connect the SAP to another SAP or network IP interface configured with the same *cc-id*.

- [Epipe on page 1449](#)
- [VPLS on page 1450](#)
- [IES on page 1451](#)
- [VPRN on page 1452](#)

### Epipe

**CLI Syntax:** `config>service#  
           epipe service-id [customer customer-id]  
           sap ccag-ccag-id.{a|b} [.sap-net|.sap-sap]:cc-id [create]`

The following displays an Epipe SAP configuration referencing a *ccag-id*:

```
A:ALA-48>config>service# info

...
 epipe 103 customer 6 vpn 103 create
 sap 3/1/1.1.1 create
 exit
 sap ccag-1.a:100 create
 exit
 no shutdown
 exit

A:ALA-48>config>service#
```

### VPLS

**CLI Syntax:** `config>service#`  
                  `vpls service-id [customer customer-id]`  
                  `sap ccag-ccag-id.{a|b} [.sap-net|.sap-sap]:cc-id [create]`

The following displays a VPLS SAP configuration referencing a *ccag-id*:

```
A:ALA-48>config>service# info

...
 vpls 740 customer 1 vpn 740 create
 stp
 shutdown
 exit
 sap 1/1/19:1 create
 exit
 sap 1/1/19:2 create
 ingress
 qos 3
 exit
 exit
 sap ccag-1.a:456 create
 ingress
 qos 3
 exit
 egress
 qos 1010
 exit
 exit
 no shutdown
 exit
...

A:ALA-48>config>service#
```

**IES**

**CLI Syntax:** config>service#  
           ies *service-id* [customer *customer-id*]  
           interface *ip-interface-name*  
           sap ccag-*ccag-id*.{a|b}[.sap-net|.sap-sap]:*cc-id* [create]  
           ate]

The following displays an IES SAP configuration referencing a *ccag-id*:

```
A:ALA-48>config>service# info

...
 ies 200 customer 1 create
 interface "ccaiesif" create
 address 8.1.1.1/24
 sap ccag-1.b:456 create
 ingress
 qos 3
 exit
 egress
 qos 1010
 exit
 exit
 exit
 no shutdown
exit
...

A:ALA-48>config>service#
```

### VPRN

**CLI Syntax:** `config>service#  
vprn service-id [customer customer-id]  
interface ip-interface-name  
sap ccag-ccag-id.{a|b} [.sap-net|.sap-sap]:cc-id [create]`

**Example:** `config>service# vprn 701 customer 2 create  
config>service>vprn$ interface "VSM Test" create  
config>service>vprn>if$ sap ccag-2.a:100 create  
config>service>vprn>if>sap$ no shutdown  
config>service>vprn>if>sap# exit  
config>service>vprn>if# exit  
config>service>vprn# no shutdown`

The following output displays the configuration:

```
A:ALA-48>config>service>vprn# info

 interface "VSM Test" create
 sap ccag-2.a:100 create
 exit
 exit
 no shutdown

A:ALA-48>config>service>vprn#
```

## Service Management Tasks

This section discusses the following service management tasks:

- [Modifying or Deleting a VSM MDA on page 1453](#)
  - [Modifying CCAG Parameters on a Network IP Interface on page 1454](#)
  - [Modifying CCAG Parameters on page 1455](#)
  - [Modifying Path Parameters on page 1456](#)
  - [Modifying Service Parameters on page 1458](#)
- 

### Modifying or Deleting a VSM MDA

To change or delete a VSM MDA already provisioned for a specific slot, first you must shut down and remove all service SAP and router interface associations ([page 1454](#)) to delete the VSM MDA from the configuration.

**CLI Syntax:**

```
config> card slot-number
 [no] mda mda-number
 [no] mda-type mda-type
 shutdown
```

**Example:**

```
config# card 10
config>card# mda 1
config>card>mda# mda-type vsm-cca
config>card>mda# shutdown
config>card>mda# exit
config>card# no mda 1
```

The following example displays the configuration:

```
A:ALA-48>config>card# info

 card-type iom-20g
 mda 2
 mda-type vsm-cca
 exit

A:ALA-48>config>card#
```

## Modifying CCAG Parameters on a Network IP Interface

**CLI Syntax:** `config# router [router-name]  
                   interface interface-name  
                   shutdown  
                   no port ccag-ccag-id.{a|b} [.net-sap]:cc-id`

The following example displays the command usage:

**Example:**       `config>router# interface ccanet  
                   config>router>if# address 3.1.1.1/24  
                   config>router>if# exit`

```
A:ALA-48>config>router# info

#-----
echo "IP Configuration"
#-----
...
 interface "ccanet"
 address 3.1.1.1/24
 port ccag-1.a.net-sap:200
 mac 00:00:00:00:00:ff
 exit
 interface "ccanet2"
 address 4.1.1.1/24
 port ccag-1.b.net-sap:300
 static-arp 4.1.1.2 00:00:00:00:00:aa
 exit
...
#-----
A:ALA-48>config>router#
```

## Modifying CCAG Parameters

**CLI Syntax:** config>vsm#

```

ccag ccag-id [create]
no ccag ccag-id [force]
access {link|distribute}
 adapt-qos
cca-rate kilobits-per-second
no cca-rate
description description-string
no description
[no] member-cca card-slot/mda-number
path {a|b}
no shutdown

```

The following example displays the command usage to provision CCAG components:

**Example:**config>vsm# ccag 1

```

config>vsm>ccag# access
config>vsm>ccag>access#
config>vsm>ccag>access# adapt-qos distribute
config>vsm>ccag>access# exit
config>vsm>ccag# member-cca 10/2
config>vsm>ccag# exit

```

The following example displays the configuration:

```

A:ALA-48>config>vsm# info

 ccag 1 create
 description "VSM test"
 member-cca 10/1
 member-cca 10/2
 path a
 weight 100
 exit
 path b
 weight 100
 rate 99999999
 exit
 no shutdown
 exit
...

A:ALA-48>config>vsm# ccag 1

```

## Modifying Path Parameters

The following example displays the command usage to provision CCAG path parameters:

```

Example:config>vsm# ccag 1
 config>vsm>ccag# path a
 config>vsm>ccag>path# no weight
 config>vsm>ccag>path# net-sap
 config>vsm>ccag>path>net-sap# queue-policy nq1
 config>vsm>ccag>path>net-sap# egress
 config>vsm>ccag>path>net-sap>egr# pool
 config>vsm>ccag>path>net-sap>egr>pool# slope-policy A
 config>vsm>ccag>path>net-sap>egr>pool# exit
 config>vsm>ccag>path>net-sap>egr# exit
 config>vsm>ccag>path>net-sap# exit
 config>vsm>ccag>path# exit
 config>vsm>ccag# path b
 config>vsm>ccag>path# no rate
 config>vsm>ccag>path# sap-sap
 config>vsm>ccag>path>sap-sap# egress
 config>vsm>ccag>path>sap-sap>egr# pool
 config>vsm>ccag>path>sap-sap>egr>pool#
 config>vsm>ccag>path>sap-sap>egr>pool# slope-policy B
 config>vsm>ccag>path>sap-sap>egr>pool# exit
 config>vsm>ccag>path>sap-sap>egr# exit
 config>vsm>ccag>path>sap-sap# exit
 config>vsm>ccag>path# exit
 config>vsm>ccag#

```

The following example displays the configuration:

```

A:ALA-48>config>vsm# info

ccag 1 create
 description "VSM test"
 member-cca 10/1
 member-cca 10/2
 path a
 net-sap
 queue-policy "nq1"
 egress
 pool
 slope-policy "A"
 exit
 exit
 exit
 exit
 path b
 weight 100
 sap-sap
 egress
 pool

```

```
 slope-policy "B"
 exit
 exit
 exit
 exit
 no shutdown
 exit
...

A:ALA-48>config>vsm#
```

## Modifying Service Parameters

- [Epipe on page 1458](#)
- [VPLS on page 1459](#)
- [IES on page 1460](#)
- [VPRN on page 1461](#)

### Epipe

**CLI Syntax:** `config>service#  
epipe service-id  
sap ccag-ccag-id.{a|b}[.sap-net|.sap-sap]:cc-id  
no sap sap-id  
shutdown`

The following service examples display the command usage to provision CCAG.

**Example:** `config>service# epipe 103  
config>service>epipe# sap ccag-1.a:100  
config>service>epipe>sap# shutdown  
config>service>epipe>sap# exit  
config>service>epipe# no sap ccag-1.a:100  
config>service>epipe# sap ccag-1.b:200 create  
config>service>epipe>sap$ no shutdown  
config>service>epipe>sap$ exit  
config>service>epipe#`

The following output displays the configuration:

```
A:ALA-48>config>service>epipe# info

 sap 3/1/1.1.1 create
 exit
 sap ccag-1.b:200 create
 exit
 no shutdown

A:ALA-48>config>service>epipe#
```

**VPLS**

**CLI Syntax:** config>service#  
 vpls service-id [customer customer-id]  
 sap ccag-ccag-id.{a|b} [.sap-net|.sap-sap]:cc-id  
 no sap sap-id  
 shutdown

**Example:** config>service>vpls# sap ccag-1.a:456  
 config>service>vpls>sap# shutdown  
 config>service>vpls>sap# exit  
 config>service>vpls# no sap ccag-1.a:456  
 config>service>vpls# sap ccag-1.b:100 create  
 config>service>vpls>sap\$ no shutdown  
 config>service>vpls>sap\$ exit  
 config>service>vpls# sap ccag-1.a:100  
 config>service>vpls>sap# ingress  
 config>service>vpls>sap>ingress# qos 3  
 config>service>vpls>sap>ingress# exit  
 config>service>vpls>sap# egress  
 config>service>vpls>sap>egress# qos 1010  
 config>service>vpls>sap>egress# exit  
 config>service>vpls>sap# exit

A:ALA-48>config>service>vpls# info

```

 stp
 shutdown
 exit
 sap 1/1/19:1 create
 exit
 sap 1/1/19:2 create
 ingress
 qos 3
 exit
 exit
 sap ccag-1.b:100 create
 exit
 no shutdown

```

A:ALA-48>config>service>vpls#

### IES

**CLI Syntax:**

```
config>service#
 ies service-id [customer customer-id]
 interface ip-interface-name
 sap ccag-ccag-id.{a|b} [.sap-net|.sap-sap]:cc-id
 no sap sap-id
 shutdown
```

**Example:**

```
config>service# ies 200
config>service>ies# interface "ccanet6"
config>service>ies>if# sap ccag-1.a:101 create
config>service>ies>if>sap# ingress
config>service>ies>if>sap>ingress# qos 3
config>service>ies>if>sap>ingress# exit
config>service>ies>if>sap# egress
config>service>ies>if>sap>egress# qos 1010
config>service>ies>if>sap>egress# exit
config>service>ies>if>sap# no shutdown
config>service>ies>if>sap# exit
config>service>ies>if#
```

The following output displays the configuration:

```
A:ALA-48>config>service>ies# info

 interface "ccaiesif" create
 address 8.1.1.1/24
 sap ccag-1.b:456 create
 ingress
 qos 3
 exit
 egress
 qos 1010
 exit
 exit
 exit
 interface "ccanet6" create
 address 7.1.1.1/24
 sap ccag-1.a:101 create
 ingress
 qos 3
 exit
 egress
 qos 1010
 exit
 exit
 exit
 no shutdown

A:ALA-48>config>service>ies#
```

**VPRN**

**CLI Syntax:** config>service#  
                 vprn *service-id* [customer *customer-id*]  
                     interface *ip-interface-name*  
                         sap *ccag-ccag-id*.{a|b}[*.sap-net*|*.sap-sap*]:*cc-id*  
                         no sap *sap-id*  
                         shutdown

On a VPRN service SAP:

**Example:** config>service#   vprn 701  
             config>service>vprn# interface "VSM-Test Config" create  
             config>service>vprn>if\$ sap ccag-2.b:50 create  
             config>service>vprn>if>sap\$ no shutdown  
             config>service>vprn>if>sap\$ exit  
             config>service>vprn>if# exit  
             config>service>vprn#

The following output displays the configuration:

```
A:ALA-48>config>service>vprn# info

 interface "VSM Test" create
 sap ccag-2.a:100 create
 exit
 exit
 interface "VSM-Test Config" create
 sap ccag-2.b:50 create
 exit
 exit
 no shutdown

A:ALA-48>config>service>vprn#
```

| <b>Syntax</b>      | <b>[no] shutdown</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Context</b>     | config>vsm>ccag                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b> | <p>This command controls the administrative state of the <i>ccag-id</i> the command is executed under. Upon creation, the default state of a CCAG is to be administratively up which corresponds to the no shutdown form of the command. If the CCAG must be forced to be operationally down, the <b>shutdown</b> command will place the CCAG into an administratively down state causing the operational state to also be down.</p> <p>When a CCAG is shutdown, all SAPs associated with the CCAG will be operationally down. An operationally down SAP cannot be used for forwarding packets. If the SAP is part of the VPLS service, all MAC entries associated with the SAP will be removed from the VPLS FDB and the SAP will be removed from the flooding domain of the VPLS. If the SAP is part of an IES service, the associated IP interface will be set to an operationally down state. Network IP interfaces bound to a shutdown CCAG will be operationally down as well.</p> <p>Executing the no shutdown command sets the CCAG to the default up administrative state. As long as at least one member CCA in the CCAG is active, all SAPs and network IP interfaces associated with the CCAG will be allowed to enter the operationally up state.</p> |
| <b>Default</b>     | <b>no shutdown</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b> | <p>This command defines an informational string associated with the CCAG. The description string may be up to 80 characters long and contain only printable ASCII characters. Each time this command is successfully executed, any previous description string will be overwritten. If the command fails due to improper string definition, a previously successful description string will remain.</p> <p>The <b>no</b> form of the command removes any current description string from the CCAG.</p> |
| <b>Default</b>     | <b>None</b> (A description string must be explicitly defined)                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Parameters**     *description-string* — Defines the string of printable ASCII characters, up to 80 characters that will be stored and displayed as a description for the *ccag-id* that the **description** command is executed under. The string must be entered in double quotation marks if the string contains spaces.

| <b>Context</b>     | config>vsm                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | <p>This command creates a Cross Connect Aggregation Group (CCAG). A CCAG represents a group of CCAs as a common forwarding entity. Objects requiring a CCA cross connect function are mapped to a CCAG, not the individual CCAs within the CCAG. The CCAG treats each active member CCA as a possible destination when forwarding packets between the cross connected objects mapped to the CCAG. The system uses both conversation hashing functions and direct service mappings to determine the load sharing distribution between the active CCAs. All packets for a given conversation flow through the same CCA to preserve packet order. Packet ordering may be momentarily affected during convergence events when CCAs are dynamically added or removed from the active list.</p> <p>The CCAG context is used to manage the following functions per CCAG instance:</p> <ul style="list-style-type: none"> <li>• Informational description of the CCAG</li> <li>• Administrative state of the CCAG</li> <li>• Alpha path bandwidth and weight parameters</li> <li>• Beta path bandwidth and weight parameters</li> <li>• CCA total bandwidth limit</li> <li>• CCA membership in the CCAG</li> </ul> <p>The <b>no</b> form of the command removes an existing <i>ccag-id</i> from the system. Once the specified <i>ccag-id</i> is removed from the system, it may not be referenced by any cross connect objects. If the <b>force</b> keyword is not specified, the <b>no ccag ccag-id</b> command will fail if the specified <i>ccag-id</i> has one or more <i>cc-ids</i> associated with it. In the event that the specified <i>ccag-id</i> does not exist, the <b>no ccag ccag-id</b> command will return to the current CLI context without any change to the system.</p> |
| <b>Default</b>     | <b>None</b> (each CCAG context must be explicitly created to be used)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- Parameters**    *ccag-id* — Identifies the CCAG instance that the system is creating or editing. Up to eight CCAGs may be created within the system. A *ccag-id* must be created on the system prior to creating cross connect object associations.
- After a *ccag-id* is created, a CCAG SAP may be created with an association with the *ccag-id*. A CCAG SAP is identified by a concatenation of an existing *ccag-id* and a *cc-id*. The *cc-id* must match the *cc-id* of the other object the CCAG SAP is paired with on the *ccag-id*. The created *ccag-id* may also be associated with a network IP interface. A network IP interface is bound to the *ccag-id* through the port command in the config router interface ip-interface context and references the *ccag-id* and a *cc-id*. Again, the *cc-id* must match the other object the IP interface is paired with on the *ccag-id*.
- Once created, the **ccag** *ccag-id* command may be executed to enter the *ccag-id* instance for the purpose of editing the CCAG parameters or operational state.
- Values**        1 through 8
- create** — The **create** keyword explicitly indicates that the specified *ccag-id* is being created. Handling the inclusion or exclusion state of the create keyword is dependent on the system environment variable create.
- When the system environment variable create is enabled, the system requires the explicit use of the create keyword when creating objects such as a CCAG. If the keyword is not included and the *ccag-id* has not already been created, an error will occur and the CLI will remain at the current CLI context. This is designed to prevent the inadvertent creation of a CCAG instance in the event where the wrong *ccag-id* is specified during an attempt to edit an existing CCAG instance. If the create keyword is specified, the *ccag-id* will be created given the *ccag-id* is within the proper range for CCAG identifiers.
- When the system environment variable create is disabled (using the no create command), the system will not require the create keyword when creating a CCAG instance. In the event that the ccag command is issued with a *ccag-id* that previously had not been created, that *ccag-id* will be considered available for cross connect associations and bindings.
- Once a *ccag-id* has been created, the create keyword is ignored when a ccag command is executed with that *ccag-id*. The **ccag** *ccag-id* create command will only result in a CLI context change to the specified CCAG instance for a pre-existing *ccag-id*.
- force** — The **force** keyword removes the specified *ccag-id* regardless of the presence of one or more *cc-id*. If a SAP exists on the *ccag-id*, the force keyword will cause the SAP to be removed from the configuration. If a network IP interface is bound to the *ccag-id*, the interface will be silently unbound from the *ccag-id*. The force keyword is intended as a time saving feature, preventing the need to first remove all service and network associations with the *ccag-id*. It is not required to first remove all CCAs from the CCAG prior to deleting the CCAG from the system. When the CCAG is removed, association with all member CCAs is automatically removed.

| <b>Context</b>     | config>vsm>ccag <i>ccag-id</i> >access                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b> | <p>This command controls how the CCAG SAP queue and virtual scheduler buffering and rate parameters are adapted over multiple active CCAs. Two adaptation modes are supported; link and distributed.</p> <p>The <b>no</b> form of the command returns the CCAG access QoS adaptation rule to the default setting of distribute.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters</b>  | <p><b>link</b> — The <b>link</b> keyword is mutually exclusive with the <b>distributed</b> keyword. When <b>link</b> is specified, the CCAG will create the SAP queues and virtual schedulers on each CCA with the actual parameters defined in the QoS and scheduler policies. This mode is useful when conversation hashing places all or most traffic over a single CCA.</p> <p><b>Values</b> link or distribute</p> <p><b>Default</b> distribute</p> <p><b>distribute</b> — The <b>distribute</b> keyword is mutually exclusive with the <b>link</b> keyword. When <b>distribute</b> is specified, the CCAG SAP queues and schedulers on each CCA will receive a portion of the defined parameters in the QoS and scheduler policies. The portion is decided on an IOM basis with the ratio determined by the number of active CCA members on the IOM relative to the total number of active members within the CCAG. The following equation may be used to determine the actual ratio:</p> $\text{IOM-parameter-value} = (\text{IOM-active-CCA} / \text{total-active-CCA}) * \text{policy-parameter-value}$ <p><b>Values</b> link or distribute</p> <p><b>Default</b> distribute</p> |

| <b>Description</b> | This command defines a maximum forwarding rate for each CCA member within the CCAG. Support of setting a maximum CCA forwarding rate is provided to prevent overrunning the ingress forwarding plane when sub-line rate ingress features are enabled. The primary ingress feature requiring this support is dual ingress access queuing. When dual ingress queuing is enabled on cross connect SAPs, the CCA forwarding rate should be limited to a rate that prevents packet loss due to ingress forwarding congestion. The specified limit is applied to the aggregate alpha and beta path bandwidth.<br>The <b>no</b> form of the command removes CCA bandwidth rate limiting. |
| <b>Parameters</b>  | <i>kilobits-per-second</i> — Defines the maximum CCA rate in kilobits per second. The actual Kilobits per second rate is rounded up to the nearest 50Mbps increment.<br><br><b>Values</b> 0 — 100000000, max<br><br><b>Default</b> <b>max</b>                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b> | This command adds and deletes provisioned CCAs from the CCAG. The only requirement to defining a CCA member is that the defined MDA position be provisioned as type cca. A CCA does not need to be populated in the defined MDA position prior to membership definition. A non-populated CCA member is considered inactive from a CCAG perspective. A populated CCA member will become active once it has been initialized by the system. A CCA member may be removed from the CCAG or depopulated from MDA slot at any time. At least one member CCA must be active on the CCAG for the CCAG to be placed in the operational state. Up to 8 member CCAs can be configured per CCAG.<br>The <b>no</b> form of the command removes a CCA member from the CCAG. If the CCA does not exist or is not currently a member of the CCAG, no error is returned. Once removed from the CCAG, all forwarding through the specified CCA stops. |
| <b>Parameters</b>  | <i>card-slot/mda-number</i> — Identifies the system MDA slot that is will be added as a member CCA for the CCAG. The specified MDA slot must have been pre-provisioned as type cca for the membership command to be successful.<br><br><i>card-slot</i> — Defines the IOM slot the provisioned CCA is or will be populated. It is separated from the following mda-position portion of the parameter by a forward slash (/).<br><br><b>Values</b> 1 through 10 (chassis type dependent)                                                                                                                                                                                                                                                                                                                                                                                                                                             |

*mda-position* — The mda-position portion of the parameter defines the MDA slot number on the IOM the CCA is or will be populated. It must be separated from the preceding card-slot portion of the parameter by a forward slash (/).

**Values**      1 or 2 (IOM type dependent)

| <b>Syntax</b>      | <b>path {a   b}</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Context</b>     | config>vsm>ccag <i>ccag-id</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | <p>This command changes the current CLI context to the path nodal context. The CCA path nodal context is where each CCA path bandwidth, buffer and accounting parameters are maintained. The path context command must be specified with either the a or b keyword specifying the CCA path context to be entered.</p> <p>Each CCA is divided into two distinct paths for bandwidth management purposes. One path is identified as alpha (a) and the other beta (b). The significance of each path for bandwidth distribution is dependent on the relative path weights each path is given in relationship to the other. A maximum path rate may also be defined allowing the provisioning of a maximum cap on the aggregate bandwidth allowed to the SAP or IP interface queues associated with the path. Each path is separated into three other contexts; SAP-2-SAP (sap-sap), SAP-2-Net (sap-net) and Net-2-SAP (net-sap). Each path context allows for the definition of the features that are usually associated with physical ports on other MDAs in the system. These include buffer pool management, ingress network queue definitions and accounting policy control.</p> <p>The CCA path nodal contexts always exist and cannot be removed.</p> |
| <b>Parameters</b>  | <p><b>a</b> — The <b>a</b> keyword is mutually exclusive to the <b>b</b> keyword and defines the CLI CCA path context to be the alpha path. Either the <b>a</b> or <b>b</b> path must be specified. If the <b>a</b> or <b>b</b> keyword is not present, the path command will fail without changing the current CLI context.</p> <p><b>b</b> — The <b>b</b> keyword is mutually exclusive to the <b>a</b> keyword and defines the CLI CCA path context to be the beta path. | <b>Context</b>     | config>vsm>ccag <i>ccag-id</i> >path {a   b}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command defines a specific bandwidth rate limitation for the alpha or beta paths on each member CCA in the CCAG. Use of the rate command is optional. When the rate command is not executed or the no rate command is executed, bandwidth allocated to the path is not limited to a specific rate.</p> <p>Path limiting on a CCA prevents the aggregate bandwidth for the path from exceeding a certain rate. If the rate is exceeded, the CCA will backpressure all active egress queues sending on that path.</p> |

Access to the available bandwidth is dependent on the various parameters associated with each object egress queue.

The specified rate may be defined as an aggregate path rate for all CCAs in the CCAG or it may be defined as a per CCA path rate.

The **no** form of the command removes path rate limiting from all CCAs in the CCAG membership list for the path.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | <b>None</b> (rate limiting the alpha path must be explicitly defined)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b> | <i>kilobits-per-second</i> — Defines the path rate in kilobits per second. The <b>aggregate</b> and <b>cca</b> keywords specify how the defined rate is applied on a per CCA basis. The actual rate at each CCA is rounded up to the nearest 50Mbps.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Values</b>     | 0 — 100000000, max                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>    | <b>max</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                   | <b>aggregate</b> — The <b>aggregate</b> keyword is optional and mutually exclusive to the <b>cca</b> keyword. When <b>aggregate</b> is specified, the defined rate is divided among the CCAs in the CCAG member list based on the number of active CCAs. If three CCAs are active, the rate is divided by three and the result is applied to each active CCA. If a fourth CCA becomes active on the CCAG, the defined rate is then divided by four with the result applied to each CCA member on the CCAG. The actual rate at each CCA is implemented in 50Mbps increments. The system will adapt the specified rate to the best rate available per CCA. |
|                   | <b>Default</b> When the kilobits-per-second parameter is specified, the default keyword is <b>aggregate</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>cca</b> — The <b>cca</b> keyword is optional and mutually exclusive to the <b>aggregate</b> keyword. When <b>cca</b> is specified, the defined rate is applied to all CCAs in the CCAG member list. The actual rate at each CCA is implemented in 50Mbps increments. The system will adapt the specified rate to the best rate available per CCA.                                                                                                                                                                                                                                                                                                     |

| <b>Description</b> | <p>This command defines a scheduling weight to the aggregate output of the alpha and beta paths. The specified weight is used to calculate a scheduling percentage for each path. The percentage for each path is based on:</p> $\text{Alpha scheduling percentage} = \text{alpha-path-weight} / (\text{alpha-path-weight} + \text{beta-path-weight})$ $\text{Beta scheduling percentage} = \text{blue-path-weight} / (\text{alpha-path-weight} + \text{beta-path-weight})$ <p>Based on the above calculation, the sum of the alpha and beta scheduling percentage always equals 100 percent. When one path is not using all of its available scheduling bandwidth, the other path may use the remainder.</p> <p>The <b>no</b> form of the command returns the path-weight for the path to the default value of 50.</p> |

|                   |                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <i>path-weight</i> — The path-weight parameter is required and is used by the system to determine the scheduling percentage for both paths. Changing the path-weight for one path affects both paths scheduling percentage. The resulting scheduling percentage changes are applied to all CCAs in the CCAG membership list. |
| <b>Values</b>     | 1 to 100                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>    | 50                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b> | <p>This command changes the current CLI context to the path SAP-SAP nodal context. This context contains the ingress and egress buffer pool configuration commands. The sap-sap&gt;path context is associated with all SAPs defined on the CCAG path (alpha or beta depending on the path context) that cross connect to a SAP on the other path.</p> <p>The CCA path SAP-SAP nodal context always exists and cannot be removed.</p> |

| <b>Description</b> | <p>This command defines the percentage of the buffer pool that is considered reserved for the CBS buffer allocation for queues created in the path's pool context.</p> <p>The <b>no</b> form of the command returns the reserved portion of the buffer pool to the default percentage.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <p><i>percentage-of-pool</i> — The percentage-of-pool parameter defines the percentage of the buffer pool that is not considered shared. The shared portion of the pool is used by queues that have crossed their CBS buffer threshold and is subject to the WRED slope functions. The reserved portion of the pool is used by queues that have not crossed their CBS threshold. The aggregate CBS on the queues associated with the pool may oversubscribe the resv-cbs percentage. If the reserved portion is oversubscribed and the in-use reserved buffers exceed the defined percentage, buffers are removed from the shared portion of the pool.</p> <p><b>Values</b>      1 to 100 (percent)</p> <p><b>Default</b>      30</p> |

## slope-policy

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Context</b>     | config>vsm>ccag <i>ccag-id</i> >path {a   b}>net-sap                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command enables collecting stats on the path's net-sap context. When enabled the statistics defined in the accounting-policy accounting-policy command will be collected according to the specifications in the policy.</p> <p>The <b>no</b> form of the command disables network billing statistics collection on the net-sap context.</p> |
| <b>Default</b>     | Network statistics are not collected by default on the net-sap context.                                                                                                                                                                                                                                                                             |

| <b>Context</b>     | config>vsm>ccag <i>ccag-id</i> >path {a   b}>net-sap                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command defines the egress network queues used by IP interfaces bound to the path's net-sap context. The specified <i>queue-policy-name</i> defines the number of queues, the rate and buffering parameters for the queues and the forwarding class mappings to the queues.</p> <p>The <b>no</b> form of the command reverts the path's net-sap network IP interface queues to the systems default queue policy.</p> |
| <b>Parameters</b>  | <p><i>queue-policy-name</i> — Specifies which existing Queue Policy will define the queuing structure for network IP interfaces bound to the path's net-sap context.</p> <p><b>Values</b> Any existing queue policy on the system.</p> <p><b>Default</b> The default queue policy is used when another is not specified.</p>                                                                                                 |

| <b>Description</b> | <p>This command provisions an adaptor into an MDA position on an IOM slot. The provisioned MDA may or may not exist in the system at the time of provisioning. If the provisioned MDA does not currently exist in the specified MDA position number, it is considered to be a 'ghost' MDA. Ports and other resources on a ghost MDA may be configured once the MDA is provisioned. When a proper MDA matching the provisioned MDA type is inserted into the IOM MDA position, forwarding through the MDA based on configured services or network interface will be available once the MDA has been properly initialized.</p> <p>A Versatile Service Module (VSM) is provisioned into the system in the same manner as all other adaptors using MDA slots. Once a VSM is provisioned, independent of it actually existing in the system on the specified slot and MDA position, the VSM may be defined as a member of a CCAG (Cross Connect Adaptor Group). A VSM inserted into the system prior to provisioning is not available for CCAG membership and will be treated as an unprovisioned MDA.</p> <p>Once a VSM is provisioned and populated in the system, it cannot be used until it has been defined membership into a CCAG. When the CCAG membership has been defined for the VSM, the various internal resources of the VSM will be configured according to the CCAG bandwidth control parameters. This includes the alpha and beta path weights, the alpha and beta path maximum rates and the aggregate alpha and beta maximum rate.</p> <p>The <b>no</b> form of the command unprovisions an MDA from the system. For a VSM to be unprovisioned, the VSM must not be a member of a CCAG. If the VSM is a member of a CCAG, the <b>no cca slot-number/mda-number</b> command must be used in the CCAG member-list context. Once a CCA is unprovisioned from the system; it cannot be made a member of a CCAG until it has been reprovisioned.</p> |
| <b>Default</b>     | <b>None</b> (An MDA position number must be explicitly specified.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <p><i>mda-slot</i> — Defines the position on the card slot-number the CCA will be populated into. On the iom-20g IOM module, two MDA positions are available. Future IOMs will support a different number of MDA positions.</p> <p><b>Values</b>      1 or 2</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b> | <p>This command cross connects a network IP interface to a CCAG SAP using the referenced <i>ccag-id</i>. A CCAG network IP interface binding is identified by four items; the <i>ccag-id</i>, the CCAG path, the pairing type and the <i>cc-id</i>. A network IP interface CCAG port binding supports all the available features as port binding using a Dot1Q virtual interface.</p> <p>To support cross connection between services and network IP interfaces, the network interface port command allows the binding of the IP interface to a <i>ccag cc-id</i>. Similar to service CCAG SAPs, the network IP interface port binding command must reference the <i>ccag-id</i>, the CCA path (.a or .b) and the <i>cc-id</i> used by the service CCAG SAP on the other CCA path. The pairing type is optional as only <i>.net-sap</i> is supported.</p> <p>The <b>no</b> form of the command removes the CCAG binding from the network IP interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><b>ccag</b> — The ccag portion of the port binding is required and specifies that the network IP interface is binding to a <b>ccag cc-id</b>.</p> <p><i>ccag-id</i> — The <i>ccag-id</i> portion of the port binding is required and specifies which <i>ccag-id</i> the network IP interface must be bound to. The specified <i>ccag-id</i> must exist on the system or the port binding will fail. The leading dash must be included as a separator between ccag and the <i>ccag-id</i>.</p> <p><b>Values</b>        -1 (dash 1) to -8 (dash 8)</p> <p><b>Default</b>        None</p> <p><b>.a   .b</b> — The .a and .b portion of the port binding is required and is used to define the CCA bandwidth path the network IP interface will be associated with. The path association must be specified and .a and .b are mutually exclusive. The .a designation identifies the network IP interface as being on the Alpha path and the .b designation identifies the network IP interface as being on the Beta path. The paired SAP using the same <i>cc-id</i> as the bound network IP interface must be associated with the opposite path. The leading period must be included as a separator between the <i>ccag-id</i> and the path designator.</p> <p><b>Values</b>        .a or .b</p> <p><b>Default</b>        None</p> <p><i>.net-sap</i> — The <i>.net-sap</i> portion of the network IP interface CCAG binding is optional and is used to explicitly define the pairing type as Net-2-SAP. A cross connection between two network IP interfaces is not currently allowed. The <i>.net-sap</i> pairing type is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.</p> <p><b>Default</b>        <b>.net-sap</b></p> <p><i>:cc-id</i> — The <i>:cc-id</i> portion of the port binding is required and specifies the unique <i>cc-id</i> in use by the CCAG network IP interface port binding and the cross connect SAP on the other path.</p> <p><b>Values</b>        1 to 4094</p> |

### Service CCAG SAP Provisioning

Services are provisioned onto a CCAG using a special CCAG SAP definition. CCAG SAPs must reference a *ccag-id*, a CCA path (a or b), a pairing type (sap-sap or sap-net) and a unique *cc-id*. The *ccag-id* identifies the group of CCAs that will be used for forwarding packets associated with the SAP. The path identifies the bandwidth control grouping used to manage CCA egress bandwidth. The pairing type helps the system identify which buffering resources will be used to manage egress queuing of packets. Finally, the *cc-id* is used to explicitly cross connect the SAP to another SAP or network IP interface configured with the same *cc-id*.

| <b>Description</b> | <p>This command creates a cross connect SAP on the <i>ccag-id</i> referenced in the Epipe service. A CCAG SAP is identified by four items; the <i>ccag-id</i>, the CCAG path, the pairing type and the <i>cc-id</i>. An Epipe CCAG SAP supports all the available QoS, filtering and accounting features as an Epipe Dot1Q SAP.</p> <p>The <b>no</b> form of the command removes a SAP from a service context. Once removed, all information and resources concerning the SAP is deleted from the system including the CCAG <i>cc-id</i> in use on the CCA path.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <p><b>ccag</b> — The ccag portion of the SAP identifier is required and specifies that the epipe SAP is of the CCAG type.</p> <p><b>-ccag-id</b> — The <i>ccag-id</i> portion of the SAP identifier is required and specifies which <i>ccag-id</i> on which the SAP must be created. The specified <i>ccag-id</i> must exist on the system or the SAP creation will fail. The leading dash must be included as a separator between <b>ccag</b> and the <i>ccag-id</i>.</p> <p><b>Values</b>      -1 (dash 1) to -8 (dash 8)</p> <p><b>Default</b>      None</p> <p><b>.a   .b</b> — The .a and .b portion of the CCAG SAP identifier is required and is used to define the CCA bandwidth path with will be associated with the SAP. The path association must be specified and .a and .b are mutually exclusive. The .a designation identifies the SAP as being on the Alpha path and the .b designation identifies the SAP as being on the Beta path. The paired SAP or network</p> |

IP interface using the same *cc-id* as the SAP must be associated with the opposite path. The leading period must be included as a separator between the *ccag-id* and the path designator.

**Values** .a or .b

**Default** None

*.sap-net* — The *.sap-net* portion of the CCAG SAP identifier specifies that the SAP is of the SAP-2-Net pairing type and is required when the *cc-id* is paired with a network IP interface. The pairing type *.sap-net* is mutually exclusive with pairing type *.sap-sap*. If *.sap-net* is not specified, *.sap-sap* is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.

**Values** .sap-net or .sap-sap

**Default** .sap-sap

*.sap-sap* — The *.sap-sap* portion of the CCAG SAP identifier is mutually exclusive to *.sap-net* and is used to define the pairing type as SAP-2-SAP. The *.sap-sap* pairing type is only used when the cross connect object sharing the same *cc-id* on the opposite path is a CCAG SAP. If the other cross connect object is a network IP interface, the pairing type must be defined as *.sap-net*. If *.sap-net* is not specified, *.sap-sap* is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.

**Values** .sap-net or .sap-sap

**Default** .sap-sap

*:cc-id* — The *:cc-id* portion of the CCAG SAP identifier is required and specifies the unique *cc-id* in use by the CCAG SAP and the cross connect object on the other path.

**Values** 1 to 4094

**Default** None

**create** — Explicitly indicates that the specified CCAG SAP is being created by the **sap** command. Handling the inclusion or exclusion state of the create keyword is dependent on the system environment variable create.

When the system environment variable create is enabled, the system requires the explicit use of the **create** keyword when creating objects such as SAPs. If the keyword is not included and the specified CCAG SAP has not already been created, an error will occur and the CLI will not change context to the specified CCAG SAP instance. This is designed to prevent the inadvertent creation of a CCAG SAP in the event where the wrong CCAG SAP identifier is specified during an attempt to edit an existing CCAG SAP. If the **create** keyword is specified, the CCAG SAP will be created if it does not already exist or if it does exist, the CLI context will change to the specified CCAG SAP.

When the system environment variable create is disabled (using the **no create** command), the system will not require the **create** keyword when creating a CCAG SAP. In the event that the **sap** command is issued with a CCAG SAP identifier that previously had not been created, that CCAG SAP will be created.

Once a CCAG SAP has been created, the **create** keyword is ignored when a **sap** command is executed with that CCAG SAP identifier and the CLI context will change to the specified CCAG SAP.

## sap

| <b>Description</b> | <p>This command creates a cross connect SAP on the <i>ccag-id</i> referenced in the VPLS service. A CCAG SAP is identified by four items; the <i>ccag-id</i>, the CCAG path, the pairing type and the <i>cc-id</i>. A VPLS CCAG SAP supports all the available QoS, filtering and accounting features as a VPLS Dot1Q SAP.</p> <p>The <b>no</b> form of the command removes a SAP from a service context. Once removed, all information and resources concerning the SAP is deleted from the system including the CCAG <i>cc-id</i> in use on the CCA path.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><b>ccag</b> — The ccag portion of the SAP identifier is required and specifies that the vpls SAP is of the CCAG type.</p> <p><b>-ccag-id</b> — Specifies which <i>ccag-id</i> on which the SAP must be created. The specified <i>ccag-id</i> must exist on the system or the SAP creation will fail. The leading dash must be included as a separator between <b>ccag</b> and the <i>ccag-id</i>.</p> <p><b>Values</b>        -1 (dash 1) to -8 (dash 8)</p> <p><b>Default</b>        None</p> <p><b>.a   .b</b> — The <b>.a</b> and <b>.b</b> portion of the CCAG SAP identifier is required and is used to define the CCA bandwidth path with will be associated with the SAP. The path association must be specified and <b>.a</b> and <b>.b</b> are mutually exclusive. The <b>.a</b> designation identifies the SAP as being on the Alpha path and the <b>.b</b> designation identifies the SAP as being on the Beta path. The paired SAP or network IP interface using the same <i>cc-id</i> as the SAP must be associated with the opposite path. The leading period must be included as a separator between the <i>ccag-id</i> and the path designator.</p> <p><b>Values</b>        .a or .b</p> <p><b>Default</b>        None</p> <p><b>.sap-net</b> — The <b>.sap-net</b> portion of the CCAG SAP identifier specifies that the SAP is of the SAP-2-Net pairing type and is required when the <i>cc-id</i> is paired with a network IP interface. The pairing type <b>.sap-net</b> is mutually exclusive with pairing type <b>.sap-sap</b>. If <b>.sap-net</b> is not specified, <b>.sap-sap</b> is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.</p> <p><b>Values</b>        .sap-net or .sap-sap</p> <p><b>Default</b>        .sap-sap</p> <p><b>.sap-sap</b> — The <b>.sap-sap</b> portion of the CCAG SAP identifier is mutually exclusive to <b>.sap-sap</b> and is used to define the pairing type as SAP-2-SAP. The <b>.sap-sap</b> pairing type is only used when the cross connect object sharing the same <i>cc-id</i> on the opposite path is a CCAG SAP. If the other cross connect object is a network IP interface, the pairing type must be defined as <b>.sap-net</b>. If <b>.sap-net</b> is not specified, <b>.sap-sap</b> is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.</p> |

**Values** .sap-net or .sap-sap

**Default** .sap-sap

**:cc-id** — The *:cc-id* portion of the CCAG SAP identifier is required and specifies the unique *cc-id* in use by the CCAG SAP and the cross connect object on the other path.

**Values** 0 1 to 4094

**Default** None

**create** — Explicitly indicates that the specified CCAG SAP is being created by the **sap** command. Handling the inclusion or exclusion state of the create keyword is dependent on the system environment variable create.

When the system environment variable create is enabled, the system requires the explicit use of the **create** keyword when creating objects such as SAPs. If the keyword is not included and the specified CCAG SAP has not already been created, an error will occur and the CLI will not change context to the specified CCAG SAP instance. This is designed to prevent the inadvertent creation of a CCAG SAP in the event where the wrong CCAG SAP identifier is specified during an attempt to edit an existing CCAG SAP. If the **create** keyword is specified, the CCAG SAP will be created if it does not already exist or if it does exist, the CLI context will change to the specified CCAG SAP.

When the system environment variable create is disabled (using the **no create** command), the system will not require the **create** keyword when creating a CCAG SAP. In the event that the **sap** command is issued with a CCAG SAP identifier that previously had not been created, that CCAG SAP will be created.

Once a CCAG SAP has been created, the **create** keyword is ignored when a **sap** command is executed with that CCAG SAP identifier and the CLI context will change to the specified CCAG SAP.

## sap

| <b>Description</b> | <p>This command creates a cross connect SAP on the <i>ccag-id</i> referenced in the IES service. A CCAG SAP is identified by four items; the <i>ccag-id</i>, the CCAG path, the pairing type and the <i>cc-id</i>. A CCAG SAP on an IES IP interface supports all the available QoS, filtering and accounting features as an IES IP interface Dot1Q SAP.</p> <p>The <b>no</b> form of the command removes a SAP from the IES service IP interface context. Once removed, all information and resources concerning the SAP is deleted from the system including the CCAG <i>cc-id</i> in use on the CCA path.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <p><b>ccag</b> — The <b>ccag</b> portion of the SAP identifier is required and specifies that the ies SAP is of the CCAG type.</p> <p><i>ccag-id</i> — The <i>ccag-id</i> portion of the SAP identifier is required and specifies which <i>ccag-id</i> on which the SAP must be created. The specified <i>ccag-id</i> must exist on the system or the SAP creation will fail. The leading dash must be included as a separator between ccag and the <i>ccag-id</i>.</p> <p><b>Values</b>        -1 (dash 1) to -8 (dash 8)</p> <p><b>Default</b>        None</p> <p><b>.a   .b</b> — The .a and .b portion of the CCAG SAP identifier is required and is used to define the CCA bandwidth path with will be associated with the SAP. The path association must be specified and .a and .b are mutually exclusive. The .a designation identifies the SAP as being on the Alpha path and the .b designation identifies the SAP as being on the Beta path. The paired SAP or network IP interface using the same <i>cc-id</i> as the SAP must be associated with the opposite path. The leading period must be included as a separator between the <i>ccag-id</i> and the path designator.</p> <p><b>Values</b>        .a or .b</p> <p><b>Default</b>        None</p> <p><b>.sap-sap</b> — The .sap-sap portion of the CCAG SAP identifier is optional and is used to explicitly define the pairing type as SAP-2-SAP. The .sap-sap pairing type is only used when the cross connect object sharing the same <i>cc-id</i> on the opposite path is a CCAG SAP. A cross connection between an IES CCAG SAP and a network IP interface is not currently allowed. If .sap-sap is not specified, .sap-sap is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.</p> <p><b>Default</b>        .sap-sap</p> <p><b>:cc-id</b> — The <i>:cc-id</i> portion of the CCAG SAP identifier is required and specifies the unique <i>cc-id</i> in use by the CCAG SAP and the cross connect object on the other path.</p> <p><b>Values</b>        1 to 4094</p> <p><b>Default</b>        None</p> |

**create** — Explicitly indicates that the specified CCAG SAP is being created by the **sap** command. Handling the inclusion or exclusion state of the create keyword is dependent on the system environment variable create.

When the system environment variable create is enabled, the system requires the explicit use of the **create** keyword when creating objects such as SAPs. If the keyword is not included and the specified CCAG SAP has not already been created, an error will occur and the CLI will not change context to the specified CCAG SAP instance. This is designed to prevent the inadvertent creation of a CCAG SAP in the event where the wrong CCAG SAP identifier is specified during an attempt to edit an existing CCAG SAP. If the **create** keyword is specified, the CCAG SAP will be created if it does not already exist or if it does exist, the CLI context will change to the specified CCAG SAP.

When the system environment variable create is disabled (using the **no create** command), the system will not require the **create** keyword when creating a CCAG SAP. In the event that the **sap** command is issued with a CCAG SAP identifier that previously had not been created, that CCAG SAP will be created.

Once a CCAG SAP has been created, the **create** keyword is ignored when a **sap** command is executed with that CCAG SAP identifier and the CLI context will change to the specified CCAG SAP.

## sap

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Context</b>     | config>service>vprn>interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command creates a cross connect SAP on the <i>ccag-id</i> referenced in the VPRN service. A CCAG SAP is identified by four items; the <i>ccag-id</i>, the CCAG path, the pairing type and the <i>cc-id</i>. A CCAG SAP on a VPRN IP interface supports all the available QoS, filtering and accounting features as a VPRN IP interface Dot1Q SAP.</p> <p>The <b>no</b> form of the command removes a SAP from the VPRN service IP interface context. Once removed, all information and resources concerning the SAP is deleted from the system including the CCAG <i>cc-id</i> in use on the CCA path.</p>                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <p><b>ccag</b> — The ccag portion of the SAP identifier is required and specifies that the vprn SAP is of the CCAG type.</p> <p><b>-ccag-id</b> — Specifies which <i>ccag-id</i> on which the SAP must be created. The specified <i>ccag-id</i> must exist on the system or the SAP creation will fail. The leading dash must be included as a separator between <b>ccag</b> and the <i>ccag-id</i>.</p> <p><b>Values</b>      -1 (dash 1) to -8 (dash 8)</p> <p><b>Default</b>      None</p> <p><b>.a   .b</b> — The <b>.a</b> and <b>.b</b> portion of the CCAG SAP identifier is required and is used to define the CCA bandwidth path with will be associated with the SAP. The path association must be specified and <b>.a</b> and <b>.b</b> are mutually exclusive. The <b>.a</b> designation identifies the SAP as being on the alpha path and the <b>.b</b> designation identifies the SAP as being on the beta path. The paired SAP or network</p> |

IP interface using the same *cc-id* as the SAP must be associated with the opposite path. The leading period must be included as a separator between the *ccag-id* and the path designator.

**Values** .a or .b

**Default** None

*.sap-net* — Specifies that the SAP is of the SAP-2-Net pairing type and is required when the *cc-id* is paired with a network IP interface. The pairing type *.sap-net* is mutually exclusive with pairing type *.sap-sap*. If *.sap-net* is not specified, *.sap-sap* is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.

**Values** .sap-net or .sap-sap

**Default** .sap-sap

*.sap-sap* — The *.sap-sap* portion of the CCAG SAP identifier is mutually exclusive to *.sap-net* and is used to define the pairing type as SAP-2-SAP. The *.sap-sap* pairing type is only used when the cross connect object sharing the same *cc-id* on the opposite path is a CCAG SAP. If the other cross connect object is a network IP interface, the pairing type must be defined as *.sap-net*. If *.sap-net* is not specified, *.sap-sap* is assumed and does not need to be included in the SAP identification. When specified, the leading period must be used as a separator between the path designator and the pairing type.

**Values** .sap-net or .sap-sap

**Default** .sap-sap

*:cc-id* — The *:cc-id* portion of the CCAG SAP identifier is required and specifies the unique *cc-id* in use by the CCAG SAP and the cross connect object on the other path.

**Values** 1 to 4094

**Default** None

**create** — Explicitly indicates that the specified CCAG SAP is being created by the **sap** command. Handling the inclusion or exclusion state of the **create** keyword is dependent on the system environment variable `create`.

When the system environment variable `create` is enabled, the system requires the explicit use of the **create** keyword when creating objects such as SAPs. If the keyword is not included and the specified CCAG SAP has not already been created, an error will occur and the CLI will not change context to the specified CCAG SAP instance. This is designed to prevent the inadvertent creation of a CCAG SAP in the event where the wrong CCAG SAP identifier is specified during an attempt to edit an existing CCAG SAP. If the `create` keyword is specified, the CCAG SAP will be created if it does not already exist or if it does exist, the CLI context will change to the specified CCAG SAP.

When the system environment variable `create` is disabled (using the `no create` command), the system will not require the `create` keyword when creating a CCAG SAP. In the event that the `sap` command is issued with a CCAG SAP identifier that previously had not been created, that CCAG SAP will be created.

Once a CCAG SAP has been created, the **create** keyword is ignored when a **sap** command is executed with that CCAG SAP identifier and the CLI context will change to the specified CCAG SAP.

## Services Show Commands

---

### Service Commands

#### customer

**Syntax** **customer** [*customer-id*] [**site** *customer-site-name*]

**Context** show>service

**Description** This command displays service customer information.

**Parameters** *customer-id* — Displays only information for the specified customer ID.

**Default** All customer IDs display.

**Values** 1 — 2147483647

**site** *customer-site-name* — Specifies the customer site which is an anchor point for an ingress and egress virtual scheduler hierarchy.

**Output** **Show Customer Command Output** — The following table describes show customer command output fields:

| Label           | Description                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| Customer-ID     | The ID that uniquely identifies a customer.                                                                               |
| Contact         | The name of the primary contact person.                                                                                   |
| Description     | Generic information about the customer.                                                                                   |
| Phone           | The phone/pager number to reach the primary contact person.                                                               |
| Total Customers | The total number of customers configured.                                                                                 |
| Site            | Multi-service site name. A multi-service customer site is a group of SAPs with common origination and termination points. |
| Description     | Displays information about a specific customer's multi-service site.                                                      |
| Assignment      | The port ID, MDA, or card number, where the SAP's that are members of this multi- service site are defined.               |
| I. Sched Pol    | The ingress QoS scheduler policy assigned to this multi-service site.                                                     |
| E. Sched Pol    | The egress QoS scheduler policy assigned to this multi-service site.                                                      |
| Service-ID      | The ID that uniquely identifies a service.                                                                                |
| SAP             | Specifies the SAP assigned to the service.                                                                                |

## fdb-mac

**Syntax** **fdb-mac** [*ieee-address*] [*expiry*]

**Context** show>service

**Description** This command displays the FDB entry for a given MAC address.

**Parameters** *ieee-address* — Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers.

**expiry** — shows amount of time until MAC is aged out.

### Sample Output

```

*A:ALA-48# show service fdb-mac
=====
Service Forwarding Database
=====

```

| ServId | MAC               | Source-Identifier | Type/Age | Last Change         |

## l2-route-table

- Syntax** **l2-route-table** [detail] [bgp-ad] [multi-homing] [bg-vpls]
- Context** show>service
- Description** This command displays L2 route table information.
- detail** — Displays detailed information.

## sap-using

**Syntax**     **sap-using** [**msap**]  
**sap-using** [**sap** *sap-id*] [**vlan-translation** | **anti-spoof**]  
**sap-using** **app-profile** *app-profile-name*  
**sap-using** **authentication-policy** *policy-name* [**msap**]  
**sap-using** **encap-type** *encap-type*  
**sap-using** **eth-tunnel** [**tunnel-id** *eth-tunnel-id*]  
**sap-using** *ingress|egress* **atm-td-profile** *td-profile-id*  
**sap-using** *ingress|egress* **filter** *filter-id*  
**sap-using** *ingress|egress* **qos-policy** *qos-policy-id* [**msap**]  
**sap-using** **interface** *ip-address|ip-int-name* [**msap**]  
**sap-using** **mc-ring** **peer** *ip-address* **ring** *sync-tag*

**Context**     show>service

**Description**     This command displays SAP information.

**Sample Output**

```
show service sap-using eth-tunnel [tunnel-id ##]
```

```
*A:Dut-C>config>service>epipe# show service sap-using eth-tunnel
```

```
=====

|                 |       | 4  | 1/1/3 | 66.13 |
| eth-tunnel-67:3 | 36733 | 2  | 3/1/3 | 16    |
|                 |       | 8  | 1/1/2 | 16    |
| eth-tunnel-68:3 | 36833 | 2  | 3/1/3 | 19    |
|                 |       | 3  | 3/1/1 | 19    |
| eth-tunnel-65:4 | 56554 | 3  | 2/1/4 | 65.11 |
|                 |       | 8  | 1/1/3 | 65.11 |
|                 |       | 16 | 2/1/3 | 65.11 |
| eth-tunnel-66:4 | 56654 | 2  | 2/1/4 | 66.14 |
|                 |       | 4  | 1/1/3 | 66.14 |
| eth-tunnel-67:4 | 56754 | 2  | 3/1/3 | 17    |
|                 |       | 8  | 1/1/2 | 17    |
| eth-tunnel-68:4 | 56854 | 2  | 3/1/3 | 20    |
|                 |       | 3  | 3/1/1 | 20    |
| eth-tunnel-65:5 | 66565 | 3  | 2/1/4 | 65.12 |
|                 |       | 8  | 1/1/3 | 65.12 |
|                 |       | 16 | 2/1/3 | 65.12 |
| eth-tunnel-66:5 | 66665 | 2  | 2/1/4 | 66.15 |
|                 |       | 4  | 1/1/3 | 66.15 |
| eth-tunnel-67:5 | 66765 | 2  | 3/1/3 | 18    |
|                 |       | 8  | 1/1/2 | 18    |
| eth-tunnel-68:5 | 66865 | 2  | 3/1/3 | 21    |
|                 |       | 3  | 3/1/1 | 21    |

-----  
Number of SAPs : 23

This command can also be used to identify SAPs with the "EthTunTagMismatch" flag and can be used to prevent the flag from occurring before activating paths through the following CLI example:

```
*A:Dut-C>config>service>epipe# show service sap-using eth-tunnel | match "-"
```

|                      |       |   |       |        |
|----------------------|-------|---|-------|--------|
| eth-tunnel-1         | 50    | 1 | 1/1/2 | 4030   |
| eth-tunnel-2         | 51    | 1 | 3/1/1 | 100    |
| eth-tunnel-67        | 52    | 2 | 3/1/3 | 672    |
| eth-tunnel-1:3       | 3133  | 1 | 1/1/2 | 4      |
| eth-tunnel-2:3       | 3233  | 1 | 3/1/1 | 7      |
| eth-tunnel-65:4094   | 4094  | 2 | -     | 4094.* |
| eth-tunnel-1024:4094 | 4094  | 1 | 2/1/1 | -      |
|                      |       | 2 | 3/1/2 | -      |
| ...                  |       |   |       |        |
| eth-tunnel-65:3      | 36533 | 3 | 2/1/4 | 65.10  |
| eth-tunnel-66:3      | 36633 | 2 | 2/1/4 | 66.13  |
| ...                  |       |   |       |        |

SAP eth-tunnel-1024:4094 does not have the eth-tunnel tags configured for the corresponding paths which causes the SAP to be oper down.

Ethernet tunnel 65 does not have path 2 configured. However, SAP eth-tunnel-65:4094 has a tag configured for path 2. This is acceptable and allows the operator to pre-provision tags under the same-fate SAPs before the corresponding path is configured under the Ethernet tunnel. This is the recommended configuration order so that there is no traffic disruption on the same-fate SAPs.

SAP eth-tunnel-65:5 currently has tags configured for paths 3, 8 and 16 and is operationally up. Note that if path 2 of Ethernet tunnel 65 was properly configured and active, SAP eth-tunnel-65:5 would be operationally down since it does not have a corresponding tag for path 2.

Any other tunnel is fine since it has no dash present in the port or tag location.

'show eth-tunnel status' summarizes the MEP status in one screen and also identifies the ports and tags associated in summary format for all loadsharing tunnels (similar to show eth-tunnel aps for g8031-1to1 mode)

## sdp

**Syntax** **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]

**Context** show>service

**Description** This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

**Parameters** *sdp-id* — The SDP ID for which to display information.

**Default** All SDPs.

**Values** 1 — 17407

**far-end** *ip-address* — Displays only SDPs matching with the specified far-end IP address.

**Default** SDPs with any far-end IP address.

**detail** — Displays detailed SDP information.

**Default** SDP summary output.

**keep-alive-history** — Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output.

**Output** **Show Service SDP** — The following table describes show service SDP output fields.

| Label          | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id         | The SDP identifier.                                                                                                                                                                                                                                                                                                                                                                         |
| Description    | Displays a text string describing the SDP.                                                                                                                                                                                                                                                                                                                                                  |
| Admin Path MTU | Displays the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. The default value of zero indicates that the path MTU should be computed dynamically from the corresponding MTU of the tunnel.                                                                                      |
| Opr Path MTU   | Displays the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. In order to be able to bind this SDP to a given service, the value of this object minus the control word size (if applicable) must be equal to or larger than the MTU of the service, as defined by its service MTU. |
| Far End        | Displays the far end IP address.                                                                                                                                                                                                                                                                                                                                                            |
| Delivery       | The type of delivery used by the SDP: GRE or MPLS.                                                                                                                                                                                                                                                                                                                                          |
| IP address     | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                                                                                                                                                                                                                                   |

| Label                          | Description (Continued)                                                                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adm<br>Admin State             | The desired state of the SDP.                                                                                                                                                                                                                                                        |
| Opr<br>Oper State              | The operating state of the SDP.                                                                                                                                                                                                                                                      |
| Flags                          | Specifies all the conditions that affect the operating status of this SDP.                                                                                                                                                                                                           |
| Signal<br>Signaling            | The signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                                                                                                                                              |
| Last Status Change             | The time of the most recent operating status change to this SDP.                                                                                                                                                                                                                     |
| Adv. NTU Over                  | Specifies whether the advertised MTU of a VLL spoke SDP bind includes the 14-byte L2 header, so that it is backward compatible with pre-2.0 software.                                                                                                                                |
| Last Mgmt Change               | The time of the most recent management-initiated change to this SDP.                                                                                                                                                                                                                 |
| KeepAlive Infor-<br>mation     | This section displays Keepalive information.                                                                                                                                                                                                                                         |
| Hello Time                     | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len                  | The length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                                 |
| Hello Timeout                  | The number of seconds to wait for an SDP echo response message before declaring a timeout.                                                                                                                                                                                           |
| Unmatched Replies              | The number of SDP unmatched message replies timer expired.                                                                                                                                                                                                                           |
| Max Drop Count                 | The maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                                |
| Hold Down Time                 | The amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                               |
| TX Hello Msgs                  | The number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                                     |
| Rx Hello Msgs                  | The number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                                        |
| Associated LSP<br>List         | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS |
| Lsp Name                       | Displays the LSP name.                                                                                                                                                                                                                                                               |
| Time Since Last<br>Transaction | Displays the time of the last transaction.                                                                                                                                                                                                                                           |

| Label              | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signaling          | Specifies the signaling type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Metric             | Displays the metric to be used within the Tunnel Table Manager for decision making purposes. When multiple SDPs going to the same destination exist, this value is used as a tie-breaker by Tunnel Table Manager users like MP-BGP to select route with lower value.                                                                                                                                                                                                                                                                                          |
| Acct. Pol          | Displays the policy to use to collect accounting statistics on this SDP. The value zero indicates that the agent should use the default accounting policy, if one exists.                                                                                                                                                                                                                                                                                                                                                                                     |
| Collect Stats      | Specifies whether the agent collects accounting statistics for this SDP. When the value is true the agent collects accounting statistics on this SDP.                                                                                                                                                                                                                                                                                                                                                                                                         |
| VLAN VC Etype      | Displays the VLAN VC type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BW Booking Factor  | Specifies the value used to calculate the max SDP available bandwidth. The value specifies the percentage of the SDP max available bandwidth for VLL call admission. When the value of is set to zero (0), no new VLL spoke-sdp bindings with non-zero bandwidth are permitted with this SDP. Overbooking, >100% is allowed.                                                                                                                                                                                                                                  |
| PBB Etype          | Displays the Ethertype used in frames sent out on this SDP when specfied as <b>vlan</b> for Provider Backbone Bridging frames.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Oper Max BW (Kbps) | Indicates the operational bandwidth in kilo-bits per seconds (Kbps) available for this SDP. The value is determined by the sum of the bandwidth of all the RSVP LSPs used by the SDP.                                                                                                                                                                                                                                                                                                                                                                         |
| Avail BW (Kbps)    | Indicates the bandwidth that is still free for booking by the SDP bindings on the SDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Net-Domain         | Specifies the network-domain name configured on this SDP. The default value of this object is the default'network-domain.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Egr Interface      | Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.<br>not applicable. indicates that there is no egress network interface that can carry traffic on this SDP.<br>consistent. Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.<br>inconsistent. indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent. |
| Revert Time        | Specifies the time to wait before reverting back from LDP to the configured LSPs, after having failed over to LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Revert Count Down  | Indicates the timer countdown before reverting back from LDP on this SDP. The timer countdown begins after the first configured LSP becomes active.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Flags              | Displays all the conditions that affect the operating status of this SDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Label            | Description (Continued)                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class Forwarding | Indicates the admin state of class-based forwarding on this SDP. When the value is true, class-based forwarding is enabled.                                                                                                                              |
| EnforceDSTELspFc | Specifies whether service manager must validate with RSVP the support of the FC by the LSP.                                                                                                                                                              |
| Default LSP      | Specifies the LSP ID that is used as a default when class-based forwarding is enabled on this SDP. This object must be set when enabling class-based forwarding.                                                                                         |
| Multicast LSP    | Displays the LSP ID that all multicast traffic will be forwarded on when class-based forwarding is enabled on this SDP. When this object has its default value, multicast traffic will be forwarded on an LSP according to its forwarding class mapping. |
| Number of SDPs   | The total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                  |

## sdp-using

**Syntax** **sdp-using** [*sdp-id[:vc-id]* | **far-end** *ip-address*]

**Context** show>service

**Description** This command displays services using SDP or far-end address options.

**Parameters** *sdp-id* — Displays only services bound to the specified SDP ID.

**Values** 1 — 17407

*vc-id* — The virtual circuit identifier.

**Values** 1 — 4294967295

**far-end** *ip-address* — Displays only services matching with the specified far-end IP address.

**Default** Services with any far-end IP address.

**Output** **Show Service SDP Using X** — The following table describes show service sdp-using output fields.

| Label      | Description                           |
|------------|---------------------------------------|
| Svc ID     | The service identifier.               |
| Sdp ID     | The SDP identifier.                   |
| Type       | Type of SDP: spoke or mesh.           |
| Far End    | The far end address of the SDP.       |
| Oper State | The operational state of the service. |

| Label         | Description (Continued)                                                                          |
|---------------|--------------------------------------------------------------------------------------------------|
| Ingress Label | The label used by the far-end device to send packets to this device in this service by this SDP. |
| Egress Label  | The label used by this device to send packets to the far-end device in this service by this SDP. |

### Sample Output

## service-using

**Syntax** **service-using** [**epipe**] [**ies**] [**vpls**] [**vprn**] [**mirror**] [**b-vpls**] [**i-vpls**] [**m-vpls**] [**apipe**] [**fpipe**] [**ipipe**] [**sdp** *sdp-id*] [**customer** *customer-id*]

**Context** show>service

**Description** This command displays the services matching certain usage properties. If no optional parameters are specified, all services defined on the system are displayed.

**Parameters**

- epipe** — Displays matching Epipe services.
- ies** — Displays matching IES instances.
- vpls** — Displays matching VPLS instances.
- i-vpls** — Displays matching I-VPLS instances.
- b-vpls** — Displays matching B-VPLS instances.
- m-vpls** — Displays matching M-VPLS instances.
- vprn** — Displays matching VPRN services.
- mirror** — Displays matching mirror services.
- apipe** — Displays matching Apipe services.
- fpipe** — Displays matching Fpipe services.
- ipipe** — Displays matching Ipipe services.
- sdp** *sdp-id* — Displays only services bound to the specified SDP ID.

**Default** Services bound to any SDP ID.

**Values** 1 — 17407

**customer** *customer-id* — Displays services only associated with the specified customer ID.

**Default** Services associated with a customer.

**Values** 1 — 2147483647

**Output** **Show Service Service-Using** — The following table describes show service service-using output fields.

| Label      | Description                                               |
|------------|-----------------------------------------------------------|
| Service Id | The service identifier.                                   |
| Type       | Specifies the service type configured for the service ID. |
| Adm        | The desired state of the service.                         |
| Opr        | The operating state of the service.                       |
| CustomerID | The ID of the customer who owns this service.             |

| Label            | Description (Continued)                                                           |
|------------------|-----------------------------------------------------------------------------------|
| Last Mgmt Change | The date and time of the most recent management-initiated change to this service. |

| <b>Description</b> | This command displays ethernet tunnel information. Any data SAP missing a tag for a defined path has the EthTunTagMismatch flag generated. In the example provided below, SAP eth-tunnel-1:1 does not have the tag for path 2 configured. Therefore, it is operationally down with the reason indicated by the EthTunTagMismatch flag.                                                  |
| <b>Parameters</b>  | <p><i>tunnel-index</i> — Specifies the tunnel index.</p> <p><b>Values</b> 1..1024</p> <p><i>path-index</i> — Specifies the path index.</p> <p><b>Values</b> 1..16</p> <p><b>detail</b> — Keyword; displays detailed information</p> <p><b>status</b> — Keyword; displays ethernet tunnel status information.</p> <p><b>aps</b> — Keyword; displays APS ethernet tunnel information.</p> |

## association

**Syntax**     **association** [*ma-index*] [**detail**]

**Context**    show>eth-cfm

**Description**    This command displays eth-cfm association information.

**Parameters**    *ma-index* — Specifies the maintenance association (MA) index.

**Values**        1— 4294967295

**detail** — Displays detailed information for the eth-cfm association.

**Output**        **Show eth-cfm Association Command Output** — The following table describes show eth-cfm association command output fields:

| Label         | Description                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| Md-index      | Displays the the maintenance domain (MD) index.                                                                 |
| Ma-index      | Displays the the maintenance association (MA) index.                                                            |
| Name          | Displays the part of the maintenance association identifier which is unique within the maintenance domain name. |
| CCM-interval  | Displays the CCM transmission interval for all MEPs in the association.                                         |
| Bridge-id     | Displays the bridge-identifier value for the domain association.                                                |
| MHF Creation  | Displays the MIP half function (MHF) for the association.                                                       |
| Primary VLAN  | Displays the primary bridge-identifier VLAN ID.                                                                 |
| Num Vids      | Displays the number of VIDs associated with the VLAN.                                                           |
| Remote Mep Id | Displays the remote maintenance association end point (MEP) identifier                                          |

## cfm-stack-table

**Syntax** **cfm-stack-table** [**port** [*port-id* [**vlan** *vlan-id*]] | **sdp** *sdp-id[:vc-id]*] [**level** 0..7] [**direction** **up** | **down**]

**Context** show>eth-cfm

**Description** This command displays stack-table information.

**Parameters** **port** *port-id* — Displays the bridge port or aggregated port on which MEPs or MHFs are configured.

**vlan** *vlan-id* — Displays the associated VLAN ID.

**sdp** *sdp-id[:vc-id]* — Displays the SDP binding for the bridge.

**level** — Display the MD level of the maintenance point.

**Values** 0 — 7

**direction** **up** | **down** — Displays the direction in which the MP faces on the bridge port.

**Output** **Show eth-cfm CFM Stack Table Command Output** — The following table describes show eth-cfm CFM stack table command output fields:

| Label       | Description                                                            |
|-------------|------------------------------------------------------------------------|
| Sap         | Displays associated SAP IDs.                                           |
| Sdp         | Displays the SDP binding for the bridge.                               |
| Level Dir   | Displays the MD level of the maintenance point.                        |
| Md-index    | Displays the the maintenance domain (MD) index.                        |
| Ma-index    | Displays the the maintenance association (MA) index.                   |
| Mep-id      | Displays the integer that is unique among all the MEPs in the same MA. |
| Mac-address | Displays the MAC address of the MP.                                    |

## Sample Output

## domain

**Syntax** **domain** [*md-index*] [**association** *ma-index* | **all-associations**] [**detail**]

**Context** show>eth-cfm

**Description** This command displays domain information.

**Parameters** *md-index* — Displays the index of the MD to which the MP is associated, or 0, if none.  
**association** *ma-index* — Displays the index to which the MP is associated, or 0, if none.  
**all-associations** — Displays all associations to the MD.  
**detail** — Displays detailed domain information.

**Output** **Show eth-cfm Domain Command Output** — The following table describes show eth-cfm domain command output fields:

| Label    | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Md-index | Displays the Maintenance Domain (MD) index value.                                                                                                                                                                                                                                                                                                                                                          |
| Level    | Displays an integer identifying the Maintenance Domain Level (MD Level). Higher numbers correspond to higher Maintenance Domains, those with the greatest physical reach, with the highest values for customers' CFM PDUs. Lower numbers correspond to lower Maintenance Domains, those with more limited physical reach, with the lowest values for CFM PDUs protecting single bridges or physical links. |
| Name     | Displays a generic Maintenance Domain (MD) name.                                                                                                                                                                                                                                                                                                                                                           |
| Format   | Displays the type of the Maintenance Domain (MD) name. Values include <b>dns</b> , <b>mac</b> , and <i>string</i> .                                                                                                                                                                                                                                                                                        |

## mep

**Syntax** **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**loopback**] [**linktrace**]  
**mep** *mep-id* **domain** *md-index* **association** *ma-index* **remote-mepid** *mep-id* | **all-remote-mepids**  
**mep** *mep-id* **domain** *md-index* **association** *ma-index* **eth-test-results** [**remote-peer** *mac-address*]  
**mep** *mep-id* **domain** *md-index* **association** *ma-index* **one-way-delay-test** [**remote-peer** *mac-address*]  
**mep** *mep-id* **domain** *md-index* **association** *ma-index* **two-way-delay-test** [**remote-peer** *mac-address*]

**Context** show>eth-cfm

**Description** This command displays Maintenance Endpoint (MEP) information.

**Parameters** *mep-id* — Displays the integer that is unique among all the MEPs in the same MA.  
**domain** *md-index* — Displays the index of the MD to which the MP is associated, or 0, if none.  
**association** *ma-index* — Displays the index to which the MP is associated, or 0, if none.  
**loopback** — Displays loopback information for the specified MEP.  
**linktrace** — Displays linktrace information for the specified MEP.  
**remote-mepid** *mep-id* — Includes specified remote mep-id information for specified the MEP.  
**all-remote-mepids** — Includes all remote mep-id information for the specified MEP.  
**eth-test-results** — Includes eth-test-result information for the specified MEP.  
**one-way-delay-test** — Includes one-way-test information for the specified MEP.  
**two-way-delay-test** — Includes two-way-test information for the specified MEP.  
**remote-peer** *mac-address* — Includes specified remote mep-id information for the specified MEP.

## Sample Output

```
*A:node-1# show eth-cfm mep 4 domain 1 association 1 loopback linktrace
```

```

## mip

**Syntax**     **mip**

**Context**    show>eth-cfm

**Description**   This command displays SAPs/bindings provisioned for allowing the default MIP creation.

## sdp

**Syntax**     **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]

**Context**    show>service

**Description**   This command displays SDP information.

**Parameters**   *sdp-id* — Specifies the SDP ID.

**Values**     1..17407

*ip-address* — Specifies the IP address (a..b.c.d).

**detail** — Adds details to the display

**keep-alive-history** — Displays the keep-alive-history

**Sample Output**

```

*A:Dut-A# show service sdp 1 detail

| Description | <p>This command displays services using the range of ingress labels. If only the mandatory <i>start-label</i> parameter is specified, only services using the specified label are displayed.</p> <p>If both <i>start-label</i> and <i>end-label</i> parameters are specified, the services using the range of labels X where <i>start-label</i> &lt;= X &lt;= <i>end-label</i> are displayed.</p> <p>Use the <b>show router vprn-service-id ldp bindings</b> command to display dynamic labels.</p> |
| Parameters  | <p><i>start-label</i> — The starting ingress label value for which to display services using the label range. If only <i>start-label</i> is specified, services only using <i>start-label</i> are displayed.</p> <p><b>Values</b>      0, 2048 — 131071</p> <p><i>end-label</i> — The ending ingress label value for which to display services using the label range.</p> <p><b>Default</b>      The <i>start-label</i> value.</p> <p><b>Values</b>      2049 — 131071</p>                          |
| Output      | <b>Show Service Ingress-Label</b> — The following table describes show service ingress-label output fields:                                                                                                                                                                                                                                                                                                                                                                                         |

| Label                    | Description                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------|
| Svc ID                   | The service identifier.                                                                                 |
| SDP Id                   | The SDP identifier.                                                                                     |
| Type                     | Indicates whether the SDP is a spoke or a mesh.                                                         |
| I.Lbl                    | The ingress label used by the far-end device to send packets to this device in this service by the SDP. |
| E.Lbl                    | The egress label used by this device to send packets to the far-end device in this service by the SDP.  |
| Number of Bindings Found | The number of SDP bindings within the label range specified.                                            |

## sap-using

**Syntax**    **sap-using** [sap sap-id]

**sap-using interface** [*ip-address* | *ip-int-name*]  
**sap-using** [ingress | egress] **atm-td-profile** *td-profile-id*  
**sap-using** [ingress | egress] **filter** *filter-id*  
**sap-using** [ingress | egress] **qos-policy** *qos-policy-id*  
**sap-using authentication-policy** *policy-name*

**Context** show>service

**Description** This command displays SAP information.  
 If no optional parameters are specified, the command displays a summary of all defined SAPs.  
 The optional parameters restrict output to only SAPs matching the specified properties.

**Parameters** **ingress** — Specifies matching an ingress policy.  
**egress** — Specifies matching an egress policy.  
**qos-policy** *qos-policy-id* — The ingress or egress QoS Policy ID for which to display matching SAPs.  
**Values** 1 — 65535  
**atm-td-profile** *td-profile-id* — Displays SAPs using this traffic description.  
**filter** *filter-id* — The ingress or egress filter policy ID for which to display matching SAPs.  
**Values** 1 — 65535  
**sap** *sap-id* — Specifies the physical port identifier portion of the SAP definition. See Common CLI Command Descriptions on page 1933 for command syntax.  
**interface** *ip-address* — The IP address of the interface for which to display matching SAPs.  
**Values** 1.0.0.0 — 223.255.255.255  
**interface** *ip-int-name* — The IP interface name for which to display matching SAPs.  
**authentication-policy** *policy name* — Specifies an existing authentication policy.

**Output** **Show Service SAP** — The following table describes show service SAP output fields:

| Label     | Description                                                     |
|-----------|-----------------------------------------------------------------|
| Port ID   | The ID of the access port where the SAP is defined.             |
| Svc ID    | The service identifier.                                         |
| Sap MTU   | The SAPMTU value.                                               |
| Ing. QoS  | The SAP ingress QoS policy number specified on the ingress SAP. |
| Ing Fltr  | The MAC or IP filter policy ID applied to the ingress SAP.      |
| Egr. QoS  | The SAP egress QoS policy number specified on the egress SAP.   |
| Egr. Fltr | The MAC or IP filter policy ID applied to the egress SAP.       |
| Adm       | The administrative state of the SAP.                            |

| Label | Description (Continued)           |
|-------|-----------------------------------|
| Opr   | The operational state of the SAP. |

**Sample Output**

A:ALA-42# show service sap-using

## sdp

- Syntax** **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]
- Context** show>service
- Description** This command displays SDP information.  
If no optional parameters are specified, a summary SDP output for all SDPs is displayed.
- Parameters** *sdp-id* — The SDP ID for which to display information.  
**Default** All SDPs.  
**Values** 1 — 17407  
*far-end ip-address* — Displays only SDPs matching with the specified far-end IP address.  
**Default** SDPs with any far-end IP address.  
**detail** — Displays detailed SDP information.  
**Default** SDP summary output.  
**keep-alive-history** — Displays the last fifty SDP keepalive events for the SDP.  
**Default** SDP summary output.
- Output** **Show Service SDP** — The following table describes show service SDP output fields:

| Label               | Description                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id              | The SDP identifier.                                                                                                                                                         |
| Adm MTU             | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Opr MTU             | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| IP address          | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                   |
| Adm<br>Admin State  | Specifies the desired state of the SDP.                                                                                                                                     |
| Opr<br>Oper State   | Specifies the operating state of the SDP.                                                                                                                                   |
| Deliver<br>Delivery | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                |
| Flags               | Specifies all the conditions that affect the operating status of this SDP.                                                                                                  |
| Signal<br>Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                           |

| Label               | Description (Continued)                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Status Change  | Specifies the time of the most recent operating status change to this SDP.                                                                                                                                                                                                           |
| Last Mgmt Change    | Specifies the time of the most recent management-initiated change to this SDP.                                                                                                                                                                                                       |
| Number of SDPs      | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                                    |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Number of SDPs      | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                                    |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len       | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Timeout       | Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout.                                                                                                                                                                                 |
| Unmatched Replies   | Specifies the number of SDP unmatched message replies.                                                                                                                                                                                                                               |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                     |
| TX Hello Msgs       | Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                           |
| Rx Hello Msgs       | Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                              |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS |

| <b>Description</b> | This command displays the services matching certain usage properties.<br>If no optional parameters are specified, all services defined on the system are displayed.                                                                                                                                                                                                                             |
| <b>Parameters</b>  | [ <b>service</b> ] — Displays information for the specified service type.<br><b>b-vpls</b> — Specifies the B-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It represents the multi-point tunneling component that multiplexes multiple customer VPNs (ISIDs) together. It is similar to a regular VPLS instance that operates on the backbone MAC addresses. |

**i-vpls** — Specifies the I-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It identifies the specific VPN entity associated to a customer multipoint (ELAN) service. It is similar to a regular VPLS instance that operates on the customer MAC addresses.

**m-vpls** — Specifies the M-component (managed VPLS) instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature.

**sdp sdp-id** — Displays only services bound to the specified SDP ID.

**Default** Services bound to any SDP ID.

**Values** 1 — 17407

**customer customer-id** — Displays services only associated with the specified customer ID.

**Default** Services associated with any customer.

**Values** 1 — 2147483647

**Output** **Show service-using output** — The following table describes the command output fields:

| Label            | Description                                                                       |
|------------------|-----------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                           |
| Type             | Specifies the service type configured for the service ID.                         |
| Adm              | The desired state of the service.                                                 |
| Opr              | The operating state of the service.                                               |
| CustomerId       | The ID of the customer who owns this service.                                     |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this service. |

|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>all</b>                                                                                                               |
| <b>Context</b>     | show>service>id                                                                                                          |
| <b>Description</b> | This command displays detailed information for all aspects of the service.                                               |
| <b>Output</b>      | <b>Show service ID Output</b> — The following table describes the output fields when the <b>all</b> option is specified: |

| Label            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| VPN Id           | The number which identifies the VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Service Type     | Specifies the type of service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| VLL Type         | Specifies the VLL type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SDP Id           | The SDP identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description      | Generic information about the service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Customer Id      | The customer identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last Mgmt Change | The date and time of the most recent management-initiated change.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Endpoint         | Specifies the name of the service endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flags            | Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCeIpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |

| Label                             | Description (Continued)                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAP Count                         | The number of SAPs specified for this service.                                                                                                                    |
| SDP Bind Count                    | The number of SDPs bound to this service.                                                                                                                         |
| Split Horizon Group specifics     |                                                                                                                                                                   |
| Split Horizon Group               | Name of the split horizon group for this VPLS.                                                                                                                    |
| Description                       | Description of the split horizon group.                                                                                                                           |
| Last Changed                      | The date and time of the most recent management-initiated change to this split horizon group.                                                                     |
| Service Destination Points (SDPs) |                                                                                                                                                                   |
| SDP Id                            | The SDP identifier.                                                                                                                                               |
| Type                              | Indicates whether this Service SDP binding is a spoke or a mesh.                                                                                                  |
| Admin Path MTU                    | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Oper Path MTU                     | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| Delivery                          | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                      |
| Admin State                       | The administrative state of this SDP.                                                                                                                             |
| Oper State                        | The operational state of this SDP.                                                                                                                                |
| Jitter Buffer (packets)           | Indicates the jitter buffer length in number of packet buffers.                                                                                                   |
| Playout Threshold (packets)       | Indicates the playout buffer packets threshold in number of packet buffers.                                                                                       |
| Playout Threshold (packets)       | Indicates the current packet depth of the jitter buffer.                                                                                                          |

| <b>Description</b> | Displays basic information about the service ID including service type, description, SAPs and SDPs. |
| <b>Output</b>      | <b>Show Service-ID Base</b> — The following table describes show service-id base output fields:     |

| Label             | Description                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id        | The service identifier.                                                                                                                                                              |
| Vpn Id            | Specifies the VPN ID assigned to the service.                                                                                                                                        |
| Service Type      | The type of service: Epipe, Apipe, Fpipe, Ipipe, VPLS, IES, VPRN.                                                                                                                    |
| Description       | Generic information about the service.                                                                                                                                               |
| Customer Id       | The customer identifier.                                                                                                                                                             |
| Last Mgmt Change  | The date and time of the most recent management-initiated change to this customer.                                                                                                   |
| Adm               | The desired state of the service.                                                                                                                                                    |
| Oper              | The operating state of the service.                                                                                                                                                  |
| Mtu               | The largest frame size (in octets) that the service can handle.                                                                                                                      |
| Def. Mesh VC Id   | This object is only valid in services that accept mesh SDP bindings. It is used to validate the VC ID portion of each mesh SDP binding defined in the service.                       |
| SAP Count         | The number of SAPs defined on the service.                                                                                                                                           |
| SDP Bind Count    | The number of SDPs bound to the service.                                                                                                                                             |
| Identifier        | Specifies the service access (SAP) and destination (SDP) points.                                                                                                                     |
| Type              | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                                    |
| AdmMTU            | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented.             |
| PBB Tunnel Point  | Specifies the endpoint in the B-VPLS environment where the Epipe terminates.                                                                                                         |
| Admin MTU         | Specifies the B-VPLS admin MTU.                                                                                                                                                      |
| Backbone-Flooding | Specifies whether or not the traffic is flooded in the B-VPLS for the destination instead of unicast. If the backbone destination MAC is in the B-VPLS FDB, then it will be unicast. |

| Label | Description (Continued)                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| ISID  | The 24 bit field carrying the service instance identifier associated with the frame. It is used at the destination PE as a demultiplexor field. |

Sample Output

```
*A:ALA-48>config>service>epipe>sap# show service id 6 base

| <b>Description</b> | This command displays information for the SAPs associated with the service. If no optional parameters are specified, a summary of all associated SAPs is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><i>sap-id</i> — The ID that displays SAPs for the service in the form <i>slot/mda/port[channel]</i>. See Common CLI Command Descriptions on page 1933 for command syntax.</p> <p><b>interface</b> <i>interface-name</i> — Displays information for the specified IP interface.</p> <p><b>ip-address</b> <i>ip-address</i> — Displays information associated with the specified IP address.</p> <p><b>detail</b> — Displays detailed information.</p> <p><b>wholesaler</b> <i>service-id</i> — The VPRN service ID of the wholesaler. When specified in this context, SAP, SDP, interface, IP address and MAC parameters are ignored.</p> <p><b>Values</b>      1 — 2147483648</p> <p><b>detail</b> — Displays detailed information for the SAP.</p> |
| <b>Output</b>      | <b>Show Service-ID SAP</b> — The following table describes show service SAP fields:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Label              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id         | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SAP                | The SAP and qtag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Encap              | The encapsulation type of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Ethertype          | Specifies an Ethernet type II Ether type value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Admin State        | The administrative state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Oper State         | The operating state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Flags              | Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCeIpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandBy-ForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| Last Status Change | The time of the most recent operating status change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Last Mgmt Change   | The time of the most recent management-initiated change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Label              | Description (Continued)                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin MTU          | The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented. |
| Oper MTU           | The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.  |
| Ingress qos-policy | The ingress QoS policy ID assigned to the SAP.                                                                                                                   |
| Egress qos-policy  | The egress QoS policy ID assigned to the SAP.                                                                                                                    |
| Ingress Filter-Id  | The ingress filter policy ID assigned to the SAP.                                                                                                                |
| Egress Filter-Id   | The egress filter policy ID assigned to the SAP.                                                                                                                 |
| Acct. Pol          | The accounting policy ID assigned to the SAP.                                                                                                                    |
| Collect Stats      | Specifies whether collect stats is enabled.                                                                                                                      |
| LLF Admin State    | Displays the Link Loss Forwarding administrative state.                                                                                                          |
| LLF Oper State     | Displays the Link Loss Forwarding operational state.                                                                                                             |

A:ALA-48>config>service>epipe#
```

If a TOD Suite is configured on a SAP, the name of the suite is shown in the show command output. The values of the policies may be different from those configured on the SAP, because the configured policy assignments may have been overruled by policy assignments of the TOD Suite.

| <b>Description</b> | This command displays information for the SDPs associated with the service.<br>If no optional parameters are specified, a summary of all associated SDPs is displayed.                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><i>sdp-id</i> — Displays only information for the specified SDP ID.</p> <p><b>Default</b> All SDPs.</p> <p><b>Values</b> 1 — 17407</p> <p><b>far-end ip-addr</b> — Displays only SDPs matching the specified far-end IP address.</p> <p><b>Default</b> SDPs with any far-end IP address.</p> <p><b>detail</b> — Displays detailed SDP information.</p> |
| <b>Output</b>      | <b>Show Service-ID SDP</b> — The following table describes show service-id SDP output fields:                                                                                                                                                                                                                                                             |

| Label               | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sdp Id              | The SDP identifier.                                                                                                                                                          |
| Type                | Indicates whether the SDP is a spoke or a mesh.                                                                                                                              |
| Split Horizon Group | Name of the split horizon group that the SDP belongs to.                                                                                                                     |
| VC Type             | The VC type, ether, vlan, or vpls.                                                                                                                                           |
| VC Tag              | The explicit dot1Q value used when encapsulating to the SDP far end.                                                                                                         |
| I. Lbl              | The VC label used by the far-end device to send packets to this device in this service by the SDP.                                                                           |
| Admin Path MTU      | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case). |
| Oper Path MTU       | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.             |
| Far End             | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                    |
| Delivery            | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                 |
| Admin State         | The administrative state of this SDP.                                                                                                                                        |
| Oper State          | The current state of this SDP.                                                                                                                                               |

| Label               | Description (Continued)                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress Label       | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                                                                                                                                      |
| Egress Label        | The label used by this device to send packets to the far-end device in this service by the SDP.                                                                                                                                                                                       |
| Last Changed        | The date and time of the most recent change to the SDP.                                                                                                                                                                                                                               |
| Signaling           | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                    |
| Admin State         | The administrative state of the Keepalive process.                                                                                                                                                                                                                                    |
| Oper State          | The operational state of the Keepalive process.                                                                                                                                                                                                                                       |
| Hello Time          | Transmission frequency of the SDP echo request messages.                                                                                                                                                                                                                              |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                       |
| Hello Msg Len       | The length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                                  |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                      |
| I. Fwd. Pkts.       | Specifies the number of forwarded ingress packets.                                                                                                                                                                                                                                    |
| I. Dro. Pkts        | Specifies the number of dropped ingress packets.                                                                                                                                                                                                                                      |
| E. Fwd. Pkts.       | Specifies the number of forwarded egress packets.                                                                                                                                                                                                                                     |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the Far End field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS. |

| <b>Description</b> | This command displays information for the spanning tree protocol instance for the service. |
| <b>Parameters</b>  | <b>detail</b> — Displays detailed information.                                             |

## VLL Clear Commands

---

### id

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                                    |
| <b>Context</b>     | clear>service<br>clear>service>statistics                                      |
| <b>Description</b> | This command clears commands for a specific service.                           |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.                 |
| <b>Values</b>      | service-id: 1 — 214748364<br>svc-name: A string up to 64 characters in length. |

### arp

|                    |                                                                                     |
|--------------------|-------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>arp</b>                                                                          |
| <b>Context</b>     | clear>service>id                                                                    |
| <b>Description</b> | This command clears all ARP entries. This command is only valid for Ipipe services. |

### host-tracking

|                    |                                                                                     |
|--------------------|-------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>host-tracking</b> [ <b>sap</b> <i>sap-id</i> ] [ <b>host</b> <i>ip-address</i> ] |
| <b>Context</b>     | clear>service>id                                                                    |
| <b>Description</b> | This command clears host tracking data.                                             |

### mesh-sdp

|                    |                                                                         |
|--------------------|-------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mesh-sdp</b> <i>sdp-id</i> [: <i>vc-id</i> ] <b>ingress-vc-label</b> |
| <b>Context</b>     | clear>service>id                                                        |
| <b>Description</b> | This command clears and reset sthe mesh SDP binding.                    |
| <b>Parameters</b>  | <i>sdp-id</i> — The spoke SDP ID for which to clear statistics.         |
| <b>Values</b>      | 1 — 17407                                                               |
|                    | <i>vc-id</i> — The virtual circuit ID on the SDP ID to be reset.        |
| <b>Values</b>      | 1 — 4294967295                                                          |
|                    | <b>ingress-vc-label</b> — Specifies to clear the ingress VC label.      |

| <b>Description</b> | This command clears statistics for the spoke SDP bound to the service.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><i>sdp-id</i> — The spoke SDP ID for which to clear statistics.</p> <p><b>Values</b> 1 — 17407</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID to be reset.</p> <p><b>Values</b> 1 — 4294967295</p> <p><b>all</b> — Clears all queue statistics and STP statistics associated with the SDP.</p> <p><b>counters</b> — Clears all queue statistics associated with the SDP.</p> <p><b>stp</b> — Clears all STP statistics associated with the SDP.</p> |

## stp

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <b>Syntax</b>      | <b>stp</b>                                              |
| <b>Context</b>     | clear>service>statistics>id                             |
| <b>Description</b> | Clears all spanning tree statistics for the service ID. |

## VLL Debug Commands

### id

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                                    |
| <b>Context</b>     | debug>service                                                                  |
| <b>Description</b> | This command debugs commands for a specific service.                           |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.                 |
| <b>Values</b>      | service-id: 1 — 214748364<br>svc-name: A string up to 64 characters in length. |

### sap

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <b>Syntax</b>      | [no] <b>sap</b> <i>sap-id</i>                        |
| <b>Context</b>     | debug>service>id                                     |
| <b>Description</b> | This command enables debugging for a particular SAP. |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the SAP ID.                |

### event-type

|                    |                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] <b>event-type</b> {arp   <b>config-change</b>   <b>oper-status-change</b> }                                                                                              |
| <b>Context</b>     | debug>service>id                                                                                                                                                              |
| <b>Description</b> | This command enables a particular debugging event type.<br>The <b>no</b> form of the command disables the event type debugging.                                               |
| <b>Parameters</b>  | <b>arp</b> — Displays ARP events.<br><b>config-change</b> — Debugs configuration change events.<br><b>svc-oper-status-change</b> — Debugs service operational status changes. |

#### Sample Output

```
A:bksim180# debug service id 1000 sap 1/7/1 event-type arp

| Description | <p>This command displays service information using the range of egress labels.</p> <p>If only the mandatory <i>egress-label1</i> parameter is specified, only services using the specified label are displayed.</p> <p>If both <i>egress-label1</i> and <i>egress-label2</i> parameters are specified, the services using the range of labels X where <i>egress-label1</i> &lt;= X &lt;= <i>egress-label2</i> are displayed.</p> <p>Use the <b>show router ldp bindings</b> command to display dynamic labels.</p> |
| Parameters  | <p><i>egress-label1</i> — The starting egress label value for which to display services using the label range. If only <i>egress-label1</i> is specified, services only using <i>egress-label1</i> are displayed.</p> <p><b>Values</b>      0, 2049 — 131071</p> <p><i>egress-label2</i> — The ending egress label value for which to display services using the label range.</p> <p><b>Default</b>     The <i>egress-label1</i> value.</p> <p><b>Values</b>      2049 — 131071</p>                                |

**Output**    **Show Service Egress Command Output** — The following table describes show service egress label output fields.

| Label                    | Description                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------|
| Svc Id                   | The ID that identifies a service.                                                                  |
| Sdp Id                   | The ID that identifies an SDP.                                                                     |
| Type                     | Indicates whether the SDP binding is a spoke or a mesh.                                            |
| I. Lbl                   | The VC label used by the far-end device to send packets to this device in this service by the SDP. |
| E. Lbl                   | The VC label used by this device to send packets to the far-end device in this service by the SDP. |
| Number of bindings found | The total number of SDP bindings that exist within the specified egress label range.               |

## fdb-info

**Syntax**    **fdb-info**

**Context**    show>service

**Description** Displays global FDB usage information.

**Output** **Show FDB-Info Command Output** — The following table describes show FDB-Info command output.

| Label            | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service ID       | The value that identifies a service.                                                                                                                                                                                                                                                                                                                                                                                    |
| Mac Move         | Indicates the administrative state of the MAC movement feature associated with the service.                                                                                                                                                                                                                                                                                                                             |
| Mac Move Rate    | The maximum rate at which MAC's can be re-learned in this TLS service, before the SAP where the moving MAC was last seen is automatically disabled in order to protect the system against undetected loops or duplicate MAC's.<br>The rate is computed as the maximum number of re-learns allowed in a 5 second interval. The default rate of 10 re-learns per second corresponds to 50 re-learns in a 5 second period. |
| Mac Move Timeout | Indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum re-learn rate is re-enabled. A value of zero indicates that the SAP will not be automatically re-enabled after being disabled. If after the SAP is re-enabled it is disabled again, the effective retry timeout is doubled in order to avoid thrashing.                                                           |
| Table Size       | The maximum number of learned and static entries allowed in the FDB.                                                                                                                                                                                                                                                                                                                                                    |
| Total Count      | The current number of entries (both learned and static) in the FDB of this service.                                                                                                                                                                                                                                                                                                                                     |
| Learned Count    | The current number of learned entries in the FDB of this service.                                                                                                                                                                                                                                                                                                                                                       |
| Static Count     | The current number of static entries in the FDB of this service.                                                                                                                                                                                                                                                                                                                                                        |
| Remote Age       | The number of seconds used to age out FDB entries learned on an SDP. These entries correspond to MAC addresses learned on remote SAPs.                                                                                                                                                                                                                                                                                  |
| Local Age        | The seconds used to age out FDB entries learned on local SAPs.                                                                                                                                                                                                                                                                                                                                                          |
| High WaterMark   | The utilization of the FDB table of this service at which a 'table full' alarm is raised by the agent.                                                                                                                                                                                                                                                                                                                  |
| Low WaterMark    | The utilization of the FDB table of this service at which a 'table full' alarm is cleared by the agent.                                                                                                                                                                                                                                                                                                                 |
| Mac Learning     | Specifies whether the MAC learning process is enabled in this service.                                                                                                                                                                                                                                                                                                                                                  |
| Discard Unknown  | Specifies whether frames received with an unknown destination MAC are discarded in this service.                                                                                                                                                                                                                                                                                                                        |
| MAC Aging        | Specifies whether the MAC aging process is enabled in this service.                                                                                                                                                                                                                                                                                                                                                     |
| MAC Pinning      | Specifies whether MAC pinning is enabled in this service.                                                                                                                                                                                                                                                                                                                                                               |

| Label                     | Description (Continued)                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relearn Only              | When enabled, indicates that either the FDB table of this service is full or that the maximum system-wide number of MAC's supported by the agent has been reached, and thus MAC learning is temporary disabled, and only MAC re-learns can take place. |
| Total Service FDB         | The current number of service FDBs configured on this node.                                                                                                                                                                                            |
| Total FDB Configured Size | The sum of configured FDBs.                                                                                                                                                                                                                            |
| Total FDB Entries In Use  | The total number of entries (both learned and static) in use.                                                                                                                                                                                          |

| <b>Description</b> | This command displays the FDB entry for a given MAC address.                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><i>ieee-address</i> — The 48-bit MAC address for which to display the FDB entry in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> where <i>aa</i>, <i>bb</i>, <i>cc</i>, <i>dd</i>, <i>ee</i> and <i>ff</i> are hexadecimal numbers.</p> <p><b>expiry</b> — Shows the time until the MAC is aged out.</p> |
| <b>Output</b>      | <b>Show FDB-MAC Command Output</b> — The following table describes the show FDB MAC command output fields:                                                                                                                                                                                                                  |

| Label             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service ID        | The service ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MAC               | The specified MAC address                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Source-Identifier | The location where the MAC is defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Type/Age          | <p>Static — FDB entries created by management.</p> <p>Learned — Dynamic entries created by the learning process.</p> <p>OAM — Entries created by the OAM process.</p> <p>H — Host, the entry added by the system for a static configured subscriber host.</p> <p>D or DHCP — DHCP-installed MAC. Learned addresses can be temporarily frozen by the DHCP snooping application for the duration of a DHCP lease.</p> <p>P — Indicates the MAC is protected by the MAC protection feature.</p> |

## sap-using

**Syntax**     **sap-using interface** [*ip-address* | *ip-int-name*]  
**sap-using** [ingress | egress] **filter** *filter-id*  
**sap-using** [sap *sap-id*]  
**sap-using** [ingress | egress] **atm-td-profile** *td-profile-id*  
**sap-using authentication-policy** *auth-plcy-name*  
**sap-using** [ingress | egress] **qos-policy** *qos-policy-id*

**Context**     show>service

**Description**     This command displays SAP information.  
 If no optional parameters are specified, the command displays a summary of all defined SAPs.  
 The optional parameters restrict output to only SAPs matching the specified properties.

**Parameters**     **ingress** — Specifies matching an ingress policy.  
**egress** — Specifies matching an egress policy.  
**qos-policy** *qos-policy-id* — The ingress or egress QoS Policy ID for which to display matching SAPs.  
                       **Values**     1 — 65535  
**atm-td-profile** *td-profile-id* — Displays SAPs using this traffic description.  
**filter** *filter-id* — The ingress or egress filter policy ID for which to display matching SAPs.  
                       **Values**     1 — 65535  
**authentication** *auth-plcy-name* — The session authentication policy for which to display matching SAPs.  
*sap-id* — Specifies the physical port identifier portion of the SAP definition. See [Common CLI Command Descriptions on page 1933](#) for command syntax.  
**interface** — Specifies matching SAPs with the specified IP interface.  
*ip-address* — The IP address of the interface for which to display matching SAPs.  
                       **Values**     1.0.0.0 — 223.255.255.255  
*ip-int-name* — The IP interface name for which to display matching SAPs.

**Output**     **Show Service SAP** — The following table describes show service SAP output fields:

| Label    | Description                                                     |
|----------|-----------------------------------------------------------------|
| Port ID  | The ID of the access port where the SAP is defined.             |
| Svc ID   | The service identifier.                                         |
| SapMTU   | The SAP MTU value.                                              |
| I.QoS    | The SAP ingress QoS policy number specified on the ingress SAP. |
| I.MAC/IP | The MAC or IP filter policy ID applied to the ingress SAP.      |

| Label     | Description (Continued)                         |
|-----------|-------------------------------------------------|
| Egr. Fltr | The filter policy ID applied to the egress SAP. |
| A.Pol     | The accounting policy ID assigned to the SAP.   |
| Adm       | The administrative state of the SAP.            |
| Opr       | The actual state of the SAP.                    |

### Sample Output

```

| <b>Context</b>     | show>service>id                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | This command displays information for the SDPs associated with the service.<br>If no optional parameters are specified, a summary of all associated SDPs is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <i>sdp-id</i> — Displays only information for the specified SDP ID. An SDP is a logical mechanism that ties a far-end 7750 SR to a particular service without having to specifically define far end SAPs. Each SDP represents a method to reach a 7750 SR router.<br><b>Default</b> All SDPs.<br><b>Values</b> 1 — 17407<br><b>far-end ip-addr</b> — Displays only SDPs matching with the specified system IP address of the far-end destination 7750 SR router for the Service Distribution Point (SDP) that is the termination point for a service.<br><b>Default</b> SDPs with any far-end IP address.<br><b>detail</b> — Displays detailed SDP information. |
| <b>Output</b>      | <b>Show Service SDP</b> — The following table describes show service-id SDP output fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Label               | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sdp Id              | The SDP identifier.                                                                                                                                                          |
| Type                | Indicates whether the SDP is a spoke                                                                                                                                         |
| Split Horizon Group | Name of the split horizon group where the SDP belongs.                                                                                                                       |
| VC Type             | Displays the VC type, ether or vlan.                                                                                                                                         |
| VC Tag              | Displays the explicit dot1Q value used when encapsulating to the SDP far end.                                                                                                |
| I. Lbl              | The VC label used by the far-end device to send packets to this device in this service by the SDP.                                                                           |
| Admin Path MTU      | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case.) |
| Oper Path MTU       | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.             |
| Far End             | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                    |

| Label               | Description (Continued)                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delivery            | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                                                                                                                          |
| Admin State         | The administrative state of this SDP.                                                                                                                                                                                                                                                 |
| Oper State          | The operational state of this SDP.                                                                                                                                                                                                                                                    |
| Ingress Label       | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                                                                                                                                      |
| Egress Label        | The label used by this device to send packets to the far-end device in this service by the SDP.                                                                                                                                                                                       |
| Last Changed        | The date and time of the most recent change to the SDP.                                                                                                                                                                                                                               |
| Signaling           | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                    |
| Admin State         | The administrative state of the Keepalive process.                                                                                                                                                                                                                                    |
| Oper State          | The operational state of the Keepalive process.                                                                                                                                                                                                                                       |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                        |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                       |
| Hello Msg Len       | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                        |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                      |
| I. Fwd. Pkts.       | Specifies the number of forwarded ingress packets.                                                                                                                                                                                                                                    |
| I. Dro. Pkts        | Specifies the number of dropped ingress packets.                                                                                                                                                                                                                                      |
| E. Fwd. Pkts.       | Specifies the number of forwarded egress packets.                                                                                                                                                                                                                                     |
| E. Fwd. Octets      | Specifies the number of forwarded egress octets.                                                                                                                                                                                                                                      |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the Far End field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS. |

## sdp-using

- Syntax** **sdp-using** [*sdp-id[:vc-id]*] | **far-end** *ip-address*]
- Context** show>service
- Description** This command displays services using SDP or far-end address options.
- Parameters** *sdp-id* — Displays only services bound to the specified SDP ID.  
**Values** 1 — 17407  
*vc-id* — The virtual circuit identifier.  
**Values** 1 — 4294967295  
**far-end ip-address** — Displays only services matching with the specified far-end IP address.  
**Default** Services with any far-end IP address.
- Output** **Show Service SDP Using** — The following table describes service-using output fields.

| Label         | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| Svc ID        | The service identifier.                                                                          |
| Sdp ID        | The SDP identifier.                                                                              |
| Type          | Specifies the type of SDP: Spoke or Mesh.                                                        |
| Far End       | The far-end address of the SDP.                                                                  |
| Oper State    | The operational state of the service.                                                            |
| Ingress Label | The label used by the far-end device to send packets to this device in this service by this SDP. |
| Egress Label  | The label used by this device to send packets to the far-end device in this service by this SDP. |

## Sample Output

```
*A:ALA-1# show service sdp-using 300

| <b>Context</b>     | show>service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | This command displays information for a particular service-id.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <p><i>service-id</i> — The unique service identification number that identifies the service in the service domain.</p> <p><b>Values</b></p> <p>service-id: 1 — 214748364</p> <p>svc-name: A string up to 64 characters in length.</p> <p><b>all</b> — Display detailed information about the service.</p> <p><b>arp</b> — Display ARP entries for the service.</p> <p><b>authentication</b> — Display subscriber authentication information</p> <p><b>base</b> — Display basic service information.</p> <p><b>dhcp</b> — Display DHCP information.</p> <p><b>endpoint</b> — Display service endpoint information.</p> <p><b>epipe</b> — Display e-pipe services associated with the b-vpls service.</p> <p><b>fdb</b> — Display FDB entries.</p> <p><b>gsmp</b> — Display GSMP information.</p> <p><b>host</b> — Display static hosts configured on the service.</p> <p><b>i-vpls</b> — Display i-vpls services associated with the b-vpls.</p> <p><b>igmp-snooping</b> — Display IGMP snooping information.</p> <p><b>interface</b> — Display service interfaces.</p> <p><b>l2-route-table</b> — Display Layer-2 route information associated with the service.</p> <p><b>l2pt</b> — Display L2PT information of SAPs and Spokes.</p> <p><b>labels</b> — Display labels being used by this service.</p> <p><b>mac-move</b> — Display Mac Move related information about the service.</p> <p><b>mac-protect</b> — Display MAC protect information.</p> <p><b>mfib</b> — Display MFIB related information.</p> <p><b>mld-snooping</b> — Display MLD snooping information.</p> <p><b>mmrp</b> — Display MMRP information.</p> <p><b>mrp</b> — Display MRP information</p> <p><b>msap</b> — Display MSAPs associated to the service.</p> <p><b>pim-snooping</b> — Display PIM snooping information.</p> <p><b>pppoe</b> — Display PPPoE information.</p> <p><b>retailers</b> — Display service retailer information.</p> |

## Show, Clear, Debug Commands

**sap** — Display SAPs associated to the service.

**sdp** — Display SDPs associated with the service.

**source-address** — Display source-address configured for applications.

**split-horizon-group** — Display split horizon group information.

**stp** — Display STP information.

**subscriber-host** — Display subscriber host information.

**wholesalers** — Display service wholesaler information.

all

|--------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>all</b>                                                                                   |
| <b>Context</b>     | show>service>id                                                                              |
| <b>Description</b> | This command displays detailed information for all aspects of the service.                   |
| <b>Output</b>      | <b>Show service ID all output</b> — The following table describes the command output fields. |

| Label               | Description                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id          | The service identifier.                                                                                                                                           |
| VPN Id              | The number which identifies the VPN.                                                                                                                              |
| Service Type        | Specifies the type of service.                                                                                                                                    |
| SDP Id              | The SDP identifier.                                                                                                                                               |
| Description         | Generic information about the service.                                                                                                                            |
| Customer Id         | The customer identifier.                                                                                                                                          |
| Last Mgmt Change    | The date and time of the most recent management-initiated change to this customer.                                                                                |
| SAP Count           | The number of SAPs specified for this service.                                                                                                                    |
| SDP Bind Count      | The number of SDPs bound to this service.                                                                                                                         |
| Split Horizon Group | Name of the split horizon group for this service.                                                                                                                 |
| Description         | Description of the split horizon group.                                                                                                                           |
| Last Changed        | The date and time of the most recent management-initiated change to this split horizon group.                                                                     |
| SDP Id              | The SDP identifier.                                                                                                                                               |
| Type                | Indicates whether this service SDP binding is a spoke or a mesh.                                                                                                  |
| Admin Path MTU      | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Oper Path MTU       | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| Delivery            | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                      |
| Admin State         | The administrative state of this SDP.                                                                                                                             |
| Oper State          | The operational state of this SDP.                                                                                                                                |

| Label                  | Description (Continued)                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress Label          | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                                                                                                                                     |
| Egress Label           | The label used by this device to send packets to the far-end device in this service by this SDP.                                                                                                                                                                                     |
| Ingress Filter         | The ID of the ingress filter policy.                                                                                                                                                                                                                                                 |
| Egress Filter          | The ID of the egress filter policy.                                                                                                                                                                                                                                                  |
| Far End                | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                                                                                                                            |
| Last Changed           | The date and time of the most recent change to this customer.                                                                                                                                                                                                                        |
| Hello Time             | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len          | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                       |
| Max Drop Count         | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Hold Down Time         | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                     |
| SDP Delivery Mechanism | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the Far End field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS |
| Number of SDPs         | The total number SDPs applied to this service ID.                                                                                                                                                                                                                                    |
| Service Id             | The service identifier.                                                                                                                                                                                                                                                              |
| Port Id                | The ID of the access port where this SAP is defined.                                                                                                                                                                                                                                 |
| Description            | Generic information about the SAP.                                                                                                                                                                                                                                                   |
| Encap Value            | The value of the label used to identify this SAP on the access port.                                                                                                                                                                                                                 |
| Admin State            | The administrative state of the SAP.                                                                                                                                                                                                                                                 |
| Oper State             | The operating state of the SAP.                                                                                                                                                                                                                                                      |
| Last Changed           | The date and time of the last change.                                                                                                                                                                                                                                                |
| Admin MTU              | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                    |
| Oper MTU               | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                     |

| Label                 | Description (Continued)                                                           |
|-----------------------|-----------------------------------------------------------------------------------|
| Ingress qos-policy    | The SAP ingress QoS policy ID.                                                    |
| Egress qos-policy     | The SAP egress QoS policy ID.                                                     |
| Ingress Filter-Id     | The SAP ingress filter policy ID.                                                 |
| Egress Filter-Id      | The SAP egress filter policy ID.                                                  |
| Multi Svc Site        | Indicates the multi-service site that the SAP is a member.                        |
| Ingress sched-policy  | Indicates the ingress QoS scheduler for the SAP.                                  |
| Egress sched-policy   | Indicates the egress QoS scheduler for the SAP.                                   |
| Acct. Pol             | Indicates the accounting policy applied to the SAP.                               |
| Collect Stats         | Specifies whether accounting statistics are collected on the SAP.                 |
| Dropped               | The number of packets or octets dropped.                                          |
| Offered Hi Priority   | The number of high priority packets, as determined by the SAP ingress QoS policy. |
| Offered Low Priority  | The number of low priority packets, as determined by the SAP ingress QoS policy.  |
| Offered Low Priority  | The number of low priority packets, as determined by the SAP ingress QoS policy.  |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.        |
| Dropped In Profile    | The number of in-profile packets or octets discarded.                             |
| Dropped Out Profile   | The number of out-of-profile packets or octets discarded.                         |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.        |
| Ingress Queue 1       | The index of the ingress QoS queue of this SAP.                                   |
| High priority offered | The packets or octets count of the high priority traffic for the SAP.             |
| High priority dropped | The number of high priority traffic packets/octets dropped.                       |
| Low priority offered  | The packets or octets count of the low priority traffic.                          |

| Label                 | Description (Continued)                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------|
| Low priority dropped  | The number of low priority traffic packets/octets dropped.                                  |
| In profile forwarded  | The number of in-profile packets or octets (rate below CIR) forwarded.                      |
| Out profile forwarded | The number of out-of-profile octets (rate above CIR) forwarded.                             |
| Egress Queue 1        | The index of the egress QoS queue of the SAP.                                               |
| In profile forwarded  | The number of in-profile packets or octets (rate below CIR) forwarded.                      |
| In profile dropped    | The number of in-profile packets or octets dropped for the SAP.                             |
| Out profile forwarded | The number of out-of-profile packets or octets (rate above CIR) forwarded.                  |
| Out profile dropped   | The number of out-of-profile packets or octets discarded.                                   |
| State                 | Specifies whether DHCP Relay is enabled on this SAP.                                        |
| Info Option           | Specifies whether Option 82 processing is enabled on this SAP.                              |
| Action                | Specifies the Option 82 processing on this SAP or interface: keep, replace or drop.         |
| Circuit ID            | Specifies whether the If Index is inserted in Circuit ID sub-option of Option 82.           |
| Remote ID             | Specifies whether the far-end MAC address is inserted in Remote ID sub-option of Option 82. |
| Managed by Service    | Specifies the service-id of the management VPLS managing this SAP.                          |
| Managed by MSTI       | Specifies the MST instance inside the management VPLS managing this SAP.                    |
| Last BPDU from        | The bridge ID of the sender of the last BPDU received on this SAP.                          |
| Managed by SAP        | Specifies the sap-id inside the management VPLS managing this SAP.                          |
| Prune state           | Specifies the STP state inherited from the management VPLS.                                 |
| Managed by Service    | Specifies the service-id of the management VPLS managing this spoke SDP.                    |
| Last BPDU from        | The bridge ID of the sender of the last BPDU received on this SAP.                          |
| Managed by Spoke      | Specifies the sap-id inside the management VPLS managing this spoke SDP.                    |
| Prune state           | Specifies the STP state inherited from the management VPLS.                                 |

## Sample Output

```

*A:ALA-48# show service id 700 all
=====
Service Detailed Information
=====
Service Id : 700 Vpn Id : 0
Service Type : VPLS
Description : IMA VPLS
Customer Id : 7
Last Status Change: 02/02/2009 09:27:55
Last Mgmt Change : 02/02/2009 09:27:57

## base

**Syntax** **base [msap]**

Context **show>service>id**  
**show>service>id>igmp-snooping**

**Description** This command displays basic information about the service ID including service type, description, SAPs and SDPs.

**Parameters** **msap** — Displays management SAPs.

**Output** **Show Service-ID Base** — The following table describes show service-id base output fields:

| Label            | Description                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                                                                                                                     |
| Vpn Id           | Specifies the VPN ID assigned to the service.                                                                                                                               |
| Service Type     | Displays the type of service.                                                                                                                                               |
| Description      | Generic information about the service.                                                                                                                                      |
| Customer Id      | The customer identifier.                                                                                                                                                    |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this customer.                                                                                          |
| Adm              | The administrative state of the service.                                                                                                                                    |
| Oper             | The operational state of the service.                                                                                                                                       |
| Mtu              | The largest frame size (in octets) that the service can handle.                                                                                                             |
| Def. Mesh VC Id  | This object is only valid in services that accept mesh SDP bindings. It is used to validate the VC ID portion of each mesh SDP binding defined in the service.              |
| SAP Count        | The number of SAPs defined on the service.                                                                                                                                  |
| SDP Bind Count   | The number of SDPs bound to the service.                                                                                                                                    |
| Identifier       | Specifies the service access (SAP) and destination (SDP) points.                                                                                                            |
| Type             | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                           |
| AdmMTU           | Specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented.            |
| OprMTU           | Specifies the actual largest service frame size (in octets) that can be transmitted through this service to the far-end ESR, without requiring the packet to be fragmented. |

| Label | Description (Continued)        |
|-------|--------------------------------|
| Opr   | The operating state of the SAP |

| <b>Description</b> | This command displays FDB entries for a given MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><b>sap</b> <i>sap-id</i> — Specifies the physical port identifier portion of the SAP. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><b>detail</b> — Displays detailed information.</p> <p><b>expiry</b> — Displays time until MAC is aged out.</p> <p><b>pbb</b> — Displays PBB related information. This keyword is only applicable to b-vpls or i-vpls services.</p> <p><i>endpoint-name</i> — Specifies an endpoint name up to 32 characters in length.</p> <p><b>Show FDB Information</b> — The following table describes service FDB output fields.</p> |

| Label            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ServID           | Displays the service ID.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MAC              | Displays the associated MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Mac Move         | Displays the administrative state of the MAC movement feature associated with this service.                                                                                                                                                                                                                                                                                                                                                         |
| Primary Factor   | Displays a factor for the primary ports defining how many MAC-relearn periods should be used to measure the MAC-relearn rate.                                                                                                                                                                                                                                                                                                                       |
| Secondary Factor | Displays a factor for the secondary ports defining how many MAC-relearn periods should be used to measure the MAC-relearn rate.                                                                                                                                                                                                                                                                                                                     |
| Mac Move Rate    | <p>Displays the maximum rate at which MAC's can be re-learned in this service, before the SAP where the moving MAC was last seen is automatically disabled in order to protect the system against undetected loops or duplicate MAC's.</p> <p>The rate is computed as the maximum number of re-learns allowed in a 5 second interval: for example, the default rate of 2 re-learns per second corresponds to 10 re-learns in a 5 second period.</p> |

| Label              | Description                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mac Move Timeout   | Displays the time in seconds to wait before a SAP that has been disabled after exceeding the maximum re-learn rate is re-enabled.<br>A value of zero indicates that the SAP will not be automatically re-enabled after being disabled. If after the SAP is re-enabled it is disabled again, the effective retry timeout is doubled in order to avoid thrashing. |
| Mac Move Retries   | Displays the number of times retries are performed for reenabling the SAP/SDP.                                                                                                                                                                                                                                                                                  |
| Table Size         | Specifies the maximum number of learned and static entries allowed in the FDB of this service.<br>The maximum value is 511999 when the the value of the chassis mode is <b>d</b> .<br>The maximum value is 196607 when the chassis mode is <b>c</b> .<br>In other cases, the maximum value is 131071.                                                           |
| Total Count        | Displays the total number of learned entries in the FDB of this service.                                                                                                                                                                                                                                                                                        |
| Learned Count      | Displays the current number of learned entries in the FDB of this service.                                                                                                                                                                                                                                                                                      |
| Static Count       | Displays the current number of static entries in the FDB of this service.                                                                                                                                                                                                                                                                                       |
| OAM-learned Count  | Displays the current number of OAM entries in the FDB of this service.                                                                                                                                                                                                                                                                                          |
| DHCP-learned Count | Displays the current number of DHCP-learned entries in the FDB of this service.                                                                                                                                                                                                                                                                                 |
| Host-learned Count | Displays the current number of host-learned entries in the FDB of this service.                                                                                                                                                                                                                                                                                 |
| Remote Age         | Displays the number of seconds used to age out FDB entries learned on an SDP. These entries correspond to MAC addresses learned on remote SAPs.                                                                                                                                                                                                                 |
| Local Age          | Displays the number of seconds used to age out FDB entries learned on local SAPs.                                                                                                                                                                                                                                                                               |
| High Watermark     | Displays the utilization of the FDB table of this service at which a table full alarm will be raised by the agent.                                                                                                                                                                                                                                              |
| Low Watermark      | Displays the utilization of the FDB table of this service at which a table full alarm will be cleared by the agent.                                                                                                                                                                                                                                             |
| Mac Learning       | Specifies whether the MAC learning process is enabled                                                                                                                                                                                                                                                                                                           |
| Discard Unknown    | Specifies whether frames received with an unknown destination MAC are discarded.                                                                                                                                                                                                                                                                                |
| Mac Aging          | Indicates whether the MAC aging process is enabled.                                                                                                                                                                                                                                                                                                             |

| Label             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relearn Only      | Displays, that when enabled, either the FDB table of this service is full, or that the maximum system-wide number of MA's supported by the agent has been reached, and thus MAC learning is temporary disabled, and only MAC re-learns can take place.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Mac Subnet Len    | Displays the number of bits to be considered when performing MAC-learning or MAC-switching.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source-Identifier | The location where the MAC is defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Type/Age          | <p>Type — Specifies the number of seconds used to age out TLS FDB entries learned on local SAPs.</p> <p>Age — Specifies the number of seconds used to age out TLS FDB entries learned on an SDP. These entries correspond to MAC addresses learned on remote SAPs.</p> <p>L — Learned - Dynamic entries created by the learning process.</p> <p>OAM — Entries created by the OAM process.</p> <p>H — Host, the entry added by the system for a static configured subscriber host.</p> <p>D or DHCP — DHCP-installed MAC. Learned addresses can be temporarily frozen by the DHCP snooping application for the duration of a DHCP lease.</p> <p>P — Indicates the MAC is protected" by the MAC protection feature.</p> <p>Static — Statically configured.</p> |
| Last Change       | Indicates the time of the most recent state changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b> | This command displays GSMP neighbor information.                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <b>group</b> — A GSMP group defines a set of GSMP neighbors which have the same properties.<br><i>name</i> — Specifies a GSMP group name is unique only within the scope of the service in which it is defined.<br><i>ip-address</i> — Specifies the ip-address of the neighbor. |

Sample Output

These commands show the configured neighbors per service, regardless of the fact there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in 'no shutdown' state. Session gives the number of session (open TCP connections) for each configured neighbor.

## l2pt

|                    |                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>l2pt disabled</b><br><b>l2pt [detail]</b>                                                                                                                   |
| <b>Context</b>     | show>service>id                                                                                                                                                |
| <b>Description</b> | This command displays Layer 2 Protocol Tunnel (L2-PT) route information associated with this service.                                                          |
| <b>Parameters</b>  | <b>disabled</b> — Displays only entries with termination disabled. This helps identify configuration errors.<br><b>detail</b> — Displays detailed information. |
| <b>Output</b>      | <b>Show L2PT Fields</b> — The following table describes show L2PT output fields:                                                                               |

| Label                  | Description                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service id             | Displays the 24 bit (0..16777215) service instance identifier for the service.                                                                                                                                                                                        |
| L2pt-term enabled      | Indicates if L2-PT-termination and/or Bpdu-translation is in use in this service by at least one SAP or spoke SDP binding. If in use, at least one of L2PT-termination or Bpdu-translation is enabled. When enabled it is not possible to enable STP on this service. |
| L2pt-term disabled     | Indicates that L2-PT-termination is disabled.                                                                                                                                                                                                                         |
| Bpdu-trans auto        | Specifies the number of L2-PT PDU's are translated before being sent out on a port or sap.                                                                                                                                                                            |
| Bpdu-trans disabled    | Indicates that Bpdu-translation is disabled.                                                                                                                                                                                                                          |
| SAPs                   | Displays the number of SAPs with L2PT or BPDU translation enabled or disabled.                                                                                                                                                                                        |
| SDPs                   | Displays the number of SDPs with L2PT or BPDU translation enabled or disabled.                                                                                                                                                                                        |
| Total                  | Displays the column totals of L2PT entities.                                                                                                                                                                                                                          |
| SapId                  | The ID of the access point where this SAP is defined.                                                                                                                                                                                                                 |
| L2pt-termination       | Indicates whether L2pt termination is enabled or disabled.                                                                                                                                                                                                            |
| Admin Bpdu-translation | Specifies whether Bpdu translation is administratively enabled or disabled.                                                                                                                                                                                           |
| Oper Bpdu-translation  | Specifies whether Bpdu translation is operationally enabled or disabled.                                                                                                                                                                                              |
| SdpId                  | Specifies the SAP ID.                                                                                                                                                                                                                                                 |

|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>proxy-db [detail]</b><br><b>proxy-db group <i>grp-ip-address</i></b>                                                                                                                                  |
| <b>Context</b>     | show>service>id>mld-snooping                                                                                                                                                                             |
| <b>Description</b> | This command displays proxy-reporting database entries.                                                                                                                                                  |
| <b>Parameters</b>  | <i>grp-ip-address</i> — Displays the IGMP snooping proxy reporting database for a specific multicast group address.<br><b>detail</b> — Displays detailed information about the proxy-reporting database, |

## querier

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <b>Syntax</b>      | <b>querier</b>                                               |
| <b>Context</b>     | show>service>id>mld-snooping                                 |
| <b>Description</b> | This command displays information about the current querier. |

## static

|                |                                                             |
|----------------|-------------------------------------------------------------|
| <b>Syntax</b>  | <b>static [sap <i>sap-id</i>   sdp <i>sdp-id:vc-id</i>]</b> |
| <b>Context</b> | show>service>id>mld-snooping                                |

**Description** This command displays MLD snooping static group membership data.

statistics

**Syntax** **statistics** [**sap** *sap-id* | **sdp** *sdp-id:vc-id*]  
**Context** show>service>id>mld-snooping  
**Description** This command displays MLD snooping statistics.

mrp-policy

**Syntax** **mrp-policy** [*mrp-policy*]  
**mrp-policy** *mrp-policy* [**association**]  
**mrp-policy** *mrp-policy* [**entry** *entry-id*]  
**Context** show>service>id  
**Description** This command displays information on an MRP policy.  
**Parameters** *mrp-policy* — Specifies the MRP policy name.

**Values** 32 chars max  
*entry-id* — Specifies the entry ID number.

**Values** 1..65535

**Output** \*A:PE-B# show service mrp-policy

```
=====

## mmrp

- Syntax** `mmrp mac [ieee-address]`
- Context** `show>service>id`
- Description** This command displays information on MACs. If a MAC address is specified, information will be displayed relevant to the specific group. No parameter will display information on all group MACs on a server.
- Parameters** *ieee-address* — Hex string: xx:xx:xx:xx:xx:xx; or xx-xx-xx-xx-xx-xx

### Output

```
*A:PE-A# show service id 10 mmrp mac 01:1E:83:00:00:65
```

| SAP/SDP      | MAC Address       | Registered | Declared |

| <b>Syntax</b>      | <b>sap</b> <i>sap-id</i> [ <i>filter</i> ]                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Context</b>     | show>service>id                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | This command displays information for the SAPs associated with the service.<br>If no optional parameters are specified, a summary of all associated SAPs is displayed.                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <b>sap</b> <i>sap-id</i> — The ID that displays SAPs for the service in the <i>slot/mda/port[.channel]</i> form. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.<br><b>detail</b> — Displays detailed information for the SAP.<br><i>filter</i> — Specifies a search term to narrow down the results.<br><b>Values</b> atm, base, detail, dhcp, mc-ring, mcac, mrp, qos, sap-stats, stats, stp, sub-mgmt |
| <b>Output</b>      | <b>Show Service-ID SAP</b> — The following table describes show service SAP fields:                                                                                                                                                                                                                                                                                                                                                           |

| Label              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id         | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SAP                | The SAP and qtag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Encap              | The encapsulation type of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Ethertype          | Specifies an Ethernet type II Ethertype value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Admin State        | The administrative state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Oper State         | The operational state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Flags              | Specifies the conditions that affect the operating status of this SAP.<br>Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCeIpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| Last Status Change | Specifies the time of the most recent operating status change to this SAP                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Mgmt Change   | Specifies the time of the most recent management-initiated change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Admin MTU          | The largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.                                                                                                                                                                                                                                                                                                                                                                         |

| Label                               | Description (Continued)                                                                                                                                         |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper MTU                            | The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented. |
| Ingress qos-policy                  | The ingress QoS policy ID assigned to the SAP.                                                                                                                  |
| Egress qos-policy                   | The egress QoS policy ID assigned to the SAP.                                                                                                                   |
| Ingress Filter-Id                   | The ingress filter policy ID assigned to the SAP.                                                                                                               |
| Egress Filter-Id                    | The egress filter policy ID assigned to the SAP.                                                                                                                |
| Acct. Pol                           | The accounting policy ID assigned to the SAP.                                                                                                                   |
| Collect Stats                       | Specifies whether collect stats is enabled.                                                                                                                     |
| Forwarding Engine Stats             |                                                                                                                                                                 |
| Dropped                             | The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                   |
| Off. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy.                                                                    |
| Off. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy.                                                                     |
| Off. Uncolor                        | The number of uncolored packets and octets, as determined by the SAP ingress QoS policy.                                                                        |
| Queueing Stats (Ingress QoS Policy) |                                                                                                                                                                 |
| Dro. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped due to: MBS exceeded, buffer pool limit exceeded, etc.     |
| Dro. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped due to: MBS exceeded, buffer pool limit exceeded, etc.      |
| For. InProf                         | The number of in-profile packets and octets (rate below CIR) forwarded.                                                                                         |
| For. OutProf                        | The number of out-of-profile packets and octets discarded due to MBS exceeded, buffer pool limit exceeded, etc.                                                 |
| Queueing Stats (Egress QoS Policy)  |                                                                                                                                                                 |
| Dro. InProf                         | The number of in-profile packets and octets discarded due to MBS exceeded, buffer pool limit exceeded, etc.                                                     |
| Dro. OutProf                        | The number of out-of-profile packets and octets due to MBS exceeded, buffer pool limit exceeded, etc.                                                           |

| Label               | Description (Continued)                                                     |
|---------------------|-----------------------------------------------------------------------------|
| For. InProf         | The number of in-profile packets and octets (rate below CIR) forwarded.     |
| For. OutProf        | The number of out-of-profile packets and octets (rate above CIR) forwarded. |
| Ingress TD Profile  | The profile ID applied to the ingress SAP.                                  |
| Egress TD Profile   | The profile ID applied to the egress SAP.                                   |
| Alarm Cell Handling | The indication that OAM cells are being processed.                          |
| AAL-5 Encap         | The AAL-5 encapsulation type.                                               |

## sdp

- Syntax** **sdp** *sdp-id:vc-id* {**mrp**}  
**sdp** [*sdp-id* | **far-end** *ip-addr*] [**detail**]
- Context** show>service>id
- Description** This command displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.
- Parameters** *sdp-id* — Displays only information for the specified SDP ID.
- Default** All SDPs
- Values** 1 — 17407
- far-end** *ip-addr* — Displays only SDPs matching with the specified far-end IP address.
- Default** SDPs with any far-end IP address.
- detail** — Displays detailed SDP information.
- Output** **Show Service-ID SDP** — The following table describes show service-id SDP output fields.

| Label               | Description                                                                   |
|---------------------|-------------------------------------------------------------------------------|
| Sdp Id              | The SDP identifier.                                                           |
| Type                | Indicates whether the SDP is spoke or mesh.                                   |
| Split Horizon Group | Indicates the name of the split horizon group that the SDP belongs to.        |
| VC Type             | Displays the VC type: ether, vlan, or vpls.                                   |
| VC Tag              | Displays the explicit dot1Q value used when encapsulating to the SDP far end. |

| Label          | Description (Continued)                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I. Lbl         | The VC label used by the far-end device to send packets to this device in this service by the SDP.                                                                           |
| Admin Path MTU | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case.) |
| Oper Path MTU  | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.             |
| Far End        | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                    |
| Delivery       | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                 |
| Admin State    | The administrative state of this SDP.                                                                                                                                        |
| Oper State     | The current status of the SDP.                                                                                                                                               |
| Ingress Label  | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                             |
| Egress Label   | The label used by this device to send packets to the far-end device in this service by the SDP.                                                                              |
| Last Changed   | The date and time of the most recent change to the SDP.                                                                                                                      |
| Signaling      | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                           |
| Admin State    | The administrative state of the Keepalive process.                                                                                                                           |
| Oper State     | The operational state of the Keepalive process.                                                                                                                              |
| Hello Time     | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                               |
| Max Drop Count | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                              |
| Hello Msg Len  | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                               |
| Hold Down Time | Specifies the amount of time to wait before the Keepalive operating status is eligible to enter the alive state.                                                             |
| I. Fwd. Pkts.  | Specifies the number of forwarded ingress packets.                                                                                                                           |
| I. Dro. Pkts   | Specifies the number of dropped ingress packets.                                                                                                                             |
| E. Fwd. Pkts.  | Specifies the number of forwarded egress packets.                                                                                                                            |
| E. Fwd. Octets | Specifies the number of forwarded egress octets.                                                                                                                             |

| Label               | Description (Continued)                                                                                                                                                                                                                                                              |

| <b>Description</b> | This command displays information for the spanning tree protocol instance for the service.                                                         |
| <b>Parameters</b>  | <b>detail</b> — Displays detailed information.<br><i>mst-inst-number</i> — Displays information about the specified MST.<br><b>Values</b> 1 — 4094 |
| <b>Output</b>      | <b>Show Service-ID STP Output</b> — The following table describes show service-id STP output fields:                                               |

| Label             | Description                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSTP Admin State  | Indicates the administrative state of the Rapid Spanning Tree Protocol instance associated with this service.                                                                              |
| Core Connectivity | Indicates the connectivity status to the core.                                                                                                                                             |
| RSTP Oper State   | Indicates the operational state of the Rapid Spanning Tree Protocol instance associated with this service. This field is applicable only when STP is enabled on the router.                |
| Bridge-id         | Specifies the MAC address used to identify this bridge in the network.                                                                                                                     |
| Hold Time         | Specifies the interval length during which no more than two Configuration BPDUs shall be transmitted by this bridge.                                                                       |
| Bridge fwd delay  | Specifies how fast a bridge changes its state when moving toward the forwarding state.                                                                                                     |
| Bridge Hello time | Specifies the amount of time between the transmission of Configuration BPDUs.                                                                                                              |
| Bridge max age    | Specifies the maximum age of Spanning Tree Protocol information learned from the network on any port before it is discarded. This is the actual value that this bridge is currently using. |
| Bridge priority   | Defines the priority of the Spanning Tree Protocol instance associated with this service.                                                                                                  |
| Topology change   | Specifies whether a topology change is currently in progress.                                                                                                                              |
| Last Top. change  | Specifies the time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service.                     |
| Top. change count | Specifies the total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized.     |

| Label                 | Description (Continued)                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Root bridge-id        | Specifies the bridge identifier of the root of the spanning tree as determined by the Spanning Tree Protocol instance associated with this service. This value is used as the Root Identifier parameter in all Configuration BPDUs originated by this node. |
| Root path cost        | Specifies the cost of the path to the root bridge as seen from this bridge.                                                                                                                                                                                 |
| Root forward delay    | Specifies how fast the root changes its state when moving toward the forwarding state.                                                                                                                                                                      |
| Root hello time       | Specifies the amount of time between the transmission of configuration BPDUs.                                                                                                                                                                               |
| Root max age          | Specifies the maximum age of Spanning Tree Protocol information learned from the network on any port before it is discarded.                                                                                                                                |
| Root priority         | This object specifies the priority of the bridge that is currently selected as root-bridge for the network.                                                                                                                                                 |
| Root port             | Specifies the port number of the port which offers the lowest cost path from this bridge to the root bridge.                                                                                                                                                |
| SAP Identifier        | The ID of the access port where this SAP is defined.                                                                                                                                                                                                        |
| RSTP State            | The operational state of RSTP.                                                                                                                                                                                                                              |
| STP Port State        | Specifies the port identifier of the port on the designated bridge for this port's segment.                                                                                                                                                                 |
| BPDU encap            | Specifies the type of encapsulation used on BPDUs sent out and received on this SAP.                                                                                                                                                                        |
| Port Number           | Specifies the value of the port number field which is contained in the least significant 12 bits of the 16-bit port ID associated with this SAP.                                                                                                            |
| Priority              | Specifies the value of the port priority field which is contained in the most significant 4 bits of the 16-bit port ID associated with this SAP.                                                                                                            |
| Cost                  | Specifies the contribution of this port to the path cost of paths towards the spanning tree root which include this port.                                                                                                                                   |
| Fast Start            | Specifies whether Fast Start is enabled on this SAP.                                                                                                                                                                                                        |
| Designated Port       | Specifies the port identifier of the port on the designated bridge for this port's segment.                                                                                                                                                                 |
| Designated Bridge     | Specifies the bridge identifier of the bridge which this port considers to be the designated bridge for this port's segment.                                                                                                                                |
| Service Access Points |                                                                                                                                                                                                                                                             |
| Managed by Service    | Specifies the service ID of the management VPLS managing this SAP or spoke SDP.                                                                                                                                                                             |

| Label                | Description (Continued)                                                                   |
|----------------------|-------------------------------------------------------------------------------------------|
| Managed by SAP/spoke | Specifies the SAP ID or SDP ID inside the management VPLS managing this SAP or spoke SDP. |
| Prune state          | Specifies the STP state inherited from the management VPLS.                               |

| <b>Description</b> | This command displays subscriber host information.                                                                                                                                                                                             |
| <b>Parameters</b>  | <b>sap</b> <i>sap-id</i> — Displays the specified subscriber host SAP information. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.                                                                        |

**ip-address/mask** — The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** Allowed values are IP addresses in the range 1.0.0.0 — 223.255.255.255 (with support of /31 subnets).  
mask: 1 — 32

**mac ieee-address** — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

**sub-profile sub-profile-name** — Specifies an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

**sla-profile sla-profile-name** — Specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

**detail** — Displays detailed information.

| <b>Context</b>     | show>service>id>igmp-snooping                                                                             |
| <b>Description</b> | This command displays detailed information for all aspects of IGMP snooping on the VPLS service.          |
| <b>Output</b>      | <b>Show All Service-ID</b> — The following table describes the show all service-id command output fields: |

| Label          | Description                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------|
| Admin State    | The administrative state of the IGMP instance.                                                |
| Querier        | Displays the address of the IGMP querier on the IP subnet to which the interface is attached. |
| Sap Id         | Displays the SAP IDs of the service ID.                                                       |
| Oper State     | Displays the operational state of the SAP IDs of the service ID.                              |
| Mrtr Port      | Specifies if the port is a multicast router port.                                             |
| Send Queries   | Specifies whether the send-queries command is enabled or disabled.                            |
| Max Num Groups | Specifies the maximum number of multicast groups that can be joined on this SAP.              |
| MVR From VPLS  | Specifies MVR from VPLS.                                                                      |
| Num Groups     | Specifies the actual number of multicast groups that can be joined on this SAP.               |

| <b>Description</b> | This command displays the multicast FIB on the VPLS service.                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <b>brief</b> — Displays a brief output.<br><b>statistics</b> — Displays statistics on the multicast FIB.<br><b>ip</b> — Displays IP address information.<br><b>mac</b> — Displays MAC address information.<br><b>group</b> <i>grp grp-address</i> — Displays the multicast FIB for a specific multicast group address. |
| <b>Output</b>      | <b>Show Output</b> — The following table describes the command output fields:                                                                                                                                                                                                                                          |

| Label               | Description                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Address      | IPv4 unicast source address.                                                                                                                                                                       |
| Group Address       | IPv4 multicast group address.                                                                                                                                                                      |
| SAP ID              | Indicates the SAP/SDP to which the corresponding multicast stream will be forwarded/blocked.                                                                                                       |
| Forwarding/Blocking | Indicates whether the corresponding multicast stream will be blocked/forwarded.                                                                                                                    |
| Number of Entries   | Specifies the number of entries in the MFIB.                                                                                                                                                       |
| Forwarded Packets   | Indicates the number of multicast packets forwarded for the corresponding source/group.                                                                                                            |
| Forwarded Octets    | Indicates the number of octets forwarded for the corresponding source/group.                                                                                                                       |
| Svc ID              | Indicates the service to which the corresponding multicast stream will be forwarded/blocked. Local means that the multicast stream will be forwarded/blocked to a SAP or SDP local to the service. |

## port-db

**Syntax**     **port-db sap** *sap-id* [**detail**]  
**port-db sap** *sap-id* **group** *grp-address*  
**port-db sdp** *sdp-id:vc-id* [**detail**]  
**port-db sdp** *sdp-id:vc-id* **group** *grp-address*

**Context**     show>service>id>igmp-snooping

**Description**     This command displays information on the IGMP snooping port database for the VPLS service.

**Parameters**     **group** *grp-ip-address* — Displays the IGMP snooping port database for a specific multicast group address.

**sap** *sap-id* — Displays the IGMP snooping port database for a specific SAP. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

**sdp** *sdp-id* — Displays only IGMP snooping entries associated with the specified mesh SDP or spoke SDP. For a spoke SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values**     1 — 17407

*vc-id* — The virtual circuit ID on the SDP ID for which to display information.

**Default**     For mesh SDPs only, all VC IDs.

**Values**     1 — 4294967295

**group** *grp-address* — Displays IGMP snooping statistics matching the specified group address.

**source** *ip-address* — Displays IGMP snooping statistics matching one particular source within the multicast group.

**Output**     **Show Output** — The following table describes the show output fields:

| Label         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | The IP multicast group address for which this entry contains information.                                                                                                                                                                                                                                                                                                                                                                                              |
| Mode          | Specifies the type of membership report(s) received on the interface for the group.<br>In the include mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report.<br>In exclude' mode, reception of packets sent to the given multicast address is requested from all IP source addresses except those listed in the source-list parameter. |
| Type          | Indicates how this group entry was learned.<br>If this group entry was learned by IGMP, the value is set to dynamic.<br>For statically configured groups, the value is set to static.                                                                                                                                                                                                                                                                                  |

| Label               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compatibility mode  | Specifies the IGMP mode. This is used in order for routers to be compatible with older version routers. IGMPv3 hosts must operate in Version 1 and Version 2 compatibility modes. IGMPv3 hosts must keep state per local interface regarding the compatibility mode of each attached network. A host's compatibility mode is determined from the host compatibility mode variable which can be in one of three states: IGMPv1, IGMPv2 or IGMPv3. This variable is kept per interface and is dependent on the version of general queries heard on that interface as well as the older version querier present timers for the interface. |
| V1 host expires     | The time remaining until the local router will assume that there are no longer any IGMP Version 1 members on the IP subnet attached to this interface. Upon hearing any IGMPv1 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv2 leave messages for this group that it receives on this interface.                                                                                                                                                                                                                                      |
| V2 host expires     | The time remaining until the local router will assume that there are no longer any IGMP Version 2 members on the IP subnet attached to this interface. Upon hearing any IGMPv2 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv3 leave messages for this group that it receives on this interface.                                                                                                                                                                                                                                      |
| Source address      | The source address for which this entry contains information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Up Time             | The time since the source group entry was created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expires             | The amount of time remaining before this entry will be aged out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Number of sources   | Indicates the number of IGMP group and source specific queries received on this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Forwarding/Blocking | Indicates whether this entry is on the forward list or block list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Number of groups    | Indicates the number of groups configured for this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## proxy-db

|                    |                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>proxy-db [detail]</b><br><b>proxy-db group grp-address</b>                                                             |
| <b>Context</b>     | show>service>id>igmp-snooping                                                                                             |
| <b>Description</b> | This command displays information on the IGMP snooping proxy reporting database for the VPLS service.                     |
| <b>Parameters</b>  | <b>group grp-ip-address</b> — Displays the IGMP snooping proxy reporting database for a specific multicast group address. |
| <b>Output</b>      | <b>Show Output</b> — The following table describes the show output fields:                                                |

| Label            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address    | The IP multicast group address for which this entry contains information.                                                                                                                                                                                                                                                                                                                                                                                                |
| Mode             | Specifies the type of membership report(s) received on the interface for the group. In the include mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report.<br><br>In “exclude” mode, reception of packets sent to the given multicast address is requested from all IP source addresses except those listed in the source-list parameter. |
| Up Time          | The total operational time in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Num Sources      | Indicates the number of IGMP group and source specific queries received on this interface.                                                                                                                                                                                                                                                                                                                                                                               |
| Number of groups | Number of IGMP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Source Address   | The source address for which this entry contains information.                                                                                                                                                                                                                                                                                                                                                                                                            |

## querier

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>querier</b>                                                             |
| <b>Context</b>     | show>service>id>igmp-snooping                                              |
| <b>Description</b> | Displays information on the IGMP snooping queriers for the VPLS service.   |
| <b>Output</b>      | <b>Show Output</b> — The following table describes the show output fields: |

| Label                   | Description                                                                     |
|-------------------------|---------------------------------------------------------------------------------|
| SAP Id                  | Specifies the SAP ID of the service.                                            |
| IP address              | Specifies the IP address of the querier.                                        |
| Expires                 | The time left, in seconds, that the query will expire.                          |
| Up time                 | The length of time the query has been enabled.                                  |
| Version                 | The configured version of IGMP.                                                 |
| General Query Interval  | The frequency at which host-query packets are transmitted.                      |
| Query Response Interval | The time to wait to receive a response to the host-query message from the host. |
| Robust Count            | Specifies the value used to calculate several IGMP message intervals.           |

statistics

- Syntax** **statistics** [**sap** *sap-id* | **sdp** *sdp-id:vc-id*]
- Context** show>service>id>igmp-snooping
- Description** This command displays IGMP snooping statistics for the VPLS service.
- Parameters**

**sap** *sap-id* — Displays IGMP snooping statistics for a specific SAP. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

**sdp** *sdp-id* — Displays the IGMP snooping statistics for a specific spoke or mesh SDP.

**Values** 1 — 17407

*vc-id* — The virtual circuit ID on the SDP ID for which to display information.

**Default** For mesh SDPs only, all VC IDs.

**Values** 1 — 4294967295

| <b>Description</b> | This command enables the context to display egress flooding information for a VPLS service context on a given MDA. A VPLS service context supports both Layer 2 and Layer 3 flooding modes. The Layer 2 flooding mode is used for broadcast, Layer 2 multicast and unknown destination MAC addressed packets. All available interfaces (SAP, spoke SDP and mesh-SDP) that reside on an egress forwarding complex are included in the egress list except for SAPs that are defined in a residential split horizon group (Layer 2 flooding is not permitted on residential SAPs). The Layer 3 flooding mode is used for VPLS interfaces participating in IGMP snooping and is represented by an IP multicast [s,g] record. |

| <b>Description</b> | <p>The <b>vpls vpls-service-id mda slot/mda</b> command displays the flooding list used by the Layer 2 flooding mode for the VPLS service on the specified MDA. The Layer 2 flooding list is limited to SAPs, spoke SDP and mesh-SDP bindings that exist on the egress forwarding complex serviced by the specified MDA. For the 10G IOM, two MDAs share the same egress forwarding plane. In this case the Layer 2 flooding list will contain destinations for both MDAs (if entries exist). . The only VPLS interfaces that will not be included in the list are residential SAPs because Layer 2 replication is not permitted to a residential SAP. A packet processed by the egress Layer 2 flooding list may not be replicated to each destination. A packet will not be replicated to an interface on the Layer 2 flooding list because of the following:</p> <p>The ingress interface is the same as egress interface (source squelching rule)</p> <ul style="list-style-type: none"> <li>• The ingress interface split horizon group is the same as the egress interface (residential bridging rule).</li> <li>• The egress interface is down or blocking.</li> <li>• The packet matches a discard event while processing that destination interface.</li> <li>• An egress MTU violation occurs for the destination interface.</li> </ul> <p>Destination SAPs in the list may be displayed in a chain context representing common replication behavior. All SAPs in a single chain are processed a single time through the egress forwarding plane. If a discard decision is made for the first SAP in the chain, no replication processing is done for any of the chain members. If the forwarding plane decides to replicate the first SAP in the chain, it will replicate to all SAPs in the chain.</p> <p>The <b>vpls vpls-service-id mda card/slot igmp-record grp-address {source source-ip-address   starg}</b> command displays the IGMP record based flooding list for the <i>vpls-service-id</i> on the specified MDA. Unlike the Layer 2 flooding list for the VPLS context, an IGMP record list may contain interfaces from other VPLS contexts due to MVR (Multicast VPLS Registration) events on the individual VPLS interfaces. VPLS interfaces in other VPLS contexts become associated with the specified vpls-</p> |

service-id based on the MVR from-vpls definition. Another difference between the VPLS Layer 2 flooding list and IGMP lists is that many IGMP lists may exist (each associated with a different [s,g] record) and the lists may contain residential SAPs. The SAP chaining and replication behavior is similar to the VPLS Layer 2 flooding list.

IP multicast packets ingressing the vpls-service-id must match either a [\*g] or [s,g] record to be associated with the record's egress IP multicast IGMP flooding list. A [\*g] record will match any ingress IP multicast packet destined to the class D destination IP address represented by "g". An [s,g] record will match any ingress IP multicast packet with a source IP address matching "s" and a destination IP address matching "g". In the case that a packet could match both a [\*g] and [s,g] record, the [s,g] record takes precedence. Each [\*g] and [s,g] record has its own IGMP flooding list. The list will only appear on an egress forwarding plane (MDA) when a member of the list (VPLS interface) exists on the forwarding plane.

#### Parameters

*service-id* — Displays information about the specified service ID or service name.

##### Values

service-id: 1 — 214748364

svc-name: A string up to 64 characters in length.

*slot/mda* — Specifies a chassis and MDA slot.

*grp-ip-address* — Specifies a multicast group address.

*src-ip-address* — Specifies a source IP address.

**starg** — Specifies a (\*, G) record.

**mRouter** — Specifies the (\*,\*) record

**ipv6** — Displays IPv6 information.

*grp-ipv6-address* — ipv6-address - x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

d - [0..255]D

multicast group IPv6 address

*src-ipv6-address* — ipv6-address - x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

d - [0..255]D

## IGMP Commands

### group

| <b>Context</b>     | show>router>igmp                                                                                                                                                                     |
| <b>Description</b> | This command displays the multicast group and (s, g) addresses. If no <i>grp-ip-address</i> parameters are specified then all IGMP group, (*, g) and (s, g) addresses are displayed. |
| <b>Parameters</b>  | <i>grp-ip-address</i> — Displays specific multicast group addresses.                                                                                                                 |
| <b>Output</b>      | <b>IGMP Group Output</b> — The following table describes the output fields for IGMP group information.                                                                               |

| Label       | Description                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------|
| IGMP Groups | Displays the IP multicast sources corresponding to the IP multicast groups which are statically configured. |
| Fwd List    | Displays the list of interfaces in the forward list.                                                        |
| Blk List    | Displays the list of interfaces in the block list.                                                          |

| <b>Syntax</b>      | <b>interface</b> [ <i>ip-int-name</i>   <i>ip-address</i> ] [ <b>group</b> ] [ <i>grp-address</i> ] [ <b>detail</b> ]                                                                                                                                                                                                                                                                                                                                                           |
| <b>Context</b>     | show>router>igmp                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command displays IGMP interface information.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <p><i>ip-int-name</i> — Only displays the information associated with the specified IP interface name.</p> <p><i>ip-address</i> — Only displays the information associated with the specified IP address.</p> <p><b>group</b> <i>grp-address</i> — Only displays IP multicast group address for which this entry contains information.</p> <p><b>detail</b> — Displays detailed IP interface information along with the source group information learned on that interface.</p> |
| <b>Output</b>      | <b>IGMP Interface Output</b> — The following table provides IGMP field descriptions.                                                                                                                                                                                                                                                                                                                                                                                            |

| Label                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                             | Specifies the interfaces that participates in the IGMP protocol.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Adm<br>Admin Status                   | Displays the administrative state for the IGMP protocol on this interface.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Oper<br>Oper Status                   | Displays the current operational state of IGMP protocol on the interface.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Querier                               | Displays the address of the IGMP querier on the IP subnet to which the interface is attached.                                                                                                                                                                                                                                                                                                                                                                                  |
| Querier Up Time                       | Displays the time since the querier was last elected as querier.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Querier Expiry<br>Timer               | Displays the time remaining before the querier ages out. If the querier is the local interface address, the value will be zero.                                                                                                                                                                                                                                                                                                                                                |
| Cfg/Opr Version<br>Admin/Oper version | Cfg – The configured version of IGMP running on this interface. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.<br>Opr . The operational version of IGMP running on this interface. If the cfg value is 3 but all of the routers in the local subnet of this interface use IGMP version v1 or v2, the operational version will be v1 or v2.                                                               |
| Num Groups                            | The number of multicast groups which have been learned by the router on the interface.                                                                                                                                                                                                                                                                                                                                                                                         |
| Policy                                | Specifies the policy that is to be applied on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Group Address                         | Specifies the IP multicast group address for which this entry contains information.                                                                                                                                                                                                                                                                                                                                                                                            |
| Up Time                               | Specifies the time since this source group entry got created.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Last Reporter                         | Specifies the IP address of the source of the last membership report received for this IP Multicast group address on this interface. If no membership report has been received, this object has the value 0.0.0.0.                                                                                                                                                                                                                                                             |
| Mode                                  | The mode is based on the type of membership report(s) received on the interface for the group. In the 'include' mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report. In 'exclude' mode, reception of packets sent to the given multicast address is requested from all IP source addresses except those listed in the source-list parameter. |
| V1 Host Timer                         | The time remaining until the local router will assume that there are no longer any IGMP version 1 members on the IP subnet attached to this interface. Upon hearing any IGMPv1 Membership Report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv2 Leave messages for this group that it receives on this interface.                                                                              |

| Label         | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V2 Host Timer | The time remaining until the local router will assume that there are no longer any IGMP version 2 members on the IP subnet attached to this interface. Upon hearing any IGMPv2 Membership Report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv3 Leave messages for this group that it receives on this interface.                                                                                                                                                                                                     |
| Type          | Indicates how this group entry was learned. If this group entry was learned by IGMP, it will be set to 'dynamic'. For statically configured groups, the value will be set to 'static'.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Compat Mode   | Used in order for routers to be compatible with older version routers. IGMPv3 hosts MUST operate in version 1 and version 2 compatibility modes. IGMPv3 hosts MUST keep state per local interface regarding the compatibility mode of each attached network. A host's compatibility mode is determined from the Host Compatibility Mode variable which can be in one of three states: IGMPv1, IGMPv2 or IGMPv3. This variable is kept per interface and is dependent on the version of General Queries heard on that interface as well as the Older Version Querier Present timers for the interface. |

## static

- Syntax** **static** [*ip-int-name* | *ip-addr*]
- Context** show>router>igmp
- Description** This command displays static IGMP, (\*, g) (s, g) information.
- Parameters** *ip-int-name* — Only displays the information associated with the specified IP interface name.  
*ip-addr* — Only displays the information associated with the specified IP address.
- Output** **Static IGMP Output** — The following table provides static IGMP field descriptions

| Label     | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Source    | Displays entries which represents a source address from which receivers are interested/not interested in receiving multicast traffic. |
| Group     | Displays the IP multicast group address for which this entry contains information.                                                    |
| Interface | Displays the interface name.                                                                                                          |

## statistics

- Syntax** **statistics** [*ip-int-name* | *ip-address*]
- Context** show>router>igmp
- Description** This command displays IGMP statistics information.
- Parameters** *ip-int-name* — Only displays the information associated with the specified IP interface name.  
*ip-addr* — Only displays the information associated with the specified IP address.

**Output**    **IGMP Statistics Output** — The following table provides statistical IGMP field descriptions

| Label                        | Description                                                                                                                                                                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IGMP Interface Statistics    | The section listing the IGMP statistics for a particular interface.                                                                                                                                                                                                                     |
| Message Type                 | <p>Queries — The number of IGMP general queries transmitted or received on this interface.</p> <p>Report — The total number of IGMP V1, V2, or V3 reports transmitted or received on this interface.</p> <p>Leaves — The total number of IGMP leaves transmitted on this interface.</p> |
| Received                     | Column that displays the total number of IGMP packets received on this interface.                                                                                                                                                                                                       |
| Transmitted                  | Column that displays the total number of IGMP packets transmitted from this interface.                                                                                                                                                                                                  |
| General Interface Statistics | The section listing the general IGMP statistics.                                                                                                                                                                                                                                        |
| Bad Length                   | Displays the total number of IGMP packets with bad length received on this interface.                                                                                                                                                                                                   |
| Bad Checksum                 | Displays the total number of IGMP packets with bad checksum received on this interface.                                                                                                                                                                                                 |
| Unknown Type                 | Displays the total number of IGMP packets with unknown type received on this interface.                                                                                                                                                                                                 |
| Bad Receive If               | Displays the total number of IGMP packets incorrectly received on this interface.                                                                                                                                                                                                       |
| Rx Non Local                 | Displays the total number of IGMP packets received from a non-local sender.                                                                                                                                                                                                             |
| Rx Wrong Version             | Displays the total number of IGMP packets with wrong versions received on this interface.                                                                                                                                                                                               |
| Policy Drops                 | Displays the number of times IGMP protocol instance matched the host IP address or group/source addresses in the import policy.                                                                                                                                                         |
| No Router Alert              | Displays the total number of IGMPv3 packets received on this interface which did not have the router alert flag set.                                                                                                                                                                    |

| <b>Output</b>      | <b>Show DHCP Summary Output</b> — The following table describes the output fields for DHCP summary. |

| Label          | Description                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | Name of the router interface.                                                                                                                                                                                                                                                                                             |
| Arp Populate   | Specifies whether or not ARP populate is enabled.                                                                                                                                                                                                                                                                         |
| Used/Provided  | Used — The number of lease-states that are currently in use on a specific interface, that is, the number of clients on that interface got an IP address by DHCP. This value is always less than or equal to the 'Provided' field.<br><br>Provided — The lease-populate value that is configured for a specific interface. |
| Info Option    | Indicates whether Option 82 processing is enabled on the interface.                                                                                                                                                                                                                                                       |
| Admin State    | Indicates the administrative state.                                                                                                                                                                                                                                                                                       |

| <b>Description</b> | This command clears FDB entries for the service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |  |
| <b>Parameters</b>  | <p><b>all</b> — Clears all FDB entries.</p> <p><b>mac</b> <i>ieee-address</i> — Clears only FDB entries in the FDB table with the specified 48-bit MAC address. The MAC address can be expressed in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> where <i>aa</i>, <i>bb</i>, <i>cc</i>, <i>dd</i>, <i>ee</i> and <i>ff</i> are hexadecimal numbers.</p> <p><i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><b>mesh-sdp</b> — Clears only service FDB entries associated with the specified mesh SDP ID. For a mesh SDP, the VC ID is optional.</p> <p><b>spoke-sdp</b> — Clears only service FDB entries associated with the specified spoke SDP ID. For a spoke SDP, the VC ID must be specified.</p> <p><i>sdp-id</i> — The SDP ID for which to clear associated FDB entries.</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID for which to clear associated FDB entries.</p> |  |  |

|               |                |               |                |
|---------------|----------------|---------------|----------------|
| <b>Values</b> | sdp-id[:vc-id] | <i>sdp-id</i> | 1 — 17407      |
|               |                | <i>vc-id</i>  | 1 — 4294967295 |
|               | sdp-id:vc-id   | <i>sdp-id</i> | 1 — 17407      |
|               |                | <i>vc-id</i>  | 1 — 4294967295 |

## mld-snooping

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mld-snooping</b>                                                  |
| <b>Context</b>     | clear>service>id                                                     |
| <b>Description</b> | This command enables the context to clear MLD snooping-related data. |

## port-db

|                    |                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Context</b>     | clear>service>statistics>id                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b> | This command clears statistics for the spoke SDP bound to the service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><i>sdp-id</i> — The spoke SDP ID for which to clear statistics.</p> <p><b>Values</b> 1 — 17407</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID to be reset.</p> <p><b>Values</b> 1 — 4294967295</p> <p><b>all</b> — Clears all queue statistics and STP statistics associated with the SDP.</p> <p><b>counters</b> — Clears all queue statistics associated with the SDP.</p> <p><b>stp</b> — Clears all STP statistics associated with the SDP.</p> <p><b>l2pt</b> — Clears all L2PT statistics associated with the SDP.</p> <p><b>mrp</b> — Clears all MRP statistics associated with the SDP.</p> |

## stp

|                |                             |
|----------------|-----------------------------|
| <b>Syntax</b>  | <b>stp</b>                  |
| <b>Context</b> | clear>service>statistics>id |

**Description** Clears all spanning tree statistics for the service ID.

## detected-protocols

**Syntax** **detected-protocols** {**all** | **sap** *sap-id* | **spoke-sdp** *sdp-id[:vc-id]*}

**Context** clear>service>id>stp

**Description** RSTP automatically falls back to STP mode when it receives an STP BPDU. The **clear detected-protocols** command forces the system to revert to the default RSTP mode on the SAP or spoke SDP.

**Parameters** **all** — Clears all detected protocol statistics.

*sap-id* — Clears the specified lease state SAP information. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

*sdp-id* — The SDP ID to be cleared.

**Values** 1 — 17407

*vc-id* — The virtual circuit ID on the SDP ID to be cleared.

**Values** 1 — 4294967295

## lease-state

**Syntax** **lease-state** [**no-dhcp-release**]  
**lease-state ip-address** *ip-address* [**no-dhcp-release**]  
**lease-state mac** *ieee-address* **no-dhcp-release**  
**lease-state sap** *sap-id* [**no-dhcp-release**]  
**lease-state sdp** *sdp-id:vc-id* [**no-dhcp-release**]

**Context** clear>service>id>dhcp

**Description** This command clears DHCP lease state information.

**Parameters** **no-dhcp-release** — Specifies that the node will clear the state without sending the DHCP release message.

**ip-address** *ip-address* — Clears the DHCP IP address lease state information. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

**mac** *ieee-address* — Clears DHCP MAC address lease state information. The 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

**sap** *sap-id* — Clears DHCP SAP lease state information. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

*sdp-id* — The SDP ID to be cleared.

**Values** 1 — 17407

*vc-id* — The virtual circuit ID on the SDP ID to be cleared.

**Values** 1 — 4294967295

# VPLS Debug Commands

## id

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                                    |
| <b>Context</b>     | debug>service                                                                  |
| <b>Description</b> | This command debugs commands for a specific service.                           |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.                 |
| <b>Values</b>      | service-id: 1 — 214748364<br>svc-name: A string up to 64 characters in length. |

## arp-host

|                    |                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no]</b> arp-host                                                                                                      |
| <b>Context</b>     | debug>service>id                                                                                                          |
| <b>Description</b> | This command enables and configures ARP host debugging.<br>The <b>no</b> form of the command disables ARP host debugging. |

## igmp-snooping

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no]</b> igmp-snooping                                    |
| <b>Context</b>     | debug>service>id                                             |
| <b>Description</b> | This command enables and configures IGMP-snooping debugging. |

## detail-level

|                    |                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>detail-level</b> { <b>low</b>   <b>medium</b>   <b>high</b> }<br><b>no detail-level</b>                                                      |
| <b>Context</b>     | debug>service>id>igmp                                                                                                                           |
| <b>Description</b> | This command enables and configures the IGMP tracing detail level.<br>The <b>no</b> form of the command disables the IGMP tracing detail level. |

## mac

|                    |                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mac</b> <i>ieee-address</i>                                                                                             |
| <b>Context</b>     | debug>service>id>igmp                                                                                                           |
| <b>Description</b> | This command shows IGMP packets for the specified MAC address.<br>The <b>no</b> form of the command disables the MAC debugging. |

## mode

|                    |                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mode</b> { <b>dropped-only</b>   <b>ingr-and-dropped</b>   <b>egr-ingr-and-dropped</b> }<br><b>no mode</b>                                  |
| <b>Context</b>     | debug>service>id>igmp                                                                                                                          |
| <b>Description</b> | This command enables and configures the IGMP tracing mode.<br>The <b>no</b> form of the command disables the configures the IGMP tracing mode. |

## sap

|                    |                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap</b> <i>sap-id</i>                                                                                                |
| <b>Context</b>     | debug>service>id>igmp                                                                                                        |
| <b>Description</b> | This command shows IGMP packets for a specific SAP.<br>The <b>no</b> form of the command disables the debugging for the SAP. |

## sdp

|                    |                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sdp</b> <i>sdp-id:vc-id</i>                                                                                                                                                                                                                                                                                                                                            |
| <b>Context</b>     | debug>service>id>igmp                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | This command shows IGMP packets for a specific SDP.<br>The <b>no</b> form of the command disables the debugging for the SDP.                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <p><i>sdp-id</i> — Displays only IGMP snooping entries associated with the specified mesh SDP or spoke SDP. For a spoke SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.</p> <p><b>Values</b>      1 — 17407</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID for which to display information.</p> <p><b>Values</b>      1 — 4294967295</p> |

## mld-snooping

|                    |                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mld-snooping</b>                                                                                                         |
| <b>Context</b>     | debug>service>id                                                                                                                 |
| <b>Description</b> | This command enables and configures MLD-snooping debugging.<br>The <b>no</b> form of the command disables MLD-snooping debugging |

## detail-level

|                    |                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>detail-level {low   medium   high}</b><br><b>no detail-level</b>                                                                           |
| <b>Context</b>     | debug>service>id>mld                                                                                                                          |
| <b>Description</b> | This command enables and configures the MLD tracing detail level.<br>The <b>no</b> form of the command disables the MLD tracing detail level. |

## mac

## mrp

|                    |                                                    |
|--------------------|----------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mrp</b>                                    |
| <b>Context</b>     | debug>service>id                                   |
| <b>Description</b> | This command enables and configures MRP debugging. |

## all-events

|                    |                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>all-events</b>                                                                                                                                                  |
| <b>Context</b>     | debug>service>id>mrp                                                                                                                                               |
| <b>Description</b> | This command enables MRP debugging for the applicant, leave all, periodic and registrant state machines and enables debugging of received and transmuted MRP PDUs. |

## applicant-sm

|                |                          |
|----------------|--------------------------|
| <b>Syntax</b>  | <b>[no] applicant-sm</b> |
| <b>Context</b> | debug>service>id>mrp     |

**Description** This command enables debugging of the applicant state machine.  
The **no** form of the command disables debugging of the applicant state machine.

## leave-all-sm

**Syntax** [no] **leave-all-sm**

**Context** debug>service>id>mrp

**Description** This command enables debugging of the leave all state machine.  
The **no** form of the command disables debugging of the leave all state machine.

## mmrp-mac

**Syntax** [no] **mmrp-mac** *ieee-address*

**Context** debug>service>id>mrp

**Description** This command filters debug events and only shows events related to the MAC address specified.  
The **no** form of the command removes the debug filter.

**Parameters** *ieee-address* — xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx (cannot be all zeroes)

## mrpdu

**Syntax** [no] **mrpdu**

**Context** debug>service>id>mrp

**Description** This command enables debugging of the MRP PDUs that are received or transmitted.  
The **no** form of the command disables debugging of MRP PDUs.

## periodic-sm

|                    |                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] periodic-sm</b>                                                                                                                              |
| <b>Context</b>     | debug>service>id>mrp                                                                                                                                 |
| <b>Description</b> | This command enables debugging of the periodic state machine.<br>The <b>no</b> form of the command disables debugging of the periodic state machine. |

## registrant-sm

|                    |                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] registrant-sm</b>                                                                                                                                |
| <b>Context</b>     | debug>service>id>mrp                                                                                                                                     |
| <b>Description</b> | This command enables debugging of the registrant state machine.<br>The <b>no</b> form of the command disables debugging of the registrant state machine. |

## sap

|                    |                                                                                                                                                |

| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular IP address.                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets). |

## mac

|                    |                                                                                                                                                                                                                                                                                    |

| <b>Syntax</b>      | <b>[no] mac</b> <i>ieee-address</i>                                                                                                                                                                                                                                                |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                                                                                                                          |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular MAC address.                                                                                                                                                                        |
| <b>Parameters</b>  | <i>mac-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses. |

## sap

|                    |                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap</b> <i>sap-id</i>                                                                                                                                              |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                  |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular SAP.                                                                        |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax. |

## sap

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap</b> <i>sap-id</i>                        |
| <b>Context</b>     | debug>service>id                                     |
| <b>Description</b> | This command enables debugging for a particular SAP. |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the SAP ID.                |

## stp

|                    |                                                     |
|--------------------|-----------------------------------------------------|
| <b>Syntax</b>      | <b>stp</b>                                          |
| <b>Context</b>     | debug>service>id                                    |
| <b>Description</b> | This command enables the context for debugging STP. |

## all-events

|                    |                                                    |
|--------------------|----------------------------------------------------|
| <b>Syntax</b>      | <b>all-events</b>                                  |
| <b>Context</b>     | debug>service>id>stp                               |
| <b>Description</b> | This command enables STP debugging for all events. |

## bpdu

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] bpdu</b>                                                       |
| <b>Context</b>     | debug>service>id>stp                                                   |
| <b>Description</b> | This command enables STP debugging for received and transmitted BPDUs. |

## core-connectivity

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] core-connectivity</b>                             |
| <b>Context</b>     | debug>service>id>stp                                      |
| <b>Description</b> | This command enables STP debugging for core connectivity. |

## exception

|                    |                                                    |
|--------------------|----------------------------------------------------|
| <b>Syntax</b>      | <b>[no] exception</b>                              |
| <b>Context</b>     | debug>service>id>stp                               |
| <b>Description</b> | This command enables STP debugging for exceptions. |

## fsm-state-changes

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-state-changes</b>                             |
| <b>Context</b>     | debug>service>id>stp                                      |
| <b>Description</b> | This command enables STP debugging for FSM state changes. |

## fsm-timers

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-timers</b>                                    |
| <b>Context</b>     | debug>service>id>stp                                      |
| <b>Description</b> | This command enables STP debugging for FSM timer changes. |

## port-role

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] port-role</b>                                         |
| <b>Context</b>     | debug>service>id>stp                                          |
| <b>Description</b> | This command enables STP debugging for changes in port roles. |

## port-state

|                    |                                                     |
|--------------------|-----------------------------------------------------|
| <b>Syntax</b>      | <b>[no] port-state</b>                              |
| <b>Context</b>     | debug>service>id>stp                                |
| <b>Description</b> | This command enables STP debugging for port states. |

## sap

|                    |                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap</b> <i>sap-id</i>                                                                                                                                              |
| <b>Context</b>     | debug>service>id>stp                                                                                                                                                       |
| <b>Description</b> | This command enables STP debugging for a specific SAP.                                                                                                                     |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax. |

## sdp

|                    |                                                        |
|--------------------|--------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sdp</b> <i>sdp-id:vc-id</i>                    |
| <b>Context</b>     | debug>service>stp                                      |
| <b>Description</b> | This command enables STP debugging for a specific SDP. |

## interface

|                    |                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] interface</b> [ <i>ip-int-name</i>   <i>ip-address</i> ]                                                                                                                                   |
| <b>Context</b>     | debug>router>igmp                                                                                                                                                                                  |
| <b>Description</b> | This command enables debugging on the IGMP interface.                                                                                                                                              |
| <b>Parameters</b>  | <i>ip-int-name</i> — Only displays the information associated with the specified IP interface name.<br><i>ip-address</i> — Only displays the information associated with the specified IP address. |

## mcs

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mcs</b> [ <i>ip-int-name</i> ]                                                              |
| <b>Context</b>     | debug>router>igmp                                                                                   |
| <b>Description</b> | This command enables debugging for IGMP MCS.                                                        |
| <b>Parameters</b>  | <i>ip-int-name</i> — Only displays the information associated with the specified IP interface name. |

## misc

|                    |                                                        |
|--------------------|--------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] misc</b>                                       |
| <b>Context</b>     | debug>router>igmp                                      |
| <b>Description</b> | This command enables debugging for IGMP miscellaneous. |

## packet

|                    |                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] packet</b> [ <i>query</i>   <i>v1-report</i>   <i>v2-report</i>   <i>v3-report</i>   <i>v2-leave</i> ] [ <i>ip-int-name</i>   <i>ip-address</i> ]                                                                                                                          |
| <b>Context</b>     | debug>router>igmp                                                                                                                                                                                                                                                                  |
| <b>Description</b> | This command enables debugging for IGMP packets.                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <i>query v1/v2/v3-report, v2-leave</i> — Select the type of packet to debug.<br><i>ip-int-name</i> — Only displays the information associated with the specified IP interface name.<br><i>ip-address</i> — Only displays the information associated with the specified IP address. |

| <b>Context</b>     | show>service                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b> | This command displays service customer information.                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><i>customer-id</i> — Displays only information for the specified customer ID.</p> <p><b>Default</b> All customer IDs display</p> <p><b>Values</b> 1 — 2147483647</p> <p><b>site</b> <i>customer-site-name</i> — Specifies the customer site which is an anchor point for an ingress and egress virtual scheduler hierarchy.</p> |
| <b>Output</b>      | <b>Show Customer Command Output</b> — The following table describes show customer command output fields:                                                                                                                                                                                                                           |

| Label               | Description                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------|
| Customer-ID         | The ID that uniquely identifies a customer.                                                                               |
| Contact             | The name of the primary contact person.                                                                                   |
| Description         | Generic information about the customer.                                                                                   |
| Phone               | The phone/pager number to reach the primary contact person.                                                               |
| Total Customers     | The total number of customers configured.                                                                                 |
| Multi-service site  |                                                                                                                           |
| Site                | Multi-service site name. A multi-service customer site is a group of SAPs with common origination and termination points. |
| Description         | Information about a specific customer's multi-service site.                                                               |
| Assignment          | The port ID, MDA, or card number, where the SAP's that are members of this multi- service site are defined.               |
| I. Sched Pol        | The ingress QoS scheduler policy assigned to this multi-service site.                                                     |
| E. Sched Pol        | The egress QoS scheduler policy assigned to this multi-service site.                                                      |
| Service Association |                                                                                                                           |
| Service-ID          | The ID that uniquely identifies a service.                                                                                |
| SAP                 | Specifies the SAP assigned to the service.                                                                                |

**Output**    **Show Service Egress Command Output** — The following table describes show service egress label output fields.

| Label                    | Description                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------|
| Svc Id                   | The value that identifies a service.                                                               |
| Sdp Id                   | The value that identifies a SDP.                                                                   |
| Type                     | Indicates whether the SDP binding is a spoke or a mesh.                                            |
| I. Lbl                   | The VC label used by the far-end device to send packets to this device in this service by the SDP. |
| E. Lbl                   | The VC label used by this device to send packets to the far-end device in this service by the SDP. |
| Number of bindings found | The total number of SDP bindings that exist within the specified egress label range.               |

### Sample Output

```
*A:ALA-12# show service egress-label 0 10000

## ingress-label

**Syntax**    **ingress-label** *start-label* [*end-label*]

**Context**    show>service

**Description**    This command displays services using the range of ingress labels. If only the mandatory *start-label*

parameter is specified, only services using the specified label are displayed.

If both *start-label* and *end-label* parameters are specified, the services using the range of labels X where *start-label* <= X <= *end-label* are displayed.

Use the **show router vprn-service-id ldp bindings** command to display dynamic labels.

**Parameters** *start-label* — The starting ingress label value for which to display services using the label range. If only *start-label* is specified, services only using *start-label* are displayed.

**Values** 0, 2048 — 131071

*end-label* — The ending ingress label value for which to display services using the label range.

**Default** The *start-label* value.

**Values** 2049 — 131071

**Output** **Show Service Ingress-Label** — The following table describes show service ingress-label output fields:

| Label                    | Description                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------|
| Svc ID                   | The service identifier.                                                                                 |
| SDP Id                   | The SDP identifier.                                                                                     |
| Type                     | Indicates whether the SDP is spoke or mesh.                                                             |
| I.Lbl                    | The ingress label used by the far-end device to send packets to this device in this service by the SDP. |
| E.Lbl                    | The egress label used by this device to send packets to the far-end device in this service by the SDP.  |
| Number of Bindings Found | The number of SDP bindings within the label range specified.                                            |

sap-using

**Syntax**     **sap-using** [**sap** *sap-id*]  
              **sap-using interface** [*ip-address* | *ip-int-name*]  
              **sap-using** [**ingress** | **egress**] **atm-td-profile** *td-profile-id*  
              **sap-using** [**ingress** | **egress**] **filter** *filter-id*  
              **sap-using** [**ingress** | **egress**] **qos-policy** *qos-policy-id*  
              **sap-using authentication-policy** *policy-name*

**Context**     show>service

**Description**     Displays SAP information.  
  
If no optional parameters are specified, the command displays a summary of all defined SAPs. The optional parameters restrict output to only SAPs matching the specified properties.

**Parameters**     **sap** *sap-id* — Specifies the physical port identifier portion of the SAP definition. See Common CLI Command Descriptions on page 1933 for command syntax.

**ingress** — Specifies matching an ingress policy.

**egress** — Specifies matching an egress policy.

**qos-policy** *qos-policy-id* — The ingress or egress QoS Policy ID for which to display matching SAPs.

**Values**        1 — 65535

**atm-td-profile** *td-profile-id* — Displays SAPs using this traffic description.

**filter** *filter-id* — The ingress or egress filter policy ID for which to display matching SAPs.

**Values**        1 — 65535

**authentication** *policy-name* — The session authentication policy for which to display matching SAPs.

**interface** — Specifies matching SAPs with the specified IP interface.

*ip-addr* — The IP address of the interface for which to display matching SAPs.

**Values**        1.0.0.0 — 223.255.255.255

*ip-int-name* — The IP interface name for which to display matching SAPs.

**Output**    **Show Service SAP** — The following table describes show service SAP output fields:

| Label    | Description                                                     |
|----------|-----------------------------------------------------------------|
| Port ID  | The ID of the access port where the SAP is defined.             |
| Svc ID   | The value that identifies the service.                          |
| SapMTU   | The SAP MTU value.                                              |
| Igr.QoS  | The SAP ingress QoS policy number specified on the ingress SAP. |
| Ing.Fltr | The MAC or IP filter policy ID applied to the ingress SAP.      |
| E.QoS    | The SAP egress QoS policy number specified on the egress SAP.   |
| Egr.Fltr | The MAC or IP filter policy ID applied to the egress SAP.       |
| A.Pol    | The accounting policy ID assigned to the SAP.                   |
| Adm      | The administrative state of the SAP.                            |
| Opr      | The actual state of the SAP.                                    |

## sdp

- Syntax** **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]
- Context** show>service
- Description** This command displays SDP information. If no optional parameters are specified, a summary SDP output for all SDPs is displayed.
- Parameters** *sdp-id* — Specifies the SDP ID for which to display information.
- Default** All SDPs.
- Values** 1 — 17407
- far-end ip-address** — Displays only SDPs matching with the specified far-end IP address.
- Default** SDPs with any far-end IP address.
- detail** — Displays detailed SDP information.
- Default** SDP summary output.
- keep-alive-history** — Displays the last fifty SDP keepalive events for the SDP.
- Default** SDP summary output.
- Output** **Show Service SDP** — The following table describes show service SDP output fields:

| Label               | Description                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id              | The SDP identifier.                                                                                                                                                         |
| Adm MTU             | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Opr MTU             | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| IP address          | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                   |
| Adm<br>Admin State  | Specifies the administrative state of the SDP.                                                                                                                              |
| Opr<br>Oper State   | Specifies the operational state of the SDP.                                                                                                                                 |
| Deliver             | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                |
| Flags               | Specifies the conditions that affect the operating status of this SDP.                                                                                                      |
| Signal<br>Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                           |
| Last Status Change  | Specifies the time of the most recent operating status change to this SDP.                                                                                                  |

| <b>Description</b> | This command displays services using SDP or far-end address options.                                                                                                                                                             |
| <b>Parameters</b>  | <p><i>sdp-id</i> — Displays only services bound to the specified SDP ID.</p> <p><b>Values</b> 1 — 17407</p> <p><i>vc-id</i> — Displays information about the virtual circuit identifier.</p> <p><b>Values</b> 1 — 4294967295</p> |

**far-end ip-address** — Displays only services matching with the specified far-end IP address.

**Default** Services with any far-end IP address.

**Output** **Show Service SDP Using X** — The following table describes show service sdp-using output fields.

| Label      | Description                                                                                      |
|------------|--------------------------------------------------------------------------------------------------|
| Svc ID     | The service identifier.                                                                          |
| Sdp ID     | The SDP identifier.                                                                              |
| Type       | Type of SDP: spoke or mesh.                                                                      |
| Far End    | The far-end address of the SDP.                                                                  |
| Oper State | The operational state of the service.                                                            |
| I.Label    | The label used by the far-end device to send packets to this device in this service by this SDP. |
| E.Label    | The label used by this device to send packets to the far-end device in this service by this SDP. |

### Sample Output

```

| <b>Description</b> | This command displays detailed information for all aspects of the service.                                       |
| <b>Output</b>      | <b>Show All Service-ID Output</b> — The following table describes the show all service-id command output fields: |

| Label                             | Description                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Detailed Information      |                                                                                                                                                                  |
| Service Id                        | The service identifier.                                                                                                                                          |
| VPN Id                            | The number which identifies the VPN.                                                                                                                             |
| Service Type                      | Specifies the type of service.                                                                                                                                   |
| SDP Id                            | The SDP identifier.                                                                                                                                              |
| Description                       | Generic information about the service.                                                                                                                           |
| Customer Id                       | The customer identifier.                                                                                                                                         |
| Last Mgmt Change                  | The date and time of the most recent management-initiated change to this customer.                                                                               |
| SAP Count                         | The number of SAPs specified for this service.                                                                                                                   |
| SDP Bind Count                    | The number of SDPs bound to this service.                                                                                                                        |
| Service Destination Points (SDPs) |                                                                                                                                                                  |
| SDP Id                            | The SDP identifier.                                                                                                                                              |
| Type                              | Indicates whether this Service SDP binding is a spoke or a mesh.                                                                                                 |
| Admin Path MTU                    | The largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.        |
| Oper Path MTU                     | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Delivery                          | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                     |
| Admin State                       | The administrative state of this SDP.                                                                                                                            |
| Oper State                        | The operational state of this SDP.                                                                                                                               |
| Ingress Label                     | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                 |

| Label                        | Description (Continued)                                                                                                                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Egress Label                 | The label used by this device to send packets to the far-end device in this service by this SDP.                                                                                                                                                                                       |
| Ingress Filter               | The ID of the ingress filter policy.                                                                                                                                                                                                                                                   |
| Egress Filter                | The ID of the egress filter policy.                                                                                                                                                                                                                                                    |
| Far End                      | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                                                                                                                              |
| Last Changed                 | The date and time of the most recent change to this customer.                                                                                                                                                                                                                          |
| Signaling                    | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                     |
| Admin State                  | Specifies the operating status of the service.                                                                                                                                                                                                                                         |
| Oper State                   | The current status of the service.                                                                                                                                                                                                                                                     |
| Hello Time                   | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                         |
| Hello Msg Len                | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                         |
| Max Drop Count               | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                        |
| Hold Down Time               | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                       |
| SDP Delivery Mechanism       | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far-end field.<br>If the SDP type is GRE, then the following message displays:<br>“SDP Delivery Mechanism is not MPLS” |
| Number of SDPs               | The total number SDPs applied to this service ID.                                                                                                                                                                                                                                      |
| <b>Service Access Points</b> |                                                                                                                                                                                                                                                                                        |
| Service Id                   | The service identifier.                                                                                                                                                                                                                                                                |
| Port Id                      | The ID of the access port where this SAP is defined.                                                                                                                                                                                                                                   |
| Description                  | Generic information about the SAP.                                                                                                                                                                                                                                                     |
| Encap                        | The value of the label used to identify this SAP on the access port.                                                                                                                                                                                                                   |
| Admin State                  | The desired state of the SAP.                                                                                                                                                                                                                                                          |
| Oper State                   | The operating state of the SAP.                                                                                                                                                                                                                                                        |
| Last Changed                 | The date and time of the last change.                                                                                                                                                                                                                                                  |

| Label                 | Description (Continued)                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin MTU             | The largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.        |
| Oper MTU              | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Ingress qos-policy    | The SAP ingress QoS policy ID.                                                                                                                                   |
| Egress qos-policy     | The SAP egress QoS policy ID.                                                                                                                                    |
| Ingress Filter-Id     | The SAP ingress filter policy ID.                                                                                                                                |
| Egress Filter-Id      | The SAP egress filter policy ID.                                                                                                                                 |
| Multi Svc Site        | Indicates the multi-service site that the SAP is a member.                                                                                                       |
| Ingress sched-policy  | Indicates the ingress QoS scheduler for the SAP.                                                                                                                 |
| Egress sched-policy   | Indicates the egress QoS scheduler for the SAP.                                                                                                                  |
| Acct. Pol             | Indicates the accounting policy applied to the SAP.                                                                                                              |
| Collect Stats         | Specifies whether accounting statistics are collected on the SAP.                                                                                                |
| <b>SAP Statistics</b> |                                                                                                                                                                  |
| Dropped               | The number of packets or octets dropped.                                                                                                                         |
| Offered Hi Priority   | The number of high priority packets, as determined by the SAP ingress QoS policy.                                                                                |
| Offered Low Priority  | The number of low priority packets, as determined by the SAP ingress QoS policy.                                                                                 |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.                                                                                           |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.                                                                                       |
| <b>Queueing Stats</b> |                                                                                                                                                                  |
| Dropped In Profile    | The number of in-profile packets or octets discarded.                                                                                                            |
| Dropped Out Profile   | The number of out-of-profile packets or octets discarded.                                                                                                        |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.                                                                                           |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.                                                                                       |

| <b>Description</b> | Displays the ARP table for the IES instance. The ARP entries for a subscriber interface are displayed uniquely. Each MAC associated with the subscriber interface child group-interfaces are displayed with each subscriber interface ARP entry. They do not reflect actual ARP entries but are displayed along the interfaces ARP entry for easy lookup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <p><i>ip-address</i> — Displays only ARP entries in the ARP table with the specified IP address.</p> <p><b>Default</b> All IP addresses.</p> <p><b>mac</b> <i>ieee-address</i> — Displays only ARP entries in the ARP table with the specified 48-bit MAC address. The MAC address can be expressed in the form <i>aa:bb:cc:dd:ee:ff</i> or <i>aa-bb-cc-dd-ee-ff</i> where <i>aa</i>, <i>bb</i>, <i>cc</i>, <i>dd</i>, <i>ee</i> and <i>ff</i> are hexadecimal numbers.</p> <p><b>Default</b> All MAC addresses.</p> <p><b>sap</b> <i>sap-id</i> — Displays SAP information for the specified SAP ID. See Common CLI Command Descriptions on page 1933 for command syntax.</p> <p><i>port-id</i> — <b>interface</b> — Specifies matching service ARP entries associated with the IP interface.</p> <p><i>ip-address</i> — The IP address of the interface for which to display matching ARP entries.</p> <p><b>Values</b> 1.0.0.0 — 223.255.255.255</p> <p><i>ip-int-name</i> — The IP interface name for which to display matching ARPs.</p> <p><i>sdp-id</i> — The SDP identifier.</p> <p><i>vc-id</i> — The virtual circuit identifier.</p> <p><b>Values</b> 1 — 4294967295</p> |
| <b>Output</b>      | <b>Show Service-ID ARP</b> — The following table describes show service-id ARP output fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Label       | Description                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address  | The IP address.                                                                                                                                                                                                |
| MAC Address | The specified MAC address.                                                                                                                                                                                     |
| Type        | Static — FDB entries created by management.<br>Learned — Dynamic entries created by the learning process.<br>OAM — Entries created by the OAM process.<br>Other — Local entries for the IP interfaces created. |
| Expiry      | The age of the ARP entry.                                                                                                                                                                                      |
| Interface   | The interface applied to the service.                                                                                                                                                                          |
| SAP         | The SAP ID.                                                                                                                                                                                                    |

**Sample Output**

A:ALA-49# show service id 88 arp

## ARP Table

| <b>Description</b> | This command displays GSMP neighbor information.                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><b>group</b> — A GSMP group defines a set of GSMP neighbors which have the same properties.</p> <p><i>name</i> — Specifies a GSMP group name is unique only within the scope of the service in which it is defined.</p> <p><i>ip-address</i> — Specifies the ip-address of the neighbor.</p> |

### Sample Output

These commands show the configured neighbors per service, regardless of the fact there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in 'no shutdown' state. Session gives the number of session (open TCP connections) for each configured neighbor.

## interface

|                    |                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>interface</b> [ <i>ip-address</i>   <i>ip-int-name</i> ] [ <i>interface-type</i> ] [ <b>detail</b> ] [ <b>family</b> ]                                                                                 |
| <b>Context</b>     | show>service>id                                                                                                                                                                                           |
| <b>Description</b> | This command displays information for the IP interfaces associated with the IES service. If no optional parameters are specified, a summary of all IP interfaces associated to the service are displayed. |
| <b>Parameters</b>  | <i>ip-address</i> — The IP address of the interface for which to display information.                                                                                                                     |

**Values**

ipv4-address: a.b.c.d (host bits must be 0)  
 ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0 — FFFF]H  
 d: [0 — 255]

*ip-int-name* — Specifies the IP interface name for which to display information.

**Values** 32 characters maximum

**family** — Displays the router IP interface table to display.

**Values** **ipv4** — Displays only those peers that have the IPv4 family enabled.  
**ipv6** — Displays the peers that are IPv6-capable.

*interface-type* — Specifies to display either group or subscriber interfaces.

**Values** group, subscriber

**detail** — Displays detailed IP interface information.

**Default** IP interface summary output.

**Output** **Show Service-ID** — The following table describes show service-id output fields.

| Label           | Description                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| If Name         | The name used to refer to the IES interface.                                                                                              |
| Type            | Specifies the interface type.                                                                                                             |
| IP-Address      | Specifies the IP address/IP subnet/broadcast address of the interface.                                                                    |
| Adm             | The administrative state of the interface.                                                                                                |
| Opr             | The operational state of the interface.                                                                                                   |
| Admin State     | The administrative state of the interface.                                                                                                |
| Oper State      | The operational state of the interface.                                                                                                   |
| IP Addr/mask    | Specifies the IP address/IP subnet/broadcast address of the interface.                                                                    |
| If Index        | The index corresponding to this IES interface. The primary index is 1; all IES interfaces are defined in the base virtual router context. |
| If Type         | Specifies the interface type.                                                                                                             |
| SAP Id          | Specifies the SAP's port ID.                                                                                                              |
| SNTP B.Cast     | Specifies whether SNTP broadcast client mode is enabled or disabled.                                                                      |
| Arp Timeout     | Specifies the timeout for an ARP entry learned on the interface.                                                                          |
| MAC Address     | Specifies the 48-bit IEEE 802.3 MAC address.                                                                                              |
| ICMP Mask Reply | Specifies whether ICMP mask reply is enabled or disabled.                                                                                 |

| Label        | Description (Continued)                                                                   |
|--------------|-------------------------------------------------------------------------------------------|
| Cflowd       | Specifies whether Cflowd collection and analysis on the interface is enabled or disabled. |
| Redirects    | Specifies the rate for ICMP redirect messages.                                            |
| Unreachables | Specifies the rate for ICMP unreachable messages.                                         |
| TTL Expired  | Specifies the rate for ICMP TTL messages.                                                 |

| SAP                | The type of SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Encap              | The encapsulation type of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Ethertype          | Specifies an Ethernet type II Ethertype value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Admin State        | The administrative state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Oper State         | The operational state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flags              | Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCelpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| Last Status Change | Specifies the time of the most recent operating status change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Last Mgmt Change   | Specifies the time of the most recent management-initiated change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Admin MTU          | The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.                                                                                                                                                                                                                                                                                                                                                              |
| Ingress qos-policy | The ingress QoS policy ID assigned to the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Egress qos-policy  | The egress QoS policy ID assigned to the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Ingress Filter-Id  | The ingress filter policy ID assigned to the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Label               | Description (Continued)                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Egress Filter-Id    | The egress filter policy ID assigned to the SAP.                                                                                                                         |
| Acct. Pol           | The accounting policy ID assigned to the SAP.                                                                                                                            |
| Collect Stats       | Specifies whether statistics collection is enabled.                                                                                                                      |
| Dropped             | The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                            |
| Off. HiPrio         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy.                                                                             |
| Off. LowPrio        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy.                                                                              |
| Off. Uncolor        | The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                              |
| Dro. HiPrio         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc. |
| Dro. LowPrio        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.  |
| For. InProf         | The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.                                                                             |
| For. OutProf        | The number of out-of-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.                                                                         |
| Dro. InProf         | The number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                          |
| Ingress TD Profile  | The profile ID applied to the ingress SAP.                                                                                                                               |
| Egress TD Profile   | The profile ID applied to the egress SAP.                                                                                                                                |
| Alarm Cell Handling | The OAM operational status of the VCL.                                                                                                                                   |
| AAL-5 Encap         | The AAL-5 encapsulation type.                                                                                                                                            |
| Mult Svc Site       | Specifies the customer's multi-service-site name.                                                                                                                        |
| I. Sched Pol        | The ingress scheduler policy applied to the customer's multi-service-site.                                                                                               |
| E. Sched Pol        | The egress scheduler policy applied to the customer's multi-service-site.                                                                                                |

**Sample Output**

```

## sdp

- Syntax** `sdp [{sdp-id | far-end ip-address}] [detail]`
- Context** `show>service>id`
- Description** Displays information for the SDPs associated with the service.  
If no optional parameters are specified, a summary of all associated SDPs is displayed.
- Parameters** *sdp-id* — The SDP ID for which to display information.
- Values** 1 — 17407
- far-end ip-address* — When specified, displays SDP having the specified far-end IP address.
- detail** — Displays detailed information for the SDP.

### Sample Output

```

A:Dut-A# show service id 1 sdp detail

| <b>Parameters</b>  | <p><b>sap</b> <i>sap-id</i> — Displays the specified subscriber host SAP information. See Common CLI Command Descriptions on page 1933 for command syntax.</p> <p><b>ip</b> <i>ip-address/mask</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <p><b>Values</b>      Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).<br/>mask: 1 — 32</p> <p><b>ieee-address</b> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p> <p><b>sub-profile</b> <i>sub-profile-name</i> — Specifies an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the <b>config&gt;subscr-mgmt&gt;sub-profile</b> context.</p> <p><b>sla-profile</b> <i>sla-profile-name</i> — Specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the <b>config&gt;subscr-mgmt&gt;sla-profile</b> context.</p> <p><b>detail</b> — Displays detailed information.</p> |

| <b>Description</b> | Clears DHCP lease state information for this service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).</p> <p><i>ieee-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p> <p><b>sap</b> <i>sap-id</i> — Clears the specified lease state SAP information. See Common CLI Command Descriptions on page 1933 for command syntax.</p> <p><i>sdp-id</i> — The specified SDP to be cleared.</p> <p><b>Values</b> 1 — 17407</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID to be cleared.</p> <p><b>Values</b> 1 — 4294967295</p> |

| <b>Description</b> | This command clears DHCP6 statistics.                                                                                                                                                                                                                                                                                                                                                                                                      |                     |                       |
| <b>Parameters</b>  | <i>ip-int-name</i> — Specifies the IP interface name up to 32 characters inlength.                                                                                                                                                                                                                                                                                                                                                         |                     |                       |
|                    | <b>ip-address</b> <i>ipv6-address/prefix-length</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets). |                     |                       |
| <b>Values</b>      | ipv6-address                                                                                                                                                                                                                                                                                                                                                                                                                               | x:x:x:x:x:x:x       | (eight 16-bit pieces) |

| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular IP address.                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets). |

| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular MAC address.                                                                                                                                                                        |
| <b>Parameters</b>  | <i>mac-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses. |

### sap

|                    |                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap <i>sap-id</i></b>                                                                  |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                      |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular |

SAP.

**Parameters**     *sap-id* — Specifies the physical port identifier portion of the SAP definition. See Common CLI Command Descriptions on page 1933 for command syntax.

## packets

**Syntax**     **[no] packets**  
**[no] packets interface** *ip-int-name* [**vrid** *virtual-router-id*]  
**[no] packets interface** *ip-int-name* **vrid** *virtual-router-id* **ipv6**

**Context**     debug>router>vrrp

**Description**     This command enables or disables debugging for VRRP packets.

**Parameters**     *ip-int-name* — [32 chars max]  
*virtual-router-id* — [1..255]

## events

**Syntax**     **[no] events**  
**[no] events interface** *ip-int-name* [**vrid** *virtual-router-id*]  
**[no] events interface** *ip-int-name* **vrid** *virtual-router-id* **ipv6**

**Context**     debug>router>vrrp

**Description**     This command enables or disables debugging for VRRP events.

**Parameters**     *ip-int-name* — [32 chars max]  
*virtual-router-id* — [1..255]

## instance

**Syntax**     **instance interface** *interface-name* **vr-id** *virtual-router-id* [**ipv6**] [**interval** *seconds*] [**repeat** *repeat*] [**absolute**|**rate**]

**Context**     monitor>router>vrrp

**Description**     This command enables monitoring for statistics for VRRP instances.

| <b>Description</b> | <p>This command displays SAP information.</p> <p>If no optional parameters are specified, the command displays a summary of all defined SAPs.</p> <p>The optional parameters restrict output to only SAPs matching the specified properties.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><b>sap-id</b> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><b>interface</b> — Specifies matching SAPs with the specified IP interface.</p> <p><i>ip-address</i> — The IP address of the interface for which to display matching SAPs.</p> <p><b>Values</b> 1.0.0.0 — 223.255.255.255</p> <p><i>ip-int-name</i> — The IP interface name for which to display matching SAPs.</p> <p><b>ingress</b> — Specifies matching an ingress policy.</p> <p><b>egress</b> — Specifies matching an egress policy.</p> <p><b>qos-policy</b> <i>qos-policy-id</i> — The ingress or egress QoS Policy ID for which to display matching SAPs.</p> <p><b>Values</b> 1 — 65535</p> <p><b>atm-td-profile</b> <i>td-profile-id</i> — Displays SAPs using this traffic description.</p> <p><b>filter</b> <i>filter-id</i> — The ingress or egress filter policy ID for which to display matching SAPs.</p> <p><b>Values</b> 1 — 65535</p> <p><b>authentication-policy</b> <i>policy name</i> — Specifies an existing authentication policy.</p> |
| <b>Output</b>      | <p><b>Show Service SAP</b> — The following table describes show service SAP output fields:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Label    | Description                                                     |
|----------|-----------------------------------------------------------------|
| Port ID  | The ID of the access port where the SAP is defined.             |
| Svc ID   | The service identifier.                                         |
| SapMTU   | The SAP MTU value.                                              |
| I.QoS    | The SAP ingress QoS policy number specified on the ingress SAP. |
| I.MAC/IP | The MAC or IP filter policy ID applied to the ingress SAP.      |
| E.QoS    | The SAP egress QoS policy number specified on the egress SAP.   |

| Label    | Description (Continued)                                  |
|----------|----------------------------------------------------------|
| E.Mac/IP | The MAC or IP filter policy ID applied to the egress SAP |
| A.Pol    | The accounting policy ID assigned to the SAP.            |
| Adm      | The desired state of the SAP.                            |
| Opr      | The actual state of the SAP.                             |

## sdp

|                    |                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp</b> [ <i>sdp-id</i>   <i>far-end ip-address</i> ] [ <i>detail</i>   <i>keep-alive-history</i> ] |
| <b>Context</b>     | show>service                                                                                           |
| <b>Description</b> | Displays SDP information.                                                                              |

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

**Parameters**

*sdp-id* — The SDP ID for which to display information.

**Default** All SDPs.

**Values** 1 — 17407

**far-end ip-address** — Displays only SDPs matching with the specified far-end IP address.

**Default** SDPs with any far-end IP address.

**detail** — Displays detailed SDP information.

**Default** SDP summary output.

**keep-alive-history** — Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output.

**Output**

**Show Service SDP** — The following table describes show service SDP output fields:

| Label               | Description                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id              | The SDP identifier.                                                                                                                                                        |
| Adm MTU             | Specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.        |
| Opr MTU             | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| IP address          | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                  |
| Adm<br>Admin State  | Specifies the state of the SDP.                                                                                                                                            |
| Opr<br>Oper State   | Specifies the operating state of the SDP.                                                                                                                                  |
| Flags               | Specifies all the conditions that affect the operating status of this SDP.                                                                                                 |
| Signal<br>Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                          |
| Last Status Change  | Specifies the time of the most recent operating status change to this SDP.                                                                                                 |
| Last Mgmt Change    | Specifies the time of the most recent management-initiated change to this SDP.                                                                                             |
| Number of SDPs      | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                          |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                             |

| Label                  | Description (Continued)                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deliver<br>Delivered   | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                                                                                                                         |
| Number of SDPs         | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                                    |
| Hello Time             | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len          | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Timeout          | Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout.                                                                                                                                                                                 |
| Unmatched Replies      | Specifies the number of SDP unmatched message replies.                                                                                                                                                                                                                               |
| Max Drop Count         | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Hold Down Time         | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| TX Hello Msgs          | Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                           |
| Rx Hello Msgs          | Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                              |
| Associated LSP<br>List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS |

## sdp-using

- Syntax** **sdp-using** [*sdp-id*[:*vc-id*] | **far-end** *ip-address*]
- Context** show>service
- Description** Display services using SDP or far-end address options.
- Parameters** *sdp-id* — Displays only services bound to the specified SDP ID.  
**Values** 1 — 17407  
*vc-id* — The virtual circuit identifier.  
**Values** 1 — 4294967295  
**far-end ip-address** — Displays only services matching with the specified far-end IP address.  
**Default** Services with any far-end IP address.
- Output** **Show Service SDP Using X** — The following table describes show service sdp-using output fields.

| Label         | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| Svc ID        | The service identifier.                                                                          |
| Sdp ID        | The SDP identifier.                                                                              |
| Type          | Type of SDP: spoke or mesh.                                                                      |
| Far End       | The far end address of the SDP.                                                                  |
| Oper State    | The operational state of the service.                                                            |
| Ingress Label | The label used by the far-end device to send packets to this device in this service by this SDP. |
| Egress Label  | The label used by this device to send packets to the far-end device in this service by this SDP. |

**Output**    **Show Service Service-Using** — The following table describes show service service-using output fields:

| Label            | Description                                                                       |
|------------------|-----------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                           |
| Type             | Specifies the service type configured for the service ID.                         |
| Adm              | The desired state of the service.                                                 |
| Opr              | The operating state of the service.                                               |
| CustomerId       | The ID of the customer who owns this service.                                     |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this service. |

| Customer Id                         | The customer identifier.                                                                                                 |
| Last Status Change                  | The date and time of the most recent change in the administrative or operating status of the service.                    |
| Last Mgmt Change                    | The date and time of the most recent management-initiated change to this customer.                                       |
| Admin State                         | The current administrative state.                                                                                        |
| Oper State                          | The current operational state.                                                                                           |
| Route Dist.                         | Displays the route distribution number.                                                                                  |
| AS Number                           | Displays the autonomous system number.                                                                                   |
| Router Id                           | Displays the router ID for this service.                                                                                 |
| ECMP                                | Displays equal cost multipath information.                                                                               |
| ECMP Max Routes                     | Displays the maximum number of routes that can be received from the neighbors in the group or for the specific neighbor. |
| Max Routes                          | Displays the maximum number of routes that can be used for path sharing.                                                 |
| Auto Bind                           | Specifies the automatic binding type for the SDP assigned to this service.                                               |
| Vrf Target                          | Specifies the VRF target applied to this service.                                                                        |
| Vrf Import                          | Specifies the VRF import policy applied to this service.                                                                 |
| Vrf Export                          | Specifies the VRF export policy applied to this service.                                                                 |
| SDP Id                              | The SDP identifier.                                                                                                      |
| Description                         | Generic information about the service.                                                                                   |
| SAP Count                           | The number of SAPs specified for this service.                                                                           |
| SDP Bind Count                      | The number of SDPs bound to this service.                                                                                |
| Split Horizon Group                 | Name of the split horizon group for this service.                                                                        |
| Description                         | Description of the split horizon group.                                                                                  |
| Last Changed                        | The date and time of the most recent management-initiated change to this split horizon group.                            |
| Service Destination Points (SDPs)   |                                                                                                                          |

| Label          | Description                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id         | The SDP identifier.                                                                                                                                               |
| Type           | Indicates whether this Service SDP binding is a spoke or a mesh.                                                                                                  |
| Admin Path MTU | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Oper Path MTU  | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| Delivery       | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                      |
| Admin State    | The administrative state of this SDP.                                                                                                                             |
| Oper State     | The operational state of this SDP.                                                                                                                                |
| Ingress Label  | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                  |
| Egress Label   | The label used by this device to send packets to the far-end device in this service by this SDP.                                                                  |
| Ingress Filter | The ID of the ingress filter policy.                                                                                                                              |
| Egress Filter  | The ID of the egress filter policy.                                                                                                                               |
| Far End        | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                         |
| Last Changed   | The date and time of the most recent change to this customer.                                                                                                     |
| Signaling      | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                |
| Admin State    | Specifies the operating status of the keepalive protocol.                                                                                                         |
| Oper State     | The current status of the keepalive protocol.                                                                                                                     |
| Hello Time     | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                    |
| Hello Msg Len  | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                    |
| Max Drop Count | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                   |
| Hold Down Time | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                  |

| Label                  | Description                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Delivery Mechanism | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS |
| Max Drop Count         | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Number of SDPs         | The total number SDPs applied to this service ID.                                                                                                                                                                                                                                    |
| Service Access Points  |                                                                                                                                                                                                                                                                                      |
| Service Id             | The service identifier.                                                                                                                                                                                                                                                              |
| Port Id                | The ID of the access port where this SAP is defined.                                                                                                                                                                                                                                 |
| Description            | Generic information about the SAP.                                                                                                                                                                                                                                                   |
| Encap Value            | The value of the label used to identify this SAP on the access port.                                                                                                                                                                                                                 |
| Admin State            | The desired state of the SAP.                                                                                                                                                                                                                                                        |
| Oper State             | The operating state of the SAP.                                                                                                                                                                                                                                                      |
| Last Changed           | The date and time of the last change.                                                                                                                                                                                                                                                |
| Admin MTU              | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                    |
| Oper MTU               | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                     |
| Ingress qos-policy     | The SAP ingress QoS policy ID.                                                                                                                                                                                                                                                       |
| Egress qos-policy      | The SAP egress QoS policy ID.                                                                                                                                                                                                                                                        |
| Ingress Filter-Id      | The SAP ingress filter policy ID.                                                                                                                                                                                                                                                    |
| Egress Filter-Id       | The SAP egress filter policy ID.                                                                                                                                                                                                                                                     |
| Multi Svc Site         | Indicates the multi-service site that the SAP is a member.                                                                                                                                                                                                                           |
| Ingress sched-policy   | Indicates the ingress QoS scheduler for the SAP.                                                                                                                                                                                                                                     |
| Egress sched-policy    | Indicates the egress QoS scheduler for the SAP.                                                                                                                                                                                                                                      |
| Acct. Pol              | Indicates the accounting policy applied to the SAP.                                                                                                                                                                                                                                  |
| Collect Stats          | Specifies whether accounting statistics are collected on the SAP.                                                                                                                                                                                                                    |
| SAP Statistics         |                                                                                                                                                                                                                                                                                      |

| Label                      | Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------|
| Dropped                    | The number of packets or octets dropped.                                          |
| Offered Hi Priority        | The number of high priority packets, as determined by the SAP ingress QoS policy. |
| Offered Low Priority       | The number of low priority packets, as determined by the SAP ingress QoS policy.  |
| Forwarded In Profile       | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| Forwarded Out Profile      | The number of out-of-profile packets or octets (rate above CIR) forwarded.        |
| <b>Queueing Stats</b>      |                                                                                   |
| Dropped In Profile         | The number of in-profile packets or octets discarded.                             |
| Dropped Out Profile        | The number of out-of-profile packets or octets discarded.                         |
| Forwarded In Profile       | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| Forwarded Out Profile      | The number of out-of-profile packets or octets (rate above CIR) forwarded.        |
| <b>SAP per Queue stats</b> |                                                                                   |
| Ingress Queue 1            | The index of the ingress QoS queue of this SAP.                                   |
| High priority offered      | The packets or octets count of the high priority traffic for the SAP.             |
| High priority dropped      | The number of high priority traffic packets/octets dropped.                       |
| Low priority offered       | The packets or octets count of the low priority traffic.                          |
| Low priority dropped       | The number of low priority traffic packets/octets dropped.                        |
| In profile forwarded       | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| Out profile forwarded      | The number of out-of-profile octets (rate above CIR) forwarded.                   |
| Egress Queue 1             | The index of the egress QoS queue of the SAP.                                     |
| In profile forwarded       | The number of in-profile packets or octets (rate below CIR) forwarded.            |
| In profile dropped         | The number of in-profile packets or octets dropped for the SAP.                   |
| Out profile forwarded      | The number of out-of-profile packets or octets (rate above CIR) forwarded.        |

| Label                                 | Description                                                                                                                                      |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Out profile dropped                   | The number of out-of-profile packets or octets discarded.                                                                                        |
| State                                 | Specifies whether DHCP relay is enabled on this SAP.                                                                                             |
| Info Option                           | Specifies whether Option 82 processing is enabled on this SAP.                                                                                   |
| Action                                | Specifies the Option 82 processing on this SAP or interface: keep, replace or drop.                                                              |
| Circuit ID                            | Specifies whether the If index is inserted in circuit ID sub-option of Option 82.                                                                |
| Remote ID                             | Specifies whether the far-end MAC address is inserted in Remote ID sub-option of Option 82.                                                      |
| <b>Service Access Points</b>          |                                                                                                                                                  |
| Managed by Service                    | Specifies the service-id of the management VPLS managing this SAP.                                                                               |
| Managed by SAP                        | Specifies the sap-id inside the management VPLS managing this SAP.                                                                               |
| Prune state                           | Specifies the STP state inherited from the management VPLS.                                                                                      |
| <b>Spoke SDPs</b>                     |                                                                                                                                                  |
| Managed by Service                    | Specifies the service-id of the management VPLS managing this spoke SDP.                                                                         |
| Managed by Spoke                      | Specifies the sap-id inside the management VPLS managing this spoke SDP.                                                                         |
| Prune state                           | Specifies the STP state inherited from the management VPLS.                                                                                      |
| <b>IPCP Address Extension Details</b> |                                                                                                                                                  |
| Peer IP Addr                          | Specifies the remote IP address to be assigned to the far-end of the associated PPP/MLPPP link via IPCP extensions.                              |
| Peer Pri DNS Addr                     | Specifies a unicast IPv4 address for the primary DNS server to be signaled to the far-end of the associate PPP/MLPPP link via IPCP extensions.   |
| Peer Sec DNS Addr                     | Specifies a unicast IPv4 address for the secondary DNS server to be signaled to the far-end of the associate PPP/MLPPP link via IPCP extensions. |

### Sample Output

```
A:ALA-48# show service id 1 all

| <b>Context</b>     | show>service>id                                                                                                                                                                                      |
| <b>Description</b> | Displays the ARP table for the IES instance.                                                                                                                                                         |
| <b>Parameters</b>  | <i>ip-address</i> — Displays only ARP entries in the ARP table with the specified IP address.<br><b>Default</b> All IP addresses.                                                                    |

**mac** *ieee-address* — Displays only ARP entries in the ARP table with the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

**Default** All MAC addresses.

**sap** *sap-id* — Displays SAP information for the specified SAP ID. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

*port id* — Specifies matching service ARP entries associated with the specified IP interface.

*ip-address* — The IP address of the interface for which to display matching ARP entries.

**Values** 1.0.0.0 — 223.255.255.255

*ip-int-name* — The IP interface name for which to display matching ARPs.

**Output** **Show Service-ID ARP** — The following table describes show service-id ARP output fields.

| Label             | Description                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service ID        | The service ID number.                                                                                                                                 |
| MAC               | The specified MAC address                                                                                                                              |
| Source-Identifier | The location the MAC is defined.                                                                                                                       |
| Type              | Static — FDB entries created by management.<br>Learned — Dynamic entries created by the learning process.<br>OAM — Entries created by the OAM process. |
| Age               | The time elapsed since the service was enabled.                                                                                                        |
| Interface         | The interface applied to the service.                                                                                                                  |
| Port              | The port where the SAP is applied.                                                                                                                     |

| <b>Description</b> | Displays basic information about the service ID including service type, description, SAPs and SDPs. |
| <b>Output</b>      | <b>Show Service-ID Base</b> — The following table describes show service-id base output fields:     |

| Label        | Description                                                              |
|--------------|--------------------------------------------------------------------------|
| Service Id   | The service identifier.                                                  |
| Vpn Id       | Specifies the VPN ID assigned to the service.                            |
| Service Type | The type of service: Apipe, Cpipe, Epipe, Fpipe, IES, Ipipe, VPLS, VPRN. |

| Label            | Description                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description      | Generic information about the service.                                                                                                                                   |
| Customer Id      | The customer identifier.                                                                                                                                                 |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this customer.                                                                                       |
| Adm              | The desired state of the service.                                                                                                                                        |
| Oper             | The operating state of the service.                                                                                                                                      |
| Mtu              | The largest frame size (in octets) that the service can handle.                                                                                                          |
| Def. Mesh VC Id  | This object is only valid in services that accept mesh SDP bindings. It is used to validate the VC ID portion of each mesh SDP binding defined in the service.           |
| SAP Count        | The number of SAPs defined on the service.                                                                                                                               |
| SDP Bind Count   | The number of SDPs bound to the service.                                                                                                                                 |
| Identifier       | Specifies the service access (SAP) and destination (SDP) points.                                                                                                         |
| Type             | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                        |
| AdmMTU           | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. |
| OprMTU           | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented.  |
| Opr              | The operating state of the SDP.                                                                                                                                          |

statistics

- Syntax

**statistics** [**sap** *sap-id*]  
**statistics** [**sdp** *sdp-id:vc-id*]  
**statistics** [**interface** *interface-name*]
- Context

show>service>id>dhcp
- Description

Displays DHCP statistics information.
- Parameters

*sap-id* — Specifies the physical port identifier portion of the SAP definition. See [Common CLI Command Descriptions on page 1933](#) for command syntax.

*sdp-id* — The SDP identifier.

**Values**      1 — 17407

*vc-id* — The virtual circuit ID on the SDP ID for which to display information.

**Values**      1 — 4294967295

**interface** *interface-name* — Displays information for the specified IP interface.

**Show DHCP Statistics Output** — The following table describes the output fields for DHCP statistics.

| Label               | Description                                            |
|---------------------|--------------------------------------------------------|
| Received Packets    | The number of packets received from the DHCP clients.  |
| Transmitted Packets | The number of packets transmitted to the DHCP clients. |

| Label                       | Description                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Received Mal-formed Packets | The number of corrupted/invalid packets received from the DHCP clients.                                                                                                                                                   |
| Received Untrusted Packets  | The number of untrusted packets received from the DHCP clients. In this case, a frame is dropped due to the client sending a DHCP packet with Option 82 filled in before “trust” is set under the DHCP interface command. |
| Client Packets Discarded    | The number of packets received from the DHCP clients that were discarded.                                                                                                                                                 |
| Client Packets Relayed      | The number of packets received from the DHCP clients that were forwarded.                                                                                                                                                 |
| Client Packets Snooped      | The number of packets received from the DHCP clients that were snooped.                                                                                                                                                   |
| Server Packets Discarded    | The number of packets received from the DHCP server that were discarded.                                                                                                                                                  |
| Server Packets Relayed      | The number of packets received from the DHCP server that were forwarded.                                                                                                                                                  |
| Server Packets Snooped      | The number of packets received from the DHCP server that were snooped.                                                                                                                                                    |

| <b>Context</b>     | show>service>id>gsmp                                                                                                                                                                                                                                                                            |
| <b>Description</b> | This command displays GSMP neighbor information.                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><b>group</b> — A GSMP group defines a set of GSMP neighbors which have the same properties.</p> <p><b>name</b> — Specifies a GSMP group name is unique only within the scope of the service in which it is defined.</p> <p><b>ip-address</b> — Specifies the ip-address of the neighbor.</p> |

### Sample Output

These commands show the configured neighbors per service, regardless of the fact there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in 'no shutdown' state. Session gives the number of session (open TCP connections) for each configured neighbor.

| <b>Description</b> | Displays information for the IP interfaces associated with the service.<br>If no optional parameters are specified, a summary of all IP interfaces associated to the service are displayed.                                                                                                                                                                     |
| <b>Parameters</b>  | <p><i>ip-address</i> — The IP address of the interface for which to display information.</p> <p><b>Values</b>      1.0.0.0 — 223.255.255.255</p> <p><i>ip-int-name</i> — The IP interface name for which to display information.</p> <p><b>detail</b> — Displays detailed IP interface information.</p> <p><b>Default</b>      IP interface summary output.</p> |
| <b>Output</b>      | <b>Show Service-ID Interface</b> — The following table describes show service-id interface output fields:                                                                                                                                                                                                                                                       |

| Label          | Description                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface-Name | The name used to refer to the interface.                                                                                                       |
| Type           | Specifies the interface type.                                                                                                                  |
| IP-Address     | Specifies the IP address/IP subnet/broadcast address of the interface.                                                                         |
| Adm            | The desired state of the interface.                                                                                                            |
| Opr            | The operating state of the interface.                                                                                                          |
| Interface      |                                                                                                                                                |
| If Name        | The name used to refer to the interface.                                                                                                       |
| Admin State    | The desired state of the interface.                                                                                                            |
| Oper State     | The operating state of the interface.                                                                                                          |
| IP Addr/mask   | Specifies the IP address/IP subnet/broadcast address of the interface.                                                                         |
| Details        |                                                                                                                                                |
| If Index       | The index corresponding to this interface. The primary index is 1. For example, all interfaces are defined in the Base virtual router context. |
| If Type        | Specifies the interface type.                                                                                                                  |
| Port Id        | Specifies the SAP's port ID.                                                                                                                   |
| SNTP B.Cast    | Specifies whether SNTP broadcast client mode is enabled or disabled.                                                                           |

| Label           | Description (Continued)                                                                   |
|-----------------|-------------------------------------------------------------------------------------------|
| Arp Timeout     | Specifies the timeout for an ARP entry learned on the interface.                          |
| MAC Address     | Specifies the 48-bit IEEE 802.3 MAC address.                                              |
| ICMP Mask Reply | Specifies whether ICMP mask reply is enabled or disabled.                                 |
| Cflowd          | Specifies whether Cflowd collection and analysis on the interface is enabled or disabled. |
| ICMP Details    |                                                                                           |
| Redirects       | Specifies the rate for ICMP redirect messages.                                            |
| Unreachables    | Specifies the rate for ICMP unreachable messages.                                         |
| TTL Expired     | Specifies the rate for ICMP TTL messages.                                                 |

| Service Id         | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SAP                | The SAP and qtag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Encap              | The encapsulation type of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Ethertype          | Specifies an Ethernet type II Ether type value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Admin State        | The administrative state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Oper State         | The operating state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Flags              | Specifies the conditions that affect the operating status of this SAP.<br>Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCeIpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| Last Status Change | Specifies the time of the most recent operating status change to this SAP                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Mgmt Change   | Specifies the time of the most recent management-initiated change to this SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Admin MTU          | The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.                                                                                                                                                                                                                                                                                                                                                                 |

| Label                               | Description (Continued)                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper MTU                            | The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.          |
| Ingress qos-policy                  | The ingress QoS policy ID assigned to the SAP.                                                                                                                           |
| Egress qos-policy                   | The egress QoS policy ID assigned to the SAP.                                                                                                                            |
| Ingress Filter-Id                   | The ingress filter policy ID assigned to the SAP.                                                                                                                        |
| Egress Filter-Id                    | The egress filter policy ID assigned to the SAP.                                                                                                                         |
| Acct. Pol                           | The accounting policy ID assigned to the SAP.                                                                                                                            |
| Collect Stats                       | Specifies whether collect stats is enabled.                                                                                                                              |
| Forwarding Engine Stats             |                                                                                                                                                                          |
| Dropped                             | The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                            |
| Off. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                          |
| Off. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                           |
| Off. Uncolor                        | The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                              |
| Queueing Stats (Ingress QoS Policy) |                                                                                                                                                                          |
| Dro. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc. |
| Dro. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.  |
| For. InProf                         | The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.                                                                             |
| For. OutProf                        | The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| Queueing Stats (Egress QoS Policy)  |                                                                                                                                                                          |
| Dro. InProf                         | The number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                          |
| Dro. OutProf                        | The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| For. InProf                         | The number of in-profile packets and octets (rate below CIR) forwarded by the egress Qchip.                                                                              |

| Label                               | Description (Continued)                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress qos-policy                  | The ingress QoS policy ID assigned to the SAP.                                                                                                                           |
| Egress qos-policy                   | The egress QoS policy ID assigned to the SAP.                                                                                                                            |
| Ingress Filter-Id                   | The ingress filter policy ID assigned to the SAP.                                                                                                                        |
| Egress Filter-Id                    | The egress filter policy ID assigned to the SAP.                                                                                                                         |
| Acct. Pol                           | The accounting policy ID assigned to the SAP.                                                                                                                            |
| Collect Stats                       | Specifies whether collect stats is enabled.                                                                                                                              |
| Forwarding Engine Stats             |                                                                                                                                                                          |
| Dropped                             | The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                            |
| Off. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                          |
| Off. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                           |
| Off. Uncolor                        | The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                              |
| Queueing Stats (Ingress QoS Policy) |                                                                                                                                                                          |
| Dro. HiPrio                         | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc. |
| Dro. LowPrio                        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.  |
| For. InProf                         | The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.                                                                             |
| For. OutProf                        | The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| Queueing Stats (Egress QoS Policy)  |                                                                                                                                                                          |

## sdp

- Syntax** `sdp [sdp-id | far-end ip-addr] [detail]`
- Context** `show>service>id`
- Description** Displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.
- Parameters** *sdp-id* — Displays only information for the specified SDP ID.
- Default** All SDPs.
- Values** 1 — 17407
- far-end ip-addr* — Displays only SDPs matching with the specified far-end IP address.
- Default** SDPs with any far-end IP address.
- detail** — Displays detailed SDP information.
- Output** **Show Service-ID SDP** — The following table describes show service-id SDP output fields:

| Label               | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sdp Id              | The SDP identifier.                                                                                                                                                          |
| Type                | Indicates whether the SDP is a spoke or a mesh.                                                                                                                              |
| Split Horizon Group | Name of the split horizon group that the SDP belongs to.                                                                                                                     |
| VC Type             | Displays the VC type: ether or vlan.                                                                                                                                         |
| VC Tag              | Displays the explicit dot1Q value used when encapsulating to the SDP far end.                                                                                                |
| I. Lbl              | The VC label used by the far-end device to send packets to this device in this service by the SDP.                                                                           |
| Admin Path MTU      | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case.) |
| Oper Path MTU       | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.             |
| Far End             | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                    |
| Delivery            | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                 |
| Admin State         | The administrative state of this SDP.                                                                                                                                        |
| Oper State          | The operational state of this SDP.                                                                                                                                           |
| Ingress Label       | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                             |

| Label               | Description (Continued)                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Egress Label        | The label used by this device to send packets to the far-end device in this service by the SDP.                                                                                                                                                                                       |
| Last Changed        | The date and time of the most recent change to the SDP.                                                                                                                                                                                                                               |
| Signaling           | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                    |
| Admin State         | The administrative state of the keepalive process.                                                                                                                                                                                                                                    |
| Oper State          | he operational state of the keepalive process.                                                                                                                                                                                                                                        |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                        |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                       |
| Hello Msg Len       | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                        |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                      |
| I. Fwd. Pkts.       | Specifies the number of forwarded ingress packets.                                                                                                                                                                                                                                    |
| I. Dro. Pkts.       | Specifies the number of dropped ingress packets.                                                                                                                                                                                                                                      |
| E. Fwd. Pkts.       | Specifies the number of forwarded egress packets.                                                                                                                                                                                                                                     |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS. |

| <b>Description</b> | This command displays subscriber host information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <p><b>sap</b> <i>sap-id</i> — Displays the specified subscriber host SAP information. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><b>ip</b> <i>ip-address/mask</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.</p> <p><b>Values</b>      1.0.0.0 – 223.255.255.255 (with support of /31 subnets).<br/>mask: 1 — 32</p> <p><b>ieee-address</b> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p> <p><b>sub-profile</b> <i>sub-profile-name</i> — Specifies an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the <b>config&gt;subscr-mgmt&gt;sub-profile</b> context.</p> <p><b>sla-profile</b> <i>sla-profile-name</i> — Specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the <b>config&gt;subscr-mgmt&gt;sla-profile</b> context.</p> <p><b>detail</b> — Displays detailed information.</p> <p><b>wholesaler</b> <i>service-id</i> — The VPRN service ID of the wholesaler.</p> <p><b>Values</b>      1 — 2147483648</p> |

## aggregate

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>aggregate</b> [ <b>active</b> ]                                                                  |
| <b>Context</b>     | show>router                                                                                         |
| <b>Description</b> | This command displays aggregated routes.                                                            |
| <b>Parameters</b>  | <b>active</b> — This keyword filters out inactive aggregates.                                       |
| <b>Output</b>      | <b>Show Aggregate Output Fields</b> — The following table describes router aggregate output fields. |

| Label   | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| Prefix  | Displays the destination address of the aggregate route in dotted decimal notation. |
| Summary | Specifies whether the aggregate or more specific components are advertised.         |

|                   |                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| AS Set            | Displays an aggregate where the path advertised for the route consists of all elements contained in all paths that are being summarized. |
| Aggr AS           | Displays the aggregator path attribute to the aggregate route.                                                                           |
| Aggr IP-Address   | The IP address of the aggregated route.                                                                                                  |
| State             | The operational state of the aggregated route.                                                                                           |
| No. of Aggregates | The total number of aggregated routes.                                                                                                   |

Sample Output

```
*A:ALA-12# show router 3 aggregate
=====
Aggregates (Service: 3)
=====
Prefix Summary AS Set Aggr AS Aggr IP-Address State

No. of Aggregates: 0

*A:ALA-12#
```

| Description | This command displays the router ARP table sorted by IP address.<br>If no command line options are specified, all ARP entries are displayed.                                                                                                                                                      |
| Parameters  | <i>ip-addr</i> — Only displays ARP entries associated with the specified IP address.<br><i>ip-int-name</i> — Only displays ARP entries associated with the specified IP interface name.<br><b>mac</b> <i>ieee-mac-addr</i> — Only displays ARP entries associated with the specified MAC address. |
| Output      | <b>ARP Table Output</b> — The following table describes ARP table output fields:                                                                                                                                                                                                                  |

| Label       | Description                       |
|-------------|-----------------------------------|
| IP Address  | The IP address of the ARP entry.  |
| MAC Address | The MAC address of the ARP entry. |
| Expiry      | The age of the ARP entry.         |

| Label              | Description (Continued)                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type               | <p>Dyn — The ARP entry is a dynamic ARP entry.</p> <p>Inv — The ARP entry is an inactive static ARP entry (invalid).</p> <p>Oth — The ARP entry is a local or system ARP entry.</p> <p>Sta — The ARP entry is an active static ARP entry.</p> |
| Interface          | The IP interface name associated with the ARP entry.                                                                                                                                                                                          |
| No. of ARP Entries | The number of ARP entries displayed in the list.                                                                                                                                                                                              |

| <b>Description</b> | <p>This command displays BGP routes with have been dampened due to route flapping. This command can be entered with or without a route parameter.</p> <p>When the keyword <b>detail</b> is included, more detailed information displays.</p> <p>When only the command is entered (without any parameters included except <b>detail</b>), then all dampened routes are listed.</p> <p>When a parameter is specified, then the matching route or routes are listed.</p> <p>When a <b>decayed</b>, <b>history</b>, or <b>suppressed</b> keyword is specified, only those types of dampened routes are listed.</p>                 |
| <b>Parameters</b>  | <p><i>ip-prefix/mask</i> — Displays damping information for the specified IP prefix and mask length.</p> <p><i>ip-address</i> — Displays damping entry for the best match route for the specified IP address.</p> <p><i>damp-type</i> — Displays damping type for the specified IP address.</p> <p><b>decayed</b> — Displays damping entries that are decayed but are not suppressed.</p> <p><b>history</b> — Displays damping entries that are withdrawn but have history.</p> <p><b>suppressed</b> — Displays damping entries suppressed because of route damping.</p> <p><b>detail</b> — Displays detailed information.</p> |
| <b>Output</b>      | <b>Show Damping Output Fields</b> — The following table describes BGP damping output fields:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b> | <p>This command displays group information for a BGP peer group. This command can be entered with or without parameters.</p> <p>When this command is entered without a group name, information about all peer groups displays.</p> <p>When the command is issued with a specific group name, information only pertaining to that specific peer group displays.</p> <p>The ‘State’ field displays the BGP group’s operational state. Other valid states are:</p> <ul style="list-style-type: none"><li>Up - BGP global process is configured and running.</li></ul> |

Down - BGP global process is administratively shutdown and not running.

Disabled - BGP global process is operationally disabled. The process must be restarted by the operator.

**Parameters** *name* — Displays information for the BGP group specified.

**detail** — Displays detailed information.

**Output** **Standard and Detailed Group Output** — The following table describes the standard and detailed command output fields for a BGP group:

### Sample Output

| Label            | Description                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group            | BGP group name                                                                                                                                                             |
| Group Type       | No Type — Peer type not configured.<br>External — Peer type configured as external BGP peers.<br>Internal — Peer type configured as internal BGP peers.                    |
| State            | Disabled — The BGP peer group has been operationally disabled.<br>Down — The BGP peer group is operationally inactive.<br>Up — The BGP peer group is operationally active. |
| Peer AS          | The configured or inherited peer AS for the specified peer group.                                                                                                          |
| Local AS         | The configured or inherited local AS for the specified peer group.                                                                                                         |
| Local Address    | The configured or inherited local address for originating peering for the specified peer group.                                                                            |
| Loop Detect      | The configured or inherited loop detect setting for the specified peer group.                                                                                              |
| Connect Retry    | The configured or inherited connect retry timer value.                                                                                                                     |
|                  | Authentication                                                                                                                                                             |
|                  | None — No authentication is configured.<br>MD5 — MD5 authentication is configured.                                                                                         |
| Local Pref       | The configured or inherited local preference value.                                                                                                                        |
| MED Out          | The configured or inherited MED value assigned to advertised routes without a MED attribute.                                                                               |
| Min Route Advt.  | The minimum amount of time that must pass between route updates for the same IP prefix.                                                                                    |
| Min AS Originate | The minimum amount of time that must pass between updates for a route originated by the local router.                                                                      |

| Label           | Description (Continued)                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multihop        | The maximum number of router hops a BGP connection can traverse.                                                                                                                                                                                                                                  |
| Multipath       | The configured or inherited multipath value, determining the maximum number of ECMP routes BGP can advertise to the RTM.                                                                                                                                                                          |
| Prefix Limit    | No Limit — No route limit assigned to the BGP peer group.<br><br>1 - 4294967295 — The maximum number of routes BGP can learn from a peer.                                                                                                                                                         |
| Passive         | Disabled — BGP attempts to establish BGP connections with neighbors in the specified peer group.<br><br>Enabled — BGP will not actively attempt to establish BGP connections with neighbors in the specified peer group.                                                                          |
| Next Hop Self   | Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to neighbors in the peer group.<br><br>Enabled — BGP sends only its own IP address as the BGP nexthop in route updates to neighbors in the specified peer group.                             |
| Aggregator ID 0 | Disabled — BGP is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates sent to the neighbor in the peer group.<br><br>Enabled — BGP is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates sent to the neighbor in the peer group. |
| Remove Private  | Disabled — BGP will not remove all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.<br><br>Enabled — BGP removes all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.                             |
| Damping         | Disabled — The peer group is configured not to dampen route flaps.<br><br>Enabled — The peer group is configured to dampen route flaps.                                                                                                                                                           |
| Export Policy   | The configured export policies for the peer group.                                                                                                                                                                                                                                                |
| Import Policy   | The configured import policies for the peer group.                                                                                                                                                                                                                                                |
| Hold Time       | The configured hold time setting.                                                                                                                                                                                                                                                                 |
| Keep Alive      | The configured keepalive setting.                                                                                                                                                                                                                                                                 |
| Cluster Id      | None — No cluster ID has been configured.                                                                                                                                                                                                                                                         |
| Client Reflect  | Disabled — The BGP route reflector will not reflect routes to this neighbor.<br><br>Enabled — The BGP route reflector is configured to reflect routes to this neighbor.                                                                                                                           |

| Label         | Description (Continued)                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| NLRI          | The type of NLRI information that the specified peer group can accept.<br>Unicast — IPv4 unicast routing information can be carried. |
| Preference    | The configured route preference value for the peer group.                                                                            |
| List of Peers | A list of BGP peers configured under the peer group.                                                                                 |
| Total Peers   | The total number of peers configured under the peer group.                                                                           |
| Established   | The total number of peers that are in an established state.                                                                          |

## neighbor

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>neighbor</b> <i>[ip-address [[family family] filter1]]</i><br><b>neighbor</b> <i>[as-number [[family family] filter2]]</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Context</b>     | show>router>bgp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | <p>This command displays BGP neighbor information. This command can be entered with or without any parameters.</p> <p>When this command is issued without any parameters, information about all BGP peers displays.</p> <p>When the command is issued with a specific IP address or ASN, information regarding only that specific peer or peers with the same AS display.</p> <p>When either <b>received-routes</b> or <b>advertised-routes</b> is specified, then the routes received from or sent to the specified peer is listed (see second output example).</p> <p>Note: This information is not available by SNMP.</p> |

When either **history** or **suppressed** is specified, then the routes learned from those peers that either have a history or are suppressed (respectively) are listed.

The 'State' field displays the BGP peer's protocol state. In addition to the standard protocol states, this field can also display the 'Disabled' operational state which indicates the peer is operationally disabled and must be restarted by the operator.

**Parameters** *ip-addr* — Displays the BGP neighbor with the specified IP address.

**family** *family* — Specifies the type of routing information to be distributed by the BGP instance.

**Values**      ipv4, vpn-ipv4

*filter1* — Specifies route criteria.

**Values**      received-routes, advertised-routes, history, suppressed, detail

*filter2* — Specifies route criteria.

**Values**      history, suppressed, detail

**Output**      **Standard and Detailed Neighbor** — The following table describes the standard and detailed command output fields for a BGP neighbor:

| Label         | Description                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Peer          | The IP address of the configured BGP peer.                                                                                                                                                                                                                                                                              |
| Group         | The BGP peer group to which this peer is assigned.                                                                                                                                                                                                                                                                      |
| Peer AS       | The configured or inherited peer AS for the peer group.                                                                                                                                                                                                                                                                 |
| Peer Address  | The configured address for the BGP peer.                                                                                                                                                                                                                                                                                |
| Peer Port     | The TCP port number used on the far-end system.                                                                                                                                                                                                                                                                         |
| Local AS      | The configured or inherited local AS for the peer group.                                                                                                                                                                                                                                                                |
| Local Address | The configured or inherited local address for originating peering for the peer group.                                                                                                                                                                                                                                   |
| Local Port    | The TCP port number used on the local system.                                                                                                                                                                                                                                                                           |
| Peer Type     | External — Peer type configured as external BGP peers.<br>Internal — Peer type configured as internal BGP peers.                                                                                                                                                                                                        |
| State         | Idle — The BGP peer is not accepting connections.<br>Active — BGP is listening for and accepting TCP connections from this peer.<br>Connect — BGP is attempting to establish a TCP connection from this peer.<br>Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer. |

| Label      | Description (Continued)                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------|
| Last State | Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION. |
|            | Established — BGP has successfully established a peering and is exchanging routing information.                 |
|            | Idle — The BGP peer is not accepting connections.                                                               |
|            | Active — BGP is listening for and accepting TCP connections from this peer.                                     |
|            | Connect — BGP is attempting to establish a TCP connection with this peer.                                       |
|            | Connect — BGP is attempting to establish a TCP connections from this peer.                                      |
| Last Event | Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer.          |
|            | Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION. |
|            | Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION. |
|            | start — BGP has initialized the BGP neighbor.                                                                   |
|            | stop — BGP has disabled the BGP neighbor.                                                                       |
|            | open — BGP transport connection opened.                                                                         |
|            | close — BGP transport connection closed.                                                                        |
|            | openFail — BGP transport connection failed to open.                                                             |
|            | error — BGP transport connection error.                                                                         |
|            | connectRetry — Connect retry timer expired.                                                                     |
|            | holdTime — Hold time timer expired.                                                                             |
|            | keepAlive — Keepalive timer expired.                                                                            |
|            | recvOpen — Receive an OPEN message.                                                                             |
|            | revKeepalive — Receive an KEEPALIVE message.                                                                    |
|            | recvUpdate — Receive an UPDATE message.                                                                         |
|            | recvNotify — Receive an NOTIFICATION message.                                                                   |
|            | None — No events have occurred.                                                                                 |
| Last Error | Displays the last BGP error and sub-code to occur on the BGP neighbor.                                          |

| Label             | Description (Continued)                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connect Retry     | The configured or inherited connect retry timer value.                                                                                                                                                                                                      |
| Local Pref.       | The configured or inherited local preference value.                                                                                                                                                                                                         |
| Min Route Advt.   | The minimum amount of time that must pass between route updates for the same IP prefix.                                                                                                                                                                     |
| Min AS Originate  | The minimum amount of time that must pass between updates for a route originated by the local router.                                                                                                                                                       |
| Multihop          | The maximum number of router hops a BGP connection can traverse.                                                                                                                                                                                            |
| Multipath         | The configured or inherited multipath value, determining the maximum number of ECMP routes BGP can advertise to the RTM.                                                                                                                                    |
| Damping           | Disabled — BGP neighbor is configured not to dampen route flaps.<br><br>Enabled — BGP neighbor is configured to dampen route flaps.                                                                                                                         |
| Loop Detect       | Ignore — The BGP neighbor is configured to ignore routes with an AS loop.<br><br>Drop — The BGP neighbor is configured to drop the BGP peering if an AS loop is detected.<br><br>Off — AS loop detection is disabled for the neighbor.                      |
| MED Out           | The configured or inherited MED value assigned to advertised routes without a MED attribute.                                                                                                                                                                |
| Authentication    | None — No authentication is configured.<br><br>MD5 — MD5 authentication is configured.                                                                                                                                                                      |
| Next Hop Self     | Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to the specified neighbor.<br><br>Enabled — BGP will send only its own IP address as the BGP nexthop in route updates to the neighbor.                 |
| AggregatorID Zero | Disabled — The BGP Neighbor is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.<br><br>Enabled — The BGP Neighbor is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.               |
| Remove Private    | Disabled — BGP will not remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.<br><br>Enabled — BGP will remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor. |
| Passive           | Disabled — BGP will actively attempt to establish a BGP connection with the specified neighbor.                                                                                                                                                             |

| Label             | Description (Continued)                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | Enabled — BGP will not actively attempt to establish a BGP connection with the specified neighbor.                                                                                  |
| Prefix Limit      | No Limit — No route limit assigned to the BGP peer group.                                                                                                                           |
|                   | 1 - 4294967295 — The maximum number of routes BGP can learn from a peer.                                                                                                            |
| Hold Time         | The configured hold time setting.                                                                                                                                                   |
| Keep Alive        | The configured keepalive setting.                                                                                                                                                   |
| Active Hold Time  | The negotiated hold time, if the BGP neighbor is in an established state.                                                                                                           |
| Active Keep Alive | The negotiated keepalive time, if the BGP neighbor is in an established state.                                                                                                      |
| Cluster Id        | The configured route reflector cluster ID.<br>None — No cluster ID has been configured                                                                                              |
| Client Reflect    | Disabled — The BGP route reflector is configured not to reflect routes to this neighbor.<br><br>Enabled — The BGP route reflector is configured to reflect routes to this neighbor. |
| Preference        | The configured route preference value for the peer group.                                                                                                                           |
| Num of Flaps      | The number of flaps in the neighbor connection.                                                                                                                                     |
| Recd. Prefixes    | The number of routes received from the BGP neighbor.                                                                                                                                |
| Active Prefixes   | The number of routes received from the BGP neighbor and active in the forwarding table.                                                                                             |
| Recd. Paths       | The number of unique sets of path attributes received from the BGP neighbor.                                                                                                        |
| Suppressed Paths  | The number of unique sets of path attributes received from the BGP neighbor and suppressed due to route damping.                                                                    |
| Input Queue       | The number of BGP messages to be processed.                                                                                                                                         |
| Output Queue      | The number of BGP messages to be transmitted.                                                                                                                                       |
| i/p Messages      | Total number of packets received from the BGP neighbor.                                                                                                                             |
| o/p Messages      | Total number of packets sent to the BGP neighbor.                                                                                                                                   |

**Output**     **Show Advertised and Received Routes Output** — The following table describes the command output fields for both the standard and detailed information for a neighbor:

| Label         | Description                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------|
| BGP Router ID | The local BGP router ID.                                                                                       |
| AS            | The configured autonomous system number.                                                                       |
| Local AS      | The configured local AS setting. If not configured, then it is the same value as the AS.                       |
| Flag          | u — used<br>s — suppressed<br>h — history<br>d — decayed<br>* — valid<br>i — igp<br>? — incomplete<br>> — best |
| Network       | Route IP prefix and mask length for the route.                                                                 |
| Next Hop      | BGP nexthop for the route.                                                                                     |
| LocalPref     | BGP local preference path attribute for the route.                                                             |
| MED           | BGP Multi-Exit Discriminator (MED) path attribute for the route.                                               |
| AS Path       | The BGP AS path for the route.                                                                                 |

| <b>Description</b> | This command displays BGP route information.                                                                                                                                                                                                                                                                                                                                      |

When this command is issued without any parameters, then the entire BGP routing table displays.

When this command is issued with an IP prefix/mask or IP address, then the best match for the parameter displays.

**Parameters** **family** *family* — Specifies the type of routing information to be distributed by the BGP instance.

**Values** **ipv4** — Displays only those BGP peers that have the IPv4 family enable and not those capable of exchanging IP-VPN routes.

**vpn-ipv4** — Displays the BGP peers that are IP-VPN capable.

**ipv6** — Displays the BGP peers that are IPv6 capable.

**mcast-ipv4** — Displays the BGP peers that are mcast-ipv4 capable.

*prefix* — Specifies the type of routing information to display.

| Values            | <i>rd</i> [[ <i>rd</i> :] <i>ip-address</i> [/ <i>mask</i> ]]                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|

| <i>ip-address</i> | a.b.c.d                                                                                                                        |
| <i>mask</i>       | 0 — 32                                                                                                                         |

*ipv6-prefix[/prefix-length]* — Specifies the type of IPv6 routing information to display.

|               |              |                                     |
|---------------|--------------|-------------------------------------|
| <b>Values</b> | ipv6-prefix: | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               |              | x:x:x:x:x:d.d.d.d                   |
|               |              | x: [0 — FFFF]H                      |
|               |              | d: [0 — 255]D                       |
| prefix-length | 0 — 128      |                                     |

*filter* — Specifies route criteria.

|               |             |                                                                           |
|---------------|-------------|---------------------------------------------------------------------------|
| <b>Values</b> | <b>hunt</b> | Displays entries for the specified route in the RIB-In, RIB-Out, and RTM. |
|---------------|-------------|---------------------------------------------------------------------------|

**longer** Displays the specified route and subsets of the route.

**detail** Display the longer, more detailed version of the output.

**aspath-regex** “*reg-exp*” — Displays all routes with an AS path matching the specified regular expression *reg-exp*.

**community** *comm.-id* — Displays all routes with the specified BGP community.

|                 |                                                                           |

| as-number2      | 0 — 4294967295                                                            |
| well-known-comm | no-export, no-export-subconfed, no-advertise                              |

**Output**    **Show BGP Routes** — The following table describes the command output fields for BGP routes.

| Label         | Description                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------|
| BGP Router ID | The local BGP router ID.                                                                                                  |
| AS            | The configured autonomous system number.                                                                                  |
| Local AS      | The configured local AS setting, if not configured it is the same as the system AS.                                       |
| Network       | The IP prefix and mask length.                                                                                            |
| Nexthop       | The BGP nexthop.                                                                                                          |
| From          | The advertising BGP neighbor's IP address.                                                                                |
| Res. Nexthop  | The resolved nexthop.                                                                                                     |
| Local Pref.   | The local preference value.                                                                                               |
| Flag          | u — used<br>s — suppressed<br>h — history<br>d — decayed<br>* — valid<br>i — igp<br>e — egp<br>? — incomplete<br>> — best |
| Aggregator AS | The aggregator AS value.<br>none — No aggregator AS attributes are present.                                               |
| Aggregator    | The aggregator attribute value.<br>none — no Aggregator attributes are present.                                           |
| Atomic Aggr.  | Atomic — The atomic aggregator flag is set.<br>Not Atomic — The atomic aggregator flag is not set.                        |
| MED           | The MED metric value.<br>none — No MED metric is present.                                                                 |
| Community     | The BGP community attribute list.                                                                                         |
| Cluster       | The route reflector cluster list.                                                                                         |
| Originator Id | The originator ID path attribute value.<br>none — The originator ID attribute is not present.                             |

| Label          | Description                                                                                  |
|----------------|----------------------------------------------------------------------------------------------|
| Peer Router Id | The router ID of the advertising router.                                                     |
| AS-Path        | The BGP AS path attribute.                                                                   |
| VPN Imported   | Displays the VPNs where a particular BGP-VPN received route has been imported and installed. |

## summary

**Syntax** **summary [all]****Context** show>router>bgp

**Description** This command displays a summary of BGP neighbor information.

If confederations are not configured, that portion of the output will not display.

The “State” field displays the global BGP operational state. The valid values are:

- Up — BGP global process is configured and running.
- Down — BGP global process is administratively shutdown and not running.
- Disabled — BGP global process is operationally disabled. The process must be restarted by the operator.

For example, if a BGP peer is operationally disabled, then the state in the summary table shows the state ‘Disabled’

**Parameters** **all** — Displays BGP peers in all instances.**Output** **Show BGP Summary Output** — The following table describes the command output fields for a BGP summary:

| Label                   | Description                                                                         |
|-------------------------|-------------------------------------------------------------------------------------|
| BGP Router ID           | The local BGP router ID.                                                            |
| AS                      | The configured autonomous system number.                                            |
| Local AS                | The configured local AS setting, if not configured it is the same as the system AS. |
| BGP Admin State         | Down — BGP is administratively disabled.<br>Up — BGP is administratively enabled.   |
| BGP Oper State          | Down — BGP is operationally disabled.<br>Up — BGP is operationally enabled.         |
| Confederation AS        | The configured confederation AS.                                                    |
| Member Confederations   | The configured members of the BGP confederation.                                    |
| Number of Peer Groups   | The total number of configured BGP peer groups.                                     |
| Number of Peers         | The total number of configured BGP peers.                                           |
| Total BGP Active Routes | The total number of BGP routes used in the forwarding table.                        |
| Total BGP Routes        | The total number of BGP routes learned from BGP peers.                              |

| Label                    | Description                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Total BGP Paths          | The total number of unique sets of BGP path attributes learned from BGP peers.                                                          |
| Total Path Memory        | Total amount of memory used to store the path attributes.                                                                               |
| Total Suppressed Routes  | Total number of suppressed routes due to route damping.                                                                                 |
| Total History Routes     | Total number of routes with history due to route damping.                                                                               |
| Total Decayed Routes     | Total number of decayed routes due to route damping.                                                                                    |
| Neighbor                 | BGP neighbor address.                                                                                                                   |
| AS<br>(Neighbor)         | BGP neighbor autonomous system number.                                                                                                  |
| PktRcvd                  | Total number of packets received from the BGP neighbor.                                                                                 |
| PktSent                  | Total number of packets sent to the BGP neighbor.                                                                                       |
| InQ                      | The number of BGP messages to be processed.                                                                                             |
| OutQ                     | The number of BGP messages to be transmitted.                                                                                           |
| Up/Down                  | The amount of time that the BGP neighbor has either been established or not established depending on its current state.                 |
| State Recv/Actv/<br>Sent | The BGP neighbor's current state (if not established) or the number of received routes, active routes and sent routes (if established). |

| <b>Description</b> | This command displays the router IP interface table sorted by interface index.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>ip-address</i> — Only displays the interface information associated with the specified IP address.</p> <p><i>ip-int-name</i> — Only displays the interface information associated with the specified IP interface name.</p> <p><b>detail</b> — Displays detailed IP interface information.</p> <p><b>summary</b> — Displays summary IP interface information for the router.</p> <p><b>exclude-services</b> — Displays IP interface information, excluding IP interfaces configured for customer services. Only core network IP interfaces are displayed.</p> |
| <b>Output</b>      | <b>Standard IP Interface Output</b> — The following table describes the standard output fields for an IP interface:                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Label          | Description                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface-Name | The IP interface name.                                                                                                                                                                                                                                                                                |
| Type           | <p>n/a — No IP address has been assigned to the IP interface, so the IP address type is not applicable.</p> <p>Pri — The IP address for the IP interface is the Primary address on the IP interface.</p> <p>Sec — The IP address for the IP interface is a secondary address on the IP interface.</p> |
| IP-Address     | <p>The IP address and subnet mask length of the IP interface.</p> <p>n/a — Indicates no IP address has been assigned to the IP interface.</p>                                                                                                                                                         |
| Adm            | <p>Down — The IP interface is administratively disabled.</p> <p>Up — The IP interface is administratively enabled.</p>                                                                                                                                                                                |
| Opr            | <p>Down — The IP interface is operationally disabled.</p> <p>Up — The IP interface is operationally enabled.</p>                                                                                                                                                                                      |
| Mode           | <p>Network — The IP interface is a network/core IP interface.</p> <p>Service — The IP interface is a service IP interface.</p>                                                                                                                                                                        |

**Detailed IP Interface Output** — The following table describes the detailed output fields for an IP interface.

| Label       | Description                                           |
|-------------|-------------------------------------------------------|
| If Name     | The IP interface name.                                |
| Admin State | Down — The IP interface is administratively disabled. |

| Label             | Description (Continued)                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Oper State        | Up — The IP interface is administratively enabled.                                                                                          |
|                   | Down — The IP interface is operationally disabled.                                                                                          |
| IP Addr/mask      | Up — The IP interface is operationally disabled.                                                                                            |
|                   | The IP address and subnet mask length of the IP interface.<br>Not Assigned — Indicates no IP address has been assigned to the IP interface. |
| Address Type      | Primary — The IP address for the IP interface is the Primary address on the IP interface.                                                   |
|                   | Secondary — The IP address for the IP interface is a Secondary address on the IP interface.                                                 |
| IGP Inhibit       | Disabled — The secondary IP address on the interface will be recognized as a local interface by the IGP.                                    |
|                   | Enabled — The secondary IP address on the interface will not be recognized as a local interface by the IGP.                                 |
| Broadcast Address | All-ones — The broadcast format on the IP interface is all ones.                                                                            |
|                   | Host-ones — The broadcast format on the IP interface is host ones.                                                                          |
| If Index          | The interface index of the IP router interface.                                                                                             |
| If Type           | Network — The IP interface is a network/core IP interface.                                                                                  |
|                   | Service — The IP interface is a service IP interface.                                                                                       |
| Port Id           | The port ID of the IP interface.                                                                                                            |
| Egress Filter     | The egress IP filter policy ID associated with the IP interface.                                                                            |
|                   | none — Indicates no egress filter policy is associated with the interface.                                                                  |
| Ingress Filter    | The ingress IP filter policy ID associated with the IP interface.                                                                           |
|                   | none — Indicates no ingress filter policy is associated with the interface.                                                                 |
| QoS Policy        | The QoS policy ID associated with the IP interface.                                                                                         |
| SNTP Broadcast    | False — Receipt of SNTP broadcasts on the IP interface is disabled.                                                                         |
|                   | True — Receipt of SNTP broadcasts on the IP interface is enabled.                                                                           |
| MAC Address       | The MAC address of the IP interface.                                                                                                        |
| Arp Timeout       | The ARP timeout for the interface, in seconds, which is the time an ARP entry is maintained in the ARP cache without being refreshed.       |
| IP MTU            | The IP Maximum Transmission Unit (MTU) for the IP interface.                                                                                |

| Label           | Description (Continued)                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ICMP Mask Reply | <p>False — The IP interface will not reply to a received ICMP mask request.</p> <p>True — The IP interface will reply to a received ICMP mask request.</p>                                                                                                                           |
| Cflowd          | <p>Specifies the type of Cflowd analysis that is applied to the interface.</p> <p>acl — ACL Cflowd analysis is applied to the interface.</p> <p>interface — Interface cflowd analysis is applied to the interface.</p> <p>none — No Cflowd analysis is applied to the interface.</p> |
| Redirects       | <p>Specifies the maximum number of ICMP redirect messages the IP interface will issue in a given period of time (Time (seconds)).</p> <p>Disabled — Indicates the IP interface will not generate ICMP redirect messages.</p>                                                         |
| Unreachables    | <p>Specifies the maximum number of ICMP destination unreachable messages the IP interface will issue in a given period of time.</p> <p>Disabled — Indicates the IP interface will not generate ICMP destination unreachable messages.</p>                                            |
| TTL Expired     | <p>The maximum number (Number) of ICMP TTL expired messages the IP interface will issue in a given period of time (Time (seconds)).</p> <p>Disabled — Indicates the IP interface will not generate ICMP TTL expired messages.</p>                                                    |

**Summary IP Interface Output** — The following table describes the summary output fields for the router IP interfaces.

| Label       | Description                                                                  |
|-------------|------------------------------------------------------------------------------|
| Instance    | The router instance number.                                                  |
| Router Name | The name of the router instance.                                             |
| Interfaces  | The number of IP interfaces in the router instance.                          |
| Admin-Up    | The number of administratively enabled IP interfaces in the router instance. |
| Oper-Up     | The number of operationally enabled IP interfaces in the router instance.    |

neighbor

- Syntax** neighbor [*ip-address* | *ip-int-name*] [**detail**] [**advertised-routes**]
- Context** show>router>rip
- Description** Displays RIP neighbor interface information.
- Parameters** *ip-address* | *ip-int-name* — Displays information for the specified IP interface.

**Default** All neighbor interfaces.

**advertised-routes** — Displays the routes advertised to RIP neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.

**Default** Display RIP information.

**Output** **Standard Show RIP Neighbor Output** — The following table describes the standard command output fields for a RIP group.
- | Label      | Description                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor   | The RIP neighbor interface name.                                                                                                                                                                                                                                                                                                          |
| Adm        | Down — The RIP neighbor interface is administratively down.<br>Up — The RIP neighbor interface is administratively up.                                                                                                                                                                                                                    |
| Opr        | Down — The RIP neighbor interface is operationally down.<br>Up — The RIP neighbor interface is operationally up.                                                                                                                                                                                                                          |
| Primary IP | The primary IP address of the RIP neighbor interface.                                                                                                                                                                                                                                                                                     |
| Send Mode  | Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address.<br>Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address.<br>None — Specifies that no RIP messages are sent (i.e., silent listener).<br>RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address. |
| Recv Mode  | Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.<br>None — Specifies that RIP updates will not be accepted.                                                                                                                                                                                    |

**Detailed Show RIP Neighbor Output** — The following table describes the standard command output fields for a RIP group.

| Label       | Description                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor    | The RIP neighbor name.                                                                                                                                                   |
| Description | The RIP neighbor description. No Description Available indicates no description is configured.                                                                           |
| Primary IP  | The RIP neighbor interface primary IP address.                                                                                                                           |
| Group       | The RIP group name of the neighbor interface.                                                                                                                            |
| Admin State | Down — The RIP neighbor interface is administratively down.<br>Up — The RIP neighbor interface is administratively up.                                                   |
| Oper State  | Down — The RIP neighbor interface is operationally down.<br>Up — The RIP neighbor interface is operationally up.                                                         |
| Send Mode   | Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address.<br>Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address. |

| Label           | Description (Continued)                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | None — Specifies that no RIP messages are sent (i.e., silent listener).                                                                                                                              |
|                 | RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.                                                                                                                   |
| Recv Mode       | Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.                                                                                                          |
|                 | None — Specifies that RIP updates will not be accepted.                                                                                                                                              |
|                 | RIPv1 — Specifies that RIP updates in version 1 format only will be accepted.                                                                                                                        |
|                 | RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.                                                                                                                        |
| Metric In       | The metric value added to routes received from a RIP neighbor.                                                                                                                                       |
| Metric Out      | The value added to routes exported into RIP and advertised to RIP neighbors.                                                                                                                         |
| Split Horizon   | Disabled — Split horizon disabled for the neighbor.                                                                                                                                                  |
|                 | Enabled — Split horizon and poison reverse enabled for the neighbor.                                                                                                                                 |
| Check Zero      | Disabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications are not checked allowing receipt of RIP messages even if mandatory zero fields are non-zero for the neighbor. |
|                 | Enabled — checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages is enabled for the neighbor.                                          |
| Message Size    | The maximum number of routes per RIP update message.                                                                                                                                                 |
| Preference      | The preference of RIP routes from the neighbor.                                                                                                                                                      |
| Auth. Type      | Specifies the authentication type.                                                                                                                                                                   |
| Update Timer    | The current setting of the RIP update timer value expressed in seconds.                                                                                                                              |
| Timeout Timer   | The current RIP timeout timer value expressed in seconds.                                                                                                                                            |
| Export Policies | The export route policy that is used to determine routes advertised to all peers.                                                                                                                    |
| Import Policies | The import route policy that is used to determine which routes are accepted from RIP neighbors.                                                                                                      |

## peer

|                    |                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>peer</b> [ <i>ip-int-name</i> ]                                                                                                          |
| <b>Context</b>     | show>router>rip                                                                                                                             |
| <b>Description</b> | Displays RIP peer information.                                                                                                              |
| <b>Parameters</b>  | <i>ip-int-name</i> — Displays peer information for peers on the specified IP interface.<br><b>Default</b> Display peers for all interfaces. |
| <b>Output</b>      | <b>Show RIP Peer Output</b> — The following table describes the command output fields for a RIP peer:                                       |

| Label          | Description                               |
|----------------|-------------------------------------------|
| Peer IP Addr   | The IP address of the peer router.        |
| Interface Name | The peer interface name.                  |
| Version        | The version of RIP running on the peer.   |
| Last Update    | The number of days since the last update. |
| No. of Peers   | The number of RIP peers.                  |

## statistics

|                    |                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>statistics</b> [ <i>ip-addr</i>   <i>ip-int-name</i> ]                                                                                                                                                                                                                             |
| <b>Context</b>     | show>router>rip                                                                                                                                                                                                                                                                       |
| <b>Description</b> | Display Interface level statistics for the RIP protocol.<br>If no IP address or interface name is specified, then all configured RIP interfaces are displayed.<br>If an IP address or interface name is specified, then only data regarding the specified RIP interface is displayed. |
| <b>Parameters</b>  | <i>ip-addr</i>   <i>ip-int-name</i> — Displays statistics for the specified IP interface.                                                                                                                                                                                             |
| <b>Output</b>      | <b>Show RIP Statistics Output</b> — The following table describes the output fields for RIP statistics.                                                                                                                                                                               |

## Sample Output

| Label            | Description                                                      |
|------------------|------------------------------------------------------------------|
| Learned Routes   | The number of RIP-learned routes were exported to RIP neighbors. |
| Timed Out Routes | The number of routes that have been timed out.                   |
| Current Memory   | The amount of memory used by this RIP router instance.           |

| Label                  | Description (Continued)                                                                                                                                                                                                                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Memory         | The amount of memory allocated for this RIP router instance.                                                                                                                                                                                                                                                                                                           |
| Interface              | Displays the name of each interface configured in RIP and associated RIP statistics.                                                                                                                                                                                                                                                                                   |
| Primary IP             | The interface IP address.                                                                                                                                                                                                                                                                                                                                              |
| Update Timer           | The current setting of the RIP update timer value expressed in seconds.                                                                                                                                                                                                                                                                                                |
| Timeout Timer          | The current RIP timeout timer value expressed in seconds.                                                                                                                                                                                                                                                                                                              |
| Flush Timer            | The number of seconds after a route has been declared invalid that it is flushed from the route database.                                                                                                                                                                                                                                                              |
| Updates Sent           | <p>Total — The total number of RIP updates that were sent.</p> <p>Last 5 Min — The number of RIP updates that were sent in the last 5 minutes.</p> <p>Last 1 Min — The number of RIP updates that were sent in the last 1 minute.</p>                                                                                                                                  |
| Triggered Updates      | <p>Total — The total number of triggered updates sent. These updates are sent before the entire RIP routing table is sent.</p> <p>Last 5 Min — The number of triggered updates that were sent in the last 5 minutes.</p> <p>Last 1 Min — The number of triggered updates that were sent in the last 1 minute.</p>                                                      |
| Bad Packets Received   | <p>Total — The total number of RIP updates received on this interface that were discarded as invalid.</p> <p>Last 5 Min — The number of RIP updates received on this interface that were discarded as invalid in the last 5 minutes.</p> <p>Last 1 Min — The number of RIP updates received on this interface that were discarded as invalid in the last 1 minute.</p> |
| RIPv1 Updates Received | <p>Total — The total number of RIPv1 updates received.</p> <p>Last 5 Min — The number of RIPv1 updates received in the last 5 minutes.</p> <p>Last 1 Min — The number of RIPv1 updates received in the last 1 minute.</p>                                                                                                                                              |
| RIPv1 Updates Ignored  | <p>Total — The total number of RIPv1 updates ignored.</p> <p>Last 5 Min — The number of RIPv1 updates ignored in the last 5 minutes.</p> <p>Last 1 Min — The number of RIPv1 updates ignored in the last 1 minute.</p>                                                                                                                                                 |

| Label                   | Description (Continued)                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------|
| RIPv1 Bad Routes        | Total — The total number of bad routes received from the peer.                                                      |
|                         | Last 5 Min — The number of bad routes received from the peer in the last 5 minutes.                                 |
|                         | Last 1 Min — The number of bad routes received from the peer in the last minute.                                    |
| RIPv1 Requests Received | Total — The total number of times the router received RIPv1 route requests from other routers.                      |
|                         | Last 5 Min — The number of times the router received RIPv1 route requests from other routers in the last 5 minutes. |
|                         | Last 1 Min — The number of times the router received RIPv1 route requests from other routers in the last 1 minute.  |
| RIPv1 Requests Ignored  | Total — The total number of times the router ignored RIPv1 route requests from other routers.                       |
|                         | Last 5 Min — The number of times the router ignored RIPv1 route requests from other routers in the last 5 minutes.  |
|                         | Last 1 Min — The number of times the router ignored RIPv1 route requests from other routers in the last 1 minute.   |
| RIPv2 Updates Received  | Total — The total number of RIPv2 updates received.                                                                 |
|                         | Last 5 Min — The number of RIPv2 updates received in the last 5 minutes.                                            |
|                         | Last 1 Min — The number of RIPv2 updates received in the last minute.                                               |
| RIPv2 Updates Ignored   | Total — The total number of RIPv2 updates ignored.                                                                  |
|                         | Last 5 Min — The number of RIPv2 updates ignored in the last 5 minutes.                                             |
|                         | Last 1 Min — The number of RIPv2 updates ignored in the last minute.                                                |
| RIPv2 Bad Routes        | Total — The total number of bad routes received from the peer.                                                      |
|                         | Last 5 Min — The number of bad routes received from the peer in the last 5 minutes.                                 |
|                         | Last 1 Min — The number of bad routes received from the peer in the last minute.                                    |
| RIPv2 Requests Received | Total — The total number of times the router received RIPv2 route requests from other routers.                      |

| Label                  | Description (Continued)                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------|
|                        | Last 5 Min — The number of times the router received RIPv2 route requests from other routers in the last 5 minutes. |
|                        | Last 1 Min — The number of times the router received RIPv2 route requests from other routers in the last minute.    |
| RIPv2 Requests Ignored | Total — The total number of times the router ignored RIPv2 route requests from other routers.                       |
|                        | Last 5 Min — The number of times the router ignored RIPv2 route requests from other routers in the last 5 minutes.  |
|                        | Last 1 Min — The number of times the router ignored RIPv2 route requests from other routers in the last minute.     |
| Authentication Errors  | Total — The total number of authentication errors to secure table updates.                                          |
|                        | Last 5 Min — The number of authentication errors to secure table updates in the last 5 minutes.                     |
|                        | Last 1 Min — The number of authentication errors to secure table updates in the last minute.                        |

static-route

- Syntax

static-route [ip-prefix /mask] | [preference preference] | [next-hop ip-addr] [detail]
- Context

show>router
- Description

This command displays the static entries in the routing table.

If no options are present, all static routes are displayed sorted by prefix.
- Parameters

*ip-prefix /mask* — Displays static routes only matching the specified *ip-prefix* and *mask*.

*preference preference* — Only displays static routes with the specified route preference.

**Values**      0 — 65535

*next-hop ip-addr* — Only displays static routes with the specified next hop IP address.

**detail** — Displays detailed information about the static route.
- Output

**Show Static Route Output** — The following table describes the output fields for the static route table:

| Label        | Description                                                                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Addr/mask | The static route destination address and mask.                                                                                                                                                                                                                                   |
| Pref         | The route preference value for the static route.                                                                                                                                                                                                                                 |
| Metric       | The route metric value for the static route.                                                                                                                                                                                                                                     |
| Type         | <p>BH — The static route is a black hole route. The <code>NextHop</code> for this type of route is <code>black-hole</code>.</p> <p>ID — The static route is an indirect route, where the <code>nextHop</code> for this type of route is the non-directly connected next hop.</p> |

| Label          | Description (Continued)                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | NH — The route is a static route with a directly connected next hop. The Nexthop for this type of route is either the next hop IP address or an egress IP interface name. |
| Next Hop       | The next hop for the static route destination.                                                                                                                            |
| Interface      | The egress IP interface name for the static route.<br>n/a — indicates there is no current egress interface because the static route is inactive or a black hole route.    |
| Active         | N — The static route is inactive; for example, the static route is disabled or the next hop IP interface is down.<br><br>Y — The static route is active.                  |
| No. of Routes: | The number of routes displayed in the list.                                                                                                                               |

| <b>Description</b> | This command displays tunnel table information.<br><br>Note that auto-bind GRE tunnels are not displayed in <b>show</b> command output. GRE tunnels are not the same as SDP tunnels that use the GRE encapsulation type. When the <b>auto-bind</b> command is used when configuring a VPRN service, it means the MP-BGP NH resolution is referring to core routing instance for IP reachability. For a VPRN service this object specifies the lookup to be used by the routing instance if no SDP to the destination exists. |
| <b>Parameters</b>  | <i>ip-address[/mask]</i> — Displays the specified tunnel table's destination IP address and mask.<br><b>protocol</b> <i>protocol</i> — Displays LDP protocol information.<br><b>sdp</b> <i>sdp-id</i> — Displays information pertaining to the specified SDP.<br><b>summary</b> — Displays summary tunnel table information.                                                                                                                                                                                                 |
| <b>Output</b>      | <b>Show Tunnel Table Output</b> — The following table describes tunnel table output fields:                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Label       | Description                                                                    |
|-------------|--------------------------------------------------------------------------------|
| Destination | The route's destination address and mask.                                      |
| Owner       | Specifies the tunnel owner.                                                    |
| Encap       | Specifies the tunnel's encapsulation type.                                     |
| Tunnel ID   | Specifies the tunnel (SDP) identifier.                                         |
| Pref        | Specifies the route preference for routes learned from the configured peer(s). |
| Nexthop     | The next hop for the route's destination.                                      |
| Metric      | The route metric value for the route.                                          |

statistics

- Syntax** **statistics** [*ip-int-name* | *ip-address*]
- Context** show>router>dhcp
- Description** Display statistics for DHCP Relay and DHCP snooping.  
If no IP address or interface name is specified, then all configured interfaces are displayed.  
If an IP address or interface name is specified, then only data regarding the specified interface is displayed.
- Parameters** *ip-int-name* | *ip-address* — Displays statistics for the specified IP interface.
- Output** **Show DHCP Statistics Output** — The following table describes the output fields for DHCP statistics.

| Label                      | Description                                                               |
|----------------------------|---------------------------------------------------------------------------|
| Received Packets           | The number of packets received from the DHCP clients.                     |
| Transmitted Packets        | The number of packets transmitted to the DHCP clients.                    |
| Received Malformed Packets | The number of malformed packets received from the DHCP clients.           |
| Received Untrusted Packets | The number of untrusted packets received from the DHCP clients.           |
| Client Packets Discarded   | The number of packets received from the DHCP clients that were discarded. |
| Client Packets Relayed     | The number of packets received from the DHCP clients that were forwarded. |
| Client Packets Snooped     | The number of packets received from the DHCP clients that were snooped.   |
| Server Packets Discarded   | The number of packets received from the DHCP server that were discarded.  |
| Server Packets Relayed     | The number of packets received from the DHCP server that were forwarded.  |
| Server Packets Snooped     | The number of packets received from the DHCP server that were snooped.    |

**Sample Output**

```
*A:ALA-1# show router dhcp statistics

| <b>Description</b> | Clears DHCP lease state information for this service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).</p> <p><i>ieee-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p> <p><i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><i>sdp-id</i> — The SDP ID to be cleared.</p> <p><b>Values</b> 1 — 17407</p> <p><i>vc-id</i> — The virtual circuit ID on the SDP ID to be cleared.</p> <p><b>Values</b> 1 — 4294967295</p> |

## site

|                    |                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>site</b> <i>service-id</i>                                                                                                          |
| <b>Context</b>     | clear>service>id                                                                                                                       |
| <b>Description</b> | This command clears site-specific information for the service.                                                                         |
| <b>Parameters</b>  | <p><i>service-id</i> — Specifies the service ID or service name up to 64 characters in length.</p> <p><b>Values</b> 1 — 2147483648</p> |

## spoke-sdp

|                    |                                                                                                                                                                                                 |

| <b>Description</b> | This command clears statistics for the spoke SDP bound to the service.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b>  | <i>sdp-id</i> — The spoke SDP ID for which to clear statistics.<br><b>Values</b> 1 — 17407<br><i>vc-id</i> — The virtual circuit ID on the SDP ID to be reset.<br><b>Values</b> 1 — 4294967295<br><b>all</b> — Clears all queue statistics and STP statistics associated with the SDP.<br><b>counters</b> — Clears all queue statistics associated with the SDP.<br><b>stp</b> — Clears all STP statistics associated with the SDP. |

## stp

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <b>Syntax</b>      | <b>stp</b>                                              |
| <b>Context</b>     | clear>service>statistics>id                             |
| <b>Description</b> | Clears all spanning tree statistics for the service ID. |

## VPRN Debug Commands

---

### id

|                    |                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] id</b> <i>service-id</i>                                                                              |
| <b>Context</b>     | debug>service                                                                                                 |
| <b>Description</b> | This command debugs commands for a specific service.<br>The <b>no</b> form of the command disables debugging. |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.                                                |

### arp-host

|                    |                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] arp-host</b>                                                                                                      |
| <b>Context</b>     | debug>service>id                                                                                                          |
| <b>Description</b> | This command enables and configures ARP host debugging.<br>The <b>no</b> form of the command disables ARP host debugging. |

### dhcp

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] dhcp</b>                                                                                                   |
| <b>Context</b>     | debug>service>id                                                                                                   |
| <b>Description</b> | This command enables the context for DHCP debugging.<br>The <b>no</b> form of the command disables DHCP debugging. |

### detail-level

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>detail-level {low   medium   high}</b><br><b>no detail-level</b>                                             |
| <b>Context</b>     | debug>service>id>dhcp                                                                                           |
| <b>Description</b> | This command configures the DHCP tracing detail level.<br>The <b>no</b> form of the command disables debugging. |

### mode

|               |                                                                      |
|---------------|----------------------------------------------------------------------|
| <b>Syntax</b> | <b>mode {dropped-only   ingr-and-dropped   egr-ingr-and-dropped}</b> |
|---------------|----------------------------------------------------------------------|

**no mode**

|                    |                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | debug>service>id>dhcp                                                                                   |
| <b>Description</b> | This command configures the DHCP tracing mode.<br>The <b>no</b> form of the command disables debugging. |

## host-connectivity-verify

|                    |                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] host-connectivity-verify                                                                                                                      |
| <b>Context</b>     | debug>service>id                                                                                                                                   |
| <b>Description</b> | This command enables Subscriber Host Connectivity Verification (SHCV) debugging.<br>The <b>no</b> form of the command disables the SHCV debugging. |

## ip

|                    |                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] ip <i>ip-address</i>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular IP address.                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets). |

## mac

|                    |                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] mac <i>ieee-address</i>                                                                                                                                                                                                                                                       |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                                                                                                                          |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular MAC address.                                                                                                                                                                        |
| <b>Parameters</b>  | <i>mac-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses. |

## sap

|                    |                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap <i>sap-id</i></b>                                                                                                                                              |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                  |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular SAP.                                                                        |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax. |

|                    |                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sap <i>sap-id</i></b>                                                                                                                                              |
| <b>Context</b>     | debug>service>id<br>debug>service>id>dhcp<br>debug>service>stp                                                                                                             |
| <b>Description</b> | This command enables STP debugging for a specific SAP.<br>The <b>no</b> form of the command disables debugging.                                                            |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax. |

## sdp

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] sdp <i>sdp-id:vc-id</i></b>                                                                             |
| <b>Context</b>     | debug>service>id<br>debug>service>id>dhcp<br>debug>service>stp                                                  |
| <b>Description</b> | This command enables STP debugging for a specific SDP.<br>The <b>no</b> form of the command disables debugging. |

## event-type

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] event-type {config-change   svc-oper-status-change   sap-oper-status-change   sdpbind-oper-status-change}</b> |
| <b>Context</b>     | debug>service>id                                                                                                      |
| <b>Description</b> | This command enables debugging for a particular event type.<br>The <b>no</b> form of the command disables debugging.  |

## event-type

|                    |                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] event-type {config-change   oper-status-change}</b>                                                          |
| <b>Context</b>     | debug>service>id>sap                                                                                                 |
| <b>Description</b> | This command enables debugging for a particular event type.<br>The <b>no</b> form of the command disables debugging. |

## stp

|                    |                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] stp</b>                                                                                              |
| <b>Context</b>     | debug>service>id                                                                                             |
| <b>Description</b> | This command enables the context for debugging STP.<br>The <b>no</b> form of the command disables debugging. |

## all-events

|                    |                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>all-events</b>                                                                                           |
| <b>Context</b>     | debug>service>id>event-type                                                                                 |
| <b>Description</b> | This command enables STP debugging for all events.<br>The <b>no</b> form of the command disables debugging. |

## bpdu

|                    |                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] bpdu</b>                                                                                                                |
| <b>Context</b>     | debug>service>stp                                                                                                               |
| <b>Description</b> | This command enables STP debugging for received and transmitted BPDUs.<br>The <b>no</b> form of the command disables debugging. |

## core-connectivity

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] core-connectivity</b>                                                                                      |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for core connectivity.<br>The <b>no</b> form of the command disables debugging. |

## exception

|                    |                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] exception</b>                                                                                       |
| <b>Context</b>     | debug>service>stp                                                                                           |
| <b>Description</b> | This command enables STP debugging for exceptions.<br>The <b>no</b> form of the command disables debugging. |

## fsm-state-changes

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-state-changes</b>                                                                                      |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for FSM state changes.<br>The <b>no</b> form of the command disables debugging. |

## fsm-timers

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-timers</b>                                                                                             |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for FSM timer changes.<br>The <b>no</b> form of the command disables debugging. |

## port-role

|                    |                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] port-role</b>                                                                                                  |
| <b>Context</b>     | debug>service>stp                                                                                                      |
| <b>Description</b> | This command enables STP debugging for changes in port roles.<br>The <b>no</b> form of the command disables debugging. |

## port-state

|                    |                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] port-state</b>                                                                                       |
| <b>Context</b>     | debug>service>stp                                                                                            |
| <b>Description</b> | This command enables STP debugging for port states.<br>The <b>no</b> form of the command disables debugging. |

## igmp

|                    |                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] igmp</b>                                                                                  |
| <b>Context</b>     | debug>router                                                                                      |
| <b>Description</b> | This command enables debugging for IGMP.<br>The <b>no</b> form of the command disables debugging. |

## interface

|                    |                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] interface</b> [ <i>ip-int-name</i>   <i>ip-address</i> ]                                                                                                                                   |
| <b>Context</b>     | debug>router>igmp                                                                                                                                                                                  |
| <b>Description</b> | This command enables debugging on the IGMP interface.<br>The <b>no</b> form of the command disables debugging.                                                                                     |
| <b>Parameters</b>  | <i>ip-int-name</i> — Only displays the information associated with the specified IP interface name.<br><i>ip-address</i> — Only displays the information associated with the specified IP address. |

### Sample Output

```

ingress-label

- Syntax** **ingress-label** *start-label* [*end-label*]
- Context** show>service
- Description**

This command displays services using the range of ingress labels. If only the mandatory *start-label* parameter is specified, only services using the specified label are displayed.

If both *start-label* and *end-label* parameters are specified, the services using the range of labels X where *start-label* <= X <= *end-label* are displayed.

Use the **show router vprn-service-id ldp bindings** command to display dynamic labels.
- Parameters**

*start-label* — The starting ingress label value for which to display services using the label range. If only *start-label* is specified, services only using *start-label* are displayed.

**Values** 0, 2048 — 131071

*end-label* — The ending ingress label value for which to display services using the label range.

**Default** The *start-label* value.

**Values** 2049 — 131071
- Output** **Show Service Ingress-Label** — The following table describes show service ingress-label output fields:

| Label                    | Description                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------|
| Svc Id                   | The ID that identifies a service.                                                                  |
| Sdp I                    | The ID that identifies an SDP.                                                                     |
| Type                     | Indicates whether the SDP binding is a spoke or a mesh.                                            |
| I. Lbl                   | The VC label used by the far-end device to send packets to this device in this service by the SDP. |
| E. Lbl                   | The VC label used by this device to send packets to the far-end device in this service by the SDP. |
| Number of bindings found | The total number of SDP bindings that exist within the specified egress label range.               |

Sample Output

## sap-using

**Syntax** **sap-using** [**sap** *sap-id*]  
**sap-using** **interface** [*ip-address* | *ip-int-name*]  
**sap-using** [**ingress** | **egress**] **filter** *filter-id*  
**sap-using** [**ingress** | **egress**] **qos-policy** *qos-policy-id*  
**sap-using** **encap-type** *encap-type*

**Context** show>service

**Description** This command displays specified SAP information.  
If no optional parameters are specified, the command displays a summary of all defined SAPs.  
The optional parameters restrict output to only SAPs matching the specified properties.

**Parameters** **ingress** — Specifies matching an ingress policy.  
**egress** — Specifies matching an egress policy.  
**qos-policy** *qos-policy-id* — The ingress or egress QoS Policy ID for which to display matching SAPs.  
**Values** 1 — 65535  
**filter** *filter-id* — The ingress or egress filter policy ID for which to display matching SAPs.  
**Values** 1 — 65535  
**sap** *sap-id* — Specifies the physical port identifier portion of the SAP definition. See [Common CLI Command Descriptions on page 1933](#) for command syntax.  
*ip-addr* — The IP address of the interface for which to display matching SAPs.  
**Values** 1.0.0.0 — 223.255.255.255  
*ip-int-name* — The IP interface name for which to display matching SAPs.  
**encap-type** *encap-type* — Displays the CEM encapsulation type.  
**Values** cem

**Output** **Show Service SAP** — The following table describes show service SAP output fields:

| Label   | Description                                         |
|---------|-----------------------------------------------------|
| Port ID | The ID of the access port where the SAP is defined. |

| Label    | Description (Continued)                                         |
|----------|-----------------------------------------------------------------|
| Svc ID   | The service identifier.                                         |
| Sap MTU  | The SAP MTU value.                                              |
| I.QoS    | The SAP ingress QoS policy number specified on the ingress SAP. |
| I.MAC/IP | The MAC or IP filter policy ID applied to the ingress SAP.      |
| E.QoS    | The SAP egress QoS policy number specified on the egress SAP.   |
| E.Mac/IP | The MAC or IP filter policy ID applied to the egress SAP.       |
| A.Pol    | The accounting policy ID assigned to the SAP.                   |
| Adm      | The administrative state of the SAP.                            |
| Opr      | The operational state of the SAP.                               |
| Alarm    | Specifies if alarms are enabled.                                |

# sdp

- Syntax** **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]
- Context** show>service
- Description** This command displays SDP information.  
If no optional parameters are specified, a summary SDP output for all SDPs is displayed.
- Parameters** *sdp-id* — The SDP ID for which to display information.

**Default** All SDPs.  
**Values** 1 — 17407

*far-end ip-address* — Displays only SDPs matching with the specified far-end IP address.

**Default** SDPs with any far-end IP address.

**detail** — Displays detailed SDP information.

**Default** SDP summary output.

**keep-alive-history** — Displays the last fifty SDP keepalive events for the SDP.

**Default** SDP summary output.
- Output** **Show Service SDP** — The following table describes show service SDP output fields:

| Label               | Description                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id              | The SDP identifier.                                                                                                                                                         |
| Adm MTU             | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Opr MTU             | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| IP address          | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                   |
| Adm<br>Admin State  | Specifies the desired state of the SDP.                                                                                                                                     |
| Opr<br>Oper State   | Specifies the operating state of the SDP.                                                                                                                                   |
| Deliver<br>Delivery | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                |
| Flags               | Specifies all the conditions that affect the operating status of this SDP.                                                                                                  |
| Signal<br>Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                           |
| Last Status Change  | Specifies the time of the most recent operating status change to this SDP.                                                                                                  |

| Label               | Description (Continued)                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Mgmt Change    | Specifies the time of the most recent management-initiated change to this SDP.                                                                                                                                                                                                       |
| Number of SDPs      | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                                    |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Number of SDPs      | Specifies the total number of SDPs displayed according to the criteria specified.                                                                                                                                                                                                    |
| Hello Time          | Specifies how often the SDP echo request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len       | Specifies the length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Timeout       | Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout.                                                                                                                                                                                 |
| Unmatched Replies   | Specifies the number of SDP unmatched message replies.                                                                                                                                                                                                                               |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                     |
| TX Hello Msgs       | Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                           |
| Rx Hello Msgs       | Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.                                                                                                                                              |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS |

### Sample Output

```
*A:ALA-12# show service sdp
```

## sdp-using

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp-using</b> [ <i>sdp-id[:vc-id]</i>   far-end <i>ip-address</i> ] |
| <b>Context</b>     | show>service                                                           |
| <b>Description</b> | Display services using SDP or far-end address options.                 |

**Parameters** *sdp-id* — Displays only services bound to the specified SDP ID.

**Values** 1 — 17407

*vc-id* — The virtual circuit identifier.

**Values** 1 — 4294967295

**far-end ip-address** — Displays only services matching with the specified far-end IP address.

**Default** Services with any far-end IP address.

**Output** **Show Service SDP Using X** — The following table describes show service sdp-using output fields.

| Label         | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| Svc ID        | The service identifier.                                                                          |
| Sdp ID        | The SDP identifier.                                                                              |
| Type          | Type of SDP: spoke or mesh.                                                                      |
| Far End       | The far-end address of the SDP.                                                                  |
| Oper State    | The operational state of the service.                                                            |
| Ingress Label | The label used by the far-end device to send packets to this device in this service by this SDP. |
| Egress Label  | The label used by this device to send packets to the far-end device in this service by this SDP. |

### Sample Output

```
*A:ALA-1# show service sdp-using 300

## service-using

**Syntax** **service-using** [**epipe**] [**ies**] [**vpls**] [**vprn**] [**mirror**] [**apipe**] [**fpipe**] [**ipipe**] [**cpipe**] [**b-vpls**] [**i-vpls**] [**m-vpls**] [**sdp sdp-id**] [**customer customer-id**]

- Context** show>service
- Description** Displays the services matching certain usage properties.  
If no optional parameters are specified, all services defined on the system are displayed.
- Parameters**
- [service]** — Displays specified service information.
  - b-vpls** — Specifies the B-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It represents the multi-point tunneling component that multiplexes multiple customer VPNs (ISIDs) together. It is similar to a regular VPLS instance that operates on the backbone MAC addresses.
  - i-vpls** — Specifies the I-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It identifies the specific VPN entity associated to a customer multipoint (ELAN) service. It is similar to a regular VPLS instance that operates on the customer MAC addresses.
  - m-vpls** — Specifies the M-component (managed VPLS) instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature.
  - sdp sdp-id** — Displays only services bound to the specified SDP ID.
    - Default** Services bound to any SDP ID.
    - Values** 1 — 17407
  - customer customer-id** — Displays services only associated with the specified customer ID.
    - Default** Services associated with any customer.
    - Values** 1 — 2147483647
- Output** **Show Service Service-Using** — The following table describes show service service-using output fields:

| Label            | Description                                                                       |
|------------------|-----------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                           |
| Type             | Specifies the service type configured for the service ID.                         |
| Adm              | The administrative state of the service.                                          |
| Opr              | The operational state of the service.                                             |
| CustomerId       | The ID of the customer who owns this service.                                     |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this service. |

| <b>Description</b> | Displays detailed information for all aspects of the service.                                                    |
| <b>Output</b>      | <b>Show All Service-ID Output</b> — The following table describes the show all service-id command output fields: |

| Label               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id          | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| VPN Id              | The number which identifies the VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Service Type        | Specifies the type of service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLL Type            | Specifies the VLL type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SDP Id              | The SDP identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description         | Generic information about the service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Customer Id         | The customer identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Mgmt Change    | The date and time of the most recent management-initiated change                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flags               | Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch,RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCelpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| SAP Count           | The number of SAPs specified for this service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SDP Bind Count      | The number of SDPs bound to this service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Split Horizon Group | Name of the split horizon group for this service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description         | Description of the split horizon group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last Changed        | The date and time of the most recent management-initiated change to this split horizon group.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SDP Id              | The SDP identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Label                  | Description (Continued)                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                   | Indicates whether this Service SDP binding is a spoke or a mesh.                                                                                                                                                                                                                     |
| Admin Path MTU         | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                    |
| Oper Path MTU          | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                     |
| Delivery               | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                                                                                                                         |
| Admin State            | The administrative state of this SDP.                                                                                                                                                                                                                                                |
| Oper State             | The operational state of this SDP.                                                                                                                                                                                                                                                   |
| Ingress Label          | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                                                                                                                                     |
| Egress Label           | The label used by this device to send packets to the far-end device in this service by this SDP.                                                                                                                                                                                     |
| Ingress Filter         | The ID of the ingress filter policy.                                                                                                                                                                                                                                                 |
| Egress Filter          | The ID of the egress filter policy.                                                                                                                                                                                                                                                  |
| Far End                | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                                                                                                                            |
| Last Changed           | The date and time of the most recent change to this customer.                                                                                                                                                                                                                        |
| Signaling              | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                   |
| Admin State            | Specifies the admin. state of the keepalive protocol.                                                                                                                                                                                                                                |
| Oper State             | Specifies the operational state of the keepalive protocol.                                                                                                                                                                                                                           |
| Hello Time             | Specifies how often the SDP Echo Request messages are transmitted on this SDP.                                                                                                                                                                                                       |
| Hello Msg Len          | Specifies the length of the SDP Echo Request messages transmitted on this SDP.                                                                                                                                                                                                       |
| Max Drop Count         | Specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                      |
| Hold Down Time         | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                     |
| SDP Delivery Mechanism | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the Far End field.<br>If the SDP type is GRE, then the following message displays:<br>SDP Delivery Mechanism is not MPLS |

| Label                 | Description (Continued)                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of SDPs        | The total number SDPs applied to this service ID.                                                                                                                 |
| Service Id            | The service identifier.                                                                                                                                           |
| Port Id               | The ID of the access port where this SAP is defined.                                                                                                              |
| Description           | Generic information about the SAP.                                                                                                                                |
| Encap Value           | The value of the label used to identify this SAP on the access port.                                                                                              |
| Admin State           | The desired state of the SAP.                                                                                                                                     |
| Oper State            | The operating state of the SAP.                                                                                                                                   |
| Last Changed          | The date and time of the last change.                                                                                                                             |
| Admin MTU             | The desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Oper MTU              | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.  |
| Ingress qos-policy    | The SAP ingress QoS policy ID.                                                                                                                                    |
| Egress qos-policy     | The SAP egress QoS policy ID.                                                                                                                                     |
| Ingress Filter-Id     | The SAP ingress filter policy ID.                                                                                                                                 |
| Egress Filter-Id      | The SAP egress filter policy ID.                                                                                                                                  |
| Multi Svc Site        | Indicates the multi-service site that the SAP is a member of.                                                                                                     |
| Ingress sched-policy  | Indicates the ingress QoS scheduler for the SAP.                                                                                                                  |
| Egress sched-policy   | Indicates the egress QoS scheduler for the SAP.                                                                                                                   |
| Acct. Pol             | Indicates the accounting policy applied to the SAP.                                                                                                               |
| Collect Stats         | Specifies whether accounting statistics are collected on the SAP.                                                                                                 |
| Dropped               | The number of packets or octets dropped.                                                                                                                          |
| Offered Hi Priority   | The number of high priority packets, as determined by the SAP ingress QoS policy.                                                                                 |
| Offered Low Priority  | The number of low priority packets, as determined by the SAP ingress QoS policy.                                                                                  |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.                                                                                            |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.                                                                                        |

| Label                 | Description (Continued)                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------|
| Dropped In Profile    | The number of in-profile packets or octets discarded.                                      |
| Dropped Out Profile   | The number of out-of-profile packets or octets discarded.                                  |
| Forwarded In Profile  | The number of in-profile packets or octets (rate below CIR) forwarded.                     |
| Forwarded Out Profile | The number of out-of-profile packets or octets (rate above CIR) forwarded.                 |
| Ingress Queue 1       | The index of the ingress QoS queue of this SAP.                                            |
| High priority offered | The packets or octets count of the high priority traffic for the SAP.                      |
| High priority dropped | The number of high priority traffic packets/octets dropped.                                |
| Low priority offered  | The packets or octets count of the low priority traffic.                                   |
| Low priority dropped  | The number of low priority traffic packets/octets dropped.                                 |
| In profile forwarded  | The number of in-profile packets or octets (rate below CIR) forwarded.                     |
| Out profile forwarded | The number of out-of-profile octets (rate above CIR) forwarded.                            |
| Egress Queue 1        | The index of the egress QoS queue of the SAP.                                              |
| In profile forwarded  | The number of in-profile packets or octets (rate below CIR) forwarded.                     |
| In profile dropped    | The number of in-profile packets or octets dropped for the SAP.                            |
| Out profile forwarded | The number of out-of-profile packets or octets (rate above CIR) forwarded.                 |
| Out profile dropped   | The number of out-of-profile packets or octets discarded.                                  |
| State                 | Specifies whether DHCP relay is enabled on this SAP.                                       |
| Info Option           | Specifies whether Option 82 processing is enabled on this SAP.                             |
| Action                | Specifies the Option 82 processing on this SAP or interface: keep, replace or drop.        |
| Circuit ID            | Specifies whether the If Index is inserted in Circuit ID sub-option of Option 82.          |
| Remote ID             | Specifies whether the far-end MAC address is inserted in Remote ID sub-option of Option 82 |
| Managed by Service    | Specifies the service-id of the management VPLS managing this SAP.                         |
| Managed by SAP        | Specifies the sap-id inside the management VPLS managing this SAP.                         |

| Label              | Description (Continued)                                                  |
|--------------------|--------------------------------------------------------------------------|
| Prune state        | Specifies the STP state inherited from the management VPLS.              |
| Managed by Service | Specifies the service-id of the management VPLS managing this spoke SDP. |
| Managed by Spoke   | Specifies the sap-id inside the management VPLS managing this spoke SDP. |
| Prune state        | Specifies the STP state inherited from the management VPLS.              |

### Sample Output

This example shows a remote Cpipe configuration (1 local SAP and SDP).

```
A:sim216# show service id 100 all

## base

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>base</b>                                                                                         |
| <b>Context</b>     | show>service>id                                                                                     |
| <b>Description</b> | Displays basic information about the service ID including service type, description, SAPs and SDPs. |
| <b>Output</b>      | <b>Show Service-ID Base</b> — The following table describes show service-id base output fields:     |

| Label            | Description                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id       | The service identifier.                                                                                                                                        |
| Vpn Id           | Specifies the VPN ID assigned to the service.                                                                                                                  |
| Service Type     | Specifies the type of service.                                                                                                                                 |
| Description      | Generic information about the service.                                                                                                                         |
| Customer Id      | The customer identifier.                                                                                                                                       |
| Last Mgmt Change | The date and time of the most recent management-initiated change to this customer.                                                                             |
| Adm              | The administrative state of the service.                                                                                                                       |
| Oper             | The operational state of the service.                                                                                                                          |
| Mtu              | The largest frame size (in octets) that the service can handle.                                                                                                |
| Def. Mesh VC Id  | This object is only valid in services that accept mesh SDP bindings. It is used to validate the VC ID portion of each mesh SDP binding defined in the service. |
| SAP Count        | The number of SAPs defined on the service.                                                                                                                     |

| Label          | Description (Continued)                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Bind Count | The number of SDPs bound to the service.                                                                                                                                 |
| Identifier     | Specifies the service access (SAP) and destination (SDP) points.                                                                                                         |
| Type           | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.                                        |
| AdmMTU         | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. |
| OprMTU         | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented.  |
| Opr            | The operating state of the SDP.                                                                                                                                          |

## endpoint

|                    |                                                                                    |
|--------------------|------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>endpoint</b> [ <i>endpoint-name</i> ]                                           |
| <b>Context</b>     | show>service>id                                                                    |
| <b>Description</b> | This command displays service endpoint information.                                |
| <b>Parameters</b>  | <i>endpoint-name</i> — Specifies the name of an existing endpoint for the service. |

## labels

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>labels</b>                                                                                       |
| <b>Context</b>     | show>service>id                                                                                     |
| <b>Description</b> | Displays the labels being used by the service.                                                      |
| <b>Output</b>      | <b>Show Service-ID Labels</b> — The following table describes show service-id labels output fields: |

| Label  | Description                                                                                        |
|--------|----------------------------------------------------------------------------------------------------|
| Svc Id | The service identifier.                                                                            |
| Sdp Id | The SDP identifier.                                                                                |
| Type   | Indicates whether the SDP is a spoke or a mesh.                                                    |
| I. Lbl | The VC label used by the far-end device to send packets to this device in this service by the SDP. |

| Label  | Description (Continued)                                                                            |
|--------|----------------------------------------------------------------------------------------------------|
| E. Lbl | The VC label used by this device to send packets to the far-end device in this service by the SDP. |

## sap

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Context</b>     | show>service>id                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | This command displays information for the SAPs associated with the service. If no optional parameters are specified, a summary of all associated SAPs is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <p><i>sap-id</i> — The ID that displays SAPs for the service. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.</p> <p><b>interface</b> <i>interface-name</i> — Displays information for the specified IP interface.</p> <p><b>ip-address</b> <i>ip-address</i> — Displays information associated with the specified IP address.</p> <p><b>detail</b> — Displays detailed information.</p> <p><b>wholesaler</b> <i>service-id</i> — The VPRN service ID of the wholesaler. When specified in this context, SAP, SDP, interface, IP address and MAC parameters are ignored.</p> <p><b>Values</b>      1 — 2147483648</p> <p><b>detail</b> — Displays detailed information for the SAP.</p> |
| <b>Output</b>      | <b>Show Service-ID SAP</b> — The following table describes show service SAP fields:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Label       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id  | The service identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SAP         | The SAP and qtag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Encap       | The encapsulation type of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Ethertype   | Specifies an Ethernet type II Ether type value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Admin State | The administrative state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Oper State  | The operating state of the SAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Flags       | Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapIpipeCeIpAddr, TodResourceUnavail, TodMssResourceUnavail, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |

| Label              | Description (Continued)                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Status Change | The time of the most recent operating status change to this SAP.                                                                                                         |
| Last Mgmt Change   | The time of the most recent management-initiated change to this SAP.                                                                                                     |
| Admin MTU          | The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.         |
| Oper MTU           | The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.          |
| Ingress qos-policy | The ingress QoS policy ID assigned to the SAP.                                                                                                                           |
| Egress qos-policy  | The egress QoS policy ID assigned to the SAP.                                                                                                                            |
| Ingress Filter-Id  | The ingress filter policy ID assigned to the SAP.                                                                                                                        |
| Egress Filter-Id   | The egress filter policy ID assigned to the SAP.                                                                                                                         |
| Acct. Pol          | The accounting policy ID assigned to the SAP.                                                                                                                            |
| Collect Stats      | Specifies whether collect stats is enabled.                                                                                                                              |
| Dropped            | The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                            |
| Off. HiPrio        | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                          |
| Off. LowPrio       | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                           |
| Off. Uncolor       | The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.                                              |
| Dro. HiPrio        | The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc. |
| Dro LowPrio        | The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.  |
| For. InProf        | The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.                                                                             |
| For. OutProf       | The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| Dro. InProf        | The number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                          |
| Dro. OutProf       | The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |

| Label               | Description (Continued)                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------|
| For. InProf         | The number of in-profile packets and octets (rate below CIR) forwarded by the egress Qchip.     |
| For. OutProf        | The number of out-of-profile packets and octets (rate above CIR) forwarded by the egress Qchip. |
| Ingress TD Profile  | The profile ID applied to the ingress SAP.                                                      |
| Egress TD Profile   | The profile ID applied to the egress SAP.                                                       |
| Alarm Cell Handling | The indication that OAM cells are being processed.                                              |
| AAL-5 Encap         | The AAL-5 encapsulation type.                                                                   |

## sdp

|                    |                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Syntax</b>      | <b>sdp</b> [ <i>sdp-id</i>   <b>far-end</b> <i>ip-addr</i> ] [ <b>detail</b> ]                                                                                                                                                                                                                                                                                   |
| <b>Context</b>     | show>service>id                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b> | Displays information for the SDPs associated with the service.<br>If no optional parameters are specified, a summary of all associated SDPs is displayed.                                                                                                                                                                                                        |
| <b>Parameters</b>  | <p><i>sdp-id</i> — Displays only information for the specified SDP ID.</p> <p><b>Default</b> All SDPs.</p> <p><b>Values</b> 1 — 17407</p> <p><b>far-end</b> <i>ip-addr</i> — Displays only SDPs matching the specified far-end IP address.</p> <p><b>Default</b> SDPs with any far-end IP address.</p> <p><b>detail</b> — Displays detailed SDP information.</p> |
| <b>Output</b>      | <b>Show Service-ID SDP</b> — The following table describes show service-id SDP output fields:                                                                                                                                                                                                                                                                    |

| Label               | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sdp Id              | The SDP identifier.                                                                                                                                                          |
| Type                | Indicates whether the SDP is a spoke or a mesh.                                                                                                                              |
| Split Horizon Group | Name of the split horizon group that the SDP belongs to.                                                                                                                     |
| VC Tag              | The explicit dot1Q value used when encapsulating to the SDP far end.                                                                                                         |
| I. Lbl              | The VC label used by the far-end device to send packets to this device in this service by the SDP.                                                                           |
| Admin Path MTU      | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case.) |

| Label               | Description (Continued)                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper Path MTU       | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.                                                                                                                      |
| Far End             | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.                                                                                                                                                                                             |
| Delivery            | Specifies the type of delivery used by the SDP: GRE or MPLS.                                                                                                                                                                                                                          |
| Admin State         | The administrative state of this SDP.                                                                                                                                                                                                                                                 |
| Oper State          | The operational state of this SDP.                                                                                                                                                                                                                                                    |
| Ingress Label       | The label used by the far-end device to send packets to this device in this service by this SDP.                                                                                                                                                                                      |
| Egress Label        | The label used by this device to send packets to the far-end device in this service by the SDP.                                                                                                                                                                                       |
| Last Changed        | The date and time of the most recent change to the SDP.                                                                                                                                                                                                                               |
| Signaling           | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                                                                                                                                    |
| Admin State         | The administrative state of the Keepalive process.                                                                                                                                                                                                                                    |
| Oper State          | The operational state of the Keepalive process.                                                                                                                                                                                                                                       |
| Hello Time          | Transmission frequency of the SDP echo request messages.                                                                                                                                                                                                                              |
| Max Drop Count      | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.                                                                                                                                       |
| Hello Msg Len       | The length of the SDP echo request messages transmitted on this SDP.                                                                                                                                                                                                                  |
| Hold Down Time      | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.                                                                                                                                                                      |
| I. Fwd. Pkts.       | Specifies the number of forwarded ingress packets.                                                                                                                                                                                                                                    |
| I. Dro. Pkts        | Specifies the number of dropped ingress packets.                                                                                                                                                                                                                                      |
| E. Fwd. Pkts.       | Specifies the number of forwarded egress packets.                                                                                                                                                                                                                                     |
| E. Fwd. Octets      | Specifies the number of forwarded egress octets.                                                                                                                                                                                                                                      |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS. |

---

## CEM Clear Commands

### id

|                    |                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                                                    |
| <b>Context</b>     | clear>service                                                                                  |
| <b>Description</b> | This command clears commands for a specific service.                                           |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.<br><b>Values</b> 1 — 2147483648 |

### statistics

|                    |                                                                                     |
|--------------------|-------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>statistics</b>                                                                   |
| <b>Context</b>     | clear>service                                                                       |
| <b>Description</b> | This command enables the context to clear statistics for a specific service entity. |

### id

|                    |                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                                                    |
| <b>Context</b>     | clear>service<br>clear>service>statistics                                                      |
| <b>Description</b> | This command clears commands for a specific service.                                           |
| <b>Parameters</b>  | <i>service-id</i> — The ID that uniquely identifies a service.<br><b>Values</b> 1 — 2147483648 |

### sap

|                    |                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sap</b> <i>sap-id</i> { <b>all</b>   <b>counters</b>   <b>stp</b> }                                                                                                                                                                                                                                                   |
| <b>Context</b>     | clear>service>statistics                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | This command clears SAP statistics for a SAP.                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <i>sap-id</i> — Specifies the physical port identifier portion of the SAP definition. See <a href="#">Common CLI Command Descriptions on page 1933</a> for command syntax.<br><b>all</b> — Clears all SAP queue statistics and STP statistics.<br><b>counters</b> — Clears all queue statistics associated with the SAP. |

**stp** — Clears all STP statistics associated with the SAP.

## sdp

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp</b> <i>sdp-id</i> <b>keep-alive</b>                           |
| <b>Context</b>     | clear>service>statistics                                             |
| <b>Description</b> | This command clears keepalive statistics associated with the SDP ID. |
| <b>Parameters</b>  | <i>sdp-id</i> — The SDP ID for which to clear keepalive statistics.  |
| <b>Values</b>      | 1 — 17407                                                            |

# Common CLI Command Descriptions

---

## In This Chapter

This section provides information about common Command Line Interface (CLI) syntax and command usage.

Topics in this chapter include:

- [SAP syntax on page 1934](#)

## Common Service Commands

### sap

**Syntax** [no] **sap** *sap-id*

**Description** This command specifies the physical port identifier portion of the SAP definition.

**Parameters** *sap-id* — Specifies the physical port identifier portion of the SAP definition.

The *sap-id* can be configured in one of the following formats:

| Type        | Syntax                                                                       | Example                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port-id     | <i>slot/mda/port[.channel]</i>                                               | 1/1/5                                                                                                                                                                                                          |

*bundle-id* — Specifies the multilink bundle to be associated with this IP interface. The **bundle** keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

*bundle-id:* **bundle-type-slot-id/mda-slot.bundle-num**  
*bundle-id* value range: 1 — 336

For example:

```
*A:ALA-12>config# port bundle-ppp-5/1.1
*A:ALA-12>config>port# multilink-bundle
```

*bpgrp-id* — Specifies the bundle protection group ID to be associated with this IP interface. The **bpgrp** keyword must be entered at the beginning of the parameter.

The command syntax must be configured as follows:

```
bpgrp-id: bpgrp-type-bpgrp-num
type: ima
bpgrp-num value range: 1 — 2000
```

For example:

```
*A:ALA-12>config# port bpgrp-ima-1
*A:ALA-12>config>service>vpls$ sap bpgrp-ima-1
```

*qtag1*, *qtag2* — Specifies the encapsulation value used to identify the SAP on the port or sub-port. If this parameter is not specifically defined, the default value is 0.

**Values**      qtag1:            \* | 0 — 4094  
                 qtag2 :        \* | 0 — 4094

The values depends on the encapsulation type configured for the interface. The following table describes the allowed values for the port and encapsulation types.

| Port Type        | Encap-Type  | Allowed Values                                                 | Comments                                                                                                                                    |
|------------------|-------------|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet         | Null        | 0                                                              | The SAP is identified by the port.                                                                                                          |
| Ethernet         | Dot1q       | 0 — 4094                                                       | The SAP is identified by the 802.1Q tag on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.             |
| Ethernet         | QinQ        | qtag1: 0 — 4094<br>qtag2: 0 — 4094                             | The SAP is identified by two 802.1Q tags on the port. Note that a 0 qtag1 value also accepts untagged packets on the Dot1q port.            |
| SONET/SDH        | IPCP        | -                                                              | The SAP is identified by the channel. No BCP is deployed and all traffic is IP.                                                             |
| SONET/SDH<br>TDM | BCP-Null    | 0                                                              | The SAP is identified with a single service on the channel. Tags are assumed to be part of the customer packet and not a service delimiter. |
| SONET/SDH<br>TDM | BCP-Dot1q   | 0 — 4094                                                       | The SAP is identified by the 802.1Q tag on the channel.                                                                                     |
| SONET/SDH<br>TDM | Frame Relay | 16 — 991                                                       | The SAP is identified by the data link connection identifier (DLCI).                                                                        |
| SONET/SDH<br>ATM | ATM         | vpi (NNI) 0 — 4095<br>vpi (UNI) 0 — 255<br>vci 1, 2, 5 — 65535 | The SAP is identified by port or by PVPC or PVCC identifier (vpi, vpi/vci, or vpi range)                                                    |

**sap ipsec-*id*.private|public:*tag*** — This parameter associates an IPsec group SAP with this interface. This is the public side for an IPsec tunnel. Tunnels referencing this IPsec group in the private side may be created if their local IP is in the subnet of the interface subnet and the routing context specified matches with the one of the interface.

This context will provide a SAP to the tunnel. The operator may associate an ingress and egress QoS policies as well as filters and virtual scheduling contexts. Internally this creates an Ethernet SAP that will be used to send and receive encrypted traffic to and from the MDA. Multiple tunnels can be associated with this SAP. The “tag” will be a dot1q value. The operator may see it as an identifier. The range is limited to 1 — 4095.

## Protocol Support

### OSPF

RFC 1765 OSPF Database Overflow  
RFC 2328 OSPF Version 2  
RFC 2370 Opaque LSA Support  
RFC 2740 OSPF for IPv6 (OSPFv3)  
draft-ietf-ospf-ospfv3-update-14.txt  
RFC 3101 OSPF NSSA Option  
RFC 3137 OSPF Stub Router Advertisement  
RFC 3623 Graceful OSPF Restart — GR helper

RFC 3630 Traffic Engineering (TE) Extensions to OSPF Version 2  
RFC 4203 for Shared Risk Link Group (SRLG) sub-TLV

### BGP

RFC 1397 BGP Default Route Advertisement  
RFC 1772 Application of BGP in the Internet  
RFC 1965 Confederations for BGP  
RFC 1997 BGP Communities Attribute  
RFC 2385 Protection of BGP Sessions via MD5  
RFC 2439 BGP Route Flap Dampening  
RFC 2547bis BGP/MPLS VPNs  
RFC 2918 Route Refresh Capability for BGP-4  
RFC 3107 Carrying Label Information in BGP-4  
RFC 3392 Capabilities Advertisement with BGP4  
RFC 4271 BGP-4 (previously RFC 1771)  
RFC 4360 BGP Extended Communities Attribute  
RFC 4364 BGP/MPLS IP Virtual Private Networks (VPNs) (previously RFC 2547bis BGP/MPLS VPNs)  
RFC 4456 BGP Route Reflection: Alternative to Full-mesh IBGP (previously RFC 1966 & 2796)  
RFC 4724 Graceful Restart Mechanism for BGP — GR helper  
RFC 4760 Multi-protocol Extensions for BGP  
RFC 4893 BGP Support for Four-octet AS Number Space  
RFC 5065 Confederations for BGP (obsoletes 3065)

### IS-IS

RFC 1142 OSI IS-IS Intra-domain Routing Protocol (ISO 10589)  
RFC 1195 Use of OSI IS-IS for routing in TCP/IP & dual environments  
RFC 2763 Dynamic Hostname Exchange for IS-IS

RFC 2966 Domain-wide Prefix Distribution with Two-Level IS-IS  
RFC 2973 IS-IS Mesh Groups  
RFC 3373 Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies  
RFC 3567 Intermediate System to Intermediate System (ISIS) Cryptographic Authentication  
RFC 3719 Recommendations for Interoperable Networks using IS-IS  
RFC 3784 Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)  
RFC 3787 Recommendations for Interoperable IP Networks  
RFC 3847 Restart Signaling for IS-IS — GR helper  
RFC 4205 for Shared Risk Link Group (SRLG) TLV  
draft-ietf-isis-igp-p2p-over-lan-05.txt

### LDP

RFC 3036 LDP Specification  
RFC 3037 LDP Applicability  
RFC 3478 Graceful Restart Mechanism for LDP — GR helper  
RFC 5283 LDP extension for Inter-Area LSP  
draft-jork-ldp-igp-sync-03

### IPSec

RFC 2401 Security Architecture for the Internet Protocol  
RFC 2409 The Internet Key Exchange (IKE)  
RFC 3706 IKE Dead Peer Detection  
RFC 3947 Negotiation of NAT-Traversal in the IKE
