

Configuring Logging with CLI

This section provides information to configure logging using the command line interface.

Topics in this section include:

- [Log Configuration Overview on page 356](#)
 - [Log Types on page 356](#)
- [Basic Event Log Configuration on page 357](#)
- [Common Configuration Tasks on page 358](#)
- [Log Management Tasks on page 376](#)

Log Configuration Overview

Configure logging parameters to save information in a log file or direct the messages to other devices. Logging does the following:

- Provides you with logging information for monitoring and troubleshooting.
 - Allows you to select the types of logging information to be recorded.
 - Allows you to assign a severity to the log messages.
 - Allows you to select the source and target of logging information.
-

Log Types

Logs can be configured in the following contexts:

- Log file — Log files can contain log event message streams or accounting/billing information. Log file IDs are used to direct events, alarms/traps and debug information to their respective targets.
- SNMP trap groups — SNMP trap groups contain an IP address and community names which identify targets to send traps following specified events.
- Syslog — Information can be sent to a syslog host that is capable of receiving selected syslog messages from a network element.
- Event control — Configures a particular event or all events associated with an application to be generated or suppressed.
- Event filters — An event filter defines whether to forward or drop an event or trap based on match criteria.
- Accounting policies — An accounting policy defines the accounting records that will be created. Accounting policies can be applied to one or more service access points (SAPs).
- Event logs — An event log defines the types of events to be delivered to its associated destination.
- Event throttling rate — Defines the rate of throttling events.

Basic Event Log Configuration

The most basic log configuration must have the following:

- Log ID or accounting policy ID
- A log source
- A log destination

The following displays a log configuration example.

```
A:ALA-12>config>log# info
#-----
echo "Log Configuration "
#-----
    event-control "bgp" 2001 generate critical
    file-id 1
        description "This is a test file-id."
        location cfl:
    exit
    file-id 2
        description "This is a test log."
        location cfl:
    exit
    snmp-trap-group 7
        trap-target 11.22.33.44 "snmpv2c" notify-community "public"
    exit
    log-id 2
        from main
        to file 2
    exit
-----
A:ALA-12>config>log#
```

Common Configuration Tasks

The following sections are basic system tasks that must be performed.

- [Configuring a File ID on page 360](#)
 - [Configuring an Event Log on page 358](#)
 - [Configuring an Accounting Policy on page 361](#)
 - [Configuring Event Control on page 362](#)
 - [Configuring a Log Filter on page 364](#)
 - [Configuring an SNMP Trap Group on page 365](#)
 - [Configuring a Syslog Target on page 373](#)
-

Configuring an Event Log

An event log file contains information used to direct events, alarms, traps, and debug information to their respective destinations. One or more event sources can be specified. File IDs, SNMP trap groups, or syslog IDs must be configured before they can be applied to an event log ID.

Use the following CLI syntax to configure a log file:

```
CLI Syntax: config>log
                log-id log-id
                description description-string
                filter filter-id
                from {[main] [security] [change] [debug-trace]}
                to console
                to file file-id
                to memory [size]
                to session
                to snmp [size]
                to syslog syslog-id}
                time-format {local|utc}
                no shutdown
```

The following displays a log file configuration example:

```
ALA-12>config>log>log-id# info
-----
...
  log-id 2
    description "This is a test log file."
    filter 1
    from main security
    to file 1
  exit
...
-----
ALA-12>config>log>log-id#
```

Configuring a File ID

To create a log file a file ID is defined, specifies the target CF drive, and the rollover and retention interval period for the file. The rollover interval is defined in minutes and determines how long a file will be used before it is closed and a new log file is created. The retention interval determines how long the file will be stored on the CF before it is deleted.

Use the following CLI syntax to configure a log file:

CLI Syntax:

```
config>log
      file-id log-file-id
            description description-string
            location cflash-id [backup-cflash-id]
            rollover minutes [retention hours]
```

The following displays a log file configuration example:

```
A:ALA-12>config>log# info
-----
      file-id 1
            description "This is a log file."
            location cfl:
            rollover 600 retention 24
      exit
-----
A:ALA-12>config>log#
```

Configuring an Accounting Policy

Before an accounting policy can be created a target log file must be created to collect the accounting records. The files are stored in system memory of compact flash (cf1: or cf2:) in a compressed (tar) XML format and can be retrieved using FTP or SCP. See [Configuring an Event Log on page 358](#) and [Configuring a File ID on page 360](#).

Accounting policies must be configured in the **config>log** context before they can be applied to a service SAP or service interface, or applied to a network port.

The default accounting policy statement cannot be applied to LDP nor RSVP statistics collection records.

An accounting policy must define a record type and collection interval. Only one record type can be configured per accounting policy.

When creating accounting policies, one service accounting policy and one network accounting policy can be defined as default. If statistics collection is enabled on a SAP or network port and no accounting policy is applied, then the respective default policy is used. If no default policy is defined, then no statistics are collected unless a specifically defined accounting policy is applied.

Use the following CLI syntax to configure an accounting policy:

```
CLI Syntax: config>log
                accounting-policy acct-policy-id interval minutes
                description description-string
                default
                record record-name
                to file log-file-id
                no shutdown
```

The following displays a accounting policy configuration example:

```
A:ALA-12>config>log# info
-----
  accounting-policy 4
    description "This is the default accounting policy."
    record complete-service-ingress-egress
    default
    to file 1
  exit
  accounting-policy 5
    description "This is a test accounting policy."
    record service-ingress-packets
    to file 3
  exit
-----
A:ALA-12>config>log#
```

Configuring Event Control

Use the following CLI syntax to configure event control. Note that the **throttle** parameter used in the **event-control** command syntax enables throttling for a specific event type. The **config>log>throttle-rate** command configures the number of events and interval length to be applied to all event types that have throttling enabled by this **event-control** command.

CLI Syntax:

```
config>log
    event-control application-id [event-name|event-number] generate
        [severity-level] [throttle]
    event-control application-id [event-name|event-number] suppress
    throttle-rate events [interval seconds]
```

The following displays an event control configuration:

```
A:ALA-12>config>log# info
#-----
echo "Log Configuration"
#-----
    throttle-rate 500 interval 10
    event-control "oam" 2001 generate throttle
    event-control "ospf" 2001 suppress
    event-control "ospf" 2003 generate cleared
    event-control "ospf" 2014 generate critical
..
#-----
A:ALA-12>config>log>filter#
```

Configuring Throttle Rate

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command.

Use the following CLI syntax to configure the throttle rate.

CLI Syntax: `config>log#
throttle-rate events [interval seconds]`

The following displays a throttle rate configuration example:

```
*A:gal171>config>log# info
-----
      throttle-rate 500 interval 10
      event-control "bgp" 2001 generate throttle
-----
*A:gal171>config>log#
```

Configuring a Log Filter

Use the following CLI syntax to configure a log filter:

```
CLI Syntax: config>log
                filter filter-id
                  default-action {drop|forward}
                  description description-string
                  entry entry-id
                    action {drop|forward}
                    description description-string
                    match
                      application {eq|neq} application-id
                      number {eq|neq|lt|lte|gt|gte} event-id
                      router {eq|neq} router-instance [regex]
                      severity {eq|neq|lt|lte|gt|gte} severity-level
                      subject {eq|neq} subject [regex]
```

The following displays a log filter configuration example:

```
A:ALA-12>config>log# info
#-----
echo "Log Configuration "
#-----
    file-id 1
      description "This is our log file."
      location cfl:
      rollover 600 retention 24
    exit
  filter 1
    default-action drop
    description "This is a sample filter."
    entry 1
      action forward
      match
        application eq "mirror"
        severity eq critical
      exit
    exit
  exit
...
  log-id 2
    shutdown
    description "This is a test log file."
    filter 1
      from main security
      to file 1
    exit
...
#-----
A:ALA-12>config>log#
```

Configuring an SNMP Trap Group

The associated *log-id* does not have to be configured before a **snmp-trap-group** can be created, however, the **snmp-trap-group** must exist before the *log-id* can be configured to use it.

Use the following CLI syntax to configure an SNMP trap group:

CLI Syntax: `config>log`
 `snmp-trap-group log-id`
 `trap-target name [address ip-address] [port port]`
 `[snmpv1|snmpv2c| snmpv3] notify-community communi-`
 `tyName |snmpv3SecurityName [security-level {no-`
 `auth-no-privacy|auth-no-privacy|privacy}] [replay]`

The following displays a basic SNMP trap group configuration example:

```
A:ALA-12>config>log# info
-----
...
snmp-trap-group 2
  trap-target 10.10.10.104:5 "snmpv3" notify-community "coummunitystring"
  exit
...
log-id 2
  description "This is a test log file."
  filter 1
  from main security
  to file 1
  exit
...
-----
A:ALA-12>config>log#
```

The following displays a SNMP trap group, log, and interface configuration examples:

```
A:SetupCLI>config>log# snmp-trap-group 44
A:SetupCLI>config>log>snmp-trap-group# info
-----
      trap-target "xyz-test" address xx.xx.x.x snmpv2c notify-community "xyztesting"
      trap-target "test2" address xx.xx.xx.x snmpv2c notify-community "xyztesting"
-----
*A:SetupCLI>config>log>log-id# info
-----
      from main
      to snmp
-----
*A:SetupCLI>config>router# interface xyz-test
*A:SetupCLI>config>router>if# info
-----
      address xx.xx.xx.x/24
      port 1/1/1
-----
*A:SetupCLI>config>router>if#
```

Setting the Replay Parameter

For this example the replay parameter was set by a SNMP SET request for the trap-target address 10.10.10.3 which is bound to port-id 1/1/1.

```
A:SetupCLI>config>log>snmp-trap-group 44
A:SetupCLI>config>log>snmp-trap-group# info
-----
      trap-target "xyz-test" address 10.10.10.3 snmpv2c notify-community "xyztesting"
replay
      trap-target "test2" address 20.20.20.5 snmpv2c notify-community "xyztesting"
-----
A:SetupCLI>config>log>snmp-trap-group#
```

In the following output, note that the **Replay** field changed from disabled to enabled.

```
A:SetupCLI>config>log>snmp-trap-group# show log snmp-trap-group 44

```

Shutdown In-Band Port

A **shutdown** on the in-band port that the trap-target address is bound to causes the route to that particular trap target to be removed from the route table. When the SNMP module is notified of this event, it marks the trap-target as inaccessible and saves the sequence-id of the first SNMP notification that will be missed by the trap-target.

Example:

```
config>log>snmp-trap-group# exit all
#configure port 1/1/1 shutdown
#
# tools perform log test-event
#
```

The **Replay from** field is updated with the sequence-id of the first event that will be replayed when the trap-target address is added back to the route table.

```
*A:SetupCLI# show log snmp-trap-group 44
=====
SNMP Trap Group 44

3823 2008/04/22 23:41:49.82 UTC WARNING: SNMP #2005 Base xyz-test
"Interface xyz-test is operational"
```

No Shutdown Port

A **no shutdown** command executed on the in-band port to which the trap-target address is bound will cause the route to that trap target to be re-added to the route table. When the SNMP trap module is notified of this event, it resends the notifications that were missed while there was no route to the trap-target address.

```
Example:    configure# port 1/1/1 no shutdown
              #
              # tools perform log test-event
```

After the notifications have been replayed the **Replay from** field indicates n/a because there are no more notifications waiting to be replayed and the **Last replay** field timestamp has been updated.

```

Configuring a Syslog Target

Log events cannot be sent to a syslog target host until a valid syslog ID exists.

Use the following CLI syntax to configure a syslog file:

```
CLI Syntax: config>log
                syslog syslog-id
                   description description-string
                   address ip-address
                   log-prefix log-prefix-string
                   port port
                   level {emergency|alert|critical|error|warning|notice|info|debug}
                   facility syslog-facility
```

The following displays a syslog configuration example:

```
A:ALA-12>config>log# info
-----
...
    syslog 1
      description "This is a syslog file."
      address 10.10.10.104
      facility user
      level warning
    exit
...
-----
A:ALA-12>config>log#
```

Configuring an Accounting Custom Record

```
A:ALA-48>config>subscr-mgmt>acct-plcy# info

Modifying a Log File

Use the following CLI syntax to modify a log file:

CLI Syntax: config>log
 log-id log-id
 description description-string
 filter filter-id
 from {[main] [security] [change] [debug-trace]}
 to console
 to file file-id
 to memory [size]
 to session
 to snmp [size]
 to syslog syslog-id}

The following displays the current log configuration:

```
ALA-12>config>log>log-id# info
-----
...
  log-id 2
    description "This is a test log file."
    filter 1
    from main security
    to file 1
  exit
...
-----
ALA-12>config>log>log-id#
```

The following displays an example to modify log file parameters:

Example: config# log
 config>log# log-id 2
 config>log>log-id# description "Chassis log file."
 config>log>log-id# filter 2
 config>log>log-id# from security
 config>log>log-id# exit

Log Management Tasks

The following displays the modified log file configuration:

```
A:ALA-12>config>log# info
-----
...
  log-id 2
    description "Chassis log file."
    filter 2
    from security
    to file 1
  exit
...
-----
A:ALA-12>config>log#
```

Deleting a Log File

The log ID must be shutdown first before it can be deleted. In a previous example, **file 1** is associated with **log-id 2**.

```
A:ALA-12>config>log# info
-----
    file-id 1
        description "LocationTest."
        location cfl:
        rollover 600 retention 24
    exit
...
    log-id 2
        description "Chassis log file."
        filter 2
        from security
        to file 1
    exit
...
-----
A:ALA-12>config>log#
```

Use the following CLI syntax to delete a log file:

```
CLI Syntax: config>log
                no log-id log-id
                shutdown
```

The following displays an example to delete a log file:

```
Example: config# log
            config>log# log-id 2
            config>log>log-id# shutdown
            config>log>log-id# exit
            config>log# no log-id 2
```

Modifying a File ID

NOTE: When the **file-id** location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear>log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log not cleared, the old location remains in effect.

Use the following CLI syntax to modify a log file:

CLI Syntax:

```
config>log
    file-id log-file-id
        description description-string
        location [cflash-id] [backup-cflash-id]
        rollover minutes [retention hours]
```

The following displays the current log configuration:

```
A:ALA-12>config>log# info
-----
    file-id 1
      description "This is a log file."
      location cf1:
      rollover 600 retention 24
    exit
-----
A:ALA-12>config>log#
```

The following displays an example to modify log file parameters:

Example:

```
config# log
config>log# file-id 1
config>log>file-id# description "LocationTest."
config>log>file-id# location cf2:
config>log>file-id# rollover 2880 retention 500
config>log>file-id# exit
```

The following displays the file modifications:

```
A:ALA-12>config>log# info
-----
...
    file-id 1
      description "LocationTest."
      location cf2:
      rollover 2880 retention 500
    exit
...
-----
A:ALA-12>config>log#
```

Deleting a File ID

NOTE: All references to the file ID must be deleted before the file ID can be removed.

Use the following CLI syntax to delete a log ID:

CLI Syntax: `config>log
no file-id log-file-id`

The following displays an example to delete a file ID:

Example: `config>log# no file-id 1`

Modifying a Syslog ID

NOTE: All references to the syslog ID must be deleted before the syslog ID can be removed.

Use the following CLI syntax to modify a syslog ID parameters:

CLI Syntax:

```
config>log
  syslog syslog-id
    description description-string
    address ip-address
    log-prefix log-prefix-string
    port port
    level {emergency|alert|critical|error|warning|notice|info|debug}
    facility syslog-facility
```

The following displays an example of the syslog ID modifications:

Example:

```
config# log
config>log# syslog 1
config>log>syslog$ description "Test syslog."
config>log>syslog# address 10.10.0.91
config>log>syslog# facility mail
config>log>syslog# level info
```

The following displays the syslog configuration:

```
A:ALA-12>config>log# info
-----
...
  syslog 1
    description "Test syslog."
    address 10.10.10.91
    facility mail
    level info
  exit
...
-----
A:ALA-12>config>log#
```

Deleting a Syslog

Use the following CLI syntax to delete a syslog file:

CLI Syntax: `config>log`
`no syslog syslog-id`

The following displays an example to delete a syslog ID:

Example: `config# log`
`config>log# no syslog 1`

Modifying an SNMP Trap Group

Use the following CLI syntax to modify an SNMP trap group:

CLI Syntax: config>log
 snmp-trap-group log-id
 trap-target name [address ip-address] [port port]
 [snmpv1|snmpv2c| snmpv3] notify-community communi-
 tyName |snmpv3SecurityName [security-level {no-
 auth-no-privacy|auth-no-privacy|privacy}]

The following displays the current SNMP trap group configuration:

```
A:ALA-12>config>log# info
-----
...
    snmp-trap-group 10
        trap-target 10.10.10.104:5 "snmpv3" notify-community "coummunitystring"
        exit
...
-----
A:ALA-12>config>log#
```

The following displays an example of the command usage to modify an SNMP trap group:

Example: config# log
 config>log# snmp-trap-group 10
 config>log>snmp-trap-group# no trap-target 10.10.10.104:5
 config>log>snmp-trap-group# snmp-trap-group# trap-target
 10.10.0.91:1 snmpv2c notify-community "com1"

The following displays the SNMP trap group configuration:

```
A:ALA-12>config>log# info
-----
...
    snmp-trap-group 10
        trap-target 10.10.0.91:1 "snmpv2c" notify-community "com1"
        exit
...
-----
A:ALA-12>config>log#
```

Deleting an SNMP Trap Group

Use the following CLI syntax to delete a trap target and SNMP trap group:

CLI Syntax: config>log
no snmp-trap-group *log-id*
no trap-target *name*

The following displays the SNMP trap group configuration:

```
A:ALA-12>config>log# info
-----
...
    snmp-trap-group 10
        trap-target 10.10.0.91:1 "snmpv2c" notify-community "com1"
    exit
...
-----
A:ALA-12>config>log#
```

The following displays an example to delete a trap target and an SNMP trap group.

Example: config>log# snmp-trap-group 10
config>log>snmp-trap-group# no trap-target 10.10.0.91:1
config>log>snmp-trap-group# exit
config>log# no snmp-trap-group 10

Modifying a Log Filter

Use the following CLI syntax to modify a log filter:

```
CLI Syntax: config>log
                filter filter-id
                  default-action {drop|forward}
                  description description-string
                  entry entry-id
                    action {drop|forward}
                    description description-string
                    match
                      application {eq|neq} application-id
                      number {eq|neq|lt|lte|gt|gte} event-id
                      router {eq|neq} router-instance [regex]
                      severity {eq|neq|lt|lte|gt|gte} severity-level
                      subject {eq|neq} subject [regex]
```

The following output displays the current log filter configuration:

```
ALA-12>config>log# info
#-----
echo "Log Configuration "
#-----
...
    filter 1
      default-action drop
      description "This is a sample filter."
      entry 1
        action forward
        match
          application eq "mirror"
          severity eq critical
        exit
      exit
    exit
  ...
#-----
ALA-12>config>log#
```

The following displays an example of the log filter modifications:

```
Example: config# log
config>log# filter 1
config>log>filter# description "This allows <n>."
config>log>filter# default-action forward
config>log>filter# entry 1
config>log>filter>entry$ action drop
config>log>filter>entry# match
config>log>filter>entry>match# application eq user
```

```
config>log>filter>entry>match# number eq 2001
config>log>filter>entry>match# no severity
config>log>filter>entry>match# exit
```

The following displays the log filter configuration:

```
A:ALA-12>config>log>filter# info
-----
...
  filter 1
    description "This allows <n>."
    entry 1
      action drop
      match
        application eq "user"
        number eq 2001
      exit
    exit
  exit
...
-----
A:ALA-12>config>log>filter#
```

Deleting a Log Filter

Use the following CLI syntax to delete a log filter:

CLI Syntax: `config>log
no filter filter-id`

The following output displays the current log filter configuration:

```
A:ALA-12>config>log>filter# info
-----
...
    filter 1
      description "This allows <n>."
      entry 1
        action drop
        match
          application eq "user"
          number eq 2001
        exit
      exit
    exit
  ...
-----
A:ALA-12>config>log>filter#
```

The following displays an example of the command usage to delete a log filter:

Example: `config>log# no filter 1`

Modifying Event Control Parameters

Use the following CLI syntax to modify event control parameters:

CLI Syntax: `config>log`
 `event-control application-id [event-name|event-number] generate[severity-level] [throttle]`
 `event-control application-id [event-name|event-number] suppress`

The following displays the current event control configuration:

```
A:ALA-12>config>log# info
-----
...
    event-control "bgp" 2014 generate critical
...
-----
A:ALA-12>config>log#
```

The following displays an example of an event control modifications:

Example: `config# log`
 `config>log# event-control bgp 2014 suppress`

The following displays the log filter configuration:

```
A:ALA-12>config>log# info
-----
...
    event-control "bgp" 2014 suppress
...
-----
A:ALA-12>config>log#
```

Returning to the Default Event Control Configuration

The **no** form of the **event-control** command returns modified values back to the default values.

Use the following CLI syntax to modify event control parameters:

CLI Syntax: `config>log`
`no event-control application [event-name |event-number]`

The following displays an example of the command usage to return to the default values:

Example: `config# log`
`config>log# no event-control "bgp" 2001`
`config>log# no event-control "bgp" 2002`
`config>log# no event-control "bgp" 2014`

```
A:ALA-12>config>log# info detail
-----
#-----
echo "Log Configuration"
#-----
event-control "bgp" 2001 generate minor
event-control "bgp" 2002 generate warning
event-control "bgp" 2003 generate warning
event-control "bgp" 2004 generate critical
event-control "bgp" 2005 generate warning
event-control "bgp" 2006 generate warning
event-control "bgp" 2007 generate warning
event-control "bgp" 2008 generate warning
event-control "bgp" 2009 generate warning
event-control "bgp" 2010 generate warning
event-control "bgp" 2011 generate warning
event-control "bgp" 2012 generate warning
event-control "bgp" 2013 generate warning
event-control "bgp" 2014 generate warning
event-control "bgp" 2015 generate critical
event-control "bgp" 2016 generate warning
...
-----
A:ALA-12>config>log#
```
