7705 Service Aggregation Router Gen 2

Release 25.3.R2

Classic CLI Command Reference Guide

3HE 21565 AAAA TQZZA 01
Edition: 01
April 2025

Nokia is committed to diversity and inclusion. We are continuously reviewing our customer documentation and consulting with standards bodies to ensure that terminology is inclusive and aligned with the industry. Our future customer documentation will be updated accordingly.

1 Getting started

This guide contains command descriptions for the classic SR OS CLI commands that are used to manage the SR OS.

See the *7250 IXR, 7450 ESS, 7705 SAR Gen 2, 7750 SR, 7950 XRS, and VSR Acronyms Reference Guide* for expansions of acronyms used in this guide.

In this guide, the term CLI refers to the classic CLI unless otherwise specified.

This guide does not include **clear**, **monitor**, **show**, or **tools** commands. These commands are documented in the *7705 SAR Gen 2 Clear, Monitor, Show, Tools CLI Command Reference Guide*.

Note: This guide generically covers Release 25.*x*.R*x* content and may contain some content that will be released in later maintenance loads. See the *SR OS R25.x.Rx Software Release Notes*, part number 3HE 21562 000*x* TQZZA, for information about features supported in each load of the Release 25.*x*.R*x* software. For a list of features and CLI commands that are present in SR OS but not supported on the 7705 SAR Gen 2 platforms, see "SR OS Features not Supported on SAR Gen 2" in the *SR OS R25.x.Rx Software Release Notes*.

The full set of CLI commands supported by the SR OS is documented in three related guides that are listed in the following table.

Table 1: Documentation for SR OS CLI commands

Guide title	Classic CLI commands	MD-CLI commands
7705 SAR Gen 2 Clear, Monitor, Show, Tools CLI Command Reference Guide	All **clear**, **monitor**, **show**, and **tools** commands	All **clear**, **monitor**, **show**, and **tools** commands
7705 SAR Gen 2 Classic CLI Command Reference Guide	All other commands	—
7705 SAR Gen 2 MD-CLI Command Reference Guide	—	All other commands

1.1 Platforms and terminology

Note:
Unless explicitly noted otherwise, this guide uses the terminology defined in the following table to collectively designate the specified platforms.

Table 2: Platforms and terminology

Platform	Collective platform designation
7705 SAR-1	7705 SAR Gen 2

1.2 Command tree

The SR OS CLI command tree is a hierarchical inverted tree. The highest level is the root level. Below this level are other tree levels with the major command groups; for example, **configuration** commands and **admin** commands are levels below root.

In the tree, you can click a command to link directly to the command description.

Note: Commands that are listed in the tree but are not linked to an associated description are available on one or more platforms but are not currently described in the guide.

1.3 Command descriptions

Command descriptions are listed in alphabetical order by command name.

The following figure shows an example of a command description.

Figure 1: Command description example

aa-sub-study

Syntax	as-sub-study *study-type*
Context	[Tree] (config>app-assure>group>statistics aa-sub-study)
Full Context	configure application-assurance group statistics aa-sub-study
Description	This command enables the context to configure accounting and statistics collection parameters per application assurance special study subscribers.
Parameters	*study-type* — Specifies special study protocol subscriber stats.
Values	application, protocol

sw3044

The following table describes the fields that may be shown for a command. Not all fields are applicable for all commands.

Table 3: Command description fields

Field	Description
Command Name	Name of the command
Syntax	Command syntax required to execute the command. See Table 4: Command syntax symbols for information about syntax symbols.
Context	Path to the command as it is displayed in the CLI prompt. Clicking on [Tree] links to the command in the CLI tree.
Full Context	Complete contextual path to perform the command
Description	Description of the command functionality and any restrictions

Field	Description
Default	Command default value
Parameters	Descriptions of command parameters
Values	Values allowed for the parameter
Default	Parameter default value
Platforms	Hardware platforms on which the command is available. See Platforms and terminology for more information about the platforms. **Note**: Some SR OS features are platform-specific and therefore may not be available or visible on all platforms. See the *SR OS R25.x.Rx Software Release Notes*, part number 3HE 21562 000*x* TQZZA, for information about platform support.

Note: All options for enumerated types and numerical ranges are listed in the command descriptions; however, not all options or ranges are valid on all platforms.

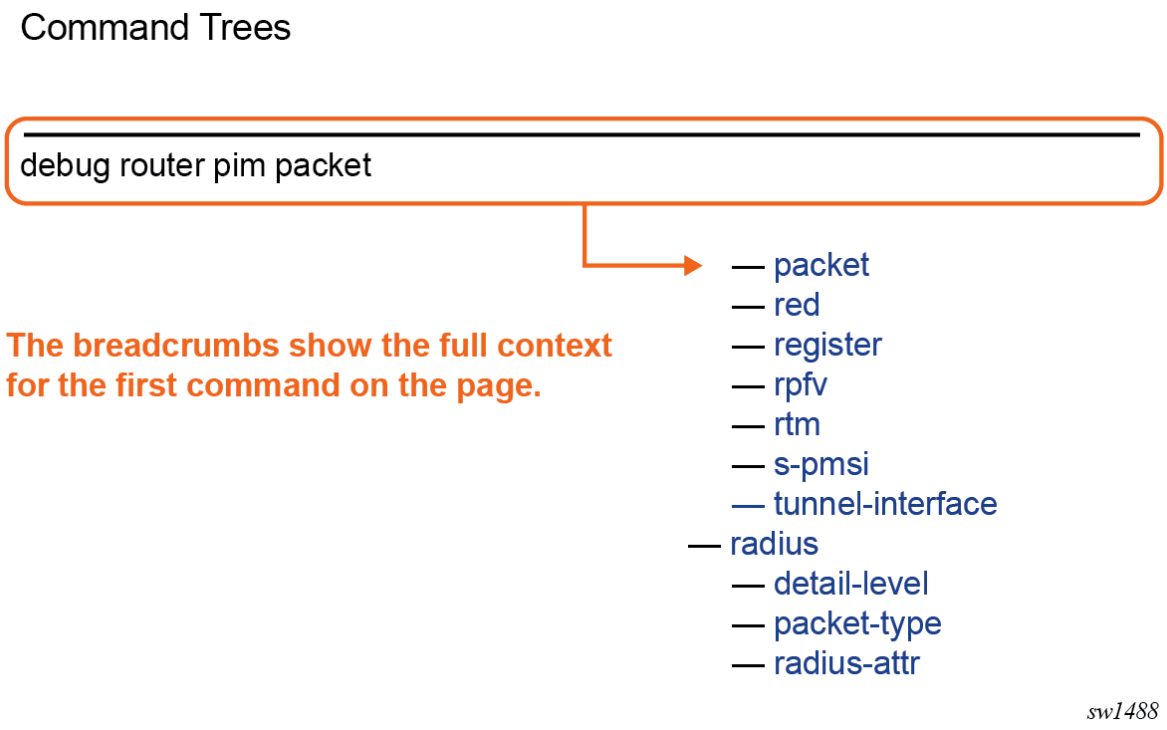
1.4 Navigational aids

The following aids help you navigate the guide and find specific commands.

1.4.1 Context path

In the CLI tree section, the complete contextual path to the first command on the page is displayed at the top of the page, as shown in the following figure.

Figure 2: Command tree navigation



1.4.2 Searching

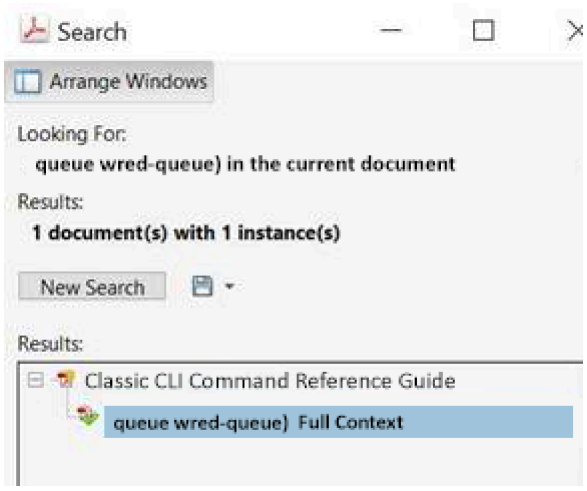
The Context field in each command description shows, in parentheses, the full path to the command as displayed in the CLI prompt. This form of the contextual path often abbreviates terms. For example:

(cfg>qos>qgrps>egr>qgrp>queue wred-queue)

To search this guide for a specific command using the Acrobat search function, enter the command name and append a closing parenthesis in the search window. For more efficient searching, add the previous level of the contextual path before the command name.

If you add the context and closing parenthesis, the resulting search returns only matching Context entries. It will not return instances of the same command found elsewhere in the guide. The following figure shows an example of a search.

Figure 3: Search window



2 Classic CLI overview

In this chapter, "CLI" refers to the classic CLI unless otherwise specified.

2.1 CLI structure

The SR OS CLI is a command-driven interface accessible through the console, Telnet, or secure shell (SSH). The CLI can be used for the configuration and management of routers.

The SR OS CLI command tree is a hierarchical inverted tree. The operational root level is the highest level of this tree. When the user enters a CLI session, the user is in the operational root context. Below this level are other tree levels for the major command groups; for example, **configure** commands and **show** commands are levels below the operational root level.

The CLI is organized so that related commands with the same scope are at the same level or in the same context. Sublevels or subcontexts have related commands with a more refined scope.

Note: The CLI engine used to execute scripts is the primary CLI engine configured with **config**>**system**>**management-interface**>**cli**>**cli-engine** {[**classic-cli**] [**md-cli**]}.

2.2 Navigating in the CLI

The following table describes command syntax symbols used in this guide.

Table 4: Command syntax symbols

Symbol	Description
|	A vertical line indicates that only one of the parameters within the brackets or braces can be selected.
[ ]	Brackets indicate optional parameters.
{ }	Braces indicate that one of the parameters must be selected.
[{ }]	Braces within square brackets indicate that the parameters are optional, but if one is selected, the information within the braces is required.
Bold	**Bold** indicates commands and keywords.
Italic	*Italics* indicates that you must enter text for the parameter.

2.2.1 CLI contexts

Use the CLI to access, configure, and manage Nokia routers. CLI commands are entered at the command line prompt. Access to specific CLI commands is controlled by the permissions set by your system administrator. Entering a CLI command makes navigation possible from one command context (or level) to another.

When the user enters a CLI session, the user is in the operational root context. Navigate to another level by entering the name of successively lower contexts. For example, at the command prompt (#), enter **configure** or **config**. See Command completion for alternative syntax for the same command. The active context displays in the command prompt.

```
A:node-2# config
A:node-2>config#
```

In a CLI context, enter commands at that context level by entering the text. Press <Enter> to move to a lower context. The user can also include commands from lower context at one context level as long as the command and parameter syntax is correct.

The following example shows two methods to navigate to a service SDP ingress level.

Method 1:

```
A:node-2# configure service epipe 6 spoke-sdp 2:6 ingress
*A:node-2>config>service>epipe>spoke-sdp>ingress#
```

Method 2:

```
A:node-2>config# service
A:node-2>config>service# epipe 6
*A:node-2>config>service>epipe# spoke-sdp 2:6
*A:node-2>config>service>epipe>spoke-sdp# ingress
*A:node-2>config>service>epipe>spoke-sdp>ingress#
```

The CLI returns an error message if the syntax is incorrect. For example, if the user enters **rooter** for the **root** command, it would result in an error.

```
*A:node-2>config# rooter
Error: Bad command.
```

The command parameter is the means by which a value is passed to the command processing program. The user must enter the value according to the syntax rules and, where applicable, the defined range. In the previous example, "6" and "2:6" are the parameter values that the user must enter to execute the command. The value "6" is the value for the Epipe service identifier parameter. For the value "2:6", "2" is the value for the SDP identifier parameter and "6" is the value for the virtual circuit identifier.

2.2.2 Operational root and global commands

The commands in the following table are available at the operational root level of the CLI hierarchy. For the command descriptions, see the respective command sections in this guide. For descriptions of the **clear**, **monitor**, **show**, and **tools** commands, see the *7705 SAR Gen 2 Clear, Monitor, Show, and Tools CLI Command Reference Guide*.

Table 5: Operational root commands

Command	Description
admin	Enters the administrative context for system operations
bof	Enters the context to configure the boot options file
clear	Clears statistics or resets the operational state
configure	Enters the configuration context
[**no**] **debug**	Enters the context to enable or disable debugging and specify debug options
environment	Enters the environment configuration context
file	Enters the context for file system commands
help	Displays help in the CLI
monitor	Enters the context to monitor statistics
password	Enters the context to change the user CLI login password
show	Shows operational information
tools	Enters the tools context for troubleshooting and debugging

Global commands are commands that can be entered at any level in the CLI hierarchy. To display the list of all system global commands, enter **help globals** in the CLI.

The global commands are listed in the following table. For the command descriptions, see the respective command sections in this guide.

Table 6: Global commands

Command	Description
back	Navigates to the parent context
candidate	Enters the context to configure candidate parameters
echo	Echoes the text that is typed in. The primary use is to display messages to the screen within an exec file.
enable-admin	Enables the user to become a system administrator
exec	Executes the contents of a text file as if they were CLI commands entered at the console
exit	Returns to the previous higher context
help	Displays help in the CLI

Command	Description
history	Displays a list of the most recently entered commands
logout	Terminates the CLI session
mrinfo	Requests multicast router information
mstat	Traces a multicast path from a source to a receiver and displays multicast packet rate and loss information (IGMP-based)
mstat2	Traces a multicast path from a source to a receiver and displays multicast packet rate and loss information (UDP-based)
mtrace	Traces a multicast path from a source to a receiver (IGMP-based)
mtrace2	Traces a multicast path from a source to a receiver (UDP-based)
oam	Provides OAM test suite options. See the *7705 SAR Gen 2 OAM and Diagnostics Guide*.
ping	Verifies the reachability of a remote host
pwc	Displays the present or previous working context of the CLI session
sleep	Causes the console session to pause operation (sleep) for 1 s or for the specified number of seconds. The primary use is to introduce a pause in the execution of an exec file.
ssh	Opens a secure shell connection to a host
telnet	Connects to a host using Telnet
traceroute	Determines the route to a destination address
tree	Displays a list of all commands at the current level and all sublevels
write	Sends a console message to a specific user or to all users with active console sessions

2.2.3 CLI environment commands

The CLI **environment** commands listed in the following table are found in the **environment** context of the operational root of the CLI tree. These commands control session preferences for a single CLI session. For more information on the commands, see the respective command sections in this guide.

Table 7: CLI environment commands

Command	Description
alias	Enables the substitution of a command line by an alias
create	Enables or disables the use of a create parameter check

Command	Description
kernel	Enables or disables the kernel
more	Enables the CLI output to be displayed one screen at a time, awaiting user input to continue
reduced-prompt	Configures the maximum number of higher-level CLI context nodes to display by name in the CLI prompt for the current CLI session
saved-ind-prompt	Saves the indicator in the prompt
shell	Enables or disables the shell
suggest-internal-objects	Enables the suggestion of internally created objects while auto-completing
terminal	Configures the terminal screen length for the current CLI session
time-display	Specifies whether time should be displayed in local time or UTC
time-stamp	Specifies whether the timestamp should be displayed before the prompt

2.3 Getting help in the CLI

The **help** system commands and the **?** key display different types of help in the CLI. The following table lists the help commands.

Table 8: Online help commands

Command	Description
help	Describes the help system
help globals	Displays information about global commands
help edit	Displays information about all editing keystrokes
help special-characters	Displays information about all special characters that can be entered at the command prompt
?	Displays context-sensitive help information and displays a full list of options and commands available from the current context When entered at the root context, displays a full list of top-level contexts and global commands
command ? *command parameter* ? *command* **keyword** ?	Displays the available syntax options for the command, lists the associated parameters and keywords, and lists all commands available from the *command* context

Command	Description
string?	Lists all commands available in the current context that start with *string*
command string? *command parameter string*? *command* **keyword** *string*?	Lists all commands, parameters, or keywords available in the *command* context that start with *string*
*string***Tab**	Completes a partial command name (auto-completion) or lists available commands that match *string*

The **tree** and **tree detail** system commands are useful when searching for a command in a lower-level context.

The following example shows a partial list of the **tree** and **tree detail** command outputs on the 7705 SAR Gen 2.

Example: tree and tree detail command outputs

```
*A:node-2>config# tree
+---router
|   |
|   +---admin-tags
|   |   |
|   |   +---admin-tag
|   |   |
|   |   +---route-admin-tag-policy
|   |   |   |
|   |   |   +---exclude
|   |   |   |
|   |   |   +---include
|   |
|   +---aggregate
|   |
|   +---allow-bgp-to-igp-export
|   |
|   +---allow-icmp-redirect
|   |
|   +---allow-icmp6-redirect
|   |
|   +---autonomous-system
|   |
|   +---bfd
|   |   |
|   |   +---abort
|   |   |
|   |   +---begin
|   |   |
|   |   +---bfd-template
|   |   |   |
|   |   |   +---echo-receive
|   |   |   |
|   |   |   +---multiplier
|   |   |   |
|   |   |   +---receive-interval
|   |   |   |
|   |   |   +---transmit-interval
|   |   |   |
|   |   |   +---type
```

```
|   |   |
|   |   +---commit
|   |
|   +---bgp
|   |   |
|   |   +---add-paths
|   |   |   |
|   |   |   +---evpn
|   |   |   |
|   |   |   +---ipv4

*A:node-2>config# tree detail
...
|   router <router-instance> [create]
|   |
|   +---admin-tags
|   |   |
|   |   +---admin-tag <tag>
|   |   |   no admin-tag <tag>
|   |   |
|   |   +---route-admin-tag-policy <policy-name>
|   |   |   no route-admin-tag-policy <policy-name>
|   |   |   |
|   |   |   +---exclude <tag>
|   |   |   |   no exclude <tag>
|   |   |   |
|   |   |   +---include <tag>
|   |   |   |   no include <tag>
|   |
|   +---no aggregate <ip-prefix/ip-prefix-length>
|   |   aggregate <ip-prefix/ip-prefix-length> [summary-only] [as-set] [aggregator
 <as-number:ip-address>] [discard-component-communities] [black-hole [generate-icmp]]
 [community <comm-id1> [<comm-id2> <comm-id3> .. up to 12]] [description <description>]
 [local-preference <local-preference>] [tunnel-group <tunnel-group-id>] [policy <policy-
name>]
|   |   aggregate <ip-prefix/ip-prefix-length> [summary-only] [as-set] [aggregator <as-
number:ip-address>] [discard-component-communities] [indirect <ip-address>] [community
 <comm-id1> [<comm-id2> <comm-id3> .. up to 12]] [description <description>] [local-
preference <local-preference>] [tunnel-group <tunnel-group-id>] [policy <policy-name>]

|   |   +---bfd-template <[32 chars max]>
|   |   |   no bfd-template <[32 chars max]>
|   |   |   |
|   |   |   +---echo-receive <milli-seconds>
|   |   |   |   no echo-receive
|   |   |   |
```

```
|   |   |   +---multiplier <multiplier>
|   |   |   |   no multiplier
|   |   |   |
|   |   |   +---no receive-interval
|   |   |   |   receive-interval <milli-seconds>
|   |   |   |
|   |   |   +---no transmit-interval
|   |   |   |   transmit-interval <milli-seconds>
|   |   |   |
|   |   |   +---no type
|   |   |
|   |   +---commit
|   |
|   +---bgp
|   |   no bgp
|   |   |
|   |   +---add-paths
|   |   |   no add-paths
|   |   |   |
|   |   |   +---no evpn
|   |   |   |   evpn send <send-limit>
|   |   |   |   evpn send <send-limit> receive [none]
|   |   |   |
|   |   |   +---ipv4 send <send-limit>
|   |   |   |   ipv4 send <send-limit> receive [none]
|   |   |   |   no ipv4
```

2.4 The CLI command prompt

By default, the CLI command prompt indicates the device being accessed, the active CPM, and the current CLI context. For example, the prompt: **A:node-2>config>router>if#** indicates that the active CPM is CPM A, the user is on the device with the hostname **node-2**, and the current context **config**>**router**>**interface**. In the prompt, the separator used between contexts is the ">" symbol. The active CPM on the 7705 SAR Gen 2 is CPM A.

At the end of the prompt, there is either a pound sign (#) or a dollar sign ($). A "#" at the end of the prompt indicates the context is an existing context. A "$" at the end of the prompt indicates the context has been newly created. Contexts are newly created for logical entities when the user first navigates into the context.

Because there can be a large number of sublevels in the CLI, the **environment** command **reduced-prompt** *no of nodes in prompt* allows the user to control the number of levels displayed in the prompt.

WARNING: In CLI command configurations, allowed values in parameter strings are printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes ("). Double quotes within a string are not supported. Parameter strings input by the user must follow this format. This rule supersedes all related parameter descriptions found in this guide.

When changes are made to the configuration file, a "*" appears in the prompt string (*A:node-2), indicating that the changes have not been saved. When an **admin save** command is executed, the "*" disappears. This behavior is controlled by the **saved-ind-prompt** command in the **environment** context.

2.5 Displaying configuration contexts

The **info**, **info detail**, and **objective** commands display the configuration for the current level. The **info** command shows non-default configurations. The **info detail** command shows the entire configuration for the current level, including defaults. The **info objective** command provides an output objective that controls the configuration parameters to be displayed.

Example: info and info detail command outputs

The following example displays the output from the **info** command and the **info detail** command.

```
*A:node-2>config>router# interface system
*A:node-2>config>router>if# info
----------------------------------------------
            address 10.10.0.1/32
----------------------------------------------
*A:node-2>config>router>if#

*A:node-2>config>router>if# info detail
----------------------------------------------
            address 10.10.10.103/32 broadcast host-ones
            no description
            no arp-timeout
            no allow-directed-broadcasts
            tos-marking-state trusted
            no local-proxy-arp
            no proxy-arp
            icmp
                mask-reply
                redirects 100 10
                unreachables 100 10
                ttl-expired 100 10
            exit
            no mac
            no cflowd
            no shutdown
----------------------------------------------
*A:node-2>config>router>if#
```

2.6 exec Files

The **exec** command allows you to execute a text file of CLI commands as if it were typed at a console device.

The **exec** command and the associated exec files can be used to conveniently execute a number of commands that are always executed together in the same order. For example, an **exec** command can be used to define a set of commonly used standard command aliases.

The **echo** command can be used within an exec command file to display messages on screen while the file executes.

Arguments can be specified with the **exec** command. These arguments are passed in to be used inside the text file that includes the CLI commands. The passing of arguments with the **exec** command only works in the classic CLI. The passing of arguments with the **exec** command cannot be used in the MD-CLI.

For example, if the file `cf3/Test.txt` contains the following set of CLI commands:

```
echo $(1)
echo $(2)
echo $(3)
```

then executing the following commands:

 # exec cf3:/Test.txt -arguments var1=10 var2=20 var3=30

or

 # exec cf3:/Test.txt -arguments 10 20 30

produces the following output:

```
10
20
30
```

2.7 CLI script control

SR OS provides centralized script management for CLI scripts that are used by CRON and the Event Handling System (EHS). A set of script policies and script objects can be configured to control such things as:

- where scripts are located (local compact FTP server)
- where to store the output of the results
- how long to keep historical script result records
- how long a script may run

If the scripts are located on local compact flash devices, the user must ensure that the scripts are on the compact flash devices of both CPMs so that operation of EHS continues as expected if a CPM switchover occurs.

Only one script can execute at a time. An SNMP table (smRunTable in the DISMAN-SCRIPT-MIB) is used as both an input queue of scripts waiting to be executed and for storage of records for completed scripts. If the input queue is full, the script request is discarded.

2.8 Entering CLI commands

The following sections outline the steps to entering CLI commands.

2.8.1 Command completion

The CLI supports both command abbreviation and command completion. If the keystrokes entered are enough to match a valid command, the CLI displays the remainder of the command syntax when **Tab** or **Spacebar** is pressed. When typing a command, **Tab** or **Spacebar** invokes auto-completion. If the keystrokes entered are sufficient to identity a specific command, auto-completion completes the

command. If the letters are not sufficient to identify a specific command, pressing **Tab** or **Spacebar** displays commands matching the letters entered.

System commands are available in all CLI contexts.

2.8.2 Unordered and unnamed parameters

In a command context, the CLI accepts command parameters in any order as long as the command is formatted in the proper command keyword and parameter syntax. Command completion works as long as enough recognizable characters of the command are entered.

The following output shows the command syntax for **static-route-entry**.

```
*A:node-2>config>router# static-route-entry ?
 - no static-route-entry <ip-prefix/prefix-length> [mcast]
 - static-route-entry <ip-prefix/prefix-length> [mcast]

<ip-prefix/prefix-*> : ipv4-prefix    - a.b.c.d (host bits must be 0)
                       ipv4-prefix-le - [0..32]
                       ipv6-prefix    - x:x:x:x:x:x:x:x   (eight 16-bit pieces)
                                        x:x:x:x:x:x:d.d.d.d
                                        x - [0..FFFF]H
                                        d - [0..255]D
                       ipv6-prefix-le - [0..128]
<mcast>              : keyword - Indicates that static-route being configured
                       is used for mcast table only

 [no] backup-tag      - Create/Configure or Delete/Deconfigure backup tag for
                        static-route-entry
 [no] black-hole      + Create/Configure or Delete/Deconfigure blackhole
                        nexthop for static-route-entry
 [no] community       - Create/Configure or Delete/Deconfigure community for
                        static-route-entry
 [no] indirect        + Create/Configure or Delete/Deconfigure indirect
                        next-hop for static-route-entry
 [no] next-hop        + Create/Configure or Delete/Deconfigure next-hop for
                        static-route-entry
 [no] tag             - Create/Configure or Delete/Deconfigure tag for
                        static-route-entry
```

Some SR OS CLI commands have multiple unnamed parameters. For example, the **subrate** *csu-mode rate-step* command has both a *csu-mode* parameter and a *rate-step* parameter that do not have leading keywords. SR OS uses a best-match algorithm to select which parts of the user input are intended to be used for each unnamed parameter. This best-match algorithm depends on the specific command.

In some cases, it is not possible for the algorithm to be 100% accurate, and SR OS may assign an unintended value to a parameter when two unnamed parameters have similar constraints and syntax. For example, the **environment alias** *alias-name alias-command-name* command may reverse the *alias-name* and *alias-command-name* parameters if the first parameter entered is more than 80 characters.

2.8.3 Using editing keystrokes

When entering a command, special keystrokes allow for editing of the command. The following table lists the command editing keystrokes.

Table 9: Command editing keystrokes

Editing action	Keystrokes
Stop the current command	**Ctrl-C**
Delete current character	**Ctrl-D**
Delete text up to cursor	**Ctrl-U**
Delete text after cursor	**Ctrl-K**
Move to beginning of line	**Ctrl-A**
Move to end of line	**Ctrl-E**
Get prior command from history	**Ctrl-P**
Get next command from history	**Ctrl-N**
Move cursor left	**Ctrl-B**
Move cursor right	**Ctrl-F**
Move back one word	**Alt-B** or **Esc+B**
Move forward one word	**Alt-F** or **Esc+F**
Convert rest of word to uppercase	**Alt-C** or **Esc+C**
Convert rest of word to lowercase	**Alt-L** or **Esc+L**
Delete remainder of word	**Alt-D** or **Esc+D**
Delete word up to cursor	**Ctrl-W**
Transpose current and previous character	**Ctrl-T**
Return to operational root. If using **Ctrl-Z** after a command, return to the operational root after executing the command (equivalent to pressing **Enter** after the command and **exit all** after the command has executed).	**Ctrl-Z**
Refresh input line	**Ctrl-L**

2.8.4 Entering absolute paths

CLI commands can be executed in any context by specifying the full path from the CLI root. To execute an out-of-context command, enter a forward slash (/) or backward slash (\) at the beginning of the command line. The commands are interpreted as absolute paths. Spaces between the slash and the first command return an error.

```
*A:node-2# configure router
```

```
*A:node-2>config>router# interface system address 10.2.3.4
*A:node-2>config>router# /admin save
*A:node-2>config>router# \clear router interface
*A:node-2>config>router#
```

The "/" or "\" cannot be used as an absolute path at the beginning of the command string of the **environment alias** command. The command may change the current context depending on whether it is a leaf command. This is the same behavior the CLI performs when CLI commands are entered individually; for example:

```
*A:node-2# admin
*A:node-2>admin# save
```

or

```
*A:node-2# admin save
*A:node-2#
```

An absolute path command behaves in the same way as manually entering a series of command line instructions and parameters.

For example, beginning in an IES context service ID 4 (IES 4):

```
config>service>ies> /clear card 1
```

behaves in the way same as the following series of commands:

```
config>service>ies>exit all
clear card 1
configure service ies 4 (returns you to your starting point)
config>service>ies
```

If the command takes you to a different context, the following occurs:

```
config>service>ies>/configure service vpls 5 create
```

becomes:

```
config>service>ies>exit all
configure service vpls 5 create
config>service>vpls>
```

2.8.5 Displaying the command history

The CLI maintains a history of the most recently entered commands. The **history** command shows the most recently entered CLI commands.

```
*A:node-2# history
   1 environment terminal length 48
   2 environment no create
   3 show version
   4 configure port 1/1/1
   5 info
   6 \configure router isis
   7 \port 1/1/2
```

```
   8 con port 1/1/2
   9 \con port 1/1/2
  10 \configure router bgp
  11 info
  12 \configure system login-control
  13 info
  14 history
  15 show version
  16 history
*A:node-2# !3

A:node-2# show version

```

2.8.6 Entering numerical ranges

The SR OS CLI allows the use of a single numerical range as an argument in the command line. This range can be a set or a sequence of numbers, or a combination of both.

A set is a range of numerical values, from a minimum to a maximum, incremented by 1. For example:

```
configure service vpls [1..10] create customer 1
```

A sequence is a list of discrete integer elements, in any order. For example:

```
configure service vpls [1,2,3] no shutdown
```

A sequence can contain sets as well as integer elements. For example:

```
configure service vpls [4..6,7,8..10] no shutdown
```

For example, it is possible to shut down ports 1 through 10 on an XMA/MDA 1 in chassis slot 1. A port can be denoted by "*slot*/*mda*/*port*", where *slot* is the slot number, *mda* is the XMA/MDA number and *port* is the port number. To shut down ports 1 through 10 on an XMA/MDA 1 in slot 1, the command is entered as follows:

```
configure port 1/1/[1..10] shutdown
```

Ctrl-C can be used to abort the execution of a range command.

CLI commands can contain ranges of hexadecimal values. This allows ranges to be used when working with data normally expressed in hexadecimal instead of decimal, such as IPv6 or MAC addresses. For example:

```
#config>service>vpls>sap$ static-mac aa:bb:[0x19..0x21]:dd:ee:ff create
#config>service>vpls>sap$ info
----------------------------------------------
               static-mac aa:bb:19:dd:ee:ff create
               static-mac aa:bb:1a:dd:ee:ff create
               static-mac aa:bb:1b:dd:ee:ff create
               static-mac aa:bb:1c:dd:ee:ff create
               static-mac aa:bb:1d:dd:ee:ff create
               static-mac aa:bb:1e:dd:ee:ff create
               static-mac aa:bb:1f:dd:ee:ff create
```

```
                static-mac aa:bb:20:dd:ee:ff create
                static-mac aa:bb:21:dd:ee:ff create
-------------------------------------------
```

A range can also be a reference to a previous range in the same command. This reference takes the form [$*x*], where *x* is an integer between 0 and 5. For example:

```
configure service vprn [11..20] router-id 10.20.[$0].1
```

This gives vprn 11 the router-id "10.20.11.1", vprn 12 the router-id "10.20.12.1", and so on.

Specifying a range in the CLI does have limitations. These limitations are summarized in the following table.

Table 10: CLI range use limitations

Limitation	Description
Up to 6 ranges (including references) with 20 range elements in each range may be specified in a single command, and they may not combine to more than 1000 iterations of the command.	For example, ports on two adapter cards can be shut down in one command by using two ranges: **configure port 1/[1..2]/[1..10]**
Ranges within quotation marks are interpreted literally.	In the CLI, enclosing a string in quotation marks ("*string*") causes the string to be treated literally and as a single parameter. For example, several commands in the CLI allow the configuration of a descriptive string. If the string is more than one word and includes spaces, it must be enclosed in quotation marks. A range that is enclosed in quotes is also treated literally. For example, **configure router interface "A[1..10]" no shutdown** creates a single router interface with the name "A[1..10]". However, a command such as: **configure router interface A[1..10] no shutdown** creates 10 interfaces with names A1, A2 .. A10.
Command completion does not work when entering a range.	After entering a range in a CLI command, command and key completion, which normally occurs by pressing **Tab** or **Spacebar**, does not work. If the command line entered is correct and unambiguous, the command works properly; otherwise, an error is returned.

2.8.6.1 Using regular expressions in numerical ranges

The user can include a regular expression inside the numerical ranges of any **clear**, **config**, **show**, or **tools** CLI commands. The beginning and ending of the regular expression must be delimited with the "/" symbol.

SR OS performs the following steps:

- auto-completes the command to get all the possible names
- performs a match of the regular expression against all the names
- executes the command for the names for which the match was successful

Note: The order of execution is the same as the order in which the names are listed in the output display of the CLI **info** command or in the output display when you invoke the auto-complete function using **Tab**. If the execution of the command fails for one of the matching object names, the execution is aborted and the remaining matching object names are not processed.

For example, the following SR-TE LSP names are configured on the router:

```
*A:bkvm35# show router mpls sr-te-lsp
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                        To              Tun      Protect     Adm    Opr
                                                Id       Path
-------------------------------------------------------------------------------
sr-te-pce                       192.0.2.198     1        N/A         Up     Dwn
RENO194_DET190_LSP1_Profile10   192.0.2.190     2        N/A         Up     Dwn
RENO194_DET190_LSP3             192.0.2.190     3        N/A         Up     Dwn
RENO194_ATL224_LSP1             192.0.2.224     4        N/A         Up     Dwn
-------------------------------------------------------------------------------
LSPs : 4
===============================================================================
```

The following command displays the subset of all SR-TE LSPs with names that include the expression "LSP":

show router mpls sr-te-lsp [/LSP/]

The SR OS expands this command into the following individual commands:

show router mpls sr-te-lsp RENO194_DET190_LSP1_Profile10

show router mpls sr-te-lsp RENO194_DET190_LSP3

show router mpls sr-te-lsp RENO194_ATL224_LSP1

The output of the three **show** commands is displayed in the following example:

```
*A:bkvm35# show router mpls sr-te-lsp [/LSP/]
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                          To              Tun     Protect   Adm  Opr
                                                  Id      Path
-------------------------------------------------------------------------------
RENO194_DET190_LSP1_Profile10     192.0.2.190     2       N/A       Up   Dwn
-------------------------------------------------------------------------------
LSPs : 1
===============================================================================
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                          To              Tun     Protect   Adm  Opr
                                                  Id      Path
-------------------------------------------------------------------------------
RENO194_DET190_LSP3               192.0.2.190     3       N/A       Up   Dwn
-------------------------------------------------------------------------------
LSPs : 1
```

```
===============================================================================
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                            To              Tun     Protect   Adm  Opr
                                                    Id      Path
-------------------------------------------------------------------------------
RENO194_ATL224_LSP1                 192.0.2.224     4       N/A       Up   Dwn
-------------------------------------------------------------------------------
```

2.8.6.1.1 Regular expression symbols in a regular expression match operation

The user can use all the regular expression symbols listed in Table 12: Regular expression symbols and Table 13: Character class expressions inside the regular expression to match.

For example, the user can list all LSP names that begin with the string "RENO194_" followed by the string "ATL" as follows:

```
*A:bkvm35# show router mpls sr-te-lsp [/^RENO194_\['ATL'\]/]
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                        To              Tun     Protect     Adm    Opr
                                                Id      Path
-------------------------------------------------------------------------------
RENO194_ATL224_LSP1             38.120.48.224   4       N/A         Up     Dwn
-------------------------------------------------------------------------------
LSPs : 1
===============================================================================
```

Note: The following conventions are used in the previous example.

- Use the character "^", which matches the start of the string, directly inside the regular expression to indicate a match at the start of the string. However, if you want to match it as a character, enter it as "\\^".
- Use the range delimiter with the escape symbol in front "\[" inside the regular expression because the range delimiter encloses the regular expression.

The following table summarizes special rules governing the use of some of the regular expression symbols inside a regular expression match operation. Any symbol from Table 12: Regular expression symbols or Table 13: Character class expressions that is not listed in Table 11: Rules governing regular expression symbols can be used directly inside a regular expression match operation.

Table 11: Rules governing regular expression symbols

String	Description
?	[/\?/] if using as a regular expression and [/\\\?/] if using to match the character ?
[ ]	[/\[\]/] if using as a regular expression and [/\\\[\\\]/] if using to match the characters []
$	[/$/] if using as a regular expression and [/\\$/] if using to match the character $

String	Description
\	[/\\\\/] if using to match the character \
/	[/\/] if using to match the character /
'	[/\'/] if using to match the character '
*	[/*/] if using to match the character *
.	[/\./] if using as a regular expression and [/\\\./] if using to match the character .
+	[/\\+/] if using to match the character +
,	[/\,/] if using to match the character ,
^	[/\\^/] if using to match the character ^
(	[/\\(/] if using to match the character (
)	[/\\)/] if using to match the character)
space	[/\ /] if using to match the character space

The SR OS does not support the combination of a partial string with a regular expression match operation.

For example, if the operator wants to display the SR-TE LSP names that begin with the string "RENO194_ATL", if part of the string is entered directly and the rest of the string is entered inside a regular expression, the command returns no match. The following example demonstrates the incorrect syntax:

```
*A:bkvm35# show router mpls sr-te-lsp RENO194_[/ATL/]
```

To obtain a match, the entire string must be inside the regular expression. The following example demonstrates the correct syntax for finding a match:

```
*A:bkvm35# show router mpls sr-te-lsp [/^RENO194_ATL/]
===============================================================================
MPLS SR-TE LSPs (Originating)
===============================================================================
LSP Name                        To              Tun      Protect     Adm    Opr
                                                Id       Path
-------------------------------------------------------------------------------
RENO194_ATL224_LSP1             38.120.48.224   4        N/A         Up     Dwn
-------------------------------------------------------------------------------
LSPs : 1
===============================================================================
```

2.8.7 Using the | match output modifier

The **| match** output modifier searches for a character string or pattern. When using the **| match** output modifier, the variables and attributes must be spelled correctly. The attributes follow the output modifier and must come before the expression or pattern. The following are examples of how to use the **| match** output modifier to complete different tasks:

- Task: Capture all the lines that include "echo" and redirect the output to a file on the compact flash:

  admin display-config | match "echo" > cf1:\test\echo_list.txt
- Task: Display all the lines that do not include "echo":

  admin display-config | match invert-match "echo"
- Task: Display the first match of "vpls" in the configuration file:

  admin display-config | match max-count 1 "vpls"
- Task: Display everything in the configuration after finding the first instance of "interface":

  admin display-config | match post-lines 999999 interface
- Task: Display a count of the total number of lines of output instead of displaying the output itself:

  admin display-config | match interface | count

Command syntax:

match *pattern* **context** {**parents** | **children** | **all**} [**ignore-case**] [**max-count** *lines-count*] [**expression**]

match *pattern* [**ignore-case**] [**invert-match**] [**pre-lines** *pre-lines*] [**post-lines** *lines-count*] [**max-count** *lines-count*] [**expression**]

where:

```
pattern         string or regular expression
context         keyword:  display context associated with the matching line
parents         keyword:  display parent context information
children        keyword:  display child context information
all             keyword:  display both parent and child context information
ignore-case     keyword
max-count       keyword:  display only a specific number of instances of matching
                          lines
lines-count     1 — 2147483647
expression      keyword:  pattern is interpreted as a regular expression
invert-match    keyword
pre-lines       keyword:  display some lines prior to the matching line
pre-lines       0 — 100
post-lines      keyword:  display some lines after the matching line
lines-count     1 — 2147483647
```

For example:

```
A:Dut-C# show log log-id 98 | match ignore-case "sdp bind"
"Status of SDP Bind 101:1002 in service 1001 (customer 1) changed to admin=up oper=u
p flags="
"Processing of a SDP state change event is finished and the status of all affected S
DP Bindings on SDP 101 has been updated."

A:Dut-C# show log log-id 98 | match max-count 1 "service 1001"
"Status of service 1001 (customer 1) changed to administrative state: up,
operational state: up"

A:Dut-C# admin display-config | match post-lines 5 max-
count 2 expression "OSPF.*Config"
echo "OSPFv2 Configuration"
#------------------------------------------------
        ospf
            timers
                spf-wait 1000 1000 1000
            exit
```

```
echo "OSPFv2 (Inst: 1) Configuration"
#--------------------------------------------------
        ospf 1
            asbr
            router-id 10.0.0.1
            export "testall"
*A:Dut# admin display-config | match debug_mirror
            profile "debug_mirror"

*A:Dut# admin display-config | match context parent debug_mirror
#--------------------------------------------------
    system
        security
            profile "debug_mirror"

*A:Dut# admin display-config | match context all debug_mirror
#--------------------------------------------------
    system
        security
            profile "debug_mirror"
                default-action deny-all
                entry 10
                exit

*A:Dut# show log event-control | match ignore-case pre-lines 10 SyncStatus
L  2016 tmnxLogOnlyEventThrottled        MA  gen          0           0
MCPATH:
   2005 tmnxMcPathSrcGrpBlackHole        MI  thr          0           0
   2006 tmnxMcPathSrcGrpBlackHoleCleared MI  thr          0           0
   2007 tmnxMcPathAvailBwLimitExceeded   MI  thr          0           0
   2008 tmnxMcPathAvailBwLimitCleared    MI  thr          0           0
MC_REDUNDANCY:
   2001 tmnxMcRedundancyPeerStateChanged WA  gen          0           0
   2002 tmnxMcRedundancyMismatchDetected WA  gen          0           0
   2003 tmnxMcRedundancyMismatchResolved WA  gen          0           0
   2004 tmnxMcPeerSyncStatusChanged      WA  gen          0           0
```

The following table describes regular expression symbols and their interpretation (similar to what is used for route policy regexp matching). Table 13: Character class expressions describes character class expressions.

Table 12: Regular expression symbols

String	Description
.	Matches any single character
[ ]	Matches a single character that is contained within the brackets [abc] matches "a", "b", or "c" [a-z] matches any lowercase letter [A-Z] matches any uppercase letter [0-9] matches any number
[^]	Matches a single character that is not contained within the brackets [^abc] matches any character other than "a", "b", or "c"

String	Description
	[^a-z] matches any single character that is not a lowercase letter
^	Matches the start of the line (or any line, when applied in multiline mode)
$	Matches the end of the line (or any line, when applied in multiline mode)
()	Defines a "marked subexpression" Every matched instance will be available to the next command as a variable
*	A single character expression followed by "*" matches zero or more copies of the expression
{m,n}	Matches least *m* and at most *n* repetitions of the term
{m}	Matches exactly *m* repetitions of the term
{m,}	Matches *m* or more repetitions of the term
?	The preceding item is optional and matched at most once
+	The preceding item is matched one or more times
-	Used between start and end of a range
\	An escape character to indicate that the following character is a match criteria and not a grouping delimiter

Table 13: Character class expressions

Character class	Characters matched[1]	Description
[:alnum:]	'ABCDEFGHIJKLMNOPQRSTUVWXYZ abcdefghijklmnopqrstuvwxyz 0123456789'	Alphanumeric characters
[:alpha:]	'ABCDEFGHIJKLMNOPQRSTUVWXYZ abcdefghijklmnopqrstuvwxyz'	Alphabetic characters
[:blank:]	' \t'	**Spacebar** and **Tab**
[:cntrl:]	'\007\b\t\n\v\f\r\1\2\3\4\5\6\16\17\20 \21\ 22\23\24\25\26\27\30 \31\32\33\34\35\ 36\37\177'	Control characters
[:digit:]	'0123456789'	Digits

[1] Characters matching the character class are delimited by single quotation marks (').

Character class	Characters matched[1]	Description
[:graph:]	'ABCDEFGHIJKLMNOPQRSTUVWXYZ abcdefghijklmnopqrstuvwxyz 0123456789 !\"#$%&'()*+,-./:;<=>?@[\\ ]^_`{|}~'	Visible characters
[:lower:]	'abcdefghijklmnopqrstuvwxyz'	Lowercase letters
[:print:]	'ABCDEFGHIJKLMNOPQRSTUVWXYZ abcdefghijklmnopqrstuvwxyz 0123456789!\"#$%&'()*+,-./:;<=>?@[\\]^_ `{|}~ '	Visible characters and the Space character
[:punct:]	'!\"#$%&'()*+,-./:;<=>?@[\\]^_`{|}~'	Punctuation characters
[:space:]	'\t\n\v\f\r '	Whitespace (blank) characters
[:upper:]	'ABCDEFGHIJKLMNOPQRSTUVWXYZ'	Uppercase letters
[:xdigit:]	'0123456789ABCDEFabcdef'	Hexadecimal digits

Character class expressions must be enclosed within brackets. The expression [[:digit:]] is treated as a regular expression containing the character class "digit", while [:digit:] is treated as a regular expression matching ":", "d", "i", "g", or "t".

2.8.8 Using the | count output modifier

The **| count** output modifier displays a count of the number of lines that would have otherwise been displayed. The **| count** output modifier is particularly useful when used in conjunction with the **| match** output modifier in order to count the number of output lines that match a specified pattern.

The following example shows usage of the **| count** output modifier.

Example: Using the | count output modifier

```
*A:dut-c# show service service-using vprn

===============================================================================
Services [vprn]
===============================================================================
ServiceId    Type      Adm  Opr  CustomerId Service Name
-------------------------------------------------------------------------------
1            VPRN      Down Down 1
44           VPRN      Up   Up   1
100          VPRN      Down Down 1
102          VPRN      Up   Up   1
235          VPRN      Down Down 1
1000         VPRN      Down Down 1000
-------------------------------------------------------------------------------
Matching Services : 6
-------------------------------------------------------------------------------
===============================================================================
*A:dut-c# show service service-using vprn | match Down | count
```

[1] Characters matching the character class are delimited by single quotation marks (').

```
Count: 4 lines
*A:dut-c#
```

2.8.9 Using the | reverse-dns output modifier

The **| reverse-dns** output modifier performs a reverse DNS lookup on any IPv4 or IPv6 address in the input. The result of the lookup is inserted as the next line in the output on each line where an IP address is identified. If no match is found, no additional output is printed. If the output line is more than 80 characters, the line is truncated.

The following example shows usage of the **| reverse-dns** output modifier.

Example: Using the | reverse-dns output modifier

```
A:node-2# ping 10.184.216.34 | reverse-dns
PING 10.184.216.34 56 data bytes
(10.184.216.34) www.example.com
64 bytes from 10.184.216.34: icmp_seq=1 ttl=61 time=82.4ms.
64 bytes from 10.184.216.34: icmp_seq=2 ttl=61 time=82.5ms.
64 bytes from 10.184.216.34: icmp_seq=3 ttl=61 time=82.4ms.
64 bytes from 10.184.216.34: icmp_seq=4 ttl=61 time=82.3ms.
64 bytes from 10.184.216.34: icmp_seq=5 ttl=61 time=82.2ms.
---- 10.184.216.34 PING Statistics ----
(10.184.216.34) www.example.com
5 packets transmitted, 5 packets received, 0.00% packet loss
round-trip min = 82.2ms, avg = 82.4ms, max = 82.5ms, stddev = 0.122ms
```

2.8.10 Redirecting output to a file

SR OS supports output redirection (>), which allows the operator to store the output of a CLI command as a local or remote file.

For example:

```
ping 10.0.0.1 > cf3:/ping/result.txt
```

In some cases, only part of the output might be desirable. The **| match** and output redirection commands can be combined. For example, the following command matches lines with the expression "time.[[:digit:]]+" and redirects the output to the file `cf3:/ping/time.txt`.

```
ping 10.0.0.1 | match expression "time.[[:digit:]]+" > cf3:/ping/time.txt
```

2.9 Configuration rollback

The Configuration Rollback feature provides the ability to undo configurations and revert to previous router configuration states while minimizing impacts to services.

This feature gives the operator better control and visibility over the router configurations and reduces operational risk while increasing flexibility and providing powerful recovery options.

Configuration Rollback is useful in cases where configuration changes are made but the operator later decides not to keep the changes (for example, experimentation or when problems are identified in the configuration during actual network operation).

The advantages of this feature include the following.

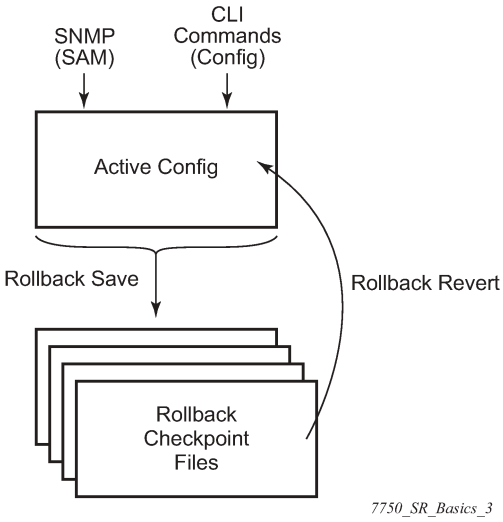
- Changes made to the router configuration are performed with minimal impact on services being provided by the 7705 SAR Gen 2 because the router does not need to be rebooted.
- There is no impact in areas of the configuration that did not change.

With the rollback feature, the operator can smoothly revert to previous configurations.

Configuration parameters that are changed or items that the changed configuration have dependencies on are removed (revert to default) and the previous values are restored, which may briefly impact services in changed areas).

A history of changes is preserved using checkpoint IDs, which allow rollback to different points, as well as examination of changes made, as shown in the following figure.

Figure 4: Rollback operation



2.9.1 Feature behavior

The following list describes detailed behavior of the rollback feature, including the applicable CLI commands.

- The user can create a rollback checkpoint and later revert to this checkpoint with minimal impact to services.

```
admin>rollback# save [comment comment-string]
```

```
comment-string: a comment associated with the checkpoint, maximum 255 characters
```

- Rollback checkpoints include all current operationally active configurations:
  - changes from direct CLI commands in the configuration branch

  - SNMP sets

- Rollback checkpoints do not include BOF configurations. The BOF file and BOF configuration are not part of a rollback save or rollback. A rollback does not change the BOF configuration. The BOF contains basic information for the node and does not change frequently; changes are mostly made during initial commissioning of the node.
- A rollback save feature can be automatically executed (for example, scheduled monthly) using the CRON facility of SR OS.
- The latest rollback checkpoint file uses the suffix ".rb". The next latest rollback checkpoint file has the suffix ".rb.1", the next oldest has the suffix "rb.2", and so on.

  file-url.rb <--- latest rollback file

  file-url.rb.1

  …

  file-url.rb.9 <--- oldest rollback file
- When a **rollback save** is executed, the system shifts the file suffix of all the previous checkpoints by 1 (new ID = old ID + 1). If there are already as many checkpoint files as the maximum number supported, the last checkpoint file is deleted.
- The maximum number of rollback checkpoints is configurable and defaults to 10, which includes the latest file and files 1 through 9.
- The locations and names of the rollback checkpoint files are configurable to be local (on the compact flash) or remote. The *file-url* must contain a path/directory and filename with no suffix. The .rb suffix for rollback checkpoint files is automatically appended to the rollback checkpoint files.

  ```
  config>system>rollback# rollback-location file-url
  ```
- There is no default rollback location. If a rollback location is not specified, or it is cleared using **no rollback-location**, and a **rollback save** is attempted, the **rollback save** fails and returns an error message.
- The entire set of rollback checkpoint files can be copied from the active CPM CF to the standby CPM CF. This synchronization is done using the following command:

  ```
  admin>redundancy# rollback-sync
  ```
- The operator can enable an automatic synchronization of rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a **rollback save** causes the new checkpoint file to be saved to both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented.

  Automatic synchronization only causes the new checkpoint file to be copied to both CFs. The older checkpoint files are not automatically copied from active to standby but can be copied manually with **admin redundancy rollback-sync**.
- The **config**>**redundancy**>**synchronize** {**boot-env** | **config**} and **admin**>**redundancy**>**synchronize** {**boot-env** | **config**} commands do not apply to rollback checkpoint files. These commands do not manually or automatically synchronize rollback checkpoint files. The dedicated **rollback-sync** commands must be used to synchronize rollback checkpoint files.

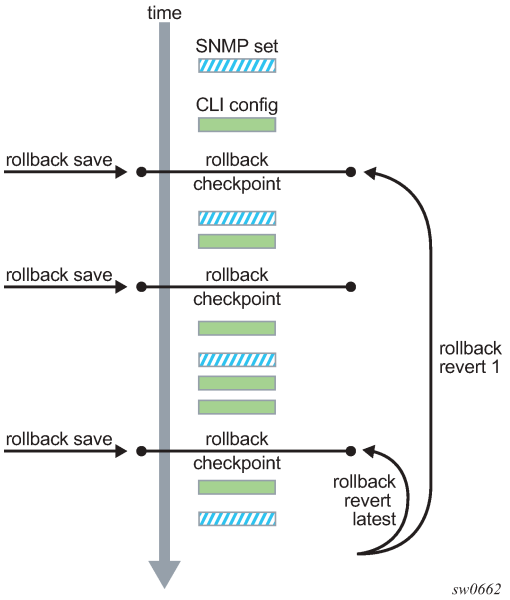
- Rollback files can be deleted using a dedicated rollback checkpoint deletion command.

```
admin>rollback# delete {latest-rb | checkpoint-id}
```

  - Deleting a rollback checkpoint causes the suffixes to be adjusted (decremented) for all checkpoints older that the one that was deleted in order to close the "hole" in the list of checkpoint files and create room to create another checkpoint.
  - If **config**>**redundancy**>**rollback-sync** is enabled, a **rollback delete** also deletes the equivalent checkpoint on the standby CF and shuffles the suffixes on the standby CF.
  - If an operator manually deletes a rollback checkpoint file using **file delete**, the suffixes of the checkpoint files are not shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a "hole" in the checkpoint file list until enough new checkpoints have been created to roll the "hole" off the end of the list.
- The following figure shows how a configuration is rolled back to a previous configuration (a saved rollback checkpoint). The previous configuration is loaded and takes operational effect.

```
admin>rollback# revert [latest-rb | checkpoint-id]
```

Figure 5: Configuration rollback



- A rollback revert does not affect the currently stored rollback checkpoint files; files are not deleted or renumbered. This means that if an operator issues the command **rollback revert 3** and then issues the **rollback save** command, the resulting rollback checkpoint files *file-url*.rb and *file-url*.rb.4 contain the same rollback state/configuration.
- The **boot-good-exec** or **boot-bad-exec** command is not automatically executed after a rollback.
- Impacts to the running services are minimized during a rollback.
  - There is no impact in areas of the configuration that did not change.

  - Configuration parameters that are changed or items that the changed configuration has dependencies on are removed (revert to default) and the previous values are restored, which may briefly impact services.
- A rollback undoes any SNMP sets or direct CLI configuration commands that occur after the creation of the last checkpoint.
- When a node is processing a **rollback revert**, both CLI commands from other users and SNMP commands continue to be processed. The only commands that are blocked during a **rollback revert** are other rollback commands, including **revert**, **save**, and **compare**. Only one **rollback** command can be executing at a time on a node.
- Commands are available to view and compare the various rollback checkpoints to current operating and candidate configurations.
- Rollback checkpoint files are not guaranteed to be in any particular format. They are not interchangeable with normal configuration files or executable scripts. A normal configuration file from an **admin save** cannot be renamed as a rollback checkpoint and then referenced for a **rollback revert** operation. Only rollback checkpoint files generated with **rollback save** can be used for rollback revert operations.
- If a hardware change is made after a **rollback save**, then:
  - a rollback can be executed as long as the hardware change was an addition of hardware to the node (for example, a new card or IOM was installed into a previously empty slot)
  - a rollback is not guaranteed to work if hardware was removed or changed (for example, an XCM/IOM was removed, or an XMA/MDA was swapped for a different XMA/MDA type)
- Rollback across a change to the following parameters is not supported:
  - **chassis-mode**
  - **configure isa application-assurance-group minimum-isa-generation**
- Rollback is supported even after an **admin reboot** is performed or the primary configuration in the BOF is changed and an **admin reboot** is performed. The **admin reboot** command does not "break the chain" for rollback.
- Lawful intercept configuration under the **config>li** branch is not affected by a rollback or rescue. LI configuration is not saved in the rollback checkpoint or rescue file, and a rollback revert does not affect any configuration under the **config>li** branch.
- Any configuration or state change performed under the debug branch of the CLI is not saved in the rollback checkpoint file or impacted by a rollback.
- Rollbacks to a checkpoint created in a more recent release are not supported (for example, a node running in 25.3.R1 cannot roll back to a checkpoint created in 25.3.R3).
- The following list captures some side effects and specific behaviors of a rollback revert. Some of these side effects are not related purely to configuration, that is, in the CLI configuration branch, and may have interactions with tools commands, RADIUS, and so on.
  - SAA jobs that are running when a rollback revert is initiated, and need configuration changes due to the rollback, are stopped. If the SAA job is a continuous type, then it is restarted as part of the rollback revert after the configuration changes have been applied (just as if the operator had typed **no shutdown** for the continuous SAA job). Non-continuous SAA jobs that were modified by the rollback would need to be manually restarted if they need to be run again.
  - If **max-nbr-mac-addr** is reduced as part of the revert and the number of MAC addresses in the forwarding database is greater than the **max-nbr-mac-addr**, the rollback is aborted before any

actions are taken and an informative error message is provided. The operator must take actions to remove the MAC addresses if they wish to proceed with the rollback.

– If active subscribers or subscriber hosts or DHCP lease states are present, some associated configuration changes may be blocked, just as those same changes would be blocked if an operator tried to make them using CLI.

– When trying to delete an SLA profile being used by active subscriber hosts, or trying to change a NAT policy in a subscriber profile, if certain configuration changes associated with the hosts or lease states are required as part of the rollback but those changes are blocked, then for each blocked configuration item a warning is printed, that particular configuration item is not changed, and the rollback continues.

– After a multi-chassis peer shutdown or if configuration changes have been made that affect the contents of the distributed database (for example, synchronization tag creation or deletion), further configuration changes related to that peer may be temporarily refused. The duration of the temporary configuration freeze depends on the size of the distributed database. A rollback attempting to make those refused configuration changes fails and an error message is provided to the CLI user.

– If a **force-switchover** command (for example, **tools perform service id 1 endpoint "x" force-switchover spoke-sdp-fec 1**) has been applied to a **spoke-sdp-fec** of a dynamic multi-segment pseudowire, and a rollback revert needs to change the admin state of the **spoke-sdp-fec** (for example, to modify **spoke-sdp-fec** parameters that may be dependent on the admin state), the rollback revert automatically removes the **force-switchover** and the node reverts to whatever is the best spoke SDP in the redundant set.

– Rollback impacts the configuration state of the router, and as with normal operator CLI or SNMP configuration changes, additional actions or steps may need to occur before certain configuration changes take operational effect.

  Configuration changes that require a manual **shutdown** and then **no shutdown** in order to take operational effect also need this manual **shutdown**/**no shutdown** in order to take operational effect after a rollback if the rollback changes those configuration items. Some examples include the following.

  • Changes to autonomous system or confederation values require a BGP **shutdown**/**no shutdown** command.

  • Changes to VPRN **max-routes** require a **shutdown**/**no shutdown** command on the VPRN service.

  • Changes to OSPF or IS-IS **export-limit** require a **shutdown**/**no shutdown** command on OSPF or IS-IS.

  • For configuration changes to an MSAP policy that normally require a **tools perform subscriber-mgmt eval-msap** command to take operational effect on subscribers that are already active, if a rollback changes the MSAP policy configuration, the operator must run the **eval-msap** tools command to have the changes applied to the active subscribers.

– Any uncommitted changes (for example, the **begin** command was entered and some changes were made, but the **commit** command was never entered) in the following areas are lost or cleared when a rollback revert is initiated:

  • **config>app-assure>group policy**

  • **config**>**router**>**policy-options**

  • **config**>**system**>**sync-if-timing**

- Some **card** and **mda** commands require a reboot, removal, or rebuild of an entire card or XMA/MDA. When these commands need to be executed as part of a rollback, the impacted cards and MDAs are listed in a warning and the operator is prompted with a single y/n prompt to proceed. This prompt will not occur for a rollback initiated via SNMP or if the operator uses the **now** keyword with the **rollback revert** command. Some examples of **card** and **mda** commands that may cause a prompt are:
  - **config>card>card-type**
  - **config>card>mda**
  - **config>card>mda>mda-type**
- Although the use of the **Ctrl-C** key combination is not recommended during a rollback revert, it is supported via CLI or SNMP. Interrupting a rollback revert may leave the router in a state that is not necessarily between the old active configuration and the rollback checkpoint, as the rollback processing may have been in the middle of tearing things down or rebuilding configurations. A strong warning is issued in this case to indicate that the operator must examine the configuration and potentially issue another rollback revert to return to a known and coherent configuration.
- An HA CPM switchover during a rollback revert causes the rollback operation to abort. The newly active CPM has an indeterminate configuration. When an HA switchover occurs during a rollback or within a few seconds of a rollback completing, the operator is advised to repeat the rollback revert operation to the same checkpoint.
- A rollback revert operation does not check authorization of each command that is applied during the revert. Permission to execute the revert operation, that is, authorization to execute the **admin rollback revert** command, should only be given to users who are allowed to initiate a rollback revert. It is generally recommended that only system administrators be allowed access to the file system where the rollback files are stored so that they cannot be manually edited.

2.9.2 Rollback and SNMP

The SR OS has SNMP support for rollback status and control. See the TIMETRA-SYSTEM-MIB for details (for example, items such as tmnxSysRollbackStarted).

When the router is doing a rollback revert, SNMP managers see a tmnxSysRollbackStarted trap, then a rapid set of "config change" traps, and then finally, the tmnxSysRollbackStatusChange trap.

During the period when a router is processing a rollback revert, both CLI commands from other users and SNMP commands continue to be processed.

2.9.3 Rescue configuration

A special rescue configuration checkpoint can be created that an operator can revert to at any time. The rescue configuration has its own keyword (**rescue**) and does not use the same rolling suffix indices as the normal rollback checkpoints. This allows the operator to easily return to the rescue configuration state without having to consider a checkpoint index, and ensures that the rescue checkpoint is always available and does not roll off the bottom of the list of checkpoints.

The operator should define a basic rescue configuration that is known to work and give appropriate management access to the node.

The location and filename of the rescue file are configurable. The SR OS appends the .rc suffix to the specified rescue filename.

2.9.4 Operational guidelines

The following points offer some operational guidance on the use of rollback.

- The **admin save** and **admin rollback save** commands should be performed periodically.
- The **admin save** command can be used to back up a complete configuration file that can be used during router reboot, with the following considerations:
  - used with a reboot as a last resort
  - performed after any major hardware changes or major service changes
  - performed after any software upgrade
- The **admin rollback save** command can be used to create a rollback checkpoint as follows:
  - to be used for intermediate checkpoints that can be recovered with minimal impact to services
  - to be performed each time a moderate number of configuration changes have been made
  - to be performed after any hardware changes
  - to be performed after any software upgrade
  - to be scheduled with CRON (for example, once every one or two weeks)
- A new **admin rollback save rescue** must be created when hardware is changed.
- Rollback checkpoint files are not editable, or compatible or interchangeable with configuration files generated with **admin save**.
- The repeated use of the **admin rollback save**, **admin rollback delete**, and **admin rollback revert** commands over the course of weeks or months is not recommended without also executing an occasional **admin save**. In a serious situation, use one of the saved configurations as the primary configuration for an **admin reboot**.
- For a software upgrade, it is recommended that a rollback checkpoint be created using **admin rollback save** in addition to saving the configuration with **admin save**, after an upgrade has been performed and the system is operating as expected. This ensures that a good checkpoint that is fully compatible with the new release is available at a point shortly after the upgrade.
- An operator can create a set of rollback checkpoints to support busy or quiet days or weekends or weekdays and use CRON to shift between them.
- It is beneficial to create a rollback checkpoint before a rollback revert is initiated, especially if significant configuration changes have been applied since the last checkpoint was created. If the rollback is especially significant, that is, there are a lot of major changes, it is also a good practice to perform an **admin save** in case a full reboot is required to recover from an issue.
- A rollback failure may occur in some limited cases where the node needs a long time to complete one of the resulting configuration changes. If a rollback (for example, **rollback revert 5**) fails during execution, it should be attempted again. The second attempt typically completes the remaining configuration changes required to fully revert to the desired checkpoint.
- When a new backup CPM is commissioned, the user executes the **admin redundancy rollback-sync** command to copy the entire set of rollback files from the active CPM CF to the new standby CPM CF. If the operator wants the system to automatically copy new rollback checkpoints to both CFs whenever a new checkpoint is created, the **configure redundancy rollback-sync** command should be enabled.
- An HA CPM switchover during a rollback revert causes the rollback operation to abort. The newly active CPM has an indeterminate configuration. A log event is created in this case to warn the operator.

When an HA switchover occurs during a rollback or within a few seconds of a rollback completing, the operator is advised to repeat the rollback revert operation to the same checkpoint.

- A rollback checkpoint stores the rollback location and the **local-max-checkpoint** and **remote-max-checkpoint** values, and it is possible that a rollback revert operation may change those values. If an operator changes the **local-max-checkpoint** or **remote-max-checkpoint** values, it is recommended that all the existing checkpoints be deleted to prevent a subsequent rollback revert from changing the maximum values to any of the previous values.
- If a warning prompt (**y/n**) is displayed when a rollback revert is initiated, it is highly recommended that the operator respond **no** to the warning prompt the first time, save a rollback checkpoint before attempting this rollback revert, execute the revert again, and respond **yes**. If the rollback encounters problems, a revert to the saved checkpoint can be used to return to the initial configuration state.

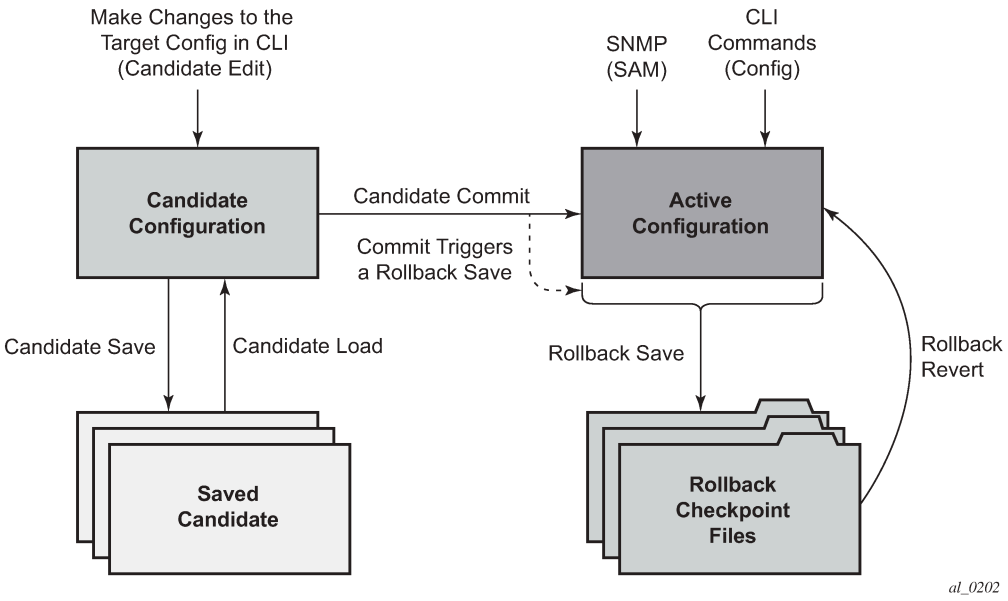
2.10 Transactional configuration

Transactional configuration allows an operator to edit a candidate configuration (a set of configuration changes) without causing operational changes in the router (the active or operational configuration). When the candidate configuration is complete, the operator can explicitly commit the changes to make the entire new configuration become active.

Transactional configuration gives the operator better control and visibility over their router configurations and reduces operational risk while increasing flexibility.

The transactional configuration and configuration rollback functions combine to provide the operational model depicted in the following figure.

Figure 6: Router configuration with rollback and transactions



2.10.1 Basic operation

In order to edit the candidate configuration, the operator must first enter the candidate edit mode (edit-cfg) with the **candidate**>**edit** command. The operator can enter and quit the configuration mode as many times as they wish before finally committing the candidate configuration.

In edit-cfg mode, the operator builds a set of candidate configuration changes using the same CLI tree as the standard line-by-line, non-transactional configuration. Tab completion and keyword syntax checking is available.

Just as there is a single operational active configuration that can be modified simultaneously by multiple users in the SR OS, there is also a single global candidate configuration instance. All users make changes in the same global candidate configuration, and a **commit** operation by any user commits the changes made by all users.

Users can exclusively create a candidate configuration by blocking other users and sessions of the same user from entering edit-cfg mode by specifying the **exclusive** parameter. The **config**>**system**>**management-interface**>**cli**>**classic-cli**>**allow-immediate** command can be used to enforce the use of candidate configuration, instead of allowing immediate line-by-line configuration changes.

If a **commit** operation is successful, all of the candidate changes take operational effect and the candidate is cleared. If there is an error in the processing of the commit, or a **commit confirmed** is not confirmed and an auto-revert occurs, the router returns to a configuration state with none of the candidate changes applied. The operator can then continue editing the candidate and try a commit later.

All commands in the candidate configuration must be in the correct order for a commit to be successful. Configuration that depends on other candidate objects must be placed after those objects in the candidate. A set of candidate editing commands (**copy**, **insert**, and so on) are available to correct and reorder the candidate configuration.

The edit-cfg mode is primarily intended for building a candidate configuration while navigating the **configure** branch of the CLI. Many CLI commands in branches other than **configure** are supported while in edit-cfg mode, but access to some CLI branches and commands are blocked, including:

- **exec** command
- **enable-admin** command
- **enable-dynamic-services-config** command
- **admin** branch
- **bof** branch
- **debug** branch
- **tools** branch

The candidate configuration can be saved to a file and subsequently loaded into a candidate configuration. A saved candidate is similar to, but not the same as, an SR OS configuration file generated with an **admin save** command. The saved candidate cannot be used in general as a configuration file and may not **exec** without failures.

There is no SNMP access to the candidate configuration and no SNMP management of candidates, although any configuration changes made using transactional configuration are reported via the standard SR OS SNMP change traps and basic candidate status information is available via SNMP.

A commit may fail for a number of reasons, including:

- **misordering**

  The candidate configuration has changes that are not in the correct order, that is, an object is referred to before it is actually created

- **invalid options and combinations**

  Although many syntax errors are eliminated during the candidate editing process, the candidate configuration may contain combinations of configurations and options that are not valid and are rejected when the SR OS attempts to have them take operational effect

- **out of resources**

  The application of the candidate may exhaust system resources, such as queue resources

Error messages are provided for commit failures to help the operator take the necessary actions to correct the candidate.

Standard line-by-line, non-transactional CLI and SNMP commands are not blocked during the creation or editing of a candidate or the processing of a commit. These commands take immediate operational effect when **Enter** is pressed.

2.10.2 Transactions and rollback

By default, the SR OS automatically creates a new rollback checkpoint after a **commit** operation. The rollback checkpoint includes the new configuration changes made by the commit. An optional **no-checkpoint** keyword can be used to prevent the auto-creation of a rollback checkpoint after a commit. If the commit fails, no new rollback checkpoint is created.

When the **commit confirmed** option is used, a rollback checkpoint is created after the processing of the commit and exists whether the commit is automatically reverted or not.

Transactional configuration relies on the rollback mechanism to operate. Any commands and configurations that are not supported in a rollback revert are also not supported in edit-cfg mode; for example, changes to **chassis-mode**.

2.10.3 Authorization

Authorization works transparently in edit-cfg mode and no unique or new local profile or TACACS+ permissions rules are required other than allowing access to the **candidate** branch. For example, if an operator has permission to access the **configure filter** context, they automatically also have access to the **configure filter** context when in edit-cfg mode.

If the operator’s profile allows access to the candidate **load** and **save** commands, the operations load and save only those items that the user is authorized to access.

The candidate view only displays the items that the user is authorized to access.

The candidate editing commands (such as adding lines, removing lines, and delete operations) only allow operations on items that the user is authorized to access.

The candidate **commit** and **discard** commands, along with **admin rollback revert**, operate on the entire candidate and impact all items; authorization does not apply.

3 Command Trees

3.1 admin Commands

```
- admin
    - certificate
        - clear-ocsp-cache
        - cmpv2
            - cert-request
            - clear-request
            - initial-registration
            - key-update
            - poll
            - show-request
        - convert-file
        - crl-update
        - display
        - est
            - cacert
            - enroll
            - renew
        - export
        - gen-keypair
        - gen-local-cert-req
        - import
        - reload
        - secure-nd-export
        - secure-nd-import
        - update-cert
    - clear
        - lockout
        - password-history
    - compare
    - debug-save
    - disconnect
    - display-config
    - enable-tech
    - ipsec
        - display-key
        - transport-mode
            - display-key
    - reboot
    - redundancy
        - force-switchover
        - rollback-sync
        - synchronize
    - reset-policy-exclusive
    - rollback
        - compare
        - delete
        - revert

            - rsvp
                - authentication-over-bypass
                - diffserv-te
                    - class-type-bw
                    - fc
                    - te-class
                - gr-helper-time
                - graceful-shutdown
                - implicit-null-label
                - interface
                    - auth-keychain
                    - authentication-key
                    - bfd-enable
                    - class-type-bw
                    - gr-helper
                    - graceful-shutdown
                    - hello-interval
                    - implicit-null-label
                    - refresh-reduction
                        - reliable-delivery
                    - shutdown
                    - subscription
                    - te-down-threshold
                    - te-up-threshold
                - keep-multiplier
                - msg-pacing
                    - max-burst
                    - period
                - node-id-in-rro
                - p2p-merge-point-abort-timer
                - preemption-timer
                - rapid-retransmit-time
                - rapid-retry-limit
                - refresh-reduction-over-bypass
                - refresh-time
                - shutdown
                - te-down-threshold
                - te-threshold-update
                    - on-cac-failure
                    - update-timer
                - te-up-threshold
```

3.4.17.52 configure router segment-routing Commands

```
- segment-routing
    - maintenance-policy
        - bfd-enable
        - bfd-template
        - hold-down-timer
        - mode
        - return-path-label
        - revert-timer
        - shutdown
        - threshold
    - sr-mpls
        - prefix-sids
            - ipv4-sid
            - ipv6-sid
            - node-sid
    - sr-policies
        - reserved-label-block
        - shutdown
        - static-policy
            - binding-sid
            - color
            - distinguisher
            - endpoint
            - head-end
            - maintenance-policy
            - preference
            - segment-list
                - segment
                    - mpls-label
                - shutdown
                - weight
            - shutdown
```

3.4.17.53 configure router sgt-qos Commands

```
            - sgt-qos
                - application
                - dscp
```

3.4.17.54 configure router single-sfm-overload Commands

```
            - single-sfm-overload
```

3.4.17.55 configure router static-route-entry Commands

```
            - static-route-entry
                - black-hole
                    - community
                    - description
                    - dynamic-bgp

4 a Commands – Part I

4.1 aaa

aaa

Syntax
aaa

Context
[Tree] (config aaa)

Full Context
configure aaa

Description
Commands in this context configure authentication, authorization, and accounting.

Platforms
7705 SAR Gen 2

aaa

Syntax
aaa

Context
[Tree] (config>service>vprn aaa)

Full Context
configure service vprn aaa

Description
Commands in this context configure AAA on the VPRN.

Platforms
7705 SAR Gen 2

4.2 abort

abort

Syntax
abort

Context
[Tree] (config>router>bfd abort)

Full Context
configure router bfd abort

Description
This command discards the changes made to a BFD template during an active session.

Platforms
7705 SAR Gen 2

abort

Syntax
abort

Context
[Tree] (config>router>route-next-hop-policy abort)

Full Context
configure router route-next-hop-policy abort

Description
This command discards the changes made to route next-hop templates during an active session.

Platforms
7705 SAR Gen 2

abort

Syntax

abort

Context

[Tree] (config>router>policy-options abort)

Full Context

configure router policy-options abort

Description

This command is required to discard changes made to a route policy.

Platforms

7705 SAR Gen 2

4.3 accept-coa

accept-coa

Syntax

[**no**] **accept-coa**

Context

[Tree] (config>service>vprn>radius-server>server accept-coa)

[Tree] (config>router>radius-server>server accept-coa)

Full Context

configure service vprn radius-server server accept-coa

configure router radius-server server accept-coa

Description

This command configures this server for Change of Authorization messages. The system will process the CoA request from the external server if configured with this command; otherwise the CoA request is dropped.

The **no** form of this command disables the command.

Platforms

7705 SAR Gen 2

4.4 accept-from-ebgp

accept-from-ebgp

Syntax

accept-from-ebgp *family* [*family*]

no accept-from-ebgp

Context

[Tree] (config>service>vprn>bgp>group>neighbor>link-bandwidth accept-from-ebgp)

[Tree] (config>service>vprn>bgp>group>link-bandwidth accept-from-ebgp)

Full Context

configure service vprn bgp group neighbor link-bandwidth accept-from-ebgp

configure service vprn bgp group link-bandwidth accept-from-ebgp

Description

This command configures BGP to accept and use the link-bandwidth extended community attached to any route received from any EBGP peer in the scope of the command, as long as that route belongs to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of discarding the link-bandwidth extended community in any route received from an EBGP peer.

Default

no accept-from-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

Platforms

7705 SAR Gen 2

accept-from-ebgp

Syntax

accept-from-ebgp *family* [*family*]

no accept-from-ebgp

Context

[Tree] (config>router>bgp>group>neighbor>link-bandwidth accept-from-ebgp)

[Tree] (config>router>bgp>group>link-bandwidth accept-from-ebgp)

Full Context

configure router bgp group neighbor link-bandwidth accept-from-ebgp

configure router bgp group link-bandwidth accept-from-ebgp

Description

This command configures BGP to accept and use the link-bandwidth extended community attached to any route received from any EBGP peer in the scope of the command, as long as that route belongs to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to six families may be configured.

The **no** form of this command restores the default behavior of discarding the link-bandwidth extended community in any route received from an EBGP peer.

Default

no accept-from-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

vpn-ipv4 — Adds a link-bandwidth extended community to IPv4 VPN (SAFI 128) routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

label-ipv6 — Adds a link-bandwidth extended community to labeled-unicast IPv6 routes.

vpn-ipv6 — Adds a link-bandwidth extended community to IPv6 VPN (SAFI 128) routes.

Platforms

accept-orf

Syntax

[**no**] **accept-orf**

Context

[Tree] (config>router>bgp>outbound-route-filtering>extended-community accept-orf)

[Tree] (config>router>bgp>group>outbound-route-filtering>extended-community accept-orf)

[Tree] (config>router>bgp>group>neighbor>outbound-route-filtering>extended-community accept-orf)

Full Context

configure router bgp outbound-route-filtering extended-community accept-orf

configure router bgp group outbound-route-filtering extended-community accept-orf

configure router bgp group neighbor outbound-route-filtering extended-community accept-orf

Description

This command instructs the router to negotiate the receive capability in the BGP ORF negotiation with a peer, and accept filters that the peer wants to send.

The **no** form of this command causes the router to remove the accept capability in the BGP ORF negotiation with a peer, and to clear any existing ORF filters that are currently in place.

Default

no accept-orf

access

Syntax

[**no**] **access**

Context

[Tree] (config>service>vprn>snmp access)

Full Context

configure service vprn snmp access

Description

This command enables SNMP access using VPRN interface addresses. This command allows SNMP messages destined to the VPRN interface IP addresses for this VPRN (including VPRN interfaces that are bound to R-VPLS services) to be processed by the SNMP agent on the router. SNMP messages that arrive on VPRN interfaces but are destined to IP addresses in the Base routing context that can be accessed in the VPRN (for example, the router system address via grt leaking) do not require **snmp access** to be enabled but do require **allow-local-management** to be enabled.

Using an SNMP community defined inside the VPRN context (**configure service vprn snmp community**) allows access to a subset of the full SNMP data model. This subset can be seen in the output of **show system security view "vprn-view"**.

Using an SNMP community defined in the system context (**configure system security snmp community**) allows access to the full SNMP data model (unless otherwise restricted used SNMP views).

Alternatively, grt leaking and a Base routing IP address can be used (along with an SNMP community defined at the system context) to get access to the entire SNMP data model (see the **allow-local-management** command).

The Nokia NSP cannot discover or fully manage an SR OS router using an SNMP community defined inside the VPRN context. Full SNMP access requires using one of the approaches described above.

See the *7705 SAR Gen 2 System Management Guide* for detailed information about SNMP.

access

Syntax

[**no**] **access** [**ftp**] [**snmp**] [**console**] [**li**] [**netconf**] [**grpc**] [**scp-sftp**] [**console-port-cli**] [**ssh-cli**] [**telnet-cli**] [**bluetooth**]

Context

[Tree] (config>system>security>user-template access)

[Tree] (config>system>security>user access)

Full Context

configure system security user-template access

configure system security user access

Description

This command configures user permissions for router management access methods.

To deny an existing access method, enter the **no** form of this command followed by the method to be denied; for example, **no access ftp** denies FTP access.

The **no** form of this command removes the user permission for all management access methods.

Default

no access

Parameters

ftp

Specifies FTP access.

snmp

Specifies SNMP access. This keyword is only configurable in the **configure system security user** context.

console

Specifies Bluetooth, console port CLI, SCP/SFTP, SSH CLI, and Telnet CLI access.

li

Specifies Lawful Intercept (LI) command access.

netconf

Specifies NETCONF access.

grpc

Specifies gRPC access.

scp-sftp

Specifies SCP/SFTP access.

console-port-cli

Specifies console port CLI access.

ssh-cli

Specifies SSH CLI access.

telnet-cli

Specifies Telnet CLI access.

bluetooth

Specifies Bluetooth access.

Platforms

7705 SAR Gen 2

access

Syntax

[**no**] **access group** *group-name* **security-model** *security-model* **security-level** *security-level* [**context** *context-name* [**prefix -match**]] [**read** *view-name-1*] [**write** *view-name-2*] [**notify** *view-name-3*]

Context

[Tree] (config>system>security>snmp access)

Full Context

configure system security snmp access

Description

This command creates an association between a user group, a security model, and the views that the user group can access. Access parameters must be configured unless security is limited to the preconfigured access groups and views for SNMPv1 and SNMPv2. An access group is defined by a unique combination of the group name, security model and security level.

Access groups are used by the usm-community command.

Access must be configured unless security is limited to SNMPv1/SNMPv2c with community strings. See the **community** command.

Default access group configurations cannot be modified or deleted.

To remove the user group with associated, security model(s), and security level(s), use:

no access group *group-name*

To remove a security model and security level combination from a group, use:

no access group *group-name* **security-model** {**snmpv1** | **snmpv2c** | **usm**} **security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}

Parameters

group-name

Specify a unique group name up to 32 characters.

security-model {snmpv1 | snmpv2c | usm}

Specifies the security model required to access the views configured in this node. A group can have multiple security models. For example, one view may only require SNMPv1/ SNMPv2c access while another view may require USM (SNMPv3) access rights.

security-level {no-auth-no-priv | auth-no-priv | privacy}

Specifies the required authentication and privacy levels to access the views configured in this node.

security-level no-auth-no-privacy

Specifies that no authentication and no privacy (encryption) is required. When configuring the user's authentication, select the **none** option.

security-level auth-no-privacy

Specifies that authentication is required but privacy (encryption) is not required. When this option is configured, both the **group** and the **user** must be configured for authentication.

security-level privacy

Specifies that both authentication and privacy (encryption) is required. When this option is configured, both the **group** and the user must be configured for **authentication**. The user must also be configured for **privacy**.

context-name

Specifies a set of SNMP objects that are associated with the context-name.

The *context-name* is treated as either a full context-name string or a context name prefix depending on the keyword specified (**exact** or **prefix**).

prefix-match

Specifies the context name **prefix-match** keywords, **exact** or **prefix**.

The VPRN context names begin with a **vprn** prefix. The numerical value is associated with the service ID that the VPRN was created with and identifies the service in the service domain. For example, when a new VPRN service is created such as **config>service>vprn 2345 customer 1**, a VPRN with context name **vprn2345** is created.

The **exact** keyword specifies that an exact match between the context name and the prefix value is required. For example, when context **vprn2345 exact** is entered, matches for only **vprn2345** are considered.

The **prefix** keyword specifies that only a match between the prefix and the starting portion of context name is required. If only the **prefix** keyword is specified, simple wildcard processing is used. For example, when context **vprn prefix** is entered, all **vprn** contexts are matched.

Default **exact**

view-name-1

Specifies the SNMP view used to control which MIB objects can be accessed using a read (get) operation.

view-name-2

Specifies the SNMP view used to control which MIB objects can be accessed using a write (set) operation.

view-name-3

Specifies the SNMP view used to control which MIB objects can be accessed for notifications.

Values none

4.9 access-algorithm

access-algorithm

Syntax

access-algorithm {**direct** | **round-robin** | **hash-based**}

no access-algorithm

Context

[Tree] (config>aaa>radius-srv-plcy>servers access-algorithm)

Full Context

configure aaa radius-server-policy servers access-algorithm

Description

This command configures the algorithm used to select a RADIUS server from the pool of configured RADIUS servers.

Default

access-algorithm direct

Parameters

direct

Specifies that the first server is used as primary server for all requests, the second as secondary and so on.

round-robin

Specifies that the first server is used as primary server for the first request, the second server as primary for the second request, and so on. If the router gets to the end of the list, it starts again with the first server.

hash-based

Select a RADIUS server based on the calculated hash result of the configured **load-balance-key** under the **radius-proxy server** hierarchy. This parameter is only applicable for radius-proxy server scenarios and results in an unpredictable RADIUS server selection if used in other scenarios.

Platforms

7705 SAR Gen 2

[Tree] (config>system>security>tacplus>request-format access-operation-cmd)

Full Context

configure service vprn aaa remote-servers tacplus request-format access-operation-cmd

configure system security tacplus request-format access-operation-cmd

Description

This command sends an operation argument in authorization requests.

In model-driven interfaces, this command configures the system to send the operation in the cmd argument, and the path in the cmd-args argument, in TACACS+ authorization requests. This command does not apply to authorization requests in classic interfaces.

The **no** form of this command removes the operation from the configuration.

Default

no access-operation-cmd

Parameters

access-operation

Specifies that an operation in the authorization request is sent.

Values delete — Keyword that sends the operation "cmd=delete" and "cmd-args=path".

Platforms

7705 SAR Gen 2

[Tree] (config>system>security>tacplus accounting)

Full Context

configure service vprn aaa remote-servers tacplus accounting

configure system security tacplus accounting

Description

This command configures the type of accounting record packet that is to be sent to the TACACS+ server. The **record-type** parameter indicates whether TACACS+ accounting start and stop packets be sent or just stop packets be sent.

Default

no accounting

Parameters

record-type start-stop

Specifies that a TACACS+ start packet is sent whenever the user executes a command and a TACACS+ stop packet when command execution is complete.

record-type stop-only

Specifies that only a TACACS+ stop packet is sent whenever the command execution is complete.

Platforms

7705 SAR Gen 2

4.12 accounting-files-total-size

accounting-files-total-size

Syntax

accounting-files-total-size *megabytes*

Context

[Tree] (config>log>storage accounting-files-total-size)

Full Context

configure log file-storage-control accounting-files-total-size

Description

This command configures the limit for the total space that all accounting files can occupy on each storage device on the active CPM.

When this threshold is reached, new accounting files are no longer created in the `\act-collect` directory of the storage device until SR OS removes older accounting files from the `\act` directory and the occupancy is below the limit. Currently open, in-progress accounting files in the `\act-collect` directory are not affected by this limit and are completed.

When unconfigured, there is no specific limit for the total size of all accounting files.

Only accounting files in the `\act` directory with system generated names (including no file extension) are applicable toward the total size limit.

If a user manually adds or deletes accounting files from the `\act` directory, the size of the files is not taken into account for up to 1 hour.

The configured total size limit is not validated against the actual size of the installed storage devices. If the configured limit is larger than the installed compact flash (CF) device, the limit is never reached.

The **no** form of this command removes the total size limit for accounting files.

Default

no accounting-files-total-size

Parameters

megabytes

Specifies the total size limit for accounting files, in MB.

Values 50 to 4,194,304 MBytes (4 TBytes, 2^{22} MB)

Default 0

Platforms

7705 SAR Gen 2

configure service vprn interface sap accounting-policy

configure service vpls spoke-sdp accounting-policy

configure service vpls mesh-sdp accounting-policy

configure service vprn interface spoke-sdp accounting-policy

configure service ies interface sap accounting-policy

Description

This command creates the accounting policy context that can be applied to an interface SAP or interface SAP spoke SDP.

An accounting policy must be defined before it can be associated with a SAP or SDP.

If the *policy-id* does not exist, an error message is generated.

A maximum of one accounting policy can be associated with a SAP or SDP at one time. Accounting policies are configured in the **config>log** context.

The **no** form of this command removes the accounting policy association from the SAP or SDP, and the accounting policy reverts to the default.

Default

no accounting policy

Parameters

acct-policy-id

Specifies the accounting *policy-id* as configured in the **config>log>accounting-policy** context.

Values 1 to 99

Platforms

7705 SAR Gen 2

accounting-policy

Syntax

accounting-policy *acct-policy-id*

no accounting-policy

Context

[Tree] (config>card>fp>ingress>access>queue-group accounting-policy)

[Tree] (config>card>fp>ingress>network>queue-group accounting-policy)

Full Context

configure card fp ingress access queue-group accounting-policy

configure card fp ingress network queue-group accounting-policy

Description

This command configures an accounting policy that can apply to a queue-group on the forwarding plane.

An accounting policy must be configured before it can be associated to an interface. If the accounting *policy-id* does not exist, an error is returned.

Accounting policies associated with service billing can only be applied to SAPs. The accounting policy can be associated with an interface at a time.

The **no** form of this command removes the accounting policy association from the queue-group.

Default

No accounting policies are specified by default. You must explicitly specify a policy. If configured, the accounting policy configured as the default is used.

Parameters

acct-policy-id

Specifies the name of the accounting policy to use for the queue-group.

Values 1 to 99

Platforms

7705 SAR Gen 2

configure port ethernet network egress queue-group accounting-policy

configure port ethernet network accounting-policy

configure port ethernet access ingress queue-group accounting-policy

configure port ethernet accounting-policy

configure port ethernet access egress queue-group accounting-policy

Description

This command configures an accounting policy that can apply to an interface.

An accounting policy must be configured before it can be associated to an interface. If the accounting *policy-id* does not exist, an error is returned.

Accounting policies associated with service billing can only be applied to SAPs. Accounting policies associated with network ports can only be associated with interfaces. Only one accounting policy can be associated with an interface at a time.

The **no** form of this command removes the accounting policy association from the network interface, and the accounting policy reverts to the default.

Default

No accounting policies are specified by default. You must explicitly specify a policy. If configured, the accounting policy configured as the default is used.

Parameters

policy-id

The accounting *policy-id* of an existing policy. Accounting policies record either service (access) or network information. A network accounting policy can only be associated with the network port configurations. Accounting policies are configured in the **config>log>accounting-policy** context.

Values 1 to 99

Description

This command creates the accounting policy context that can be applied to an SDP. An accounting policy must be defined before it can be associated with a SDP. If the *acct-policy-id* does not exist, an error message is generated.

A maximum of one accounting policy can be associated with a SDP at one time. Accounting policies are configured in the **config>log** context.

The **no** form of this command removes the accounting policy association from the SDP, and the accounting policy reverts to the default.

Default

no accounting-policy

Parameters

acct-policy-id

Specifies the accounting *policy-id* as configured in the **config>log>accounting-policy** context.

Values 1 to 99

Platforms

7705 SAR Gen 2

accounting-policy

Syntax

accounting-policy *policy-id* [**interval** *minutes*]

no accounting-policy *policy-id*

Context

[Tree] (config>log accounting-policy)

Full Context

configure log accounting-policy

Description

This command creates an access or network accounting policy. An accounting policy defines the accounting records that are created.

Access accounting policies are policies that can be applied to one or more SAPs. Changes made to an existing policy, using any of the sub-commands, are applied immediately to all SAPs where this policy is applied.

If an accounting policy is not specified on a SAP, then accounting records are produced in accordance with the access policy designated as the **default**. If a default access policy is not specified, then no accounting records are collected other than the records for the accounting policies that are explicitly configured.

Only one policy can be regarded as the default access policy. If a policy is configured as the default policy, then a **no default** command must be used to allow the data that is currently being collected to be written before a new access default policy can be configured.

Network accounting policies are policies that can be applied to one or more network ports or SONET/SDH channels. Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all network ports or SONET/SDH channels where this policy is applied.

If no accounting policy is defined on a network port, accounting records will be produced in accordance with the default network policy as designated with the **default** command. If no network default policy is created, then no accounting records will be collected other than the records for the accounting policies explicitly configured. Default accounting policies cannot be explicitly applied. For example, for **accounting-policy 10**, if default is set, then that policy cannot be used:

```
A:node-2>config>service>vpls>spoke-sdp# accounting-policy 10
```

Only one policy can be regarded as the default network policy. If a policy is configured as the default policy, then a **no default** command must be used to allow the data that is currently being collected to be written before a new network default policy can be configured.

The **no** form of this command deletes the policy from the configuration. The accounting policy cannot be removed unless it is removed from all the SAPs, network ports or channels where the policy is applied.

Parameters

policy-id

Specifies the policy ID that uniquely identifies the accounting policy, expressed as a decimal integer.

Values 1 to 99

Platforms

7705 SAR Gen 2

4.14 accounting-port

accounting-port

Syntax

accounting-port *port*

no accounting-port

4.15 acct-interim

acct-interim

Syntax

acct-interim min *min-val* **max** *max-val* **lifetime** *lifetime*

no acct-interim

Context

[Tree] (config>aaa>radius-srv-plcy>servers>buffering acct-interim)

Full Context

configure aaa radius-server-policy servers buffering acct-interim

Description

This command enables RADIUS accounting interim update message buffering.

1. The message is stored in the buffer, a lifetime timer is started and the message is sent to the RADIUS server
2. If after retry*timeout seconds no RADIUS accounting response is received for the interim update then a new attempt to send the message is started after minimum[(min-val*2n), max-val] seconds.
3. Repeat step 2 until for one of the following:
   a. a RADIUS accounting response is received.
   b. the lifetime of the buffered message expires.
   c. a new RADIUS accounting interim-update or a RADIUS accounting stop for the same accounting session-id and radius-server-policy is stored in the buffer.
   d. the message is manually purged from the message buffer via a clear command.
4. The message is purged from the buffer.

The **no** form of this command disables RADIUS accounting interim update message buffering.

Parameters

min-val

Specifies the minimum interval in seconds between attempts to resend the RADIUS accounting interim update.

Values 1 to 3600

max-val

Specifies the maximum interval in seconds between attempts to resend the RADIUS accounting interim update.

Values 1 to 3600

lifetime

Specifies the lifetime in hours.

Values 1 to 25

Platforms

7705 SAR Gen 2

4.16 acct-on-off

acct-on-off

Syntax

acct-on-off

acct-on-off monitor-group *group-name*

acct-on-off oper-state-change [**group** *group-name*]

Context

[Tree] (config>aaa>radius-srv-plcy acct-on-off)

Full Context

configure aaa radius-server-policy acct-on-off

Description

This command controls the sending of Accounting-On and Accounting-Off messages and the acct-on-off oper-state of the radius-server-policy:

acct-on-off: enables the sending of Accounting-On and Accounting-Off messages for this radius-server-policy. The acct-on-off oper-state is always not blocked.

acct-on-off oper-state-change [group *group-name*]: enables the sending of Accounting-On and Accounting-Off messages for this radius-server-policy. The acct-on-off oper-state is function of the Accounting-response received for the Accounting-On and Accounting-Off. Optionally, sets the acct-on-off oper-state of the acct-on-off-group.

acct-on-off monitor-group *group-name*: no Accounting-On and Accounting-Off messages are sent for this radius-server-policy. The acct-on-off oper-state is inherited from the acct-on-off-group.

The **no** form of this command disables the sending of Accounting-On and Accounting-Off messages.

Parameters

group-name

Specifies the name of an acct-on-off group up to 32 characters.

Platforms

7705 SAR Gen 2

4.17 acct-port

acct-port

Syntax

acct-port *port*

no acct-port

Full Context

configure service vprn radius-server server acct-port

configure router radius-server server acct-port

Description

This command specifies the UDP listening port for RADIUS accounting requests.

The **no** form of this command resets the UDP port to its default value (1813).

Default

acct-port 1813

Parameters

port

Specifies the UDP listening port for accounting requests of the external RADIUS server.

Values 1 to 65535

Platforms

7705 SAR Gen 2

4.18 acct-stats

acct-stats

Syntax

[**no**] **acct-stats**

Context

[Tree] (config>ipsec>rad-acct-plcy>include acct-stats)

Full Context

configure ipsec radius-accounting-policy include-radius-attribute acct-stats

Description

This command enables the system to include accounting attributes in RADIUS acct-stop and interim-update packets.

The **no** form of this command disables the system from including accounting attributes in RADIUS acct-stop and interim-update packets.

Platforms

7705 SAR Gen 2

4.19 acct-stop

acct-stop

Syntax

acct-stop min *min-val* **max** *max-val* **lifetime** *lifetime*

no acct-stop

Context

[Tree] (config>aaa>radius-srv-plcy>servers>buffering acct-stop)

Full Context

configure aaa radius-server-policy servers buffering acct-stop

Description

This command enables RADIUS accounting stop message buffering.

1. The message is stored in the buffer, a lifetime timer is started and the message is sent to the RADIUS server
2. If after retry*timeout seconds no RADIUS accounting response is received for the accounting stop, then a new attempt to send the message is started after minimum[(min-val*2n), max-val] seconds.
3. Repeat step 2 until one of the following events occurs:
   a. A RADIUS accounting response is received.
   b. The lifetime of the buffered message expires.
   c. The message is manually purged from the message buffer via a clear command.
4. The message is purged from the buffer.

The **no** form of this command disables RADIUS accounting stop message buffering.

Parameters

min-val

Specifies the minimum interval in seconds between attempts to resend the RADIUS accounting stop.

Values 1 to 3600

max-val

Specifies the maximum interval in seconds between attempts to resend the RADIUS accounting stop.

Values 1 to 3600

lifetime

Specifies the lifetime in hours.

Values 1 – 25

action

Syntax

action {**accept** | **next-entry** | **next-policy** | **drop** | **reject**}

no action

Context

[Tree] (config>router>policy-options>policy-statement>entry action)

Full Context

configure router policy-options policy-statement entry action

Description

This command creates the context to configure actions to take for routes matching a route policy statement entry.

This command is required and must be entered for the entry to be active.

Any route policy entry without the **action** command will be considered incomplete and will be inactive.

The **no** form of this command deletes the action context from the entry.

Default

no action

Parameters

accept

Specifies that routes matching the entry match criteria will be accepted and propagated.

next-entry

Specifies that the actions specified would be made to the route attributes and then policy evaluation would continue with next policy entry (if any others are specified).

next-policy

Specifies that the actions specified would be made to the route attributes and then policy evaluation would continue with next route policy (if any others are specified).

drop

Specifies that routes matching the entry match criteria should be rejected. This parameter provides a context for modifying route properties.

reject

Specifies that routes matching the entry match criteria should be rejected. This parameter does not provide a context for modifying route properties.

[Tree] (config>service>vprn>if>dhcp>option action)

Full Context

configure service vpls sap dhcp option action

configure service ies interface dhcp option action

configure service vprn interface dhcp option action

Description

This command configures the processing required when the SR OS receives a DHCP request that already has a Relay Agent Information Option (Option 82) field in the packet.

The **no** form of this command returns the system to the default value.

Default

action keep — Per RFC 3046, *DHCP Relay Agent Information Option*, section 2.1.1, *Reforwarded DHCP requests*. The default is to keep the existing information intact. The exception to this is if the giaddr of the received packet is the same as the ingress address on the router. In that case the packet is dropped and an error is logged.

Parameters

replace

In the upstream direction (from the user), the existing Option 82 field is replaced with the Option 82 field from the router. In the downstream direction (towards the user) the Option 82 field is stripped (in accordance with RFC 3046).

drop

Specifies that the packet is dropped, and an error is logged.

keep

Specifies that the existing information is kept in the packet and the router does not add any additional information. In the downstream direction the Option 82 field is not stripped and is sent on towards the client.

The behavior is slightly different in case of Vendor Specific Options (VSOs). When the keep parameter is specified, the router inserts its own VSO into the Option 82 field. This is only done when the incoming message has already an Option 82 field.

If no Option 82 field is present, the router will not create the Option 82 field. In this in that case, no VSO is added to the message.

Platforms

7705 SAR Gen 2

action

Syntax

action {**drop** | **forward**}

no action

Context

[Tree] (config>service>vprn>log>filter>entry action)

[Tree] (config>log>filter>entry action)

Full Context

configure service vprn log filter entry action

configure log filter entry action

Description

This command specifies a drop or forward action associated with the filter entry. If neither **drop** nor **forward** is specified, the default-action will be used for traffic that conforms to the match criteria. This could be considered a No-Op filter entry used to explicitly exit a set of filter entries without modifying previous actions.

Multiple action statements entered will overwrite previous actions.

The **no** form of this command removes the specified action statement.

Default

Action specified by the **default-action** command will apply.

Parameters

drop

Specifies packets matching the entry criteria will be dropped.

forward

Specifies packets matching the entry criteria will be forwarded.

Platforms

7705 SAR Gen 2

action

Syntax

action {**drop** | **forward**}

no action

Context

[Tree] (config>log>filter>entry action)

Full Context

configure log filter entry action

Description

This command specifies a drop or forward action associated with the filter entry. If neither **drop** nor **forward** is specified, the **default-action** will be used for traffic that conforms to the match criteria. This could be considered a No-Op filter entry used to explicitly exit a set of filter entries without modifying previous actions.

Multiple action statements entered will overwrite previous actions.

The **no** form of this command removes the specified **action** statement.

Default

no action

Parameters

drop

Specifies packets matching the entry criteria will be dropped.

forward

Specifies packets matching the entry criteria will be forwarded.

Platforms

7705 SAR Gen 2

action

Syntax

action {**log-only** | **reset-mda** | **fail-mda**}

no action

Context

[Tree] (config>card>mda>event action)

Full Context

configure card mda event action

Description

This command defines the action to be taken when a specific hardware error event is raised against the target mda.

Only one action can be enabled at a time. Entering a new action will override a previously defined action.

The **no** form of this command sets the action to the default value.

Default

action log-only

Parameters

log-only

Specifies to pass the log event to log management. No other action is taken.

reset-mda

Specifies to reset the mda.

fail-mda

Specifies to set the operational state of the mda to Failed. This Failed state will persist until the clear mda command is issued (reset) or the mda is removed and re-inserted (re-seat).

Platforms

7705 SAR Gen 2

action

Syntax

[**no**] **action**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization action)

no action

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

action

Syntax

[**no**] **action** [**secondary**]

Context

[Tree] (config>filter>ip-filter>entry action)

[Tree] (config>filter>ipv6-filter>entry action)

Full Context

configure filter ip-filter entry action

configure filter ipv6-filter entry action

Description

Commands in this context configure a primary (no option specified) or secondary (**secondary** option specified) action to be performed on packets matching this filter entry. An ACL filter entry remains inactive (is not programmed in hardware) until a specific action is configured for that entry.

A primary action supports any filter entry action, a secondary action is used for redundancy and defines a redundant Layer 3 PBR action for an Layer 3 PBR primary action or a redundant L2 PBF action for a Layer 2 PBF primary action.

The **no** form of this command removes the specific action configured in the context of the action command. The primary action cannot be removed if a secondary action exists.

Default

no action

Parameters

secondary

Specifies a secondary action to be performed on packets matching this filter entry. A secondary action can only be configured if a primary action is configured.

Platforms

7705 SAR Gen 2

action

Syntax

action [**fc** *fc-name*] [**priority** {**high** | **low**}] [**policer** *policer-id*]

no action

Context

[Tree] (config>qos>sap-ingress>ipv6-criteria>entry action)

[Tree] (config>qos>sap-ingress>ip-criteria>entry action)

[Tree] (config>qos>sap-ingress>mac-criteria>entry action)

Full Context

configure qos sap-ingress ipv6-criteria entry action

configure qos sap-ingress ip-criteria entry action

configure qos sap-ingress mac-criteria entry action

Description

This mandatory command associates the forwarding class or enqueuing priority with specific IP, IPv6, or MAC criteria entry ID. The action command supports setting the forwarding class parameter to a subclass. Packets that meet all match criteria within the entry have their forwarding class and enqueuing priority overridden based on the parameters included in the **action** parameters. When the forwarding class is not specified in the **action** command syntax, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the action, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

When a policer is specified in the action, a matching packet is directed to the configured policer instead of the policer/queue assigned to the forwarding class of the packet.

The **action** command must be executed for the match criteria to be added to the active list of entries. If the entry is designed to prevent more explicit (higher entry ID) entries from matching certain packets, the **fc** *fc-name* and **match** *protocol* fields should not be defined when executing action. This allows packets matching the entry to preserve the forwarding class and enqueuing priority derived from previous classification rules.

Each time action is executed on a specific entry ID, the previously entered values for **fc** *fc-name* and **priority** are overridden with the newly defined parameters or inherit previous matches when a parameter is omitted.

The **no** form of this command removes the entry from the active entry list. Removing an entry on a policy immediately removes the entry from all SAPs using the policy. All previous parameters for the action is lost.

If no action is specified, the action specified by the **default-fc** command will be used.

Parameters

fc *fc-name*

The value given for **fc** *fc-name* must be one of the predefined forwarding classes in the system. Specifying the **fc** *fc-name* is required. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Default Inherit (When **fc** *fc-name* is not defined, the rule preserves the previous forwarding class of the packet.)

priority

The **priority** parameter overrides the default enqueuing priority for all packets received on a SAP using this policy that match this rule. Specifying the priority (**high** or **low**) is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Default Inherit (When the **priority** (**high** or **low**) is not defined, the rule preserves the previous enqueuing priority of the packet)

high

The **high** parameter is used in conjunction with the **priority** parameter. Setting the **priority** enqueuing parameter to **high** for a packet increases the likelihood to enqueue the packet when the queue is congested. The enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the queue, the significance of the enqueuing priority is lost.

low

The **low** parameter is used in conjunction with the **priority** parameter. Setting the **priority** enqueuing parameter to **low** for a packet decreases the likelihood to enqueue the packet when the queue is congested. The enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Default Inherit

policer-id

A valid policer-id must be specified. The parameter policer-id references a policer-id that has already been created within the sap-ingress QoS policy.

Values 1 to 63

Context

[Tree] (config>qos>sap-egress>ip-criteria>entry action)

[Tree] (config>qos>sap-egress>ipv6-criteria>entry action)

Full Context

configure qos sap-egress ip-criteria entry action

configure qos sap-egress ipv6-criteria entry action

Description

This command defines the reclassification actions that should be performed on any packet matching the defined IP flow criteria within the entries match node. When defined under the **ip-criteria** context, the reclassification only applies to IPv4 packets. When defined under the **ipv6-criteria** context, the reclassification only applies to IPv6 packets.

If an egress packet on the SAP matches the specified IP flow entry, the forwarding class, or profile or egress queue accounting behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions. Matching an IP flow reclassification entry will override all IP precedence- or DSCP-based reclassification rule actions when an explicit reclassification action is defined for the entry.

It is also possible to redirect the egress packet to a configured policer. The forwarding class or profile can also be optionally specified.

When an IP flow entry is first created, the entry will have no explicit behavior defined as the reclassification actions to be performed. In **show** and **info** commands, the entry will display no action as the specified reclassification action for the entry. When the entry is defined with no action, the entry will not be populated in the IP flow reclassification list used to evaluate packets egressing a SAP with the SAP egress policy defined. An IP flow reclassification entry is only added to the evaluation list when the action command for the entry is executed either with explicit reclassification entries or without any actions defined. Specifying action without any trailing reclassification actions allows packets matching the entry to exit the evaluation list without matching entries lower in the list. Executing no action on an entry removes the entry from the evaluation list and also removes any explicitly defined reclassification actions associated with the entry.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior.

The **policer** keyword is optional. When specified, the egress packet will be redirected to the configured policer. Optional parameters allow the user to control how the forwarded policed traffic exits the egress port. By default, the policed forwarded traffic will use a queue in the egress port's policer-output-queue queue group; alternatively, a queue in an instance of a user-configured queue group can be used or a local SAP egress queue.

The **no** form of this command removes all reclassification actions from the IP flow reclassification entry and also removes the entry from the evaluation list. An entry removed from the evaluation list will not be matched to any packets egress a SAP associated with the SAP egress QoS policy.

Parameters

fc *fc-name*

The fc reclassification action is optional. When specified, packets matching the IP flow reclassification entry will be explicitly reclassified to the forwarding class specified as fc-name regardless of the ingress classification decision. The fc-name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the IP flow entry, the action command must be re-executed without the fc reclassification action defined.

Values

fc	class	
	class	be, l2, af, l1, h2, ef, h1, nc

profile {in | out | exceed | inplus}

The profile reclassification action is optional. When specified, packets matching the IP flow reclassification entry will be explicitly reclassified to the configured profile regardless of the ingress profiling decision. To remove the profile reclassification action for the IP flow reclassification entry, the action command must be re-executed without the profile reclassification action defined.

in

The **in** parameter is mutually exclusive to the **exceed**, **inplus**, and **out** parameters following the profile reclassification action keyword. **In, exceed**, **inplus**, or **out** must be

specified when the profile keyword is present. When **in** is specified, any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

The **out** parameter is mutually exclusive to the **exceed**, **inplus**, and **in** parameters following the profile reclassification action keyword. **In, exceed**, **inplus**, or **out** must be specified when the profile keyword is present. When **out** is specified, any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

The **exceed** parameter is mutually exclusive to the **out**, **inplus**, and **in** parameters following the profile reclassification action keyword. **In, exceed**, **inplus**, or **out** must be specified when the profile keyword is present. When **exceed** is specified, any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

The **inplus** parameter is mutually exclusive to the **out**, **exceed**, and **in** parameters following the profile reclassification action keyword. **In, exceed**, **inplus**, or **out** must be specified when the profile keyword is present. When **inplus** is specified, any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

policer *policer-id*

When the action policer command is executed, a valid policer ID must be specified. The parameter policer ID references a policer ID that has already been created within the SAP egress QoS policy.

Values 1 to 63

port-redirect-group-queue queue *queue-id*

Used to override the forwarding class default egress queue destination to an egress port queue group. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the SAP. Therefore, this parameter is only valid if SAP-based redirection is required. The queue parameter overrides the policer's default egress queue destination to a specified queue-id in the egress port queue group instance.

Values 1 to 8

queue *queue-id*

This parameter overrides the policer's default egress queue destination to a specified local SAP queue of that queue-id. A queue of ID queue-id must exist within the egress QoS policy.

Values 1 to 8

use-fc-mapped-queue

This parameter overrides the policer's default egress queue destination to the queue mapped by the traffic's forwarding class.

Platforms

7705 SAR Gen 2

action

Syntax

action [**fc** *fc-name* **profile** {**in** | **out** | **exceed** | **inplus**}] [**port-redirect-group** {**queue** *queue-id* | **policer** *policer-id* [**queue** *queue-id*]}]

Context

[Tree] (config>qos>network>egress>ip-criteria>entry action)

[Tree] (config>qos>network>egress>ipv6-criteria>entry action)

Full Context

configure qos network egress ip-criteria entry action

configure qos network egress ipv6-criteria entry action

Description

This command defines the reclassification actions that are performed on any packet matching the defined IP flow criteria within the entry's matched node. When defined under the **ip-criteria** context, the reclassification only applies to IPv4 packets. When defined under the **ipv6-criteria** context, the reclassification only applies to IPv6 packets.

If an egress packet matches the specified IP flow entry, the forwarding class and profile may be overridden. By default, the forwarding class and profile of the packet are derived from ingress classification and profiling functions. Matching an IP flow reclassification entry will override all IP precedence-based or DSCP-based reclassification rule actions when an explicit reclassification action is defined for the entry.

When an IP flow entry is first created, the entry will have no explicit behavior defined as the reclassification actions to be performed. When the entry is defined with no action, the entry will not be populated in the IP flow reclassification list used to evaluate egress packets. An IP flow reclassification entry is only added to the evaluation list when the action command for the entry is executed.

The **fc** and **profile** keywords are optional. When specified, the egress classification rule will overwrite the forwarding class and profile derived from ingress. The new forwarding class and profile are used for egress remarking, queue mapping decisions, and queue congestion behavior.

The **port-redirect-group** keyword is optional. When specified, the egress packet will be redirected to the configured queue or policer in the specified egress network queue group. By default, the policed forwarded traffic will use the regular network queue to which the packet's forwarding class is mapped. Alternatively, a queue in the network egress queue group instance can be used for post-policed traffic by specifying a queue after the **policer** parameter. The **port-redirect-group** keyword requires that the network egress queue group instance is specified when this network QoS policy is applied to a network interface.

The **no** form of this command removes all reclassification actions from the IP flow reclassification entry and also removes the entry from the evaluation list. An entry removed from the evaluation list will not be matched to any egress packets.

Default

no action

Parameters

fc *fc-name*

The fc reclassification action is optional. When specified, packets matching the IP flow reclassification entry will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The *fc-name* defined must be one of the eight forwarding classes supported by the system. The profile reclassification action is mandatory when an **fc** is specified. To remove the forwarding class reclassification action for the IP flow entry, the action command must be re-executed without the fc reclassification action defined.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out | exceed | inplus}

The profile reclassification action is mandatory when an fc is specified, otherwise it is optional. When specified, packets matching the IP flow reclassification entry will be explicitly reclassified to the configured profile regardless of the ingress profiling decision. **In**, **exceed**, **inplus**, or **out** must be specified when the profile keyword is present. To remove the profile reclassification action for the IP flow reclassification entry, the action command must be re-executed without the profile reclassification action defined.

in

When specified, any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

When specified, any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

When specified, any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

When specified, any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

queue *queue-id*

Used to override the forwarding class default egress queue destination to the specified network egress queue group instance queue. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the network interface.

Values 1 to 8

policer *policer-id*

Specifies a valid policer ID that has already been created within the network egress queue group instance.

Values 1 to 16

queue *queue-id*

The queue following the configured policer overrides the default policed traffic egress queue destination to a specified queue in the network egress queue group instance.

Values 1 to 8

7705 SAR Gen 2

action

Syntax

action fc *fc-name* **profile** {**in** | **out**}

no action

Context

[Tree] (config>qos>network>ingress>ipv6-criteria>entry action)

[Tree] (config>qos>network>ingress>ip-criteria>entry action)

Full Context

configure qos network ingress ipv6-criteria entry action

configure qos network ingress ip-criteria entry action

Description

This command defines the reclassification actions that are performed on any packet matching the defined IP flow criteria within the entry's matched node. When defined under the **ip-criteria** context, the reclassification only applies to IPv4 packets. When defined under the **ipv6-criteria** context, the reclassification only applies to IPv6 packets.

If an ingress packet matches the specified IP flow entry, the forwarding class and profile may be overridden. By default, the forwarding class and profile of the packet are derived from ingress classification and profiling functions. Matching an IP flow reclassification entry will override all non-criteria reclassification rule actions when an explicit reclassification action is defined for the entry.

When an IP flow entry is first created, the entry will have no explicit behavior defined as the reclassification actions to be performed. When the entry is defined with no action, the entry will not be populated in the IP flow reclassification list used to evaluate ingress packets. An IP flow reclassification entry is only added to the evaluation list when the action command for the entry is executed.

The **no** form of this command removes all reclassification actions from the IP flow reclassification entry and also removes the entry from the evaluation list. An entry removed from the evaluation list will not be matched to any ingress packets.

Default

no action

Parameters

fc *fc-name*

The fc reclassification action is optional. When specified, packets matching the IP flow reclassification entry will be explicitly reclassified to the forwarding class specified as *fc-*

name regardless of the ingress classification decision. The *fc-name* defined must be one of the eight forwarding classes supported by the system. The profile reclassification action is mandatory when an **fc** is specified. To remove the forwarding class reclassification action for the IP flow entry, the action command must be re-executed without the fc reclassification action defined.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

The profile reclassification action is mandatory. Packets matching the IP flow reclassification entry will be explicitly reclassified to the configured profile regardless of other ingress profiling decisions. **In** or **out** must be specified when the profile keyword is present. To remove the profile reclassification action for the IP flow reclassification entry, the action command must be re-executed without the profile reclassification action defined.

in

When specified, any packets matching the reclassification rule will be treated as in-profile by the ingress forwarding plane.

out

When specified, any packets matching the reclassification rule will be treated as out-of-profile by the ingress forwarding plane.

7705 SAR Gen 2

action

Syntax

action {**replace** | **drop** | **keep**}

no action

Context

[Tree] (config>router>if>dhcp>option action)

Full Context

configure router interface dhcp option action

Description

This command configures the processing required when the router receives a DHCP request that already has a Relay Agent Information Option (Option 82) field in the packet.

The **no** form of this command returns the system to the default value.

Default

Per RFC 3046, *DHCP Relay Agent Information Option*, section 2.1.1, *Reforwarded DHCP requests*, the default is to keep the existing information intact. The exception to this is if the GI address of the received

packet is the same as the ingress address on the router. In that case the packet is dropped and an error is logged.

Parameters

replace

In the upstream direction (from the user), the existing Option 82 field is replaced with the Option 82 field from the router. In the downstream direction (toward the user) the Option 82 field is stripped (in accordance with RFC 3046).

drop

The packet is dropped, and an error is logged.

keep

The existing information is kept in the packet and the router does not add any additional information. In the downstream direction the Option 82 field is not stripped and is sent on toward the client.

The behavior is slightly different in case of Vendor Specific Options (VSOs). When the keep parameter is specified, the router will insert his own VSO into the Option 82 field. This will only be done when the incoming message has already an Option 82 field.

If no Option 82 field is present, the router will not create the Option 82 field. In this in that case, no VSO will be added to the message.

Full Context

configure system security management-access-filter mac-filter entry action

configure system security management-access-filter ipv6-filter entry action

configure system security management-access-filter ip-filter entry action

Description

This command creates the action associated with the management access filter match criteria entry.

The **action** keyword is required. If no **action** is defined, the filter is ignored. If multiple action statements are configured, the last one overwrites previous configured actions.

If the packet does not meet any of the match criteria the configured **default action** is applied.

Parameters

permit

Specifies that packets matching the configured criteria will be permitted.

deny

Specifies that packets matching the configured selection criteria will be denied and that a ICMP host unreachable message will not be issued.

deny-host-unreachable

Specifies that packets matching the configured selection criteria will be denied and that a host unreachable message will not be issued.

The **deny-host-unreachable** parameter only applies to ip-filter and ipv6-filter.

Platforms

7705 SAR Gen 2

action

Syntax

action {**deny** | **permit** | **read-only**}

Context

[Tree] (config>system>security>profile>entry action)

Full Context

configure system security profile entry action

Description

This command configures the action associated with the profile entry.

Parameters

deny

Specifies that commands matching the entry command match criteria are to be denied.

permit

Specifies that commands matching the entry command match criteria is permitted.

read-only

Specifies the commands matching the entry command match criteria is available with read-only access.

4.24 activate

activate

Syntax
activate [*file-url*] [**now**]

Context
[Tree] (admin>system>license activate)

Full Context
admin system license activate

Description
This command performs an activation on the license file pointed to by the command line argument. The file is first validated as described in the **admin>system>license>validate** command and upon success, replaces the existing license attributes in the system with the information in the new license file.

The license attributes that are active on a system can be viewed with the **show>licensing>entitlements** command.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

Values local-url, remote-url

now

If the **now** keyword is not present, the operator is prompted to confirm the activation. With the **now** keyword the license file is activated without the additional prompt.

Platforms

7705 SAR Gen 2

activate

Syntax

activate card *cpm-slot* **serial-number** *cpm-serial-number* **confirmation-code** *code*

Context

[Tree] (admin>system>security>secure-boot activate)

Full Context

admin system security secure-boot activate

Description

This command activates Secure Boot to enforce digital signature verification of the software on every boot.

Once Secure Boot is activated on a CPM, the capability is permanently enabled and cannot be disabled.

Parameters

cpm-slot

Specifies the CPM slot.

Values A,B

cpm-serial-number

Specifies the CPM serial number, up to 256 characters.

code

Specifies the secure boot confirmation code, up to 32 characters.

Platforms

7705 SAR Gen 2

4.25 active-hold-delay

active-hold-delay

Syntax

active-hold-delay *active-hold-delay*

no active-hold-delay

Context

[Tree] (config>service>epipe>endpoint active-hold-delay)

Full Context

configure service epipe endpoint active-hold-delay

Description

This command specifies that the node will delay sending the change in the T-LDP status bits for the VLL endpoint when the MC-LAG transitions the LAG subgroup which hosts the SAP for this VLL endpoint from **active** to **standby** or when any object in the endpoint. For example, SAP, ICB, or regular spoke SDP, transitions from up to down operational state.

By default, when the MC-LAG transitioned the LAG subgroup which hosts the SAP for this VLL endpoint from **active** to **standby**, the node sends immediately new T-LDP status bits indicating the new value of "standby" over the spoke SDPs which are on the mate-endpoint of the VLL. The same applies when any object in the endpoint changes an operational state from up to down.

There is no delay applied to the VLL endpoint status bit advertisement when the MC-LAG transitions the LAG subgroup which hosts the SAP from **standby** to **active** or when any object in the endpoint transitions to an operationally up state.

Default

active-hold-delay 0

Parameters

active-hold-delay

Specifies the active hold delay in 100s of milliseconds.

A value of zero means that when the MC-LAG transitioned the LAG subgroup which hosts the SAP for this VLL endpoint from **active** to **standby,** the node sends immediately new T-LDP status bits indicating the new value of **standby** over the spoke SDPs which are on the mate-endpoint of the VLL. The same applies when any object in the endpoint changes an operational state from up to down.

Values 0 to 60

Platforms

7705 SAR Gen 2

4.26 active-mda-limit

active-mda-limit

Syntax

active-mda-limit *number*

no active-mda-limit

Context

[Tree] (config>isa>nat-group active-mda-limit)

Full Context

configure isa nat-group active-mda-limit

Description

This command configures the number of active ESA-VM or ISA members in a NAT group.

The system automatically selects which ESA-VMs or ISAs are active. In active/standby (A/S) redundancy mode, the correlation between ESA-VM or ISA members is direct, meaning each ESA-VM or ISA equates to one member. In active/active (A/A) redundancy mode, an individual ESA-VM or ISA may be associated with multiple members.

For A/S redundancy, any surplus ESA-VMs or ISAs beyond the configured active threshold automatically transition to standby. These standby units remain idle until an active unit fails, at which point a standby unit takes over, handling traffic from only one failed active unit. This setup allows for the configuration of multiple standby units to provide resilience against several concurrent failures.

In A/A redundancy, the combination of this command and the **failed-mda-limit** command guides the distribution of resources among ESA-VMs or ISAs, essentially defining how the members are structured.

In both A/S and A/A modes, the system strives to maintain the configured number of active members as outlined by the active MDA limit, drawing from the pool of available spare resources to compensate for any failures. If the actual number of active members drops below this limit because of a lack of available spares, the NAT group status changes to degraded. In this state, traffic intended for the missing ESA-VM or ISA members (up to the active MDA limit) is blackholed. In Layer 2-aware NAT this condition can be circumvented where traffic can bypass NAT altogether and be directly routed within the internal network that may have an alternate path to a backup NAT system. For additional details, see "L2-Aware bypass" in the *7705 SAR Gen 2 Multiservice ISA and ESA Guide*

The **no** form of this command removes the active MDA limit configuration.

Default

no active-mda-limit

Parameters

number

Specifies the active MDA limit.

Values 1 to 28

Platforms

7705 SAR Gen 2

4.27 active-mda-number

active-mda-number

Syntax

active-mda-number *number*

no active-mda-number

Context

[Tree] (config>isa>tunnel-grp active-mda-number)

Full Context

configure isa tunnel-group active-mda-number

Description

This command specifies the number of active MS-ISA within all configured MS-ISA in the tunnel-group with multi-active enabled. IPsec traffic will be load balanced across all active MS-ISAs. If the number of configured MS-ISA is greater than the active-mda-number then the delta number of MS-ISA will be backup.

Default

active-mda-number 1

Parameters

number

Specifies the number of active MDAs.

Values 1 to 16

Platforms

7705 SAR Gen 2

4.28 active-outbound-sa

active-outbound-sa

Syntax

active-outbound-sa *spi*

no active-outbound-sa

Context

[Tree] (config>grp-encryp>encryp-keygrp active-outbound-sa)

Full Context

configure group-encryption encryption-keygroup active-outbound-sa

Description

This command specifies the Security Association, referenced by the Security Parameter Index (SPI), to use when performing encryption and authentication on NGE packets egressing the node for all services configured using this key group.

The **no** form of the command returns the parameter to its default value and is the same as removing this key group from all outbound direction key groups in all services configured with this key group (that is, all packets of services using this key group will egress the node in without being encrypted).

Parameters

spi

Specifies the SPI to use for packets of services using this key group when egressing the node.

Values 1 to 127

Platforms

7705 SAR Gen 2

4.29 active-psk

active-psk

Syntax

active-psk *active-pre-shared-key*

no active-psk

Context

[Tree] (config>macsec>conn-assoc>static-cak active-psk)

Full Context

configure macsec connectivity-association static-cak active-psk

Description

This command specifies the active transmitting pre-shared-key. If two pre-shared-keys are configured, the arriving MACsec MKA can be decrypted via CAKs of both pre-shared keys; however, only the active-psk will be used for TX encryption of MKA PDUs.

Default

active-psk 1

Parameters

active-pre-shared-key

Specifies the value of the pre-shared-key.

Values 1 or 2

Platforms

7705 SAR Gen 2

4.30 ad-per-evi-routes

ad-per-evi-routes

Syntax

4.31 ad-validation

ad-validation

Syntax

ad-validation {**fall-through** | **drop**}

no ad-validation

Context

[Tree] (config>system>dns>dnssec ad-validation)

Full Context

configure system dns dnssec ad-validation

Description

This command enables validation of the presence of the AD-bit in responses from the DNS servers, and reports a warning to the SECURITY log if DNSSEC validation was not possible.

This command requires either the fall-through or drop parameters be configured. When the fall-through parameter is supplied, the system will allow DNS responses that do not pass DNSSEC validation to be accepted and logged. When the drop parameter is specified, the system will reject and log DNS responses that do not pass DNSSEC validation and the resolution will appear to fail.

Default

no ad-validation

Parameters

fall-through

Specifies that the DNSSEC validator should allow non-DNSSEC responses to fall-through to permit resolution in case of validation failure.

drop

Specifies that the DNSSEC validator should drop non-DNSSEC responses in case of validation failure.

Platforms

7705 SAR Gen 2

4.32 adapt-qos

adapt-qos

Syntax

adapt-qos {**link** | **port-fair** | **distribute** [**include-egr-hash-cfg**]}

Context

[Tree] (config>lag>access adapt-qos)

Full Context

configure lag access adapt-qos

Description

This command specifies how the LAG SAP queue and virtual scheduler buffering and rate parameters are adapted over multiple active XMAs/MDAs. This command applies only to access LAGs.

Default

adapt-qos distribute

Parameters

link

Specifies that the LAG will create the SAP queues and virtual schedulers with the actual parameters on each LAG member port.

port-fair

Places the LAG instance into a mode that enforces QoS bandwidth constraints in the following manner:

- all egress QoS objects associated with the LAG instance are created on a per port basis
- bandwidth is distributed over these per port objects based on the proportion of the port's bandwidth relative to the total of all active ports bandwidth within the LAG
- the **include-egr-hash-cfg** behavior is automatically enabled allowing the system to detect objects that hash to a single egress link in the lag and enabling full bandwidth for that object on the appropriate port

distribute

Creates an additional internal virtual scheduler per IOM/XCM as parent of the configured SAP queues and virtual schedulers per LAG member port on that IOM/XCM. This internal virtual scheduler limits the total amount of egress bandwidth for all member ports on the IOM/XCM to the bandwidth specified in the egress qos policy.

include-egr-hash-cfg

Specifies whether explicitly configured hashing should factor into the egress buffering and rate distribution.

When this parameter is configured, all SAPs on this LAG which have explicit hashing configured, the egress HQoS and HPol (including queues, policers, schedulers and arbiters) will receive 100% of the configured bandwidth (essentially operating in adapt-qos link mode). For any Multi-Service-Sites assigned to such a LAG, bandwidth will continue to be divided according to adapt-qos distribute mode.

A LAG instance that is currently in adapt-qos link mode may be placed at any time in port-fair mode. Similarly, a LAG instance that is currently in adapt-qos port-fair mode may be placed at any time in link mode. However, a LAG instance in adapt-qos distribute mode may not be placed into port-fair (or link) mode while QoS objects are associated with the LAG instance. To move from distribute to port-fair mode it is necessary to remove all QoS objects from the LAG instance.

4.33 adaptation-rule

adaptation-rule

Syntax

adaptation-rule [**pir** *adaptation-rule*] [**cir** *adaptation-rule*]

Context

[Tree] (config>service>ies>if>sap>egress>queue-override>queue adaptation-rule)

[Tree] (config>service>vpls>sap>egress>queue-override>queue adaptation-rule)

[Tree] (config>service>vpls>sap>ingress>queue-override>queue adaptation-rule)

[Tree] (config>service>ies>if>sap>ingress>queue-override>queue adaptation-rule)

Full Context

configure service ies interface sap egress queue-override queue adaptation-rule

configure service vpls sap egress queue-override queue adaptation-rule

configure service vpls sap ingress queue-override queue adaptation-rule

configure service ies interface sap ingress queue-override queue adaptation-rule

Description

This command overrides specific attributes of the specified queue's adaptation rule parameters. The adaptation rule controls the method used by the system to derive the operational CIR and PIR settings when the queue is provisioned in hardware. For the CIR and PIR parameters individually, the system attempts to find the best operational rate depending on the defined constraint.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the adaptation rule is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command removes any explicitly defined constraints used to derive the operational CIR and PIR created by the application of the policy. When a specific **adaptation-rule** is removed, the default constraints for **rate** and **cir** apply.

Default

no adaptation-rule

Parameters

pir

Specifies the constraints enforced when adapting the PIR rate defined within the **queue** *queue-id* **rate** command. The **pir** parameter requires a qualifier that defines the constraint used when deriving the operational PIR for the queue. When the **rate** command is not specified, the default applies.

cir

Specifies the constraints enforced when adapting the CIR rate defined within the **queue** *queue-id* **rate** command. The **cir** parameter requires a qualifier that defines the constraint used when deriving the operational CIR for the queue. When the **cir** parameter is not specified, the default constraint applies.

adaptation-rule

Specifies the CIR and PIR adaptation rules.

Values max — The **max** (maximum) option is mutually exclusive with the **min** and **closest** options. When **max** is defined, the operational PIR for the queue is equal to or less than the administrative rate specified using the **rate** command.

min — The **min** (minimum) option is mutually exclusive with the **max** and **closest** options. When **min** is defined, the operational PIR for the queue is equal to or greater than the administrative rate specified using the **rate** command.

closest — The **closest** parameter is mutually exclusive with the **min** and **max** parameter. When **closest** is defined, the operational PIR for the queue is the rate closest to the rate specified using the **rate** command.

Platforms

7705 SAR Gen 2

Full Context

configure port ethernet network egress queue-group queue-overrides queue adaptation-rule

configure port ethernet access ingress queue-group queue-overrides queue adaptation-rule

configure port ethernet access egress queue-group queue-overrides queue adaptation-rule

Description

This command specifies the method used by the system to derive the operational CIR and PIR settings when the queue is provisioned in hardware. For the CIR and PIR parameters individually, the system attempts to find the best operational rate depending on the defined constraint.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the adaptation rule is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of this command removes any explicitly defined constraints used to derive the operational CIR and PIR created by the application of the policy. When a specific **adaptation-rule** is removed, the default constraints for **rate** and **cir** apply.

Default

adaptation-rule pir closest cir closest

Parameters

pir

Defines the constraints enforced when adapting the PIR rate defined within the **queue** *queue-id* **rate** command. The **pir** parameter requires a qualifier that defines the constraint used when deriving the operational PIR for the queue. When the **rate** command is not specified, the default applies.

cir

Defines the constraints enforced when adapting the CIR rate defined within the **queue** *queue-id* **rate** command. The **cir** parameter requires a qualifier that defines the constraint used when deriving the operational CIR for the queue. When the **cir** parameter is not specified, the default constraint applies.

adaptation-rule

Specifies the adaptation rule to be used while computing the operational CIR or PIR value.

Values **max** — The **max** (maximum) option is mutually exclusive with the **min** and **closest** options. When **max** is defined, the operational PIR for the queue will be equal to or less than the administrative rate specified using the **rate** command.

min — The **min** (minimum) option is mutually exclusive with the **max** and **closest** options. When **min** is defined, the operational PIR for the queue will be equal to or greater than the administrative rate specified using the **rate** command.

closest — The **closest** parameter is mutually exclusive with the **min** and **max** parameter. When **closest** is defined, the operational PIR for the queue will be the rate closest to the rate specified using the **rate** command.

4.35 add-paths

add-paths

Syntax

[**no**] **add-paths**

Context

[Tree] (config>router>bgp add-paths)

[Tree] (config>router>bgp>group add-paths)

[Tree] (config>router>bgp>group>neighbor add-paths)

Full Context

configure router bgp add-paths

configure router bgp group add-paths

configure router bgp group neighbor add-paths

Description

This command allows the add-paths node to be the configured for one or more families of the BGP instance, a group or a neighbor. The BGP add-paths capability allows the router to send and/or receive multiple paths per prefix to/from a peer. The add-paths command without additional parameters is equivalent to removing Add-Paths support for all address families, which causes sessions that previously negotiated the add-paths capability for one or more address families to go down and come back up without the add-paths capability.

The no form of this command (no add-paths) removes add-paths from the configuration of BGP, the group or the neighbor, causing sessions established using add-paths to go down and come back up without the add-paths capability.

Default

no add-paths

Platforms

7705 SAR Gen 2

4.36 add-paths-send-limit

add-paths-send-limit

Syntax

add-paths-send-limit *send-limit*

no add-paths-send-limit

Context

[Tree] (config>router>policy-options>policy-statement>default-action add-paths-send-limit)

Full Context

configure router policy-options policy-statement default-action add-paths-send-limit

Description

This command sets the *send-limit* to a specific value for all routes matched by the policy entry or default action. Add-paths allows a BGP router to send multiple paths for the same NLRI/prefix to a peer

advertising the add-paths receive capability. The *send-limit* dictates the maximum number of paths that can be advertised.

The default *send-limit* is controlled by the instance, group or neighbor level configuration and applies to all prefixes in a particular address family. Using route policies allows the default send-limit to be overridden to use a larger or smaller maximum value on a per-prefix basis. For example, if, for most prefixes advertised to a peer, at most 1 path should be advertised but for a few exceptional prefixes up to 4 paths should be advertised, then the neighbor-level *send-limit* can be set to a value of 1 and the **add-paths-send-limit** in the policy entry that matches the exceptional routes can be set to a value of 4.

Default

no add-paths-send-limit

Parameters

send-limit

Specifies the maximum number of paths to advertise for matched routes to an Add-Paths peer. If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each matched route that is the best path for its prefix (NLRI). Add paths can be advertised only if the peer has signaled support for receiving multiple add paths.

Values 1 to 16, none, multipaths

Full Context

configure service vprn bgp group evpn-link-bandwidth add-to-received-bgp

configure service vprn bgp group neighbor evpn-link-bandwidth add-to-received-bgp

Description

This command configures the weight value added to all BGP PE-CE routes for the purpose of weighted ECMP if EVPN-IFL and BGP PE-CE routes are combined into the same ECMP set.

For the load-balancing between EVPN-IFL and BGP PE-CE routes the **configure service vprn bgp eibgp-loadbalance** command must already be configured on the system.

The **no** form of this command disables the weight value added to all BGP PE-CE routes.

Default

no add-to-received-bgp

Parameters

weight

Specifies the weight value added to all BGP PE-CE routes.

Values 1 to 128

Full Context

configure service vprn bgp group link-bandwidth add-to-received-ebgp

configure service vprn bgp group neighbor link-bandwidth add-to-received-ebgp

Description

This command configures BGP to automatically add a link-bandwidth extended community to every route received from a directly connected (single-hop) EBGP peer within the scope of the command, as long as that route belongs to one of the listed address families.

The link-bandwidth extended community added by this command encodes the local-AS number of receiving BGP instance and the bandwidth of the interface to the directly connected EBGP peer.

Up to three families may be configured.

The **no** form of this command removes the link-bandwidth extended community added to received BGP routes.

Default

no add-to-received-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

configure router bgp group link-bandwidth add-to-received-ebgp

configure router bgp group neighbor link-bandwidth add-to-received-ebgp

Description

This command configures BGP to automatically add a link-bandwidth extended community to every route received from a directly connected (single-hop) EBGP peer within the scope of the command, as long as that route belongs to one of the listed address families.

The link-bandwidth extended community added by this command encodes the local-AS number of receiving BGP instance and the bandwidth of the interface to the directly connected EBGP peer.

Up to six families may be configured.

The **no** form of this command removes the link-bandwidth extended community added to received BGP routes.

Default

no add-to-received-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

vpn-ipv4 — Adds a link-bandwidth extended community to IPv4 VPN (SAFI 128) routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

label-ipv6 — Adds a link-bandwidth extended community to labeled-unicast IPv6 routes.

vpn-ipv6 — Adds a link-bandwidth extended community to IPv6 VPN (SAFI 128) routes.

4.39 address

address

Syntax

address gi-address [**scope** *scope*]

address *ip-address*[*/prefix-length*]

address pool *pool-name* [**secondary-pool** *sec-pool-name*] [**delimiter** *delimiter*]

address use-pool-from-client [**delimiter** *delimiter*]

no address

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host address)

Full Context

configure subscriber-mgmt local-user-db ipoe host address

Description

This command configures how the IP address is defined for this host.

When the user database is used from a local DHCP server, then this command defines how to define the IP address the server offers to the DHCP-client.

When the user-db is used for PPPoE authentication, the **gi-address** parameter cannot be used. A fixed IP address causes PPPoE to use this IP address. If no IP address is specified, the PPPoE looks for IP address by other means (DHCP). If a pool name is given, this pool is sent in the DHCP request so it can be used in by the DHCP server to determine which address to give to the host.

The **no** form of this command causes no IP address to be assigned to this host. In a user database referred to from a local DHCP server, creating a host without address information causes the matching client never to get an IP address.

The **no** form of this command reverts to the default.

Parameters

gi-address

When specified, the gi-address of the DHCP message is taken to look for a subnet in the local DHCP server. The first available free address of the subnet is taken and "offered" to the host. When **local-user-db** is used for PPPoE authentication, this has the same result as **no address**.

ip-address

Specifies the fixed IP address to use for this host.

Values a.b.c.d

pool-name/sec-pool-name

Specifies the primary (and secondary) pool (in the local DHCP server), up to 32 characters, to look for an available address. The first available IP address from any subnet in the pool is used. When the local user database is used for PPPoE authentication, this causes the specified pool name to be sent to the DHCP server in a vendor-specific sub-option under Option 82.

use-pool-from-client

Use the pool-name in the Option 82 vendor-specific sub-option.

delimiter

Specifies a single ASCII character specifies the delimiter of separating primary and secondary pool names in option82 VSO.

Platforms

7705 SAR Gen 2

address

Syntax

address *ipv6-address/prefix-length* [**eui-64**] [**track-srrp** *srrp-instance*] [**modifier** *cga-modifier*] [**dad-disable**] [**primary-preference** *primary-preference*]

no address *ipv6-address/prefix-length*

Context

[Tree] (config>service>ies>if>ipv6 address)

[Tree] (config>service>vprn>if>ipv6 address)

Full Context

configure service ies interface ipv6 address

configure service vprn interface ipv6 address

Description

This command assigns an IPv6 address/subnet to the interface.

Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

The **no** form of this command removes the IPv6 address from the interface.

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address on the interface.

Values	ipv6-address/prefix:	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
			x:x:x:x:x:x:d.d.d.d
			x [0 to FFFF]H
			d [0 to 255]D
	prefix-length		1 to 128

eui-64

When the **eui-64** keyword is specified, a complete IPv6 address from the supplied prefix and 64-bit interface identifier is formed. The 64-bit interface identifier is derived from MAC address on Ethernet interfaces. For interfaces without a MAC address, for example ATM interfaces, the Base MAC address of the chassis is used.

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Values 1 to 4294967295

cga-modifier

Specifies the modifier in 32 hexadecimal nibbles.

Values 0x0–0xFFFFFFFF

dad-disable

Disables Duplicate Address Detection (DAD) and sets the address to preferred, even if there is a duplicated address.

primary-preference

Specifies a *primary-preference* index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications which require a fixed address of the interface. These include LDP and Segment Routing.

When originating packets from this interface, the source IPv6 address follows the selection rules in RFC 6724 except for the specific cases where a fixed address is required. In the latter case, the IPv6 address with the lowest primary-preference index is selected. If the selected address is removed, the system selects the IPv6 address with the next lowest *primary-preference* index.

The system assigns the next available index value to any IPv6 address of the interface when configured without the *primary-preference* index value specified. The address index space is unique across all addresses of a given interface.

[Tree] (config>service>vprn>if address)

Full Context

configure service ies interface address

configure service vprn network-interface address

configure service vprn interface address

Description

This command assigns an IP address, IP subnet, and broadcast address format to an IES IP router interface. Only one IP address can be associated with an IP interface. Use the **secondary** command to assign multiple addresses.

An IP address must be assigned to each IES or VPRN IP interface. An IP address and a mask are used together to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.

The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. The show commands display CIDR notation and is stored in configuration files.

By default, no IP address or subnet association exists on an IP interface until it is explicitly created.

Table 14: Address Admin and Operational States

Address	Admin State	Oper State
No address	up	down
No address	down	down
1.1.1.1	up	up
1.1.1.1	down	down

The operational state is a read-only variable and the only controlling variables are the address and admin states. The address and admin states are independent and can be set independently. If an interface is in an administratively up state and an address is assigned, it becomes operationally up and the protocol interfaces and the MPLS LSPs associated with that IP interface are reinitialized.

The **no** form of this command removes the IP address assignment from the IP interface. When the **no address** command is entered, the interface becomes operationally down.

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

/

The forward slash is a parameter delimiter and separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-address*, the "*/*" and the *mask-length* parameter. If a forward slash is not immediately following the *ip-address*, a dotted decimal mask must follow the prefix.

mask-length

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask-length* parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address.

Note:
A mask length of 32 is reserved for loopback addresses (includes system addresses).

Default 0 to 31

mask

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

Note:
A mask of 255.255.255.255 is reserved for system IP addresses.

broadcast

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface.

Default host-ones

all-ones

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

host-ones

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

srrp-instance

Tracks the specified SRRP instance state on the IPv6 address.

configure service vpls interface address

Description

This command assigns an IP address, IP subnet, and broadcast address format to an IES IP router interface. Only one IP address can be associated with an IP interface.

An IP address must be assigned to each IES IP interface. An IP address and a mask are used together to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.

The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. The show commands display CIDR notation and is stored in configuration files.

By default, no IP address or subnet association exists on an IP interface until it is explicitly created.

Use the **no** form of this command to remove the IP address assignment from the IP interface. When the **no address** command is entered, the interface becomes operationally down.

Table 15: Address Admin and Operational States

Address	Admin State	Oper State
No address	up	down
No address	down	down
1.1.1.1	up	up
1.1.1.1	down	down

The operational state is a read-only variable and the only controlling variables are the address and admin states. The address and admin states are independent and can be set independently. If an interface is in an administratively up state and an address is assigned, it becomes operationally up and the protocol interfaces and the MPLS LSPs associated with that IP interface will be reinitialized.

Parameters

ip-address

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP netmask

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 to 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

address

Syntax

address *ip-address*

no address

Context

[Tree] (config>service>vprn>log>syslog address)

Full Context

configure service vprn log syslog address

Description

This command adds the syslog target host IP address to/from a syslog ID.

The *ip-address* parameter is mandatory. If no **address** is configured, syslog data cannot be forwarded to the syslog target host.

Only one address can be associated with a *syslog-id*. If multiple addresses are entered, the last address entered overwrites the previous address.

The same syslog target host can be used by multiple log IDs.

The **no** form of this command removes the syslog target host IP address.

Default

no address

Parameters

ip-address

Specifies the IP address of the syslog target host in dotted decimal notation.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x:d.d.d.d[-interface]

Full Context

configure router interface address

Description

This command assigns an IP address, IP subnet, and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface. Use the **secondary** command to assign additional addresses.

An IP address must be assigned to each IP interface. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.

From Release 19.10, The overlap restriction is not applicable for host-addresses configured on loopback interfaces. For example, a loopback interface addresses configured with mask of 32 or netmask of 255.255.255.255 can overlap with other prefixes on other IP interfaces in the same routing context within the router.

The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. **Show** commands display CIDR notation and are stored in configuration files.

By default, no IP address or subnet association exists on an IP interface until it is explicitly created.

The **no** form of this command removes the IP address assignment from the IP interface. Interface specific configurations for MPLS are also removed. This will operationally stop any MPLS LSPs that explicitly reference that IP address. When a new IP address is configured, interface specific configurations for MPLS need to be added. IEEE 1588 port based timestamping configured with **ptp-hw-assist** is also disabled.

Default

no address

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values 1.0.0.0 to 223.255.255.255

/

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-address*, the "*/*" and the *mask* parameter. If a forward slash does not immediately follow the *ip-address*, a dotted decimal mask must follow the prefix.

mask

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1— 32. A mask length of 32 is reserved for system IP addresses.

Values 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

broadcast

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones,** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

Default host-ones

Values all-ones, host-ones

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

Specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet

described by the *ip-address* and the *netmask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

Values 1 to 4294967295

gre-termination

The optional **gre-termination** keyword allows GRE SDP tunnel packets to terminate on the router interface using the /31 value of the configured IP address. Refer to the *7705 SAR Gen 2 Services Overview Guide* for information about using **gre-termination**.

Platforms

7705 SAR Gen 2

address

Syntax

address *ipv6-address/prefix-length* [**eui-64**] [**track-srrp** *srrp-instance*] [**modifier** *cga-modifier*] [**dad-disable**] [**primary-preference** *primary-preference*]

no address *ipv6-address/prefix-length*

Context

[Tree] (config>router>if>ipv6 address)

Full Context

configure router interface ipv6 address

Description

This command assigns an IPv6 address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces.

Caution:
Configurations must not exceed 16 IPv6 addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

A global IPv6 address together with the *prefix-length* create a locally configured interface IPv6 prefix and subnet. The defined global IP prefix must be unique within the context of a routing instance. It cannot overlap with any other existing global IP prefix defined on another IP interface within the same routing context in the router.

This overlap restriction is not applicable for IPv6 host addresses configured on loopback interfaces. For example, an IPv6 loopback host address configured upon a loopback interface may overlap with another prefix subnet configured on another IP interface within the same routing context.

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address on the interface.

Values

ipv6-address/prefix-length:	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
	prefix-length	1 to 128

eui-64

When the **eui-64** keyword is specified, a complete IPv6 address from the supplied prefix and 64-bit interface identifier is formed. The 64-bit interface identifier is derived from MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, the Base MAC address of the chassis should be used.

srrp-instance

Indicates the unique identifier of the tracked SRRP instance.

Values 1 to 4294967295

cga-modifier

Sets the modifier for cryptographically-assigned addresses.

Values 0x0..0xFFFFFFFF...(32 hex nibbles)

dad-disable

Disables Duplicate Address Detection (DAD) and sets the address to preferred, even if there is a duplicated address.

primary-preference

Specifies a *primary-preference* index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications which require a fixed address of the interface. These include LDP and Segment Routing.

When originating packets from this interface, the source IPv6 address follows the selection rules in RFC 6724 except for the specific cases where a fixed address is required. In the latter case, the IPv6 address with the lowest primary-preference index is selected. If the selected address is removed, the system selects the IPv6 address with the next lowest *primary-preference* index.

The system assigns the next available index value to any IPv6 address of the interface when configured without the *primary-preference* index value specified. The address index space is unique across all addresses of a given interface.

Values 1 to 4294967295

srrp

Tracks the specified SRRP instance state on the IPv6 address.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

address

Syntax

[**no**] **address** *ip-prefix/ip-prefix-length* [**active** | **standby** | **standby/A** | **standby/B** | **standby/C** | **standby/D**]

Context

[Tree] (bof address)

Full Context

bof address

Description

This command assigns an IP address to the management Ethernet port on a CPM. The IP addresses are applied by the boot loader and the running image. The active and standby IP addresses must be on the same subnet.

An address must be assigned with the **active** keyword and for systems with a redundant CPM an additional address may be assigned with the **standby** keyword. The active address is used by the active CPM whether its CPM A or CPM B and the standby address, if specified, is used by the standby CPM whether its CPM B or CPM A.

Deleting a BOF address entry is not allowed from a remote session.

Note that changing the active and standby addresses without reboot standby CPM may cause a boot-env sync to fail.

The **no** form of this command deletes the IP address from the CPM Ethernet port.

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the aggregate route in dotted decimal notation.

Values

ipv4-prefix	*a.b.c.d* (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d

	x:	[0 to FFFF]H
	d:	[0 to 255]D
ipv6-prefix-length	0 to 128	

active | standby | standby/A | standby/B | standby/C | standby/D
specifies which CPM Ethernet address is being configured

Default active

Platforms
7705 SAR Gen 2

address

Syntax
address *ip-address*

no address

Context
[Tree] (config>log>syslog address)

Full Context
configure log syslog address

Description
This command adds the syslog target host IP address to/from a syslog ID.

This parameter is mandatory. If no **address** is configured, syslog data cannot be forwarded to the syslog target host.

Only one address can be associated with a *syslog-id*. If multiple addresses are entered, the last address entered overwrites the previous address.

The same syslog target host can be used by multiple log IDs.

The **no** form of this command removes the syslog target host IP address.

Default
no address

Parameters
ip-address
Specifies the IP address of the syslog target host in dotted decimal notation.

Values ipv4-address a.b.c.d

	ipv6-address	x:x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addressesipv6-address x:x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface] x: [0..FFFF]H d: [0..255]D interface: 32 characters maximum, mandatory for link local addresses

Platforms

address

Syntax

address *ip-address* [**port** *port*]

no address

Context

[Tree] (config>system>security>ldap>server address)

Full Context

configure system security ldap server address

Description

This command configures the IPv4 or IPv6 address for the LDAP server.

The **no** version of this command removes the server address.

Parameters

ip-address

The IP address of the LDAP server.

Values	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

port

Specifies the port ID. The port is the LDAP server listening port; by default it is 389 but if the listening port on LDAP server is changed, this command needs to be configured accordingly.

Values 1 to 65535

Default 389

Platforms

7705 SAR Gen 2

4.40 address-map

address-map

Syntax

address-map *start-inside-ip-address* **to** *end-inside-ip-address* **subscriber-type** *nat-sub-type* **nat-policy** *nat-policy-name* [**create**]

no address-map *start-inside-ip-address* **to** *end-inside-ip-address* **subscriber-type** *nat-sub-type* **nat-policy** *nat-policy-name*

Context

[Tree] (config>router>nat>inside>deterministic address-map)

[Tree] (config>service>vprn>nat>inside>deterministic address-map)

Full Context

configure router nat inside deterministic address-map

configure service vprn nat inside deterministic address-map

Description

This command configures the mapping of the inside IP addresses of deterministic NAT44 subscribers to the outside IP addresses in a NAT pool. This mapping is applicable is applicable only to deterministic NAT44 with a single ESA-VM in a NAT-group. The number of subscribers per outside IP address is flexible and not restricted to a discrete range governed by the 2^n rule.

When configured, the **classic-lsn-max-subscriber-limit** command must be set to 1.

The **no** form of this command removes the configuration.

Parameters

start-inside-ip-address

Specifies the first IP address in the inside IP address range.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

end-inside-ip-address

Specifies the last IP address in the inside IP address range.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

nat-sub-type

Specifies the NAT subscriber type.

Values classic-lsn-sub, dslite-lsn-sub

nat-policy-name

Specifies the NAT policy name, up to 32 characters, that is referencing a NAT pool.

Values classic-lsn-sub, dslite-lsn-sub

create

Keyword used to create the address mapping.

Platforms

4.41 address-pref

address-pref

Syntax

address-pref {**ipv4-only** | **ipv6-first**}

no address-pref

Context

[Tree] (config>system>dns address-pref)

Full Context

configure system dns address-pref

Description

This command configures the DNS address resolving order preference. By default, DNS names are queried for A-records only (address-preference is IPv4-only).

If the address-preference is set to IPv6-first, the DNS server will be queried for AAAA-records (IPv6) first and if a successful replied is not received, then the DNS server is queried for A-records.

Default

address-pref ipv4-only

Platforms

7705 SAR Gen 2

4.42 address-range

address-range

Syntax

no address-range *start-ip-address end-ip-address* [**failover** {**local** | **remote** | **access-driven**}]

no address-range *start-ip-address end-ip-address*

Context

[Tree] (config>router>dhcp>server>pool>subnet address-range)

Full Context

configure router dhcp local-dhcp-server pool subnet address-range

Description

This command configures a range of IP addresses to be served from the pool. All IP addresses between the start and end IP addresses are included (other than specific excluded addresses).

The **no** form of this command removes the address-range parameters from the configuration.

Parameters

start-ip-address

Specifies the start address of this range to include. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

end-ip-address

Specifies the end address of this range to include. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

local

Specifies that the local DHCP server has the ownership of this dress range in a redundant setup under normal operation.

remote

Specifies that the remote DHCP server has the ownership of this address range in a redundant setup under normal operation.

access-driven

Specifies that the DHCP server failover system is in control by the access protection mechanisms (SRRP or MC-LAG).

Platforms

7705 SAR Gen 2

address-range

Syntax

address-range *start-ip-address end-ip-address* [**create**]

configure service vprn interface sap ipsec-gw local-address-assignment ipv4 address-source

configure service vprn interface sap ipsec-gw local-address-assignment ipv6 address-source

configure service ies interface sap ipsec-gw local-address-assignment ipv6 address-source

Description

This command specifies the IPv4 or IPv6 source of the local address assignment for the IPsec gateway, which is a pool of a local DHCPv4 or DHCPv6 server. The system will assign an internal address to an IKEv2 remote-access client from the specified pool.

Beside the IP address, netmask and DNS server can also be returned. For IPv4, the netmask and DNS server address can be returned from the specified pool, as well as the IP address. The netmask returned to the IPsec client is derived from the subnet length from the **subnet** *x.x.x.x/m* **create** configuration, not the **subnet-mask** configuration in the subnet context. For IPv6, the DNS server address can be returned from the specified pool, as well as the IP address.

For IPv4, a secondary pool can be optionally specified. The secondary pool is used if the system is unable to assign addresses from the primary pool.

Default

no address-source

Parameters

router-instance

Specifies the router instance ID where the local DHCPv4 or DHCPv6 server is defined, up to 32 characters.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **address-source service-name** *service-name* variant can be used in all configuration modes.

service-name

Specifies the name of the service where the local DHCPv4 or DHCPv6 server is defined, up to 64 characters.

local-dhcp4-svr-name

Specifies the name of the local DHCPv4 server, up to 32 characters.

local-dhcp6-svr-name

Specifies the name of the local DHCv6 server, up to 32 characters.

dhcp4-server-pool

The name of the pool defined in the specified DHCPv4 server, up to 32 characters.

dhcp6-server-pool

The name of the pool defined in the specified DHCPv6 server, up to 32 characters.

secondary-pool-name

The name of the secondary pool defined in the specified server, up to 32 characters.

4.44 adj-sid-hold

adj-sid-hold

Syntax

adj-sid-hold *seconds*

no adj-sid-hold

Context

[Tree] (config>router>isis>segm-rtng adj-sid-hold)

Full Context

configure router isis segment-routing adj-sid-hold

Description

This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedures are followed for both the LFA protected SID and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, but the following procedures apply even if a LFA backup was not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed.

  When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

The **no** form of this command reverts to the default value.

Default

adj-sid-hold 15

Parameters

seconds

Specifies the adjacency SID hold time, in seconds.

Values 1 to 1800

Full Context

configure router interface if-attribute admin-group

configure service ies interface if-attribute admin-group

configure router mpls interface admin-group

configure service vprn interface if-attribute admin-group

Description

This command configures the admin group membership of an interface. The user can apply admin groups to an IES, VPRN, network IP, or MPLS interface.

Each single operation of the **admin-group** command allows a maximum of five (5) groups to be specified at a time. However, a maximum of 32 groups can be added to a given interface through multiple operations. Once an admin group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured **admin-group** membership will be applied in all levels or areas the interface is participating in. The same interface cannot have different memberships in different levels or areas.

Only the admin groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the admin-group memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Default

no admin-group

Parameters

group-name

Specifies up to five groups, each up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **admin-group** command allows a maximum of 5 groups to be specified. However, a maximum of 32 groups can be added to a given interface through multiple operations.

Platforms

7705 SAR Gen 2

configure router if-attribute admin-group

Description

This command defines an Administrative Group (AG) that can be associated with an IP or MPLS interface.

AGs, also known as affinity, are used to tag IP and MPLS interfaces that share a specific characteristic with the same identifier. For example, an AG identifier can represent:

- all links that connect to core routers
- all links that have a bandwidth higher than 10 Gb
- all links that are dedicated to a specific service

First configure locally on each router the name and identifier of each AG. A maximum of 32 AGs can be configured per system.

After configuring the router name and identifier, configure the AG membership of an interface. You can apply AGs to a IES, VPRN, network IP, or MPLS interface.

When applied to MPLS interfaces, the interfaces can be included or excluded in the LSP path definition by inferring the AG name. CSPF computes a path that satisfies the AG include and exclude constraints.

When applied to IES, VPRN, or network IP interfaces, the interfaces can be included or excluded in the route next-hop selection by inferring the AG name in a route next-hop policy template applied to an interface or a set of prefixes.

The following provisioning rules apply to the AG configuration. The system rejects the creation of an AG:

- if the name of the AG is the same as that of an existing group, even if the new AG group value is different from the existing group value
- if the AG reuses the same group value but with a different name from an existing group

Only the AGs bound to an MPLS interface are advertised area wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP or MPLS domain.

Values 0 to 31 – Specifies the value range to use with link LFA next-hop policies or is used as a link color (AG or EAG) with Segment Routing Flex-Algorithms.

32 to 255 – Specifies the value range to use when the EAG is used as a link color with Segment Routing Flex-Algorithms. This higher range fails if used for other applications, such as LFA next-hop policies.

admin-group

Syntax

admin-group *admin-group*

no admin-group *admin-group*

Context

[Tree] (config>router>fad>flex-algo>exclude admin-group)

Full Context

configure router flexible-algorithm-definitions flex-algo exclude admin-group

Description

This command configures an administrative group link that will be excluded from the topology graph of the flexible algorithm. If multiple administrative groups are configured, they are all excluded from the topology graph.

Administrative groups are attributes associated with a link. Frequently these administrative groups are described as link colors.

The **no** form of this command removes the admin-group from being excluded from the topology graph.

Default

no admin-group

Parameters

admin-group

Configures an administrative group link to exclude from the topology graph of the configured FAD.

Platforms

7705 SAR Gen 2

admin-group

Syntax

admin-group *admin-group*

no admin-group *admin-group*

Context

[Tree] (config>router>fad>flex-algo>include-all admin-group)

Full Context

configure router flexible-algorithm-definitions flex-algo include-all admin-group

Description

This command configures an administrative group link that will be included in the topology graph of the defined FAD. If multiple administrative groups are configured, groups must be present in a link before the link is included in the flexible algorithm topology graph.

The **no** form of this command removes the specified *admin-group* from being included in the topology graph.

Default

no admin-group

Parameters

admin-group

Configures an administrative group to include in topology graph of the configured FAD.

Platforms

7705 SAR Gen 2

admin-group

Syntax

admin-group *admin-group*

no admin-group *admin-group*

Context

[Tree] (config>router>fad>flex-algo>include-any admin-group)

Full Context

configure router flexible-algorithm-definitions flex-algo include-any admin-group

Description

This command configures an administrative group link that will be included in the topology graph of the configured FAD. If multiple administrative groups are configured, at least one of the administrative groups must be present in a link before the link is included into the flexible algorithm topology graph.

The **no** form of this command removes the *admin-group* from being included in the topology graph.

Default

no admin-group

Parameters

admin-group

Configures an administrative group to include in the topology graph of the configured FAD.

Platforms

7705 SAR Gen 2

4.50 admin-group-frr

admin-group-frr

Syntax

[**no**] **admin-group-frr**

Context

[Tree] (config>router>mpls admin-group-frr)

Full Context

configure router mpls admin-group-frr

Description

This command enables the use of the admin-group constraints in the association of a manual or dynamic bypass LSP with the primary LSP path at a Point-of-Local Repair (PLR) node.

When this command is enabled, each PLR node reads the admin-group constraints in the FAST_REROUTE object in the Path message of the LSP primary path. If the FAST_REROUTE object is not included in the Path message, then the PLR will read the admin-group constraints from the Session Attribute object in the Path message.

If the PLR is also the ingress LER for the LSP primary path, then it just uses the admin-group constraint from the LSP and/or path level configurations.

The PLR node then uses the admin-group constraints along with other constraints, such as hop-limit and SRLG, to select a manual or dynamic bypass among those that are already in use.

If none of the manual or dynamic bypass LSP satisfies the admin-group constraints, and/or the other constraints, the PLR node will request CSPF for a path that merges the closest to the protected link or node and that includes or excludes the specified admin-group IDs.

If the user changes the configuration of the above command, it will not have any effect on existing bypass associations. The change will only apply to new attempts to find a valid bypass.

The **no** form of this command disables the use of administrative group constraints on a FRR backup LSP at a PLR node.

Default

no frr-admin-group

Platforms

7705 SAR Gen 2

4.51 admin-password

admin-password

Syntax

admin-password *password* [**hash** | **hash2**]

no admin-password

Context

[Tree] (config>system>security>password admin-password)

Full Context

configure system security password admin-password

Description

This command allows a user (with admin permissions) to configure a password that enables a user to become an administrator.

This password is valid only for one session. When enabled, no authorization to TACACS+ or RADIUS is performed and the user is locally regarded as an admin user.

This functionality can be enabled in two contexts:

config>system>security>password>admin-password

<global> enable-admin

If the admin-password is configured in the **config>system>security>password** context, then any user can enter the special mode by entering the **enable-admin** command.

enable-admin is in the default profile. By default, all users are given access to this command.

After the **enable-admin** command is entered, the user is prompted for a password. If the password matches, user is given unrestricted access to all the commands.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

Note:
The *password* argument of this command is not sent to the servers. This is consistent with other commands that configure secrets.

The usernames and passwords in the FTP and TFTP URLs will not be sent to the authorization or accounting servers when the **file>copy** *source-url dest-url* command is executed.

For example:

file copy ftp://test:secret@10.20.31.79/test/srcfile cf1:\destfile

In this example, the username 'test' and password 'secret' will not be sent to the AAA servers (or to any logs). They will be replaced with "*****".

The **no** form of this command removes the admin password from the configuration.

Note:
This command applies to a local user, in addition to users on RADIUS, TACACS, and LDAP.

Default

no admin-password

Parameters

password

Configures the password that enables a user to become a system administrator. The maximum length can be up to 56 characters if unhashed, 60 characters if hashed with bcrypt, from 87 to 92 characters if hashed with sha2-pbkdf2, 32 characters if the hash keyword is specified, or 54 characters if the hash2 keyword is specified. The unhashed cleartext password form should meet all the requirements that are defined by the **complexity** command.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form or hashed with bcrypt or PBKDF2. For security, all keys are stored in the configuration file in hashed form (using bcrypt or PBKDF2, depending on the hashing configuration parameter) or, for backward compatibility, can be stored in encrypted form with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form or hashed with bcrypt or PBKDF2. For security, all keys are stored in the configuration file in hashed form (using bcrypt or PBKDF2, depending

on the hashing configuration parameter) or, for backward compatibility, can be stored in encrypted form with the **hash** or **hash2** parameter specified.

4.52 admin-state

admin-state

Syntax

[no] admin-state

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>info-output>always-display admin-state)

Full Context

configure system management-interface cli md-cli environment info-output always-display admin-state

Description

This command configures that the values of the **admin-state** elements in the **info** output (without the **detail** option) are always displayed, even if they are the default values.

The **no** form of this command excludes the values of the **admin-state** elements from the **info** output display.

Default

no admin-state

Platforms

7705 SAR Gen 2

4.53 admin-status

admin-status

Syntax

admin-status {**rx** | **tx** | **tx-rx** | **disabled**}

Context

[Tree] (config>port>ethernet>lldp>dstmac admin-status)

Full Context

configure port ethernet lldp dest-mac admin-status

Description

This command configures LLDP transmission/reception frame handling.

Default

admin-status disabled

Parameters

rx

Specifies the LLDP agent will receive, but will not transmit LLDP frames on this port.

tx

Specifies that the LLDP agent will transmit LLDP frames on this port and will not store any information about the remote systems connected.

tx-rx

Specifies that the LLDP agent transmits and receives LLDP frames on this port.

disabled

Specifies that the LLDP agent does not transmit or receive LLDP frames on this port. If there is remote systems information which is received on this port and stored in other tables, before the port's admin status becomes disabled, then the information will naturally age out.

Platforms

7705 SAR Gen 2

admin-status

Syntax

admin-status {**rx** | **tx** | **tx-rx** | **disabled**}

Context

[Tree] (config>lag>lldp-member-template>dstmac admin-status)

Full Context

configure lag lldp-member-template dest-mac admin-status

Description

This command configures the LLDP transmission and reception frame handling.

Default

admin-status disabled

Parameters

rx

Keyword to specify that the LLDP agent receives, but does not transmit LLDP frames on this port.

tx

Keyword to specify that the LLDP agent transmits LLDP frames on this port and does not store any information about the remote systems connected.

tx-rx

Keyword to specify that the LLDP agent transmits and receives LLDP frames on this port.

disabled

Keyword to specify that the LLDP agent does not transmit or receive LLDP frames on this port. If remote system information is received on this port and stored in other tables before the administrative status of the port becomes disabled, the information naturally ages out.

[Tree] (config>router>mpls>lsp admin-tag)

Full Context

configure router mpls lsp-template admin-tag

configure router mpls lsp admin-tag

Description

This assigns an administrative tag to an LSP. The administrative tag can be used to enable routes with certain administrative tags to resolve using LSPs of matching administrative tags.

Up to four tags can be assigned to an LSP.

The administrative tag must exist under **config>router>admin-tags**.

The **no** form of this command removes the administrative tag.

Parameters

tag-value

The value of the admin-tag, up to 32 characters.

Platforms

7705 SAR Gen 2

admin-tag

Syntax

[**no**] **admin-tag** *tag*

Context

[Tree] (config>router>admin-tags admin-tag)

Full Context

configure router admin-tags admin-tag

Description

This command configures an admin tag value in the nodal LSP administrative tag database.

Up to 256 admin tags can be configured.

The **no** form of this command removes the admin tag.

Parameters

tag

The value of the administrative tag, up to 32 characters.

Platforms

7705 SAR Gen 2

4.55 admin-tag-policy

admin-tag-policy

Syntax

admin-tag-policy *policy-name*

no admin-tag-policy

Context

4.57 adspec

adspec

Syntax

[**no**] **adspec**

Context

[Tree] (config>router>mpls>lsp-template adspec)

[Tree] (config>router>mpls>lsp adspec)

Full Context

configure router mpls lsp-template adspec

configure router mpls lsp adspec

Description

When enabled, the ADSPEC object will be included in RSVP messages for this LSP. The ADSPEC object is used by the ingress LER to discover the minimum value of the MTU for links in the path of the LSP. By default, the ingress LER derives the LSP MTU from that of the outgoing interface of the LSP path.

A bypass LSP always signals the ADSPEC object since it protects both primary paths which signal the ADSPEC object and primary paths which do not. This means that MTU of LSP at ingress LER may change to a different value from that derived from the outgoing interface even if the primary path has ADSPEC disabled.

Default

no adspec — No ADSPEC objects are included in RSVP messages.

Platforms

7705 SAR Gen 2

4.58 adv-adj-addr-only

adv-adj-addr-only

Syntax

[**no**] **adv-adj-addr-only**

Context

[Tree] (config>router>ldp>session-params>peer adv-adj-addr-only)

Full Context

configure router ldp session-parameters peer adv-adj-addr-only

Description

This command provides a means for an LDP router to advertise only the local IPv4 or IPv6 interfaces it uses to establish hello adjacencies with an LDP peer. By default, when a router establishes an LDP session with a peer, it advertises in an LDP Address message the addresses of all local interfaces to allow the peer to resolve LDP FECs distributed by this router. Similarly, a router sends a Withdraw Address message to of all its peers to withdraw a local address if the corresponding interface went down or was deleted.

This new option reduces CPU processing when a large number of LDP neighbors come up or go down. The new CLI option is strongly recommended in mobile backhaul networks where the number of LDP peers can be very large.

The **no** form of this command reverts LDP to the default behavior of advertising all local interfaces.

Platforms

7705 SAR Gen 2

4.59 adv-local-lsr-id

adv-local-lsr-id

Syntax

[**no**] **adv-local-lsr-id**

Context

[Tree] (config>router>ldp>targeted-session>peer-template adv-local-lsr-id)

[Tree] (config>router>ldp>session-params>peer adv-local-lsr-id)

Full Context

configure router ldp targeted-session peer-template adv-local-lsr-id

configure router ldp session-parameters peer adv-local-lsr-id

Description

This command advertises a local LSR ID over a specified LDP session.

Advertisement of a local LSR ID over a given LDP session is configured using the **adv-local-lsr-id** command in the peer session-parameters. If a user disables the **adv-local-lsr-id** command, then the system will withdraw the FEC for the local LSR ID.

The SR OS router uses the following rules when advertising a local LSR ID:

- If the session parameters have the default configuration and the targeted peer template has the default configuration, the local LSR ID is not advertised.

- If the session parameters have the default configuration but the targeted peer template has an explicit configuration for advertisement of the local LSR ID, the targeted peer template configuration is used.
- If the session parameters have an explicit configuration for advertisement of the local LSR ID but the targeted peer template has the default configuration, the session parameter configuration is used.
- If both the session parameters and the targeted peer template have an explicit configuration for advertisement of the local LSR ID, then the session parameter configuration is used.

The **no** form of this command withdraws the FEC for the local LSR ID.

Default

no adv-local-lsr-id

Platforms

7705 SAR Gen 2

4.60 adv-mtu-override

adv-mtu-override

Syntax

[**no**] **adv-mtu-override**

Context

[Tree] (config>service>sdp adv-mtu-override)

Full Context

configure service sdp adv-mtu-override

Description

This command overrides the advertised VC-type MTU of all spoke-sdps of L2 services using this SDP-ID. When enabled, the router signals a VC MTU equal to the service MTU, which includes the Layer 2 header. It also allows this router to accept an MTU advertised by the far-end PE which value matches either its advertised MTU or its advertised MTU minus the L2 headers.

By default, the router advertises a VC-MTU equal to the L2 service MTU minus the Layer 2 header and always matches its advertised MTU to that signaled by the far-end PE router, otherwise the spoke-sdp goes operationally down.

When this command is enabled on the SDP, it has no effect on a spoke-sdp of an IES/VPRN spoke interface using this SDP-ID. The router continues to signal a VC MTU equal to the net IP interface MTU, which is min{ip-mtu, sdp operational path mtu - L2 headers}. The router also continues to make sure that the advertised MTU values of both PE routers match or the spoke-sdp goes operationally down.

The **no** form of the command disables the VC-type MTU override and returns to the default behavior.

Default

no adv-mtu-override

Platforms

7705 SAR Gen 2

4.61 adv-noaddrs-global

adv-noaddrs-global

Syntax

adv-noaddrs-global [**esm-proxy**] [**esm-relay**] [**relay**] [**server**]

no adv-noaddrs-global

Context

[Tree] (config>system>dhcp6 adv-noaddrs-global)

Full Context

configure system dhcp6 adv-noaddrs-global

Description

This command configures the different DHCPv6 applications to send the NoAddrsAvail Status-Code in DHCPv6 Advertise messages at the global DHCP message level.

By default, all applications send the NoAddrsAvail Status-Code in DHCPv6 Advertise messages at the IA_NA Option level.

Different applications for which NoAddrsAvail Status-Code in DHCPv6 Advertise messages can be configured at the global DHCP message level.

The only valid combination in current SR OS is **adv-noaddrs-global esm-relay server**.

The **no** form of this command reverts to the default.

Default

no adv-noaddrs-global. All applications send the NoAddrsAvail Status-Code in DHCPv6 Advertise messages at the IA_NA Option level.

Parameters

esm-proxy

Specifies the DHCPv6 proxy server on subscriber group-interfaces. Not supported in current SR OS.

esm-relay

Specifies the DHCPv6 relay on subscriber group-interfaces. Must be enabled together with the DHCPv6 server (server) application.

relay

Specifies the DHCPv6 relay on regular IES or VPRN interfaces. Not supported in current SR OS.

server

Specifies the DHCPv6 server. Must be enabled together with the DHCPv6 relay on subscriber interfaces (esm-relay) application.

7705 SAR Gen 2

4.62 adv-service-mtu

adv-service-mtu

Syntax

adv-service-mtu *octets*

no adv-service-mtu

Context

[Tree] (config>service>epipe>spoke-sdp adv-service-mtu)

[Tree] (config>service>vpls>spoke-sdp adv-service-mtu)

Full Context

configure service epipe spoke-sdp adv-service-mtu

configure service vpls spoke-sdp adv-service-mtu

Description

This command configures the MTU value signaled in the targeted LDP for the spoke-SDP and is used to validate the value signaled by the far-end PE. If configured, this value is used instead of the service MTU. However, the configuration does not affect the locally enforced value, which is still based on the service MTU. This command cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command.

When configured, an adjusted service MTU is used. See the **service-mtu** command for more information.

The **no** form of this command removes the configuration.

Default

no adv-service-mtu

Parameters

octets

The size of the MTU in octets, expressed as a decimal integer.

Values 0 to 9782

Platforms

7705 SAR Gen 2

adv-service-mtu

Syntax

adv-service-mtu *number*

no adv-service-mtu

Context

[Tree] (config>service>epipe>bgp adv-service-mtu)

[Tree] (config>service>vpls>bgp adv-service-mtu)

Full Context

configure service epipe bgp adv-service-mtu

configure service vpls bgp adv-service-mtu

Description

This command configures the Layer 2 MTU value (advertised for BGP signaling) or the MTU interface parameter (advertised for LDP signaling) for the service. The configured MTU information is used to validate the value signaled by the far-end PE. However, this configuration does not affect the locally enforced value, which is still based on the service MTU.

The **no** form of this command reverts to the default Layer 2 MTU value for BGP signaling or to the default MTU interface parameter for LDP signaling for the service, which uses an adjusted **service-mtu** value. See the **service-mtu** command for more information.

Default

no adv-service-mtu

Parameters

number

Specifies the size, in octets, of the Layer 2 MTU value to advertise for BGP signaling for the service.

Values 0 to 9782

Platforms

7705 SAR Gen 2

4.63 advertise

advertise

Syntax

[Tree] (config>service>ies>if>vpls>evpn>nd advertise)

Full Context

configure service ies interface vpls evpn arp advertise

configure service ies interface vpls evpn nd advertise

Description

This command enables the advertisement of static and dynamic ARP and ND entries that are installed in the ARP and ND cache into EVPN MAC/IP routes. This command must be used along with **no learn-dynamic**.

Default

no advertise

Parameters

static

Enables ARP/ND host routes to be created in the route table from EVPN ARP/ND entries

dynamic

Enables ARP/ND host routes to be created in the route table out of dynamic ARP/ND entries (learned from ARP/ND messages received from the hosts).

route-tag

Specifies the route tag that is added in the route table for ARP/ND host routes of type **dynamic**, or **static**. This tag can be matched on BGP VRF export and BGP peer export policies.

Values 1 to 255

Platforms

7705 SAR Gen 2

[Tree] (config>service>vprn>if>vpls>evpn>nd advertise)

Full Context

configure service vprn interface vpls evpn arp advertise

configure service vprn interface vpls evpn nd advertise

Description

This command enables the advertisement of static and dynamic ARP and ND entries that are installed in the ARP and ND cache into EVPN MAC/IP routes. This command must be used along with the **no learn-dynamic** command.

Default

no advertise

Parameters

static

Enables ARP or ND host routes to be created in the route table from EVPN ARP or ND entries

dynamic

Enables ARP or ND host routes to be created in the route table out of dynamic ARP or ND entries (learned from ARP or ND messages received from the hosts).

route-tag

Keyword to specify the route tag is added in the route table for ARP or ND host routes of type **dynamic**, or **static**. This tag can be matched on BGP VRF export and BGP peer export policies.

Values 1 to 255

interface-less-routing

Keyword to specify that the advertisement in EVPN MAC/IP advertisement routes include the label1 and route target of the R-VPLS EVPN service and the label2 value and route target of the EVPN interface-less instance in the linked VPRN.

bgp-evpn-instance

Keyword to specify the EVPN interface-less BGP instance from which the label and route target are taken when advertising the ARP or ND entry in an EVPN MAC/IP advertisement route.

Values 1 to 1

Platforms

7705 SAR Gen 2

advertise

Syntax

advertise *fad-name*

no advertise

Context

[Tree] (config>router>isis>flex-algos>flex-algo advertise)

[Tree] (config>router>ospf>flex-algos>flex-algo advertise)

Full Context

configure router isis flexible-algorithms flex-algo advertise

configure router ospf flexible-algorithms flex-algo advertise

Description

This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD).

A locally defined FAD is only advertised if it is administratively enabled. A router can advertise only a single locally defined FAD by using the *fad-name* as reference anchor.

The winning FAD used by a router must be consistent with the winning FAD on all other routers. This avoids routing loops and traffic blackholing. The winning FAD is selected using a tie-breaker algorithm that first selects the highest advertised FAD priority and next the highest system Id.

The **no** form of this command removes the advertisement of a flexible algorithm definition.

Default

no advertise

Parameters

fad-name

Configures the FAD name, up to 32 characters. By default, no locally configured FAD is advertised.

Platforms

7705 SAR Gen 2

advertise

Syntax

[**no**] **advertise**

advertise weight dynamic [**max-dynamic-weight** *max-dynamic-weight*]

advertise weight *weight*

Full Context

configure service vpls bgp-evpn ip-route-link-bandwidth advertise

configure service vprn bgp-evpn mpls evpn-link-bandwidth advertise

Description

This command enables the advertisement of the EVPN link bandwidth extended community along with the IP Prefix routes.

The **no** form of this command disables the advertisement of the EVPN link bandwidth extended community.

Default

no advertise

Parameters

weight

Specifies the weight advertised in the EVPN link bandwidth extended community for the advertised EVPN IP prefix routes for the service.

Values 1 to 128

weight dynamic

Keyword to specify that the weight is dynamically set based on the number of BGP PE-CE paths for the IP-Prefix that is advertised in an EVPN IP-Prefix route.

max-dynamic-weight

Specifies the maximum weight advertised in the EVPN link bandwidth extended community for the advertised EVPN IP-Prefix routes for the service. If **weight dynamic** is configured, the actual advertised weight is the minimum of the number of BGP PE-CE paths for the prefix and the configured maximum weight.

Values 1 to 128

configure service vprn bgp group neighbor bfd-strict-mode advertise

Description

This command configures BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements:

- The **bfd-enable** command that applies to the peer is enabled (through either configuration or inheritance).
- The interface associated with the peer has a valid BFD configuration.

When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state.

The **no** form of this command prevents BGP from advertising the Strict-BFD capability to peers.

Default

no advertise

Parameters

seconds

Specifies the maximum time (in seconds) BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold

time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the **holdtime** parameter is not considered.

Values 1 to 65535

Default 30

Platforms

4.64 advertise-admin-group

advertise-admin-group

Syntax

advertise-admin-group {prefer-ag | eag-only | ag-eag}

no advertise-admin-group

Context

[Tree] (config>router>ospf>flex-algos advertise-admin-group)

[Tree] (config>router>isis>flex-algos advertise-admin-group)

Full Context

configure router ospf flexible-algorithms advertise-admin-group

configure router isis flexible-algorithms advertise-admin-group

Description

This command configures the type of Aministrative Group (AG) or Extended Administrative Group (EAG) TLVs the router advertises as the Interior Gateway Protocol (IGP) link attribute. This command is configured for this IGP instance.

The **no** form of this command removes the configuration.

Default

prefer-ag

Parameters

prefer-ag

Keyword to specify that the router advertises the Administrative Group (AG) TLV as the IGP link attribute if the affinity bits in the **configure router if-attribute admin-group** *value* command are configured between 0 to 31. If no EAG (32 to 255) affinity bits are configured, only the AG TLV is advertised as the IGP link attribute.

If the affinity bits are configured in both the AG (0 to 31) and EAG (32 to 255) range, the router advertises both the AG and the EAG TLVs as the IGP link attributes.

eag-only

Keyword to specify that the router advertises only the EAG TLV as the IGP link attribute. No AG TLV is advertised if this keyword is configured.

ag-eag

Keyword to specify that the router can advertise both the AG and the EAG TLVs as the IGP link attributes, even without the affinity bit in the EAG range configured in the **configure router if-attribute admin-group** *value* command. If no affinity bit is configured in the AG range (0 to 31), the router prunes the AG TLV. Configuring this keyword allows for backward compatibility for vendor implementations that support only AG, while still supporting EAG.

4.65 advertise-bgp

advertise-bgp

Syntax

advertise-bgp route-distinguisher *rd* [**community** *community*]

no advertise-bgp route-distinguisher *rd*

Context

[Tree] (config>service>pw-routing>local-prefix advertise-bgp)

Full Context

configure service pw-routing local-prefix advertise-bgp

Description

This command enables a given prefix to be advertised in MP-BGP for dynamic MS-PW routing.

The **no** form of this command will explicitly withdraw a route if it has been previously advertised.

Default

no advertise-bgp

Parameters

rd

Specifies an 8-octet route distinguisher associated with the prefix. Up to 4 unique route distinguishers can be configured and advertised for a given prefix though multiple instances of the advertise-bgp command. This parameter is mandatory.

Values (6 bytes, other 2 Bytes of type will be automatically generated) asn:number1 (RD Type 0): 2bytes ASN and 4 bytes locally administered number ip-address:number2 (RD Type 1): 4bytes IPv4 and 2 bytes locally administered number;

community

An optional BGP communities attribute associated with the advertisement. To delete a previously advertised community, advertise-bgp route-distinguisher must be run again with the same value for the RD but excluding the community attribute.

Values

community	{2-byte-as-number:comm-va1}
2-byte-asnumber	0 to 65535
comm.-val	0 to 65535

4.66 advertise-delay

advertise-delay

Syntax

[**no**] **advertise-delay**

Context

[Tree] (config>router>ospf>te-opts advertise-delay)

Full Context

configure router ospf traffic-engineering-options advertise-delay

Description

This command configures the advertisement of link delay in the IGP LSDB within the OSPF-TE TLV attribute or when the Application Specific Link Attribute (ASLA) is enabled within the SR-TE ASLA.

When the router is configured with the **configure router ospf traffic-engineering-options sr-te application-specific-link-attributes** command to generate SR-TE ASLA attributes, link delay is advertised as a legacy RFC 3630 TE TLV when RSVP-TE is enabled and as an ASLA RFC 8920 TLV for SR-TE when MPLS is enabled for an interface.

SR OS accepts and handles both legacy RSVP-TE TLVs and ASLAs for the RSVP application. However, SR OS only advertises RFC 3630 legacy RSVP-TE TLVs (as recommended by RFC 8920) to avoid compatibility issues.

The **no** form of this command disables link delay advertisement.

Default

no advertise-delay

Platforms

7705 SAR Gen 2

advertise-delay

Syntax

[**no**] **advertise-delay**

Context

[Tree] (config>router>isis>te advertise-delay)

Full Context

configure router isis traffic-engineering-options advertise-delay

Description

This command enables the advertisement of link delay in the IGP LSDB within legacy Traffic Engineering (TE) attributes in IS-IS or within the Application Specific Link Attribute (ASLA) when ASLA is enabled for SR-TE or RSVP-TE applications.

When **application-link-attributes legacy** command is configured for SR-TE or RSVP-TE, link delay is advertised as a legacy TE TLV with the ASLA legacy bit set.

The **no** form of this command disables link delay advertisement.

Default

no advertise-delay

Platforms

7705 SAR Gen 2

4.67 advertise-external

advertise-external

Syntax

[**no**] **advertise-external** [**ipv4**] [**ipv6**] [**label-ipv4**] [**label-ipv6**]

Context

[Tree] (config>router>bgp advertise-external)

Full Context

configure router bgp advertise-external

Description

This command allows BGP to advertise its best external route to a destination even when its best overall route is an internal route. Entering the command (or its **no** form) with no address family parameters is equivalent to specifying all supported address families.

The **no** form of this command disables Advertise Best External for the BGP family.

Default

no advertise-external

Parameters

ipv4

Enables the best-external advertisement for unlabeled unicast IPv4 routes.

ipv6

Enables the best-external advertisement for unlabeled unicast IPv6 routes.

label-ipv4

Enables the best-external advertisement for labeled-unicast IPv4 routes.

label-ipv6

Enables the best-external advertisement for labeled-unicast IPv6 routes.

[Tree] (config>service>vprn>bgp advertise-inactive)

Full Context

configure service vprn bgp group advertise-inactive

configure service vprn bgp group neighbor advertise-inactive

configure service vprn bgp advertise-inactive

Description

This command enables or disables the advertising of inactive BGP routers to other BGP peers.

By default, BGP only advertises BGP routes to other BGP peers if a given BGP route is chosen by the route table manager as the most preferred route within the system and is active in the forwarding plane. This command allows system administrators to advertise a BGP route even though it is not the most preferred route within the system for a given destination.

When the BGP **advertise-inactive** command is configured so that it applies to a BGP session it has the following effect on the IPv4, IPv6, mcast-ipv4, mcast-ipv6, label-IPv4 and label-IPv6 routes advertised to that peer:

- If the active route for the IP prefix is a BGP route then that route is advertised.
- If the active route for the IP prefix is a non-BGP route and there is at least one valid but inactive BGP route for the same destination then the best of the inactive and valid BGP routes is advertised unless the non-BGP active route is matched and accepted by an export policy applied to the session.
- If the active route for the IP prefix is a non-BGP route and there are no (valid) BGP routes for the same destination then no route is advertised for the prefix unless the non-BGP active route is matched and accepted by an export policy applied to the session.

Default

no advertise-inactive

Full Context

configure service vprn bgp group neighbor advertise-ipv6-next-hops

configure service vprn bgp group advertise-ipv6-next-hops

configure service vprn bgp advertise-ipv6-next-hops

Description

When this command is configured, with the IPv4 option, so that it applies to a BGP session established on top of IPv6 transport, IPv4 BGP routes can be advertised with a true IPv6 address when originated or when **next-hop-self** (configured or automatic) is applied.

If an IPv4 route must originate or be advertised with a **next-hop-self** and the corresponding **advertise-ipv6-next-hops** command option does not apply to the session or if an appropriate **extended-nh-encoding** capability was not received from the remote peer, then the route is advertised with the IPv4 system address as the BGP next-hop.

If an IPv4 route is matched by a BGP export policy entry that tries to change the next hop to an IPv6 address and the corresponding **advertise-ipv6-next-hops** command option does not apply to the session or if an appropriate **extended-nh-encoding** capability was not received from the remote peer, then the route is handled as though it was rejected by the policy entry.

This command has no effect on sessions established over IPv4 transport.

The **no** form of this command reverts to the default.

Default

no advertise-ipv6-next-hops

Parameters

ipv4

Allows IPv4 unicast routes to be advertised to IPv6-transport peers with an IPv6 address as the BGP next-hop in cases of route origination or **next-hop-self** (configured or automatic). It also allows export policies to change the BGP next-hop of an IPv4 route to an IPv6 address. All of these cases require the remote peer to advertise the necessary extended NH encoding capability. It may be necessary to configure the **forward-ipv4-packets** command under the appropriate **interface>ipv6** contexts in order to enable datapath support for these control plane exchanges.

7705 SAR Gen 2

advertise-ipv6-next-hops

Syntax

advertise-ipv6-next-hops [**vpn-ipv6**] [**label-ipv6**] [**evpn**] [**vpn-ipv4**] [**label-ipv4**] [**ipv4**]

no advertise-ipv6-next-hops

Context

[Tree] (config>router>bgp advertise-ipv6-next-hops)

[Tree] (config>router>bgp>group advertise-ipv6-next-hops)

[Tree] (config>router>bgp>group>neighbor advertise-ipv6-next-hops)

Full Context

configure router bgp advertise-ipv6-next-hops

configure router bgp group advertise-ipv6-next-hops

configure router bgp group neighbor advertise-ipv6-next-hops

Description

This command applies to a BGP session established on top of IPv6 transport; BGP routes belonging to the specified families can be advertised with a true IPv6 address when originated or when **next-hop-self** (configured or automatic) is applied.

This command has no effect on routes advertised to IPv4 peers.

When this command is not enabled, the following considerations apply:

- If a VPN IPv6 or label IPv6 route needs to be originated or advertised with **next-hop-self** to an IPv6 transport peer the route is advertised with the IPv4 system address as BGP next-hop (encoded as an IPv4-mapped IPv6 address).
- If a VPN-IPv4 or label IPv4 route needs to be originated or advertised with **next-hop-self** or if an appropriate **extended-nh-encoding** capability was not received from the remote peer, the route is advertised with the IPv4 system address as the BGP next-hop.
- If a VPN IPv4 or label IPv4 route is matched by a BGP export policy entry that tries to change the next-hop to an IPv6 address and an appropriate **extended-nh-encoding** capability was not received from the remote peer, the route is handled as though it was rejected by the policy entry.

The **no** form of this command disables the setting of next hops to a global IPv6 address for the family.

Default

no advertise-ipv6-next-hops

Parameters

vpn-ipv6

Allows VPN IPv6 routes to be advertised to IPv6 transport peers with an IPv6 address as the BGP next-hop in cases of route origination or **next-hop-self** (configured or automatic).

label-ipv6

Allows label IPv6 routes to be advertised to IPv6 transport peers with an IPv6 address as the BGP next-hop in cases of route origination or **next-hop-self** (configured or automatic).

vpn-ipv4

Allows VPN IPv4 routes to be advertised to IPv6 transport peers with an IPv6 address as the BGP next-hop in cases of route origination or **next-hop-self** (configured or automatic). It also allows export policies to change the BGP next-hop of a VPN IPv4 route to an IPv6 address. All of these cases require the remote peer to advertise the necessary extended NH encoding capability.

label-ipv4

Allows label IPv4 routes to be advertised to IPv6 transport peers with an IPv6 address as the BGP next-hop in cases of route origination or **next-hop-self** (configured or automatic). It also allows export policies to change the BGP next-hop of a label IPv4 route to an IPv6 address. All of these cases require the remote peer to advertise the necessary extended NH encoding capability.

ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=1 and next-hop AFI=2.

evpn

Allows EVPN routes to be advertised to IPv6 transport peers.

7705 SAR Gen 2

4.70 advertise-label

advertise-label

Syntax

advertise-label {**per-prefix** | **pop** | **pop-and-forward**}

no advertise-label

Context

[Tree] (config>router>policy-options>policy-statement>entry>action advertise-label)

[Tree] (config>router>policy-options>policy-statement>default-action advertise-label)

Full Context

configure router policy-options policy-statement entry action advertise-label

configure router policy-options policy-statement default-action advertise-label

Description

This command configures the label allocation method for advertised routes. The effect of the **advertise-label** command depends on the context where the associated policy is applied.

Use the **per-prefix** option and configure the command in the default action or entry-specific action of a VRF export policy to advertise every qualifying matched route with a per-prefix label in the resulting VPN-IP routes. In this situation, non-qualifying routes include local interface routes and BGP-VPN routes. The command overrides, for specific routes, the configured label-mode of the exporting VPRN service.

Use the per-prefix option and configure the command in the default action or entry-specific action of a BGP import policy to assign a per-prefix label to qualifying label-IPv4 and label-IPv6 routes when:

- these routes are the best path for their prefix in the respective RIB
- there is a BGP next-hop change

A label-IPv4 or label-IPv6 route advertised with a pre-prefix label supports ECMP forwarding across multiple BGP next-hops.

The **pop** option is applicable in route-table-import policies. The advertised BGP label is programmed for a pop operation when:

- a /32 IPv4 static, OSPF, or IS-IS route is matched and accepted by a label-IPv4 or label-IPv6 RIB route-table-import policy entry or default-action with this command
- the route is a candidate to be advertised as a label-IPv4 or label-IPv6 route (due to a BGP export policy)

When the label-IPv4 RIB imports a /32 static, OSPF, or IS-IS route and then exports the route as a BGP route, the default behavior is to program a swap operation in the datapath, which swaps the BGP label with the tunnel label that takes traffic to the destination of the /32 route.

The **pop-and-forward** option is applicable in route-table-import policies, when these policies match an unlabeled BGP route and apply this policy action.

Use the **pop-and-forward** option to program the label that is advertised in the BGP-LU route to forward the packet according to the resolution of the unlabeled route that triggered the origination of the BGP-LU route. The forwarding is done without an IP FIB lookup, which can be useful in situations where the IP FIB at the exit of the MPLS tunnel is not synchronized with the FIB at the head-end of the MPLS tunnel. The advertisement of a pop-and-forward label overrides the configuration to advertise label-ipv6 routes with an explicit null label and the configuration to advertise BGP-LU with a prefix SID attribute. Those features are not available when using the pop-and-forward label.

Default

no advertise-label

Parameters

per-prefix

Sets the per-prefix label allocation for matched routes. This takes effect only in VRF export policies and BGP import policies, and only for certain types of routes.

pop

Sets the pop label allocation for matched routes. This takes effect only in label-IPv4 route-table-import policies and only applies to /32 IPv4 routes that were learned through static configuration, OSPF, or IS-IS.

pop-and-forward

Sets the pop-and-forward label allocation for matched routes. This takes effect only when an unlabeled BGP IPv4 or IPv6 route is matched by a label-IPv4 or label-IPv6 route-table-import policy.

configure service vprn bgp group neighbor graceful-restart long-lived advertise-stale-to-all-neighbors

configure service vprn bgp graceful-restart long-lived advertise-stale-to-all-neighbors

Description

This command allows BGP routes marked as LLGR stale to be advertised to BGP peers that did not advertise the LLGR capability when the session was opened. The **no** version of this command causes advertisement behavior to follow the rule that stale routes cannot be advertised to a peer that does not understand or implement the LLGR capability. Stale routes are withdrawn towards such peers.

When this command is configured with the **without-no-export** option, LLGR stales routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. Towards IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the LOCAL_PREFERENCE attribute in the advertised stale routes is automatically set to zero.

When this command is configured without the **without-no-export** option, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. Towards IBGP and confederation-EBGP peers that did not advertise the LLGR capability the LOCAL_PREFERENCE attribute in the advertised stale routes is automatically set to zero and a NO_EXPORT standard community is automatically added to the routes.

Default

no advertise-stale-to-all-neighbors

Parameters

without-no-export

Allows LLGR stale routes to be advertised to all peers, such that they can exit the local AS.

Platforms

configure router bgp group neighbor graceful-restart long-lived advertise-stale-to-all-neighbors

configure router bgp group graceful-restart long-lived advertise-stale-to-all-neighbors

configure router bgp graceful-restart long-lived advertise-stale-to-all-neighbors

Description

This command allows BGP routes marked as LLGR stale to be advertised to BGP peers that did not advertise the LLGR capability when the session was opened.

When this command is configured with the **without-no-export** option, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. Towards IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the LOCAL_PREFERENCE attribute in the advertised stale routes is automatically set to zero.

When this command is configured without the **without-no-export** option, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. Towards IBGP and confederation-EBGP peers that did not advertise the LLGR capability the LOCAL_PREFERENCE attribute in the advertised stale routes is automatically set to zero and a NO_EXPORT standard community is automatically added to the routes.

The **no** version of this command causes advertisement behavior to follow the rule that stale routes cannot be advertised to a peer that does not understand or implement the LLGR capability. Stale routes are withdrawn towards such peers.

Default

no advertise-stale-to-all-neighbors

Parameters

without-no-export

Allows LLGR stale routes to be advertised to all peers, such that they can exit the local AS.

Platforms

7705 SAR Gen 2

4.76 advertise-subnet

advertise-subnet

Syntax

[**no**] **advertise-subnet**

Context

[Tree] (config>service>vprn>ospf>area>if advertise-subnet)

Full Context

configure service vprn ospf area interface advertise-subnet

Description

This command enables advertising point-to-point interfaces as subnet routes (network number and mask). When disabled, point-to-point interfaces are advertised as host routes.

This command is not supported in the OSPF3 context.

The **no** form of this command disables advertising point-to-point interfaces as subnet routes meaning they are advertised as host routes.

Default

advertise-subnet — Advertises point-to-point interfaces as subnet routes.

advertise-tunnel-link

Syntax

[**no**] **advertise-tunnel-link**

Context

[Tree] (config>router>ospf advertise-tunnel-link)

[Tree] (config>router>isis advertise-tunnel-link)

Full Context

configure router ospf advertise-tunnel-link

configure router isis advertise-tunnel-link

Description

This command enables the forwarding adjacency feature. With this feature, IS-IS or OSPF advertises an RSVP LSP as a link so that other routers in the network can include it in their SPF computations. The RSVP LSP is advertised as an unnumbered point-to-point link and the link LSP or LSA has no Traffic Engineering opaque sub-TLVs, as per RFC 3906. An SR-TE LSP is not supported with forwarding adjacency.

The forwarding adjacency feature can be enabled independently from the IGP shortcut feature in CLI. If both **igp-shortcut** and **advertise-tunnel-link** options are enabled for a given IGP instance, then the **advertise-tunnel-link** takes precedence.

When the forwarding adjacency feature is enabled, each node advertises a p2p unnumbered link for each best metric tunnel to the router ID of any endpoint node. The node does not include the tunnels as IGP shortcuts in SPF computation directly. Instead, when the LSA or LSP that advertises the corresponding P2P unnumbered link is installed in the local routing database, the node performs an SPF using it like any other link LSA or LSP. The bidirectional check of the link requires that a link, regular or tunnel, exists in the reverse direction for the tunnel to be used in SPF.

The **igp-shortcut** option under the LSP name governs the use of the LSP with both the **igp-shortcut** and the **advertise-tunnel-link** options in IGP. In other words, the user can exclude a specific RSVP LSP from being used as a forwarding adjacency by entering the command **config>router>mpls>lsp>no igp-shortcut**.

Support is provided for resolving and forwarding IPv4 and IPv6 prefixes over IPv4 forwarding adjacency RSVP-TE LSP. Specifically, the forwarding adjacency feature supports family IPv4 in OSPFv2, family IPv6 in OSPFv3, families IPv4 and IPv6 in ISIS MT=0, and family IPv6 in ISIS MT=2.

In addition, both IPv4 and IPv6 SR-ISIS tunnels can be resolved and further tunneled over one or more RSVP-TE LSPs used as forwarding adjacencies. This is enabled by configuring both segment routing and forwarding adjacency features within an IS-IS instance in a multi-topology MT=0.

IS-IS forwarding adjacency using the **advertise-tunnel-link** command is not supported in combination with the IS-IS link bundling and the IS-IS metric link quality adjustment features.

The **no** form of this command disables forwarding adjacency and disables the advertisement of RSVP LSP into IGP.

Default

no advertise-tunnel-link

Context

[Tree] (config>service>vprn aggregate)

Full Context

configure service vprn aggregate

Description

This command creates an aggregate route. Use this command to automatically install an aggregate route in the routing table when there are one or more component routes. A component route is any route used for forwarding that is a more specific match of the aggregate.

The use of aggregate routes can reduce the number of routes that need to be advertised to neighbor routers, leading to smaller routing table sizes.

Overlapping aggregate routes may be configured; in this case a route becomes a component of only the one aggregate route with the longest prefix match. For example if one aggregate is configured as 10.0.0.0/16 and another as 10.0.0.0/24, then route 10.0.128/17 would be aggregated into 10.0.0.0/16, and route 10.0.0.128/25 would be aggregated into 10.0.0.0/24. If multiple entries are made with the same prefix and the same mask the previous entry is overwritten.

A list of up to 12 BGP communities (any mix of standard, extended, and large communities) may be associated with an aggregate route. These communities can be matched in route policies and are automatically added to BGP routes that are created from the aggregate route.

By default, aggregate routes are not installed in the forwarding table, however there are configuration options that allow an aggregate route to be installed with a black-hole next hop or with an indirect IP address as next hop.

Aggregate routes can be advertised via MP-BGP to other PEs within the network. Aggregate routes advertised using MP-BGP do not include aggregated BGP path attributes from the component routes which were used to activate the aggregate route. The aggregate route will be advertised with the minimal set of path attributes as if the aggregate was originated by the advertising routes. Export route policies should be used to control and modify the advertisement and path attributes of the aggregate routes.

The **no** form of this command removes the aggregate.

Default

no aggregate

Parameters

ip-prefix

The destination address of the aggregate route in dotted decimal notation.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

the mask associated with the network address expressed as a mask length

Values: 0 to 32

summary-only

This optional parameter suppresses advertisement of more specific component routes for the aggregate.

To remove the **summary-only** option, enter the same aggregate command without the **summary-only** parameter.

as-set

This optional parameter is only applicable to BGP and creates an aggregate where the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized. Use this feature carefully as it can increase the amount of route churn due to best path changes.

aggregator *as-number*:*ip-address*

This optional parameter specifies the BGP aggregator path attribute to the aggregate route. When configuring the aggregator, a two-octet AS number used to form the aggregate route must be entered, followed by the IP address of the BGP system that created the aggregate route.

discard-component-communities

This optional keyword causes the aggregate to be advertised with only the configured BGP community set, none of the communities from the component routes activating the aggregate are included. (Component attributes are never included in aggregate routes advertised to other PE routers via MP-BGP).

black-hole

This optional parameter installs the aggregate route, when activated, in the FIB with a black-hole next-hop, where packets matching this route are discarded.

generate-icmp

This optional parameter keyword generates an ICMP.

community

This configuration option associates a BGP community with the aggregate route. The community can be matched in route policies and is automatically added to BGP routes exported from the aggregate route.

comm-id

Specifies a BGP community value, up to 72 characters.

Values [*as-num:comm-val* | *well-known-comm* | *ext-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*
  - color:co-bits:*color-value*

  where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - *val-in-mbps* — 0 to 16777215
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFFFF
  - *co-bits* — 00, 01, 10 or 11
  - *color-value* — 0 to 4294967295
- *large-comm — asn-or-ex:val-or-ex:val-or-ex*

description

Specifies a text description stored in the configuration file for a configuration context.

local-preference

Specifies a BGP local-preference value with the aggregate route. The local-preference overrides the default local preference value of a BGP route originated by exporting the aggregate route.

Values 0 to 4294967295

indirect *ip-address*

This configuration option specifies that the aggregate route should be installed in the FIB with a next-hop taken from the route used to forward packets to ip-address.

Values		
	ipv4-prefix	a.b.c.d
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

tunnel-group-id

Specifies that the MC-IPsec state of the specific tunnel-group is added to the aggregate route.

Values 1 to 16

Platforms

7705 SAR Gen 2

Context

[Tree] (config>router aggregate)

Full Context

configure router aggregate

Description

This command creates an aggregate route.

Use this command to automatically install an aggregate route in the routing table when there are one or more component routes. A component route is any route used for forwarding that is a more-specific match of the aggregate.

The use of aggregate routes can reduce the number of routes that need to be advertised to neighbor routers, leading to smaller routing table sizes.

Overlapping aggregate routes may be configured; in this case a route becomes a component of only the one aggregate route with the longest prefix match. For example if one aggregate is configured as 10.0.0.0/16 and another as 10.0.0.0/24, then route 10.0.128/17 would be aggregated into 10.0.0.0/16, and route 10.0.0.128/25 would be aggregated into 10.0.0.0/24. If multiple entries are made with the same prefix and the same mask the previous entry is overwritten.

A standard 4-byte BGP community may be associated with an aggregate route in order to facilitate route policy matching.

By default aggregate routes are not installed in the forwarding table, however there are configuration options that allow an aggregate route to be installed with a black-hole next hop or with an indirect IP address as next hop.

The **no** form of this command removes the aggregate.

Default

no aggregate

Parameters

ip-prefix

Specifies the destination address of the aggregate route in dotted decimal notation.

Values	ipv4-prefix	a.b.c.d (host bits must be 0)	
	ipv4-prefix-length	0 to 32	
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x:	[0 to FFFF]H
		d:	[0 to 255]D
	ipv6-prefix-length	0 to 128	

ip-prefix-length

Specifies the mask associated with the network address expressed as a mask length.

Values 0 to 32

summary-only

Suppresses advertisement of more specific component routes for the aggregate.

To remove the **summary-only** option, enter the same aggregate command without the **summary-only** parameter.

as-set

This optional parameter is only applicable to BGP and creates an aggregate where the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized. Use this feature carefully as it can increase the amount of route churn due to best path changes.

as-number:ip-address

Specifies the BGP aggregator path attribute to the aggregate route. When configuring the aggregator, a two-octet AS number used to form the aggregate route must be entered, followed by the IP address of the BGP system that created the aggregate route.

discard-component-communities

Causes the aggregate to be advertised with only the configured BGP community set, none of the communities from the component routes activating the aggregate are included.

black-hole

Installs the aggregate route, when activated, in the FIB with a black-hole next-hop, where packets matching this route are discarded.

generate-icmp

Mandatory keyword to generate an ICMP.

community

Associates a BGP community with the aggregate route. The community can be matched in route policies and is automatically added to BGP routes exported from the aggregate route.

comm-id

Specifies a BGP community value, up to 72 characters. A maximum of twelve community IDs can be specified in a single statement.

Values [*as-num:comm-val* | *well-known-comm* | *ext-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*
  - color:co-bits:*color-value*

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- *val-in-mbps* — 0 to 16777215
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFFFF
- *co-bits* — 00, 01, 10 or 11
- *color-value* — 0 to 4294967295

• *large-comm — asn-or-ex:val-or-ex:val-or-ex*

indirect *ip-address*

Specifies that the aggregate route should be installed in the FIB with a next-hop taken from the route used to forward packets to ip-address.

Values		
	ipv4-prefix	a.b.c.d
	ipv6-prefix	x:x:x:x:x:x:x:x
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

description

Specifies a text description stored in the configuration file for a configuration context, up to 80 characters.

local-preference

Specifies a BGP local-preference value with the aggregate route. The local-preference overrides the default local preference value of a BGP route originated by exporting the aggregate route.

Values 0 to 4294967295

policy-name

Specifies the route policy, up to 64 characters.

Platforms

7705 SAR Gen 2

4.81 aggregate-prefix-match

aggregate-prefix-match

Syntax

[**no**] **aggregate-prefix-match**

Context

[Tree] (config>router>ldp aggregate-prefix-match)

Full Context

configure router ldp aggregate-prefix-match

Description

The command enables the use by LDP of the aggregate prefix match procedures.

When this option is enabled, LDP performs the following procedures for all prefixes. When an LSR receives a FEC-label binding from an LDP neighbor for a given specific FEC1 element, it will install the binding in the LDP FIB if:

- It is able to perform a successful longest IP match of the FEC prefix with an entry in the routing table, and
- The advertising LDP neighbor is the next-hop to reach the FEC prefix.

When such a FEC-label binding has been installed in the LDP FIB, then LDP programs an NHLFE entry in the egress data path to forward packets to FEC1. It also advertises a new FEC-label binding for FEC1 to all its LDP neighbors.

When a new prefix appears in the routing table, LDP inspects the LDP FIB to determine if this prefix is a better match (a more specific match) for any of the installed FEC elements. For any FEC for which this is true, LDP may have to update the NHLFE entry for this FEC.

When a prefix is removed from the routing table, LDP inspects the LDP FIB for all FEC elements which matched this prefix to determine if another match exists in the routing table. If so, it updates the NHLFE entry accordingly. If not, it sends a label withdraw message to its LDP neighbors to remove the binding.

When the next hop for a routing prefix changes, LDP updates the LDP FIB entry for the FEC elements which matched this prefix. It also updates the NHLFE entry for these FEC elements accordingly.

The **no** form of this command disables the use by LDP of the aggregate prefix procedures and deletes the configuration. LDP resumes performing exact prefix match for FEC elements.

Default

no aggregate-prefix-match

[Tree] (config>service>vprn>bgp>group>link-bandwidth aggregate-used-paths)

Full Context

configure service vprn bgp group neighbor link-bandwidth aggregate-used-paths

configure service vprn bgp group link-bandwidth aggregate-used-paths

Description

This command configures BGP to aggregate the bandwidth values from the link-bandwidth extended communities of the used multipaths towards an IP prefix when it is re-advertising a route with next-hop-self towards peers within the scope of the command, as long as the route belongs to one of the listed address families.

Aggregation is not supported unless all of the used multipaths (up to the configured ECMP limit) correspond to received BGP routes with a link-bandwidth extended community. If add-path is also enabled toward the peer, then all of the add-paths advertised to the peer encode the aggregated bandwidth in a link-bandwidth extended community.

Up to three families may be configured.

The **no** form of this command disables aggregation in a next-hop-self scenario and the link-bandwidth extended community in the advertised route is a copy of the link-bandwidth extended community in the received route (which may have been added by import policy or by the effect of the **add-to-received-ebgp** command).

Default

no aggregate-used-paths

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

configure router bgp group link-bandwidth aggregate-used-paths

Description

This command configures BGP to aggregate the bandwidth values from the link-bandwidth extended communities of the used multipaths towards an IP prefix when it is re-advertising a route with next-hop-self towards peers within the scope of the command, as long as the route belongs to one of the listed address families.

Aggregation is not supported unless all of the used multipaths (up to the configured ECMP limit) correspond to received BGP routes with a link-bandwidth extended community. If add-path is also enabled toward the peer, then all of the add-paths advertised to the peer encode the aggregated bandwidth in a link-bandwidth extended community.

Up to six families may be configured.

The **no** form of this command disables aggregation in a next-hop-self scenario and the link-bandwidth extended community in the advertised route is a copy of the link-bandwidth extended community in the received route (which may have been added by import policy or by the effect of the **add-to-received-ebgp** command).

Default

no aggregate-used-paths

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

vpn-ipv4 — Adds a link-bandwidth extended community to IPv4 VPN (SAFI 128) routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

label-ipv6 — Adds a link-bandwidth extended community to labeled-unicast IPv6 routes.

vpn-ipv6 — Adds a link-bandwidth extended community to IPv6 VPN (SAFI 128) routes.

4.83 aggregator-id-zero

aggregator-id-zero

Syntax

[**no**] **aggregator-id-zero**

Context

[Tree] (config>service>vprn>bgp>group aggregator-id-zero)

[Tree] (config>service>vprn>bgp>group>neighbor aggregator-id-zero)

[Tree] (config>service>vprn>bgp aggregator-id-zero)

Full Context

configure service vprn bgp group aggregator-id-zero

configure service vprn bgp group neighbor aggregator-id-zero

configure service vprn bgp aggregator-id-zero

Description

This command is used to set the router ID in the BGP aggregator path attribute to zero when BGP aggregates routes. This prevents different routers within an AS from creating aggregate routes that contain different AS paths.

When BGP is aggregating routes, it adds the aggregator path attribute to the BGP update messages. By default, BGP adds the AS number and router ID to the aggregator path attribute.

When this command is enabled, BGP adds the router ID to the aggregator path attribute. This command is used at the group level to revert to the value defined under the global level, while this command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of this command used at the global level reverts to default where BGP adds the AS number and router ID to the aggregator path attribute.

The **no** form of this command used at the group level reverts to the value defined at the group level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no aggregator-id-zero — BGP adds the AS number and router ID to the aggregator path attribute.

Platforms

7705 SAR Gen 2

[Tree] (config>router>bgp>group>neighbor aggregator-id-zero)

Full Context

configure router bgp aggregator-id-zero

configure router bgp group aggregator-id-zero

configure router bgp group neighbor aggregator-id-zero

Description

This command sets the router ID in the BGP aggregator path attribute to zero when BGP aggregates routes. This prevents different routers within an AS from creating aggregate routes for the same prefix with different path attributes.

When BGP is aggregating routes, it adds the aggregator path attribute to the BGP update messages. By default, BGP adds the AS number and router ID to the aggregator path attribute.

When this command is enabled, BGP adds the router ID to the aggregator path attribute. This command is used at the group level to revert to the value defined under the global level, while this command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of this command used at the global level reverts to default where BGP adds the AS number and router ID to the aggregator path attribute.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no aggregator-id-zero

Platforms

4.84 aging

aging

Syntax

aging *days*

no aging

Context

[Tree] (config>system>security>password aging)

Full Context

configure system security password aging

Description

This command configures the number of days a user password is valid before the user must change their password. This parameter can be used to force the user to change the password at the configured interval. Note the aging starts after the last password configuration or update. This timer is persistence (per user) over a node reboot or activity switch between CPMs. When the user changes the password, the timer is reset to the maximum age. When the password for a user ages out, the user is prompted at login to change the password. Console/SSH/Telnet supports password change prompt.

The **no** form of this command reverts to the default value.

Parameters

days

Specifies the maximum number of days the password is valid.

Values 1 to 500

Note:
This command applies to local users.

Platforms

7705 SAR Gen 2

4.85 ah-ext-hdr

ah-ext-hdr

Syntax

ah-ext-hdr {**true** | **false**}

no ah-ext-hdr

Context

[Tree] (config>filter>ipv6-filter>entry>match ah-ext-hdr)

Full Context

configure filter ipv6-filter entry match ah-ext-hdr

Description

This command enables match on existence of AH Extension Header in the IPv6 filter policy.

The **no** form of this command ignores AH Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

Default

no ah-ext-hdr

Parameters

true

Matches a packet with an AH Extension Header.

false

Matches a packet without an AH Extension Header.

Platforms

7705 SAR Gen 2

4.86 aigp

aigp

Syntax

[**no**] **aigp**

Context

[Tree] (config>router>bgp>group aigp)

[Tree] (config>router>bgp>group>neighbor aigp)

Full Context

configure router bgp group aigp

configure router bgp group neighbor aigp

Description

This command enables or disables Accumulated IGP (AIGP) path attribute support with one or more BGP peers. BGP path selection among routes with an associated AIGP metric is based on the end-to-end IGP metrics of the different BGP paths, even when these BGP paths span more than one AS and IGP instance.

The effect of disabling AIGP (using the **no** form of this command or implicit) is to remove the AIGP attribute from advertised routes, if present, and to ignore the AIGP attribute in received routes.

Default

no aigp

Platforms

7705 SAR Gen 2

4.87 aigp-metric

aigp-metric

Syntax

aigp-metric *metric*

aigp-metric add

aigp-metric igp

no aigp-metric

Context

[Tree] (config>router>policy-options>policy-statement>default-action aigp-metric)

[Tree] (config>router>policy-options>policy-statement>entry>action aigp-metric)

Full Context

configure router policy-options policy-statement default-action aigp-metric

configure router policy-options policy-statement entry action aigp-metric

Description

This command assigns a BGP AIGP metric to routes matching the entry. The effect of this command on a route matched and accepted by a route policy entry depends on how the policy is applied (BGP import policy vs. BGP export policy), the type of route and the specific form of this command.

In a BGP import policy this command is used to:

- Associate an AIGP metric with an IBGP route received with an empty AS path and no AIGP attribute.
- Associate an AIGP metric with an EBGP route received without an AIGP attribute that has an AS path containing only AS numbers belonging to the local AIGP administrative domain.
- Modify the received AIGP metric value prior to BGP path selection.

In a BGP export policy this command is used to:

- Add the AIGP attribute and set the AIGP metric value in a BGP route originated by exporting a direct, static or IGP route from the routing table.
- Remove the AIGP attribute from a route advertisement to a particular peer.
- Modify the AIGP metric value in a route advertisement to a particular peer.

Default

no aigp-metric

Parameters

metric

Administratively defined metric.

Values 0 to 4294967295

Default name — The AIGP metric parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

add

Adds the AIGP attribute.

igp

Sets the AIGP metric to the IGP metric.

Platforms

7705 SAR Gen 2

4.88 alarm

alarm

Syntax

alarm *rmon-alarm-id* **variable-oid** *oid-string* **interval** *seconds* [*sample-type*] [**startup-alarm** *alarm-type*] [**rising-event** *rmon-event-id* **rising-threshold** *threshold*] [**falling-event** *rmon-event-id* **falling-threshold** *threshold*] [**owner** *owner-string*]

no alarm *rmon-alarm-id*

Context

[Tree] (config>system>thresholds>rmon alarm)

Full Context

configure system thresholds rmon alarm

Description

The alarm command configures an entry in the RMON-MIB alarmTable. The alarm command controls the monitoring and triggering of threshold crossing events. In order for notification or logging of a threshold crossing event to occur there must be at least one associated rmon>event configured.

The agent periodically takes statistical sample values from the MIB variable specified for monitoring and compares them to thresholds that have been configured with the alarm command. The alarm command configures the MIB variable to be monitored, the polling period (interval), sampling type (absolute or delta value), and rising and falling threshold parameters. If a sample has crossed a threshold value, the associated event is generated.

Use the **no** form of this command to remove an rmon-alarm-id from the configuration.

Parameters

rmon-alarm-id

Specifies a numerical identifier for the alarm being configured. The number of alarms that can be created is limited to 1200. Alarm ID values above 65400 are used for dynamic system threshold commands and should be avoided.

Values 1 to 65535

oid-string

Specifies the SNMP object identifier of the particular variable to be sampled. Only SNMP variables that resolve to an ASN.1 primitive type of integer (integer, Integer32, Counter32, Counter64, Gauge, or TimeTicks) may be sampled. The oid-string, up to 255 characters, may be expressed using either the dotted string notation or as object

name plus dotted instance identifier. For example, "1.3.6.1.2.1.2.2.1.10.184582144" or "ifInOctets.184582144".

seconds

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds. When setting this interval value, care should be taken in the case of 'delta' type sampling - the interval should be set short enough that the sampled variable is very unlikely to increase or decrease by more than 2147483647 - 1 during a single sampling interval. Care should also be taken not to set the interval value too low to avoid creating unnecessary processing overhead.

Values 1 to 2147483647

sample-type

Specifies the method of sampling the selected variable and calculating the value to be compared against the thresholds.

Values absolute — Specifies that the value of the selected variable will be compared directly with the thresholds at the end of the sampling interval.

delta — Specifies that the value of the selected variable at the last sample will be subtracted from the current value, and the difference compared with the thresholds.

Default absolute

alarm-type

Specifies the alarm that may be sent when this alarm is first created.

If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, then a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

rising-event *rmon-event-id*

Specifies the identifier of the **rmon>event** that specifies the action to be taken when a rising threshold crossing event occurs.

If there is no corresponding event configured for the specified rmon-event-id, then no association exists and no action is taken.

If the **rising-event** *rmon-event-id* has a value of zero (0), no associated event exists.

If a **rising-event** *rmon-event-id* is configured, the CLI requires a **rising-threshold** to also be configured.

Values 0 to 65535

Default 0

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the **falling-threshold** value.

Values -2147483648 to 2147483647

Default 0

falling-event *rmon-event-id*

Specifies the identifier of the **rmon>event** that specifies the action to be taken when a falling threshold crossing event occurs. If there is no corresponding event configured for the specified rmon-event-id, then no association exists and no action is taken. If the **falling-event** has a value of zero (0), no associated event exists.

If a **falling-event** is configured, the CLI requires a **falling-threshold** to also be configured.

Values 0 to 65535

Default 0

falling-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

Values -2147483648 to 2147483647

Default 0

owner-string

Specifies the owner string; the owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not normally be configured by CLI users and can be a maximum of 80 characters long.

Default TiMOS CLI

Configuration example

```
alarm 3 variable-oid ifInOctets.184582144 interval 20 sample-type delta
start-alarm either rising-event 5 rising-threshold 10000 falling-event 5
falling-threshold 9000 owner "TiMOS CLI"
```

4.89 alarms

alarms

Syntax

alarms

Context

[Tree] (config>system alarms)

Full Context

configure system alarms

Description

Commands in this context configure facility alarm parameters. Alarm support is intended to cover a focused subset of router states that are likely to indicate service impacts (or imminent service impacts) related to the overall state of hardware assemblies (cards, fans, links, and so on).

Platforms

7705 SAR Gen 2

4.90 alias

alias

Syntax

alias *alias-name alias-command-name*

no alias *alias-name*

Context

[Tree] (environment alias)

Full Context

environment alias

Description

This command enables the substitution of a command line (or part of a command line) by an alias. Use this command to create alternative or easier to remember or understand names for an entity or command string. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. The special characters forward slash (/) and backslash (\) cannot be used as the first character inside an alias string. An alias can contain a double quote character by preceding the quote with a backslash (\) character (for example, **alias my-alias "| match \"***string***\""**). Only a single command can be present in the command string (the command can be long with many parameters but there is no support for aliases that include multiple CLI commands or lines). This command can be entered in any context but must be created in the **root environment** context.

For example, to create an alias named **soi** to display OSPF interfaces, enter the following command:

alias soi "show router ospf interface”

Complex aliases can be created to have shortcuts for customized show routine output.

environment alias my-summary "| match expression \"----|Description|Interface|Admin State|Oper State|Transceiver Type|Optical Compliance|Link Length\" | match invert-match expression \"Ethernet Interface|OTU Interface\" | match invert-match expression \"----\" post-lines 1"

and then used like this:

show port detail my-summary

Parameters

alias-name

Specifies the alias name, up to 80 characters. Do not use a valid command string for the name of the alias. If the alias specified is an actual command, this causes the command to be replaced by the alias.

alias-command-name

Specifies the command name to be associated, up to 320 characters.

allow-bgp-to-igp-export

Syntax

[no] allow-bgp-to-igp-export

Context

[Tree] (config>router allow-bgp-to-igp-export)

Full Context

configure router allow-bgp-to-igp-export

Description

This command enables the export of base BGP RTM routes into the IGP routing instance within the base router. This command applies to already exported BGP prefixes and to newly received BGP prefixes.

Default

allow-bgp-to-igp-export

Platforms

7705 SAR Gen 2

5.8 allow-boot-license-violations

allow-boot-license-violations

Syntax

[**no**] **allow-boot-license-violations**

Context

[Tree] (config>system allow-boot-license-violations)

Full Context

configure system allow-boot-license-violations

Description

This command configures whether the system should allow successful execution of the bootup configuration file when it contains license violations. When enabled, the system will not error on any configuration that causes a license violation and as a result permits the system to come into service. However, if violations are detected, the system reboots after a period of time if the violations are not fixed.

Platforms

7705 SAR Gen 2

5.9 allow-directed-broadcasts

allow-directed-broadcasts

Syntax

[**no**] **allow-directed-broadcasts**

Context

[Tree] (config>router>if allow-directed-broadcasts)

[Tree] (config>service>vprn>nw-if allow-directed-broadcasts)

[Tree] (config>service>vprn>if allow-directed-broadcasts)

[Tree] (config>service>ies>if allow-directed-broadcasts)

Full Context

configure router interface allow-directed-broadcasts

configure service vprn network-interface allow-directed-broadcasts

configure service vprn interface allow-directed-broadcasts

configure service ies interface allow-directed-broadcasts

Description

This command enables the forwarding of directed broadcasts out of the IP interface.

A directed broadcast is a packet received on a local router interface destined for the subnet broadcast address on another IP interface. The **allow-directed-broadcasts** command on an IP interface enables or disables the transmission of packets destined to the subnet broadcast address of the egress IP interface.

When enabled, a frame destined to the local subnet on this IP interface is sent as a subnet broadcast out this interface. Care should be exercised when allowing directed broadcasts as it is a well-known mechanism used for denial-of-service attacks.

When disabled, directed broadcast packets discarded at this egress IP interface are counted in the normal discard counters for the egress SAP.

Note:
Allowing directed broadcasts is a well-known mechanism used for denial-of-service attacks.

By default, directed broadcasts are not allowed and are discarded at this egress IP interface.

The **no** form of this command disables the forwarding of directed broadcasts out of the IP interface. All broadcasts are dropped.

Default

no allow-directed-broadcasts — Directed broadcasts are dropped.

Platforms

7705 SAR Gen 2

5.10 allow-egress-remark-dscp

allow-egress-remark-dscp

Syntax

[**no**] **allow-egress-remark-dscp**

Context

[Tree] (config>oam-pm>session>ip allow-egress-remark-dscp)

Full Context

configure oam-pm session ip allow-egress-remark-dscp

Description

This command instructs the egress QoS process to modify the DSCP based on the egress QoS configuration. This command exposes the DSCP to egress DSCP processing rules.

The **no** form of this command instructs the egress QoS process to ignore the DSCP and allow it to bypass egress QoS. If the **config**>**qos**>**network**>**egress**>**remark force** command is configured for the network egress QoS profile, the egress QoS process is applied and the DSCP can be overwritten regardless of the **allow-egress-remark-dscp** configuration.

5.11 allow-export-bgp-vpn

allow-export-bgp-vpn

Syntax

[**no**] **allow-export-bgp-vpn**

Context

[Tree] (config>service>vprn allow-export-bgp-vpn)

Full Context

configure service vprn allow-export-bgp-vpn

Description

This command allows routes leaked from another local VPRN service to be re-exported by this VPRN in the form of new VPN-IP routes. The service label, route targets, and BGP next-hop of the re-advertised routes are based on the configuration and default values of the re-exporting VPRN.

When re-exporting leaked routes, the following restrictions apply.

- The **allow-export-bgp-vpn** command is not configurable in combination with any of the following commands: **carrier-carrier-vpn** (CSC), **label-mode next-hop** (LPN), **type** {**hub** | **spoke** | **subscriber-split-horizon**}, **redundant-interface**, and **export-inactive-bgp**.
- Re-exported routes always have the per-VRF label of the exporting VPRN; label-per-prefix advertisement is not supported.
- The best-external (inactive BGP) routes leaked by another VPRN cannot be re-exported by a VPRN configured with **allow-export-bgp-vpn**.

Caution:
When a VPRN configured with **allow-export-bgp-vpn** advertises a leaked route, the **split-horizon** context is lost. A re-exported route can be easily advertised back to the sending peer unless this is blocked by BGP export policies. This can cause route flaps or other similar instability. In addition, **allow-export-bgp-vpn** may never be used in a VPRN service with a

route distinguisher that is used in other PEs attached to the same service; if the same route distinguisher is used in this case, there is constant route flap.

If the **no** form of this command is configured, leaked routes cannot be re-advertised as VPN-IP routes; they can only be re-advertised to PE-CE BGP peers of the VPRN.

Default

no allow-export-bgp-vpn

configure service vprn bgp-ipvpn mpls auto-bind-tunnel allow-flex-algo-fallback

configure service epipe bgp-evpn mpls auto-bind-tunnel allow-flex-algo-fallback

configure service vprn bgp-evpn mpls auto-bind-tunnel allow-flex-algo-fallback

Description

This command configures a router to relax the strictly enforced Flex-Algorithm aware autobind, which is enabled through an import policy configured with the **action flex-algo** command.

If the **allow-flex-algo-fallback** command is enabled, the BGP router can autobind to a fallback algorithm 0 tunnel if no target Flex-Algorithm tunnel is available. If the **allow-flex-algo-fallback** command is disabled, the BGP autobind is strictly enforced to an intended Flex-Algorithm tunnel, which may cause traffic loss if no corresponding Flex-Algorithm tunnel exists.

The **no** form of this command removes the **allow-flex-algo-fallback** command from the configuration.

Default

no allow-flex-algo-fallback

5.19 allow-ip-int-bind

allow-ip-int-bind

Syntax

[**no**] **allow-ip-int-bind**

Context

[Tree] (config>service>vpls allow-ip-int-bind)

Full Context

configure service vpls allow-ip-int-bind

Description

The allow-ip-int-bind command that sets a flag on the VPLS or I-VPLS service that enables the ability to attach an IES or VPRN IP interface to the VPLS service in order to make the VPLS service routable. When the allow-ip-int-bind command is not enabled, the VPLS service cannot be attached to an IP interface.

VPLS Configuration Constraints for Enabling allow-ip-int-bind

When attempting to set the allow-ip-int-bind VPLS flag, the system first checks to see if the correct configuration constraints exist for the VPLS service and the network ports. The following VPLS features must be disabled or not configured for the allow-ip-int-bind flag to set:

- SAP ingress QoS policies applied to the VPLS SAPs cannot have MAC match criteria defined
- The VPLS service type cannot be B-VPLS or M-VPLS
- MVR from Routed VPLS and to another SAP is not supported
- Enhanced and Basic Subscriber Management (ESM and BSM) features
- Network domain on SDP bindings

Once the VPLS allow-ip-int-bind flag is set on a VPLS service, the above features cannot be enabled on the VPLS service.

Network Port Hardware Constraints

The system also checks to ensure that all ports configured in network mode are associated with FlexPath2 forwarding planes. If a port is currently in network mode and the port is associated with a FlexPath1

forwarding plane, the allow-ip-int-bind command will fail. Once the allow-ip-int-bind flag is set on any VPLS service, attempting to enable network mode on a port associated with a FlexPath1 forwarding plane will fail.

VPLS SAP Hardware Constraints

Besides VPLS configuration and network port hardware association, the system also checks to that all SAPs within the VPLS are created on Ethernet ports and the ports are associated with FlexPath2 forwarding planes. Certain Ethernet ports and virtual Ethernet ports are not supported which include CCAG virtual ports (VSM based). If a SAP in the VPLS exists on an unsupported port type or is associated with a FlexPath1 forwarding plane, the allow-ip-int-bind command will fail. Once the allow-ip-int-bind flag is set on the VPLS service, attempting to create a VPLS SAP on the wrong port type or associated with a FlexPath1 forwarding plane will fail.

VPLS Service Name Bound to IP Interface without allow-ip-int-bind flag Set

If a service name is applied to a VPLS service and that service name is also bound to an IP interface but the allow-ip-int-bind flag has not been set on the VPLS service context, the system attempt to resolve the service name between the VPLS service and the IP interface will fail. After the allow-ip-int-bind flag is successfully set on the VPLS service, either the service name on the VPLS service must be removed and reapplied or the IP interface must be re-initialized using the **shutdown** / **no shutdown** commands. This will cause the system to reattempt the name resolution process between the IP interface and the VPLS service.

The **no** form of this command resets the allow-ip-int-bind flag on the VPLS service. If the VPLS service currently has an IP interface from an IES or VPRN service attached, the no allow-ip-int-bind command will fail. Once the allow-ip-int-bind flag is reset on the VPLS service, the configuration and hardware restrictions associated with setting the flag are removed. The port network mode hardware restrictions are also removed.

Context

[Tree] (config>service>vprn>grt>enable-grt allow-local-management)

Full Context

configure service vprn grt-lookup enable-grt allow-local-management

Description

This command enables the support of specific management protocols over VPRN interfaces that terminate on Base routing context IPv4 and IPv6 interface addresses, including Base loopback and system addresses. Global Routing Table (GRT) leaking is used to enable the visibility and access of the Base interface addresses in the VPRN. The supported protocols are Telnet, FTP, SNMP, TACACS+, RADIUS (IPv4 only, not IPv6), SSH (including applications that ride over the standard SSH TCP port 22 such as SCP and SFTP) and NETCONF (configured on port 22 or 830).

Ping and traceroute responses from the Base router interfaces are supported but are not configurable.

The **allow-local-management** command does not control the support for management protocols terminating on VPRN interfaces directly. See "Node Management using VPRN" in the *7705 SAR Gen 2 Layer 3 Services Guide: IES and VPRN* for more information. Also, see the **access** command in the **config>service>vprn>snmp** context, and the commands in the **config>service>vprn>management** context.

allow-sr-over-srte

Syntax

[**no**] **allow-sr-over-srte**

Context

[Tree] (config>router>ospf>igp-sc allow-sr-over-srte)

[Tree] (config>router>isis>igp-sc allow-sr-over-srte)

Full Context

configure router ospf igp-shortcut allow-sr-over-srte

configure router isis igp-shortcut allow-sr-over-srte

Description

This command enables the SR-TE LSPs as eligible SRv4 or SRv6 IGP shortcuts.

For SR-MPLS SRv4 and SRv6, IGP shortcuts can only use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled that have an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as shortcuts regardless of the explicit **allow-sr-over-srte** configuration.

Under ECMP, when IGP **allow-sr-over-srte** is configured, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.

The **no** form of this command disables the eligibility.

Default

no allow-sr-over-srte

Platforms

5.27 allow-static

allow-static

Syntax

allow-static

no allow-static

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes allow-static)

Full Context

configure router bgp next-hop-resolution labeled-routes allow-static

Description

This command allows the BGP next-hop of label-IPv4, label-IPv6, VPN-IPv4, and VPN-IPv6 routes received from any EBGP or IBGP peer to be resolved using static routes, except for static default routes (0/0 and ::/0).

A static route is less preferred than a local or interface route for resolving the BGP next-hop of labeled route, but more preferred than other IGP routes or tunnels.

Note:
A label-IPv4 or label-IPv6 route can be resolved by a static blackhole route, even when the **allow-static** command is not configured, but only if the static blackhole route is the longest prefix match (LPM) static route for the BGP next-hop address.

Default

no allow-static

5.34 allowed-peer-as

allowed-peer-as

Syntax

[**no**] **allowed-peer-as** *min-as-number* [**max** *max-as-number*]

Context

[Tree] (config>service>vprn>bgp>group>dynamic-neighbor>match>prefix allowed-peer-as)

Full Context

configure service vprn bgp group dynamic-neighbor match prefix allowed-peer-as

Description

This command configures a single peer AS value or a contiguous range of peer AS values to associate with a prefix from which dynamic BGP sessions can be accepted.

If an incoming dynamic BGP session is associated with the prefix then the peer's AS, as reported in the OPEN message, is checked against the list of allowed-peer-as values. If the peer AS is not contained in one of the **allowed-peer-as** commands, then the connection is rejected with a Bad_Peer_AS error. If there is no **allowed-peer-as** configuration in the matched prefix, then the ASN in the peer's OPEN message, is checked against the group level peer-as.

The **no** form of this command removes an allowed-peer-as entry.

Default

no allowed-peer-as

Parameters

min-as-number

Specifies an allowed peer AS value as well as the start of an allowed range if the *max-as-number* value is also configured.

Values 1 to 4294967295

max-as-number

Specifies the end of an allowed range.

Values 1 to 4294967295

[Tree] (config>router>bgp>group>dynamic-neighbor>match>prefix allowed-peer-as)

Full Context

configure router bgp group dynamic-neighbor match prefix allowed-peer-as

Description

This command configures a single peer AS value or a contiguous range of peer AS values to associate with a prefix from which dynamic BGP sessions can be accepted.

If an incoming dynamic BGP session is associated with the prefix, then the peer's AS, as reported in the OPEN message, is checked against the list of allowed-peer-as values. If the peer AS is not contained in one of the **allowed-peer-as** commands, then the connection is rejected with a Bad_Peer_AS error. If there is no **allowed-peer-as** configuration in the matched prefix, then the ASN in the peer's OPEN message, is checked against the group level peer-as.

The **no** form of this command removes an allowed-peer-as entry.

Default

no allowed-peer-as

Parameters

min-as-number

Specifies an allowed peer AS value as well as the start of an allowed range if the *max-as-number* value is also configured.

Values 1 to 4294967295

max-as-number

Specifies the end of an allowed range.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

allowed-peer-as

Syntax

[**no**] **allowed-peer-as** *min-as-number* [**max** *max-as-number*]

Context

[Tree] (config>router>bgp>group>dynamic-neighbor>interface allowed-peer-as)

[Tree] (config>service>vprn>bgp>group>dynamic-neighbor>interface allowed-peer-as)

Full Context

configure router bgp group dynamic-neighbor interface allowed-peer-as

configure service vprn bgp group dynamic-neighbor interface allowed-peer-as

Description

This command configures a singular allowed peer AS value or a range of acceptable values.

The **no** form of this command removes an allowed peer AS value or range of acceptable values.

Parameters

min-as-number

Specifies an allowed peer AS value as well as the start of an allowed range if the *max-as-number* value is also configured.

Values 1 to 4294967295

max-as-number

Specifies the end of an allowed range.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

5.36 always-compare-med

always-compare-med

Syntax

always-compare-med {**zero** | **infinity**}

no always-compare-med strict-as {**zero** | **infinity**}

no always-compare-med

Context

[Tree] (config>router>bgp>best-path-selection always-compare-med)

[Tree] (config>service>vprn>bgp>path-selection always-compare-med)

Full Context

configure router bgp best-path-selection always-compare-med

configure service vprn bgp best-path-selection always-compare-med

Description

This command configures the comparison of BGP routes based on the MED attribute. The default behavior of SR OS (equivalent to the **no** form of this command) is to only compare two routes on the basis of MED if they have the same neighbor AS (the first non-confed AS in the received AS_PATH attribute). Also by default, a route without a MED attribute is handled the same as though it had a MED attribute with the value 0. The **always-compare-med** command without the **strict-as** keyword allows MED to be compared even if the paths have a different neighbor AS; in this case, if neither **zero** nor **infinity** is specified, the **zero** option is inferred, meaning a route without a MED is handled the same as though it had a MED attribute with the value 0. When the **strict-as** keyword is present, MED is only compared between paths from the same neighbor AS, and in this case, **zero** or **infinity** is mandatory and tells BGP how to interpret paths without a MED attribute.

Default

no always-compare-med

Parameters

zero

Specifies that for routes learned without a MED attribute that a zero (0) value is used in the MED comparison. The routes with the lowest metric are the most preferred.

infinity

Specifies for routes learned without a MED attribute that a value of infinity (2^32-1) is used in the MED comparison. This in effect makes these routes the least desirable.

strict-as

Specifies that the BGP MED values are only compared if the route comes from the same neighbor AS.

5.40 anycast

anycast

Syntax

[**no**] **anycast** *rp-ip-address*

Context

[Tree] (config>service>vprn>pim>rp anycast)

Full Context

configure service vprn pim rp anycast

Description

This command configures a PIM anycast protocol instance for the RP being configured. Anycast enables fast convergence when a PIM RP router fails by allowing receivers and sources to rendezvous at the closest RP.

The **no** form of this command removes the anycast instance from the configuration.

Parameters

rp-ip-address

Configure the loopback IP address shared by all routes that form the RP set for this anycast instance. Only a single address can be configured. If another anycast command is entered with an address then the old address will be replaced with the new address. If no ip-address is entered then the command is simply used to enter the anycast CLI level.

Values Any valid loopback address configured on the node.

Platforms

7705 SAR Gen 2

anycast

Syntax

anycast *ipv6-address*

no anycast *ipv6-address*

Context

[Tree] (config>service>vprn>pim>rp>ipv6 anycast)

Full Context

configure service vprn pim rp ipv6 anycast

Description

This command configures an IPv6 PIM anycast protocol instance for the RP being configured. Anycast enables fast convergence when a PIM RP router fails by allowing receivers and sources to rendezvous at the closest RP.

The **no** form of this command removes the anycast instance from the configuration.

Parameters

ipv6-address

Configures the loopback IP address shared by all routes that form the RP set for this anycast instance. Only a single address can be configured. If another anycast command is

entered with an address then the old address will be replaced with the new address. If no address is entered then the command is simply used to enter the anycast CLI context.

Values

ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D

7705 SAR Gen 2

5.41 app-route-notifications

app-route-notifications

Syntax

app-route-notifications

Context

[Tree] (config>log app-route-notifications)

Full Context

configure log app-route-notifications

Description

Specific system applications in SR OS can take action based on a route to certain IP destinations being available. This CLI branch contains configuration related to these route availability notifications. A delay can be configured between the time that a route is determined as available in the CPM, and the time that the application is notified of the available route. For example, this delay may be used to increase the chances that other system modules (such as IOMs/XCMs/MDAs/XMAs) are fully programmed with the new route before the application takes action. Currently, the only application that acts upon these *route available* or *route changed* notifications with their configurable delays is the SNMP replay feature, which receives notifications of route availability to the SNMP trap receiver destination IP address.

Platforms

7705 SAR Gen 2

5.42 application

application

Syntax

application *dscp-app-name* **dscp** {*dscp-value* | *dscp-name*}

application *dot1p-app-name* **dot1p** *dot1p-priority*

no application {*dscp-app-name* | *dot1p-app-name*}

Context

[Tree] (config>service>vprn>sgt-qos application)

[Tree] (config>router>sgt-qos application)

Full Context

configure service vprn sgt-qos application

configure router sgt-qos application

Description

This command configures DSCP/dot1p remarking for self-generated application traffic. When an application is configured using this command, the specified DSCP name is used for all packets generated by this application within the router instance it is configured. The instances can be base router, vprn, or management.

Using the value configured in this command:

- sets the DSCP bits in the IP packet
- maps to the FC. This value will be signaled from the CPM to the egress forwarding complex.
- based on this signaled FC, the egress forwarding complex QoS policy sets the Ethernet 802.1p and MPLS EXP bits. This includes ARP, PPPoE, and IS-IS packets that do not carry DSCP bits.
- configure the DSCP value in the egress IP header. The egress QoS policy does not overwrite this value.

Only one DSCP name can be configured per application, if multiple entries are configured, the subsequent entry overrides the previous configured entry.

The **no** form of this command reverts back to the default value.

Parameters

dscp-app-name

Specifies the DSCP application name.

Values Some of the following values may only apply to specific products. Refer to the *SR OS R25.x.Rx Software Release Notes* for details about application support for different SR OS products:

bfd, bgp, bmp, call-trace, cflowd, dhcp, diameter, dns, ftp, grpc, gtp, http, icmp, igmp, igmp-reporter, l2tp, ldp, mld, mpls-udp-return, msdp, mtrace2, ndis, ntp, ospf, pcep, pim, ptp, radius, rip, rsvp, sflow, snmp, snmp-notification, srrp, ssh, syslog, tacplus, telnet, tftp, traceroute, vrrp

dscp-value

Specifies a value when this packet egresses; the respective egress policy should provide the mapping for the DSCP value to either LSP-EXP bits or IEEE 802.1p (dot1p) bits as appropriate. Otherwise, the default mapping applies.

Values 0 to 63

dscp-name

Specifies the DSCP name.

Values none, be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

dot1p-priority

Specifies the dot1p priority.

Values none, 0 to 7

dot1p-app-name

Specifies the dot1p application name.

Values Some of the following values may only apply to specific products. Refer to the *SR OS R25.x.Rx Software Release Notes* for details about application support for different SR OS products:

[Tree] (config>filter>match-list>ipv6-prefix-list apply-path)

Full Context

configure filter match-list ip-prefix-list apply-path

configure filter match-list ipv6-prefix-list apply-path

Description

Commands in this context configure the auto-generation of address prefixes for IPv4 or IPv6 address prefix match lists. The context in which the command is executed governs whether IPv4 or IPv6 prefixes will be auto-generated.

The **no** form of this command removes all auto-generation configuration under the **apply-path** context.

Default

no apply path

Platforms

7705 SAR Gen 2

5.47 apply-to

apply-to

Syntax

apply-to {**all** | **none**}

Context

[Tree] (config>service>vprn>pim apply-to)

Full Context

configure service vprn pim apply-to

Description

This command creates a PIM interface with default parameters.

If a manually created interface or modified interface is deleted, the interface will be recreated when the **apply-to** command is executed. If PIM is not required on a specific interface, then execute a **shutdown** command.

The **apply-to** command is saved first in the PIM configuration structure, all subsequent commands either create new structures or modify the defaults as created by the **apply-to** command.

Default

apply-to none

Parameters

all

Specifies that all VPRN and non-VPRN interfaces are automatically applied in PIM.

none

No interfaces are automatically applied in PIM. PIM interfaces must be manually configured.

Platforms

7705 SAR Gen 2

apply-to

Syntax

apply-to {**ies** | **non-ies** | **all** | **none**}

Context

[Tree] (config>router>pim apply-to)

Full Context

configure router pim apply-to

Description

This command creates a PIM interface with default parameters.

If a manually created or a modified interface is deleted, the interface is recreated when (re)processing the **apply-to** command and if PIM is not required on a specific interface a shutdown should be executed.

The **apply-to** command is first saved in the PIM configuration structure. Then, all subsequent commands either create new structures or modify the defaults as created by the apply-to command.

Default

apply-to none

Parameters

ies

Specifies to apply all IES interfaces in PIM.

non-ies

Specifies to apply non-IES interfaces created in PIM.

all

Specifies to apply all IES and non-IES interfaces created in PIM.

none

Removes all interfaces that are not manually created or modified. It also removes explicit no interface commands if present.

Platforms

7705 SAR Gen 2

5.48 arbiter

arbiter

Syntax

arbiter *arbiter-name* [**create**]

no arbiter *arbiter-name*

Context

[Tree] (config>qos>plcr-ctrl-plcy>tier arbiter)

Full Context

configure qos policer-control-policy tier arbiter

Description

This command is used to create an arbiter within the context of **tier 1** or **tier 2**. An arbiter is a child policer bandwidth control object that manages the throughput of a set of child policers. An arbiter allows child policers or other arbiters to parent to one of eight strict levels. Each arbiter is itself parented to either another tiered arbiter or to the **root** arbiter.

The root arbiter starts with its defined maximum rate and distributes the bandwidth to its directly attached child policers and arbiters beginning with priority 8. As the children at each priority level are distributed bandwidth according to their needs and limits, the root proceeds to the next lower priority until either all children's needs are met or it runs out of bandwidth. The bandwidth given to a tiered arbiter is then divided between that arbiter's children (child policers or a tier 2 arbiter) in the same fashion. A tiered arbiter may also have a rate limit defined that limits the amount of bandwidth it may receive from its parent.

An arbiter that is currently parented by another arbiter cannot be deleted.

Each time the **policer-control-policy** is applied to either a SAP, or a subscriber (through association with a sub-profile that has the policy applied), or a multiservice site, an instance of the parent policer and the arbiters is created.

Any child policer that uses the arbiter's name in its parenting command will be associated with the arbiter instance. The child policer will also become associated with any arbiter to which its parent arbiter is parented (grandparent). Having child policers parented to an arbiter does not prevent that arbiter from being removed from the **policer-control-policy**. When removed, the child policers become orphaned.

You can create up to 31 tiered arbiters within the **policer-control-policy** on either tier 1 or tier 2 (in addition to the arbiter).

The **no** form of this command is used to remove an arbiter from tier 1 or tier 2. If the specified arbiter does not exist, the command returns without an error. If the specified arbiter is currently specified as the parent for another arbiter, the command will fail. When an arbiter is removed from a **policer-control-policy**, all instances of the arbiter will also be removed. Any child policers currently parented to the arbiter instance will become orphans and will not be bandwidth managed by the policer control policy instances parent policer.

Parameters

arbiter-name

Any unique name within the policy. Up to 31 arbiters may be created.

Platforms

7705 SAR Gen 2

5.49 area

area

Syntax

[**no**] **area** *area-id*

Context

[Tree] (config>service>vprn>ospf3 area)

[Tree] (config>service>vprn>ospf area)

Full Context

configure service vprn ospf3 area

configure service vprn ospf area

Description

This command creates the context to configure an OSPF area. An area is a collection of network segments within an AS that have been administratively grouped together. The area ID can be specified in dotted decimal notation or as a 32-bit decimal integer.

The **no** form of this command deletes the specified area from the configuration. Deleting the area also removes the OSPF configuration of all the interfaces, virtual-links, sham-links, address-ranges and so on, that are currently assigned to this area.

Default

no area — No OSPF areas are defined.

Parameters

area-id

The OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

Values 0.0.0.0 to 255.255.255.255 (dotted decimal)
0 to 4294967295 (decimal integer)

[Tree] (debug>router>ospf area)

Full Context

debug router ospf3 area

debug router ospf area

Description

This command enables debugging for an OSPF area.

Parameters

area-id

Specifies the OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

Values ip-address — a.b.c.d

area — 0 to 4294967295

Platforms

7705 SAR Gen 2

area

Syntax

area *area-id*

no area

Context

[Tree] (config>router>policy-options>policy-statement>entry>from area)

Full Context

configure router policy-options policy-statement entry from area

Description

This command configures an OSPF area as a route policy match criterion.

This match criterion is only used in export policies.

All OSPF routes (internal and external) are matched using this criterion if the best path for the route is by the specified area.

The **no** form of this command removes the OSPF area match criterion.

Default

no area

Parameters

area-id

Specifies the OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

Values 0.0.0.0 to 255.255.255.255 (dotted decimal), 0 to 4294967295 (decimal)

Platforms

7705 SAR Gen 2

5.50 area-id

area-id

Syntax

[**no**] **area-id** *area-address*

Context

[Tree] (config>service>vprn>isis area-id)

Full Context

configure service vprn isis area-id

Description

This command configures the area ID portion of NSAP addresses for the VPRN instance. This identifies a point of connection to the network, such as a router interface, and is called a Network Service Access Point (NSAP). Addresses in the IS-IS protocol are based on the ISO NSAP addresses and Network Entity Titles (NETs), not IP addresses.

A maximum of 3 **area addresses** can be configured for the VPRN instance.

NSAP addresses are divided into three parts.

- Area ID — A variable length field between 1 and 13 bytes long. This includes the Authority and Format Identifier (AFI) as the most significant byte and the area ID.
- System ID — A six-byte system identification. When not configured, the system ID is derived from the configurations for **configure router isis router-id**, **configure router router-id**, or **system address** *ipv4 address*. If the previous commands are not configured, the system ID defaults to the last four octets of the chassis MAC address.
- Selector ID — A one-byte selector identification that must contain zeros when configuring a NET. This value is not configurable. The selector ID is always 00.

The NET is constructed like an NSAP but the selector byte contains a 00 value. NET addresses are exchanged in hello and LSP PDUs. All net addresses configured on the node are advertised to its neighbors.

For Level 1 interfaces, neighbors can have different area IDs, but, they must have at least one area ID (AFI + area) in common. Sharing a common area ID, they become neighbors and area merging between the potentially different areas can occur.

For Level 2 (only) interfaces, neighbors can have different area IDs. However, if they have no area IDs in common, they become only Level 2 neighbors and Level 2 LSPs are exchanged.

For Level 1 and Level 2 interfaces, neighbors can have different area IDs. If they have at least one area ID (AFI + area) in common, they become neighbors. In addition to exchanging Level 2 LSPs, area merging between potentially different areas can occur.

If multiple **area-id** commands are entered, the system ID of all subsequent entries must match the first **area** address.

The **no** form of this command removes the area address.

[**no**] **area-id** *area-address*

Context

[Tree] (config>router>isis area-id)

Full Context

configure router isis area-id

Description

This command was previously named the **net** *network-entity-title* command. The **area-id** command allows you to configure the area ID portion of NSAP addresses which identifies a point of connection to the network, such as a router interface, and is called a Network Service Access Point (NSAP). Addresses in the IS-IS protocol are based on the ISO NSAP addresses and Network Entity Titles (NETs), not IP addresses.

A maximum of three **area addresses** can be configured.

NSAP addresses are divided into three parts.

- Area ID — A variable length field between 1 and 13 bytes long. This includes the Authority and Format Identifier (AFI) as the most significant byte and the area ID.
- System ID — A six-byte system identification. When not configured, the system ID is derived from the configurations for **configure router isis router-id**, **configure router router-id**, or **system address** *ipv4 address*. If the previous commands are not configured, the system ID defaults to the last four octets of the chassis MAC address.
- Selector ID — A one-byte selector identification that must contain zeros when configuring a NET. This value is not configurable. The selector ID is always 00.

The NET is constructed like an NSAP but the selector byte contains a 00 value. NET addresses are exchanged in hello and LSP PDUs. All net addresses configured on the node are advertised to its neighbors.

For Level 1 interfaces, neighbors can have different area IDs, but, they must have at least one area ID (AFI + area) in common. Sharing a common area ID, they become neighbors and area merging between the potentially different areas can occur.

For Level 2 (only) interfaces, neighbors can have different area IDs. However, if they have no area IDs in common, they become only Level 2 neighbors and Level 2 LSPs are exchanged.

For Level 1 and Level 2 interfaces, neighbors can have different area IDs. If they have at least one area ID (AFI + area) in common, they become neighbors. In addition to exchanging Level 2 LSPs, area merging between potentially different areas can occur.

If multiple **area-id** commands are entered, the system ID of all subsequent entries must match the first **area** address.

The **no** form of this command removes the area address.

Parameters

area-address

Specifies a 1 — 13-byte address. Of the total 20 bytes comprising the NET, only the first 13 bytes can be manually configured. As few as one byte can be entered or, at most, 13 bytes. If less than 13 bytes are entered, the rest is padded with zeros.

Full Context

configure service vprn ospf area nssa area-range

configure service vprn ospf area area-range

configure service vprn ospf3 area area-range

configure service vprn ospf3 area nssa area-range

Description

This command creates ranges of addresses on an Area Border Router (ABR) for the purpose of route summarization or suppression. When a range is created, it is configured to be advertised or not advertised into other areas. Multiple range commands are used to summarize or hide different ranges. In the case of overlapping ranges, the most specific range command applies.

ABRs send summary link advertisements to describe routes to other areas. To minimize the number of advertisements that are flooded, you can summarize a range of IP addresses and send reachability information about these addresses in an LSA.

The **no** form of this command deletes the range (non) advertisement.

Default

no area-range

Parameters

ipv6-prefix/prefix-length

The IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

mask

The subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

advertise | not-advertise

Specifies whether or not to advertise the summarized range of addresses into other areas. The **advertise** keyword indicates the range will be advertised, and the keyword **not-advertise** indicates the range will not be advertised.

The default is **advertise**.

configure router interface arp-learn-unsolicited

configure service ies interface arp-learn-unsolicited

Description

This command allows the ARP application to learn new entries based on any received ARP message (GARP, ARP-Request, or ARP-Reply, such as any frame with ethertype 0x0806).

The **no** form of this command disables the above behavior and causes ARP entries to only be learned when needed, that is, when the router receives an ARP-reply after an ARP-request triggered by received traffic.

Platforms

7705 SAR Gen 2

5.55 arp-limit

arp-limit

Syntax

arp-limit *limit* [**log-only**] [**threshold** *percent*]

no arp-limit

Context

[Tree] (config>service>ies>interface arp-limit)

Full Context

configure service ies interface arp-limit

Description

This command configures the maximum amount of dynamic IPv4 ARP entries that can be learned on an IP interface.

When the number of dynamic ARP entries reaches the configured percentage of this limit, a log event is raised. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations will be dropped. Entries that have already been learned will be refreshed.

The **no** form of this command removes the **arp-limit**.

Default

no arp-limit

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, entries above the limit will be learned.

percent

The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

Default 90

limit

The number of entries that can be learned on an IP interface expressed as a decimal integer. If the limit is set to 0, dynamic ARP learning is disabled and no dynamic ARP entries are learned.

Values 0 to 524288

Platforms

7705 SAR Gen 2

arp-limit

5.58 arp-populate

arp-populate

Syntax

[**no**] **arp-populate**

Context

[Tree] (config>service>vprn>if arp-populate)

[Tree] (config>service>ies>if arp-populate)

Full Context

configure service vprn interface arp-populate

configure service ies interface arp-populate

Description

This command, when enabled, disables dynamic learning of ARP entries. Instead, the ARP table is populated with static and dynamic entries from the DHCP Lease State Table (enabled with **lease-populate**), and optionally with static entries entered with the **static-host** command.

The host's IP address and MAC address are placed in the system ARP cache as a managed entry. Static hosts must be defined on the interface using the **static-host** command. Dynamic hosts are enabled on the system through enabling lease-populate in the IP interface DHCP context.

In the event that both a static host and a dynamic host share the same IP and MAC address, the system's ARP cache retains the host information until both the static and dynamic information are removed.

Both static and dynamic hosts override static ARP entries. Static ARP entries are marked as inactive when they conflict with static or dynamic hosts and will be repopulated once all static and dynamic host information for the IP address are removed. Since static ARP entries are not possible when static subscriber hosts are defined or when DHCP lease state table population is enabled, conflict between static ARP entries and the arp-populate function is not an issue.

Enabling the **arp-populate** command removes any dynamic ARP entries learned on this interface from the ARP cache.

The **arp-populate** command fails if an existing static ARP entry exists for this interface.

When **arp-populate** is enabled, the system does not send out ARP requests for hosts that are not in the ARP cache. Only statically configured and DHCP learned hosts are reachable through an IP interface with **arp-populate** enabled. The **arp-populate** command can only be enabled on IES and VPRN interfaces supporting Ethernet encapsulation.

The **no** form of this command disables ARP cache population functions for static and dynamic hosts on the interface. All static and dynamic host information for this interface is removed from the system's ARP cache. Any existing static ARP entries previously inactive due to static or dynamic hosts will be populated in the system ARP cache.

Default

no arp-populate

5.61 arp-timeout

arp-timeout

Syntax

arp-timeout *seconds*

no arp-timeout

Context

[Tree] (config>service>vprn>if arp-timeout)

[Tree] (config>service>ies>if arp-timeout)

Full Context

configure service vprn interface arp-timeout

configure service ies interface arp-timeout

Description

This command configures the minimum time in seconds an ARP entry learned on the IP interface is stored in the ARP table. ARP entries are automatically refreshed when an ARP request or gratuitous ARP is seen from an IP host, otherwise, the ARP entry is aged from the ARP table. If **arp-timeout** is set to a value of zero seconds, ARP aging is disabled.

When the **arp-populate** and **lease-populate** commands are enabled on an interface, the ARP table entries will no longer be dynamically learned, but instead by snooping DHCP ACK message from a DHCP server. In this case the configured **arp-timeout** value has no effect.

The default value for **arp-timeout** is 14400 seconds (4 hours).

The **no** form of this command reverts to the default value.

Default

arp-timeout 14400

Parameters

seconds

Specifies the minimum number of seconds a learned ARP entry is stored in the ARP table, expressed as a decimal integer. A value of zero specifies that the timer is inoperative and learned ARP entries will not be aged.

Values 0 to 65535

Platforms

7705 SAR Gen 2

arp-timeout

This command configures the minimum time in seconds an ARP entry learned on the IP interface will be stored in the ARP table. ARP entries are automatically refreshed when an ARP request or gratuitous ARP is seen from an IP host, otherwise, the ARP entry is aged from the ARP table. If **arp-timeout** is set to a value of zero seconds, ARP aging is disabled.

The default value for **arp-timeout** is 14400 seconds (4 hours).

The **no** form of this command restores **arp-timeout** to the default value.

Default

arp-timeout 14400

Parameters

seconds

The minimum number of seconds a learned ARP entry will be stored in the ARP table, expressed as a decimal integer. A value of zero specifies that the timer is inoperative and learned ARP entries will not be aged.

Values 0 to 65535

Platforms

7705 SAR Gen 2

arp-timeout

Syntax

arp-timeout *seconds*

no arp-timeout

Context

[Tree] (config>router>if arp-timeout)

Full Context

configure router interface arp-timeout

Description

This command configures the minimum time, in seconds, an ARP entry learned on the IP interface is stored in the ARP table. ARP entries are automatically refreshed when an ARP request or gratuitous ARP is seen from an IP host. Otherwise, the ARP entry is aged from the ARP table. If the **arp-timeout** value is set to 0 seconds, ARP aging is disabled.

The **no** form of this command reverts to the default value.

Default

no arp-timeout

Parameters

seconds

The minimum number of seconds a learned ARP entry is stored in the ARP table, expressed as a decimal integer. A value of 0 specifies that the timer is inoperative and learned ARP entries will not be aged.

Values 0 to 65535

Platforms

7705 SAR Gen 2

5.62 as-override

as-override

Syntax

[**no**] **as-override**

Context

[Tree] (config>service>vprn>bgp>group as-override)

[Tree] (config>service>vprn>bgp>group>neighbor as-override)

Full Context

configure service vprn bgp group as-override

configure service vprn bgp group neighbor as-override

Description

This command replaces all instances of the peer's AS number with the local AS number in a BGP route's AS_PATH.

This command breaks BGP's loop detection mechanism. It should be used carefully.

Default

no as-override

Platforms

7705 SAR Gen 2

as-override

Syntax

[**no**] **as-override**

Context

[Tree] (config>router>bgp>group>neighbor as-override)

[Tree] (config>router>bgp>group as-override)

Full Context

configure router bgp group neighbor as-override

configure router bgp group as-override

Description

This command enables BGP to monitor the outbound routes toward the peer and whenever there is a route with the peer's autonomous system number (ASN) in the AS_PATH, all occurrences are removed and replaced with the advertising router's local ASN (or its confederation ID if the peer is outside the confederation).

In the group context, the **no** form of this command disables the functionality. In the neighbor context, the **no** form of this command causes the setting to be inherited from the group level.

Default

no as-override

Platforms

7705 SAR Gen 2

5.63 as-path

as-path

Syntax

[**no**] **as-path** *name*

Context

[Tree] (config>router>policy-options as-path)

Full Context

configure router policy-options as-path

Description

This command creates a route policy AS path to use in route policy entries.

The **no** form of this command deletes the AS path.

Default

no as-path

Parameters

name

The AS path regular expression name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

as-path

Syntax

as-path *name*

no as-path

Context

[Tree] (config>router>policy-options>policy-statement>entry>from as-path)

Full Context

configure router policy-options policy-statement entry from as-path

Description

This command configures an AS path regular expression statement as a match criterion for the route policy entry.

If no AS path criterion is specified, any AS path is considered to match.

AS path regular expression statements are configured at the global route policy level (**config>router>policy-options>as-path** *name*).

The **no** form of this command removes the AS path regular expression statement as a match criterion.

Default

no as-path

Parameters

name

Specifies the AS path regular expression name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end", " @variable@end", or "start@variable@".

Platforms

7705 SAR Gen 2

Syntax

as-path {**add** | **replace**} *name*

no as-path

Context

[Tree] (config>router>policy-options>policy-statement>default-action as-path)

[Tree] (config>router>policy-options>policy-statement>entry>action as-path)

Full Context

configure router policy-options policy-statement default-action as-path

configure router policy-options policy-statement entry action as-path

Description

This command assigns a BGP AS path list to routes matching the route policy statement entry.

If no AS path list is specified, the AS path attribute is not changed.

The **no** form of this command disables the AS path list editing action from the route policy entry.

Default

no as-path

Parameters

add

Specifies that the AS path list is to be prepended to an existing AS list.

replace

Specifies AS path list replaces any existing as path attribute.

name

Specifies the AS path list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters

must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

The *name* specified must already be defined.

5.65 as-path-ignore

as-path-ignore

Syntax

as-path-ignore [**ipv4**] [**ipv6**] [**label-ipv4**] [**label-ipv6**]

no as-path-ignore

Context

[Tree] (config>service>vprn>bgp>path-selection as-path-ignore)

Full Context

configure service vprn bgp best-path-selection as-path-ignore

Description

This command configures whether AS path length is considered in the selection of the best BGP route for a prefix.

If an address family is listed in this command, the length of AS paths is not a factor in the route selection process for routes of that address family.

The **no** form of this command removes the parameter from the configuration.

Default

no as-path-ignore

Parameters

ipv4

Specifies that the AS path length is ignored for all unlabeled unicast IPv4 routes.

ipv6

Specifies that the AS path length is ignored for all unlabeled unicast IPv6 routes.

label-ipv4

Specifies that the AS path length is ignored for all labeled unicast IPv4 routes.

label-ipv6

Specifies that the AS path length is ignored for all labeled unicast IPv6 routes.

Platforms

7705 SAR Gen 2

as-path-ignore

Syntax

as-path-ignore [**ipv4**] [**label-ipv4**] [**vpn-ipv4**] [**ipv6**] [**label-ipv6**] [**vpn-ipv6**] [**mcast-ipv4**] [**mcast-ipv6**] [**mvpn-ipv4**] [**mvpn-ipv6**] [**l2-vpn**]

no as-path-ignore

Context

[Tree] (config>router>bgp>best-path-selection as-path-ignore)

Full Context

configure router bgp best-path-selection as-path-ignore

Description

This command configures whether AS path length is considered in the selection of the best BGP route for a prefix.

If an address family is listed in this command, then the length of AS paths is not a factor in the route selection process for routes of that address family.

The **no** form of this command removes the parameter from the configuration.

Default

no as-path-ignore

Parameters

ipv4

Specifies that the AS-path length will be ignored for all unlabeled unicast IPv4 routes.

label-ipv4

Specifies that the AS-path length will be ignored for all labeled-unicast IPv4 routes.

vpn-ipv4

Specifies that the length AS-path will be ignored for all VPN IPv4 (SAFI 128) routes.

ipv6

Specifies that the AS-path length will be ignored for all unlabeled unicast IPv6 routes.

label-ipv6

Specifies that the AS-path length will be ignored for all labeled-unicast IPv6 routes.

vpn-ipv6

Specifies that the AS-path length will be ignored for all VPN IPv6 (SAFI 128) routes.

mcast-ipv4

Specifies that the AS-path length will be ignored for all IPv4 multicast routes.

mcast-ipv6

Specifies that the AS-path length will be ignored for all IPv6 multicast routes.

mvpn-ipv4

Specifies that the AS-path length will be ignored for all IPv4 MVPN routes.

mvpn-ipv6

Specifies that the AS-path length will be ignored for all IPv6 MVPN routes.

l2-vpn

Specifies that the AS-path length will be ignored for all L2-VPN NLRIs.

Platforms

7705 SAR Gen 2

5.66 as-path-length

as-path-length

Syntax

as-path-length *length* [**equal** | **or-higher** | **or-lower**] [**unique**]

no as-path-length

Context

[Tree] (config>router>policy-options>policy-statement>entry>from as-path-length)

Full Context

configure router policy-options policy-statement entry from as-path-length

Description

This command matches BGP routes based on their AS path length (the number of AS numbers in the AS_PATH).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

Confederation member AS numbers in the AS_PATH do not count towards the total. An AS_SET element is considered to have a length of 1.

The **unique** option counts.

A non-BGP route does not match a policy entry if it contains the **as-path-length** command.

Default

no as-path-length

Parameters

length

Specifies the length of the AS path.

Values 0 to 255, or a parameter name delimited by starting and ending at-sign (@) characters

equal

Specifies that matched routes should have the same number of AS path elements as the value specified.

or-higher

Specifies that matched routes should have the same or a greater number of AS path elements as the value specified.

or-lower

Specifies that matched routes should have the same or a lower number of AS path elements as the value specified.

unique

Specifies that only the unique AS numbers should be counted (that is, multiple occurrences of the same AS number in the sequence count as one).

Platforms

7705 SAR Gen 2

5.67 as-path-prepend

as-path-prepend

Syntax

as-path-prepend *as-path* [*repeat*]

as-path-prepend most-recent [*repeat*]

no as-path-prepend

Context

[Tree] (config>router>policy-options>policy-statement>default-action as-path-prepend)

[Tree] (config>router>policy-options>policy-statement>entry>action as-path-prepend)

Full Context

configure router policy-options policy-statement default-action as-path-prepend

configure router policy-options policy-statement entry action as-path-prepend

Description

The command prepends a BGP AS number once or numerous times to the AS path attribute of routes matching the route policy statement entry.

If an AS number is not configured, the AS path is not changed.

If the optional *number* is specified, then the AS number is prepended as many times as indicated by the number.

The **no** form of this command disables the AS path prepend action from the route policy entry.

Default

no as-path-prepend

Parameters

as-path

Specifies the AS number to prepend expressed as a decimal integer.

Values 1 to 4294967295

param-name — Specifies the AS path parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

repeat

Specifies the number of times to prepend the specified AS number expressed as a decimal integer.

Values 1 to 50

param-name — Specifies the AS path parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

most-recent

Specifies that the most recent AS number must be prepended to the AS-Path attribute of the route.

7705 SAR Gen 2

5.68 asbr

asbr

Syntax

[**no**] **asbr** [**trace-path** *domain-id*]

no asbr

[**no**] **asbr**

Context

[Tree] (config>router>ospf asbr)

[Tree] (config>router>ospf3 asbr)

Full Context

configure router ospf asbr

configure router ospf3 asbr

Description

This command configures the router as an Autonomous System Boundary Router (ASBR) if the router is to be used to export routes from the Routing Table Manager (RTM) into this instance of OSPF. After a router is configured as an ASBR, the export policies into this OSPF domain take effect. If no policies are configured, no external routes are redistributed into the OSPF domain.

The **no** form of this command removes the ASBR status and withdraws the routes redistributed from the Routing Table Manager into this instance of OSPF from the link state database.

When configuring multiple instances of OSPF, there is a risk of loops because networks are advertised by multiple domains configured with multiple interconnections to one another. To prevent this from happening, all routers in a domain should be configured with the same domain ID. Each domain (OSPF-instance) should be assigned a specific bit value in the 32-bit tag mask.

When an external route is originated by an ASBR using an internal OSPF route in a given domain, the corresponding bit is set in the AS-external LSA. As the route gets redistributed from one domain to another, more bits are set in the tag mask, each corresponding to the OSPF domain the route visited. Route redistribution looping is prevented by checking the corresponding bit as part of the export policy; if the bit corresponding to the announcing OSPF process is already set, the route is not exported there.

Domain IDs are incompatible with any other use of normal tags. The domain ID should be configured with a value between 1 and 31 by each router in a given OSPF domain (OSPF Instance).

When an external route is originated by an ASBR using an internal OSPF route in a given domain, the corresponding (1-31) bit is set in the AS-external LSA.

As the route gets redistributed from one domain to another, more bits are set in the tag mask, each corresponding to the OSPF domain the route visited. Route redistribution looping is prevented by checking the corresponding bit as part of the export policy; if the bit corresponding to the announcing OSPF process is already set, the route is not exported there.

Default

no asbr

Parameters

domain-id

Specifies the domain ID.

Values 1 to 31

Default 0

5.71 assignment

assignment

Syntax

assignment {**port** *port-id* | **card** *slot-number*}

no assignment

Context

[Tree] (config>service>cust>multi-service-site assignment)

Full Context

configure service customer multi-service-site assignment

Description

This command assigns a multi-service customer site to a specific chassis slot, port, or channel. This allows the system to allocate the resources necessary to create the virtual schedulers defined in the ingress and egress scheduler policies as they are specified. This also verifies that each SAP assigned to the site exists within the context of the proper customer ID and that the SAP was configured on the proper slot, port, or channel. The assignment must be given prior to any SAP associations with the site.

The **no** form of this command removes the port, channel, or slot assignment. If the customer site has not yet been assigned, the command has no effect and returns without any warnings or messages.

Default

no assignment

Parameters

port-id

Assigns the multi-service customer site to the port-id or port-id.channel-id given. When the multi-service customer site is assigned to a specific port or channel, all SAPs associated with this customer site must be on a service owned by the customer and created on the defined port or channel. The defined port or channel must already have been pre-provisioned on the system but need not be installed when the customer site assignment is made.

Syntax: *port-id*[:encap-val]

Values

port-id	slot/mda/port[.channel]	
aps-id	aps-group-id[.channel]	
	aps keyword	
	group-id	1 to 128

		eth-tunnel-id	eth-tunnel-<id>	
			eth-tunnel	keyword
			id	1 to 1024
		lag-id	lag-id	
			lag	keyword
			id	1 to 800
			id	1 to 1024
		eth-sat-id	esat-<id>/<slot>/[u]<port>	
			esat	keyword
			id	1 to 20
			u	keyword for up-link port
		tdm-sat-id	tsat-<id>/<slot>/[<u>]<port>.<channel>	
			tsat	keyword
			id	1 to 20
			u	keyword for up-link port
		pxc-id	psc-id.sub-port	
			pxc psc-id.sub-port	
			pxc	keyword
			id: 1 to 64	
			sub-port: a, b	
		pw-id	pw-<id>	
			pw	keyword
			id	1 to 32767
	slot-number	1 to 10		
	fpe-id	1 to 64		

slot-number

Assigns the multi-service customer site to the slot-number given. When the multi-service customer site is assigned to a specific slot in the chassis, all SAPs associated with this customer site must be on a service owned by the customer and created on the defined chassis slot. The defined slot must already be pre-provisioned on the system but need not be installed when the customer site assignment is made.

Values Any pre-provisioned slot number for the chassis type that allows SAP creation.

1 to 20

fpe-id

Specifies the multi-service-site (MSS) assignment to an FPE object for the purpose of controlling aggregated bandwidth across a set of PW SAPs.

Values 1 to 64

Platforms

7705 SAR Gen 2

5.74 asynchronous-execution

asynchronous-execution

Syntax

asynchronous-execution *seconds*

asynchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeout asynchronous-execution)

Full Context

configure system management-interface operations global-timeouts asynchronous-execution

Description

This command configures the period of time that operations launched as "asynchronous" are allowed to execute before being automatically stopped by the SR OS.

An asynchronous operation is not deleted from the system when it is stopped. See the **asynchronous-retention** command.

If a specific execution timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Default

asynchronous-execution 3600

Parameters

seconds

Specifies the period of time, in seconds, that asynchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to asynchronous operations.

Platforms

7705 SAR Gen 2

5.75 asynchronous-retention

asynchronous-retention

Syntax

asynchronous-retention *seconds*

asynchronous-retention never

Context

[Tree] (config>system>management-interface>ops>global-timeout asynchronous-retention)

Full Context

configure system management-interface operations global-timeouts asynchronous-retention

Description

This command configures the period of time that data related to operations launched as "asynchronous" is retained in the system. After the retention timeout expires, all information related to the operation is deleted, including any status information and result data.

If a specific retention timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies.

Default

asynchronous-retention 86400

Parameters

seconds

Specifies the period of time, in seconds, that data related to asynchronous operations is retained in the system.

Values 1 to 604800

never

Keyword to specify that data related to asynchronous operations will persist in memory until explicitly deleted.

Platforms

7705 SAR Gen 2

5.76 attempts

attempts

Syntax

attempts *count* [**time** *minutes1* [**lockout** *minutes2*]

no attempts

Context

[Tree] (config>system>security>password attempts)

Full Context

configure system security password attempts

Description

This command configures a threshold value of unsuccessful login attempts allowed in a specified time frame.

If the threshold is exceeded, the user is locked out for a specified time period.

If multiple **attempts** commands are entered, each command overwrites the previously entered command.

The **no attempts** command resets all values to default.

Note:
This command applies to a local user, in addition to users on RADIUS, TACACS, and LDAP.

Default

attempts 3 time 5 lockout 10

Parameters

count

Specifies the number of unsuccessful login attempts allowed for the specified **time**. This is a mandatory value that must be explicitly entered.

Values 1 to 64

minutes

Specifies the period of time, in minutes, that a specified number of unsuccessful attempts can be made before the user is locked out.

Values 0 to 60

minutes

Specifies the lockout period, in minutes, during which the user is not allowed to login.

Values 0 to 1440, or infinite

If the user exceeds the attempted **count** times in the specified **time**, then that user is locked out from any further login attempts for the configured lockout time period.

Values 0 to 1440

Values infinite; user is locked out and must wait until manually unlocked before any further attempts.

Platforms

7705 SAR Gen 2

attempts

Syntax

attempts [*count*] [**time** *minutes1*] [**lockout** *minutes2*]

no attempts

Context

[Tree] (config>system>security>snmp attempts)

Full Context

configure system security snmp attempts

Description

This command configures a threshold value of unsuccessful SNMPv2 or SNMPv3 connection attempts allowed in a specified time frame. The command parameters are used to counter denial of service (DoS) attacks through SNMP.

If the threshold is exceeded, the host is locked out for the lockout time period.

The **no** form of the command restores the default values.

Default

attempts 20 time 5 lockout 10

Parameters

count

Specifies the number unsuccessful SNMP attempts allowed for the specified **time**.

Values 1 to 64

minutes1

Specifies period of time, in minutes, that a specified number of unsuccessful attempts can be made before the host is locked out.

Values 0 to 60

minutes2

Specifies the lockout period in minutes where the host is not allowed to login. When the host exceeds the attempted count times in the specified time, then that host is locked out from any further login attempts for the configured time period.

Values 0 to 144**0**

attrib

Syntax

attrib [**+r** | **-r**] *file-url*

attrib

Context

[Tree] (file attrib)

Full Context

file attrib

Description

This command sets or clears/resets the read-only attribute for a file in the local file system. To list all files and their current attributes enter **attrib** or **attrib x** where **x** is either the filename or a wildcard (*).

When an **attrib** command is entered to list a specific file or all files in a directory, the file's attributes are displayed with or without an "R" preceding the filename. The "R" implies that the **+r** is set and that the file is read-only. Files without the "R" designation implies that the **-r** is set and that the file is read-write-all. For example:

```
ALA-1>file cf3:\ # attrib
cf3:\bootlog.txt
cf3:\bof.cfg
cf3:\boot.ldr
cf3:\sr1.cfg
cf3:\test
cf3:\bootlog_prev.txt
cf3:\BOF.SAV
```

Parameters

file-url

Specifies the URL for the local file.

Values

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login*:*pswd*@*remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 199 characters
remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

+r

Sets the read-only attribute on the specified file.

-r

Clears/resets the read-only attribute on the specified file.

5.78 attribute-propagation

attribute-propagation

Syntax

[**no**] **attribute-propagation**

Context

[Tree] (config>service>system>bgp-evpn>ad-per-evi-routes attribute-propagation)

Full Context

configure service system bgp-evpn ad-per-evi-routes attribute-propagation

Description

This command enables attribute propagation in multi-instance Epipe services.

The **no** form of this command disables the propagation of attributes, including D-PATH, even if the **domain-id** is configured in the service.

Default

no attribute-propagation

Platforms

7705 SAR Gen 2

5.79 attribute-set

attribute-set

Syntax

attribute-set

Context

[Tree] (config>service>vprn>bgp attribute-set)

Full Context

configure service vprn bgp attribute-set

Description

Commands in this context configure the handling of attribute set (ATTR_SET) attributes in BGP routes received from PE-CE peers of the VPRN.

ATTR_SET is an optional transitive BGP path attribute standardized by RFC 6368 that is added to BGP Layer 3 VPN routes to provide logical separation between the BGP domain of a customer and the BGP domain of a service provider.

Platforms

7705 SAR Gen 2

attribute-set

Syntax

attribute-set

Context

[Tree] (config>service>vprn>bgp-ipvpn attribute-set)

Full Context

configure service vprn bgp-ipvpn attribute-set

Description

Commands in this context configure the handling of attribute set (ATTR_SET) attributes attached to VPN-IP routes imported into or exported from the VPRN.

ATTR_SET is an optional transitive BGP path attribute standardized by RFC 6368 that is added to BGP Layer 3 VPN routes to provide logical separation between the BGP domain of a customer and the BGP domain of a service provider.

Platforms

7705 SAR Gen 2

5.80 attribute-uniform-propagation

attribute-uniform-propagation

Syntax

[**no**] **attribute-uniform-propagation**

Context

[Tree] (config>service>system>bgp-evpn>ip-prefix-routes>iff attribute-uniform-propagation)

Full Context

configure service system bgp-evpn ip-prefix-routes interface-ful attribute-uniform-propagation

Description

This command enables the uniform propagation of BGP attributes for EVPN Interface-ful (EVPN-IFF) routes. EVPN-IFF is used in R-VPLS services with **bgp-evpn**>**ip-route-advertisement**. When enabled, the received EVPN-IFF routes for the R-VPLS can be propagated with the original BGP path attributes into EVPN-IFL, IPVPN, EVPN-IFF (in other R-VPLS services), or BGP IP routes advertised for the attached VPRN. This command also enables the attribute propagation in the opposite direction; for example, from EVPN-IFL, IPVPN, IP, or EVPN-IFF routes into EVPN-IFF routes.

The propagation is in accordance with the uniform mode defined in *draft-ietf-bess-evpn-ipvpn-interworking*.

The **no** form of this command re-originates the BGP path attributes when propagating EVPN-IFF routes into other inter-subnet forwarding families.

Default

no attribute-uniform-propagation

Platforms

7705 SAR Gen 2

5.81 augment-route-table

augment-route-table

Syntax

[**no**] **augment-route-table**

Context

[Tree] (config>router>isis>loopfree-alternates augment-route-table)

Full Context

configure router isis loopfree-alternates augment-route-table

Description

This command enables IS-IS to attach Remote LFA specific information to RTM entries for use by other protocols. This command requires **configure router isis lfa remote-lfa** to be enabled. Currently only LDP makes use of this additional information.

The **no** form of this command disables IS-IS to attach Remote LFA specific information to RTM entries for use by other protocols.

Platforms

7705 SAR Gen 2

augment-route-table

Syntax

[**no**] **augment-route-table**

Context

[Tree] (config>router>ospf>loopfree-alternates augment-route-table)

Full Context

configure router ospf loopfree-alternates augment-route-table

Description

This command enables OSPF to attach Remote LFA (rLFA) information to RTM entries for use by other protocols. Before this command is configured, the **configure router ospf lfa remote-lfa** command, must be enabled on the system. Currently, only LDP makes use of this additional information.

The **no** form of this command disables the attachment of rLFA-specific information to RTM entries for use by other protocols.

Default

no augment-route-table

Platforms

7705 SAR Gen 2

5.82 auth

auth

Syntax

[**no**] **auth**

Context

[Tree] (debug>router>rsvp>event auth)

Full Context

debug router rsvp event auth

Description

This command debugs auth events.

The **no** form of the command disables the debugging.

Platforms

7705 SAR Gen 2

auth

Syntax

[**no**] **auth** [**neighbor** *ip-int-name* | *ip-address*]

Context

[Tree] (debug>router>rip auth)

Full Context

debug router rip auth

Description

This command enables debugging for RIP authentication.

Parameters

ip-int-name* | *ip-address

Debugs the RIP authentication for the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

5.83 auth-keychain

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>service>vprn>bgp>group auth-keychain)

[Tree] (config>service>vprn>bgp auth-keychain)

Full Context

configure service vprn bgp group auth-keychain

configure service vprn bgp group neighbor auth-keychain

configure service vprn bgp auth-keychain

Description

This command configures the BGP authentication key for all peers.

The keychain allows the rollover of authentication keys during the lifetime of a session.

Default

no auth-keychain

Parameters

name

Specifies the name of an existing keychain, up to 32 characters, to use for the specified TCP session or sessions.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>service>vprn>isis auth-keychain)

[Tree] (config>service>vprn>isis>level auth-keychain)

Full Context

configure service vprn isis auth-keychain

configure service vprn isis level auth-keychain

Description

This command configures an authentication keychain to use for the protocol interface for the VPRN instance. The keychain allows the rollover of authentication keys during the lifetime of a session.

Default

no auth-keychain

Parameters

name

Specifies the name of the keychain, up to 32 characters, to use for the specified protocol session or sessions.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>router>isis auth-keychain)

Full Context

configure service vprn ospf area sham-link auth-keychain

configure service vprn ospf area interface auth-keychain

configure service vprn ospf area virtual-link auth-keychain

Description

This command enables the authentication keychain.

Parameters

name

Specifies the name of the authentication keychain, up to 32 characters.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>router>ldp>tcp-session-params auth-keychain)

[Tree] (config>router>ldp>tcp-session-params>peer-transport auth-keychain)

Full Context

configure router ldp tcp-session-parameters auth-keychain

configure router ldp tcp-session-parameters peer-transport auth-keychain

Description

This command configures the TCP authentication keychain to use for the TCP session. The per-peer authentication configuration takes precedence over the global authentication configuration.

Parameters

name

Specifies the name of the keychain, up to 32 characters. This keychain is used for the specified TCP session or sessions, and allows the rollover of authentication keys during the lifetime of a session. The peer address used must be the TCP session transport address.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>router>rsvp>interface auth-keychain)

Full Context

configure router rsvp interface auth-keychain

Description

This command configures an authentication keychain to use for authentication of protocol messages sent and received over the associated interface. The keychain must include a valid entry to properly authenticate protocol messages, including a key, specification of a supported authentication algorithm, and beginning time. Each entry may also include additional options to control the overall lifetime of each entry to allow for the seamless rollover of without affecting the protocol adjacencies.

The **no** form of the auth-keychain command removes the association between the routing protocol and any keychain currently used.

Default

no auth-keychain

Parameters

name

Specifies the name of the keychain, up to 32 characters, to use for the specified protocol session or sessions.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>router>ospf>area>interface auth-keychain)

Full Context

configure router ospf area virtual-link auth-keychain

configure router ospf area interface auth-keychain

Description

This command configures an authentication keychain to use for the protocol interface. The keychain allows the rollover of authentication keys during the lifetime of a session.

The **no** form of this command removes the association to a previously specified keychain.

Default

no auth-keychain

Parameters

name

Specifies the name of the keychain, up to 32 characters, to use for the specified protocol session or sessions.

Platforms

7705 SAR Gen 2

auth-keychain

Syntax

auth-keychain *name*

Context

[Tree] (config>router>pcep>pcc>peer auth-keychain)

Full Context

configure router pcep pcc peer auth-keychain

Description

This command specifies a keychain to be used for TCP-AO authentication between the PCC and the PCE. The keychain must first be configured in the **configure system security keychain** context.

Default

no auth-keychain

Parameters

name

Specifies the name of the keychain, up to 32 characters.

Platforms

7705 SAR Gen 2

5.84 auth-method

auth-method

Syntax

auth-method {**psk** | **plain-psk-xauth** | **cert-auth** | **psk-radius** | **cert-radius** | **eap** | **auto-eap-radius** | **auto-eap**}

no auth-method

Context

[Tree] (config>ipsec>ike-policy auth-method)

Full Context

configure ipsec ike-policy auth-method

Description

This command specifies the authentication method used with this IKE policy.

The **no** form of this command removes the parameter from the configuration.

Default

no auth-method

Parameters

psk

Both client and gateway authenticate each other by a hash derived from a pre-shared secret. Both client and gateway must have the PSK. This work with both IKEv1 and IKEv2

plain-psk-xauth

Both client and gateway authenticate each other by pre-shared key and RADIUS. This work with IKEv1 only.

psk-radius

Use the pre-shared-key and RADIUS to authenticate. IKEv2 remote-access tunnel only.

cert-radius

Use the certificate, public/private key and RADIUS to authenticate. IKEv2 remote-access tunnel only.

eap

Use the EAP to authenticate peer. IKEv2 remote-access tunnel only

auto-eap-radius

Use EAP or potentially other method to authenticate the peer. IKEv2 remote-access tunnel only. Also see **config>ipsec>ike-policy auto-eap-method** and **config>ipsec>ike-policy auto-eap-own-method**.

auto-eap

Use the EAP or potentially other RADIUS-related method to authenticate the peer. IKEv2 remote-access tunnel only. Also see **config>ipsec>ike-policy auto-eap-method** and **config>ipsec>ike-policy auto-eap-own-method**.

[Tree] (config>router>radius-server>server auth-port)

Full Context

configure service vprn radius-server server auth-port

configure router radius-server server auth-port

Description

This command specifies the UDP listening port for RADIUS authentication requests.

The **no** form of this commands resets the UDP port to its default value (1812)

Default

auth-port 1812

Parameters

port

Specifies the UDP listening port for accounting requests of the external RADIUS server.

Values 1 to 65535

Platforms

7705 SAR Gen 2

5.86 authenticate

authenticate

Syntax

[**no**] **authenticate**

Context

[Tree] (config>service>vprn>ntp authenticate)

authentication

Syntax

authentication bidirectional *sa-name*

authentication inbound *sa-name* **outbound** *sa-name*

no authentication

Context

[Tree] (config>service>vprn>ospf3>area>if authentication)

[Tree] (config>service>vprn>ospf3>area>virtual-link authentication)

Full Context

configure service vprn ospf3 area interface authentication

configure service vprn ospf3 area virtual-link authentication

Description

This command configures OPSFv3 confidentiality authentication.

The **no** form of this command removes the SA name from the configuration.

Parameters

bidirectional *sa-name*

Specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated.

inbound *sa-name*

Specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated.

outbound *sa-name*

Specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated.

Platforms

7705 SAR Gen 2

authentication

Syntax

authentication *ascii-algorithm* **ascii-key** *ascii-string* [**hash** | **hash2** | **custom**]

authentication *auth-algorithm* **hex-key** *hex-string* [**hash** | **hash2** | **custom**]

no authentication

Context

[Tree] (config>ipsec>static-sa authentication)

Full Context

configure ipsec static-sa authentication

Description

This command configures the authentication algorithm to use for an IPsec manual SA.

Default

no authentication

Parameters

auth-algorithm

Specifies the authentication algorithm to be used.

Values mda5, sha1

ascii-string

Specifies an ASCII key; 16 characters for **md5** and 20 characters for **sha1**.

hex-string

Specifies a HEX key; 32 hex nibbles for **md5** and 40 hex nibbles for **sha1**.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7705 SAR Gen 2

authentication

Syntax

authentication none

authentication *authentication-protocol authentication-key* [**privacy-none**] [**hash** | **hash2** | **custom**]

authentication *authentication-protocol authentication-key* **privacy** *privacy-protocol privacy-key* [**hash** | **hash2** | **custom**]

no authentication

Context

[Tree] (config>system>security>user>snmp authentication)

Full Context

configure system security user snmp authentication

Description

This command configures the SNMPv3 authentication and privacy protocols for the user to communicate with the router. The keys are stored in an encrypted format in the configuration.

The keys configured with these commands must be localized keys, which are a hash of the SNMP engine ID and a password. The password is not entered directly in this command. Use the **tools perform system management-interface snmp generate-key** command to generate localized authentication and privacy keys.

Default

authentication none

Parameters

none

Keyword to specify that no authentication protocol is used. If **none** is specified, privacy cannot be configured.

authentication-protocol

Specifies the SNMPv3 authentication protocol.

Values **hmac-md5-96** — Specifies use of the HMAC-MD5-96 authentication protocol.

hmac-sha1-96 — Specifies use of the HMAC-SHA-96 authentication protocol.

hmac-sha2-224 — Specifies use of the HMAC-SHA-224 authentication protocol.

hmac-sha2-256 — Specifies use of the HMAC-SHA-256 authentication protocol.

hmac-sha2-384 — Specifies use of the HMAC-SHA-384 authentication protocol.

hmac-sha-512 — Specifies use of the HMAC-SHA-512 authentication protocol.

authentication-key

Specifies the localized authentication key, which is entered as a hexadecimal string; the character length depends on the specified authentication protocol. The following table lists the authentication protocol key lengths.

Table 17: Authentication protocol key lengths

Authentication protocol	Character lengths
HMAC-MD5-96	32
HMAC-SHA-96	40
HMAC-SHA-224	56
HMAC-SHA-256	64
HMAC-SHA-384	96
HMAC-SHA-512	128

privacy-none

Keyword to specify that a privacy protocol is not used in the communication.

Default privacy none

privacy-protocol

Specifies the SNMPv3 privacy protocol.

Values **cbc-des** — Specifies the use of the CBC-DES privacy protocol.

cfb128-aes-128 — Specifies the use of the CFB128-AES-128 privacy protocol.

cfb128-aes-192 — Specifies the use of the CFB128-AES-192 privacy protocol.

cfb128-aes-256 — Specifies the use of the CFB128-AES-256 privacy protocol.

privacy-key

Specifies the localized privacy key, which is entered as a hexadecimal string; the character length depends on the specified privacy protocol. The following table lists the privacy protocol key lengths.

Table 18: Privacy protocol key lengths

Privacy protocol	Character length
CBC-DES	32
CFB128-AES-128	32
CFB128-AES-192	48
CFB128-AES-256	64

hash

Keyword that specifies the key is entered in an encrypted form. If the **hash** or **hash2** keyword is not specified, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Keyword that specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone; that is, the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** keyword is not specified, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Keyword that specifies the custom encryption to the management interface.

[Tree] (config>router>ospf3>area>interface authentication)

Full Context

configure router ospf3 area virtual-link authentication

configure router ospf3 area interface authentication

Description

This command configures the password used by the OSPF3 interface or virtual-link to send and receive OSPF3 protocol packets on the interface when simple password authentication is configured.

All neighboring routers must use the same type of authentication and password for proper protocol communication.

By default, no authentication key is configured.

The **no** form of this command removes the authentication.

Default

no authentication

Parameters

bidirectional sa-name

Specifies bidirectional OSPF3 authentication.

inbound sa-name

Specifies the inbound security association (SA) name for OSPF3 authentication.

outbound sa-name

Specifies the outbound SA name for OSPF3 authentication.

Platforms

7705 SAR Gen 2

5.89 authentication-check

authentication-check

Syntax

[**no**] **authentication-check**

Context

[Tree] (config>service>vprn>isis authentication-check)

Full Context

configure service vprn isis authentication-check

Description

This command sets an authentication check to reject PDUs that do not match the type or key requirements for the VPRN instance.

The default behavior when authentication is configured is to reject all IS-IS protocol PDUs that have a mismatch in either the authentication type or authentication key.

When **no authentication-check** is configured, authentication PDUs are generated and IS-IS PDUs are authenticated on receipt. However, mismatches cause an event to be generated and will not be rejected.

The **no** form of this command allows authentication mismatches to be accepted and generates a log event.

Default

authentication-check — Rejects authentication mismatches.

Platforms

7705 SAR Gen 2

authentication-check

Syntax

[**no**] **authentication-check**

Context

[Tree] (config>service>vprn>ntp authentication-check)

Full Context

configure service vprn ntp authentication-check

Description

This command provides the option to skip the rejection of NTP PDUs that do not match the authentication key-id, type or key requirements. The default behavior when authentication is configured is to reject all NTP protocol PDUs that have a mismatch in either the authentication key-id, type or key.

When **authentication-check** is enabled, NTP PDUs are authenticated on receipt. However, mismatches cause a counter to be increased, one counter for type and one for key-id, one for type, value mismatches. These counters are visible in a show command.

The **no** form of this command allows authentication mismatches to be accepted; the counters however are maintained.

Default

authentication-check — Rejects authentication mismatches.

no authentication-key

Context

[Tree] (config>redundancy>multi-chassis>peer authentication-key)

Full Context

configure redundancy multi-chassis peer authentication-key

Description

This command configures the authentication key used between this node and the multi-chassis peer. The authentication key can be any combination of letters or numbers. The **no** form of the command removes the authentication key.

Default

no authentication-key

Parameters

authentication-key

Specifies the authentication key. Allowed values are any string up to 20 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 33 (hash1-key) or 55 (hash2-key) characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Description

This command configures the BGP authentication key.

Authentication is performed between neighboring routers before setting up the BGP session by verifying the password. Authentication is performed using the MD5 message-based digest. The authentication key can be any combination of letters or numbers from 1 to 16.

The **no** form of this command removes the authentication password from the configuration and effectively disables authentication.

Default

Authentication is disabled and the authentication password is empty.

Parameters

authentication-key

Specifies the authentication key. The key can be any combination of ASCII characters up to 255 characters (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 342 characters (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys

are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

no authentication-key

Context

[Tree] (config>service>ies>if>vrrp authentication-key)

Full Context

configure service ies interface vrrp authentication-key

Description

The **authentication-key** command, within the **vrrp** *virtual-router-id* context, is used to assign a simple text password authentication key to generate master VRRP advertisement messages and validating received VRRP advertisement messages.

The authentication-key command is one of the few commands not affected by the presence of the owner keyword. If simple text password authentication is not required, the authentication-key command is not required. If the command is re-executed with a different password key defined, the new key will be used immediately. If a no authentication-key command is executed, the password authentication key is restored to the default value. The authentication-key command may be executed at any time.

To change the current in-use password key on multiple virtual router instances:

- Identify the current master
- Shutdown the virtual router instance on all backups
- Execute the authentication-key command on the master to change the password key
- Execute the authentication-key command and no shutdown command on each backup key

The **no** form of the command removes the authentication key.

Default

No default. The authentication data field contains the value 0 in all 16 octets.

Parameters

authentication-key

The *key* parameter identifies the simple text password used when VRRP Authentication Type 1 is enabled on the virtual router instance. Type 1 uses a string eight octets long that is inserted into all transmitted VRRP advertisement messages and compared against all received VRRP advertisement messages. The authentication data fields are used to transmit the key.

The *key* parameter is expressed as a string consisting up to eight alpha-numeric characters. Spaces must be contained in quotation marks (" "). The quotation marks are not considered part of the string.

The string is case sensitive and is left-justified in the VRRP advertisement message authentication data fields. The first field contains the first four characters with the first octet (starting with IETF RFC bit position 0) containing the first character. The second field holds the fifth through eighth characters. Any unspecified portion of the authentication data field is padded with the value 0 in the corresponding octet.

Values Any 7-bit printable ASCII character.

Exceptions:	Double quote (")	ASCII 34
	Carriage Return	ASCII 13
	Line Feed	ASCII 10
	Tab	ASCII 9
	Backspace	ASCII 8

hash-key

The hash key. The key can be any combination of ASCII characters up to 22 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

configure service vprn interface vrrp authentication-key

Description

The **authentication-key** command, within the **vrrp** *virtual-router-id* context, is used to assign a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages.

The **authentication-key** command is one of the few commands not affected by the presence of the **owner** keyword. If simple text password authentication is not required, this command is not required. If the command is re-executed with a different password key defined, the new key will be used immediately. If a no **authentication-key** command is executed, the password authentication key is restored to the default value. The **authentication-key** command may be executed at any time.

To change the current in-use password key on multiple virtual router instances:

- Identify the current master
- Shut down the virtual router instance on all backups
- Execute the **authentication-key** command on the master to change the password key
- Execute the **authentication-key** command and the **no shutdown** command on each backup key

The **no** form of this command restores the default null string to the value of key.

Parameters

authentication-key

The *key* parameter identifies the simple text password used when VRRP Authentication Type 1 is enabled on the virtual router instance. Type 1 uses a string eight octets long that is inserted into all transmitted VRRP advertisement messages and compared against all received VRRP advertisement messages. The authentication data fields are used to transmit the key.

The *key* parameter is expressed as a string consisting of up to eight alpha-numeric characters. Spaces must be contained in quotation marks (" ”). The quotation marks are not considered part of the string.

The string is case sensitive and is left-justified in the VRRP advertisement message authentication data fields. The first field contains the first four characters with the first octet (starting with IETF RFC bit position 0) containing the first character. The second field holds the fifth through eighth characters. Any unspecified portion of the authentication data field is padded with the value 0 in the corresponding octet.

Values Any 7-bit printable ASCII character.

Exceptions:	Double quote (")	ASCII 34
	Carriage Return	ASCII 13
	Line Feed	ASCII 10
	Tab	ASCII 9
	Backspace	ASCII 8

hash-key

The hash key. The key can be any combination of ASCII characters up to 22 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ”)

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

[Tree] (config>service>vprn>isis authentication-key)

[Tree] (config>service>vprn>isis>level authentication-key)

Full Context

configure service vprn isis authentication-key

configure service vprn isis level authentication-key

Description

This command sets the authentication key used to verify PDUs sent by neighboring routers on the interface for the VPRN instance.

Neighboring routers use passwords to authenticate PDUs sent from an interface. For authentication to work, both the authentication *key* and the authentication *type* on a segment must match. The OSPF Commands statement must also be included.

To configure authentication on the global level, configure this command in the **config>router>isis** context. When this parameter is configured on the global level, all PDUs are authenticated including the Hello PDU.

To override the global setting for a specific level, configure the **authentication-key** command in the **config>router>isis>level** context. When configured within the specific level, hello PDUs are not authenticated.

The **no** form of this command removes the authentication key.

Default

no authentication-key — No authentication key is configured.

Parameters

authentication-key

The authentication key. The key can be any combination of ASCII characters up to 255 characters in length (un-encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7705 SAR Gen 2

authentication-key

no authentication-key *key-id*

Context

[Tree] (config>service>vprn>ntp authentication-key)

Full Context

configure service vprn ntp authentication-key

Description

This command sets the authentication key-id, type and key used to authenticate NTP PDUs sent by the broadcast server function toward external clients or to authenticate NTP PDUs received from external unicast clients within the VPRN routing instance. For authentication to work, the authentication key-id, type, and key value must match.

The **no** form of this command removes the authentication key.

Parameters

key-id

Configure the authentication key-id that will be used by the node when transmitting or receiving Network Time Protocol packets.

Entering the authentication-key command with a key-id value that matches an existing configuration key will result in overriding the existing entry.

Recipients of the NTP packets must have the same authentication key-id, type, and key value in order to use the data transmitted by this node. This is an optional parameter.

Values 1 to 255

key

The authentication key associated with the configured key-id, the value configured in this parameter is the actual value used by other network elements to authenticate the NTP packet.

The key can be any combination of ASCII characters up to 8 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (".").

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

type

This parameter determines if DES or message-digest authentication is used.

This is a required parameter; either DES or message-digest must be configured.

Values des — Specifies that DES authentication is used for this key.

message-digest — Specifies that MD5 authentication in accordance with RFC 2104 is used for this key.

configure service vprn ospf area sham-link authentication-key

configure service vprn ospf area virtual-link authentication-key

configure service vprn ospf area interface authentication-key

Description

This command configures the password used by the OSPF interface or virtual-link to send and receive OSPF protocol packets on the interface when simple password authentication is configured.

This command is not valid in the OSPF3 context.

All neighboring routers must use the same type of authentication and password for proper protocol communication. If the **authentication-type** is configured as password, then this key must be configured.

By default, no authentication key is configured.

This command is not supported in the OSPF context.

The **no** form of this command removes the authentication key.

Default

no authentication-key — No authentication key is defined.

Parameters

authentication-key

The authentication key. The key can be any combination of ASCII characters up to 8 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

The hash key. The key can be any combination of ASCII characters up to 22 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

configure service vprn rip group authentication-key

configure service vprn rip group neighbor authentication-key

configure service vprn rip authentication-key

Description

This command sets the authentication password to be passed between RIP neighbors.

The authentication type and authentication key must match exactly to authenticate and then process the RIP message.

The **no** form of this command removes the authentication password from the configuration and disables authentication.

Default

no authentication-key

Parameters

authentication-key

The authentication key. The key can be any combination of ASCII characters up to 16 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

The hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. [Tree] (config>router>ldp>tcp-session-params authentication-key)

[Tree] (config>router>ldp>tcp-session-params>peer-transport authentication-key)

Full Context

configure router ldp tcp-session-parameters authentication-key

configure router ldp tcp-session-parameters peer-transport authentication-key

Description

This command specifies the authentication key used to establish a session between LDP peers. Authentication uses the MD5 message-based digest. The peer address used in authentication must be the TCP session transport address. If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR-ID value, the user must add each transport address to the authentication-key configuration as a separate peer. As a result, when the TCP connection is bootstrapped by a specific Hello adjacency, the authentication can operate over that TCP connection by using its specific transport address. The per peer authentication configuration takes precedence over global authentication configuration, and authentication keychain configuration takes precedence over authentication key configuration.

The **no** form of this command disables authentication.

Parameters

authentication-key

Specifies the authentication key. The key can be any combination of ASCII characters, up to 255 characters (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

Specifies the hash key. The key can be any combination of up to 33 alphanumeric characters. If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex, encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

Context

[Tree] (config>router>rsvp>interface authentication-key)

Full Context

configure router rsvp interface authentication-key

Description

This command specifies the authentication key for use between RSVP neighbors to authenticate RSVP messages. Authentication uses the MD5 message-based digest.

When enabled on an RSVP interface, authentication of RSVP messages operates in both directions of the interface. A router maintains a security association using one authentication key for each interface to an RSVP neighbor.

An RSVP neighbor transmits an authenticating digest of the RSVP message that is computed using the shared authentication key and a keyed-hash algorithm. The message digest is included in an INTEGRITY object, which also contains a flags field, a key identifier field, and a sequence number field. An RSVP neighbor uses the key together with the authentication algorithm to process received RSVP messages. The RSVP MD5 authentication complies to the procedures for RSVP message generation in RFC 2747, *RSVP Cryptographic Authentication*.

The MD5 implementation does not support the authentication challenge procedures in RFC 2747.

The **no** form of this command disables authentication.

Default

no authentication-key - The authentication key value is the null string.

Parameters

authentication-key

Specifies the authentication key. The key can be any combination of ASCII characters up to 16 characters in length (unencrypted). If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

hash-key

Specifies the hash key. The key can be any combination of up 33 alphanumeric characters. If spaces are used in the string, enclose the entire string in quotation marks (" ”)

This is useful when a user must configure the parameter, but for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be

copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

Context

[Tree] (config>router>if>vrrp authentication-key)

Full Context

configure router interface vrrp authentication-key

Description

This command sets the simple text authentication key used to generate master VRRP advertisement messages and validates VRRP advertisements.

If simple text password authentication is not required, the **authentication-key** command is not required.

The command is configurable in both non-owner and owner **vrrp** nodal contexts.

The *key* parameter identifies the simple text password to be used when VRRP Authentication Type 1 is enabled on the virtual router instance. Type 1 uses an eight octet long string that is inserted into all transmitted VRRP advertisement messages and is compared against all received VRRP advertisement messages. The authentication data fields are used to transmit the *key*.

The *key* string is case sensitive and is left justified in the VRRP advertisement message authentication data fields. The first field contains the first four characters with the first octet (starting with IETF RFC bit position 0) containing the first character. The second field similarly holds the fifth through eighth characters. Any unspecified portion of the authentication data field is padded with a 0 value in the corresponding octet.

If the command is re-executed with a different password key defined, the new key is used immediately.

The **authentication-key** command can be executed at anytime.

To change the current in-use password key on multiple virtual router instances:

Identify the current master.

1. Shutdown the virtual router instance on all backups.
2. Execute the **authentication-key** command on the master to change the password key.
3. Execute the **authentication-key** command and **no shutdown** command on each backup.

The **no** form of the command reverts to the default value.

Default

no authentication-key — The authentication key value is the null string.

Parameters

authentication-key

The authentication key. Allowed values are any string up to 8 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

hash-key

The hash key. The key can be any combination of ASCII characters up to 22 (hash-key1) or 121 (hash-key2) characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

configure system time ntp authentication-key

Description

This command sets the authentication key-id, type and key used to authenticate NTP PDUs sent to or received by other network elements participating in the NTP protocol. For authentication to work, the authentication key-id, type and key value must match.

The **no** form of the command removes the authentication key.

Parameters

key-id

Configures the authentication key-id that will be used by the node when transmitting or receiving Network Time Protocol packets

Entering the authentication-key command with a key-id value that matches an existing configuration key will result in overriding the existing entry.

Recipients of the NTP packets must have the same authentication key-id, type, and key value in order to use the data transmitted by this node. This is an optional parameter.

Values 1 to 255

key

Specifies the authentication key associated with the configured key-id, the value configured in this parameter is the actual value used by other network elements to authenticate the NTP packet.

The key can be any combination of ASCII characters up to 32 characters for message-digest (md5) or 8 characters for des (length limits are unencrypted lengths). If spaces are used in the string, enclose the entire string in quotation marks (".").

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

type

Determines if DES or message-digest authentication is used.

This is a required parameter; either DES or message-digest must be configured.

des

Specifies that DES authentication is used for this key.

message-digest

Specifies that MD5 authentication in accordance with RFC 2104 is used for this key.

Description

This command configures the BGP authentication key.

Authentication is performed between neighboring routers before setting up the BGP session by verifying the password. Authentication is performed using the MD5 message based digest.

The **no** form of this command reverts to the default value.

Default

no authentication-key

Parameters

authentication-key

Specifies an authentication key. The key can be up to 255 characters (unencrypted).

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7705 SAR Gen 2

authentication-key

Syntax

authentication-key [*authentication-key* | *hash-key*] [**hash** | **hash2** | **custom**]

no authentication-key

Context

[Tree] (config>router>isis authentication-key)

[Tree] (config>router>isis>level authentication-key)

Full Context

configure router isis authentication-key

configure router isis level authentication-key

Description

This command sets the authentication key used to verify PDUs sent by neighboring routers on the interface.

Neighboring routers use passwords to authenticate PDUs sent from an interface. For authentication to work, both the authentication *key* and the authentication *type* on a segment must match. The **authentication-type** command must also be included.

To configure authentication on the global level, configure this command in the **config>router>isis** context. When this parameter is configured on the global level, all PDUs are authenticated, including the hello PDU.

To override the global setting for a specific level, configure the **authentication-key** command in the **config>router>isis>level** context. When configured within the specific level, hello PDUs are not authenticated.

The **no** form of this command removes the authentication key.

Default

no authentication-key

Parameters

authentication-key

Specifies the authentication key. The key can be any combination of ASCII characters up to 255 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

[Tree] (config>router>ospf>area>virtual-link authentication-key)

Full Context

configure router ospf area interface authentication-key

configure router ospf area virtual-link authentication-key

Description

This command configures the password used by the OSPF interface or virtual link to send and receive OSPF protocol packets on the interface when simple password authentication is configured.

All neighboring routers must use the same type of authentication and password for proper protocol communication. If **authentication-type password** is configured, this key must be configured.

By default, no authentication key is configured.

The **no** form of this command removes the authentication key.

Default

no authentication-key

Parameters

authentication-key

Specifies the authentication key. The key can be any combination of ASCII characters up to 8 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 22 characters (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

[Tree] (config>router>rip authentication-key)

Full Context

configure router rip group neighbor authentication-key

configure router rip group authentication-key

configure router rip authentication-key

Description

This command sets the authentication password to be passed between RIP neighbors.

The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.

The **no** form of the command removes the authentication password from the configuration and disables authentication.

Default

no authentication-key

Parameters

authentication-key

Specifies the authentication key. Allowed values are any string up to 16 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

hash-key

Specifies the hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

authentication-keychain

Syntax

authentication-keychain *keychain-name*

no authentication-keychain

Context

[Tree] (config>system>time>ntp authentication-keychain)

Full Context

configure system time ntp authentication-keychain

Description

This command configures the authentication keychain used to handle unsolicited NTP requests.

If the system receives a request with a key ID that matches both the configured key and the keychain, the system checks the MAC ID using the key information first. If the key authentication fails, the system then checks the MAC ID using the information from the keychain.

The **no** form of the command removes the authentication keychain.

Parameters

keychain-name

Specifies the keychain name, up to 32 characters.

Platforms

7705 SAR Gen 2

authentication-keychain

Syntax

authentication-keychain *keychain-name*

no authentication-keychain

Context

5.93 authentication-order

authentication-order

Syntax

authentication-order [*method-1*] [*method-2*] [*method-3*] [*method-4*] [**exit-on-reject**]

no authentication-order

Context

[Tree] (config>system>security>password authentication-order)

Full Context

configure system security password authentication-order

Description

This command configures the sequence in which the system attempts authentication and authorization among the local user database, RADIUS servers, TACACS+ servers, and LDAP servers.

Configure the order from the most preferred method to the least preferred. The presence of all methods in the command line does not guarantee they are all operational. Specifying options that are not available delays user authentication.

If all operational methods are attempted and no authentication for a particular login has been granted, an entry in the security log records the failed attempt. Both the attempted login identification and originating IP address are logged with a timestamp.

The **no** form of this command reverts to the default order.

The order is not applicable to SNMPv3. SNMPv3 messages ignore the configured order and are authorized using the locally configured users only. TACACS+, RADIUS, and LDAP are not supported for SNMPv3 authentication.

Note:
This command applies to a local user, in addition to users on RADIUS, TACACS+, and LDAP.

Default

authentication-order radius tacplus ldap local

Parameters

method-1

Specifies the first password authentication method to attempt.

Values local, radius, tacplus, ldap

method-2

Specifies the second password authentication method to attempt.

Values local, radius, tacplus, ldap

method-3

Specifies the third password authentication method to attempt.

Values local, radius, tacplus, ldap

method-4

Specifies the fourth password authentication method to attempt.

Values local, radius, tacplus, ldap

local

Specifies the password authentication based on the local password database.

radius

Specifies RADIUS authentication.

tacplus

Specifies TACACS+ authentication.

ldap

Specifies LDAP authentication.

exit-on-reject

When this parameter is configured, the router stops authentication and authorization if one of the AAA methods configured in the order sends a rejection.

When this parameter is not configured, the router attempts the next AAA method if a AAA method sends a rejection. If all AAA methods are exhausted, authentication and authorization are rejected.

If the order specifies **local** as the first method, the following actions apply:

- If this parameter is configured and the user does not exist, the user is not authenticated.
- If the user can be authenticated locally, other methods, if configured, are used for authorization and accounting.
- If the user is configured locally but without console access, login is denied.

7705 SAR Gen 2

5.94 authentication-over-bypass

authentication-over-bypass

Syntax

authentication-over-bypass [**enable** | **disable**]

Context

[Tree] (config>router>rsvp authentication-over-bypass)

Full Context

configure router rsvp authentication-over-bypass

Description

This command configures the MD5 authentication over the bypass LSP of all Point of Local Repairs (PLRs) and Merge Points (MPs) on the router. Only enable this command when the TE interfaces in the RSVP-TE network use the same MD5 authentication parameters.

When a Point of Local Repair (PLR) activates a bypass LSP towards a Merge Point (MP), by default, the INTEGRITY object corresponding to the bypass LSP interface is not added to a transmitted RSVP message except for packets of routed RSVP messages (Resv, Srefresh, and ACK), and only when the packet is intended for a bypass LSP endpoint (PLR or MP) that is a directly connected neighbor.

When this command is enabled, the INTEGRITY object of the interface corresponding to the bypass LSP is added to a transmitted RSVP message regardless of whether the bypass LSP endpoint (PLR or MP) is a directly connected RSVP neighbor. The INTEGRITY object is included with the following RSVP messages: Path, PathTear, PathErr, Resv, ResvTear, ResvErr, Srefresh, and ACK.

In all cases, an RSVP message received from a PLR or a MP (sender address in the SenderTemplate/ FilterSpec is different from an Extended Tunnel Id in a Session Object), and which includes the INTEGRITY object is authenticated against the bypass LSP interface. An RSVP message received from a PLR or MP without the INTEGRITY object is also accepted.

Default

authentication-over-bypass disable

Parameters

enable

Enables the MD5 authentication over the bypass LSP of all PLRs on the node.

disable

Disables the MD5 authentication over the bypass LSP of all PLRs on the node.

Platforms

7705 SAR Gen 2

5.95 authentication-type

authentication-type

Syntax

authentication-type {**none** | **password** | **message-digest** | **message-digest-20**}

no authentication-type

Context

[Tree] (config>subscr-mgmt>rip-plcy authentication-type)

Full Context

configure subscriber-mgmt rip-policy authentication-type

Description

This command sets the type of authentication to be used between RIP neighbors. The type and password must match exactly for the RIP message to be considered authentic and processed.

The **no** form of this command removes the authentication type from the configuration and effectively disables authentication.

Parameters

none

Disables authentication at a given level (global, group, neighbor). If the command does not exist in the configuration, the parameter is inherited.

password

Specifies enable simple password (plain text) authentication. If authentication is enabled and no authentication type is specified in the command, simple password authentication is enabled.

message-digest

Configures 16 byte message digest for MD5 authentication. If this option is configured, then at least one message-digest-key must be configured.

message-digest-20

Configures 20 byte message digest for MD5 authentication in accordance with RFC 2082, RIP-2 MD5 Authentication. If this option is configured, then at least one message-digest-key must be configured.

Platforms

7705 SAR Gen 2

authentication-type

Syntax

authentication-type {**password** | **message-digest**}

no authentication

Context

[Tree] (config>service>vprn>isis authentication-type)

[Tree] (config>service>vprn>isis>level authentication-type)

Full Context

configure service vprn isis authentication-type

configure service vprn isis level authentication-type

Description

This command enables either simple password or message digest authentication or must go in either the global IS-IS or IS-IS level context.

Both the authentication key and the authentication type on a segment must match. The **authentication-key** statement must also be included.

Configure the authentication type on the global level in the **config>router>isis** context.

Configure or override the global setting by configuring the authentication type in the **config>router>isis>level** context.

The **no** form of this command disables authentication.

Default

no authentication-type — No authentication type is configured and authentication is disabled.

Parameters

password

Specifies that simple password (plain text) authentication is required.

message-digest

Specifies that MD5 authentication in accordance with RFC 2104 is required.

Platforms

7705 SAR Gen 2

authentication-type

Syntax

authentication-type {**password** | **message-digest**}

no authentication-type

Full Context

configure service vprn ospf area sham-link authentication-type

configure service vprn ospf area virtual-link authentication-type

configure service vprn ospf area interface authentication-type

Description

This command enables authentication and specifies the type of authentication to be used on the OSPF interface, virtual-link, and sham-link.

This command is not valid in the OSPF3 context.

Both simple **password** and **message-digest** authentication are supported.

The **no** form of this command disables authentication on the interface.

Default

no authentication-type — No authentication is enabled on an interface.

Parameters

password

This keyword enables simple password (plain text) authentication. If authentication is enabled and no authentication type is specified in the command, simple **password** authentication is enabled.

message-digest

This keyword enables message digest MD5 authentication in accordance with RFC 1321. If this option is configured, then at least one message-digest-key must be configured.

authorization

Syntax

authorization [**use-priv-lvl**]

no authorization

Context

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus authorization)

[Tree] (config>system>security>tacplus authorization)

Full Context

configure service vprn aaa remote-servers tacplus authorization

configure system security tacplus authorization

Description

This command configures TACACS+ command authorization parameters.

If this command is enabled without the **use-priv-lvl** option, each command is sent to the TACACS+ server for authorization (this is true whether the **tacplus use-default-template** setting is enabled or not).

If the **tacplus authorization** command is disabled, and the **tacplus use-default-template** setting is enabled, the local profile in the **user-template tacplus_default** is used for command authorization.

The **no** form of this command removes authorization parameters from the configuration.

Default

no authorization

Parameters

use-priv-lvl

Specifies to automatically perform a single authorization request to the TACACS+ server for cmd* (all commands) immediately after login, and then use the local profile associated (via the **priv-lvl-map** command) with the privilege level returned by the TACACS+ server for all subsequent authorization (except **enable-admin**). After the initial authorization for cmd*, no further authorization requests are sent to the TACACS+ server (except **enable-admin**). If the TACACS+ server does not return a privilege level for a user, the profile from the **user-template tacplus_default** is used for command authorization (as long as **tacplus use-default-template** is enabled, otherwise all commands are rejected).

Full Context

configure service vpls bgp-evpn mpls auto-bind-tunnel

configure service vprn bgp-evpn mpls auto-bind-tunnel

configure service epipe bgp-evpn mpls auto-bind-tunnel

configure service vprn bgp-ipvpn mpls auto-bind-tunnel

Description

Commands in this context configure automatic binding of a VPRN service using tunnels to MP-BGP peers.

The **auto-bind-tunnel** node is simply a context to configure the binding of BGP IPVPN or EVPN routes to tunnels. The user must configure the **resolution** option to enable auto-bind resolution to tunnels in TTM. If the **resolution** option is explicitly set to **disabled**, the auto-binding to tunnel is removed.

If resolution is set to **any**, any supported tunnel type in the Epipe/VPRN/VPLS context is selected following TTM preference. If one or more explicit tunnel types are specified using the **resolution-filter** option, then only these tunnel types are selected again following the TTM preference.

The user must set **resolution** to **filter** in order to activate the list of tunnel-types configured under resolution-filter.

In VPRN services and for BGP-IPVPN, when an explicit SDP to a BGP next hop is configured (**config**>**service**>v**prn**>**spoke-sdp**), it overrides the auto-bind-tunnel selection for that BGP next hop only. There is no support for reverting automatically to the auto-bind-tunnel selection if the explicit SDP goes down. The user must delete the explicit spoke-sdp in the VPRN service context to resume using the auto-bind-tunnel selection for the BGP next hop.

5.99 auto-boot

auto-boot

Syntax

auto-boot [**management-port**] [**inband** [**vlan** *vlan-id* | **vlan-discovery**]] [**ipv4**] [**ipv6**] [**client-identifier** {**string** *ascii-string* | **hex** *hex-string* | **chassis-mac**}] [**include-user-class**] [**timeout** *minutes*]

auto-boot ospf [**neid** *neid-hex-string*] [**vendor-id** *vendor-id*] [**neip-ipv4** *ip-address*] [**neip-ipv6** *ipv6-address*] [**port-mtu** *mtu-bytes*] [**ospf-mtu** *ip-mtu-bytes*] [**vlan** *vlan-id*] [**timeout** *minutes*]

no auto-boot

Context

[Tree] (bof auto-boot)

Full Context

bof auto-boot

Description

This command enables the **auto-boot** flag in the BOF and configures the **auto-boot** options for ZTP. When modifying **auto-boot** options using CLI, all required options must be explicitly configured, as the default cases will no longer be used.

The **no** form of this command disables the **auto-boot** flag.

Default

no auto-boot

Parameters

management-port

Specifies that the out-of-band management port (Mgmt port) should be used for ZTP.

inband

Specifies that in-band management through an Ethernet port should be used for ZTP. Unless the **vlan-discovery** flag is used, the **inband** option disables VLAN discovery.

vlan-id

Specifies an in-band VLAN to use for the auto-boot process.

Values 1 to 4094

vlan-discovery

Floods all VLANs (1 to 4094) with DHCP discovery messages and is supported only on **inband** ports. The first offer received on a specific VLAN is processed.

ipv4

Enables IPv4 DHCP discovery. This parameter is mandatory if the **ipv6** parameter is not specified.

ipv6

Enables IPv6 DHCP solicitation. This parameter is mandatory if the **ipv4** parameter is not specified.

ascii-string

Specifies a DHCP client identification string, up to 58 ASCII characters, to be used for Option 61 (IPv4) or Option 1 (IPv6).

hex-string

Specifies a DHCP client identification string, up to 116 hexadecimal nibbles, to be used for Option 61 (IPv4) or Option 1 (IPv6).

Values 0x0 to 0xFFFFFFFF

chassis-mac

Specifies that the chassis MAC address should be used as the DHCP client identification string for Option 61 (IPv4) or Option 1 (IPv6).

include-user-class

Specifies that Option 77 should be included in DHCP messages.

client-identifier

Specifies that a custom client ID should be used in network discovery requests.

minutes

Specifies the time interval after which, if the auto-boot process is unsuccessful (in the case of auto-boot using OSPF, if no OSPF adjacency is found), the node is rebooted and the auto-boot process is retried.

Values 30 to 1440

Default 30

ospf

Specifies that OSPF auto-discovery should be used.

neid-hex-string

Specifies a hexadecimal network element identification string.

Values 0x10101to 0xFEFEFE

ip-address

Specifies the IPv4 address for the network element.

Values a.b.c.d

Default *vendor-id.neid-hex-string*

ipv6-address

Specifies the IPv6 address for the network element.

Values

x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x [0 to FFFF]H

d [0 to 255]D

Default The IPv6 version of *vendor-id.neid-hex-string*

vendor-id

Specifies the vendor identification number. The number 140 corresponds to "Nokia”.

Values 1 to 254

Default 140

ip-mtu-bytes

Specifies the OSPF MTU in bytes.

Values 512 to 9786

Default 1500

mtu-bytes

Specifies the port MTU in bytes.

Values 512 to 9800

Default The default MTU of the port type.

5.100 auto-config

auto-config

Syntax

[**no**] **auto-config**

Context

[Tree] (config>service>epipe>spoke-sdp-fec auto-config)

Full Context

configure service epipe spoke-sdp-fec auto-config

Description

This command enables single sided automatic endpoint configuration of the spoke SDP. The router acts as the passive T-PE for signaling this MS-PW.

Automatic Endpoint Configuration allows the configuration of a spoke SDP endpoint without specifying the TAII associated with that spoke SDP. It allows a single-sided provisioning model where an incoming label mapping message with a TAII that matches the SAII of that spoke SDP to be automatically bound to that endpoint. In this mode, the far end T-PE actively initiates MS-PW signaling and will send the initial label mapping message using T-LDP, while the router T-PE for which auto-config is specified will act as the passive T-PE.

The **auto-config** command is blocked in CLI if signaling active has been enabled for this spoke SDP. It is only applicable to spoke SDPs configured under the Epipe, IES and VPRN interface context.

The **no** form of this command means that the router T-PE either acts as the active T-PE (if signaling active is configured) or automatically determines which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP. If the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

configure ipsec ike-policy auto-eap-method

Description

This command enables following behavior for IKEv2 remote-access tunnel when auth-method is configured as auto-eap-radius:

- If there is no AUTH payload in IKE_AUTH request, then system use EAP to authenticate client and also will own-auth-method to generate AUTH payload.
- If there is AUTH payload in IKE_AUTH request:
  - if auto-eap-method is psk, then system proceed as auth-method:psk-radius
  - if auto-eap-method is cert, then system proceed as auth-method:cert-radius
  - if auto-eap-method is psk-or-cert, then:
    - if the "Auth Method" field of AUTH payload is PSK, then system proceed as auth-method:psk-radius
    - if the "Auth Method" field of AUTH payload is RSA or DSS, then system proceed as auth-method:cert-radius
  - The system will use **auto-eap-own-method** to generate AUTH payload.

This command only applies when **auth-method** is configured as **auto-eap-radius**.

Default

auto-eap-method cert

Parameters

psk

Uses the pre-shared-key as the authentication method.

cert

Uses the certificate as the authentication method.

psk-or-cert

Uses either the pre-shared-key or certificate based on the "Auth Method" field of the received AUTH payload.

[Tree] (config>service>pw-template>split-horizon-group auto-learn-mac-protect)

Full Context

configure service vpls endpoint auto-learn-mac-protect

configure service pw-template split-horizon-group auto-learn-mac-protect

Description

This command enables the automatic protection of source MAC addresses learned on the associated object. MAC protection is used in conjunction with the **restrict-protected-src**, **restrict-unprotected-dst**,

and **mac-protect** commands. When **auto-learn-mac-protect** command is applied or removed, the MAC addresses are cleared from the related object.

When the **auto-learn-mac-protect** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG). To enable this function for spoke SDPs within a SHG, the **auto-learn-mac-protect** command must be enabled explicitly under the spoke SDP. If required, the **auto-learn-mac-protect** command can also be enabled explicitly under specific SAPs within the SHG.

The **no** form of the command reverts to the default.

Default

no auto-learn-mac-protect

configure service vpls mesh-sdp auto-learn-mac-protect

configure service vpls spoke-sdp auto-learn-mac-protect

configure service vpls sap auto-learn-mac-protect

configure service vpls split-horizon-group auto-learn-mac-protect

configure service pw-template auto-learn-mac-protect

Description

This command specifies whether to enable automatic population of the MAC protect list with source MAC addresses learned on the associated object under which the command is configured.

When configured, dynamically learned MAC Source Addresses (SA) are protected only if they are learned on an object with ALMP configured and there is no exclude list associated to the same object or if there is an exclude list but the MAC does not match any entry.

The same list can be used in multiple objects of the same or different service. If the list is empty, ALMP does not exclude any learned MAC from protection on the object.

The **no** form of the command disables the automatic population of the MAC protect list.

Default

auto-learn-mac-protect

Parameters

name

Specifies the name of the exclude list, up to 32 characters.

Platforms

7705 SAR Gen 2

5.108 auto-lsp

auto-lsp

Syntax

auto-lsp lsp-template *template-name* {**policy** *peer-prefix-policy* [**peer-prefix-policy**] | **one-hop**}

no auto-lsp lsp-template *template-name*

Context

[Tree] (config>router>mpls auto-lsp)

Full Context

configure router mpls auto-lsp

Description

This command enables the automatic creation of an RSVP point-to-point LSP to a destination node whose router ID matches a prefix in the specified peer prefix policy. This LSP type is referred to as auto-LSP of type mesh.

The user can associate multiple templates with same or different peer prefix policies. Each application of an LSP template with a given prefix in the prefix list results in the instantiation of a single CSPF computed LSP primary path using the LSP template parameters as long as the prefix corresponds to a router ID for a node in the TE database. This command does not support the automatic signaling of a secondary path for an LSP. If the signaling of multiple LSPs to the same destination node is required, the user must apply a separate LSP template to the same or different prefix list that contains the same destination node. Each instantiated LSP will have a unique LSP ID and a unique tunnel ID. This command also does not support the signaling of a non-CSPF LSP. The selection of the **no cspf** option in the LSP template is blocked.

Up to five peer prefix policies can be associated with a given LSP template at all times. Each time the user runs the **auto-lsp** command with the same or different prefix policy associations, or the user changes a

prefix policy associated with an LSP template, the system re-evaluates the prefix policy. The outcome of the re-evaluation tells MPLS if an existing LSP needs to be torn down or if a new LSP needs to be signaled to a destination address that is already in the TE database.

If a /32 prefix is added to (removed from) or if a prefix range is expanded (shrunk) in a prefix list associated with an LSP template, the preceding prefix policy re-evaluation is performed.

The user must perform a **no shutdown** of the template before the template takes effect. After a template is in use, the user must shut down the template before effecting any changes to the parameters, except for those LSP parameters for which the change can be handled with the Make-Before-Break (MBB) procedures. These parameters are **bandwidth** and enabling **fast-reroute** with or without the **hop-limit** or **node-protect** options. For all other parameters, the user must shut down the template, makes the change, and perform a **no shutdown**. This results in the existing instances of the LSP using this template to be torn down and re-signaled.

When a router with a router ID that matches a prefix in the prefix list appears in the TE database, it is a trigger to signal the LSP. The signaled LSP is installed in the Tunnel Table Manager (TTM) and is available to applications such as LDP-over-RSVP, resolution of BGP label routes, resolution of BGP, IGP, and static routes. It is, however, not available for use as a provisioned SDP for explicit binding or auto-binding by services.

Except for the MBB limitations to the configuration parameter change in the LSP template, MBB procedures for manual and timer based re-signaling of the LSP, for TE Graceful Shutdown and for soft preemption are supported.

The **one-to-one** option under **fast-reroute**, the LSP Diff-Serv **class-type** and **backup-class-type** parameters are not supported. If **diffserv-te** is enabled under RSVP, the auto-created LSP is still signaled but with the default LSP class type.

If the **one-hop** option is specified instead of a prefix list, this command enables the automatic signaling of one-hop point-to-point LSPs using the specified template to all directly connected neighbors. This LSP type is referred to as auto-LSP of type one-hop. Although the provisioning model and CLI syntax differ from that of a mesh LSP only by the absence of a prefix list, the actual behavior is quite different. When this command is executed, the TE database keeps track of each TE link that comes up to a directly connected IGP neighbor whose router ID is discovered. It then instructs MPLS to signals an LSP with a destination address matching the router ID of the neighbor and with a strict hop consisting of the address of the interface used by the TE link. Thus, the **auto-lsp** command with the **one-hop** option results in one or more LSPs signaled to the neighboring router.

An auto-created mesh or one-hop LSP can collect egress statistics at the ingress LER by adding the **egress-statistics** node configuration into the LSP template. The user can also collect ingress statistics at the egress LER by using the same **ingress-statistics** node configuration. The user must specify the full LSP name as signaled by the ingress LER in the RSVP session name field of the Session Attribute object in the received Path message.

This feature also provides for the auto-creation of an SR-TE mesh LSP and for an SR-TE one-hop LSP.

The SR-TE mesh LSP feature specifically binds a **mesh-p2p-srte** LSP template with one or more prefix lists. When the TE database discovers a router that has a router ID matching an entry in the prefix list, it triggers MPLS to instantiate an SR-TE LSP to that router using the LSP parameters in the LSP template.

The SR-TE one-hop LSP feature specifically activates a **one-hop-p2p-srte** LSP template. In this case, the TE database keeps track of each TE link that comes up to a directly connected IGP neighbor. It then instructs MPLS to instantiate a SR-TE LSP with the following parameters:

- the source address of the local router
- an outgoing interface matching the interface index of the TE-link

- a destination address matching the router ID of the neighbor on the TE link

In both types of SR-TE auto-LSP, the router's hop-to-label translation computes the label stack required to instantiate the LSP.

Note:
An SR-TE auto-LSP can be reported to a PCE but cannot be delegated or have its paths computed by PCE.

The **no** form of this command deletes all LSPs signaled using the specified template and prefix policy. When the **one-hop** option is used, it deletes all one-hop LSPs signaled using the specified template to all directly-connected neighbors.

Parameters

lsp-template *template-name*

Specifies an LSP template name, up to 32 characters in length.

policy *peer-prefix-policy*

Specifies an peer prefix policy name, up to 32 characters in length.

one-hop

Enables the automatic signaling of one-hop point-to-point LSPs.

5.110 auto-rp-discovery

auto-rp-discovery

Syntax

auto-rp-discovery [**candidate**] [**mapping-agent**]

no auto-rp-discovery

Context

[Tree] (config>service>vprn>pim>rp auto-rp-discovery)

Full Context

configure service vprn pim rp auto-rp-discovery

Description

This command enables the auto-RP protocol in discovery mode. In discovery mode, RP-mapping and RP-candidate messages are received and forwarded to downstream nodes. RP-mapping messages are received locally to learn the availability of RP nodes present in the network. In a VPRN configuration, Nokia recommends that a local loopback interface should be created with the same IP address as the system IP address.

The following configuration guidelines apply.

- Either **bsr-candidate** for IPv4 or **auto-rp-discovery** can be configured; the two mechanisms cannot be enabled together.
- **bsr-candidate** for IPv6 and **auto-rp-discovery** for IPv4 can be enabled together.
- **auto-rp-discovery** cannot be enabled together with **mdt-type sender-only** or **mdt-type receiver-only**, or **wildcard-spmsi** configurations.

This command also enables the auto-RP listener functionality. The auto-RP listener forwards the candidate 224.0.1.39 and mapping 224.0.1.40 messages over the PIM interfaces.

The **no** form of this command disables auto-RP discovery, auto-RP listener, candidate, and mapping-agent.

Default

no auto-rp-discovery

Parameters

candidate

Specifies that the RP is a candidate RP. The auto-RP C-RP announces the candidate RP messages on the 224.0.1.39 multicast address. This functionality is in addition to the listener functionality enabled by the auto RP discovery.

The default value is **no candidate**.

mapping agent

Specifies the mapping agent on the node. The auto-RP MA observes the **auto-rp-announcement** messages, selects the RP, and generates the RP discovery 224.0.1.40 messages. This functionality is in addition to the auto RP discovery functionality.

The default value is **no mapping-agent**.

5.114 autonegotiate

autonegotiate

Syntax

autonegotiate [**limited**]

no autonegotiate

Context

[Tree] (config>port>ethernet autonegotiate)

Full Context

configure port ethernet autonegotiate

Description

This command enables speed and duplex autonegotiation on Fast Ethernet ports and enables far-end fault indicator support on Gb ports.

There are three possible settings for autonegotiation:

- "on" or enabled with full port capabilities advertised
- "off" or disabled where there are no autonegotiation advertisements
- "limited" where a single speed/duplex is advertised.

When autonegotiation is enabled on a port, the link attempts to automatically negotiate the link speed and duplex parameters. If autonegotiation is enabled, the configured duplex and speed parameters are ignored.

When autonegotiation is disabled on a port, the port does not attempt to autonegotiate and will only operate at the **speed** and **duplex** settings configured for the port. Note that disabling autonegotiation on Gb ports is not allowed as the IEEE 802.3 specification for Gb Ethernet requires autonegotiation be enabled for far end fault indication.

If the **autonegotiate limited** keyword option is specified the port will auto-negotiate but will only advertise a specific speed and duplex. The speed and duplex advertised are the **speed** and **duplex** settings configured for the port. One use for limited mode is for multi-speed Gb ports to force Gb operation while keeping autonegotiation enabled for compliance with IEEE 802.3.

Router requires that autonegotiation be disabled or limited for ports in a Link Aggregation Group to guarantee a specific port speed.

The **no** form of this command disables autonegotiation on this port.

Default

autonegotiate

Parameters

limited

The Ethernet interface will automatically negotiate link parameters with the far end, but will only advertise the speed and duplex mode specified by the Ethernet **config>port>ethernet speed** and **config>port>ethernet duplex** commands.

Platforms

7705 SAR Gen 2

no autonomous-system

Context

[Tree] (config>router autonomous-system)

Full Context

configure router autonomous-system

Description

This command configures the autonomous system (AS) number for the router. A router can only belong to one AS. An AS number is a globally unique number with an AS. This number is used to exchange exterior routing information with neighboring ASs and as an identifier of the AS itself.

If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted either by administratively disabling/enabling (**shutdown**/**no shutdown**) the BGP instance or rebooting the system with the new configuration.

Default

no autonomous-system

Parameters

autonomous-system

Specifies the autonomous system number expressed as a decimal integer.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

5.117 avg-flr-event

avg-flr-event

Syntax

avg-flr-event {**forward** | **backward**} **threshold** *raise-threshold-percentage* [**clear** *clear-threshold-percentage*]

no avg-flr-event {**forward** | **backward**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events avg-flr-event)

Full Context

configure oam-pm session ip twamp-light loss-events avg-flr-event

Description

This command sets the frame loss ratio threshold configuration to be applied and checked at the end of the measurement interval for the specified direction. This is a percentage based on average frame loss ratio over the entire measurement interval. If the *clear-threshold-percent* value is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within measurement interval. If the optional *clear-threshold-percent* value is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no avg-flr-event forward

no avg-flr-event backward

Parameters

forward

Specifies the threshold is applied to the forward direction value.

backward

Specifies the threshold is applied to the backward direction value.

raise-threshold-percentage

Specifies the rising percentage that determines when the event is to be generated.

Values 0.001 to 100.000

clear-threshold-percentage

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0.000 to 99.999

A value 0.000 means that the FLR must be 0.000.

7705 SAR Gen 2

5.118 avg-frame-overhead

avg-frame-overhead

Syntax

avg-frame-overhead *percent*

no avg-frame-overhead

Context

[Tree] (config>qos>sap-egress>queue avg-frame-overhead)

[Tree] (config>qos>network-queue>queue avg-frame-overhead)

Full Context

configure qos sap-egress queue avg-frame-overhead

configure qos network-queue queue avg-frame-overhead

Description

This command configures the average frame overhead, expressed as a percentage, at which the offered load expands on the physical medium (wire) at egress. This is important for accurate "on-the-wire"

rate calculations at various levels of H-QoS that do not inherently account for the physical medium characteristics. For example, without considering this overhead, a port scheduler in H-QoS might inaccurately estimate the available bandwidth on the wire, potentially leading to congestion issues and unexpected packet loss.

The rates impacted by the average frame overhead encompass the rates set on port schedulers and aggregate rate limits for subscribers and Vports. This impact is evident in the configured values, which represent on-the-wire (OTW) rates. Queue-configured rates, however, remain unaffected by this adjustment and continue to reflect Layer 2 rates.

This average frame overhead should be configured in networks with physical mediums that have constant sizes of transmission units (packets or cells) or in scenarios where the average packet size is known.

For Ethernet ports, the effect of this command depends on the setting of the **avg-frame-overhead-mode** command in advanced QoS configuration policy associated with the queue. If the **avg-frame-overhead-mode** is set to **auto**, the packet encapsulation overhead calculation is based on a fixed 20 bytes (7 bytes for preamble, 1 byte for start of frame delimiter, and 12 bytes for Inter-Frame Gap (IFG)) that the Ethernet medium adds to every packet during transmission. In other words, the configured rates for port-scheduler and aggregate rate limits for subscribers and Vports represent OTW rates.

The average frame overhead only affects rate and weight calculations and does not impact collected statistics for accounting purposes.

The **no** form of this command disables the average frame overhead.

Default

no avg-frame-overhead

Parameters

percent

Specifies the average amount of packet-to-frame encapsulation overhead expected for the queue. This value is not used by the system for egress Ethernet queues.

Values 0.00 to 100.00

Platforms

7705 SAR Gen 2

Context

[Tree] (config>isa>tunnel-grp backup)

Full Context

configure isa tunnel-group backup

Description

This command assigns a tunnel ISA configured in the specified slot to this IPsec group. The backup module provides the IPsec group with warm redundancy when the primary module in the group is configured. An IPsec group must always have a primary configured.

Primary and backup modules have equal operational status and when both modules are coming up, the one that becomes operational first becomes the active module. An IPsec module can serve as a backup for multiple IPsec groups but the backup can become active for only one ISA IPsec group at a time.

All configuration information is pushed down to the backup MDA from the CPM once the CPM gets notice that the primary module has gone down. This allows multiple IPsec groups to use the same backup module. Any statistics not yet spooled are lost. Auto-switching from the backup to primary, after the primary becomes available again, is supported.

The user is notified through SNMP events when:

- When the ISA IPsec service goes down (all modules in the group are down) or comes back up (a module in the group becomes active).
- When ISA IPsec redundancy fails (one of the modules in the group is down) or recovers (the failed module comes back up).
- When an ISA IPsec activity switch took place.

The **no** form of this command removes the specified module from the IPsec group.

Default

no backup

Parameters

mda-id

Specifies the card/slot identifying a provisioned module to be used as a backup module.

Values mda-id: *slot*/*mda* slot 1 to up to 10 depending on chassis model mda 1 to 2

Platforms

7705 SAR Gen 2

backup

Syntax

[**no**] **backup** *ip-address*

Context

[Tree] (config>router>if>vrrp backup)

Full Context

configure router interface vrrp backup

Description

This command associates router IP addresses with the parental IP interface IP addresses.

The **backup** command has two distinct functions when used in an **owner** or a **non-owner** context of the virtual router instance.

Non-owner virtual router instances actually create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). The **backup** command in **owner** virtual router instances does not create a routable IP interface address; it simply defines the existing parental IP interface IP addresses that are advertised by the virtual router instance.

For **owner** virtual router instances, the **backup** command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. Advertising a correct list is important. The

specified *ip-address* must be equal to one of the existing parental IP interface IP addresses (primary or secondary) or the **backup** command fails.

For non-owner virtual router instances, the **backup** command actually creates an IP interface IP address used for routing IP packets and communicating with the system when the access commands are defined (**ntp-reply, ping-reply**, **telnet-reply**, and **ssh-reply**). The specified *ip-address* must be an IP address that is within one of the parental IP interface local subnets created with the **address** or **secondary** commands. If a local subnet does not exist that includes the specified *ip-address* or if *ip-address* is the same IP address as the parental IP interface IP address, the **backup** command fails.

The new interface IP address created with the **backup** command assumes the mask and parameters of the corresponding parent IP interface IP address. The *ip-address* is only active when the virtual router instance is operating in the master state. When not operating as master, the virtual router instance acts as if it is operationally down. It does not respond to ARP requests to *ip-addr*ess, nor does it route packets received with its *vrid* derived source MAC address. A non-master virtual router instance always silently discards packets destined to *ip-address*. A single virtual router instance may only have a single virtual router IP address from a given parental local subnet. Multiple virtual router instances can define a virtual router IP address from the same local subnet as long as each is a different IP address.

In IPv4, up to sixteen **backup** *ip-address* commands can be executed within the same virtual router instance. Executing **backup** multiple times with the same *ip-addr*ess results in no operation performed and no error generated. At least one successful **backup** *ip-address* command must be executed before the virtual router instance can enter the operational state.

When operating as (non-owner) master, the default functionality associated with *ip-address* is ARP response to ARP requests to *ip-address*, routing of packets destined to the virtual router instance source MAC address and silently discarding packets destined to *ip-address*. Enabling the non-owner-access parameters selectively allows ping, Telnet and SSH connectivity to *ip-address* when the virtual router instance is operating as master.

The **no** form of the command removes the specified virtual router IP address from the virtual router instance. For non-owner virtual router instances, this causes all routing and local access associated with the *ip-address* to cease. For **owner** virtual router instances, the **no backup** command only removes *ip-addr*ess from the list of advertised IP addresses. If the last *ip-address* is removed from the virtual router instance, the virtual router instance will enter the operationally down state

Default

no backup — No virtual router IP address is assigned.

Parameters

ip-address

The virtual router IP address expressed in dotted decimal notation. The IP virtual router IP address must be in the same subnet of the parental IP interface IP address or equal to one of the primary or secondary IP addresses for **owner** virtual router instances.

Values 1.0.0.1 to 223.255.255.254

Platforms

7705 SAR Gen 2

backup

Syntax

[**no**] **backup** *ipv6-address*

Context

[Tree] (config>router>if>ipv6>vrrp backup)

Full Context

configure router interface ipv6 vrrp backup

Description

This command associates router IPv6 addresses with the parental IP interface IP addresses.

The **backup** command has two distinct functions when used in an **owner** or a **non-owner** context of the virtual router instance.

Non-owner virtual router instances actually create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). The **backup** command in **owner** virtual router instances does not create a routable IP interface address; it simply defines the existing parental IP interface IP addresses that are advertised by the virtual router instance.

For **owner** virtual router instances, the **backup** command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. Advertising a correct list is important. The specified *ipv6-addr* must be equal to one of the existing parental IP interface IP addresses (link-local or global) or the **backup** command will fail.

For non-owner virtual router instances, the **backup** command actually creates an IP interface IP address used for routing IP packets and communicating with the system when the access commands are defined (**ntp-reply, ping-reply**, **telnet-reply**, and **ssh-reply**). The specified *ipv6-addr* must be an IP address that is within one of the parental IP interface local subnets created with the **link-local-address or address** commands. If a local subnet does not exist that includes the specified *ipv6-addr* or if *ipv6-addr* is the same IP address as the parental IP interface IP address, the **backup** command will fail.

The new interface IP address created with the **backup** command assumes the mask and parameters of the corresponding parent IP interface IP address. The *ipv6-addr* is only active when the virtual router instance is operating in the master state. For IPv6 VRRP, the parental interface's IP address that is in the same subnet as the backup address must be manually-configured, non EUI-64 and configured to be in the preferred state.

When not operating as master, the virtual router instance acts as if it is operationally down. It will not respond to Neighbor Solicitation (NS) requests to *ipv6-addr*, nor will it route packets received with its *vrid* derived source MAC address. A non-master virtual router instance always silently discards packets destined to *ipv6-addr*.

IPv6 allows the configuration of a link-local IPv6 address and multiple global IPv6 addresses on an interface. For each of these configured subnets, a virtual router IP address can be configured. Each IPv6 enabled device on a particular IPv6 subnet dynamically learns the connected IPv6 routers and correlated subnets in addition to the IPv6 default gateway using IPv6 neighbor discovery protocol (RFC 4861). This protocol behavior is revised from IPv4 where the default gateway is manually configured or derived from supporting protocols (for example, DHCP). During the IPv6 neighbor discovery process, VRRP enabled

routers will use backup IPv6 addresses and correlated derived virtual MAC addresses. Multiple virtual router instances can define a virtual router IP address from the same local subnet as long as each is a different IP address.

Executing **backup** multiple times with the same *ipv6-addr* results in no operation performed and no error generated. At least one successful **backup** *ipv6-addr* command must be executed before the virtual router instance can enter the operational state.

When operating as (non-owner) master, the default functionality associated with *ipv6-addr* results in the IPv6 Neighbor Advertisement response to IPv6 Neighbor Solicitation requests to *ip-addr*, routing of packets destined to the virtual router instance source MAC address, and silently discarding packets destined to *ipv6-addr*. An IPv6 virtual router instance can enter the operational state only if one of the configured backup addresses is a link-local address and the router advertisement of the interface is configured to use the virtual MAC address. Enabling the non-owner-access parameters selectively allows ping, Telnet, and traceroute connectivity to *ipv6-addr* when the virtual router instance is operating as master.

The **no** form of the command removes the specified virtual router IP address from the virtual router instance. For non-owner virtual router instances, this causes all routing and local access associated with the *ipv6-addr* to cease. For **owner** virtual router instances, the **no backup** command only removes *ipv6-addr* from the list of advertised IP addresses. If the last *ipv6-addr or the link-local address* is removed from the virtual router instance, the virtual router instance will enter the operationally down state

Default

no backup — No virtual router IP address is assigned.

Parameters

ipv6-address

The virtual router IP address is represented as eight groups of four hexadecimal digits, each group representing 16 bits (two octets). The groups are separated by colons (:). The IP virtual router IP address must be in the same subnet of the parental IP interface IP address or equal to one of the parent interface addresses for **owner** virtual router instances.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x::d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

Platforms

7705 SAR Gen 2

6.3 backup-class-type

backup-class-type

Syntax

backup-class-type ct-number

no backup-class-type

Context

[Tree] (config>router>mpls>lsp>primary backup-class-type)

Full Context

configure router mpls lsp primary backup-class-type

Description

This command enables the use of the Diff-Serv backup Class-Type (CT), instead of the Diff-Serv main CT, to signal the LSP primary path when it fails and goes into retry. The Diff-Serv main CT is configured at the LSP level or at the primary path level using the following commands:

config>router>mpls>lsp>class-type *ct-number*

config>router>mpls>lsp>primary>class-type *ct-numbe*r

When an LSP primary path retries due a failure, for example, it fails after being in the UP state, or undergoes any type of Make-Before-Break (MBB), MPLS will retry a new path for the LSP using the main CT. If the first attempt failed, the head-end node performs subsequent retries using the backup CT. This procedure must be followed regardless if the currently used CT by this path is the main or backup CT. This applies to both CSPF and non-CSPF LSPs.

The triggers for using the backup CT after the first retry attempt are:

1. A local interface failure or a control plane failure (hello timeout and so on).
2. Receipt of a PathErr message with a notification of a FRR protection becoming active downstream and/or Receipt of a Resv message with a 'Local-Protection-In-Use' flag set. This invokes the FRR Global Revertive MBB.
3. Receipt of a PathErr message with error code=25 ("Notify") and sub-code=7 ("Local link maintenance required") or a sub-code=8 ("Local node maintenance required"). This invokes the TE Graceful Shutdown MBB.
4. Receipt of a Resv refresh message with the 'Preemption pending' flag set or a PathErr message with error code=34 ("Reroute") and a value=1 ("Reroute request soft preemption"). This invokes the soft preemption MBB.
5. Receipt of a ResvTear message.
6. A configuration change MBB.
7. The user executing the **clear**>**router**>**mpls**>**lsp** command.

When an unmapped LSP primary path goes into retry, it uses the main CT until the number of retries reaches the value of the new **main-ct-retry-limit** parameter. If the path did not come up, it must start using the backup CT at that point in time. By default, this parameter is set to infinite value. The new main-ct-retry-limit parameter has no effect on an LSP primary path which retries due to a failure event.

An unmapped LSP primary path is a path which has never received a Resv in response to the first Path message sent. This can occur when performing a 'shut/no-shut' on the LSP or LSP primary path or when the node reboots. An unmapped LSP primary path goes into retry if the retry timer expired or the head-end node received a PathErr message before the retry timer expired.

When the re-signal timer expires, CSPF will try to find a path with the main CT. The head-end node must re-signal the LSP even if the new path found by CSPF is identical to the existing one since the idea is to restore the main CT for the primary path. A path with main CT is not found, the LSP remains on its current primary path using the backup CT.

When the user performs a manual re-signal of the primary path, CSPF will try to find a path with the main CT. The head-end node must re-signal the LSP as in current implementation.

The **no** form of this command disables the use of the Diff-Serv backup CT.

Default

no backup-class-type

Parameters

ct-number

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7, integer

backup-node-sid *ip-prefix/prefix-length* **label** *label*

no backup-node-sid

Context

[Tree] (config>router>ospf>segm-rtng backup-node-sid)

Full Context

configure router ospf segment-routing backup-node-sid

Description

This command enables LFA Protection using segment routing backup node SID.

The objective of this feature is to reduce the label stack pushed in a LFA tunnel next hop of inter-area and inter-domain prefixes. This is applicable in MPLS deployments across multiple IGP areas or domains such in seamless MPLS design.

The user enables the feature by configuring a backup node SID at an ABR/ASBR that is acting as a backup to the primary exit ABR/ASBR of inter-area or inter-as routes learned as BGP labeled routes. The user can enter either a label or an index for the backup node SID.

When a node in a IGP domain resolves a BGP label route for an inter-area or inter-domain prefix via the primary ABR exit router, it will use the backup node SID of this router, which is advertised by the backup ABR/ABR, as the LFA backup instead of the SID to the remote LFA PQ node to save on the pushed label stack.

This feature only allows the configuration of a single backup node SID per IGP instance and per ABR/ASBR. In other words, only a pair of ABR/ASBR nodes can back up each other in an IGP domain. Each time the user invokes the above command within the same IGP instance, it will override any previous configuration of the backup node SID. The same ABR/ASBR can, however, participate in multiple IGP instances and provide backup support within each instance.

Default

no backup-node-sid

Parameters

ip-prefix/prefix-length

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask:

- ip-prefix a.b.c.d (host bits must be 0)

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-length: 0 to 128

index

Specifies the index for this backup node SID.

Values 0 to 4294967295

label

Specifies the SID value for this backup node SID.

Values 1 to 4294967295

Full Context

configure service ies interface sap ip-tunnel backup-remote-ip

configure service vprn interface sap ip-tunnel backup-remote-ip

Description

This command configures the alternate destination IPv4 or IPv6 address to use for an IP tunnel. This destination address is used only if the primary destination configured with the **remote-ip** command is unreachable in the delivery service. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the backup-remote-ip address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the backup-destination address from the tunnel configuration.

Default

no backup-remote-ip

Parameters

ip-address

Specifies the destination IPv4 address or IPv6 address of the tunnel.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H

no bandwidth

Context

[Tree] (config>service>epipe>spoke-sdp bandwidth)

Full Context

configure service epipe spoke-sdp bandwidth

Description

This command specifies the bandwidth to be used for VLL bandwidth accounting by the VLL CAC feature.

The service manager keeps track of the available bandwidth for each SDP. The maximum value is the sum of the bandwidths of all constituent LSPs in the SDP. The SDP available bandwidth is adjusted by the user configured booking factor.

If an LSP consists of a primary and many secondary standby LSPs, then the bandwidth used in the maximum SDP available bandwidth is that of the active path. Any change to and LSP active path bandwidth will update the maximum SDP available bandwidth. Note however that a change to any constituent LSP bandwidth due to re-signaling of the primary LSP path or the activation of a secondary path which causes overbooking of the maximum SDP available bandwidth causes a warning and a trap to be issued but no further action is taken. The activation of a bypass or detour LSP in the path of the primary LSP does not change the maximum SDP available bandwidth.

When the user binds a VLL service to this SDP, an amount of bandwidth equal to bandwidth is subtracted from the SDP available bandwidth adjusted by the booking factor. When the user deletes this VLL service binding from this SDP, an amount of bandwidth equal to bandwidth is added back into the SDP available bandwidth.

If the total SDP available bandwidth when adding this VLL service is about to overbook, a warning is issued and the binding is rejected. This means that the spoke SDP bandwidth does not update the maximum SDP available bandwidth. In this case, the spoke SDP is put in operational down state and a status message of "pseudowire not forwarding" is sent to the remote SR OS PE node. A trap is also generated. The service manager will not put the spoke SDP into an operationally up state until the user executes a **shutdown** command and then a **no-shutdown** command of the spoke SDP and the bandwidth check succeeds. Therefore, the service manager will not automatically audit spoke SDPs subsequently to their creation to check if bandwidth is available.

If the VLL service contains an endpoint with multiple redundant spoke SDPs, each spoke SDP will have its bandwidth checked against the available bandwidth of the corresponding SDP.

If the VLL service performs a pseudowire switching (VC switching) function, each spoke SDP is separately checked for bandwidth against the corresponding SDP.

This feature does not alter the way service packets are sprayed over multiple RSVP LSPs, which are part of the same SDP. That is, by default load balancing of service packets occurs over the SDP LSPs based on service-id, or based on a hash of the packet header if ingress SAP shared queuing is enabled. In both cases, the VLL bandwidth is not checked against the available bandwidth of the selected LSPs but on the total SDP available bandwidth. Therefore, if there is a single LSP per SDP, these two matches.

If class-forwarding is enabled on the SDP, VLL service packets are forwarded to the SDP LSP which the packet forwarding class maps to, or if this is down to the default LSP. However, the VLL bandwidth is not checked against the selected LSP available bandwidth but on the total SDP available bandwidth. If there is a single LSP per SDP, these two matches.

If a non-zero bandwidth is specified for a VLL service and attempts to bind the service to an LDP or a GRE SDP, a warning is issued that CAC failed but the VLL is established. A trap is also generated.

The **no** form of this command reverts to the default value.

Parameters

bw-value

The bandwidth to be used for VLL bandwidth accounting by the VLL CAC feature, in kilobits per second.

Values 0 to 100000000

Default 0

Platforms

bandwidth

Syntax

bandwidth *bandwidth*

no bandwidth

Context

[Tree] (config>service>vpls>sap bandwidth)

Full Context

configure service vpls sap bandwidth

Description

This command specifies the admin bandwidth assigned to SAPs, ports and LAGs which is used by SAP bandwidth CAC.

SAP: Attempts to increase the SAP admin bandwidth will fail if there is insufficient available admin bandwidth on its port or LAG, otherwise the port or LAG available admin bandwidth will be reduced by the incremental SAP admin bandwidth. Reducing the SAP admin bandwidth will increase the available admin bandwidth on its port or LAG. This is not supported for PW-SAPs, Ethernet tunnels or subscriber group interface SAPs.

The **no** version of the command reverts to the default value.

Default

no bandwidth

Parameters

bandwidth

Specifies the admin bandwidth assigned to the SAP, port or LAG, in kb/s.

Values 1 to 6400000000

Full Context

configure service vprn interface bfd

configure service vprn network-interface bfd

configure service vprn interface ipv6 bfd

configure service ies interface bfd

configure service ies interface ipv6 bfd

Description

This command specifies the BFD parameters for the associated IP interface. If no parameters are defined the default value are used.

The multiplier specifies the number of consecutive BFD messages that must be missed from the peer before the BFD session state is changed to down and the upper level protocols (OSPF, IS-IS, BGP or PIM) is notified of the fault.

The **no** form of this command removes BFD from the interface.

Note:
The *transmit-interval,* **receive** *receive-interval, and* **echo-receive** *echo-interval* values can only be modified to a value less than 100 when:

1. The **type cpm-np option** is explicitly configured.
2. The service is shut down (**shutdown**)
3. The interval is specified 10 to 100000.
4. The service is re-enabled (**no shutdown**)

To remove the **type cpm-np** option, re-issue the **bfd** command without specifying the **type** parameter.

Parameters

transmit-interval

Sets the transmit interval for the BFD session.

Values 100 to 100000
10 to 100000

Default 100

receive ***receive-interval***

Sets the receive interval for the BFD session.

Values 100 to 100000
10 to 100000

Default 100

multiplier ***multiplier***

Sets the multiplier for the BFD session.

Values 3 to 20

Default 3

echo-receive ***echo-interval***

Sets the minimum echo receive interval, in milliseconds, for the BFD session.

Values 100 to 100000

10 to 100000

Default 100

type cpm-np

Specifies that BFD sessions associated with this interface is created on the CPM network processor to allow for fast timers down to 10 ms granularity.

Platforms

7705 SAR Gen 2

bfd

Syntax

bfd *transmit-interval* [**receive** *receive-interval*] [**multiplier** *multiplier*] [**echo-receive** *echo-interval*] [**type cpm-np**]

no bfd

Context

[Tree] (config>router>if>ipv6 bfd)

[Tree] (config>router>if bfd)

Full Context

configure router interface ipv6 bfd

configure router interface bfd

Description

This command specifies the bidirectional forwarding detection (BFD) parameters for the associated IP interface. If no parameters are defined the default values are used.

The multiplier specifies the number of consecutive BFD messages that must be missed from the peer before the BFD session state is changed to down and the upper level protocols (OSPF, IS-IS, BGP or PIM) is notified of the fault.

The **no** form of this command removes BFD from the router interface regardless of the IGP/RSVP.

Important notes: The *transmit-interval* and **receive receive-interval** values can only be modified to a value less than 100 ms when:

1. The **type cpm-np option** is explicitly configured.
2. The service is shut down (**shutdown**)
3. The interval is specified 10 to 100000.
4. The service is re-enabled (**no shutdown**)

To remove the **type cpm-np** option, re-issue the **bfd** command without specifying the **type** parameter.

Default

no bfd

Parameters

transmit-interval

Sets the transmit interval, in milliseconds, for the BFD session.

Values 10 to 100000 (see Important Notes above)

Default 100

receive-interval

Sets the receive interval, in milliseconds, for the BFD session.

Values 10 to 100000 (see Important Notes above)

Default 100

multiplier

Sets the multiplier for the BFD session. A multiplier of less than 3 should not be used in production environments.

Values 1 to 20

Default 3

echo-interval

Sets the minimum echo receive interval, in milliseconds, for the session.

Values 100 to 100000

Default 0

cpm-np

Selects the CPM network processor type as the local termination point for the BFD session. See Important Notes, above.

[Tree] (config>service>ies>if>vrrp bfd-enable)

Full Context

configure service ies interface ipv6 vrrp bfd-enable

configure service ies interface vrrp bfd-enable

Description

This commands assigns a bi-directional forwarding (BFD) session providing heart-beat mechanism for the given VRRP/SRRP instance. There can be only one BFD session assigned to any given VRRP/SRRP instance, but there can be multiple SRRP/VRRP sessions using the same BFD session.

BFD control the state of the associated interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface. The specified interface may not be configured with BFD; however, when it is, the virtual router will then initiate the BFD session.

The **no** form of this command removes BFD from the configuration.

Parameters

service-id

Specifies the service ID of the interface running BFD.

Values service-id: 1 to 2147483648

No service ID indicates a network interface.

interface *interface-name*

Specifies the name of the interface running BFD.

dst-ip *ip-address*

Specifies the destination address to be used for the BFD session.

name *name*

Specifies the name, up to 64 characters.

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

[**no**] **bfd-enable**

Context

[Tree] (config>service>vprn>static-route-entry>next-hop bfd-enable)

Full Context

configure service vprn static-route-entry next-hop bfd-enable

Description

This command associates the static route state to a BFD session between the local system and the configured nexthop.

The remote end of the BFD session must also be configured to originate or accept the BFD session controlling the static route state.

The **no** form of this command removes the association of the static route state to that of the BFD session.

Default

no bfd-enable

Context

[Tree] (config>service>vprn>if>ipv6>vrrp bfd-enable)

[Tree] (config>service>vprn>if>vrrp bfd-enable)

Full Context

configure service vprn interface ipv6 vrrp bfd-enable

configure service vprn interface vrrp bfd-enable

Description

This commands assigns a bi-directional forwarding (BFD) session providing heart-beat mechanism for the given VRRP/SRRP instance. There can be only one BFD session assigned to any given VRRP/SRRP instance, but there can be multiple SRRP/VRRP sessions using the same BFD session. If the interface used is configured with centralized BFD, the BFD transmit and receive intervals need to be set to at least 300 ms.

BFD control the state of the associated interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface. The specified interface may not be configured with BFD; when it is, the virtual router will then initiate the BFD session.

The **no** form of this command removes BFD from the configuration.

Parameters

svc-id

Specifies the service ID of the interface running BFD. If no *svc-id* is specified then it indicates that the interface is a network interface in the Base router instance.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **bfd-enable interface** *interface-name* **dst-ip** *ip-address* **name** *name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: Specifies an existing service name up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration)

interface *interface-name*

Specifies the name of the interface running BFD, up to 32 characters.

dst-ip *ip-address*

Specifies the destination address to be used for the BFD session.

name *name*

Specifies a service name, up to 64 characters.

Platforms

Full Context

configure service vprn isis interface bfd-enable

Description

This command enables the use of bi-directional forwarding (BFD) to control IPv4 or adjacencies. By enabling BFD on an IPv4 or IPv6 protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set by the BFD command under the IP interface. This command must be given separately to enable or disable BFD for IPv4 and IPv6.

The **no** form of this command removes BFD from the associated adjacency.

Default

no bfd-enable ipv4

no bfd-enable ipv6

Parameters

ipv4

Keyword to enable BFD to control IPv4 adjacencies.

ipv6

Keyword to enable BFD to control IPv6 adjacencies.

include-bfd-tlv

Enables support for the IS-IS BFD TLV options in accordance with RFC 6213, which specifies that a BFD session must be established before an IS-IS adjacency can transition to the established state. This option must be enabled on all IS-IS neighbors on a shared interface.

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

bfd-enable [**remain-down-on-failure**]

bfd-enable [**remain-down-on-failure**] **strict** [**strict-mode-holddown** *number*]

no bfd-enable

Context

[Tree] (config>service>vprn>ospf>area>if bfd-enable)

Full Context

configure service vprn ospf3 area interface bfd-enable

configure service vprn ospf area interface bfd-enable

Description

This command configures Bidirectional Forwarding Detection (BFD) to control the state of the associated protocol interface. By enabling BFD on a protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD session are set using the **bfd** command in the associated IP interface context.

The **no** form of this command removes BFD from the associated IGP protocol adjacency.

Default

no bfd-enable

Parameters

remain-down-on-failure

Keyword to force adjacency down on BFD failure.

strict

Keyword to specify that the system uses BFD strict-mode, which requires that an active BFD session exists between the OSPF neighbors before establishing a full adjacency. When this keyword is configured, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires that both sides have the B-flag set.

During OSPFv3 BFD strict-mode operations, the router advertises the Local Interface IPv4 Address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.

strict-mode-holddown ***number***

Specifies a delay in bringing up the OSPF adjacency after the BFD session is established. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset on an adjacency when a BFD session operationally toggles.

Values 1 to 600

Context

[Tree] (config>router>ldp>if-params>if bfd-enable)

Full Context

configure router ldp interface-parameters interface bfd-enable

Description

This command enables tracking of the Hello adjacency to an LDP peer using BFD.

When this command is enabled on an LDP interface, LDP registers with BFD and starts tracking the LSR-id of all peers it formed Hello adjacencies with over that LDP interface. The LDP hello mechanism is used to determine the remote address to be used for the BFD session. The parameters used for the BFD session, that is, transmit-interval, receive-interval, and multiplier are those configured under the IP interface in existing implementation: **config>router>if>bfd**.

The operation of BFD over an LDP interface tracks the next-hop of the IPv4 and IPv6 prefixes in addition to tracking the LDP peer address of the Hello adjacency over that link. This is required since LDP can resolve

both IPv4 and IPv6 prefix FECs over a single IPv4 or IPv6 LDP session and as such the next-hop of a prefix will not necessarily match the LDP peer source address of the Hello adjacency.

The failure of either or both of the BFD session tracking the FEC next-hop and the one tracking the Hello adjacency will cause the LFA backup NHLFE for the FEC to be activated or the FEC to be re-resolved if there is no FRR backup.

When multiple links exist to the same LDP peer, a Hello adjacency is established over each link and a separate BFD session is enabled on each LDP interface. If a BFD session times out on a specific link, LDP will immediately associate the LDP session with one of the remaining Hello adjacencies and trigger the LDP FRR procedures. As soon as the last Hello adjacency goes down due to BFD timing out, the LDP session goes down and the LDP FRR procedures will be triggered.

The **no** form of this command disables BFD on the LDP interface.

[**no**] **bfd-enable**

Context

[Tree] (config>router>rsvp>interface bfd-enable)

Full Context

configure router rsvp interface bfd-enable

Description

This command enables the use of bi-directional forwarding (BFD) to control the state of the associated RSVP interface. This causes RSVP to register the interface with the BFD session on that interface.

The user configures the BFD session parameters, such as, **transmit-interval**, **receive-interval**, and **multiplier**, under the IP interface in the **config>router> if>bfd** context.

Note:
It is possible that the BFD session on the interface was started because of a prior registration with another protocol, for example, OSPF or IS-IS.

The registration of an RSVP interface with BFD is performed at the time of neighbor gets its first session. This means when this node sends or receives a new Path message over the interface. If however the session did not come up, due to not receiving a Resv for a new path message sent after the maximum number of re-tries, the LSP is shutdown and the node de-registers with BFD. In general, the registration of RSVP with BFD is removed as soon as the last RSVP session is cleared.

The registration of an RSVP interface with BFD is performed independent of whether RSVP hello is enabled on the interface or not. However, hello timeout will clear all sessions towards the neighbor and RSVP de-registers with BFD at clearing of the last session.

An RSVP session is associated with a neighbor based on the interface address the path message is sent to. If multiple interfaces exist to the same node, each interface is treated as a separate RSVP neighbor. The user will have to enable BFD on each interface and RSVP will register with the BFD session running with each of those neighbors independently

Similarly the disabling of BFD on the interface results in removing registration of the interface with BFD.

When a BFD session transitions to DOWN state, the following actions are triggered. For RSVP signaled LSPs, this triggers activation of FRR bypass/detour backup (PLR role), global revertive (head-end role), and switchover to secondary if any (head-end role) for affected LSPs with FRR enabled. It triggers switchover to secondary if any and scheduling of re-tries for signaling the primary path of the non-FRR affected LSPs (head-end role).

The **no** form of this command removes BFD from the associated RSVP protocol adjacency.

Default

no bfd-enable

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

bfd-enable service-name *service-name* **interface-name** *interface-name* **dst-ip** *ip-address*

configure service ies interface ipsec ipsec-tunnel bfd-enable

configure service vprn interface sap ipsec-tunnel bfd-enable

configure router interface ipsec ipsec-tunnel bfd-enable

configure service vprn interface ipsec ipsec-tunnel bfd-enable

Description

This command assigns a BFD session to provide a heart-beat mechanism for a given IPsec tunnel. There can be only one BFD session assigned to any given IPsec tunnel, but there can be multiple IPsec tunnels using same BFD session. BFD controls the state of the associated tunnel. If the BFD session goes down, the system will also bring down the associated non-designated IPsec tunnel.

Parameters

service-name

Specifies the service name, up to 64 characters, on which the BFD session resides.

interface-name

Specifies the name, up to 32 characters, of the interface used by the BFD session.

ip-address

Specifies the destination address to be used for the BFD session.

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

[**no**] **bfd-enable**

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ipsec bfd-enable)

Full Context

configure redundancy multi-chassis peer mc-ipsec bfd-enable

Description

This command enables tracking a central BFD session, if the BFD session goes down, then system consider the peer is down and change the mc-ipsec status of configured tunnel-group accordingly.

The BFD session uses specified the loopback interface (in the specified service) address as the source address and uses specified dst-ip as the destination address. Other BFD parameters are configured with the **bfd** command on the specified interface.

Default

no bfd-enable

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

[**no**] **bfd-enable** [**ipv4** | **ipv6**]

Context

[Tree] (config>router>pim>interface bfd-enable)

Full Context

configure router pim interface bfd-enable

Description

This command enables the use of IPv4 or IPv6 bidirectional forwarding detection (BFD) to control the state of the associated protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface.

The **no** form of this command removes BFD from the associated IGP protocol adjacency.

Default

no bfd-enable

Parameters

ipv4

Enables the use of IPv4 BFD.

ipv6

Enables the use of IPv6 BFD.

Platforms

7705 SAR Gen 2

bfd-enable

Syntax

[Tree] (config>router>if>ipv6>vrrp bfd-enable)

Full Context

configure router interface vrrp bfd-enable

configure router interface ipv6 vrrp bfd-enable

Description

This commands assigns a bidirectional forwarding detect (BFD) session to a specific VRRP/SRRP instance. This BFD sessions provided a heartbeat mechanism that can be used to speed up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers will immediately send a VRRP Advertisement message. In addition, the standby VRRP router(s) will transition to a Master state to speed convergence. The normal VRRP election process will then take place based on the Advertisement messages sent by all VRRP routers.

There can be only one BFD session assigned to any given VRRP/SRRP instance, but there can be multiple SRRP/VRRP sessions using the same BFD session.

The parameters used for the BFD sessions are set by the BFD command under the IP interface.

The **no** form of this command removes BFD from the configuration.

Parameters

interface-name

Specifies the name of the interface running BFD. The specified interface may not yet be configured with BFD. However, when it is, this virtual router will then initiate the BFD session.

ip-address

Specifies the destination address to be used for the BFD session.

svc-id

Specifies the service ID of the interface running BFD.

Values *service-id*:1 to 2147483647

svc-name: 64 characters maximum

Full Context

configure router isis interface bfd-enable

Description

This command enables the use of bidirectional forwarding detection (BFD) to control IPv4 or IPv6 adjacencies. By enabling BFD on an IPv4 or IPv6 protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for

the BFD are set by the BFD command under the IP interface. This command must be given separately to enable or disable BFD for both IPv4 and IPv6.

The **no** form of this command removes BFD from the associated adjacency.

Default

no bfd-enable ipv4

no bfd-enable ipv6

Parameters

ipv4

Keyword to enable BFD to control IPv4 adjacencies.

ipv6

Keyword to enable BFD to control IPv6 adjacencies.

include-bfd-tlv

Enables support for the IS-IS BFD TLV options in accordance with RFC 6213, which specifies that a BFD session must be established before an IS-IS adjacency can transition to the established state. This option must be enabled on all IS-IS neighbors on a shared interface.

Platforms

7705 SAR Gen 2

[Tree] (config>router>ospf>area>interface bfd-enable)

Full Context

configure router ospf3 area interface bfd-enable

configure router ospf area interface bfd-enable

Description

This command configures BFD to control the state of the associated protocol interface. By enabling BFD on a protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD session are set through the **bfd** command under the IP interface.

The **no** form of this command removes BFD from the associated OSPF protocol adjacency.

Default

no bfd-enable

Parameters

remain-down-on-failure

Keyword to specify that OSPF brings down the adjacency and waits on BFD again if the BFD session does not come back up within 10 seconds. This can cause OSPF neighbors to flap, because OSPF will form the adjacency and then bring it down if the BFD session is still down. If this parameter is not configured, the OSPF adjacency will form even if the BFD adjacency does not come back up after a failure.

strict

Keyword to specify that the system uses BFD strict-mode, which requires that an active BFD session exists between the OSPF neighbors before establishing a full adjacency. When this keyword is configured, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires that both sides have the B-flag set.

During OSPFv3 BFD strict-mode operations, the router advertises the Local Interface IPv4 Address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.

strict-mode-holddown *number*

Keyword to specify a delay in bringing up the OSPF adjacency after the BFD session is established. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset on an adjacency when a BFD session operationally toggles.

Values 1 to 600

bfd-template

Syntax

[**no**] **bfd-template** *name*

Context

[Tree] (config>router>bfd bfd-template)

Full Context

configure router bfd bfd-template

Description

This command configures a BFD template. A BFD template defines the set of configurable parameters used by a BFD session. These include the transmit and receive timer intervals used for BFD CC packets, the transmit timer interval used when the session is providing a CV function, the multiplier value, the echo-receive interval, and whether the BFD session terminates in the CPM network processor.

The **no** form of this command reverts to the default value.

Default

no bfd-template

Parameters

name

Specifies a text string name for the template, up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

Platforms

7705 SAR Gen 2

bfd-template

Syntax

bfd-template *bfd-template*

no bfd-template

Context

[Tree] (config>router>segment-routing>maintenance-policy bfd-template)

Full Context

configure router segment-routing maintenance-policy bfd-template

Description

This command references a named BFD template that is used by seamless BFD. The template specifies parameters, such as the minimum transmit and receive control packet timer intervals, that are used by the BFD session. Templates are configured under the **config**>**router**>**bfd** context.

A BFD template must exist on the system before being referenced from a maintenance policy.

The **no** form of this command removes the configured template.

Parameters

bfd-template

Specifies the name of the BFD template, up to 32 characters.

bgp

Syntax

bgp *bgp-instance*

no bgp *bgp-instance*

Context

[Tree] (config>service>vpls bgp)

Full Context

configure service vpls bgp

Description

Commands in this context configure the BGP related parameters for BGP VPLS.

A maximum of two BGP instances can be configured in a VPLS service. The *bgp-instance* parameter value can be configured as 1 or 2. If it is not specified, the parameter value is configured as 1 by default.

The **route-distinguisher** configured in BGP instance 1 and 2 must be different. However, the route-target value may be configured the same or different for the two instances.

Only BGP-EVPN MPLS is allowed to be assigned to instance 2. Instance 1 must be used for the VXLAN and L2VPN address families.

BGP-EVPN VXLAN and BGP-EVPN MPLS can only be configured as **no shutdown** in the same service if they are associated with different instances (When the two BGP instances are created, the **bgp-instance** command must be configured in the **bgp-evpn mpls** context).

The **evi** value in **bgp-evpn** can be used to auto-derive the route distinguisher in instance 1 only. However, the **evi** value can be used to auto-derive the **route-target** in both instances.

The **no** version of the command removes the BGP instance.

Parameters

bgp-instance

Specifies the value associated with the BGP instance.

Values 1 to 2

Platforms

7705 SAR Gen 2

bgp

Syntax

[**no**] **bgp**

Context

[Tree] (config>router bgp)

Full Context

configure router bgp

Description

This command creates the BGP protocol instance and BGP configuration context. BGP is administratively enabled upon creation.

The **no** form of this command deletes the BGP protocol instance and removes all configuration parameters for the BGP instance. BGP must be **shutdown** before deleting the BGP instance. An error occurs if BGP is not **shutdown** first.

Full Context

configure service system bgp-auto-rd-range

Description

This command defines the type-1 route-distinguisher IPv4 address and community value range within which the system will select a route-distinguisher for the **bgp-enabled** services using **auto-rd**.

Interactions:

This command is used along with the **route-distinguisher auto-rd** command supported in VPLS, VPRN and Epipe services. The system forces the user to create a **bgp-auto-range** before the **auto-rd** option can be used in the services.

The system will keep allocating values for services configured with **route-distinguisher auto-rd** as long as there are available community values within the configured range. After the command is added, the following changes are allowed:

- The ip-address can be changed without modifying the *comm-val* range, even if services using **auto-rd** are present. The affected routes will be withdrawn and re-advertised with the new route-distinguishers.
- The *comm-val* range can be modified as long as no conflicting values are present in the new range. For example, the user may expand the range as long as the new range does not overlap with existing manual route-distinguishers. The user may also reduce the range as long as the new range can accommodate the already allocated auto-RDs.

Parameters

ip-address

Specifies the IPv4 address used in the first 4 octets of all the type-1 auto route-distinguishers selected by the system.

comm-val

Specifies the community value of the type-1 auto route-distinguisher.

Values 1 to 65535

Full Context

configure router policy-options policy-statement entry action bgp-high-priority

configure router policy-options policy-statement default-action bgp-high-priority

Description

This command enables eligible BGP routes matched by the policy entry or policy default-action that are tagged for faster route table updates.

This action applies only when the policy is applied as a BGP import policy to a base router BGP peer or VPRN BGP peer and applies only to the following route types:

- IPv4
- label-IPv4
- IPv6
- label-IPv6

This command is useful when the BGP RIB contains a large number of routes and quick routing table updates are needed for a small subset of these routes. The effectiveness of this command decreases as the subset becomes a larger proportion of the total RIB.

The **no** form of this command disables the routes that are tagged for faster route table updates.

Default

no bgp-high-priority

bgp-labels-hold-timer *seconds*

no bgp-labels-hold-timer

Context

[Tree] (config>router>mpls-labels bgp-labels-hold-timer)

Full Context

configure router mpls-labels bgp-labels-hold-timer

Description

This command configures the time to delay before the label-forwarding entries programmed by BGP are removed from the datapath. A non-zero delay is useful in the following situations:

- label-unicast route is readvertised by an ABR/ASBR operating in label-per-next-hop mode to choose a new primary path

- IP VPN route is readvertised by an ABR/ASBR operating in label-per-next-hop mode to choose a new primary path
- IP VPN best-external route is readvertised by a VPRN to choose a new backup path
- IP VPN route is readvertised by a VPRN in label-per-next-hop mode to choose a new primary path

In the preceding situations, configure the hold timer to be large enough to account for the propagation delay of the route withdrawal to all ingress routers.

Default

bgp-labels-hold-timer 0

Parameters

seconds

Specifies the time delay, in seconds.

Values 0 to 255

Platforms

7705 SAR Gen 2

6.24 bgp-leak

bgp-leak

Syntax

Full Context

configure router policy-options policy-statement entry action bgp-leak

configure router policy-options policy-statement default-action bgp-leak

Description

This command causes qualifying matched BGP routes to be marked as leakable, meaning they are candidates to be leaked into other routing instances (copied with their complete set of path attributes). A BGP route is a qualifying route if it is an IPv4 route (unlabeled), IPv6 route (unlabeled) or a label-IPv4 route.

Note:
A leakable BGP route is not actually leaked into another routing instance unless it is accepted by a leak-import policy of that other routing instance.

The **bgp-leak** command has an effect only when the policy is applied as a BGP import policy in the base router or a VPRN context.

Default

no bgp-leak

no bgp-med

Context

[Tree] (config>router>policy-options>policy-statement>entry>action bgp-med)

[Tree] (config>router>policy-options>policy-statement>default-action bgp-med)

Full Context

configure router policy-options policy-statement entry action bgp-med

configure router policy-options policy-statement default-action bgp-med

Description

This command changes the BGP MED attribute value in BGP routes matched by the route policy entry (or the policy default action).

If the matched route already has a MED attribute, this command overwrites the existing value. If the matched route does not have a MED attribute, then one is added and the value is set based on the parameters of this command.

This command has no effect on non-BGP routes. The default, **no bgp-med**, does not modify MED values.

Default

no bgp-med

Parameters

expression

Specifies a logical expression parsed as a string. The string can contain:

- parentheses () to change the order of operations
- mathematical operators: + (addition), - (subtraction) and * (multiplication)
- directly entered decimal values that act as operands of the mathematical operators. Each decimal value supports up to three decimal places precision in the range of 0.000 to 4294967295.000
- decimal values represented by parameter names (using the usual @parameter-name@ syntax) that act as operands of the mathematical operators. Each parameterized decimal value supports up to three decimal places precision in the range of 0.000 to 4294967295.000

igp

Instructs the policy to set the MED based on the current route table or tunnel table cost to resolve the BGP next-hop address.

min-igp

Instructs the policy to set the MED based on the minimum route table or tunnel table cost to resolve the BGP next-hop of the route, over its lifetime in the local RIB.

med-value

Specifies a new MED value (or parameter name to use for the new MED value) to use with the route.

Values *value*

- 0 to 4294967295

param-name

- up to 32 characters
- Must start and end with an at-sign (@)

bgp-path-selection

Syntax
[**no**] **bgp-path-selection**

Context
[Tree] (config>service>system>bgp-evpn>ad-per-evi-routes bgp-path-selection)

Full Context
configure service system bgp-evpn ad-per-evi-routes bgp-path-selection

Description
This command compares the received EVPN VPWS AD per-EVI routes based on BGP path attributes.

Attribute propagation must be configured before configuring this command.

The **no** form of this command disables the comparison of the routes.

Default
no bgp-path-selection

Platforms
7705 SAR Gen 2

bgp-path-selection

Syntax
bgp-path-selection [**d-path-length-ignore**]

no bgp-path-selection

Context

[Tree] (config>service>system>bgp-evpn>ip-prefix-routes>iff bgp-path-selection)

Full Context

configure service system bgp-evpn ip-prefix-routes interface-ful bgp-path-selection

Description

This command enables BGP path selection for EVPN-IFF (Interface-ful) routes.

Once the command is enabled, the EVPN-IFF routes are ordered and selected in a similar manner as IPVPN or EVPN-IFL routes, that is, based on the regular BGP path selection process.

The **no** form of this command causes the system to order EVPN-IFF routes based on their {R-VPLS Ifindex, RD, Ethernet Tag}. For example, if two EVPN-IFF routes with different Route Distinguishers (RDs) are received for the same prefix on the same R-VPLS, the route with the lowest RD is selected.

Default

no bgp-path-selection

Parameters

d-path-length-ignore

Keyword used to make EVPN ignore the D-PATH length when **iff-bgp-path-selection** is enabled.

Platforms

7705 SAR Gen 2

[Tree] (config>filter>match-list>ip-prefix-list>apply-path bgp-peers)

Full Context

configure filter match-list ipv6-prefix-list apply-path bgp-peers

configure filter match-list ip-prefix-list apply-path bgp-peers

Description

This command configures auto-generation of IPv4 or IPv6 address prefixes (as required by the context that the command is executed within) based on the base router BGP instance configuration.

The **no** form of this command removes the bgp-peers configuration for auto-generation of address prefixes for the specified index value.

Parameters

service-name

Specifies the service name, up to 64 characters in length.

group

Configures a match against the base router BGP instance group configuration.

Regex match (.*) can be used to match against any group.

neighbor

Configures a match against the base router BGP instance neighbor configuration.

Regex match (.*) can be used to match against any neighbor.

criterion-index

Specifies an integer from 1 to 255 enumerating BGP peers auto-generation configuration within this list.

router-instance

Specifies the router name or service ID.

Values router-instance: *router-name* or *vprn-svc-id*

router-name: "Base"

vprn-svc-id: 1 to 2147483647

service-name: Specifies the service name, up to 64 characters in length.

router

Configures a match against the base router BGP instance configuration.

reg-exp

Specifies a regular expression that defines a match string, up to 255 characters in length, to be used to auto-generate address prefixes. Matching is performed from the least-significant digit. For example, a string **10.0** matches all neighbors with addresses starting with **10**, such as **10.0.x.x** or **10.0xx.x.x**.

bgp-shared-queue

Syntax

bgp-shared-queue [**cir** *rate*] [**pir** *rate*]

no bgp-shared-queue

Context

[Tree] (config>service>vprn bgp-shared-queue)

Full Context

configure service vprn bgp-shared-queue

Description

This command enables all BGP peers within a VPRN instance to share a single CPM queue. This command takes effect on new BGP connections established; already established BGP peers continue to use their own CPM queue. Any changes to PIR/CIR of the shared queue takes effect only after BGP connections are re-established.

Parameters

cir *rate*

Specifies the CIR rate for the shared queue.

pir *rate*

Specifies the PIR rate for the shared queue.

configure router mpls lsp bgp-transport-tunnel

configure router mpls lsp-template bgp-transport-tunnel

Description

This command allows or blocks RSVP-TE LSP to be used as a transport LSP for BGP tunnel routes.

Default

bgp-transport-tunnel include

Parameters

include

Allows RSVP-TE LSP to be used as transport LSP from the ASBR to local PE router, from ingress PE to ASBR in the local AS or between multi-hop External Border Gateway Protocol (EBGP) peers with ASBR to ASBR adjacency.

exclude

Blocks RSVP-TE LSP to be used as transport LSP from the ASBR to local PE router, from ingress PE to ASBR in the local AS or between multi-hop EBGP peers with ASBR to ASBR adjacency.

Platforms

7705 SAR Gen 2

6.32 bgp-tunnel

bgp-tunnel

Syntax

[**no**] **bgp-tunnel**

Context

[Tree] (config>service>sdp bgp-tunnel)

Full Context

configure service sdp bgp-tunnel

Description

This command allows the use of BGP route tunnels available in the tunnel table to reach SDP far-end nodes. Use of BGP route tunnels are only available with MPLS-SDP. Only one of the transport methods is allowed per SDP - LDP, RSVP-LSP BGP, SR-ISIS, or SR-OSPF. This restriction is relaxed for some combinations of the transport methods when the mixed-lsp-mode option is enabled within the SDP.

The **no** form of the command disables resolving BGP route tunnel LSP for SDP far-end.

Default

no bgp-tunnel (BGP tunnel route to SDP far-end is disabled)

7705 SAR Gen 2

6.33 bgp-tunnel-metric

bgp-tunnel-metric

Syntax

bgp-tunnel-metric [*value*] [**prefer-med**]

bgp-tunnel-metric [*value*] **prefer-aigp**

bgp-tunnel-metric [*value*] **prefer-aigp prefer-med**

bgp-tunnel-metric [*value*] [**prefer-aigp**]

no bgp-tunnel-metric

Context

[Tree] (config>router>bgp bgp-tunnel-metric)

Full Context

configure router bgp bgp-tunnel-metric

Description

This command sets the TTM metric of all BGP tunnels to a fixed value or a value derived from the AIGP or the MED metric of the BGP-LU route, if the BGP-LU route has an AIGP or MED path attribute. Otherwise, the TTM metric is set to the number specified using the *value* parameter. BGP import policies override the configuration of this command.

By default, BGP tunnels are installed with a fixed cost of 1000 in the tunnel table. This can overstate or understate their true cost when compared to other tunnels with IGP-derived costs.

The **no** form of the command configures the router to use the default value.

Default

no bgp-tunnel-metric

Parameters

value

Specifies the BGP tunnel metric.

Values 0 to 4294967295

prefer-aigp

Specifies that the TTM metric is based on the AIGP metric value of the BGP-LU route. When a BGP-LU route is selected for installation in TTM and is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route with the resolved cost to the BGP next hop of the route added to it. Otherwise, the metric is set to the value configured using the *value* parameter.

prefer-med

Specifies that the TTM metric is based on the MED metric value of the BGP-LU route. When a BGP-LU route is selected for installation in TTM and is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the resolved cost to the BGP next hop of the route added to it. Otherwise, the metric is set to the value configured using the *value* parameter.

Note: prefer-aigp takes precedence over this parameter if the received BGP-LU has both attributes.

Platforms

7705 SAR Gen 2

Full Context

configure router policy-options policy-statement default-action bgp-tunnel-metric

configure router policy-options policy-statement entry action bgp-tunnel-metric

Description

This command sets the TTM metric of all BGP tunnels matched by the policy entry or the policy default action to a fixed value or a value derived from the AIGP or the MED metric of the BGP-LU route, if the BGP-LU route has an AIGP or MED path attribute. Otherwise, the TTM metric is set to the number specified using the *value* parameter.

The **no** form of this command configures the router to use the default value.

Default

no bgp-tunnel-metric

Parameters

value

Specifies the BGP tunnel metric.

Values 0 to 4294967295

param-name

Specifies the parameter name, up to 32 characters that starts and ends with an at-sign (@).

prefer-aigp

Specifies that if a BGP-LU route is selected for installation in the TTM and is matched by this action in a BGP import policy, the TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route with the IGP cost to reach the BGP next hop added to it.

prefer-med

Specifies that if a BGP-LU route is selected for installation in the TTM and is matched by this action in a BGP import policy, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the IGP cost to reach the BGP next hop added to it.

6.34 bgp-tunnel-preference

bgp-tunnel-preference

Syntax

bgp-tunnel-preference [*preference*]

no bgp-tunnel-preference

Context

[Tree] (config>router>bgp bgp-tunnel-preference)

Full Context

configure router bgp bgp-tunnel-preference

Description

This command configures the tunnel table preference for BGP-LU tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP which enabled the **mixed-lsp-mode** option. The tunnel preference, in such an SDP, is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default
bgp-tunnel-preference 12

Parameters
preference
Specifies the BGP tunnel preference.

Values 1 to 255

Default 12

Platforms

Syntax
bgp-vpls-mh-ve-id *number*

no bgp-vpls-mh-ve-id

Context

[Tree] (config>service>vpls>sap bgp-vpls-mh-ve-id)

Full Context

configure service vpls sap bgp-vpls-mh-ve-id

Description

This command upon the configuration of the ve-id under the SAP and if BGP-VPLS is configured and is operationally up, causes the PE to advertise a bgp-mh route for the ve-id (the route does not contain label information). The bgp-mh route contains the F and D flags properly set based on the SAP operational state. Upon switchover, the former active PE (DF in case of EVPN-MH) sends an update with a transition of the F bit from 1 to 0. This is an indication for the remote PEs to flush their MACs associated to the advertising PE.

This command is required when MC-LAG or EVPN-MH is used for multi-homing redundancy and mac-flush is required at remote BGP-VPLS PEs when there is a failure in the active PE.

The **no** form of this command withdraws the L2 VPN route.

Parameters

number

Specifies the BGP-VPLS multi-homing virtual-edge identifier.

Values 1 to 65535

Platforms

7705 SAR Gen 2

bin-group

Syntax

bin-group *bin-group-number* [**fd-bin-count** *fd-bin-count* **fdr-bin-count** *fdr-bin-count* **ifdv-bin-count** *ifdv-bin-count* **create**]

no bin-group *bin-group-number*

Context

[Tree] (config>oam-pm bin-group)

Full Context

configure oam-pm bin-group

Description

This command allows the operator to configure the parameters for a specific bin group. Bin-group 1 is a default **bin-group** and cannot be modified. If no bin group is assigned to an oam-pm session, this is assigned by default. The default values for bin-group 1 are (fd-bin-count 3 bin 1 lower-bound 5000us, bin 2 lower-bound 10000us fdr-bin-count 2 bin 1lower-bound 5000us and ifdv-bin-count 2 bin 1lower-bound 5000us)

The **no** form of this command disables the OAM Performance Monitoring bin group.

Parameters

bin-group-number

Specifies an identifier for a bin-group that is referenced by oam-pm sessions. A bin group can only shutdown and modified when all the PM Sessions referencing the bin group have been shutdown. The only exception is the description parameter.

Values 1 to 255

fd-bin-count

Specifies the number of frame delay bins that are created.

Values 2 to 10

fdr-bin-count

Specifies the number of frame delay range bins that are created.

Values 2 to 10

ifdv-bin-count

Specifies the number of inter-frame delay variation bins that are created.

Values 2 to 10

create

Keyword that creates the bin group.

6.42 bind-authentication

bind-authentication

Syntax

bind-authentication *root-dn* [**password** *password*] [**hash** | **hash2** | **custom**]

no bind-authentication

Context

[Tree] (config>system>security>ldap>server bind-authentication)

Full Context

configure system security ldap server bind-authentication

Description

This command configures the LDAP binding used to log into LDAP server. A string of domain components (DC) and common names (CN) can be programmed to identify the user in addition to the password field. The password is hashed. For example, "cn=admin,dc=nokia,dc=com" indicates the user admin in domain nokia.com. Table 19: LDAP Attributes lists the LDAP attributes.

The **no** version of this command removes the bind-authentication.

Table 19: LDAP Attributes

Object Class	Naming Attribute Display Name	Naming Attribute LDAP Name
user	Common-Name	cn
organizationalUnit	Organizational-Unit-Name	ou
domain	Domain-Component	dc

Parameters

root-dn

Up to 512 characters.

password

Configures the password which enables a user to bind to the LDAP server. The maximum length is 128 characters.

hash

Specifies that the password is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the password is assumed to be in an unencrypted, clear text form. For security, all passwords are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

hash2

Specifies the password is entered in a more complex encrypted form that involves more variables than the password value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the password is assumed to be in an unencrypted, clear text form. For security, all passwords are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

binding-label

Syntax

binding-label *label-number*

no binding-label

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy binding-label)

Full Context

configure router mpls forwarding-policies forwarding-policy binding-label

Description

This command configures a binding label for the MPLS forwarding policy.

The policy associates an incoming label, referred to as a binding label, to an NHG in which the primary and backup direct or indirect next hops are defined. This type of MPLS forwarding policy is referred to as a label-binding policy.

The **no** form of the command removes the binding label from the MPLS forwarding policy.

Parameters

label-number

Specifies the label number.

Values 32 to 1048575

Platforms

7705 SAR Gen 2

6.44 binding-operator

binding-operator

Syntax

binding-operator {**and** | **or**}

no binding-operator

Context

[Tree] (config>filter>redirect-policy-binding binding-operator)

Full Context

configure filter redirect-policy-binding binding-operator

Description

This command configures the logical operator to use with the destinations test results to obtain the master test result (the redirect-policy binding test result). A change in this configuration results in the re-evaluation of the master test result.

The **no** version of this command sets the value to its default

Default

binding-operator and

Parameters

and | or

Keyword to specify the type of logical or boolean operation to perform between the individual destinations test results to obtain the master result.

Platforms

7705 SAR Gen 2

6.45 binding-sid

binding-sid

Syntax

binding-sid *number*

no binding-sid

Context

[Tree] (conf>router>segment-routing>sr-policies>policy binding-sid)

Full Context

configure router segment-routing sr-policies static-policy binding-sid

Description

This command associates a binding SID with a statically defined segment routing policy. This is a mandatory parameter and configuration command to enable the segment routing policy; if the binding SID label value is not configured, the execution of the **no shutdown** command on the static segment routing policy fails.The BSID label should be an available label in the **reserved-label-block** range.

The **no** form of this command removes the BSID association.

Default

no binding-sid

Parameters

number

Specifies the binding SID label value.

Values 32 to 1048575

Platforms

7705 SAR Gen 2

binding-sid

Syntax

binding-sid *label*

no binding-sid

Context

[Tree] (config>router>mpls>lsp binding-sid)

Full Context

configure router mpls lsp binding-sid

Description

This command configures a binding SID label for the LSP. The label value must belong to the reserved label block that is configured with the **configure router mpls lsp-bsid-block** command.

The **no** form of this command unbinds the label, removes the ILM entry, and triggers the appropriate PCEP messages.

Parameters

label

Specifies an MPLS label value from a specific reserved label block.

Values 32 to 1048575

Platforms

7705 SAR Gen 2

binding-sid

Syntax

[no] binding-sid

Context

[Tree] (config>router>mpls>lsp-template binding-sid)

Full Context

configure router mpls lsp-template binding-sid

Description

This command configures the system to allocate and bind a label to any LSP that is created using the template.

The **no** form of this command removes the configuration but does not affect LSPs that were already created using the template.

Default

no binding-sid

Platforms

7705 SAR Gen 2

6.46 bindings

bindings

Syntax

[**no**] **bindings**

Context

[Tree] (debug>router>ldp>peer>event bindings)

Full Context

debug router ldp peer event bindings

Description

This command displays debugging information about addresses and label bindings learned from LDP peers for LDP bindings.

The **no** form of the command disables the debugging output.

Platforms

7705 SAR Gen 2

6.47 black-hole

black-hole

Syntax

[**no**] **black-hole**

Context

[Tree] (config>service>vprn>static-route-entry black-hole)

Full Context

configure service vprn static-route-entry black-hole

Description

This command specifies that the route is a black hole route. If the destination address on a packet matches this static route, it will be silently discarded.

Default

no black-hole

Platforms

7705 SAR Gen 2

black-hole

Syntax

[**no**] **black-hole**

Context

[Tree] (config>router>static-route-entry black-hole)

Full Context

configure router static-route-entry black-hole

Description

This command specifies that the route is a black hole route. If the destination address on a packet matches this static route, it will be silently discarded.

Default

no black-hole

Platforms

7705 SAR Gen 2

6.48 black-hole-dup-mac

black-hole-dup-mac

Syntax

[**no**] **black-hole-dup-mac**

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication black-hole-dup-mac)

Full Context

configure service vpls bgp-evpn mac-duplication black-hole-dup-mac

Description

The **black-hole-dup-mac** command is disabled by default. If enabled, a duplicated MAC detected in the network is programmed as a black-hole MAC in the FDB and displayed in the **show service id fdb detail** command as follows:

- Source-Identifier—black-hole
- Type—EvpnD:P

Because the MAC is now programmed in the FDB as a black-hole, all received frames with MAC DA matching the duplicate MAC are discarded. The duplicate black-hole MACs are installed as Protected, therefore, all received frames with MAC SA matching the duplicate MAC are discarded by default.

A BGP-EVPN (MPLS or VXLAN) shutdown is required to add or remove the **black-hole-dup-mac** command.

The **no** form of the command removes the feature, and duplicate MACs are no longer programmed as black-hole MACs.

Default

no black-hole-dup-mac

Platforms

7705 SAR Gen 2

6.49 blackhole-aggregate

blackhole-aggregate

Syntax

[**no**] **blackhole-aggregate**

Context

[Tree] (config>service>vprn>ospf>area blackhole-aggregate)

[Tree] (config>service>vprn>ospf3>area blackhole-aggregate)

Full Context

configure service vprn ospf area blackhole-aggregate

configure service vprn ospf3 area blackhole-aggregate

Description

This command installs a low priority blackhole route for the entire aggregate. Existing routes that make up the aggregate have a higher priority and only the components of the range for which no route exists are blackholed.

It is possible that when performing area aggregation, addresses may be included in the range for which no actual route exists. This can cause routing loops. To avoid this problem, configure the **blackhole-aggregate** command.

The **no** form of this command removes this configuration.

Default

blackhole-aggregate

Syntax

[**no**] **blackhole-aggregate**

Context

[Tree] (config>router>ospf>area blackhole-aggregate)

[Tree] (config>router>ospf3>area blackhole-aggregate)

Full Context

configure router ospf area blackhole-aggregate

configure router ospf3 area blackhole-aggregate

Description

This command installs a low priority blackhole route for the entire aggregate. Existing routes that make up the aggregate will have a higher priority and only the components of the range for which no route exists are blackholed.

When performing area aggregation, addresses may be included in the range for which no actual route exists, which can cause routing loops. To avoid this problem, configure the **blackhole-aggregate** option.

The **no** form of this command removes this option.

Default

blackhole-aggregate

Platforms

Full Context

configure service nat nat-policy block-limit

Description

This command configures the maximum number of port blocks per subscriber.

The **no** form of the command reverts to the default.

Default

block-limit 1

Parameters

1..40

Specifies the maximum number of port-blocks per NAT subscriber.

Platforms

7705 SAR Gen 2

6.51 block-on-mesh-failure

block-on-mesh-failure

Syntax

[**no**] **block-on-mesh-failure**

Context

[Tree] (config>service>vpls>endpoint block-on-mesh-failure)

[Tree] (config>service>vpls>spoke-sdp block-on-mesh-failure)

Full Context

configure service vpls endpoint block-on-mesh-failure

configure service vpls spoke-sdp block-on-mesh-failure

Description

This command enables blocking (brings the entity to an operationally down state) after all configured SDPs or endpoints are in operationally down state. This event is signaled to corresponding T-LDP peer by withdrawing service label (status-bit-signaling non-capable peer) or by setting "PW not forwarding" status bit in T-LDP message (status-bit-signaling capable peer).

The **no** form of this command reverts to the default.

Default

no block-on-mesh-failure

Platforms

7705 SAR Gen 2

6.52 block-on-peer-fault

block-on-peer-fault

Syntax

[**no**] **block-on-peer-fault**

Context

[Tree] (config>service>epipe>spoke-sdp block-on-peer-fault)

Full Context

configure service epipe spoke-sdp block-on-peer-fault

Description

When enabled, this command blocks the transmit direction of a PW when any of the following PW status codes is received from the far end PE:

0x00000001	Pseudowire Not Forwarding
0x00000002	Local Attachment Circuit (ingress) Receive Fault
0x00000004	Local Attachment Circuit (egress) Transmit Fault
0x00000008	Local PSN-facing PW (ingress) Receive Fault
0x00000010	Local PSN-facing PW (egress) Transmit Fault

The transmit direction is unblocked when the following PW status code is received:

0x00000000	Pseudowire forwarding (clear all failures)

This command is mutually exclusive with **no pw-status-signaling**, and **standby-signaling-slave**. It is not applicable to spoke SDPs forming part of an MC-LAG or spoke SDPs in an endpoint.

Default

no block-on-peer-fault

Platforms

7705 SAR Gen 2

block-on-peer-fault

Syntax

[**no**] **block-on-peer-fault**

Context

[Tree] (config>service>pw-template block-on-peer-fault)

Full Context

configure service pw-template block-on-peer-fault

Description

When enabled, this command blocks the transmit direction of a pseudowire when any of the following pseudowire status codes is received from the far end PE:

0x00000001	Pseudowire Not Forwarding
0x00000002	Local Attachment Circuit (ingress) Receive Fault
0x00000004	Local Attachment Circuit (egress) Transmit Fault
0x00000008	Local PSN-facing PW (ingress) Receive Fault
0x00000010	Local PSN-facing PW (egress) Transmit Fault

The transmit direction is unblocked when the following pseudowire status code is received:

0x00000000	Pseudowire forwarding (clear all failures)

This command is mutually exclusive with **no pw-status-signaling**, and **standby-signaling-slave**. It is not applicable to spoke SDPs forming part of an MC-LAG or spoke SDPs in an endpoint.

6.53 block-prefix-sid

block-prefix-sid

Syntax

[**no**] **block-prefix-sid**

Context

[Tree] (config>router>bgp>group>neighbor block-prefix-sid)

[Tree] (config>router>bgp block-prefix-sid)

[Tree] (config>router>bgp>group block-prefix-sid)

Full Context

configure router bgp group neighbor block-prefix-sid

configure router bgp block-prefix-sid

configure router bgp group block-prefix-sid

Description

This command specifies whether all prefix SID attributes are removed from label IPv4 and label IPv6 routes when they are exchanges with EBGP and IBGP peers covered by the scope of the command. Even locally-imposed prefix SID attributes are removed.

A change of this configuration causes the affected BGP sessions to flap.

The **no** form of this command allows prefix SID attributes associated with label IPv4 and label IPv6 routes to be propagated without restriction.

Default

no block-prefix-sid

Platforms

7705 SAR Gen 2

6.54 bof

bof

Syntax

bof

Context

[Tree] (bof)

Full Context

bof

Description

This command creates or edits the boot option file (BOF) for the specified local storage device.

A BOF file specifies where the system searches for runtime images, configuration files, and other operational parameters during system initialization.

BOF parameters can be modified. Changes can be saved to a specified compact flash. The BOF must be located in the root directory of either an internal or external compact flash local to the system and have the mandatory filename of *bof.cfg*.

When modifications are made to in-memory parameters that are currently in use or operating, the changes are effective immediately. For example, if the IP address of the management port is changed, the change takes place immediately.

Only one entry of the BOF configuration command statement can be saved once the statement has been found to be syntactically correct.

When opening an existing BOF that is not the BOF used in the most recent boot, a message is issued notifying the user that the parameters will not affect the operation of the node.

No default boot option file exists. The router boots with the factory default boot sequence and options.

6.55 booking-factor

booking-factor

Syntax

booking-factor *factor*

no booking-factor

Context

[Tree] (config>lag>access booking-factor)

[Tree] (config>port>ethernet>access booking-factor)

Full Context

configure lag access booking-factor

configure port ethernet access booking-factor

Description

This command specifies the booking factor applied against the port or LAG administrator bandwidth by SAP administrator bandwidth CAC.

The service manager keeps track of the available administrator bandwidth for each port or LAG configured with an administrator bandwidth. The port or LAG available administrator bandwidth is adjusted by the user configured booking factor, allowing the port or LAG bandwidth to be overbooked or under booked.

If the booking factor is increased then available administrator bandwidth on the port or LAG increases. If the booking factor is decreased then available administrator bandwidth on the port or LAG decreases.

However, if the reduction of available administrator bandwidth is insufficient to cover the sum of the current SAP administrator bandwidth on the port or LAG, the command fails.

The **no** form of this command reverts to the default value.

Default

booking-factor 100

Parameters

factor

Specifies the percentage of the port or LAG admin bandwidth for SAP bandwidth CAC.

Values 1 to 1000

Platforms

7705 SAR Gen 2

booking-factor

Syntax

booking-factor *percentage*

no booking-factor

Context

[Tree] (config>service>sdp booking-factor)

Full Context

configure service sdp booking-factor

Description

This command specifies the booking factor applied against the maximum SDP available bandwidth by the VLL CAC feature.

The service manager keeps track of the available bandwidth for each SDP. The maximum value is the sum of the bandwidths of all constituent LSPs in the SDP. The SDP available bandwidth is adjusted by the user configured booking factor. A value of 0 means no VLL can be admitted into the SDP.

The **no** form of the command reverts to the default value.

Default

no booking-factor

Parameters

percentage

Specifies the percentage of the SDP maximum available bandwidth for VLL call admission. When the value of this parameter is set to zero (0), no new VLL spoke SDP bindings with non-zero bandwidth are permitted with this SDP. Overbooking, >100% is allowed.

Values 0 to 1000%

Default 100

Platforms

6.56 boot-bad-exec

boot-bad-exec

Syntax

boot-bad-exec *file-url*

no boot-bad-exec

Context

[Tree] (config>system boot-bad-exec)

Full Context

configure system boot-bad-exec

Description

Use this command to configure a URL for a CLI script to **exec** following a failure of a bootup configuration. The command specifies a URL for the CLI scripts to be run following the completion of the bootup configuration. A URL must be specified or no action is taken.

The commands are persistent between router (re)boots and are included in the configuration saves (**admin>save**).

Related Commands

exec — This command executes the contents of a text file as if they were CLI commands entered at the console.

Default

no boot-bad-exec

Parameters

file-url

Specifies the location and name of the CLI script file executed following failure of the bootup configuration file execution. When this parameter is not specified, no CLI script file is executed.

Values

file url	*local-url* | *remote-url*	255 chars max
local-url	[*cflash-id*/][*file-path*]	
remote-url	[{ftp://} *login:pswd@remote-locn*/][*file-path*]

6.60 boot-timer

boot-timer

Syntax

boot-timer *interval*

no boot-timer

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep boot-timer)

Full Context

configure redundancy multi-chassis peer mc-endpoint boot-timer

Description

This command configures the boot timer interval. This command applies only when the node reboots. It specifies the time the MC-EP protocol keeps trying to establish a connection before assuming a failure of the remote peer. This is different from the keep-alive mechanism which is used just after the peer-peer communication was established. After this time interval passed all the mc-endpoints configured under services will revert to single chassis behavior, activating the best local PW.

The **no** form of this command sets the interval to default.

Default

no boot-timer

Parameters

interval

Specifies the boot timer interval.

Values 1 to 600

Platforms

7705 SAR Gen 2

boot-timer

Syntax

boot-timer *seconds*

no boot-timer

Context

[Tree] (config>service>vpls>site boot-timer)

Full Context

configure service vpls site boot-timer

Description

This command configures for how long the service manager waits after a node reboot before running the DF election algorithm. The boot-timer value should be configured to allow for the BGP sessions to come up and for the NLRI information to be refreshed/exchanged.

The **no** form of this command reverts the default.

Default

boot-timer 10

Parameters

seconds

Specifies the site boot-timer in seconds.

Values 0 to 100

Platforms

7705 SAR Gen 2

boot-timer

Syntax

6.63 boundary-type

boundary-type

Syntax

boundary-type {**clock-aligned** | **test-relative**}

no boundary-type

Context

[Tree] (config>oam-pm>session>meas-interval boundary-type)

Full Context

configure oam-pm session meas-interval boundary-type

Description

This command establishes the alignment of the start of the measurement interval with either the time of day clock or the start of the test. Alignment with the time of day clock always defaults to the representative top of the hour. Clock-aligned 15-minute measurement intervals divide the hour into four equal sections 00, 15, 30, 45. Clock-aligned 1-hour measurement intervals start at 00. Clock-aligned 1-day measurement intervals start at midnight. Test relative start times launches the measurement interval when the individual test enters the active (**no shutdown**) state. It is typical for the first measurement interval of a clock-aligned test to have the suspect flag set to yes because it is unlikely the **no shutdown** exactly corresponds to the clock based measurement interval start time. Clock-aligned measurement intervals can include an additional offset.

The **no** form of this command sets the boundary to the default clock-aligned.

Default

boundary-type clock-aligned

Parameters

clock-aligned

Aligns the start of the measurement interval with the time of day clock.

test-relative

Aligns the start of the measurement interval with the start of the test.

[Tree] (config>service>vpls>sap bpdu-translation)

Full Context

configure service vpls spoke-sdp bpdu-translation

configure service vpls sap bpdu-translation

Description

This command enables the translation of BPDUs to a specified format, meaning that all BPDUs transmitted on a specified SAP or spoke-SDP will have a specified format.

The **no** form of this command reverts to the default.

Default

no bpdu-translation

Parameters

auto

Specifies that appropriate format will be detected automatically, based on type of BPDUs received on such port.

auto-rw

Specifies that appropriate format will be detected automatically and the VLAN ID will be rewritten as follows:

- BPDU sent on egress of dot1q SAP will contain the VLAN ID of the SAP in BPDU-PVID TLV
- BPDU sent on egress of default QinQ SAP will contain the outer VLAN ID of the SAP in BPDU-PVID TLV
- BPDU sent on egress of QinQ SAP will contain the inner VLAN ID of the SAP in BPDU-PVID TLV

pvst

Specifies the BPDU-format as PVST. Note: the correct VLAN tag is included in the payload (depending on encapsulation value of outgoing SAP).

pvst-rw

Specifies the BPDU-format as PVST. The VLAN ID will be rewritten as follows:

- BPDU sent on egress of dot1q SAP will contain the VLAN ID of the SAP in BPDU-PVID TLV
- BPDU sent on egress of default QinQ SAP will contain the outer VLAN ID of the SAP in BPDU-PVID TLV
- BPDU sent on egress of QinQ SAP will contain the inner VLAN ID of the SAP in BPDU-PVID TLV

stp

Specifies the BPDU-format as STP.

Platforms

7705 SAR Gen 2

6.66 breakout

breakout

Syntax

breakout *breakout*

no breakout

Context

[Tree] (config>port>connector breakout)

Full Context

configure port connector breakout

Description

This command configures the transceiver port breakout for use in the connector. Specifying the breakout type triggers the creation of accessible ports for the connector.

When a QSFP28 connector uses an SFP+ optical module with the QSFP28-to-SFP+/SFP28 adapter, the user should set the *breakout* parameter to **c1-10g**, which indicates the presence of this adapter.

The options for breakout on specific connectors depend on both the card type and level (or XMA type and level). See the applicable installation guides for more information.

For some connectors (such as QSFPDD), there can be overlap in the breakout for different host interfaces. The same port breakout can be supported on an optical module that uses a host interface of CAUI-4 as another optical module that uses 100GAUI-2. To distinguish from the CAUI-4 host interface, the "-aui2" suffix is used on some breakout options. This is only necessary where there is overlap. In other situations, SR OS sets the host interface correctly without requiring the distinction in the breakout option.

The **no** form of this command removes the ports under the connector.

Default

no breakout

Parameters

breakout

Specifies the breakout type.

Values c1-40g, c4-10g, c1-100g, c4-25g, c10-10g, c1-400g, c2-100g, c4-100g, c1-10g, c1-25g, c1-50g, c8-50g, c1-800g, c3-100g, c8-100g, c2-400g, c1-100g-aui2, c2-100g-aui2, c1-400g-aui4, c4-100g-aui1

broadcast

Syntax

broadcast {**interface** *ip-int-name*} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**ttl** *ttl*]

no broadcast {**interface** *ip-int-name*}

Context

[Tree] (config>service>vprn>ntp broadcast)

Full Context

configure service vprn ntp broadcast

Description

This command configures the node to transmit NTP packets on a given interface. Broadcast and multicast messages can easily be spoofed, therefore, authentication is strongly recommended.

The **no** form of this command removes the address from the configuration.

Parameters

ip-int-name

Specifies the local interface on which to transmit NTP broadcast packets. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes.

Values 32 character maximum

key-id

Identifies the configured authentication key and authentication type used by this node to receive and transmit NTP packets to and from an NTP server and peers. If an NTP packet is received by this node both authentication key and authentication type must be valid otherwise the packet is rejected and an event/trap generated.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all versions are accepted.

Values 2 to 4

Default 4

ttl

Specifies the IP Time To Live (TTL) value.

Values 1 to 255

Context

[Tree] (config>system>time>ntp broadcast)

Full Context

configure system time ntp broadcast

Description

This command configures the node to transmit NTP packets on a given interface. Broadcast and multicast messages can easily be spoofed, therefore, authentication is strongly recommended.

The **no** form of this command removes the address from the configuration.

Parameters

router-name

Specifies the router name used to transmit NTP packets. Base is the default. Select management to use the management port (Ethernet port on the CPM). Note that broadcast server capability can also be enabled on an interface within a VPRN context. Refer to "NTP Within a VPRN Service" in the *7705 SAR Gen 2 Layer 3 Services Guide: IES and VPRN* for more information.

Values Base | Management

Default Base

ip-int-name

Specifies the local interface on which to transmit NTP broadcast packets, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

key-id

Identifies the configured authentication key and authentication type used by this node to receive and transmit NTP packets to and from an NTP server and peers. If an NTP packet is received by this node both authentication key and authentication type must be valid otherwise the packet is rejected and an event or trap generated.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode in which case all versions are accepted.

Values 2 to 4

Default 4

ttl

Specifies the IP Time To Live (TTL) value.

Values 1 to 255

broadcast-policer

Syntax

broadcast-policer *policer-id* [**fp-redirect-group**]

no broadcast-policer

Context

[Tree] (config>qos>sap-ingress>fc broadcast-policer)

Full Context

configure qos sap-ingress fc broadcast-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **broadcast-policer** command is used to map packets that match the forwarding class and are considered broadcast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is the broadcast address (ff:ff:ff:ff:ff:ff), the packet is classified into the broadcast forwarding type.

Broadcast forwarding type packets are mapped to either an ingress multipoint queue (using the **broadcast** *queue-id* or **broadcast** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**broadcast-policer** *policer-id*). The **broadcast** and **broadcast-policer** commands within the forwarding class context are mutually exclusive. By default, the broadcast forwarding type is mapped to the SAP ingress default multipoint queue. If the **broadcast-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the broadcast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **broadcast-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where broadcast packets are not supported.

When the broadcast forwarding type within a forwarding class is mapped to a policer, the broadcast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the broadcast forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscribers or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no broadcast-policer** command will fail and the broadcast forwarding type within the forwarding class will continue its mapping to the existing policer-id. If the **no broadcast-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **broadcast-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the sap-ingress QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7705 SAR Gen 2

6.70 broadcast-queue

broadcast-queue

Syntax

broadcast-queue *queue-id* [**group** *queue-group-name*]

no broadcast queue

Context

[Tree] (config>qos>sap-ingress>fc broadcast-queue)

Full Context

configure qos sap-ingress fc broadcast-queue

Description

This command overrides the default broadcast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all broadcast traffic on a SAP using this policy will be forwarded using the *queue-id*.

The broadcast forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the broadcast forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

The *queue-id* parameter must be an existing, multipoint queue defined in the config>qos>sap-ingress context.

Values Any valid multipoint queue ID in the policy including 2 through 32.

Default 11

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

7705 SAR Gen 2

6.71 broadcastclient

broadcastclient

Syntax

broadcastclient [**router** *router-instance* | **service-name** *service-name*] {**interface** *ip-int-name*} [**authenticate**]

no broadcastclient [**router** *router-instance* | **service-name** *service-name*] {**interface** *ip-int-name*}

Context

[Tree] (config>system>time>ntp broadcastclient)

Full Context

configure system time ntp broadcastclient

Description

When configuring NTP, the node can be configured to receive broadcast packets on a specified subnet. This command configures a specific interface to listen for broadcast NTP messages. The interface may exist within a VPRN service.

Broadcast and multicast messages can easily be spoofed, so authentication is strongly recommended. If broadcast is not configured, then any received NTP broadcast traffic will be ignored. Use the **show** command to view the state of the configuration.

The **no** form of this command removes the interface from the configuration.

Parameters

router-instance

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management

service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN. The name can be up to 64 characters in length. Note that CPM routing instances are not supported.

ip-int-name

Specifies the VPRN interface on which to receive NTP broadcast packets. If the string contains special characters (such as #, $, or spaces) the entire string must be enclosed within double quotes.

authenticate

Specifies whether or not to require authentication of NTP PDUs. When enabled, NTP PDUs are authenticated upon receipt.

6.77 burst-limit

burst-limit

Syntax

burst-limit {**default** | *size* [**bytes** | **kilobytes**]}

no burst-limit

Context

[Tree] (config>service>vprn>if>sap>egress>queue-override>queue burst-limit)

Full Context

configure service vprn interface sap egress queue-override queue burst-limit

Description

The queue **burst-limit** command defines an explicit shaping burst size for a queue. The configured size defines the shaping leaky bucket threshold level that indicates the maximum burst over the queue shaping rate.

The **no** form of this command restores the default burst limit to the specified queue. This is equivalent to specifying burst-limit default within the QoS policies. When specified within a queue-override queue context, any current burst limit override for the queue is removed and the queue burst limit is controlled by its defining policy.

Default

no burst-limit

Parameters

default

Reverts the queues burst limit to the system default value.

size

When a numeric value is specified (size), the system interprets the value as an explicit burst limit size. The value is expressed as an integer and, by default, is interpreted as the burst limit in kilobytes. If the value is intended to be interpreted in bytes, the **bytes** qualifier must be added following size.

Values 0 to 13671 kilobytes

0 to 14000000 bytes

Default No default for *size*; use the **default** keyword to specify default burst limit.

bytes

Specifies that the value given for *size* must be interpreted as the burst limit in bytes.

kilobytes

Specifies that the value given for *size* must be interpreted as the burst limit in kilobytes. If neither bytes, nor kilobytes is specified, the default qualifier is **kilobytes**.

Platforms

7705 SAR Gen 2

6.78 bypass-resignal-timer

bypass-resignal-timer

Syntax

bypass-resignal-timer *minutes*

no bypass-resignal-timer

Context

[Tree] (config>router>mpls bypass-resignal-timer)

Full Context

configure router mpls bypass-resignal-timer

Description

This command triggers the periodic global re-optimization of all dynamic bypass LSP paths associated with RSVP P2P LSP. The operation is performed at each expiry of the user configurable bypass LSP resignal timer.

When this command is enabled, MPLS requests CSPF for the best path for each dynamic bypass LSP originated on this node. The constraints, hop-limit, SRLG and admin-group constraints, of the first associated LSP primary path that originally triggered the signaling of the bypass LSP must be satisfied. To do this, MPLS saves this initial Path State Block (PSB) of that LSP primary path, even if the latter is torn down.

CSPF first updates the SRLG membership of the current bypass LSP path and checks if the path violates the SRLG constraint of the initial PSB. It then attempts a new path computation for the bypass LSP using the initial PSB constraints. If CSPF returns no path or returns a new path with a cost that is lower than the current path, MPLS does not signal the new bypass path. If CSPF returns a new path with a cost that is lower than the current one, MPLS signals it. Also, if the new bypass path is SRLG strict disjoint with the primary path of the original PSB while the current path is SRLG loose disjoint, the manual bypass path is resignaled regardless of cost comparison.

Once the new path is successfully signaled, MPLS evaluates each PSB of each PLR (that is, each unique avoid-node or avoid-link constraint) associated with the current bypass LSP path to check if the corresponding LSP primary path constraints are still satisfied by the new bypass LSP path. If so, the PSB association is moved to the new bypass LSP.

Each PSB for which the constraints are not satisfied remains associated with the PLR on the current bypass LSP and is checked at the next timer or manual bypass re-optimization. Additionally, if SRLG FRR loose disjointness is configured using the **configure router mpls srlg-frr** command and the current bypass LSP is SRLG disjoint with a primary path while the new bypass LSP is not SRLG disjoint, the PSB association is not moved. When CSPF does not return a new bypass path or it returns a less optimal one, the PSBs remain associated with the current bypass path. However, it is possible that CSPF found the current bypass LSP path no longer satisfies the SRLG constraint of one or more PLRs after the update of the current path SRLG information. In that case, MPLS detaches from current bypass path the PSB associations of these PLRs. These orphaned PSBs are re-evaluated by the FRR background task which checks unprotected PSBs on a regular basis and following the same above procedure.

If a specific PLR associated with a bypass LSP is active, the corresponding PSBs remain associated with the current PLR until the Global Revertive Make-Before-Break (MBB) tears down all corresponding primary paths, which also causes the current PLR to be removed.

Note:
While it is in the preceding state, the older PLR does not get any new PSB association until the specific PLR with an active bypass LSP is removed. When the last PLR is removed, the older bypass LSP is torn down.

This feature is not supported with inter-area dynamic bypass LSP and bypass LSP protecting S2L paths of a P2MP LSP.

The **no** form of this command disables the periodic global re-optimization of dynamic bypass LSP paths.

Default

no bypass-resignal timer.

Parameters

minutes

Specifies the time, in minutes, MPLS waits before attempting to resignal dynamic bypass LSP paths originated on the system.

Values 1 to 10080

Platforms

7705 SAR Gen 2

7 c Commands

7.1 ca-name

ca-name

Syntax

ca-name *ca-name*

no ca-name

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port ca-name)

Full Context

configure port ethernet dot1x macsec sub-port ca-name

Description

This command configures the Connectivity Association (CA) linked to this MACsec sub-port. The specified CA provides the MACsec parameter to be used or negotiated with other peers.

The **no** form of this command removes the CA from the MACsec sub-port.

Parameters

ca-name

Specifies the appropriate ca to be used under this MACsec sub-port, up to 32 characters.

Platforms

7705 SAR Gen 2

7.2 ca-profile

ca-profile

Syntax

[**no**] **ca-profile** *name*

Context

Full Context

configure ipsec cert-profile entry send-chain ca-profile

Description

This command specifies a CA certificate in the specified **ca-profile** to be sent to the peer.

Multiple configurations (up to seven) of this command are allowed in the same entry.

Parameters

name

Specifies the profile name up to 32 characters.

Platforms

7705 SAR Gen 2

ca-profile

Syntax

ca-profile *name* [**create**]

no ca-profile *name*

Context

[Tree] (config>system>security>pki ca-profile)

Full Context

configure system security pki ca-profile

Description

This command creates a new **ca-profile** or enters the configuration context of an existing **ca-profile**. Up to 128 ca-profiles can be created in the system. A **shutdown** of the **ca-profile** will not affect the current up and running **ipsec-tunnel** or **ipsec-**gw that is associated with the **ca-profile**. However, authentication afterwards will fail with a **shutdown ca-profile**.

Executing a **no shutdown** command in this context causes the system to reload the configured cert-file and crl-file.

A **ca-profile** can be applied under the **ipsec-tunnel** or **ipsec-gw** configuration.

The **no** form of this command removes the name parameter from the configuration. A ca-profile cannot be removed until all the associated entities (ipsec-tunnel/gw) have been removed.

Parameters

name

Specifies the name of the **ca-profile** up to 32 characters.

create

Keyword used to create a new **ca-profile**. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

debug certificate cmpv2 ca-profile

debug certificate ocsp ca-profile

Description

This command debugs output of the specified CA profile.

- Protection method of each message is logged.
- All HTTP messages are logged. Format allows offline analysis using Wireshark.
- In the event of failed transactions, saved certificates are not deleted from file system for further debug and analysis.
- The system allows CMPv2 debugging for multiple ca-profile at the same time.

Parameters

profile-name

Specifies the name of the CA profile, up to 32 characters.

Platforms

7705 SAR Gen 2

ca-profile

Syntax

[**no**] **ca-profile** *name*

Context

[Tree] (config>system>security>tls>cert-profile>entry>send-chain ca-profile)

Full Context

configure system security tls cert-profile entry send-chain ca-profile

Description

This command enables a certificate authority (CA) certificate in the specified CA profile to be sent to the peer. Up to seven configurations of this command are permitted in the same entry.

The **no** form of the command disables the transmission of a CA certificate from the specified CA profile.

Parameters

name

Specifies the name of the certificate authority profile, up to 32 characters in length.

Platforms

7705 SAR Gen 2

7.3 cacert

cacert

Syntax

cacert est-profile *name* **output** *output-cert-filename* [**force**]

Context

[Tree] (admin>certificate>est cacert)

Full Context

admin certificate est cacert

Description

This command downloads a Certificate Authority (CA) certificate from an EST server specified by the EST profile. The downloaded certificate is imported and saved with the filename specified by the *output-cert-filename*.

Parameters

name

Specifies the EST profile name, up to 32 characters

output-cert-filename

Specifies the filename of the resulting CA certificate, up to 200 characters

force

Overwrites the existing file with same filename

Platforms

7705 SAR Gen 2

7.4 cache-reset

cache-reset

Syntax

[**no**] **cache-reset**

Context

[Tree] (debug>router>rpki-session>packet cache-reset)

Full Context

debug router rpki-session packet cache-reset

Description

This command enables debugging for cache reset RPKI packets.

The **no** form of this command disables debugging for cache reset RPKI packets.

Platforms

7705 SAR Gen 2

7.5 cache-response

cache-response

Syntax

[**no**] **cache-response**

Context

[Tree] (debug>router>rpki-session>packet cache-response)

Full Context

debug router rpki-session packet cache-response

Description

This command enables debugging for cache response RPKI packets.

The **no** form of this command disables debugging for cache response RPKI packets.

Platforms

7705 SAR Gen 2

7.6 cak

cak

Syntax

cak *hex-string* [**hash** | **hash2** | **custom**]

no cak

Context

[Tree] (config>macsec>conn-assoc>static-cak>pre-shared-key cak)

Full Context

configure macsec connectivity-association static-cak pre-shared-key cak

Description

Specifies the connectivity association key (CAK) for a pre-shared key. Two values are derived from CAK.

- Key Encryption Key (KEK), this is used to encrypt the MKA and SAK (symmetric key used for data path PDUs) to be distributed between all members.
- Integrity Check Value (ICK), this is used to authenticate the MKA and SAK PDUs to be distributed between all members.

The **no** form of this command removes the value.

Parameters

hex-string

Specifies the value of the CAK.

Values up to 64 hexadecimal characters, 32 hexadecimal characters for 128-bit key and 64 hexadecimal characters for 256-bit key

hash

Keyword, specifying the hash scheme.

hash2

Keyword, specifying the hash scheme.

custom

Specifies the custom encryption for management interface.

Platforms

7705 SAR Gen 2

7.7 called-station-id

called-station-id

Syntax

[**no**] **called-station-id**

Context

[Tree] (config>ipsec>rad-auth-plcy>include called-station-id)

[Tree] (config>ipsec>rad-acct-plcy>include called-station-id)

Full Context

configure ipsec radius-authentication-policy include-radius-attribute called-station-id

configure ipsec radius-accounting-policy include-radius-attribute called-station-id

Description

This command includes called station ID attributes.

The **no** form of this command excludes called station ID attributes.

Default

no called-station-id

Platforms

7705 SAR Gen 2

7.8 calling-station-id

calling-station-id

Syntax

[**no**] **calling-station-id**

Context

[Tree] (config>ipsec>rad-auth-plcy>include calling-station-id)

[Tree] (config>ipsec>rad-acct-plcy>include calling-station-id)

Full Context

configure ipsec radius-authentication-policy include-radius-attribute calling-station-id

configure ipsec radius-accounting-policy include-radius-attribute calling-station-id

Description

This command enables the inclusion of the **calling-station-id** attribute in RADIUS authentication requests and RADIUS accounting messages.

Default

no calling-station-id

Platforms

7705 SAR Gen 2

7.9 cancel-commit

cancel-commit

Syntax

[**no**] **cancel-commit**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization cancel-commit)

Full Context

configure system security profile netconf base-op-authorization cancel-commit

Description

This command enables the NETCONF <cancel-commit> RPC.

The **no** form of this command disables the RPC.

Default

no cancel-commit

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

7.10 candidate

candidate

Syntax

candidate

Context

[Tree] (candidate)

Full Context

candidate

Description

Commands in this context edit candidate configurations.

Commands in the **candidate** CLI branch, except **candidate edit**, are available only when in edit-cfg mode.

Platforms

7705 SAR Gen 2

candidate

Syntax

[**no**] **candidate**

Context

[Tree] (config>system>netconf>capabilities candidate)

Full Context

configure system netconf capabilities candidate

Description

This command allows the SR OS NETCONF server to access the candidate configuration datastore. Configuring this command also enables using **commit** and **discard-changes**.

When **configure system management-interface configuration-mode** is set to **classic**, the candidate capability is disabled, even if this command is configured.

The **no** form of the command disables the SR OS NETCONF server from accessing the candidate datastore. If the candidate is disabled, requests that reference the candidate datastore return an error, and when a NETCONF client establishes a new session, the candidate capability is not advertised in the SR OS NETCONF Hello message.

Default

candidate

Platforms

7705 SAR Gen 2

7.11 cannot-change-password

cannot-change-password

Syntax

[**no**] **cannot-change-password**

Context

[Tree] (config>system>security>user>console cannot-change-password)

Full Context

configure system security user console cannot-change-password

Description

This command allows a user the privilege to change their password for both FTP and console login.

To disable a user's privilege to change their password, use the **cannot-change-password** form of this command.

Note:
The **cannot-change-password** flag is not replicated when a user copy is performed. A new-password-at-login flag is created instead.

Default

no cannot-change-password

Platforms

7705 SAR Gen 2

7.12 capture

capture

Syntax

capture [{**start** | **stop**}]

Context

[Tree] (debug>pcap capture)

Full Context

debug pcap capture

Description

This command starts and stops the packet capture process for the specified *session-name*.

Parameters

start

Starts the packet capture process and also start or restarts the FTP or TFTP session. If the FTP or TFTP server is unreachable, the command prompt rejects further input until the retires are timed out after 24 seconds (after four attempts of about six seconds each). If the same file name is unchanged in the **config**>**mirror**>**mirror-dest**>**pcap** context between captures, this command overwrites the file content.

stop

Stops the packet capture process and also stops the FTP or TFTP session. If the FTP or TFTP server is unreachable, the command prompt rejects further input until the retires are timed out after 24 seconds (after four attempts of about six seconds each).

Platforms

7705 SAR Gen 2

7.13 card

card

Syntax

[**no**] **card** *slot-number*

Context

[Tree] (config card)

Full Context

configure card

Description

This mandatory command enables access to the chassis and context. In SR OS cards cover IOM, IMM, and XCM.

The **no** form of this command removes the card from the configuration. All associated ports, services, and MDAs must be shutdown.

Default

no card

Parameters

slot-number

Specifies the slot number of the card in the chassis. The maximum slot number is platform dependent. Refer to the hardware installation guides.

Values 1 to 10

Platforms

7705 SAR Gen 2

7.14 card-type

card-type

Syntax

card-type *card-type* [**level** *card-level*]

no card-type

Context

[Tree] (config>card card-type)

Full Context

configure card card-type

Description

This mandatory command adds an IOM/XCM to the device configuration for the slot. The card type can be preprovisioned, meaning that the card does not need to be installed in the chassis.

A card must be provisioned before an MDA, connector, or port can be configured.

A card can only be provisioned in a slot that is vacant, meaning no other card can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

A card can only be provisioned in a slot if the card type is allowed in the slot. An error message is generated if an attempt is made to provision a card type that is not allowed.

If a card is inserted that does not match the configured card type for the slot, then a log event and facility alarm is raised. The alarm is cleared when the correct card type is installed or the configuration is modified.

A log event and facility alarm are is raised if an administratively enabled card is removed from the chassis. The alarm is cleared when the correct card type is installed or the configuration is modified. A log event is issued when a card is removed that is administratively disabled.

Because IMMs do not have the capability to install separate MDAs, the configuration of the MDA is automatic. This configuration only includes the default parameters such as default buffer policies. Commands to manage the MDA such as **shutdown** and so on, remain in the MDA configuration context.

Some card hardware can support two different firmware loads. One load includes the base Ethernet functionality, including 10G WAN mode, but does not include 1588 port-based timestamping. The second load includes the base Ethernet functionality and 1588 port-based timestamping, but does not include 10G WAN mode. These are identified as two card types that are the same, except for a "-ptp” suffix to indicate the second loadset; for example, *imm40-10gb-sfp* and *imm40-10gb-sfp-ptp*. A hard reset of the card occurs when switching between the two provisioned types.

An appropriate alarm is raised if a partial or complete card failure is detected. The alarm is cleared when the error condition ceases.

New generations of cards include variants controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the card type. A card cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by card type.

The provisioned level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that card.

The **no** form of this command removes the card from the configuration.

Default

no card-type

Parameters

card-type

Specifies the type of card to be configured and installed in that slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported card-types and their CLI strings. In addition, the command can be queried to check which card-types are relevant for the active platform type. Some examples include iom4-e-b and imm-2pac-fp3.

card-level

Specifies the license level of the card, up to 32 characters. Possible values vary by card type.

Full Context

configure service vpls sap ingress queue-override queue cbs

configure service ies interface sap ingress queue-override queue cbs

configure service ies interface sap egress queue-override queue cbs

configure service vpls sap egress queue-override queue cbs

Description

This command overrides specific attributes of the specified queue's CBS parameters.

It is permissible, and possibly desirable, to oversubscribe the total CBS reserved buffers for a given access port egress buffer pool. Oversubscription may be desirable due to the potential large number of service queues and the economy of statistical multiplexing the individual queue's CBS settings into the defined reserved total.

When oversubscribing the reserved total, it is possible for a queue depth to be lower than its CBS setting and still not receive a buffer from the buffer pool for an ingress frame. As more queues are using their CBS buffers and the total in use exceeds the defined reserved total, essentially the buffers are being removed from the shared portion of the pool without the shared in use average and total counts being decremented. This can affect the operation of the high and low priority RED slopes on the pool, causing them to miscalculate when to start randomly drop packets.

If the CBS value is larger than the MBS value, an error will occur, preventing the CBS change.

The **no** form of this command returns the CBS size to the default value.

Parameters

size-in-kbytes

Specifies the size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is desired, enter the value 10. A value of 0 specifies

that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes).

Values 0 to 1048576, default

Full Context

configure card fp ingress network queue-group policer-override policer cbs

configure card fp ingress access queue-group policer-override policer cbs

Description

This command configures the policer's CIR leaky bucket's exceed threshold. The CIR bucket's exceed threshold represents the committed burst tolerance allowed by the policer. If the policer's forwarding rate is equal to or less than the policer's defined CIR, the CIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the forwarding rate increases beyond the profiling rate, the amount of data allowed to be in-profile above the rate is capped by the threshold.

The policer's **cbs** size defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command returns the policer to its default CBS size.

Parameters

size

Specifies that the *size* parameter is required when specifying **cbs** and is expressed as an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **bytes** and **kilobytes** keywords are mutually exclusive and are used to explicitly define whether *size* represents bytes or kilobytes.

Values 0 to 2683435456

bytes

When **bytes** is defined, the value given for size is interpreted as the queue's CBS value specified in bytes.

kilobytes

When **kilobytes** is defined, the value is interpreted as the queue's CBS value given in kilobytes.

Default **kilobyte**

default

Specifying the keyword **default** sets the CBS to its default value.

configure qos sap-egress policer cbs

configure qos sap-ingress policer cbs

Description

This command configures the policer’s CIR leaky bucket’s exceed threshold. The CIR bucket’s exceed threshold represents the committed burst tolerance allowed by the policer. If the policer’s forwarding rate is equal to or less than the policer's defined CIR, the CIR bucket depth hovers around the 0 depth with spikes up to the maximum packet size in the offered load. If the forwarding rate increases beyond the profiling rate, the amount of data allowed to be in-profile above the rate is capped by the threshold.

The policer’s **cbs** size defined in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command returns the policer to its default CBS size.

By default, the CBS is 16 Mbytes when CIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured CBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max CIR capped to 3968 kbytes, with a minimum of 256 bytes.

Parameters

size [bytes | kilobytes]

Specifies an integer representing the required size in either bytes or kilobytes. The default is kilobytes. The optional **byte** and **kilobyte** keywords are mutually exclusive and are used to explicitly define whether size represents bytes or kilobytes.

Values 0 to 2683435456, **default**

cbs delay-time *microseconds*

cbs delay-percent *percent*

no cbs

Context

[Tree] (config>qos>sap-egress>queue cbs)

Full Context

configure qos sap-egress queue cbs

Description

This command provides a mechanism to override the default reserved buffers for the queue. It is permissible, and possibly desirable, to oversubscribe the total CBS reserved buffers for a specific access

port egress buffer pool. Oversubscription may be desirable because of the potentially large number of service queues and the economy of statistical multiplexing the CBS settings of the individual into the defined reserved total.

When oversubscribing the reserved total, it is possible for a queue depth to be lower than its CBS setting and still not receive a buffer from the buffer pool for an ingress frame. As more queues use their CBS buffers and the total-in-use exceeds the defined reserved total, essentially the buffers are removed from the shared portion of the pool without the shared in-use average and total counts being decremented. This can affect the operation of the high- and low-priority RED slopes on the pool, causing them to miscalculate when to start randomly dropping packets.

If the CBS value is larger than the MBS value, the CBS is capped to the value of the MBS or the minimum CBS value. If the MBS and CBS values are configured to be equal (or nearly equal), this will result in the CBS being slightly higher than the value configured.

The **delay-time** command option configures the CBS as a function of the expected delay. The system automatically translates this configuration into kilobytes based on the administrative rate of the queue parent (for example, the port, scheduler, or aggregate-shaper).

The **delay-percent** command option configures the CBS as percentage of the SAP delay budget of the queue configured using the **latency-budget** command.

The **no** form of this command returns the CBS size to the default value.

Default

cbs default

Parameters

size-in-kbytes

The size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is required, enter the value 10. A value of 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes). The CBS maximum value used is constrained by the pool size in which the queue exists.

Values 0 to 1048576

Minimum configurable non-zero value: 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Minimum non-zero default value: maximum of 10 ms of CIR, or 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

microseconds

Specifies the CBS as a function of delay time.

Values 0 to 1000000

percent

Specifies the CBS as a percentage of the SAP latency budget.

Values 0.00 to 100.00

Platforms

cbs

Syntax

cbs *size-in-kbytes*

no cbs

Context

[Tree] (config>qos>sap-ingress>queue cbs)

Full Context

configure qos sap-ingress queue cbs

Description

This command provides a mechanism to override the default reserved buffers for the queue. It is permissible, and possibly desirable, to oversubscribe the total CBS reserved buffers for a given access port egress buffer pool. Oversubscription may be desirable due to the potentially large number of service queues and the economy of statistical multiplexing the individual queue's CBS settings into the defined reserved total.

When oversubscribing the reserved total, it is possible for a queue depth to be lower than its CBS setting and still not receive a buffer from the buffer pool for an ingress frame. As more queues are using their CBS buffers and the total in use exceeds the defined reserved total, essentially the buffers are being removed from the shared portion of the pool without the shared in use average and total counts being decremented. This can affect the operation of the high- and low-priority RED slopes on the pool, causing them to miscalculate when to start randomly dropping packets.

If the CBS value is larger than the MBS value, the CBS is capped to the value of the MBS or the minimum CBS value. If the MBS and CBS values are configured to be equal (or nearly equal), this will result in the CBS being slightly higher than the value configured.

The **no** form of this command returns the CBS size to the default value.

Default

cbs default

Parameters

size-in-kbytes

The size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is desired, enter the value 10. A value of 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes) The CBS maximum value used is constrained by the pool size in which the queue exists.

Values 0 to 1048576 or default

Minimum configurable non-zero value: 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Minimum non-zero default value: maximum of 10 ms of CIR, or 6 kbytes on an FP2, 7680 bytes on an FP3, and 16 kbytes on an FP4

Platforms

7705 SAR Gen 2

cbs

Syntax

cbs *percent*

no cbs

Context

[Tree] (config>qos>network-queue>queue cbs)

Full Context

configure qos network-queue queue cbs

Description

The Committed Burst Size (**cbs**) command specifies the relative number of reserved buffers for a specific ingress network FP forwarding class queue or egress network port forwarding class queue. The value is entered as a percentage.

The CBS for a queue is used to determine whether it has exhausted its reserved buffers while enqueuing packets. When the queue has exceeded the number of buffers considered in reserve for this queue, it must contend with other queues for the available shared buffer space within the buffer pool. Access to this shared pool space is controlled through Random Early Detection (RED) slope application.

Two RED slopes are maintained in each buffer pool. A high-priority slope is used by in-profile packets. A low-priority slope is used by out-of-profile packets. At egress, there are two additional RED slopes maintained in each buffer pool: the highplus slope is used by inplus-profile packets, and the exceed slope is used by exceed-profile packets. All network control and management packets are considered in-profile. Assured packets are handled by their in-profile and out-of-profile markings. All best-effort packets are considered out-of-profile. Premium queues should be configured such that the CBS percent is sufficient to prevent shared buffering of packets. This is generally taken care of by the CIR scheduling of premium queues and the overall small amount of traffic on the class. Premium queues in a properly designed system will drain before all others, limiting their buffer utilization.

The RED slopes will detect congestion conditions and work to discard packets and slow down random TCP session flows through the queue. The RED slope definitions can be defined, modified, or disabled through the slope policy assigned to the FP for the network ingress buffer pool or assigned to the network port for network egress buffer pools.

The resultant CBS size can be larger than the MBS. This will result in a portion of the CBS for the queue to be unused and should be avoided.

The **no** form of this command returns the CBS size for the queue to the default for the forwarding class.

Default

The cbs forwarding class defaults are listed in the Table 20: CBS Forwarding Class Defaults.

Table 20: CBS Forwarding Class Defaults

Forwarding Class	Forwarding Class Label	Default CBS
Network-Control	nc	3
High-1	h1	3
Expedited	ef	1
High-2	h2	1
Low-1	l1	3
Assured	af	1
Low-2	l2	3
Best-Effort	be	1

Parameters

percent

The percent of buffers reserved from the total buffer pool space, expressed as a decimal integer. If 10 Mbytes is the total buffer space in the buffer pool, a value of 10 would reserve 1 Mbyte (10%) of buffer space for the forwarding class queue. The value 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can be applied for scheduling purposes).

Values 0 to 100

no cbs

Context

[Tree] (config>qos>qgrps>ing>qgrp>policer cbs)

[Tree] (config>qos>qgrps>egr>qgrp>policer cbs)

Full Context

configure qos queue-group-templates ingress queue-group policer cbs

configure qos queue-group-templates egress queue-group policer cbs

Description

The **cbs** command is used to define the default committed buffer size for the template queue or the CBS for the template policer. Overall, the cbs command follows the same behavior and provisioning characteristics as the cbs command in the SAP ingress and egress QoS policy.

The **no** form of this command restores the default CBS size to the template policer.

Default

default

Parameters

size-in-kbytes

For the queues, the size parameter is an integer expression of the number of kilobytes reserved for the queue. If a value of 10 kbytes is desired, enter the value 10. A value of 0 specifies that no reserved buffers are required by the queue (a minimal reserved size can still be applied for scheduling purposes). For policers, the size parameter is an integer expression of the number of kilobytes for the policer CBS.

Values 0 to 2683435456, **default**

Minimum default value: 16 Mbytes when CIR equals max or is greater than or equal to the FP capacity (this overrides an explicit configured CBS value); otherwise, 10 ms volume of traffic for a configured non-zero/non-max CIR capped to 3968 kbytes, with a minimum of 256 bytes.

7.19 cert-file

cert-file

Syntax

cert-file *filename*

no cert-file

Context

[Tree] (config>system>security>pki>ca-profile cert-file)

Full Context

configure system security pki ca-profile cert-file

Description

This command specifies the filename of a file in cf3:\system-pki\cert as the CA's certificate of the ca-profile.

Notes:

- The system will perform following checks against configured cert-file when a **no shutdown** command is issued:
  - Configured cert-file must be a DER formatted X.509v3 certificate file.
  - All non-optional fields defined in section 4.1 of RFC 5280 must exist and conform to the RFC 5280 defined format.
  - Check the version field to see if its value is 0x2.
  - Check The Validity field to see that if the certificate is still in validity period.
  - X509 basic constraints extension must exists, and CA Boolean must be True.
  - If Key Usage extension exists, then at least keyCertSign and cRLSign should be asserted.
  - If the certificate is not a self-signing certificate, then system will try to look for issuer's CA's certificate to verify if this certificate is signed by issuer's CA; but if there is no such CA-profile configured, then system will just proceed with a warning message.
  - If the certificate is not a self-signing certificate, then system will try to look for issuer's CA's CRL to verify that it has not been revoked; but if there is no such CA-profile configured or there is no such CRL, then system will just proceed with a warning message.

  If any of above checks fails, then the **no shutdown** command will fail.
- Changing or removing of **cert-file** is only allowed when the **ca-profile** is in a **shutdown** state.

The **no** form of this command removes the filename from the configuration.

Parameters

filename

Specifies a local CF card file URL.

Platforms

7705 SAR Gen 2

configure system security tls server-tls-profile cert-profile

Description

This command assigns a TLS certificate profile to be used by the TLS server profile. This certificate is sent to the client for authentication of the server and public key.

The **no** form of the command removes the TLS certificate profile assignment.

Parameters

name

Specifies the name of the TLS certificate profile, up to 32 characters in length.

Platforms

7705 SAR Gen 2

7.21 cert-request

cert-request

Syntax

cert-request ca *ca-profile-name* **current-key** *key-filename* **current-cert** *cert-filename* [**hash-alg** *hash-algorithm*] **newkey** *key-filename* **subject-dn** *subject-dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* | *ipv6-address*] **save-as** *save-path-of-result-cert*

Context

[Tree] (admin>certificate>cmpv2 cert-request)

Full Context

admin certificate cmpv2 cert-request

Description

This command requests an additional certificate after the system has obtained the initial certificate from the CA.

The request is authenticated by a signature signed by the current-key, along with the current-cert. The hash algorithm used for signature is depends on the key type:

- DSA key: SHA1
- RSA key: MD5/SHA1/SHA224 | SHA256 | SHA384 | SHA512, by default is SHA1

In some cases, the CA may not return a certificate immediately, due to reasons such as **request processing need manual intervention**. In such cases, the **admin certificate cmpv2 poll** command can be used to poll the status of the request.

Parameters

ca *ca-profile-name*

Specifies a ca-profile name which includes CMP server information up to 32 characters.

current-key *key-filename*

Specifies corresponding certificate issued by the CA up to 95 characters.

current-cert *cert-filename*

Specifies the file name of an imported certificate that is attached to the certificate request up to 95 characters.

newkey *key-filename*

Specifies the file name of the imported key up to 95 characters.

hash-alg *hash-algorithm*

Specifies the hash algorithm for RSA key.

Values md5,sha1,sha224,sha256,sha384,sha512

subject-dn *dn*

Specifies the subject of the requesting certificate up to 256 characters.

Values attr1=val1,attr2=val2 where: attrN={C | ST | O | OU | CN}

save-as *save-path-of-result-cert*

Specifies the save full path name of saving the result certificate, up to 200 characters.

domain-name *domain-names*

Specifies FQDNs for SubjectAltName of the requesting certificate, separated by commas, up to 512 characters.

ip-addr *ip-address* | *ipv6-address*

Specifies an IPv4 or IPv6 address for SubjectAltName of the requesting certificate.

Platforms

7705 SAR Gen 2

7.22 cert-sync

cert-sync

Syntax

[**no**] **cert-sync**

Context

[Tree] (config>redundancy cert-sync)

configure system security pki certificate-display-format

Description

This command specifies the display format used for the Certificates and Certificate Revocation Lists.

Default

certificate-display-format ascii

Parameters

ascii

Specifies the ASCII format to use for the Certificates and Certificate Revocation Lists.

utf8

Specifies the UTF8 format to use for the Certificates and Certificate Revocation Lists.

Platforms

7705 SAR Gen 2

7.26 certificate-expiration-warning

certificate-expiration-warning

Syntax

certificate-expiration-warning *hours* [**repeat** *repeat-hours*]

no certificate-expiration-warning

Context

[Tree] (config>system>security>pki certificate-expiration-warning)

Full Context

configure system security pki certificate-expiration-warning

Description

With this command configured, the system issues two types of warnings related to certificate expiration:

- **BeforeExp —** A warning message issued before certificate expire
- **AfterExp —** A warning message issued when certificate expire

This command specifies when system will issue **BeforeExp** message before a certificate expires. For example, with c**ertificate-expiration-warning 5**, the system will issue a **BeforeExp** message 5 hours before a certificate expires. An optional **repeat** <*repeat-hour*> parameter will enable the system to repeat the **BeforeExp** message every hour until the certificate expires.

If the user only wants **AfterExp**, then **certificate-expiration-warning 0** can be used to achieve this.

BeforeExp and **AfterExp** warnings can be cleared in following cases:

- The certificate is reloaded by the **admin certificate reload** command. In this case, if the reloaded file is not expired, then **AfterExp** is cleared. And, if the reloaded file is outside of configured warning window, then the **BeforeExp** is also cleared.
- When the **ca-profile/ipsec-gw/ipsec-tunnel/cert-profile** is shutdown, then **BeforeExp** and **AfterExp** of corresponding certificates are cleared.
- When **no certificate-expiration-warning** command is configured, then all existing **BeforeExp** and **AfterExp** are cleared.
- Users may change the configuration of the **certificate-expiration-warning** so that certain certificates are no longer in the warning window. **BeforeExp** of corresponding certificates are cleared.
- If the system time changes so that the new time causes the certificates to no longer be in the warning window, then **BeforeExp** is cleared. If the new time causes an expired certificate to come non-expired, then **AfterExp** is cleared.

Default

no certificate-expiration-warning

Parameters

hours

Specifies the amount of time before a certificate expires when system issues BeforeExp.

Values 0 to 8760

repeat-hours

Specifies the time the system will repeat BeforeExp every repeat-hour.

Values 0 to 8760

Platforms

7705 SAR Gen 2

7.27 certificate-update-profile

certificate-update-profile

Syntax

certificate-update-profile *profile-name* [**create**]

Context

[Tree] (config>system>security>pki certificate-update-profile)

Full Context

configure system security pki certificate-update-profile

Description

Commands in this context configure a certificate update profile that specifies the behavior of the automatic update certificate.

The **no** form of this command removes the profile.

Parameters

profile-name

Specifies the name of the profile, up to 32 characters.

create

Mandatory keyword to create a certificate update profile.

Platforms

7705 SAR Gen 2

7.28 cflash-cap-alarm

cflash-cap-alarm

Syntax

cflash-cap-alarm *cflash-id* **rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]

no cflash-cap-alarm *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-alarm)

Full Context

configure system thresholds cflash-cap-alarm

Description

This command enables capacity monitoring of the compact flash specified in this command. The severity level is alarm. Both a rising and falling threshold can be specified.

The **no** form of this command removes the configured compact flash threshold alarm.

Parameters

cflash-id

Specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period, in seconds, over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created

If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-alarm cf1-A: rising-threshold 50000000 falling-
threshold 49999900
interval 120 rmon-event-type both start-alarm rising
```

7.29 cflash-cap-alarm-pct

cflash-cap-alarm-pct

Syntax

cflash-cap-alarm-pct *cflash-id* **rising-threshold** *percentage* [**falling-threshold** *percentage*] **interval** *seconds* [**rmon-event-type** *event-type*] [**startup-alarm** *alarm-type*]

no cflash-cap-alarm-pct *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-alarm-pct)

Full Context

configure system thresholds cflash-cap-alarm-pct

Description

This command enables capacity monitoring of the compact flash specified in this command. The usage is monitored as a percentage of the capacity of the compact flash. The severity level is alarm. Both a rising and falling threshold can be specified.

The **no** form of this command removes the configured compact flash threshold alarm.

Parameters

cflash-id

Specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold ***percentage***

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value is the percentage of used space versus capacity for the specified compact flash.

Values 0 to 100

Default 0

falling-threshold ***percentage***

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value is the percentage of used space versus capacity for the specified compact flash.

Values 0 to 100

Default 0

seconds

Specifies the polling period, in seconds, over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created.

If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-alarm-pct cf1-A: rising-threshold 70 falling-
threshold 60 interval 120 rmon-event-type both start-alarm
 rising
```

Platforms

7705 SAR Gen 2

7.30 cflash-cap-warn

cflash-cap-warn

Syntax

cflash-cap-warn *cflash-id* **rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]

no cflash-cap-warn *cflash-id*

Context

[Tree] (config>system>thresholds cflash-cap-warn)

Full Context

configure system thresholds cflash-cap-warn

Description

This command enables capacity monitoring of the compact flash specified in this command.

The severity level is warning. Both a rising and falling threshold can be specified. The **no** form of this command removes the configured compact flash threshold warning.

Parameters

cflash-id

Specifies that the cflash-id specifies the name of the cflash device to be monitored.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rising-threshold *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal to the **falling-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

falling-threshold ***threshold***

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.

The threshold value represents units of 512 bytes.

Values -2147483648 to 2147483647

Default 0

seconds

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

Values 1 to 2147483647

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and a SR OS logger event are generated.

none — No action is taken.

Default both

alarm-type

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated.

If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.

Values rising, falling, either

Default either

Configuration example

```
cflash-cap-warn cf1-B: rising-threshold 2000000 falling-threshold 1999900
interval 240 rmon-event-type trap start-alarm either
```

Platforms

7.32 chain-to-system-filter

chain-to-system-filter

Syntax

[**no**] **chain-to-system-filter**

Context

[Tree] (config>filter>ipv6-filter chain-to-system-filter)

[Tree] (config>filter>ip-filter chain-to-system-filter)

Full Context

configure filter ipv6-filter chain-to-system-filter

configure filter ip-filter chain-to-system-filter

Description

This command chains this filter to a currently active system filter. When the filter is chained to the system filter, the system filter rules are executed first, and the filter rules are only evaluated if no match on the system filter was found.

The **no** form of the command detaches this filter from the system filter.

Operational note:

If no system filter is currently active, the command has no effect.

Default

no chain-to-system-filter

Platforms

7705 SAR Gen 2

7.33 check-id-kp-cmcra-only

check-id-kp-cmcra-only

Syntax

[**no**] **check-id-kp-cmcra-only**

Context

[Tree] (config>system>security>pki>est-profile check-id-kp-cmcra-only)

Full Context

configure system security pki est-profile check-id-kp-cmcra-only

Description

This command enables checking id-kp-cmcRA in the EST certificate. When enabled, instead of the subject or subject alternative name, only the id-kp-cmcRA existence in extended key usage extension of EST server certificate is checked. The id-kp-cmcRA identifies a Registration Authority.

The **no** form of this command reverts to the default value.

Default

no check-id-kp-cmcra-only

Platforms

7705 SAR Gen 2

7.34 check-zero

check-zero

Syntax

check-zero {**enable** | **disable**}

no check-zero

configure service vprn rip check-zero

configure service vprn ripng check-zero

configure service vprn rip group neighbor check-zero

configure service vprn ripng group neighbor check-zero

configure service vprn rip group check-zero

configure service vprn ripng group check-zero

Description

This command enables checking for zero values in fields specified to be zero by the RIPv1 and RIPv2 specifications.

The **no** form of this command disables this check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

Default

no check-zero

Parameters

enable

Enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting noncompliant RIP messages.

disable

Disables the checking and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

Platforms

7705 SAR Gen 2

check-zero

Syntax

check-zero {**enable** | **disable**}

no check-zero

Context

[Tree] (config>router>rip check-zero)

[Tree] (config>router>ripng>group>neighbor check-zero)

[Tree] (config>router>ripng>group check-zero)

[Tree] (config>router>ripng check-zero)

[Tree] (config>router>rip>group check-zero)

Full Context

configure router rip check-zero

configure router rip group neighbor check-zero

configure router ripng group neighbor check-zero

configure router ripng group check-zero

configure router ripng check-zero

configure router rip group check-zero

Description

This command enables checking for zero values in fields specified to be zero by the RIPv1 and RIPv2 specifications.

The **check-zero enable** command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages.

The **check-zero disable** command disables this check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no check-zero**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command removes the **check-zero** command from the configuration.

Parameters

enable

Specifies to reject RIP messages which do not have zero in the RIPv1 and RIPv2 mandatory fields.

disable

Specifies allows receipt of RIP messages which do not have the mandatory zero fields reset.

7705 SAR Gen 2

7.35 checksum

checksum

Syntax

checksum {**md5** | **sha256**} *file-url*

Context

[Tree] (file checksum)

Full Context

file checksum

Description

This command computes and displays a checksum for a file.

Parameters

md5

Specifies the use of the MD5 algorithm to produce the file checksum.

sha256

Specifies the use of the SHA-256 algorithm to produce the file checksum.

file-url

Specifies the location of the file.

Values

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters

	directory length up to 199 characters
remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
ipv4-address	*a.b.c.d*

7.36 chli-event

chli-event

Syntax

chli-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no chli-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events chli-event)

Full Context

configure oam-pm session ip twamp-light loss-events chli-event

Description

This command sets the consecutive high loss interval (CHLI) threshold to be monitored and the associated thresholds using the counter of the specified direction. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried

forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no chli-event forward

no chli-event backward

no chli-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies the numerical value compared to the CHLI counter that is the rising threshold that determines when the event is to be generated, when the percentage of loss value is reached.

Values 1 to 864000

clear-threshold

Specifies an optional numerical value compared to the CHLI counter used for stateful behavior that allows the operator to configure a value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the CHLI counter must be 0.

Platforms

7705 SAR Gen 2

7.37 cipher

cipher

Syntax

cipher *index* **name** *cipher-name*

no cipher *index*

Context

[Tree] (config>system>security>ssh>server-cipher-list cipher)

[Tree] (config>system>security>ssh>client-cipher-list cipher)

Full Context

configure system security ssh server-cipher-list cipher

configure system security ssh client-cipher-list cipher

Description

This command configures a cipher. Client-ciphers are used when the SR OS is acting as an SSH client. Server-ciphers are used when the SR OS is acting as an SSH server.

The **no** form of this command removes the index and cipher name from the configuration.

Default

no cipher *index*

Parameters

index

Specifies the index of the cipher in the list.

Values 1 to 255

cipher-name

Specifies the algorithm used when performing encryption or decryption.

Values Client ciphers: 3des-cbc, aes128-cbc, aes192-cbc, aes256-cbc, aes128-ctr, aes192-ctr, aes256-ctr.

Server ciphers: 3des-cbc, aes128-cbc, aes192-cbc, aes256-cbc, aes128-ctr, aes192-ctr, aes256-ctr.

The following table lists the default ciphers used for SSHv2.

Table 21: SSHv2 Default Ciphers

Cipher index value	Cipher name
190	aes256-ctr
192	aes192-ctr
194	aes128-ctr
200	aes128-cbc
205	3des-cbc

configure system security tls client-tls-profile cipher-list

Description
This command assigns the cipher list to be used by the TLS client profile for negotiation in the client Hello message.

Parameters
name
Specifies the name of the cipher list.

Platforms
7705 SAR Gen 2

cipher-list

Syntax
cipher-list *name*
no cipher-list

Context

[Tree] (config>system>security>tls>server-tls-profile cipher-list)

Full Context

configure system security tls server-tls-profile cipher-list

Description

This command assigns a cipher list to be used by the TLS server profile. This cipher list is used to find matching ciphers with the cipher list that is received from the client.

The **no** form of the command removes the cipher list.

Parameters

name

Specifies the name of the cipher list, up to 32 characters in length.

Platforms

7705 SAR Gen 2

7.39 cipher-suite

cipher-suite

Syntax

cipher-suite *cipher-suite*

no cipher-suite

Context

[Tree] (config>macsec>connectivity-association cipher-suite)

Full Context

configure macsec connectivity-association cipher-suite

Description

This command configures encryption of data path PDUs. When all parties in the Connectivity Association (CA) have the SAK, they use the above algorithm in conjunction with the SAK to encrypt the data path PDUs.

The XPN 64 bit (extended packet number) can be used for higher rate ports such as 10 GigE to minimize the window rollover and renegotiation of the SAK.

The **no** form of this command disables encryption of data path PDUs.

Default

cipher-suite gcm-aes-128

Parameters

cypher-suite

Specifies the algorithm.

Values gcm-aes-128 — algorithm is used for control plain encryption

gcm-aes-256 — algorithm is used for control plain encryption

gcm-aes-xpn-128 — algorithm with extended packet number is used for control plain encryption

gcm-aes-xpn-256 — algorithm with extended packet number is used for control plain encryption

circuit-id

Syntax

circuit-id string *ascii-string*

circuit-id hex *hex-string*

no circuit-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident circuit-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification circuit-id

Description

This command specifies the circuit ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the circuit ID is matched against DHCP Option 82.

Note:
This command is only used when **circuit-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the circuit ID from the configuration.

Parameters

ascii-string

Specifies the circuit ID from the Option 82, up to 127 characters.

hex-string

Specifies the circuit ID in hexadecimal format from the Option 82.

Values 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

Platforms

7705 SAR Gen 2

circuit-id

Syntax

circuit-id

circuit-id {**ascii-tuple** | **if-index** | **sap-id** | **vlan-ascii-tuple**}

circuit-id hex [*hex-string*]

no circuit-id

Context

[Tree] (config>service>vprn>if>dhcp>option circuit-id)

[Tree] (config>service>vpls>sap>dhcp>option circuit-id)

[Tree] (config>service>ies>if>dhcp>option circuit-id)

Full Context

configure service vprn interface dhcp option circuit-id

configure service vpls sap dhcp option circuit-id

configure service ies interface dhcp option circuit-id

Description

When enabled, the router sends an ASCII-encoded tuple in the **circuit-id** sub-option of the DHCP packet. This ASCII-tuple consists of the access-node-identifier, service-id, and SAP-ID, separated by "|". If no keyword is configured, then the circuit-id sub-option will not be part of the information option (Option 82). When the command is configured without any parameters, it equals to circuit-id ascii-tuple.

To send a tuple in the circuit ID, the **action replace** command must be configured in the same context.

If disabled, the **circuit-id** sub-option of the DHCP packet is left empty.

The **no** form of this command specifies to leave the circuit-id option of the packet empty.

Default

circuit-id ascii-tuple

Parameters

ascii-tuple

Specifies that the ASCII-encoded concatenated tuple consisting of the access-node-identifier, service-id, and interface-name is used.

ifindex

Specifies that the interface index is used. The If Index of a router interface can be displayed using the command **show>router>if>detail**.

sap-id

Specifies that the SAP identifier is used.

vlan-ascii-tuple

Specifies that the format will include VLAN-id and dot1p bits in addition to what is included in ascii-tuple already. The format is supported on dot1q and qinq ports only. Thus, when the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of an outgoing packet.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF...(up to 64 hex nibbles)

Platforms

7705 SAR Gen 2

circuit-id

Syntax

circuit-id {**ascii-tuple** | **ifindex** | **if-name** | **port-id** | **vlan-ascii-tuple** | **none**}

no circuit-id

Context

[Tree] (config>router>if>dhcp>option circuit-id)

Full Context

configure router interface dhcp option circuit-id

Description

When enabled, the router sends the interface index (If Index) in the **circuit-id** suboption of the DHCP packet. The If Index of a router interface can be displayed using the command **show router interface detail**. This option specifies data that must be unique to the router that is relaying the circuit.

If disabled, the **circuit-id** suboption of the DHCP packet will be left empty.

The **no** form of this command returns the system to the default.

Default

circuit-id ascii-tuple

Parameters

ascii-tuple

Specifies that the ASCII-encoded concatenated tuple will be used which consists of the access-node-identifier, service-id, and interface-name, separated by a pipe (|).

ifindex

Specifies that the interface index will be used. The If Index of a router interface can be displayed using the command **show router interface detail**.

if-name

Specifies the interface name.

port-id

Specifies the port ID.

vlan-ascii-tuple

Specifies that the format will include VLAN-id and dot1p bits in addition to what is included in ascii-tuple already. The format is supported on dot1q and qinq ports only. Therefore, when the Option 82 bits are stripped, dot1p bits will be copied to the Ethernet header of an outgoing packet.

none

Specifies that no circuit should be used.

Platforms

7.41 ckn

ckn

Syntax

ckn *hex-string*

no ckn

Context

[Tree] (config>macsec>conn-assoc>static-cak>pre-shared-key ckn)

Full Context

configure macsec connectivity-association static-cak pre-shared-key ckn

Description

Specifies the connectivity association key name (CKN) for a pre-shared key.

CKN is appended to the MKA for identification of the appropriate CAK by the peer.

The **no** form of this command reverts to the default value.

Parameters

hex-string

Specifies the value of the CKN.

Values 32 octets char (64 hex)

Platforms

[Tree] (config>router>mpls>lsp>primary class-type)

[Tree] (config>router>mpls>lsp-template class-type)

[Tree] (config>router>mpls>lsp class-type)

[Tree] (config>router>mpls>lsp>secondary class-type)

Full Context

configure router mpls lsp primary class-type

configure router mpls lsp-template class-type

configure router mpls lsp class-type

configure router mpls lsp secondary class-type

Description

This command configures the Diff-Serv Class Type (CT) for an LSP, the LSP primary path, or the LSP secondary path. The path level configuration overrides the LSP level configuration. However, only one CT per LSP path will be allowed as per RFC 4124.

The signaled CT of a dynamic bypass is always be CT0 regardless of the CT of the primary LSP path. The setup and hold priorities must be set to default values, that is, 7 and 0 respectively. This assumes that

the operator configured a couple of TE classes, one which combines CT0 and a priority of 7 and the other which combines CT0 and a priority of 0. If not, the bypass LSP will not be signaled and will go into the down state.

The operator cannot configure the CT, setup priority, and hold priority of a manual bypass. They are always signaled with CT0 and the default setup and holding priorities.

The signaled CT and setup priority of a detour LSP must match those of the primary LSP path it is associated with.

If the operator changes the CT of an LSP or of an LSP path, or changes the setup and holding priorities of an LSP path, the path will be torn down and retried.

An LSP which does not have the CT explicitly configured will behave like a CT0 LSP when Diff-Serv is enabled.

If the operator configured a combination of a CT and a setup priority and/or a combination of a CT and a holding priority for an LSP path that are not supported by the user-defined TE classes, the LSP path will be kept in a down state and an error code will be displayed in the show command output for the LSP path.

The **no** form of this command reverts to the default value.

Default

class-type 0

Parameters

ct-number

Specifies the Diff-Serv Class Type number.

Values 0 to 7

Platforms

7705 SAR Gen 2

7.43 class-type-bw

class-type-bw

Syntax

class-type-bw ct0 *%-link-bandwidth* **ct1***%-link-bandwidth* **ct2***%-link-bandwidth* **ct3***%-link-bandwidth* **ct4***%-link-bandwidth* **ct5***%-link-bandwidth* **ct6***%-link-bandwidth* **ct7***%-link-bandwidth*

no class-type-bw

Context

[Tree] (config>router>rsvp>interface class-type-bw)

[Tree] (config>router>rsvp>diffserv-te class-type-bw)

Full Context

configure router rsvp interface class-type-bw

configure router rsvp diffserv-te class-type-bw

Description

This command configures the percentage of RSVP interface bandwidth each CT shares, for example, the Bandwidth Constraint (BC).

The absolute value of the CT share of the interface bandwidth is derived as the percentage of the bandwidth advertised by IGP in the Maximum Reservable Link Bandwidth TE parameter, for example, the link bandwidth multiplied by the RSVP interface **subscription** *percentage* parameter.

Note:
This configuration also exists at RSVP interface level and the interface specific configured value overrides the global configured value. The BC value can be changed at any time.

The RSVP interface **subscription** *percentage* parameter is configured in the **config>router>rsvp>interface** context.

The operator can specify the Bandwidth Constraint (BC) for a CT which is not used in any of the TE class definition but that does not get used by any LSP originating or transiting this node.

When Diff-Serv is disabled on the node, this model degenerates into a single default CT internally with eight preemption priorities and a non-configurable BC equal to the Maximum Reservable Link Bandwidth. This would behave exactly like CT0 with eight preemption priorities and BC= Maximum Reservable Link Bandwidth if Diff-Serv was enabled.

The **no** form of this command reverts to the default value.

Parameters

ct0 (ct1/ct2/ —ct7) %*link-bandwidth*

The Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 100 %

Default 0

7.45 classic-lsn-max-subscriber-limit

classic-lsn-max-subscriber-limit

Syntax

classic-lsn-max-subscriber-limit *max*

no classic-lsn-max-subscriber-limit

Context

[Tree] (config>router>nat>inside classic-lsn-max-subscriber-limit)

[Tree] (config>service>vprn>nat>inside classic-lsn-max-subscriber-limit)

Full Context

configure router nat inside classic-lsn-max-subscriber-limit

configure service vprn nat inside classic-lsn-max-subscriber-limit

Description

This command sets the granularity of traffic distribution in the upstream direction across the MS-ISA within the scope of an inside routing context. Traffic distribution mechanism is based on the source IPv4 addresses/prefixes. More granular distribution is based on the IPv4 address, while distribution based on the IPv4 prefix (determined by prefix length) will be less granular. The granularity will further decrease with shorter prefix length.

For example, a prefix length of 32 will distribute individual /32 IPv4 addresses over multiple MS-ISAs in an ISA group. This will ensure better traffic load balancing at the expense of forwarding table utilization on the outside (public side) where each /32 is installed in the forwarding table. On the contrary, shorter prefixes will ensure better utilization of the forwarding table on the outside, at the expense of coarser spread of IP addresses over multiple MS-ISAs.

This command affects all flavors of LSN44 within the inside routing contexts, although its primary use is intended for deterministic NAT and dnat-only.

The length of the prefix that is used for distribution purposes is (32-n), where 2^n= classic-lsn-max-subscriber-limit. For example, if traffic distribution is based on the IPv4 address (prefix length = 32), then n must be 0. From here, it follows that classic-lsn-max-subscriber-limit must be set to 1:

Prefix length = 32 -> 32-n = 32 -> n=0 -> 2^0= 1 = *classic-lsn-max-subscriber-limit classic-lsn-max-subscriber-limit* = 1

The implicit method given by this command uses power of 2 calculations to provide prefix length for traffic distribution purposes. This roundabout approach to determine the prefix-length has roots in deterministic NAT where this command was originally introduced.

Even though deterministic NAT and dnat-only have very little in common, the method (and CLI syntax) for calculating the prefix length using the classic-lsn-max-subscriber-limit parameter for traffic distribution purposes is shared between the two. In dnat-only, this parameter is important from an operational perspective since it affects traffic load balancing over MS-ISA and the size of the routing table.

This command must be configured before any prefix is configured and can be modified only if there are no prefixes configured under the deterministic NAT.

Parameters

max

The power of 2 (2^n) value which in deterministic NAT must match the largest subscriber-limit value in any deterministic pool referenced from this inside routing instance.

In **dnat-only**, this value can be set to any value from the allowed range.

In both cases, this value will determine the prefix-length (17-32) that will directly influence load distribution between the MS-ISAs and the size of the routing table.

Values 1,2,4,8 to 32768

client-cipher-list

Syntax

client-cipher-list *name* [**create**]

no client-cipher-list *name*

Context

[Tree] (config>system>security>tls client-cipher-list)

Full Context

configure system security tls client-cipher-list

Description

This command creates a cipher list that the client sends to the server in the client Hello message. It is a list of ciphers that are supported and preferred by the SR OS to be used in the TLS session. The server matches this list against the server cipher list. The most preferred cipher found in both lists is chosen.

Parameters

name

Specifies the name of the client cipher list, up to 32 characters in length.

create

Keyword used to create the client cipher list.

Platforms

7705 SAR Gen 2

7.59 client-db

client-db

Syntax

client-db *db-name* [**create**]

no client-db *db-name*

Context

[Tree] (config>ipsec client-db)

Full Context

configure ipsec client-db

Description

This command creates a new IPsec client-db or enters the configuration context of an existing client-db.

An IPsec client-db can be used for IKEv2 dynamic LAN-to-LAN tunnel authentication and authorization. When a new tunnel request is received, the system will match the request to the client entries configured in client-db and use credentials returned by the matched client entry for authentication. If authentication succeeds, the system could also use the IPsec configuration parameters (such as **private-service-id**) returned by the matched entry to set up the tunnel.

The configured client-db is referenced under the ipsec-gw configuration context using the **client-db** command.

The **no** form of this command removes the *db-name* from the configuration.

Parameters

db-name

Specifies the name of this IPsec client up to 32 characters.

create

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

client-db

Syntax

client-db *name*

client-db *name* **fallback**

client-db *name* **no-fallback**

no client-db

Context

[Tree] (config>service>ies>if>sap>ipsec-gw client-db)

[Tree] (config>service>vprn>if>sap>ipsec-gw client-db)

Full Context

configure service ies interface sap ipsec-gw client-db

configure service vprn interface sap ipsec-gw client-db

Description

This command enables the use of an IPsec client database. The system uses the specified client database to authenticate IKEv2 dynamic LAN-to-LAN tunnel.

Default

no client-db

Parameters

name

Specifies the name of the client database.

fallback

Specifies whether or not this IPsec gateway falls back to the default authentication policy when the IPsec tunnel authentication request fails to match any clients in the IPsec database.

no-fallback

Specifies that if the client database lookup fails to return a matched result, the system will fail the tunnel setup.

Platforms

7705 SAR Gen 2

client-db

Syntax

[**no**] **no client-db** *db-name*

Context

configure ipsec client-db client client-name

Description

This command specifies the name of the client entry. The client name can be used in CLI navigation or in show commands.

Default

no client-name

Parameters

name

Specifies the name of the client.

Platforms

7705 SAR Gen 2

7.67 client-signature-list

client-signature-list

Syntax

client-signature-list *name* [**create**]

no client-signature-list *name*

Context

[Tree] (config>system>security>tls client-signature-list)

Full Context

configure system security tls client-signature-list

Description

This command configures a list of TLS 1.3-supported signature suite codes that the client sends in a client Hello message.

The **no** form of this command removes the client signature list.

Parameters

name

Specifies the name of the client signature list, up to 32 characters.

create

Keyword used to create the client signature list.

Platforms

7705 SAR Gen 2

7.68 client-tls-profile

client-tls-profile

Syntax

client-tls-profile *name*

no client-tls-profile

Context

[Tree] (config>system>security>pki>est-profile client-tls-profile)

Full Context

configure system security pki est-profile client-tls-profile

Description

This command configures the TLS client profile to be assigned to applications for encryption. The profile creates the TLS connection to the EST server.

The **no** form of this command removes the name from the configuration.

Default

no client-tls-profile

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters

Platforms

7705 SAR Gen 2

client-tls-profile

Syntax

client-tls-profile *name* [**create**]

no client-tls-profile *name*

configure system security tls client-tls-profile

Description

This command configures the TLS client profile to be assigned to applications for encryption.

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters in length.

create

Keyword used to create the client TLS profile.

Platforms

7705 SAR Gen 2

client-tls-profile

Syntax

client-tls-profile *name*

no client-tls-profile

Context

[Tree] (config>system>management-interface>remote-management client-tls-profile)

Full Context

configure system management-interface remote-management client-tls-profile

Description

This command configures the TLS client profile used for encryption by all remote managers. This command and **allow-unsecure-connection** are mutually exclusive.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the profile configuration not to be used.

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters.

Platforms

7705 SAR Gen 2

client-tls-profile

Syntax

client-tls-profile *name*

no client-tls-profile

Context

[Tree] (config>system>management-interface>remote-management>manager client-tls-profile)

Full Context

configure system management-interface remote-management manager client-tls-profile

Description

This command configures the TLS client profile used for encryption by this remote manager. This command and **allow-unsecure-connection** are mutually exclusive.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the profile configuration to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters

name

Specifies the name of the client TLS profile, up to 32 characters.

Platforms

7705 SAR Gen 2

7.69 clli-code

clli-code

Syntax

clli-code *clli-code*

no clli-code

Context

[Tree] (config>system clli-code)

Full Context

configure system clli-code

Description

This command creates a Common Language Location Identifier (CLLI) code string for the router. A CLLI code is an 11-character standardized geographic identifier that uniquely identifies geographic locations and certain functional categories of equipment unique to the telecommunications industry.

No CLLI validity checks other than truncating or padding the string to eleven characters are performed.

Only one CLLI code can be configured, if multiple CLLI codes are configured the last one entered overwrites the previous entry.

The **no** form of the command removes the CLLI code.

Default

no clli-code

Parameters

clli-code

Specifies the 11 character string CLLI code. Any printable, seven bit ASCII characters can be used within the string. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. If more than 11 characters are entered, the string is truncated. If less than 11 characters are entered the string is padded with spaces.

Platforms

7.70 clock-offset

clock-offset

Syntax

clock-offset *seconds*

no clock-offset

Context

[Tree] (config>oam-pm>session>meas-interval clock-offset)

Full Context

configure oam-pm session meas-interval clock-offset

Description

This command allows measurement intervals with a boundary-type of clock aligned to be offset from the default time of day clock. The configured offset must be smaller than the size of the measurement interval. As an example, an offset of 120 (seconds) shifts the start times of the measurement intervals by two minutes from their default alignments with respect to the time of day clock.

The **no** form of this command sets the offset to 0.

Default

clock-offset 0

Parameters

seconds

Specifies the number of seconds to offset a clock-alignment measurement interval from its default.

Values 0 to 86399

Default 0

Platforms

7705 SAR Gen 2

7.71 close-session

close-session

Syntax

[**no**] **close-session**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization close-session)

Full Context

configure system security profile netconf base-op-authorization close-session

Description

This command enables the NETCONF <close-session> RPC.

The **no** form of this command disables the RPC.

Default

no close-session

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

[Tree] (config>service>vprn>bgp>group cluster)

Full Context

configure service vprn bgp cluster

configure service vprn bgp group neighbor cluster

configure service vprn bgp group cluster

Description

This command configures the cluster ID for a route reflector server.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives a route, first it must select the best path from all the paths received. If the route was received from a non-client peer, then the route reflector sends the route to all clients in the cluster. If the route came from a client peer, the route reflector sends the route to all non-client peers and to all client peers except the originator.

For redundancy, a cluster can have multiple route reflectors.

Confederations can also be used to remove the full IBGP mesh requirement within an AS.

The **no** form of this command deletes the cluster ID and effectively disables the Route Reflection for the given group.

Default

no cluster — No cluster ID is defined.

Parameters

cluster-id

The route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

Platforms

7705 SAR Gen 2

cluster

Syntax

cluster *cluster-id* **orr-location** *location-id* [**allow-local-fallback**]]

Context

[Tree] (config>router>bgp cluster)

Full Context

configure router bgp cluster

Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; refer to *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

Default

no cluster

Parameters

ip-address

Specifies the route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

orr-location location-id

Specifies the optimal route reflection location index for this set of route reflector clients.

Values 1 to 255

allow-local-fallback

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

Platforms

7705 SAR Gen 2

cluster

Syntax

cluster *cluster-id*

no cluster

Context

[Tree] (config>router>bgp>group cluster)

[Tree] (config>router>bgp>group>neighbor cluster)

Full Context

configure router bgp group cluster

configure router bgp group neighbor cluster

Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; see *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs

will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

The **no** form of this command deletes the cluster ID and effectively disables route reflection for the group.

Default

no cluster

Parameters

ip-address

Specifies the route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

orr-location location-id

Specifies the optimal route reflection location index for this set of route reflector clients.

Values 1 to 255

allow-local-fallback

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

7.73 cluster-id

cluster-id

Syntax

cluster-id *ip-address/mask* [*ip-address/mask*]

cluster-id none

no cluster-id

Context

[Tree] (config>router>policy-options>policy-statement>entry>from cluster-id)

Full Context

configure router policy-options policy-statement entry from cluster-id

Description

This command enables BGP routes to be matched based on the IP addresses encoded in the CLUSTER_LIST attribute.

The first i*p-address/mask pair* is matched against the most recently added cluster ID. Each subsequent *ip-address/mask* pair is tested against the next most recent cluster ID.

For example, to match all routes reflected by the RR with cluster ID 1.1.1.1 and then any other RR before reaching the router where the policy is applied, use the command **cluster-id 0.0.0.0/0 1.1.1.1/32**.

Note:
The command matches routes with two or more cluster IDs; the third and older cluster IDs are not evaluated and are automatically considered matching.

The **cluster-id none** form of this command only matches BGP routes without any CLUSTER_LIST attribute.

A non-BGP route does not match a policy entry if it contains the **cluster-id** command.

Default

no cluster-id

Parameters

ip-address

Specifies the 32-bit cluster ID in dotted decimal notation.

Values a.b.c.d

mask

Specifies a bit mask to apply to the *ip-address* parameter.

Values 0 to 32 (0 is only allowed if the *ip-address* is 0.0.0.0)

none

Specifies that only BGP routes without a CLUSTER_LIST attribute should be matched.

configure service vprn radius-server server coa-script-policy

configure router radius-server server coa-script-policy

Description

This command specifies the RADIUS script policy to modify the Change-of-Authorization messages sent from this RADIUS server.

The **no** form of this command removes the policy name from the configuration.

Parameters

policy-name

Specifies the name of radius-script-policy up to 80 characters.

Platforms

7705 SAR Gen 2

7.76 code-type

code-type

Syntax

code-type [**sonet** | **sdh**]

[**no**] **code-type**

Context

[Tree] (config>port>ethernet>ssm code-type)

Full Context

configure port ethernet ssm code-type

Description

This command configures the encoding of synchronization status messages. For example, whether to use an SDH or SONET set of values. Configuring the network-type is only applicable to SyncE ports. It is not configurable on SONET/SDH ports. For the network-type, sdh refers to ITU-T G.781 Option I, while sonet refers to G.781 Option II (equivalent to Telcordia GR-253-CORE).

Default

code-type sdh

Parameters

sdh

Specifies the values used on a G.781 Option 1 compliant network.

sonet

Specifies the values used on a G.781 Option 2 compliant network.

Platforms

Default

commit

Platforms

7705 SAR Gen 2

commit

Syntax

commit [**confirmed** *timeout*] [**comment** *comment*]

commit no-checkpoint [**confirmed** *timeout*]

Context

[Tree] (candidate commit)

Full Context

candidate commit

Description

This command applies the changes in the candidate configuration to the active running configuration. The candidate changes will take operational effect.

If a commit operation is successful then all of the candidate changes will take operational effect and the candidate is cleared. If there is an error in the processing of the commit, or a 'commit confirmed' is not confirmed and an auto-revert occurs, then the router will return to a configuration state with none of the candidate changes applied. The operator can then continue editing the candidate and try a commit later.

By default, the SR OS will automatically create a new rollback checkpoint after a commit operation. The rollback checkpoint will contain the new configuration changes made by the commit. An optional **no-checkpoint** keyword can be used to avoid the auto-creation of a rollback checkpoint after a commit.

A commit operation is blocked if a rollback revert is currently being processed.

Parameters

confirmed

specifies that the commit operation (if successful) should be automatically reverted (undone) at the end of the timeout period unless the operator issues the confirm command before the timeout period expires. A rollback checkpoint is created after the commit operation (if successful) and will remain available whether the commit is auto-reverted or not. The contents of the candidate will remain visible (candidate view) and changes to the candidate are blocked until the timeout is completed or the **candidate confirm** command is executed. If the timeout expires and an auto-revert occurs, then the original candidate config will be available in edit-cfg mode.

Standard line-by-line non-transactional configuration commands (including via SNMP) are not blocked during the countdown period and any changes made to the configuration during the countdown period will be rolled back if the timeout expires. The confirmed option is useful when changes are being made that could impact management reachability to the router.

A rollback revert is blocked during the countdown period until the commit has been confirmed.

timeout

Specifies the auto-revert timeout period, in minutes.

Values 1 to 168

no-checkpoint

Specifies to avoid the automatic creation of a rollback checkpoint for a successful commit.

comment *comment*

Adds a comment up to 255 characters to the automatic rollback checkpoint.

configure system security pki common-name-list

Description

This command configures a list of common names (CNs) that will be used to authenticate X.509.3 certificates. If the CN field of the X.509.3 certificate matches any of the CNs in the list, then the certificate can be used.

Parameters

name

Specifies the name of the CN list, up to 32 characters maximum.

Platforms

7705 SAR Gen 2

7.89 community

community

Syntax

community *community-name* [**hash** | **hash2** | **custom**] [**access-permissions**] [**version** *SNMP-version*] [**src-access-list** *list-name*]

no community *community-name* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>service>vprn>snmp community)

Full Context

configure service vprn snmp community

Description

This command sets the SNMP community name(s) to be used with the associated VPRN instance. These VPRN community names are used to associate SNMP v1/v2c requests with a particular vprn context and to return a reply that contains VPRN-specific data or limit SNMP access to data in a specific VPRN instance.

VPRN snmp communities configured with an access permission of 'r' are automatically associated with the default access group "snmp-vprn-ro" and the "vprn-view" view (read only). VPRN snmp communities configured with an access permission of 'rw' are automatically associated with the default access group "snmp-vprn" and the "vprn-view" view (read/write).

The community in an SNMP v1/v2 request determines the SNMP context (i.e., the vprn# for accessing SNMP tables) and not the VPRN of the incoming interface on which the request was received. When an SNMP request arrives on VPRN 5 interface "ringo" with a destination IP address equal to the "ringo"

interface, but the community in the SNMP request is the community configured against VPRN 101, then the SNMP request will be processed using the VPRN 101 context. (the response will contain information about VPRN 101). It is recommended to avoid using a simple series of vprn snmp-community values that are similar to each other (for example, avoid my-vprncomm-1, my-vprn-comm-2, etc).

The **no** form of this command removes the SNMP community name from the given VPRN context.

Parameters

community-name

Specifies the SNMP v1/v2c community name. This is a secret/confidential key used to access SNMP and specify a context (base vs vprn1 vs vprn2).

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

version *SNMP-version*

Specifies the SNMP version.

Values v1, v2c, both

access-permissions

Specifies the access rights to MIB objects.

Values **r** — Grants only read access to MIB objects. Creates an association of the community-name with the **snmp-vprn-ro** access group.**rw** — Grants read and write access to MIB objects. Creates an association of the community-name with the **snmp-vprn** access group.

list-name

Configures the **community** to reference a specific **src-access-list** (created under **configure system security snmp**), which will be used to validate the source IP address of all received SNMP requests that use this **community**. Multiple **community** (vprn or base router) and **usm-community** instances can reference the same **src-access-list**.

community *comm-id* [*comm-id*]

no community [*comm-id* [*comm-id*]]

Context

[Tree] (config>service>vprn>static-route-entry community)

Full Context

configure service vprn static-route-entry community

Description

This command associates a list of up to 12 BGP communities (any mix of standard, extended, and large communities) with the static route. These communities can be matched in route policies and are automatically added to BGP routes that are created from the static route.

The communities specified at this level of the static route causes communities configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the association.

Default

no community

Parameters

comm-id

Specifies a BGP community value, up to 72 characters.

Values [*as-num:comm-val* | *well-known-comm* | *ext-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:
  - {*target* | *origin*}:*ip-address*:*comm-val*
  - {*target* | *origin*}:*asnum*:*ext-comm-val*
  - {*target* | *origin*}:*ext-asnum*:*comm-val*
  - **bandwidth**:*asnum*:*val-in-mbps*
  - **ext:4300**:*ovstate*
  - **ext**:*value1*:*value2*

– color:co-bits:*color-value*

where:

– *target* — route target
– *origin* — route origin
– *ip-address* — a.b.c.d
– *ext-comm-val* — 0 to 4294967295
– *ext-asnum* — 0 to 4294967295
– *val-in-mbps* — 0 to 16777215
– *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
– *value1* — 0000 to FFFF
– *value2* — 0 to FFFFFFFFFFFF
– *co-bits* — 00, 01, 10 or 11
– *color-value* — 0 to 4294967295

Context

[Tree] (config>router>ldp>session-params>peer community)

[Tree] (config>router>ldp>targeted-session>peer-template community)

Full Context

configure router ldp session-parameters peer community

configure router ldp targeted-session peer-template community

Description

This command configures a community name associated with a targeted session to a specified peer. The community is a local configuration for a targeted session. FECs received over a session of a given community are taken to belong to that community, and are redistributed over sessions of the same community.

The SR OS router uses the following rules for community:

- If both the session parameters for a specified peer and targeted peer template that is applied to session have the default configuration then no community applies.
- If the session parameters for a peer have the default configuration, but targeted session peer template has an explicit configuration for community, then the targeted peer template configuration will be used.
- If the session parameters have an explicit configuration for community, and the targeted session peer template has the default configuration, then the session parameter configuration applies.
- If both session parameters and targeted peer template have an explicit configuration for community, then the session parameter configuration is used.

The **no** form of this command removes the community from the session to the peer. FEC subsequently received over the session are treated as having no community.

Default

no community

Parameters

community-name

Specifies the string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

no community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp community)

Full Context

configure system security snmp community

Description

This command creates SNMP community strings for SNMPv1 and SNMPv2c access. This command is used in combination with the predefined access groups and views. To create custom access groups and views and associate them with SNMPv1 or SNMPv2c access use the **usm-community** command.

When configured, community implies a security model for SNMPv1 and SNMPv2c only.

For SNMPv3 security, the **access group** command must be configured.

The **no** form of the command removes the specified community string.

Parameters

community-string

Configures the SNMPv1 and/or SNMPv2c community string.

Values community-string — Specifies the community string. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

hash-key — Up to 33 characters

hash2-key — Up to 96 characters

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be

in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

access-permissions

Configures the access permissions for objects in the MIB.

r — Grants only read access to objects in the MIB, except security objects, using the internal "snmp-ro" access group and the "no-security" snmp view.

rw — Grants read and write access to all objects in the MIB, using the internal "snmp-rw" access group and the "no-security" snmp view.

rwa — Grants read and write access to all objects in the MIB, including security, using the internal snmp-rwa access group and the iso snmp view.

mgmt — Assigns a unique SNMP community string for SNMP access via the management router instance. This community uses the internal snmp-mgmt access group and the mgmt snmp view.

vpls-mgmt — Assigns a unique SNMP community string for SNMP access via the vpls-management router instance. This community uses the internal snmp-vpls-mgmt access group and mgmt-view snmp view.

version {v1 | v2c | both}

Configures the scope of the community string to be for SNMPv1, SNMPv2c, or both SNMPv1 and SNMPv2c access.

Default both

list-name

Configures the **community** to reference a specific **src-access-list**, which will be used to validate the source IP address of all received SNMP requests that use this community. Multiple community, usm-community, or VPRN SNMP community instances can reference the same src-access-list.

Platforms

7705 SAR Gen 2

community

Syntax

[**no**] **community** *name*

Context

[Tree] (config>router>policy-options community)

Full Context

configure router policy-options community

Description

This command creates a route policy community list or expression to use in route policy entries. A community list is an unordered set of community values (members). In general a route matches a community list if it has any of the member values. A community expression is a set of community values that are arranged in a logical expression using operators such as AND, OR, and NOT. A route matches a community expression if it satisfies the logic of the expression.

For additional information, see the **expression** and **members** commands in the **config**> **router**>**policy-options**>**community** context.

The **no** form of this command deletes the community list or the provided community ID.

Default

no community

Parameters

name

Specifies the community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

[Tree] (config>router>policy-options>policy-statement>entry>action community)

Full Context

configure router policy-options policy-statement default-action community

configure router policy-options policy-statement entry action community

Description

This command adds or removes a BGP community list to or from routes matching the route policy statement entry.

If no community list is specified, the community path attribute is not changed.

The community list changes the community path attribute according to the **add** and **remove** keywords.

The **no** form of this command disables the action to edit the community path attribute for the route policy entry.

Default

no community

Parameters

name

Specifies up to 28 names.

add

The specified community list is added to any existing list of communities.

remove

The specified community list is removed from the existing list of communities.

replace

The specified community list replaces any existing community attribute. name — The community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

Syntax

community *comm-name*

community expression *expression*

no community

Context

[Tree] (config>router>policy-options>policy-statement>entry>from community)

Full Context

configure router policy-options policy-statement entry from community

Description

This command configures a community list as a match criterion for the route policy entry.

If no community list is specified, any community is considered a match.

The **no** form of this command removes the community list match criterion.

Default

no community

Parameters

comm-name

Specifies the community list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

expression

Specifies that the parameters are applied to routes matching the entry.

Values *expression* is one of the following, up to 900 characters:

<expression> {AND| OR} <expression>

[NOT] (<expression>)

[NOT] "["<comm-name> "]

The following are examples of valid logical expressions:

- "[community_list_A] OR ([community_list_B] AND [community_list_C])"
- "NOT [community_list_A]”
- "[community_list_A] AND [community_list_B] OR [community_list_C]”
- "NOT ([community_list_A] OR [community_list_B] OR [community_list_C])”

7.90 community-count

community-count

Syntax

community-count *count* [**equal** | **or-higher** | **or-lower**] [**standard** | **extended** | **large**]

no community-count

Context

[Tree] (config>router>policy-options>policy-statement>entry>from community-count)

Full Context

configure router policy-options policy-statement entry from community-count

Description

This command matches BGP routes based on community length (that is, the number of community members in the COMMUNITY, EXTENDED_COMMUNITY, or LARGE_COMMUNITY the attributes).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

Without the optional **standard**, **extended**, or **large** keyword, the community length applies to the total number of communities, of all types. If some keywords are present, then only the types specified are counted against the limit.

A non-BGP route does not match a policy entry if it contains the **community-count** command.

Default

no community-count

Parameters

count

Specifies the number of community members.

Values 0 to 1024, or a parameter, up to 32 characters, name delimited by a starting and ending at-sign (@) character

equal

Specifies that matched routes should have the same number of AS path elements as the value specified.

or-higher

Specifies that matched routes should have the same or a greater number of community members as the value specified.

or-lower

Specifies that matched routes should have the same or a lower number of community members as the value specified.

standard

Specifies that only communities in the COMMUNITY attribute should be counted.

extended

Specifies that only communities in the EXTENDED_COMMUNITY attribute should be counted.

large

Specifies that only communities in the LARGE_COMMUNITY attribute should be counted.

Platforms

7705 SAR Gen 2

7.91 compare

compare

Syntax

compare *source1* **to** *source2*

Context

[Tree] (admin compare)

Full Context

admin compare

Description

This command displays the differences between rollback checkpoints and the active operational configuration, with source1 as the base/first file to which source2 is compared.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

Default

The defaults for source1 and source2 are context aware and differ based on the branch in which the command is executed. In general, the default for source1 matches the context from which the command is issued.

- In the admin node: No defaults. source1 and source2 must be specified.
- In the admin>rollback node:

  source1 default = active-cfg, source2 default = latest-rb

  compare: equivalent to "compare active-cfg to latest-rb”

  compare to source2: equivalent to "compare active-cfg to source2”
- In a config>*xx* node:

  compare to source2: equivalent to "compare active-cfg to source2”

Parameters

source1, source2

Specifies comparison information.

Values **active-cfg** — The current operational configuration that is active in the node.

latest-rb — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with "*.rb” as the suffix).

rescue — The rescue configuration (at the configured rescue-location).

checkpoint-id — An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with "*.rb.1" as the suffix, 2 for file "*.rb.2", and so on.

Platforms

7705 SAR Gen 2

compare

Syntax

compare [**to** *checkpoint2*]

compare *checkpoint1* **to** *checkpoint2*

Context

[Tree] (admin>rollback compare)

Full Context

admin rollback compare

Description

This command can be used in any branch under configure, but not with configure itself. The command syntax, parameter names, and default values are context aware and will differ based on the branch in which the command is executed.

This command displays the differences between rollback checkpoints and the active operational configuration, with checkpoint1 as the base/first file to which checkpoint2 is compared. This command displays the comparison for the configuration context where it is entered and all branches below that context level.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

Default

The defaults for checkpoint1 and checkpoint2 are context-aware and differ based on the branch in which the command is executed. In general, the default for checkpoint1 matches the context from which the command is issued.

- In the admin node: No defaults. checkpoint1 and checkpoint2 must be specified.
- In the admin>rollback node:

  checkpoint1 default = active-cfg, checkpoint2 default = latest-rb

  compare: equivalent to "compare active-cfg to latest-rb"

  compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2"

- In a config>*xx* node:

  compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2”

Parameters

checkpoint1, checkpoint2

Specifies comparison information.

Values **active-cfg** — The current operational configuration that is active in the node.

latest-rb — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with "*.rb” as the suffix).

rescue — The rescue configuration (at the configured rescue-location).

checkpoint-id — An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with "*.rb.1” as the suffix, 2 for file "*.rb.2”, and so on.

7.92 compare-chain-include

compare-chain-include

Syntax

compare-chain-include *ca-profile-name*

no compare-chain-include

Context

[Tree] (config>ipsec>cert-profile>entry compare-chain-include)

Full Context

configure ipsec cert-profile entry compare-chain-include

Description

This command configures the Certificate Authority (CA) profile that needs to be included in the compare-chain for the entry. This configuration is required in instances where there are multiple overlapping compare-chains, for example, the configured root CA is cross-signed by another CA.

Default

no compare-chain-include

Parameters

ca-profile-name

Specifies the name of the CA profile.

Platforms

7705 SAR Gen 2

7.93 compare-origin-validation-state

compare-origin-validation-state

Syntax

[**no**] **compare-origin-validation-state**

Context

[Tree] (config>service>vprn>bgp>best-path-selection compare-origin-validation-state)

Full Context

configure service vprn bgp best-path-selection compare-origin-validation-state

Description

This command enables the comparison of origin validation states during the BGP decision process. When this command is configured, a new step is inserted in the BGP decision process after the removal of invalid routes and before the comparison of Local Preference. This step compares the origin validation state so a BGP route with a "Valid" state is preferred over a BGP route with a "Not-Found" state. A BGP route with a "Not-Found" state is preferred over a BGP route with an "Invalid" state assuming that these routes are considered "usable".

This comparison only applies to BGP routes learned from VPRN BGP peers. It does not apply to any comparison involving BGP-VPN routes that have been imported into the VPRN.

The **no** form of this command causes the new step to be skipped during the BGP decision process.

Default

no compare-origin-validation-state

Platforms

7705 SAR Gen 2

compare-origin-validation-state

Syntax

[**no**] **compare-origin-validation-state**

Context

[Tree] (config>router>bgp>best-path-selection compare-origin-validation-state)

Full Context

configure router bgp best-path-selection compare-origin-validation-state

Description

When this command is configured, a new step is inserted in the BGP decision process after removal of invalid routes and before the comparison of Local Preference. The new step compares the RPKI origin validation state so that a BGP route with a 'Valid' state is preferred over a BGP route with a 'Not-Found' state, and a BGP route with a 'Not-Found' state is preferred over a BGP route with an 'Invalid' state assuming that these routes are considered 'usable'.

The new step is skipped when **no compare-origin-validation-state** is configured.

Default

no compare-origin-validation-state

Platforms

7705 SAR Gen 2

7.94 compatibility

compatibility

Syntax

compatibility *mode*

Context

[Tree] (config>port>dwdm>coherent compatibility)

Full Context

configure port dwdm coherent compatibility

Description

This command configures the optical mode and rate of operation.

Parameters

mode

Specifies the optical mode.

Values **long-haul** - The port operates in the native long-haul mode.

long-haul-non-diff - The port operates in the native long-haul mode using non-differential encoding.

metro - The port operates in the native metro regional mode.

access - The port operates in the native access mode (80km reach).

interop - The port operates in the third party interop mode.

interop2 - The port operates in the third party interop mode with alternate differential encoding.

interop3 - The port operates in the CFP2-DCO Rev A0 Staircase FEC interop mode.

oif-400g-zr - The port operates in compliance with the OIF 400G ZR implementation agreement (IA). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

open-zrp-ofec1 - The port operates in compliance with the OpenZR + multi-source agreement (MSA) (100GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

open-zrp-ofec2 - The port operates in compliance with the OpenZR+ MSA (75 GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

Default long-haul

7.95 compatible-rfc1583

compatible-rfc1583

Syntax

[**no**] **compatible-rfc1583**

Context

[Tree] (config>service>vprn>ospf compatible-rfc1583)

Full Context

configure service vprn ospf compatible-rfc1583

Description

This command enables OSPF summary and external route calculations in compliance with RFC 1583 and earlier RFCs.

RFC 1583 and earlier RFCs use a different method to calculate summary and external route costs. To avoid routing loops, all routers in an OSPF domain should perform the same calculation method.

Although it would be favorable to require all routers to run a more current compliance level, this command allows the router to use obsolete methods of calculation.

This command is not supported in OSPF3.

The **no** form of this command enables the post-RFC 1583 method of summary and external route calculation.

Default

compatible-rfc1583 — RFC 1583 compliance is enabled.

Platforms

7705 SAR Gen 2

compatible-rfc1583

Syntax

[**no**] **compatible-rfc1583**

Context

[Tree] (config>router>ospf compatible-rfc1583)

7.98 confederation

confederation

Syntax

confederation *confed-as-num* [**members** *as-number* [*as-number*]]

no confederation *confed-as-num* **members** *as-number* [*as-number*]

no confederation

Context

[Tree] (config>service>vprn confederation)

Full Context

configure service vprn confederation

Description

This command configures the VPRN BGP instance to participate in a BGP confederation. BGP confederations can be used to reduce the number of IBGP sessions required within an AS.

When a VPRN BGP instance is part of a confederation, it can form confederation-EBGP sessions with CE router peers in a different sub-autonomous systems of the same confederation as well as regular EBGP sessions with CE router peers outside the confederation. A VPRN BGP instance that is part of a confederation cannot import or export its routes to the base router instance (as VPN-IP routes).

The **no** form of this command deletes the specified member AS from the confederation. When members are not specified in the no statement, the entire list is removed and confederations is disabled. When the last member of the list is removed, confederations is disabled.

Default

no confederation

Parameters

confed-as-num

The confederation AS number defined as a decimal value.

Values 1 to 4294967295

members *as-number*

The AS number(s) that are members of the confederation, each expressed as a decimal integer. Configure up to 15 members per confed-as-num.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

confederation

Syntax

confederation *confed-as-num* [**members** *as-number* [*as-number*]]

no confederation *confed-as-num* **members** *as-number* [*as-number*]

no confederation

Context

[Tree] (config>router confederation)

Full Context

configure router confederation

Description

This command creates confederation autonomous systems within an AS.

This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is another technique that is commonly deployed to reduce the number of IBGP sessions.

The **no** form of this command deletes the specified member AS from the confederation.

When no members are specified in the **no** statement, the entire list is removed and **confederation** is disabled.

When the last member of the list is removed, **confederation** is disabled.

Default

no confederation - no confederations are defined.

Parameters

confed-as-num

Specifies the confederation AS number expressed as a decimal integer.

Values 1 to 65535

as-number

Specifies the AS number of members that are part of the confederation, expressed as a decimal integer. Up to 15 members per *confed-as-num* can be configured.

Values 1 to 65535

Platforms

7705 SAR Gen 2

7.99 config-backup

config-backup

Syntax

config-backup *count*

no config-backup

Context

[Tree] (config>system config-backup)

Full Context

configure system config-backup

Description

This command configures the maximum number of backup versions maintained for configuration files and BOF.

For example, assume the **config-backup** *count* is set to 5 and the configuration file is called *xyz.cfg.* When the configuration is saved, the file *xyz.cfg* is saved with a 1 extension. Each configuration save increments the numeric extension until the maximum count is reached.

xyz.cfg xyz.cfg.1 xyz.cfg.2 xyz.cfg.3 xyz.cfg.4 xyz.cfg.5

Each classic CLI persistent index file is updated at the same time as the associated configuration file. When the index file is updated, then the save is performed to *xyz.cfg* and the index file is created as *xyz.ndx*. Synchronization between the active and standby CPM is performed for all configurations and their associated persistent index files.

The **no** form of the command returns the configuration to the default value.

Default

config-backup 50

Parameters

count

Specifies the maximum number of backup revisions.

Values 1 to 200

Platforms

7705 SAR Gen 2

7.100 configuration-mode

configuration-mode

Syntax

configuration-mode {**classic** | **mixed** | **model-driven**}

Context

[Tree] (config>system>management-interface configuration-mode)

Full Context

configure system management-interface configuration-mode

Description

This command controls which management interfaces are used for editing and changing the configuration of the router.

Any management interface can be used in any configuration mode (to gather state information or perform operations, for example), but only specific management interfaces (CLI, NETCONF, and so on) are allowed to edit the configuration of the router in different modes. For example, only classic CLI and SNMP can be used to edit the configuration when in classic mode.

Default

configuration-mode model-driven

Parameters

classic

Enables editing of router configuration via classic CLI and SNMP management interfaces, but not using model-driven interfaces.

model-driven

Enables editing of router configuration via model-driven management interfaces (NETCONF with 'Nokia' YANG models, MD-CLI or gRPC), but not using classic interfaces.

mixed

Enables editing of router configuration using a mix of classic CLI and/or model-driven management interfaces (with some restrictions and limitations).

7705 SAR Gen 2

7.102 confirm

confirm

Syntax

confirm

Context

[Tree] (candidate confirm)

Full Context

candidate confirm

Description

This command is used to stop an automatic reversion to the previous configuration after the **candidate commit confirmed** command was used. If the **confirm** command is not executed before the commit confirmed timeout period expires then the previous commit changes will be undone and the previous candidate configuration will be available for editing and a subsequent commit.

During the countdown the contents of the candidate will remain visible (candidate view) and changes to the candidate are blocked until the timeout is completed or the candidate confirm command is executed. Executing the **confirm** command clears the contents of the candidate and allows editing of the candidate.

Platforms

[Tree] (config>service>vprn>bgp connect-retry)

Full Context

configure service vprn bgp group connect-retry

configure service vprn bgp group neighbor connect-retry

configure service vprn bgp connect-retry

Description

This command configures the BGP connect retry timer value in seconds.

When this timer expires, BGP tries to reconnect to the configured peer. This configuration parameter can be set at three levels: global level (applies to all peers), peer-group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

120 seconds

Parameters

seconds

Specifies the BGP connect retry timer value in seconds, expressed as a decimal integer.

Values 1 to 65535

Platforms

7705 SAR Gen 2

connect-retry

Syntax

connect-retry *seconds*

no connect-retry

Context

connection-profile-vlan

Syntax

connection-profile-vlan *conn-prof-id* [**create**]

no connection-profile-vlan *conn-prof-id*

Context

[Tree] (config connection-profile-vlan)

Full Context

configure connection-profile-vlan

Description

Commands in this context configure the VLAN ranges that will be associated with a service SAP.

Each connection-profile-vlan must be explicitly configured.

Parameters

conn-prof-id

Specifies the connection-profile identifier. This value will be configured in the service along with the SAP when the user associates a VLAN bundle to a single SAP. For example, a SAP defined in a dot1q port 1/1/1 that matches all the VLANs defined in the connection-profile-vlan 1 will be created as '**sap 1/1/1:cp-1 create**'.

Values 1 to 8000

Platforms

7705 SAR Gen 2

7.106 connection-timeout

connection-timeout

Syntax

connection-timeout *seconds*

no connection-timeout

Context

[Tree] (config>system>management-interface>remote-management connection-timeout)

Full Context

configure system management-interface remote-management connection-timeout

Description

This command configures the amount of time that all remote managers cannot be reached before they are considered to be down.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command reverts to the default.

Default

connection-timeout 60

Parameters

seconds

Specifies the connection timeout in seconds.

Values 1 to 3600

Platforms

7705 SAR Gen 2

connection-timeout

Syntax

connection-timeout *seconds*

no connection-timeout

Context

[Tree] (config>system>management-interface>remote-management>manager connection-timeout)

Full Context

configure system management-interface remote-management manager connection-timeout

Description

This command configures the amount of time that this remote manager cannot be reached before it is considered to be down.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command reverts to the default.

Default

connection-timeout 60

Parameters

seconds

Specifies the connection timeout in seconds.

Values 1 to 3600

Platforms

7705 SAR Gen 2

7.107 connectivity-association

connectivity-association

Syntax

connectivity-association *ca-name* [**create**]

no connectivity-association *ca-name*

Context

[Tree] (config>macsec connectivity-association)

Full Context

configure macsec connectivity-association

Description

This command configures a connectivity association. MACsec connectivity associations are applied to a port dot1x configuration to enable MACsec on that port.

The **no** form of this command removes the connectivity association.

Parameters

ca-name

The name of the connectivity association, a string up to 32 characters long.

create

Mandatory while creating an entry.

7.110 consider-system-ip-in-gep

consider-system-ip-in-gep

Syntax

[**no**] **consider-system-ip-in-gep**

Context

[Tree] (config>router>ldp consider-system-ip-in-gep)

Full Context

configure router ldp consider-system-ip-in-gep

Description

When this command is enabled, the system interprets the presence or absence of the system IP and its associated action in the applied Global Export Policies in the same way as for other interfaces' IP addresses. In that case:

- if the system IP is not present, its FEC will not be exported or it will be withdrawn if it has been exported
- if the system IP is present with "accept", its FEC will be exported
- if the system IP is present with "deny", its FEC will not be exported or it will be withdrawn if it had been exported

Enabling or disabling this command leads to the applied Global Export Policies being reevaluated.

The **no** form of this command causes the system to not interpret the presence or absence of the system IP in applied Global Export Policies, and the FEC for the system IP is exported (default behavior).

Default

no consider-system-ip-in-gep

[Tree] (config>service>vpls>bgp-evpn>mpls control-word)

Full Context

configure service epipe bgp-evpn mpls control-word

configure service vpls bgp-evpn mpls control-word

Description

This command enables the transmission and reception of the **control-word**. As defined in RFC 7432, the use of the control-word helps avoid frame disordering.

It is enabled or disabled for all EVPN-MPLS destinations at the same time.

Default

no control-word

Platforms

7705 SAR Gen 2

control-word

Syntax

[**no**] **control-word**

Context

[Tree] (config>service>epipe>spoke-sdp control-word)

Full Context

configure service epipe spoke-sdp control-word

Description

The control word command provides the option to add a control word as part of the packet encapsulation for pseudowire types for which the control word is optional. These are Ethernet pseudowires (Epipe). ATM N:1 cell mode pseudowires (apipe vc-types atm-vcc and atm-vpc) and VT pseudowire (apipe vc-type atm-cell).

The configuration for the two directions of the pseudowire must match because the control word negotiation procedures described in Section 6.2 of RFC 4447 are not supported. The C-bit in the pseudowire FEC sent in the label mapping message is set to 1 when the control word is enabled. Otherwise, it is set to 0.

The service will only come up if the same C-bit value is signaled in both directions. If a spoke-sdp is configured to use the control word but the node receives a label mapping message with a C-bit clear, the node releases the label with the an "Illegal C-bit" status code as per Section 6.1 of RFC 4447. As soon as the user also enabled the control the remote peer, the remote peer will withdraw its original label and will

send a label mapping with the C-bit set to 1 and the VLL service will be up in both nodes. The control word must be enabled to allow MPLS-TP OAM to be used on a static spoke-sdp in a Apipe, Epipe and Cpipe service.

[Tree] (config>service>vpls>mesh-sdp control-word)

Full Context

configure service vpls spoke-sdp control-word

configure service vpls mesh-sdp control-word

Description

This command enables the use of the control word on pseudowire packets in VPLS and enables the use of the control word individually on each mesh SDP or spoke-SDP. By default, the control word is disabled. When the control word is enabled, all VPLS packets, including the BPDU frames, are encapsulated with the control word when sent over the pseudowire. The T-LDP control plane behavior is the same as in the implementation of control word for VLL services. The configuration for the two directions of the Ethernet pseudowire should match. The **no** form of this command reverts the mesh SDP or spoke-SDP to the default behavior of not using the control word. The control word must be enabled to use MPLS-TP OAM on a static spoke-sdp terminating in a VPLS.

Default

no control word

7.120 convert-file

convert-file

Syntax

convert-file *filename* **to** *output-file-name* **format** {**secure** | **legacy**} [**force**]

Context

[Tree] (admin>certificate convert-file)

Full Context

admin certificate convert-file

Description

This command converts imported certificates and keys in the cf3:/system-pki directory between secure and legacy format.

Parameters

filename

Specifies an existing filename, up to 95 characters.

output-file-name

Specifies the output file name, up to 95 characters. If the output filename already exists, and the **force** keyword is not selected, the system prompts to proceed or abort.

format

Specifies the target format.

Values secure — Specifies the enhanced secure format

legacy — Specifies the legacy format

force

Forces the conversion even if there is an existing file with the same output filename.

Platforms

7705 SAR Gen 2

7.121 coordinates

coordinates

Syntax

coordinates *coordinates*

no coordinates

Context

[Tree] (config>system coordinates)

Full Context

configure system coordinates

Description

This command creates a text string that identifies the system coordinates for the device location. For example, the command **coordinates** "*37.390 -122.0550*" is read as latitude 37.390 north and longitude 122.0550 west.

Only one set of coordinates can be configured. If multiple coordinates are configured, the last one entered overwrites the previous entry.

The **no** form of the command reverts to the default value.

Parameters

coordinates

Specifies the coordinates describing the device location character string. The string may be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. If the coordinates are subsequently used by an algorithm that locates the exact position of this node then the string must match the requirements of the algorithm.

Platforms

7705 SAR Gen 2

7.122 copy

copy

Syntax

copy

Context

[Tree] (config>filter copy)

Full Context

configure filter copy

Description

This command copies existing filter list entries for a specific filter ID to another filter ID. The **copy** command is a configuration level maintenance tool used to create new filters using existing filters. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

Platforms

7705 SAR Gen 2

copy

Syntax

copy *source-file-url dest-file-url* [**force**] [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

Context

[Tree] (file copy)

Full Context

file copy

Description

This command copies a file or all files in a directory from a source URL to a destination URL. At least one of the specified URLs should be a local URL. The optional wildcard (*) can be used to copy multiple files that share a common (partial) prefix and/or (partial) suffix.

When a file is copied to a destination with the same file name, the original file is overwritten by the new file specified in the operation. The following prompt appears if the destination file already exists:

"Overwrite destination file (y/n)?”

For example:

To copy a file named `srcfile` in a directory called `test` on cf2 in slot B to a file called `destfile` in a directory called production on cf1 in slot A, the syntax is:

```
sr1>file cf2:\ # copy cf2-B/test/srcfile cf1-A/production/destfile
```

To FTP a file named `121201.cfg` in directory `mydir` stored on cf1 in slot A to a network FTP server with IP address 192.0.2.79 in a directory called `backup` with a destination file name of `121201.cfg`, the FTP syntax is:

```
copy cf1-A/mydir/121201.cfg 192.0.2.79/backup/121201.cfg
```

Parameters

source-file-url

Specifies the location of the source file or directory to be copied.

Values

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length 99 chars max each
remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 199 characters
remote-locn	[*hostname* | *ipv4-address* | [*ipv6-address*]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

dest-file-url

Specifies the destination of the copied file or directory.

force

Specifies to force an immediate copy of the specified file(s). Executes the command without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**>**client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Specifies to automatically refuse any HTTP redirects without prompting the user.

Platforms

7705 SAR Gen 2

copy

Syntax

copy [*line*]

Context

[Tree] (candidate copy)

Full Context

candidate copy

Description

This command copies the selected CLI node (which includes all sub-branches) into a temporary buffer that can be used for a subsequent insert. The contents of the temporary buffer are deleted when the operator exits the candidate edit mode.

Parameters

line

Specifies which line to copy.

Values line, offset, **first**, **edit-point**, **last**

line — absolute line number

offset — relative line number to the current edit point. Prefixed with '+' or '-'.

first — keyword to indicate the first line

edit-point — keyword to indicate the current edit point

last — keyword to indicate the last line that is not 'exit'

Platforms

7705 SAR Gen 2

copy

Syntax

copy {**user** *source-user* | *profile source-profile*} **to** *destination* [**overwrite**]

Context

[Tree] (config>system>security copy)

Full Context

configure system security copy

Description

This command copies a profile or user from a source profile to a destination profile.

Parameters

source-profile

Specifies an existing profile to copy.

dest-profile

Specifies the copied profile is copied to the destination profile.

overwrite

Specifies that the destination profile configuration is overwritten with the copied source profile configuration. A profile is not overwritten if the **overwrite** command is not specified.

7.126 count

count

Syntax
count *number*

no count

Context
[Tree] (config>system>cron>sched count)

Full Context

configure system cron schedule count

Description

This command configures the total number of times a CRON "interval" schedule is run. For example, if the interval is set to 600 and the count is set to 4, the schedule runs 4 times at 600 second intervals.

Default

no count

Parameters

number

Specifies the number of times the schedule is run.

Values 1 to 65535

Default 65535

Platforms

7705 SAR Gen 2

7.127 cpe-check

cpe-check

Syntax

cpe-check *cpe-ip-address*

no cpe-check [*cpe-ip-address*]

Context

[Tree] (config>service>vprn>static-route-entry>indirect cpe-check)

[Tree] (config>service>vprn>static-route-entry>next-hop cpe-check)

Full Context

configure service vprn static-route-entry indirect cpe-check

configure service vprn static-route-entry next-hop cpe-check

Description

This command enables CPE-check and specifies the IP address of the target CPE device.

This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. The target-ip-

address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.

Note:
A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a **drop-count** of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

The **no** form of this command disables the **cpe-check** option.

Default

no cpe-check

Parameters

cpe-ip-address

Specifies the IP address of the CPE device.

Platforms

7705 SAR Gen 2

cpe-check

Syntax

cpe-check *cpe-ip-address*

no cpe-check [*cpe-ip-address*]

Context

[Tree] (config>router>static-route-entry>indirect cpe-check)

Full Context

configure router static-route-entry next-hop cpe-check

configure router static-route-entry indirect cpe-check

Description

This command enables CPE-check and specifies the IP address of the target CPE device.

This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. The target-ip-address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.

Note:
A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a **drop-count** of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

The **no** form of this command disables the **cpe-check** option.

Default

no cpe-check

Parameters

cpe-ip-address

Specifies the IP address of the CPE device.

Platforms

7705 SAR Gen 2

7.128 cpr-window-size

cpr-window-size

Syntax

cpr-window-size *window-size*

Context

[Tree] (config>port>dwdm>coherent cpr-window-size)

Full Context

configure port dwdm coherent cpr-window-size

Description

This command configures the window size used for carrier phase recovery.

Default

32

Parameters

window-size

Indicates the number of symbols used for carrier phase recovery algorithm of the receiver. When this parameter is changed, the link bounces because the receiver needs to be reconfigured.

Values 2, 4, 8, 16, 32, 64

Platforms

7705 SAR Gen 2

7.129 crc-monitor

crc-monitor

Syntax

crc-monitor

Context

[Tree] (config>port>ethernet crc-monitor)

Full Context

configure port ethernet crc-monitor

Description

This command configures Ethernet CRC Monitoring parameters.

Platforms

7.130 create

create

Syntax

[**no**] **create**

Context

[Tree] (environment create)

Full Context

environment create

Description

By default, the **create** command is required to create a new OS entity.

The **no** form of the command disables requiring the **create** keyword.

Default

create

Platforms

7705 SAR Gen 2

7.131 create-mpls-tunnel

create-mpls-tunnel

Syntax

[**no**] **create-mpls-tunnel**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action create-mpls-tunnel)

Full Context

configure router policy-options policy-statement entry action create-mpls-tunnel

Description

This command enables the creation of an MPLS tunnel to the BGP next-hop. It is supported for the following address families:

- vpn-ipv4
- vpn-ipv6
- evpn
- label-ipv4
- label-ipv6
- ipv4
- ipv6

The **no** form of the command disables the creation of an MPLS tunnel.

Default

no create-mpls-tunnel

Platforms

7705 SAR Gen 2

7.132 create-subscription

create-subscription

Syntax

[**no**] **create-subscription**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization create-subscription)

Full Context

configure system security profile netconf base-op-authorization create-subscription

Description

This command enables the NETCONF <create-subscription> RPC in the default user profile.

The **base-op-authorization create-subscription** configuration is not pre-emptive, which means that it is checked only at the time of the initial subscription. Configuration changes to the **base-op-authorization** do not cancel any in-progress subscriptions and operators who successfully subscribed continue to receive messages.

The **no** form of this command disables the RPC.

Default

no create-subscription

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

7.133 create-udp-tunnel

create-udp-tunnel

Syntax

create-udp-tunnel

no create-udp-tunnel

Context

[Tree] (config>router>policy-options>policy-statement>entry>action create-udp-tunnel)

[Tree] (config>router>policy-options>policy-statement>default-action create-udp-tunnel)

Full Context

configure router policy-options policy-statement entry action create-udp-tunnel

configure router policy-options policy-statement default-action create-udp-tunnel

Description

This command instructs the router to create an MPLS-over-UDP tunnel upon receiving BGP routes that match the import policy.

Default

no create-udp-tunnel

Platforms

7705 SAR Gen 2

7.134 credential

credential

Syntax

credits

Syntax

credits [**lowercase** *credits*] [**uppercase** *credits*] [**numeric** *credits*] [**special-character** *credits*]

no credits

Context

[Tree] (config>system>security>password>complexity-rules credits)

Full Context

configure system security password complexity-rules credits

Description

The maximum credits given for usage of the different character classes in the local passwords.

The **no** form of this command resets to default.

Default

no credits

Parameters

credits

Specifies the number of credits that can be used for each characters class.

Values 0 to 10

Platforms

7705 SAR Gen 2

7.136 crl-expiration-warning

crl-expiration-warning

Syntax

crl-expiration-warning *hours* [**repeat** *repeat-hours*]

no crl-expiration-warning

Context

[Tree] (config>system>security>pki crl-expiration-warning)

Full Context

configure system security pki crl-expiration-warning

Description

This command specifies when the systems issues a **BeforeExp** message before a CRL expires. For example, with **certificate-expiration-warning 5**, the system issues a **BeforeExp** message 5 hours before a CRL expires. An optional **repeat** *repeat-hour* parameter enables the system to repeat the **BeforeExp** message every hour until the CRL expires.

If the user only wants **AfterExp**, then **certificate-expiration-warning 0** can be used to achieve this.

BeforeExp and **AfterExp** warnings can be cleared in following cases:

- The CRL is reloaded by the **admin certificate reload** command. In this case, if the reloaded file is not expired, then **AfterExp** is cleared. And, if the reloaded file is outside of configured warning window, then the **BeforeExp** is also cleared.
- When the **ca-profile** is shutdown, then **BeforeExp** and **AfterExp** of corresponding certificates are cleared.
- When **no crl-expiration-warning** command is configured, then all existing **BeforeExp** and **AfterExp** are cleared.
- Users may change the configuration of the **crl-expiration-warning** so that certain CRL are no longer in the warning window. **BeforeExp** of corresponding CRL are cleared.
- If the system time changes so that the new time causes the CRL to no longer be in the warning window, then **BeforeExp** is cleared. If the new time causes an expired CRL to come non-expired, then **AfterExp** is cleared.

Default

no crl-expiration-warning

Parameters

hours

Specifies the amount of time before a CRL expires when system issues **BeforeExp**

Values 0 to 8760

repeat-hour

Specifies that the system repeats **BeforeExp** every repeat-hour

Values 0 to 8760

Platforms

7705 SAR Gen 2

7.137 crl-file

crl-file

Syntax

crl-file *filename*

no crl-file

Context

[Tree] (config>system>security>pki>ca-profile crl-file)

Full Context

configure system security pki ca-profile crl-file

Description

This command specifies the name of a file in cf3:\system-pki\crl as the Certification Revoke List file of the **ca-profile**.

Notes:

- The system performs following checks against configured crl-file when a **no shutdown** command is issued:
  - A valid cert-file of the ca-profile must be already configured.
  - Configured crl-file must be a DER formatted CRLv2 file.
  - All non-optional fields defined in section 5.1 of RFC 5280 must exist and conform to the RFC 5280 defined format.
  - Check the version field to see if its value is 0x1.
  - Delta CRL Indicator must not exist (delta CRL is not supported).
  - CRL's signature must be verified by using the cert-file of ca-profile.

  If any of above checks fail, the **no shutdown** command fails.
- Changing or removing the **crl-file** is only allowed when the **ca-profile** is in a **shutdown** state.

The **no** form of this command removes the filename from the configuration.

Parameters

filename

Specifies the name of CRL file stored in cf3:\system-pki\crl.

Platforms

7705 SAR Gen 2

7.138 crl-update

crl-update

Syntax

crl-update ca *ca-profile-name*

Context

[Tree] (admin>certificate crl-update)

Full Context

admin certificate crl-update

Description

This command manually triggers the Certificate Revocation List file (CRL) update for the specified ca-profile.

Using this command requires shutting down the **auto-crl-update**.

Parameters

ca-profile-name

Specifies the name of the Certificate Authority profile.

Platforms

7705 SAR Gen 2

7.139 crl-urls

crl-urls

Syntax

crl-urls

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update crl-urls)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls

Description

Commands in this context configure **crl-urls** parameters. The system allows up to eight URL entries to be configured and tries each URL in order and stop when a qualified CRL is successfully downloaded. A qualified CRL is a valid CRL signed by the CA and is more recent than the existing CRL.

If none of the configured URLs returns a qualified CRL, then:

- If the schedule-type is next-update-based, system will wait for configure retry-interval before it start from beginning of the list again.
- If the schedule-type is periodic, then system will wait till next periodic update time.

If the user wants to manually stop the download, shutting down of auto-crl-retrieval could be used to achieve this.

Platforms

7705 SAR Gen 2

7.140 cron

cron

Syntax

cron

Context

[Tree] (config>system cron)

Full Context

configure system cron

Description

This command creates the context to create scripts, script parameters and schedules which support the Service Assurance Agent (SAA) functions.

CRON features are saved to the configuration file on both primary and backup control modules. If a control module switchover occurs, CRON events are restored when the new configuration is loaded. If a control module switchover occurs during the execution of a cron script, the failover behavior will be determined by the contents of the script.

Platforms

7705 SAR Gen 2

cron

[Tree] (config>service>vprn>isis>level csnp-authentication)

Full Context

configure service vprn isis csnp-authentication

configure service vprn isis level csnp-authentication

Description

This command enables authentication of individual ISIS packets of complete sequence number PDUs (CSNP) type for the VPRN instance.

Platforms

7705 SAR Gen 2

csnp-authentication

Syntax

[**no**] **csnp-authentication**

Context

[Tree] (config>router>isis>level csnp-authentication)

[Tree] (config>router>isis csnp-authentication)

Full Context

configure router isis level csnp-authentication

configure router isis csnp-authentication

Description

This command enables authentication of individual IS-IS packets of complete sequence number PDUs (CSNP) type.

The **no** form of this command suppresses authentication of CSNP packets.

Default

csnp-authentication

Platforms

7705 SAR Gen 2

7.142 csnp-interval

csnp-interval

Syntax

csnp-interval *seconds*

no csnp-interval

Context

[Tree] (config>service>vprn>isis>if csnp-interval)

Full Context

configure service vprn isis interface csnp-interval

Description

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

Default

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

Parameters

seconds

The time interval, in seconds between successive CSN PDUs sent from this interface expressed as a decimal integer.

Values 1 to 65535

Platforms

7705 SAR Gen 2

csnp-interval

Syntax

csnp-interval *seconds*

no csnp-interval

Context

[Tree] (config>router>isis>interface csnp-interval)

Full Context

configure router isis interface csnp-interval

Description

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

Default

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

Parameters

seconds

Specifies the time interval, in seconds, between successive CSN PDUs sent from this interface expressed as a decimal integer.

Values 1 to 65535

Platforms

7705 SAR Gen 2

7.143 csnp-on-p2p

csnp-on-p2p

Syntax

[**no**] **csnp-on-p2p**

Context

[Tree] (config>router>isis csnp-on-p2p)

[Tree] (config>service>vprn>isis csnp-on-p2p)

Full Context

configure router isis csnp-on-p2p

configure service vprn isis csnp-on-p2p

Description

This command enables the periodic transmission of CSNP PDUs to point-to-point adjacent systems.

The **no** form of this command disables the periodic transmission of CSNP PDUs to point-to-point adjacent systems.

Default

csnp-on-p2p

Platforms

7705 SAR Gen 2

7.144 cspf

cspf

Syntax

[**no**] **cspf**

Context

[Tree] (debug>router>isis cspf)

Full Context

debug router isis cspf

Description

This command enables debugging for IS-IS cspf.

The **no** form of the command disables debugging.

Platforms

7705 SAR Gen 2

cspf

Syntax

cspf [*ip-address*]

no cspf

Context

[Tree] (debug>router>ospf cspf)

Full Context

debug router ospf cspf

Description

This command enables debugging for an OSPF constraint-based shortest path first (CSPF).

Parameters

ip-address

Specifies the IP address for the range used for CSPF.

Platforms

7705 SAR Gen 2

7.145 cspf-on-loose-hop

cspf-on-loose-hop

Syntax

[**no**] **cspf-on-loose-hop**

Context

[Tree] (config>router>mpls cspf-on-loose-hop)

Full Context

configure router mpls cspf-on-loose-hop

Description

This command enables the option to do CSPF calculations until the next loose hop or the final destination of LSP on LSR. On receiving a PATH message on LSR and processing of all local hops in the received ERO, if the next hop is loose, then the LSR node will first do a CSPF calculation until the next loose hop. On successful completion of CSPF calculation, ERO in PATH message is modified to include newly calculated intermediate hops and propagate it forward to the next hop. This allows setting up inter-area LSPs based on ERO expansion method.

Note:
The LSP may fail to set up if this option is enabled on an LSR that is not an area border router and receives a PATH message without proper next loose hop in ERO. The 'cspf-on-loose-hop' configuration is allowed to change dynamically and applied to new LSP setup after change.

Default

no cspf-on-loose-hop

Platforms

7705 SAR Gen 2

7.146 cspf-te

cspf-te

Syntax

cspf-te [**detail**]

no cspf-te

Context

[Tree] (debug>router>pcep>pcc cspf-te)

[Tree] (debug>router>pcep>pcc>conn cspf-te)

Full Context

debug router pcep pcc cspf-te

debug router pcep pcc connection cspf-te

Description

This command debugs Constrained Shortest Path First-Traffic Engineering (CSPF-TE) events.

The **no** form of this command disables debugging.

Parameters

detail

Keyword used to specify detailed information about all events.

Platforms

7705 SAR Gen 2

7.147 cumulative-factor

cumulative-factor

Syntax

[**no**] **cumulative-factor** *cumulative-factor*

Context

[Tree] (config>service>vpls>mac-move>secondary-ports cumulative-factor)

[Tree] (config>service>vpls>mac-move>primary-ports cumulative-factor)

[Tree] (config>service>template>vpls-template>mac-move>secondary-ports cumulative-factor)

[Tree] (config>service>template>vpls-template>mac-move>primary-ports cumulative-factor)

Full Context

configure service vpls mac-move secondary-ports cumulative-factor

configure service vpls mac-move primary-ports cumulative-factor

configure service template vpls-template mac-move secondary-ports cumulative-factor

configure service template vpls-template mac-move primary-ports cumulative-factor

Description

This command defines a factor defining how many mac-relearn measurement periods can be used to measure mac-relearn rate. The rate must be exceeded during the defined number of consecutive periods before the corresponding port is blocked by the mac-move feature. The cumulative-factor of primary ports must be higher than cumulative-factor of secondary ports.

Default

cumulative-factor 2 — secondary ports

cumulative-factor 3 — primary ports

Parameters

factor

Specifies the factor defining the number of mac-relearn measurement periods can be used to measure mac-relearn rate

Values 2 to 10

Platforms

7705 SAR Gen 2

7.148 current-hop-limit

current-hop-limit

Syntax

current-hop-limit *limit*

no current-hop-limit

Context

[Tree] (config>service>vprn>router-advert>if current-hop-limit)

Full Context

configure service vprn router-advertisement interface current-hop-limit

Description

This command configures the hop limit to be advertised.

The **no** form of this command returns the command to the default setting.

Default

current-hop-limit 64

Parameters

limit

Specifies the default value to be placed in the current hop limit field in router advertisement policies sent.

Values 0 to 255

Platforms

7705 SAR Gen 2

current-hop-limit

Syntax

current-hop-limit *number*

no current-hop-limit

Context

[Tree] (config>router>router-advert>if current-hop-limit)

Full Context

configure router router-advertisement interface current-hop-limit

Description

This command configures the current-hop-limit in the router advertisement messages. It informs the nodes on the subnet about the hop-limit when originating IPv6 packets.

Default

current-hop-limit 64

Parameters

number

Specifies the hop limit.

Values 0 to 255. A value of zero means there is an unspecified number of hops.

Platforms

7705 SAR Gen 2

7.149 custom-option

custom-option

Syntax

custom-option *option-number* **address** [*ip-address*]

custom-option *option-number* **address** *ipv6-address* [*ipv6-address*]

custom-option *option-number* **domain** [*domain-string*]

configure router dhcp local-dhcp-server pool subnet options custom-option

configure subscriber-mgmt local-user-db ipoe host options custom-option

configure service vprn dhcp local-dhcp-server pool options custom-option

configure router dhcp local-dhcp-server pool options custom-option

Description

This command configures specific DHCP options. The options defined here can overrule options in the local user database.

The **no** form of the removes the custom option parameters from the configuration.

Parameters

option-number

Specifies up to four option numbers that the DHCP server uses to send the identification strings to the DHCP client.

Values 1 to 254

ip-address

Specifies the IP address of a host.

Values a.b.c.d

ipv6-address

Specifies the IPv6 address of a host. Applicable to DHCP6 only.

Values

ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

domain-string

Specifies the domain name, up to 127 characters.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF (up to 254 hex nibbles)

ascii-string

Specifies the value of this option, up to 127 characters.

Platforms

7705 SAR Gen 2

custom-option

Syntax

custom-option *option-number* **address** [*ipv6-address*]

custom-option *option-number* **domain** [*domain-string*]

custom-option *option-number* **hex** *hex-string*

custom-option *option-number* **string** *ascii-string*

configure service vprn dhcp6 local-dhcp-server pool prefix options custom-option

Description

This command configures specific DHCP6 options. The options defined here can overrule options in the local user database.

The **no** form of the removes the custom option parameters from the configuration.

Parameters

option-number

Specifies up to four option numbers that the DHCP6 server uses to send the identification strings to the DHCP6 client.

Values 1 to 254

ipv6-address

Specifies the IPv6 address of a host.

Values	:ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x:	[0 to FFFF]H
		d:	[0 to 255]D

domain-string

Specifies the domain name, up to 127 characters.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF (up to 254 hex nibbles)

ascii-string

Specifies the value of this option, up to 127 characters.

7.150 custom-record

custom-record

Syntax

[**no**] **custom-record**

Context

[Tree] (config>log>acct-policy custom-record)

Full Context

configure log accounting-policy custom-record

Description

Commands in this context configure the layout and setting for a custom accounting record associated with this accounting policy.

The **no** form of this command reverts the configured values to the defaults.

Platforms

7705 SAR Gen 2

7.151 customer

customer

Syntax

customer *customer-id* [**create**] [**name** *name*]

no customer *customer-id*

Context

[Tree] (config>service customer)

Full Context

configure service customer

Description

This command creates a customer ID and customer context used to associate information with a particular customer. Services can later be associated with this customer at the service level.

Each *customer-id* must be unique. The **create** keyword must follow each new **customer** *customer-id* entry.

Enter an existing **customer** *customer-id* (without the *create* keyword) to edit the customer's parameters.

An optional customer **name** can be specified and is tied to the **customer-name** in the customer context (setting either **customer-name** or **name** will cause the other to change as well).

The **no** form of this command removes a *customer-id* and all associated information. Before removing a *customer-id*, all references to that customer in all services must be deleted or changed to a different customer ID.

Default

customer 1 always exists on the system and cannot be deleted.

Parameters

customer-id

Specifies the ID number to be associated with the customer, expressed as an integer.

Values *customer-id*: 1 to 2147483647

customer-name: 64 characters maximum

create

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

name name

This parameter configures an optional customer name, up to 64 characters in length, which adds a name identifier to a given customer to then use that customer name in configuration references as well as display and use customer names in show commands throughout the system. This helps the service provider/administrator to identify and manage services within the SR OS platforms.

All services are required to assign a customer ID to initially create a customer. However, either the customer ID or the customer name can be used to identify and reference a given customer once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *customer-id* as the name.

Values *name*: 64 characters maximum

Platforms

7705 SAR Gen 2

7.152 customer-id-range

customer-id-range

Syntax

customer-id-range start *customer-id* **end** *customer-id*

no customer-id-range

Context

[Tree] (config>service>md-auto-id customer-id-range)

Full Context

configure service md-auto-id customer-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to customers that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A customer created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no customer-id-range

Parameters

start *customer-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 2 to 2147483647

end *customer-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 2 to 2147483647

Platforms

7705 SAR Gen 2

8 d Commands

8.1 d-path-ignore

d-path-ignore

Syntax

[**no**] **d-path-ignore**

Context

[Tree] (config>service>system>bgp-evpn>ad-per-evi-routes d-path-ignore)

Full Context

configure service system bgp-evpn ad-per-evi-routes d-path-ignore

Description

This command makes the router ignore the Domain PATH attribute (D-PATH) when BGP computes the best path selection for received routes.

The **no** form of this command considers the D-PATH length and value as a tiebreaker in determining the best-path selection. In accordance with *draft-sr-bess-evpn-dpath*, the router compares the D-PATH attribute received in AD per-EVI routes with the same key as follows:

- The routes with the shortest D-PATH are preferred; therefore, routes not tied for the shortest D-PATH are removed. Routes without D-PATH are considered zero-length D-PATH.
- The routes with the numerically lowest left-most Domain-ID are preferred; therefore, routes not tied for the numerically lowest left-most Domain-ID are removed from consideration.

Default

no d-path-ignore

Platforms

7705 SAR Gen 2

8.2 d-path-length-ignore

d-path-length-ignore

Syntax

[**no**] **d-path-length-ignore**

Context

[Tree] (config>service>vprn d-path-length-ignore)

[Tree] (config>router>bgp>path-selection d-path-length-ignore)

Full Context

configure service vprn d-path-length-ignore

configure router bgp best-path-selection d-path-length-ignore

Description

This command enables and disables the ability of the router to ignore D-PATH domain segment length during best-path selection. At the base router level (or **vprn>bgp** level for PE-CE routers), this command allows BGP to ignore the D-PATH domain segment length for best-path selection purposes. The D-PATH length is ignored when comparing two VPN routes or two IFL routes within the same RD. However, these VPN/IFL routes are processed in Main-BGP instance.

At the VPRN router level, this command allows the VPRN RTM to ignore the D-PATH domain segment length for best path selection purposes (for routes in VPRN). The user can control whether the D-PATH length is considered when two VPN routes with different RDs are compared.

Best-path selection for EVPN-IFF routes against other owners (for example, EVPN-IFL or IPVPN) still relies on RTM preference. When EVPN-IFF RTM preference matches the RTM preference of another BGP owner, the existing RTM selection applies and D-PATH is not considered, irrespective of the **d-path-length-ignore** configuration.

The **no** form of this command disables the ability to ignore the D-PATH domain segment length.

Default

no d-path-length-ignore

Platforms

7705 SAR Gen 2

8.3 dad-disable

dad-disable

Syntax

[**no**] **dad-disable**

Context

[Tree] (config>service>ies>if>ipv6 dad-disable)

[Tree] (config>service>vprn>if>ipv6 dad-disable)

[Tree] (config>router>if>ipv6 dad-disable)

Full Context

configure service ies interface ipv6 dad-disable

configure service vprn interface ipv6 dad-disable

configure router interface ipv6 dad-disable

Description

This command disables duplicate address detection (DAD) on the interface. When **dad-disable** is configured on the interface, the router does not perform a DAD check and all IPv6 addresses on the interface immediately enter a preferred state without checking for uniqueness on the interface. This command is useful when an interface enters a looped state during troubleshooting and becomes operationally disabled when the loop is detected; a manual intervention is required to clear the DAD violation.

The **no** form of this command enables duplicate address detection (DAD) on the interface.

Default

no dad-disable

8.4 damp-peer-oscillations

damp-peer-oscillations

Syntax

damp-peer-oscillations [**idle-hold-time** *initial-wait second-wait max-wait*] [**error-interval** *error-interval*]

Context

[Tree] (config>service>vprn>bgp damp-peer-oscillations)

[Tree] (config>service>vprn>bgp>group damp-peer-oscillations)

[Tree] (config>service>vprn>bgp>group>neighbor damp-peer-oscillations)

Full Context

configure service vprn bgp damp-peer-oscillations

configure service vprn bgp group damp-peer-oscillations

configure service vprn bgp group neighbor damp-peer-oscillations

Description

This command controls how long a BGP peer session remains in the idle-state after some type of error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short while after each session reset cause longer and longer hold times in the idle state. This command supports the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4).*

The default behavior, which applies when no damp-peer-oscillations is configured, is to immediately transition out of the idle-state after every reset.

Default

no damp-peer-oscillations

Parameters

initial-wait

Specifies the amount of time, in minutes, that a session remains in the idle-state after it has been stable for a while.

Values 0 to 2048

Default 0

second-wait

Specifies the period of time, in minutes, that is doubled after each repeated session failure that occurs within a relatively short span of time.

Values 0 to 2048

Default 5

max-wait

Specifies the maximum amount of time, in minutes, that a session remains in the idle-state after it has experienced repeated instability.

Values 0 to 2048

Default 60

error-interval

Specifies the interval of time, in minutes after a session reset, during which the session must be error-free in to reset the penalty counter and return to idle-hold-time to initial-wait.

Values 0 to 2048

Default 30

Platforms

7705 SAR Gen 2

8.5 dampening

dampening

Syntax

dampening

Context

[Tree] (config>port>ethernet dampening)

Full Context

configure port ethernet dampening

Description

Commands in this context configure exponential port dampening for an Ethernet port.

Exponential Port Dampening (EPD) reduces the number of physical link transitions reported to upper layer protocols, potentially reducing upper layer protocol churn caused by a faulty link. Penalties are added against a port whenever the port's physical link state transitions from a link up state to a link down state. When the penalties exceed a configurable threshold, port-up and port-down transitions are no longer advertised to upper layers and the port's operational state will remain down until the penalty amount drops below a configurable reuse threshold. Each transition of link up state to link down state increments the accumulated penalty value by 1000. The accumulated penalties for a port are reduced at an exponential decay rate according to a configurable half-life parameter.

[Tree] (config>service>vprn>bgp>group damping)

Full Context

configure service vprn bgp damping

configure service vprn bgp group neighbor damping

configure service vprn bgp group damping

Description

This command enables BGP route damping for learned routes which are defined within the route policy. Use damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes. Damping parameters are set via route policy definition.

The **no** form of this command used at the global level disables route damping.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

When damping is enabled and the route policy does not specify a damping profile, the default damping profile is used. This profile is always present and consists of the following parameters:

Half-life: 15 minutes

Max-suppress: 60 minutes

Suppress-threshold: 3000

Reuse-threshold: 750

Default

no damping — Learned route damping is disabled.

debug router pim data

Description

This command enables debugging for PIM data exception.

The **no** form of this command disables PIM data exception debugging.

Parameters

grp-ip-address

Debugs information associated with the specified data exception.

Values multicast group address (ipv4, ipv6)

ip-address

Debugs information associated with the specified data exception.

Values source address (ipv4, ipv6)

detail

Debugs detailed IP data exception information.

Platforms

8.8 database-export

database-export

Syntax

database-export [**identifier** *id*] [**bgp-ls-identifier** *bgp-ls-id*] [**reachable-ls-only**]

no database-export

Context

[Tree] (config>router>isis database-export)

Full Context

configure router isis database-export

Description

This command configures the population of the extended Traffic Engineering Database (TE-DB) with the link-state information from a specific IGP instance.

This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

Parameters

id

Specifies an entry ID to export. This parameter is used to uniquely identify the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. However, because the concept of instance ID defined in IS-IS (RFC 6822) is unique within a routing domain while the one specified for OSPF is local subnet significant (RFC 6549), the user can remove any overlap by configuring the **identifier** value to be unique within a specific IGP domain when this router sends the IGP link-state information using BGP-LS.

Values 0 to 18446744073709551615

bgp-ls-id

Specifies a BGP-LS ID to export. This parameter is used, along with the Autonomous System Number (ASN) to correlate the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {bgp-ls-identifier, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note: If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

Values 0 to 4294967295

reachable-ls-only

Keyword to specify that only reachable link-state information is encoded. When this keyword is configured, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged.

configure router ospf3 database-export

Description

This command enables the population of the extended Traffic Engineering Database (TE-DB) with the link-state information from a specific IGP instance.

This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

Default

no database-export

Parameters

id

Specifies an entry ID to export. This parameter is used to uniquely identify the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. The concept of instance ID specified for OSPF is local subnet significant (RFC 6549). The user can remove the router specific overlap by configuring the **identifier** value to be unique within a specific IGP domain when this router sends the IGP link-state information using BGP-LS.

Values 0 to 18446744073709551615

bgp-ls-id

Specifies a BGP-LS ID to export. This parameter is used, along with the ASN, to correlate the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {bgp-ls-identifier, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note: If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

Values 0 to 4294967295

reachable-ls-only

Keyword to specify that only reachable link-state information is encoded. When this keyword is configured, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged.

8.10 day-of-month

day-of-month

Syntax

day-of-month {*day-number* [*..day-number*] **all**}

no day-of-month

Context

[Tree] (config>system>cron>sched day-of-month)

Full Context

configure system cron schedule day-of-month

Description

This command specifies which days of the month that the schedule will occur. Multiple days of the month can be specified. When multiple days are configured, each of them will cause the schedule to trigger. If a day-of-month is configured without configuring month, weekday, hour, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of-month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified day-of-month from the list.

Default

no day-of-month

Parameters

day-number

Specifies the positive integers specify the day of the month counting from the first of the month. The negative integers specify the day of the month counting from the last day of the month. For example, configuring **day-of-month -5, 5** in a month that has 31 days will specify the schedule to occur on the 27th and 5th of that month.

Integer values must map to a valid day for the month in question. For example, February 30 is not a valid date.

Values 1 to 31, -31 to -1 (maximum 62 day-numbers)

all

Specifies all days of the month.

Platforms

7705 SAR Gen 2

8.13 de-1-out-profile

de-1-out-profile

Syntax
[**no**] **de-1-out-profile**

Context
[Tree] (config>qos>sap-ingress>fc de-1-out-profile)

Full Context
configure qos sap-ingress fc de-1-out-profile

Description

This command, when enabled on a parent forwarding class, applies a color profile mode to the packets stored in the queue associated with this forwarding class. The queue associated with the parent forwarding class must be of type **profile-mode**.

When this QoS policy is applied to the ingress of a Frame Relay VLL SAP, the system will treat the received FR frames with DE bit set as out-of-profile, regardless of their previous marking as the result of the default classification or on a match with an IP filter. It also adjusts the CIR of the ingress SAP queue to consider out-of-profile frames that were sent while the SAP queue was in the "< CIR" state of the bucket. This makes sure that the CIR of the SAP is achieved.

All received DE = 0 frames that are classified into this parent forwarding class or any of its subclasses have their profile unchanged by enabling this option. That is, the DE = 0 frame profile could be undetermined (default), in-profile, or out-of-profile as per previous classification. The DE = 0 frames that have a profile of undetermined will be evaluated by the system CIR marking algorithm and will be marked appropriately.

The **priority** option, if used, has no effect. All FR VLL DE = 1 frames have their priority automatically set to low while DE = 0 frames have their priority set to high. Furthermore, DE = 1 frames have the drop-preference bit set in the internal header. The internal settings of the priority bit and of the drop-preference bit of the frame is independent of the use of the profile mode.

All other capabilities of the Fpipe service are maintained. This includes remarking of the DE bit on egress SAP, and FR PW control word on egress network port for the packets that were classified into "out-of-profile" at ingress SAP.

This **de-1-out-profile** keyword has an effect when applied to the ingress of a SAP that is part of an Fpipe service. It can also be used on the ingress of an Epipe or VPLS SAP.

The **no** form of this command disables the color profile mode of operation on all SAPs to which this ingress QoS policy is applied.

Default

no de-1-out-profile

Platforms

7705 SAR Gen 2

8.14 de-mark

de-mark

Syntax

de-mark [**force** *de-value*]

no demark

Context

[Tree] (config>qos>sap-egress>fc de-mark)

Full Context

configure qos sap-egress fc de-mark

Description

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile/in-profile or out-of-profile/exceed-profile status of the packet (*fc-name* may be used to identify the dot1p-value).

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

If this command is not used, the DE bit should be preserved if an ingress TAG exist; otherwise, set to zero.

If the DE value is included in the command line, this value is to be used for all the packets of this forwarding class regardless of their profile status.

The commands **de-mark-inner** and **de-mark-outer** take precedence over the **de-mark** command if both are specified in the same policy.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

Platforms

7705 SAR Gen 2

de-mark

Syntax

de-mark [**force** *de-value*]

no de-mark

Context

[Tree] (config>qos>network>egress>fc de-mark)

Full Context

configure qos network egress fc de-mark

Description

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile or in-profile and out-of-profile or exceed-profile status of the packet (*fc-name* may be used to identify the dot1p value).

Parameters

de-value

Specifies that this value is to be used for all the packets of this forwarding class regardless of their profile status.

If no DE value is present, the default values are used for the marking of the DE bit; that is, 0 for inplus-profile and in-profile packets, 1 for out-of-profile and exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, use the following rules for a network port (B-SDP):

- the outer VID follows the rules for regular SDP
- for packets originating from a local I-VPLS/PBB-Epipe, this command dictates the marking of the DE bit for both the outer (link level) BVID and ITAG; if the command is not used, the DE bit is set to zero.
- for transit packets (B-SAP/B-SDP to B-SDP), the related ITAG bits are preserved, the same as for BVID.

Values 0, 1

Platforms

7705 SAR Gen 2

8.15 de-mark-inner

de-mark-inner

Syntax

de-mark-inner [**force** *de-value*]

no de-mark-inner

Context

[Tree] (config>qos>sap-egress>fc de-mark-inner)

Full Context

configure qos sap-egress fc de-mark-inner

Description

This command is used to explicitly define the marking of the DE bit in the inner VLAN tag for **fc** *fc-name* on a QinQ SAP, according to the in- and out-of-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the inner tags of packets of this forwarding class, regardless of their profile status.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **de-mark-inner** in the policy. That is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured (the marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system).

If no de-mark commands are used, the DE bit is preserved if an ingress inner tag exists; otherwise, set to 0.

Remarking the inner DE bit is not supported based on the profile result of egress policing.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

Platforms

7705 SAR Gen 2

8.16 de-mark-outer

de-mark-outer

Syntax

de-mark-outer [**force** *de-value*]

no de-mark-outer

Context

[Tree] (config>qos>sap-egress>fc de-mark-outer)

Full Context

configure qos sap-egress fc de-mark-outer

Description

This command is used to explicitly define the marking of the DE bit in the outer or single VLAN tag on a qinq or dot1q SAP, respectively, according to the in, out, or exceed-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile/in-profile packets, 1 for out-of-profile/exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the outer or single tags of packets of this forwarding class, regardless of their profile status.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

If no de-mark commands are used, the DE bit is preserved if an ingress outer or single tag exists; otherwise, set to 0.

Parameters

de-value

Specifies the DE marking value.

Values 0 or 1

Platforms

7705 SAR Gen 2

8.18 dead-timer

dead-timer

Syntax

dead-timer *seconds*

no dead-timer

Context

[Tree] (config>router>pcep>pcc dead-timer)

Full Context

configure router pcep pcc dead-timer

Description

This command configures the PCEP session dead timer value, which is the amount of time a PCEP speaker (PCC or PCE) will wait after the receipt of the last PCEP message before declaring its peer down.

The keep-alive mechanism is asymmetric, meaning that each PCEP speaker can propose a different dead timer value to its peer to use to detect session timeout.

The **no** form of the command returns the dead timer to the default value.

Default

dead-timer 120

Parameters

seconds

the dead timer value, in seconds

Values 1 to 255

Platforms

7705 SAR Gen 2

8.19 debounce

debounce

Syntax

debounce *occurrences* [**within** *seconds*]

no debounce

Context

[Tree] (config>log>event-trigger>event>trigger-entry debounce)

Full Context

configure log event-trigger event trigger-entry debounce

Description

This command configures when to trigger, for example after one or more event occurrences. The number of occurrences of an event can be bounded by a time window or left open.

The **no** form of this command removes the debounce configuration.

Parameters

occurrences

Specifies the number of times an event must occur for EHS to trigger a response.

Values 2 to 15

within *seconds*

Specifies the time window within which a specific event must occur a number of times equivalent to the specified *occurrences* for EHS to trigger a response.

Values 1 to 604800

8.21 debug-save

debug-save

Syntax
debug-save [*file-url*]

Context
[Tree] (admin debug-save)

Full Context
admin debug-save

Description
This command saves existing debug configuration (configuration done under the debug branch of CLI). Debug configurations are not saved by the **admin save** command and not preserved across a node reboot or CPM switchover. The **debug-save** command makes the debug configuration available for the operator to execute after a reboot by using the **exec** command or after a CPM switchover by using the **switchover-exec** command, if desired.

Parameters

file-url

Specifies the file URL location to save the debug configuration. If no file-url is specified then the debug configuration is saved at the same location as the standard configuration file (**bof>primary-config**/**bof>secondary-config**/**bof>tertiary-config**) with the same file name as the standard configuration file but with a .dbg suffix.

Values

file url	local-url | remote-url: 255 chars max
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id *file-path* 199 chars max
remote-url	[{ftp:// | tftp://}*login*:*pswd@remote-locn*/][*file-path*]
	255 chars max
	directory length 99 chars max each
remote-locn	{hostname | ipv4-address | [ipv6-address]}
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses 255

[Tree] (config>router>bgp>group def-recv-evpn-encap)

Full Context

configure router bgp group neighbor def-recv-evpn-encap

configure router bgp group def-recv-evpn-encap

Description

This command defines how the BGP will treat a received EVPN route without RC5512 BGP encapsulation extended community. If no encapsulation is received, BGP will validate the route as MPLS or VXLAN depending on how this command is configured.

Default

no def-recv-evpn-encap

Parameters

mpls

Specifies that **mpls** is the default encapsulation value in the case where no RFC 5512 extended community is received in the incoming BGP-EVPN route.

vxlan

Specifies that **vxlan** is the default encapsulation value.

Platforms

7705 SAR Gen 2

8.23 default

default

Syntax

[**no**] **default**

Context

[Tree] (config>log>accounting-policy default)

Full Context

configure log accounting-policy default

Description

This command configures the default accounting policy to be used with all SAPs that do not have an accounting policy.

If no access accounting policy is defined on a SAP, accounting records are produced in accordance with the default access policy. If no default access policy is created, then no accounting records will be collected other than the records for the accounting policies that are explicitly configured.

If no network accounting policy is defined on a network port, accounting records will be produced in accordance with the default network policy. If no network default policy is created, then no accounting records will be collected other than the records for the accounting policies explicitly configured.

Only one access accounting policy ID can be designated as the default access policy. Likewise, only one network accounting policy ID can be designated as the default network accounting policy.

The record name must be specified prior to assigning an accounting policy as default.

If a policy is configured as the default policy, then a **no default** command must be issued before a new default policy can be configured.

The **no** form of this command removes the default policy designation from the policy ID. The accounting policy will be removed from all SAPs or network ports that do not have this policy explicitly defined.

Platforms

7705 SAR Gen 2

8.24 default-action

default-action

Syntax

default-action {**bypass-host-creation** | **drop**}

no default-action

Context

[Tree] (config>filter>dhcp-filter default-action)

Full Context

configure filter dhcp-filter default-action

Description

This command specifies the default action for DHCP filters when no entries match.

The **no** form of this command reverts to the default.

Parameters

bypass-host-creation

Specifies to bypass ESM host creation options.

drop

Specifies to drop and not process the DHCP message.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action bypass-host-creation [**na**] [**pd**]

default-action drop

no default-action

Context

[Tree] (config>filter>dhcp6-filter default-action)

Full Context

configure filter dhcp6-filter default-action

Description

This command specifies the default action for DHCP6 filters when no entries match.

The **no** form of this command reverts to the default.

Parameters

bypass-host-creation

Specifies to bypass ESM host creation options.

Values **na** — Bypasses the DHCP NA hosts creation.
pd — Bypasses the DHCP PD hosts creation.

drop

Specifies to drop and not process the DHCP6 message.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**drop** | **forward**}

no default-action

Context

[Tree] (config>service>vprn>log>filter default-action)

Full Context

configure service vprn log filter default-action

Description

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

Default

default-action forward — The events which are not explicitly dropped by an event filter match are forwarded.

Parameters

drop

The events which are not explicitly forwarded by an event filter match are dropped.

forward

The events which are not explicitly dropped by an event filter match are forwarded.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action fc *fc-name* **profile** {**in** | **out**}

Context

[Tree] (config>qos>network>ingress default-action)

Full Context

configure qos network ingress default-action

Description

This command defines or edits the default action to be taken for packets that have an undefined DSCP or MPLS EXP bit set. The **default-action** command specifies the forwarding class to which such packets are assigned.

Multiple default-action commands will overwrite each previous default-action command.

Default

default-action fc be profile out

Parameters

fc-name

Specifies the forwarding class name. All packets with DSCP value or MPLS EXP or dot1p bits that are not defined will be placed in this forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command. In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

Values in, out

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**drop** | **forward**}

Context

[Tree] (config>filter>ip-filter default-action)

[Tree] (config>filter>ipv6-filter default-action)

Full Context

configure filter ip-filter default-action

configure filter ipv6-filter default-action

Description

This command defines the default action to be applied to packets not matching any entry in this ACL filter policy or to packets for that match a PBF/PBR filter entry for which the PBF/PBR target is down and **pbr-down-action-override** per-entry is set to **filter-default-action**.

Default

default-action drop

Parameters

drop

Specifies the default action is to drop a packet.

forward

Specifies the default action is to forward a packet.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**drop** | **forward**}

no default-action

Context

[Tree] (config>log>filter default-action)

Full Context

configure log filter default-action

Description

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

Default

default-action forward

Parameters

drop

The events which are not explicitly forwarded by an event filter match are dropped.

forward

The events which are not explicitly dropped by an event filter match are forwarded.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**permit** | **deny** | **deny-host-unreachable**}

Context

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter default-action)

[Tree] (config>system>security>mgmt-access-filter>ip-filter default-action)

[Tree] (config>system>security>mgmt-access-filter>mac-filter default-action)

Full Context

configure system security management-access-filter ipv6-filter default-action

configure system security management-access-filter ip-filter default-action

configure system security management-access-filter mac-filter default-action

Description

This command creates the default action for management access in the absence of a specific management access filter match.

The **default-action** is applied to a packet that does not satisfy any match criteria in any of the management access filters. Whenever management access filters are configured, the **default-action** must be defined.

Parameters

permit

Specifies that packets not matching the configured selection criteria in any of the filter entries will be permitted.

deny

Specifies that packets not matching the selection criteria be denied and that an ICMP host unreachable message will not be issued.

deny-host-unreachable

Specifies that packets not matching the selection criteria be denied access and that an ICMP host unreachable message will be issued.

The **deny-host-unreachable** only applies to ip-filter and ipv6filter.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**deny-all** | **permit-all** | **none** | **read-only-all**}

Context

[Tree] (config>system>security>profile default-action)

Full Context

configure system security profile default-action

Description

This command specifies the default action to be applied when no match conditions are met in the list of **profile entry match** commands. It does not apply in any way to other parts of the profile such as **grpc rpc-authorization** or **netconf base-op-authorization**.

When a user is a member of multiple profiles, profiles are evaluated in the order that they are configured. Evaluation stops if there is a match, or when the default action of the profile is **deny-all**, **permit-all**, or **read-only-all**. When the profile default action is **none** and if no match conditions are met in the profile, the next profile is evaluated. When the default action of the last profile is **none** and no explicit match is found, the command is denied.

Parameters

deny-all

Sets the default of the profile to deny access to all commands.

permit-all

Sets the default of the profile to permit access to all commands.

Note:
In classic CLI but not in MD-CLI the **permit-all** parameter does not change access to **security** commands. Specific entries must be created in a command authorization profile in order to give access to **security** commands. The system populated "administrative" profile contains rules to access **security** commands.

none

Sets the default of the profile to no-action. This option is useful to assign multiple profiles to a user.

read-only-all

Sets the default of the profile to allow read-only access to all commands.

Platforms

7705 SAR Gen 2

default-action

Syntax

default-action {**accept** | **next-entry** | **next-policy** | **drop** | **reject**}

no default-action

Context

[Tree] (config>router>policy-options>policy-statement default-action)

Full Context

configure router policy-options policy-statement default-action

Description

Commands in this context configure actions to apply to routes that do not match any entries of a route policy statement.

The **no** form of this command deletes the **default-action** context for the policy statement.

Default

no default-action

Parameters

accept

Specifies that routes not matched by any entry should be allowed or accepted. This parameter provides a context for modifying route properties.

next-entry

Specifies that routes not matched by any entry should be evaluated by the next sequential entry in the policy chain, after route properties are possibly modified by the default action of the current policy.

next-policy

Specifies that routes not matched by any entry should be evaluated by the next sequential policy in the policy chain, after route properties are possibly modified by the default action of the current policy.

drop

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter provides a context for modifying route properties.

reject

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter does not provide a context for modifying route properties.

8.25 default-domain

default-domain

Syntax

default-domain *dns-name*

no default-domain

Context

[Tree] (config>service>vprn>dns default-domain)

Full Context

configure service vprn dns default-domain

Description

This command configures the DNS domain name to be added in DNS retries when a DNS query is not replied or an empty DNS reply is received.

The **no** form of this command prevents DNS retries when the DNS query is not replied or an empty DNS reply is received.

Parameters

dns-name

Specifies the name of the default domain, up to 255 characters. Allowed values for characters are alphabetical (A-Z), numeric (0-9), the minus sign (-), and the period (.). For example, "3gpp-network.org”.

Platforms

7705 SAR Gen 2

8.26 default-fc

default-fc

Syntax

default-fc *fc-name*

no default-fc

Context

[Tree] (config>qos>sap-ingress default-fc)

Full Context

configure qos sap-ingress default-fc

Description

This command configures the default forwarding class for the policy. If an ingress packet does not match a higher priority (more explicit) classification command, the default forwarding class or subclass if associated with the packet. Unless overridden by an explicit forwarding class classification rule, all packets received on an ingress SAP using this ingress QoS policy are classified to the default forwarding class. Optionally, the default ingress enqueuing priority for the traffic can be overridden as well.

The default forwarding class is best effort (be). The **default-fc** settings are displayed in the **show configuration** and **save** output regardless of inclusion of the **detail** keyword.

Default

default-fc "be”

Parameters

fc-name

Specify the forwarding class name for the queue. The value specified for *fc-name* must be one of the predefined forwarding classes in the system.

The subclass-name parameter is optional and used with the fc-name parameter to define a preexisting subclass. The fc-name and subclass-name parameters must be separated by a period (dot). If subclass-name does not exist in the context of fc -name, an error will occur. If subclass-name is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

7705 SAR Gen 2

8.27 default-instance

default-instance

Syntax

[**no**] **default-instance**

Context

[Tree] (config>service>vprn>isis>if default-instance)

Full Context

configure service vprn isis interface default-instance

Description

This command enables a non-MI capable router to establish an adjacency and operate with an SR OS in a non-zero instance. If the router does not receive IID-TLVs, it establishes an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router establishes an adjacency in the configured non-zero instance. The router then operates in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

Default

no default-instance

Platforms

7705 SAR Gen 2

default-instance

Syntax

[**no**] **default-instance**

Context

[Tree] (config>router>isis>interface default-instance)

Full Context

configure router isis interface default-instance

Description

This command enables a non-MI capable router to establish an adjacency and operate with a router in a non-zero instance. If the router does not receive IID-TLVs, it will establish an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router will establish an adjacency in the configured non-zero instance. The router will then operate in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

This feature must be configured on the router connected to non-MI capable routers and on all other SR OS routers in the area, so that they receive non-MI LSPs in the correct instance and not in the base instance.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

8.31 default-label-preference

default-label-preference

Syntax

default-label-preference [**ebgp** *ebgp label preference*] [**ibgp** *ibgp label preference*]

no default-label-preference

Context

[Tree] (config>router>bgp>group>neighbor default-label-preference)

[Tree] (config>router>bgp>group default-label-preference)

[Tree] (config>router>bgp default-label-preference)

Full Context

configure router bgp group neighbor default-label-preference

configure router bgp group default-label-preference

configure router bgp default-label-preference

Description

This command specifies a route-table preference value to use for EBGP or IBGP routes carrying labeled-unicast prefixes and received from peers covered by the context of the command. Route-table preference comes into play when the route-table has multiple routes for the same IP prefix. In this case the route with the numerically lowest preference value is usually the route that is activated and installed into the IP FIB. By default all BGP routes have a route-table preference value of 170.

This command overrides the preference value assigned by the **label-preference** command; that other command does not distinguish between EBGP and IBGP routes. Overriding happens even when the default-label-preference value is inherited from a higher level of configuration and competes with an explicitly configured label-preference value at a lower level of configuration in the BGP hierarchy.

Note:
The preference value assigned by the **default-label-preference** command can always be overwritten by a route policy entry that accepts the route with a **preference** command in the action.

The **no** form of the command lets BGP route-table preference for labeled-unicast routes to be controlled by other means.

Default

no default-label-preference

Parameters

ebgp label preference

Specifies the EBGP default preference label value.

Values 0 to 255

ibgp label preference

Specifies the IBGP default preference label value.

Values 0 to 255

Platforms

7705 SAR Gen 2

8.35 default-priority

default-priority

Syntax

default-priority {**high** | **low**}

no default-priority

Context

[Tree] (config>qos>sap-ingress default-priority)

Full Context

configure qos sap-ingress default-priority

Description

This command configures the default enqueuing priority for all packets received on an ingress SAP using this policy. To change the default priority for the policy, the **fc-name** must be defined whether it is being changed or not.

Default

default-priority low

Parameters

high

Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

[Tree] (config>service>vpls>bgp-evpn>mpls default-route-tag)

Full Context

configure service vprn bgp-evpn mpls default-route-tag

configure service epipe bgp-evpn mpls default-route-tag

configure service vpls bgp-evpn mpls default-route-tag

Description

This command configures a route tag that EVPN and IP-VPN use when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP EVPN instance is enabled, the command cannot be changed. Additionally, EVPN services can add tags to routes with **proxy-arp/nd>evpn-route-tag** or the route table tag (added using the import policy). Only one tag is passed from EVPN to the BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.

The following are examples of the conflict priority handling:

- If a service is configured with both **default-route-tag** *X* and **proxy-arp>evpn-route-tag** *Y*, EVPN uses route tag *Y* when sending EVPN proxy-arp routes to the BGP RIB for advertisement.
- If a given IP-prefix route is tagged in the route-table with tag *A* and the R-VPLS, in which the route is advertised, uses *B* as the **default-route-tag**, then EVPN keeps tag *A* when sending the route to the BGP RIB.

The **default-route-tag** configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.

The **no** form of this command removes the **default-route-tag** (that is, it sets the route tag to zero).

Default

no default-route-tag

Parameters

tag

Specifies the route tag.

Values 1 to 255

Platforms

7705 SAR Gen 2

default-route-tag

Syntax

configure subscriber-mgmt local-user-db ipoe host options default-router

Description

This command configures the IP address of the default router for a DHCP client. Up to four IP addresses can be specified.

The **no** form of this command removes the address(es) from the configuration.

Parameters

ip-address

Specifies up to four default router IP addresses. Each address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

8.40 default-sap

default-sap

Syntax

[**no**] **default-sap**

Context

[Tree] (config>service>vpls>sap>managed-vlan-list default-sap)

Full Context

configure service vpls sap managed-vlan-list default-sap

Description

This command adds a default SAP to the managed VLAN list.

The **no** form of this command removes the default SAP to the managed VLAN list.

Platforms

7705 SAR Gen 2

8.41 default-secure-service

default-secure-service

Syntax

default-secure-service *service-id ip-int-name*

no default-secure-service

Context

[Tree] (config>service>ies>if>sap>ipsec-gw default-secure-service)

[Tree] (config>service>vprn>if>sap>ipsec-gw default-secure-service)

Full Context

configure service ies interface sap ipsec-gw default-secure-service

configure service vprn interface sap ipsec-gw default-secure-service

Description

This command specifies a service ID or service name of the default security service used by this SAP IPsec gateway.

Parameters

service-id

Specifies a default secure service.

Values *service-id*: 1 to 2147483647*svc-name:* An existing service name up to 64 characters.

ip-int-name

The name of private IPsec tunnel interface.

Platforms
7705 SAR Gen 2

8.42 default-tunnel-template

default-tunnel-template

Syntax
default-tunnel-template *ipsec-template-identifier*
no default-tunnel-template

Context
[Tree] (config>service>ies>if>sap>ipsec-gw default-tunnel-template)
[Tree] (config>service>vprn>if>sap>ipsec-gw default-tunnel-template)

Full Context
configure service ies interface sap ipsec-gw default-tunnel-template
configure service vprn interface sap ipsec-gw default-tunnel-template

Description
This command configures a default tunnel policy template for the gateway.

delay

Syntax

delay *interval*

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>progress-indicator delay)

Full Context

configure system management-interface cli md-cli environment progress-indicator delay

Description

This command sets the delay before the progress indicator is displayed in the MD-CLI.

Default

delay 500

Parameters

interval

Specifies the delay interval, in milliseconds.

Values 1 to 10000

Platforms

7705 SAR Gen 2

8.44 delay-event

delay-event

Syntax

delay-event {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number* **threshold***raise-threshold* [**clear** *clear-threshold*]

no delay-event {**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type delay-event)

Full Context

configure oam-pm bin-group bin-type delay-event

Description

This command sets the bin number, the threshold and the direction that is monitored to determine if a delay metric threshold crossing event has occurred or has cleared. It requires a bin number, a rising threshold value and a direction. If the *clear-threshold* value is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. When a raise threshold is reached, the log event is generated. Each unique threshold can only be raised once for the threshold within measurement interval. If the optional clear threshold is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes, and the clear threshold has not been exceeded. A clear event is raised under that condition. In general, alarms are generated when there is a state change. The thresholds configured are applied to the count in specified bin and all higher number bins.

The **no** form of this command removes thresholding for this delay metric. The complete command must be configured in order to remove the specific threshold.

Parameters

forward

Specifies the threshold is applied to the forward direction bin.

backward

Specifies the threshold is applied to the backward direction bin.

round-trip

Specifies the threshold is applied to the roundtrip direction bin.

bin-number

Specifies the number of the bin that the threshold is applied to. This bin and all higher bins are monitored to determine if the sum total results in these bins have reached or crossed the configured threshold.

Values 0 to 9

raise-threshold

Specifies the rising numerical value in the range that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional numerical value in the range threshold used to indicate stateful behavior that allows the operator to configure a lower value than the rising threshold that determines when the clear event should be generated. Clear is generated when the end of measurement interval count is less than or equal to the configured value. If this option is

not configured the behavior is stateless. Zero means no results can exist in the lower bin or any higher.

Values 0 to 863999

Default Clear threshold disabled

Platforms

7705 SAR Gen 2

8.45 delay-event-exclusion

delay-event-exclusion

Syntax

delay-event-exclusion {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number*

no delay-event-exclusion {**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type delay-event-exclusion)

Full Context

configure oam-pm bin-group bin-type delay-event-exclusion

Description

This optional command allows results from probes that map to the specified bin and higher bins to be excluded from the TCA count. The TCA count is used to determine if a threshold has been reached by the event monitoring function. Individual counters are incremented in the bin, but the counts in the specified bin and higher bins are not included in the TCA threshold computation. A **delay-event** must be configured in the same direction, and the **lowest-bin** configured as part of the **delay-event-exclusion** command must be higher than the lowest bin specified by the corresponding **delay-event** command.

The bin group allows this optional command to be added, modified, or deleted while tests are actively referencing the bin group. The bin group does not need to be shut down during **delay-event-exclusion** configuration. If the values are modified while the active tests are executing, all configured TCAs for the specified direction within the bin group enters a pending (p) state until the start of the next measurement interval. Any existing stateful TCAs that were raised are cleared without creating a log event, and no further processing for the affected TCAs occur in the active window. Depending on timing, the pending state may continue past the adjacent measurement interval until the start of the following measurement interval.

The **no** form of this command does not exclude any values from the configured TCA threshold.

Default

no delay-event-exclusion forward

no delay-event-exclusion backward

no delay-event-exclusion round-trip

Parameters

forward

Specifies the forward direction bin.

backward

Specifies the backward direction bin.

round-trip

Specifies the round-trip direction bin.

bin-number

Specifies the number of the lowest bin that the exclusion is applied to. This bin and all higher bins are excluded from the **delay-event** (TCA) count. If no bin numbers are configured, this command is ignored.

Values 1 to 9

Platforms

7705 SAR Gen 2

8.46 delay-events

delay-events

Syntax

[**no**] **delay-events**

Context

[Tree] (config>oam-pm>session>meas-intvl>event-mon delay-events)

Full Context

configure oam-pm session meas-interval event-mon delay-events

Description

This command enables the monitoring of all configured delay events. Adding this functionality starts the monitoring of the configured delay events at the start of the next measurement interval. If the function is removed using the **no** command, all monitoring of configured delay events, logging, and recording of new events for that session are suspended. Any existing events at the time of the shut down are maintained until the active measurement window in which the removal was performed has completed. The state of this monitoring function can be changed without having to shut down all the tests in the session.

The **no** form of this command disables the monitoring of all configured delay events.

8.51 delegated-prefix-length

delegated-prefix-length

Syntax

delegated-prefix-length [**minimum** *prefix-length*] [**maximum** *prefix-length*]

no delegated-prefix-length

Context

[Tree] (config>service>vprn>dhcp6>server>pool delegated-prefix-length)

[Tree] (config>router>dhcp6>server>pool delegated-prefix-length)

Full Context

configure service vprn dhcp6 local-dhcp-server pool delegated-prefix-length

configure router dhcp6 local-dhcp-server pool delegated-prefix-length

Description

This command configures the delegated prefix length that is used if the DHCPv6 client does not specify a prefix length hint.

The DHCPv6 client prefix length hint is limited by the range specified by the **minimum** and **maximum** parameters. If the hint is smaller than the minimum, the allocated prefix length is equal to the minimum length. If the hint is larger than the maximum, the allocated prefix length is equal to the maximum length.

The **no** form of this command reverts to the default.

Default

delegated-prefix-length 64 minimum 48 maximum 64

Parameters

prefix-length

Specifies the minimum or maximum allowed prefix length, in bits.

Values 48 to 127

Platforms

7705 SAR Gen 2

8.52 delete

delete

Syntax

delete *file-url* [**force**] [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

Context

[Tree] (file delete)

Full Context

file delete

Description

This command deletes the specified file.

The optional wildcard (*) can be used to delete multiple files that share a common (partial) prefix and/or (partial) suffix. When the wildcard is entered, the following prompt displays for each file that matches the wildcard:

"Delete file <filename> (y/n)?”

Parameters

file-url

Specifies the file name to delete.

Values		
	local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each

remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd*@*remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

force

Forces an immediate deletion of the specified file(s). The command **file delete * force** deletes all the wildcard matching files without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**>**client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Specifies to automatically refuse any HTTP redirects without prompting the user.

Platforms

7705 SAR Gen 2

delete

Syntax

delete [*line*]

Context

[Tree] (candidate delete)

Full Context

candidate delete

Description

This command deletes the selected CLI node (which includes all sub-branches). The deleted lines are also copied into a temporary buffer that can be used for a subsequent insert.

Parameters

line

Indicates which line to delete.

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

Platforms

7705 SAR Gen 2

delete

Syntax

delete [{*checkpoint-id* | **rescue** | **latest-rb**}]

Context

[Tree] (admin>rollback delete)

Full Context

admin rollback delete

Description

This command deletes a rollback checkpoint and causes the suffixes to be adjusted (decremented) for all checkpoints older that the one that was deleted (to close the hole in the list of checkpoint files and create room to create another checkpoint).

If **config redundancy rollback-sync** is enabled, a rollback delete will also delete the equivalent checkpoint on the standby CF and shuffle the suffixes on the standby CF.

It is not advised to manually delete a rollback checkpoint (for example, using a **file delete** command). If a rollback checkpoint file is manually deleted without using the **admin rollback delete** command then the suffixes of the checkpoint files are not shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a hole in the checkpoint file list until enough new checkpoints have been created to roll the hole off the end of the list.

Parameters

checkpoint-id

An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback location) with *.rb.1 as the suffix, 2 for file *.rb.2, and so on.

Values 1 to 9

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

rescue

Deletes the rescue checkpoint. No checkpoint suffix numbers are changed.

Platforms

7705 SAR Gen 2

8.53 delete-config

delete-config

Syntax

[**no**] **delete-config**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization delete-config)

Full Context

configure system security profile netconf base-op-authorization delete-config

Description

This command enables the NETCONF <delete-config> RPC.

The **no** form of this command disables the RPC.

Default

no delete-config

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

8.54 delivery-service

delivery-service

Syntax

delivery-service *service-id*

delivery-service name *service-name*

no delivery-service

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel delivery-service)

[Tree] (config>service>ies>if>sap>ip-tunnel delivery-service)

Full Context

configure service vprn interface sap ip-tunnel delivery-service

configure service ies interface sap ip-tunnel delivery-service

Description

This command sets the delivery service for GRE encapsulated packets associated with a particular GRE tunnel. This is the IES or VPRN service where the GRE encapsulated packets are injected and terminated. The delivery service may be the same service that owns the private tunnel SAP associated with the GRE tunnel. The GRE tunnel does not come up until a valid delivery service is configured.

The **no** form of this command deletes the delivery-service from the GRE tunnel configuration.

Parameters

service-id

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **delivery-service name** *service-name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id:	1 to 2147483647
svc-name:	up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

service-name

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

Values 1 to 64 characters

Platforms

7705 SAR Gen 2

8.55 delta-in-use-limit

delta-in-use-limit

Syntax

delta-in-use-limit *limit*

no delta-in-use-limit

Context

[Tree] (config>vrrp>policy delta-in-use-limit)

Full Context

configure vrrp policy delta-in-use-limit

Description

This command sets a lower limit on the virtual router in-use priority that can be derived from the delta priority control events.

Each *vrrp-priority-id* places limits on the delta priority control events to define the in-use priority of the virtual router instance. Setting this limit prevents the sum of the delta priority events from lowering the in-use priority value of the associated virtual router instances below the configured value.

The limit has no effect on explicit priority control events. Explicit priority control events are controlled by setting the in-use priority to any value between 1 and 254.

Only non-owner virtual router instances can be associated with VRRP priority control policies and their priority control events.

Once the total sum of all delta events is calculated and subtracted from the base **priority** of the virtual router instance, the result is compared to the **delta-in-use-limit** value. If the result is less than the limit, the

delta-in-use-limit value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the **delta-in-use-limit** has no effect.

Setting the limit to a higher value than the default of 1 limits the effect of the delta priority control events on the virtual router instance base **priority** value. This allows for multiple priority control events while minimizing the overall effect on the in-use priority.

Changing the *in-use-priority-limit* causes an immediate re-evaluation of the in-use priority values for all virtual router instances associated with this *vrrp-policy-id* based on the current sum of all active delta control policy events.

The **no** form of the command reverts to the default value.

Default

delta-in-use-limit 1 — Specifies the lower limit of 1 for the in-use priority, as modified, by delta priority control events.

Parameters

limit

Specifies the lower limit of the in-use priority base, as modified by priority control policies. The *in-use-priority-limit* has the same range as the non-owner virtual router instance base-priority parameter. If the result of the total delta priority control events minus the virtual router instances base-priority, is less than the *in-use-priority-limit*, the *in-use-priority-limit* value is used as the virtual router instances in-use priority value.

Setting the *in-use-priority-limit* to a value equal to or larger than the virtual router instance *base-priority* prevents the delta priority control events from having any effect on the virtual router instance in-use priority value.

Values 1 to 254

Platforms

7705 SAR Gen 2

8.56 depleted-event

depleted-event

Syntax

[**no**] **depleted-event**

Context

[Tree] (config>router>dhcp6>server>pool>prefix>thresholds>minimum-free depleted-event)

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Default

no description

Parameters

short-description-string

Specifies the description entered as a character string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

Default

No description is associated with the configuration context.

Parameters

short-description-string

Specifies the description character string. Allowed values are any string, up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

8.58 designated-role

designated-role

Syntax

designated-role {**standby** | **active**}

no designated-role

Context

[Tree] (config>redundancy>multi-chassis>ipsec-domain designated-role)

Full Context

configure redundancy multi-chassis ipsec-domain designated-role

Description

This command sets the designated role for the tunnel group in the IPsec domain.

The **no** form of this command reverts to the default value.

Default

designated-role standby

Parameters

standby

Sets the designated role to standby.

active

Sets the designated role to active.

Platforms

7705 SAR Gen 2

8.59 dest-ip

dest-ip

Syntax

[**no**] **dest-ip** *ip-address*

Context

[Tree] (config>service>ies>if>sap>ip-tunnel dest-ip)

[Tree] (config>service>vprn>if>sap>ip-tunnel dest-ip)

Full Context

configure service ies interface sap ip-tunnel dest-ip

configure service vprn interface sap ip-tunnel dest-ip

Description

This command configures a private IPv4 or IPv6 address of the remote tunnel endpoint. A tunnel can have up to 16 **dest-ip** commands. At least one **dest-ip** address is required in the configuration of a tunnel. A tunnel does not come up operationally unless all **dest-ip** addresses are reachable (part of a local subnet).

Unnumbered interfaces are not supported.

The **no** form of this command deletes the destination IP of the tunnel.

Parameters

ip-address

Specifies the private IPv4 or IPv6 address of the remote IP tunnel endpoint. If this remote IP address is not within the subnet of the IP interface associated with the tunnel then the tunnel will not come up.

Values

<ip-address>	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

dest-mac

Syntax

dest-mac {**nearest-bridge** | **nearest-non-tpmr** | **nearest-customer**}

Context

[Tree] (config>port>ethernet>lldp dest-mac)

Full Context

configure port ethernet lldp dest-mac

Description

This command configures destination MAC address parameters.

Default

dest-mac nearest-bridge

Parameters

nearest-bridge

Specifies to use the nearest bridge.

nearest-non-tpmr

Specifies to use the nearest non-Two-Port MAC Relay (TPMR).

nearest-customer

Specifies to use the nearest customer.

Platforms

7705 SAR Gen 2

dest-mac

Syntax

dest-mac {**nearest-bridge** | **nearest-non-tpmr** | **nearest-customer**}

Context

[Tree] (config>lag>lldp-member-template dest-mac)

Full Context

configure lag lldp-member-template dest-mac

Description

This command configures the destination MAC address parameters.

Default

dest-mac nearest-bridge

Parameters

nearest-bridge

Keyword to specify that the nearest bridge should be used.

nearest-non-tpmr

Keyword to specify that the nearest non-Two-Port MAC Relay (TPMR) should be used.

nearest-customer

Keyword to specify that the nearest customer should be used.

Platforms

7705 SAR Gen 2

8.61 dest-mac-address

dest-mac-address

Syntax

dest-mac-address *mac-address* [**create**]

no dest-mac-address *mac-address*

Context

[Tree] (config>macsec>mac-policy dest-mac-address)

Full Context

configure macsec mac-policy dest-mac-address

Description

This command specifies the destination MAC address.

The **no** form of this command removes the MAC address.

Parameters

mac-address

Specifies the value of the MAC address policy.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

create

Mandatory to create the configuration.

Platforms

7705 SAR Gen 2

8.62 dest-mac-rewrite

dest-mac-rewrite

Syntax

dest-mac-rewrite *ieee-address*

no dest-mac-rewrite

Context

[Tree] (config>service>vpls>sap>egress dest-mac-rewrite)

Full Context

configure service vpls sap egress dest-mac-rewrite

Description

This commands enables the overwriting of a destination MAC address to an operator-configured value for all unicast packets egressing the specified SAP. The command is intended to be deployed with L2 PBF SAP redirect when a remote end of the SAP interface is an L3 interface with a MAC address different from the MAC address of the non-PBF-ed L3 interface. See Filter Policy in the *7705 SAR Gen 2 Router Configuration Guide* for more details.

The **no** form disables the option.

Default

no dest-mac-rewrite

Parameters

ieee-address

Specifies the MAC address

Values 1xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Cannot be all zeros

Platforms

7705 SAR Gen 2

8.63 dest-udp-port

dest-udp-port

Syntax

dest-udp-port *udp-port-number*

no dest-udp-port

Context

[Tree] (config>oam-pm>session>ip dest-udp-port)

Full Context

configure oam-pm session ip dest-udp-port

Description

This command defines the destination UDP port on outbound TWAMP Light packets sent from the session controller. The destination UDP port must match the UDP port value configured on the TWAMP Light reflector that is responding to this specific TWAMP Light test.

The **no** form of this command removes the destination UDP port setting.

Parameters

udp-port-number

Specifies the UDP source port.

Values 1 to 65535

Platforms

7705 SAR Gen 2

8.64 destination

destination

Syntax

destination *ip-address*

no destination

Context

[Tree] (config>oam-pm>session>ip destination)

Full Context

configure oam-pm session ip destination

Description

This command defines the destination IP address that is assigned to the TWAMP Light packets. The destination address must be included in the prefix list on the session reflector within the configured context in order to allow the reflector to process the inbound TWAMP Light packets.

The **no** form of this command removes the destination parameters.

Parameters

ip-address

Specifies the IP address of the IP peer to which the packet is directed.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

7705 SAR Gen 2

destination

Syntax

destination *ip-address* [**create**]

no destination *ip-address*

Context

[Tree] (config>filter>redirect-policy destination)

Full Context

configure filter redirect-policy destination

Description

This command defines a destination in a redirect policy. More than one destination can be configured. Whether a destination IPv4/IPv6 address will receive redirected packets depends on the effective priority value after evaluation.

The most preferred destination is programmed in hardware as action forward next-hop. If all destinations are down (as determined by the supported tests), action forward is programmed in hardware. All

destinations within a given policy must be either IPv4 or (exclusive) IPv6. The redirect policy with IPv4 destinations configured can only be used by IPv4 filter policies. The redirect policy with IPv6 destinations configured can only be used by IPv6 filter policies.

Default

no destination

Parameters

ip-address

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address to send the redirected traffic to.

Values IPv4 address: ip-address: a.b.c.d

IPv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Platforms

7705 SAR Gen 2

destination

Syntax

destination memory *num-entries*

destination syslog *syslog-id*

no destination

Context

[Tree] (config>filter>log destination)

Full Context

configure filter log destination

Description

This command configures the destination for filter log entries for the filter log ID.

Filter logs can be sent to either memory (**memory**) or to an existing Syslog server definition (**syslog**).

If the filter log destination is **memory**, the maximum number of entries in the log must be specified.

The **no** form of the command deletes the filter log association.

Default

destination memory 1000

Parameters

memory *num-entries*

Specifies the destination of the filter log ID is a memory log. The *num-entries* value is the maximum number of entries in the filter log expressed as a decimal integer.

Values 10 to 50000

syslog *syslog-id*

Specifies the destination of the filter log ID is a Syslog server. The *syslog-id* parameter is the number of the Syslog server definition.

Values 1 to 10

Platforms

7705 SAR Gen 2

destination

Syntax

destination {*ip-address* | *fqdn*} **port** *port* [**create**]

no destination {*ip-address* | *fqdn*} **port** *port*

Context

[Tree] (config>system>grpc-tunnel>destination-group destination)

[Tree] (config>system>telemetry>destination-group destination)

Full Context

configure system grpc-tunnel destination-group destination

configure system telemetry destination-group destination

Description

This command configures a destination IP address and port for a specific destination within a destination group. Up to two destinations can be defined within a destination group. Each destination is an IPv4 address, an IPv6 address, or the Fully Qualified Domain Name (FQDN).

The **no** form of this command removes the destination from the destination group.

Parameters

ip-address

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address.

Values IPv4 address: ip-address: a.b.c.d

IPv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

fqdn

Specifies the FQDN.

port

Specifies the TCP destination port number.

Values 1 to 65535

create

Keyword used to create a destination.

Platforms

7705 SAR Gen 2

8.65 destination-group

destination-group

Syntax

destination-group *name* [**create**]

no destination-group *name*

Context

[Tree] (config>system>grpc-tunnel destination-group)

[Tree] (config>system>telemetry destination-group)

Full Context

configure system grpc-tunnel destination-group

configure system telemetry destination-group

Description

Commands in this context configure commands for destination groups.

The **no** form of this command removes the destination group name.

Parameters

name

Specifies the destination group name, up to 32 characters.

create

Keyword used to create a destination group.

Platforms

7705 SAR Gen 2

destination-group

Syntax

destination-group *name*

no destination-group

Context

[Tree] (config>system>grpc-tunnel>tunnel destination-group)

Full Context

configure system grpc-tunnel tunnel destination-group

Description

This command assigns the specified destination group to a gRPC tunnel.

The **no** form of this command removes the specified destionation group from the gRPC tunnel.

Default

no destination-group

Parameters

name

Specifies the destination group name, up to 32 characters

Platforms

7705 SAR Gen 2

destination-group

Syntax

destination-group *name*

no destination-group

Context

[Tree] (config>system>telemetry>persistent-subscriptions>subscription destination-group)

Full Context

configure system telemetry persistent-subscriptions subscription destination-group

Description

This command assigns an existing destination group to the specified persistent subscription. The assigned **destination-group** must already exist before the configured persistent subscription can be activated.

The **no** form of this command removes the destination group name from the persistent subscription.

Parameters

name

Specifies the destination group name, up to 32 characters.

Platforms

7705 SAR Gen 2

8.66 destination-prefix

destination-prefix

Syntax

destination-prefix *ip-prefix/length* [**nat-policy** *nat-policy-name*]

no destination-prefix *ip-prefix/length*

Context

[Tree] (config>router>nat>inside destination-prefix)

[Tree] (config>service>vprn>nat>inside destination-prefix)

Full Context

configure router nat inside destination-prefix

configure service vprn nat inside destination-prefix

Description

This command configures a destination prefix. An (internal) static route will be created for this prefix. All traffic that hits this route will be subject to NAT. The system will not allow a destination-prefix to be configured if the configured nat-policy refers to an IP pool that resides in the same service (as this would result in a routing loop).

Parameters

ip-prefix

Specifies the IP prefix; host bits must be zero (0).

Values a.b.c.d

length

Specifies the prefix length.

Values 0 to 32

nat-policy-name

Specifies the NAT policy name, up to 32 characters.

Platforms

7705 SAR Gen 2

8.67 detail-level

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>router>ip>dhcp detail-level)

[Tree] (debug>router>local-dhcp-server detail-level)

Full Context

debug router ip dhcp6 detail-level

debug router ip dhcp detail-level

debug router local-dhcp-server detail-level

Description

This command debugs the DHCP tracing detail level.

Parameters

low

Displays a low detail level for DHCP debugging.

medium

Displays a medium detail level for DHCP debugging.

high

Displays a high detail level for DHCP debugging.

Platforms

7705 SAR Gen 2

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>router>radius detail-level)

Full Context

debug router radius detail-level

Description

This command specifies the output detail level of command **debug router radius**.

Default

detail-level medium

Parameters

low

Specifies that the output includes packet type, server address, length, radius-server-policy name.

medium

Specifies all output in low level including the RADIUS attributes in the packet.

high

Specifies all output in medium level including the hex packet dump.

Platforms

7705 SAR Gen 2

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>igmp-snooping detail-level)

Full Context

debug service id igmp-snooping detail-level

Description

This command enables and configures the IGMP tracing detail level.

The **no** form of this command disables the IGMP tracing detail level.

Platforms

7705 SAR Gen 2

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>mld detail-level)

Full Context

debug service id mld-snooping detail-level

Description

This command enables and configures the MLD tracing detail level.

The **no** form of this command disables the MLD tracing detail level.

Platforms

7705 SAR Gen 2

detail-level

Syntax

detail-level {**low** | **medium** | **high**}

no detail-level

Context

[Tree] (debug>service>id>dhcp detail-level)

Full Context

debug service id dhcp detail-level

Description

This command configures the DHCP tracing detail level.

The **no** form of the command disables debugging.

Parameters

low

Displays a low detail level for DHCP debugging.

medium

Displays a medium detail level for DHCP debugging.

high

Displays a high detail level for DHCP debugging.

Platforms

7705 SAR Gen 2

8.68 detect

detect

Syntax

detect num-moves *num-moves* **window** *minutes* [**trusted-mac-move-factor** *factor*]

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication detect)

Full Context

configure service vpls bgp-evpn mac-duplication detect

Description

This command modifies the behavior of the **mac-duplication** command, which is always enabled by default. It monitors the number of moves of a MAC address for a period of time (window).

Default

detect num-moves 5 window 3 trusted-mac-move-factor 1

Parameters

num-moves

Identifies the number of MAC moves in a VPLS service. The counter is incremented when a specified MAC is locally relearned in the FDB or flushed from the FDB due to the reception of a better remote EVPN route for that MAC.

Values 3 to 10

Default 5

minutes

Specifies the length of the window in minutes.

Values 1 to 15

Default 3

factor

Specifies the multiplying value used to calculate a MAC duplication event. The *num-moves* value is multiplied by this value to determine the number of moves needed to declare a trusted MAC as duplicate.

For example, if *num-moves*=5 and *factor*=3, five moves within the window is enough to declare a non-trusted MAC as duplicate. However, 15 moves are needed to declare a trusted MAC as duplicate.

By default, the value of *factor* is 1, which means the factor for a trusted MAC is the same as for a non-trusted MAC. This provides a backwards compatible solution upon upgrade of the node.

Values 1 to 10

Default 1

Platforms

7705 SAR Gen 2

8.69 detection-time

detection-time

Syntax

detection-time *seconds*

no detection-time

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters detection-time)

Full Context

configure system security dist-cpu-protection policy protocol dynamic-parameters detection-time

Description

When a dynamic enforcing policer is instantiated, it remains allocated until at least a contiguous conforming period of detection-time passes.

Default

detection-time 30

Parameters

seconds

Specifies the detection time.

Values 1 to 128000

Platforms

7705 SAR Gen 2

detection-time

Syntax

detection-time *seconds*

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>static-policer detection-time)

Full Context

configure system security dist-cpu-protection policy static-policer detection-time

Description

When a policer is declared as in an "exceed" state, it remains as exceeding until a contiguous conforming period of **detection-time** passes. The **detection-time** only starts after the exceed-action hold-down is complete. If the policer detects another exceed during the detection count down then a hold-down is once again triggered before the policer re-enters the detection time (that is, the countdown timer starts again at the configured value). During the hold-down (and the detection-time), the policer is considered as in an "exceed" state.

Default

detection-time 30

Parameters

seconds

Specifies the detection time.

Values 1 to 128000

Platforms
7705 SAR Gen 2

8.70 deterministic

deterministic

Syntax
deterministic

Context
[Tree] (config>router>nat>inside deterministic)
[Tree] (config>service>vprn>nat>inside deterministic)

Full Context
configure router nat inside deterministic
configure service vprn nat inside deterministic

Description

Platforms
7705 SAR Gen 2

8.71 deterministic-med

deterministic-med

Syntax
[**no**] **deterministic-med**

Context
[Tree] (config>service>vprn>bgp>best-path-selection deterministic-med)

Full Context
configure service vprn bgp best-path-selection deterministic-med

Description

This command controls how the BGP decision process compares routes on the basis of MED. When **deterministic-med** is configured, BGP groups paths that are equal up to the MED comparison step based on neighbor AS, and then compares the best path from each group to arrive at the overall best path. This change to the BGP decision process makes best path selection completely deterministic in all cases. Without **deterministic-med**, the overall best path selection is sometimes dependent on the order of the route arrival because of the rule that MED cannot be compared in routes from different neighbor AS.

Default

no deterministic-med

Platforms

7705 SAR Gen 2

deterministic-med

Syntax

[**no**] **deterministic-med**

Context

[Tree] (config>router>bgp>best-path-selection deterministic-med)

8.72 device-label

device-label

Syntax

device-label *name*

no device-label

Context

[Tree] (config>system>management-interface>remote-management device-label)

Full Context

configure system management-interface remote-management device-label

Description

This command configures the metadata label that is supplied to all remote managers. This label can be used to group devices (network-nodes) that serve a common purpose or role.

If this command is also configured for a specific remote manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes an empty string to be used.

Parameters

name

Specifies the device-label name, up to 64 characters.

Platforms

7705 SAR Gen 2

device-label

Syntax

device-label *name*

no device-label

Context

[Tree] (config>system>management-interface>remote-management>manager device-label)

Full Context

configure system management-interface remote-management manager device-label

Description

This command configures the metadata label that is supplied to this remote manager. This label can be used to group devices (network-nodes) with a common purpose/role.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the device-label name to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management)**.

Parameters

name

Specifies the device-label name, up to 64 characters.

Platforms

7705 SAR Gen 2

8.73 device-name

device-name

Syntax

device-name *name*

no device-name

Context

[Tree] (config>system>management-interface>remote-management device-name)

Full Context

configure system management-interface remote-management device-name

Description

This command configures a device name that is supplied to all remote managers. This name identifies the specified SR OS node in the network.

If this command is also configured for a specific manager in the **config**>**system**>**management-interface**>**remote-management**> **manager** context, that configuration takes precedence.

The **no** form of this command causes the system to use the default device name (system-name).

Default

system-name

Parameters

name

Specifies the device name, up to 64 characters.

Platforms

7705 SAR Gen 2

device-name

Syntax

device-name *name*

no device-name

Context

[Tree] (config>system>management-interface>remote-management>manager device-name)

Full Context

configure system management-interface remote-management manager device-name

Description

This command configures a device name that is supplied to the specific manager. This name identifies the specified SR OS node in the network.

This command takes precedence over the same command configured in the global context **(config>system>management-interface>remote-management**).

The **no** form of this command causes the device name to be inherited from the global context (**config>system>management-interface>remote-management)**.

Default

system-name

Parameters

name

Specifies the device name, up to 64 characters.

Platforms

7705 SAR Gen 2

8.74 dh-group

dh-group

Syntax

dh-group {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}

Context

[Tree] (config>ipsec>ike-transform dh-group)

Full Context

configure ipsec ike-transform dh-group

Description

This command specifies the Diffie-Hellman group to be used in this IKE transform instance.

Default

dh-group 2 (1024-bit — More Modular Exponential (MODP))

Parameters

dh-group {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits

Group 2: 1024 bits

Group 5: 1536 bits

Group 14: 2048 bits

Group 15: 3072 bits

Group 19: P-256 ECC Curve, 256 bits

Group 20: P-384 ECC Curve, 384 bits

Group 21: P-512 ECC Curve, 512 bits

Syntax

[**no**] **dhcp** [**interface** *ip-int-name*]

[**no**] **dhcp mac** *ieee-address*

[**no**] **dhcp sap** *sap-id*

Context

[Tree] (debug>router>ip dhcp)

Full Context

debug router ip dhcp

Description

This command enables DHCP debugging.

The **no** form of this command disables debugging.

Parameters

ip-int-name

Specifies the name of the IP interface, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

sap-id

Specifies the physical port identifier portion of the SAP definition.

Platforms

7705 SAR Gen 2

[**no**] **dhcp**

Context

[Tree] (config>service>vprn>if>sap>ipsec-gw dhcp)

[Tree] (config>service>ies>if>sap>ipsec-gw dhcp)

Full Context

configure service vprn interface sap ipsec-gw dhcp

configure service ies interface sap ipsec-gw dhcp

Description

Commands in this context configure DHCPv4-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv4 client on behalf of the IPsec client, and also a relay agent to relay DHCPv4 packets to the DHCPv4 server.

DHCPv4 DORA(Discovery/Offer/Request/Ack) exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

In order to use this feature, the **relay-proxy** must be enabled on the corresponding interface (either the private interface or the interface that has the gi-address as the interface address).

Default

no dhcp

bof autoconfigure ipv4 dhcp

Description

This command configures the IPv4 DHCP client for OOB management. The OOB management IPv4 can be set using a DHCP server offer.

The **no** form of this command disables IPv4 DHCP OOB management.

Default

no dhcp

Parameters

include-user-class

Specifies to include Option 77 user class data in the offer.

client-id

Specifies to include the client ID for IPv4 Option 61 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

timeout

Specifies the DHCP offer timeout, in seconds.

Values 1 to 65535

Default 30

ascii-string

Specifies the string format for this option, up to 127 characters.

hex-string

Specifies the hexadecimal format for this option, up to 254 hex nibbles.

Values 0x0 to 0xFFFFFFFF

bof autoconfigure ipv6 dhcp

Description

This command configures the IPv6 DHCP client for out-of-band (OOB) management. The OOB management IPv6 can be set using a DHCP server offer.

The **no** form of this command disables IPv6 DHCP client OOB management.

Default

no dhcp

Parameters

include-user-class

Specifies to include Option 15 user class data in the offer.

client-id

Specifies to include the client ID for IPv6 DHCP Option 1 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

seconds

Specifies the DHCP client ID timeout, in seconds.

Values 1 to 65535

duid-type

Specifies the type code of the server DUID.

Values duid-link-local, duid-enterprise

ascii-string

Specifies the string format for this option, up to 124 characters.

hex-string

Specifies the hexadecimal format for this option, up to 248 hex nibbles.

Values 0x0 to 0xFFFFFFFF

timeout

Specifies the DHCP offer timeout, in seconds.

Values 1 to 65535

Default 30

configure filter dhcp-filter

Description

Commands in this context create and configure the specified DHCP filter policy.

Parameters

filter-id

Specifies the DHCP filter policy ID expressed as a decimal integer.

Values 1 to 65535

create

Keyword required to create the configuration context.

Platforms

7705 SAR Gen 2

8.77 dhcp-leasetime-threshold

dhcp-leasetime-threshold

Syntax

dhcp-leasetime-threshold [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no dhcp-leasetime-threshold

Context

[Tree] (config>system>persistence>options dhcp-leasetime-threshold)

Full Context

configure system persistence options dhcp-leasetime-threshold

Description

This command configures Dynamic Data Persistence (DDP) compact flash access optimization for DHCP leases.

The DHCP lease-time threshold controls the eligibility of a DHCP lease for persistency updates when no data other than the lease expiry time is to be updated. When the offered lease time of the DHCP lease is less than the configured threshold, the lease is flagged to skip persistency updates and will be installed with its full lease time upon a persistency recovery after a reboot.

The **dhcp-leasetime-threshold** command controls persistency updates for DHCPv4 and DHCPv6 leases for a DHCP relay or proxy and DHCPv4 leases for DHCP snooping (enabled with **subscriber-mgmt**) and a DHCP server (enabled with **dhcp-server**).

The **no** form of the command disables the DHCP lease time threshold.

Default

no dhcp-leasetime-threshold

Parameters

days

Specifies the threshold in days.

Values 0 to 7305

hours

Specifies the threshold in hours.

Values 0 to 23

minutes

Specifies the threshold in minutes.

Values 0 to 59

seconds

Specifies the threshold in seconds.

Context

[Tree] (debug>router>ip dhcp6)

Full Context

debug router ip dhcp6

Description

This command enables DHCPv6 debugging with optional interface, SAP, and client-identifier match criteria to filter the debug output.

The **no** form of this command disables debugging.

Parameters

ip-int-name

Specifies the name of an existing IP interface, up to 32 characters. Up to four DHCPv6 interface match criteria can be specified per routing instance.

client-identifier

Specifies a client identifier option match criteria.

duid duid-hex-string

Specifies a hexadecimal value for an opaque match on the client DUID in the client identifier option. When the actual length of the client DUID is longer than the length of

the specified hex-string, only the left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

Values 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

mask mask-hex-string

Specifies an optional substring match criteria. When a mask is specified, both hex-string lengths must be equal.

Values 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

link-layer-address lla-hex-string

Specifies a hexadecimal value for a link layer address field match of a type 1 (DUID-LLT) or type 3 (DUID-LL) client DUID in the client identifier option. When the actual length of the link layer address field is longer than the length of the specified hex-string, only the left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

Values 0x0 to 0xFFFFFFFF (maximum 252 hex nibbles)

sap-id

Specifies an existing SAP identifier. Up to four DHCPv6 SAP match criteria can be specified per routing instance.

Platforms

dhcp6

Syntax

[**no**] **dhcp6**

Context

[Tree] (config>service>vprn>if>sap>ipsec-gw dhcp6)

[Tree] (config>service>ies>if>sap>ipsec-gw dhcp6)

Full Context

configure service vprn interface sap ipsec-gw dhcp6

configure service ies interface sap ipsec-gw dhcp6

Description

Commands in this context configure DHCPv6-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv6 client on behalf of the IPsec client, and also acts as a relay agent to relay DHCPv6 packets to the DHCPv6 server.

DHCPv6 exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

Default

no dhcp6

Platforms

7705 SAR Gen 2

8.81 dhcp6-filter

dhcp6-filter

Syntax

dhcp6-filter *filter-id* [**create**]

no dhcp6-filter

Context

[Tree] (config>filter dhcp6-filter)

Full Context

configure filter dhcp6-filter

Description

Commands in this context create and configure the specified DHCPv6 filter policy.

The **no** form of this command reverts to the default.

Parameters

filter-id

Specifies the DHCPv6 filter policy ID expressed as a decimal integer.

Values 1 to 65535

create

Keyword required to create the configuration context.

Platforms

7705 SAR Gen 2

8.82 dhcp6-relay

dhcp6-relay

Syntax

[**no**] **dhcp6-relay**

Context

[Tree] (config>service>vprn>if>ipv6 dhcp6-relay)

[Tree] (config>service>ies>if>ipv6 dhcp6-relay)

Full Context

configure service vprn interface ipv6 dhcp6-relay

configure service ies interface ipv6 dhcp6-relay

Description

Commands in this context configure DHCPv6 relay parameters for the interface.

The **no** form of this command disables DHCPv6 relay.

Platforms

7705 SAR Gen 2

8.83 dhcp6-user-db

dhcp6-user-db

Syntax

dhcp6-user-db *local-user-db*

no dhcp6-user-db

Context

[Tree] (config>service>vpls>sap dhcp6-user-db)

Full Context

configure service vpls sap dhcp6-user-db

Description

This command enabled access to LUDB for DHCPv6 hosts under the capture SAP. The name of this LUDB must match the name of the LUDB configured under the **config>service>vprn/ies>sub-if>grp-if>dhcp** hierarchy.

The **no** form of this command reverts to the default.

Parameters

local-user-db

Specifies the name of the local-user-database, up to 32 characters.

Platforms

7705 SAR Gen 2

8.84 diffserv-te

diffserv-te

Syntax

diffserv-te [**mam** | **rdm**]

no diffserv-te

Context

[Tree] (config>router>rsvp diffserv-te)

Full Context

configure router rsvp diffserv-te

Description

This command enables Diff-Serv TE on the node.

When this command is enabled, IS-IS and OSPF starts advertising available bandwidth for each TE class configured under the diffserv-te node. This command only takes effect if the operator has already enabled TE at the IS-IS, OSPF, or both routing protocol levels:

configure router isis traffic-engineering

and/or:

configure router ospf traffic-engineering

IGP advertises for each RSVP interface in the system the available bandwidth in each TE class in the unreserved bandwidth TE parameter for that class. In addition, IGP continues to advertise the existing Maximum Reservable Link Bandwidth TE parameter to mean the maximum bandwidth that can be booked on a given interface by all classes. The value advertised is adjusted with the link **subscription** *percentage* factor configured in the **configure router rsvp interface** context.

The user configures the following parameters for the operation of Diff-Serv:

- Definition of TE classes, TE Class = {Class Type (CT), LSP priority}.
- Mapping of the system forwarding classes to the Diff-Serv Class Type (CT).
- Configuration of the percentage of RSVP interface bandwidth each CT shares, that is, the Bandwidth Constraint (BC).

When Diff-Serv TE is enabled, the system automatically enables the Max Allocation Model (MAM) Admission Control Policy. MAM represents the bandwidth constraint model for the admission control of an LSP reservation to a link.

Each CT shares a percentage of the Maximum Reservable Link Bandwidth through the user-configured Bandwidth Constraint (BC) for this CT. The Maximum Reservable Link Bandwidth is the link bandwidth multiplied by the RSVP interface subscription factor.

The sum of all BC values across all CTs does not exceed the Maximum Reservable Link Bandwidth. In other words, the following rule is enforced:

SUM (BCc) =< Max-Reservable-Bandwidth, 0 <= c <= 7

An LSP of class-type CTc, setup priority p, holding priority h (h=<p), and bandwidth B is admitted into a link if the following condition is satisfied:

B <= Unreserved Bandwidth for TE-Class[i]

where TE-Class [i] maps to < CTc , p > in the definition of the TE classes on the node. The bandwidth reservation is effected at the holding priority, that is, in TE-class [j] = <CTc, h>. Thus, the reserved bandwidth for CTc and the unreserved bandwidth for the TE classes using CTc are updated as follows:

Reserved(CTc) = Reserved(CTc) + B

Unreserved TE-Class [j] = BCc - SUM (Reserved(CTc,q)) for 0<= q <= h

Unreserved TE-Class [i] = BCc - SUM (Reserved(CTc,q)) for 0<= q <= p

The same is done to update the unreserved bandwidth for any other TE class making use of the same CTc. These new values are advertised to the rest of the network at the next IGP-TE flooding.

The Russian Doll Model (RDM) LSP admission control policy allows bandwidth sharing across Class Types. It provides a hierarchical model by which the reserved bandwidth of a CT is the sum of the reserved bandwidths of the numerically equal and higher CTs.

The RDM model is defined using the following equations:

SUM (Reserved (CTc)) <= BCb,

where the SUM is across all values of c in the range b <= c <= (MaxCT - 1), and BCb is the bandwidth constraint of CTb.

BC0= Max-Reservable-Bandwidth, so that

SUM (Reserved(CTc)) <= Max-Reservable-Bandwidth,

where the SUM is across all values of c in the range 0 <= c <= (MaxCT - 1).

When Diff-Serv is disabled on the node, this model degenerates into a single default CT internally with eight preemption priorities and a non-configurable BC equal to the Maximum Reservable Link Bandwidth. This would behave exactly like CT0 with eight preemption priorities and BC= Maximum Reservable Link Bandwidth if Diff-Serv was enabled.

The enabling or disabling of Diff-Serv TE on the system requires the RSVP and MPLS protocol be shutdown.

The **no** form of this command reverts to the default value.

Default

no diffserv-te

Parameters

mam

Defines the default admission control policy for Diff-Serv LSPs.

rdm

Defines Russian doll model for the admission control policy of Diff-Serv LSPs.

8.86 dir

dir

Syntax

dir [*file-url*] [**sort-order** { **d** | **n** | **s**}] [**reverse**]

Context

[Tree] (file dir)

Full Context

file dir

Description

This command displays a list of files and subdirectories in a directory.

Parameters

file-url

Specifies the path or directory name.

Use the *file-url* with the optional wildcard (*) to reduce the number of files to list.

sort-order {d | n | s}

Specifies the sort order.

Values d — date
n — name
s — size

reverse

Reverses the sort order.

Default Lists all files in the current working directory.

local-url	[*cflash-id*/][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp:// | tftp://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]

	x:x:x:x:x:x:d.d.d.d[*-interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

8.89 disable-aging

disable-aging

Syntax

[**no**] **disable-aging**

Context

[Tree] (config>service>template>vpls-template disable-aging)

[Tree] (config>service>vpls>spoke-sdp disable-aging)

[Tree] (config>service>vpls>sap disable-aging)

[Tree] (config>service>vpls disable-aging)

Full Context

configure service template vpls-template disable-aging

configure service vpls spoke-sdp disable-aging

configure service vpls sap disable-aging

configure service vpls disable-aging

Description

This command disables MAC address aging across a VPLS service, on a VPLS service SAP or spoke-SDP, or VXLAN instance with static binds. Learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the VPLS forwarding database (FDB).

The **disable-aging** command turns off aging for local and remote learned MAC addresses. When **no disable-aging** is specified for a VPLS, aging can be disabled for specific SAPs, spoke-SDPs, and VXLAN instances (or any combination) by entering the **disable-aging** command at the appropriate level.

When the **disable-aging command** is entered at the VPLS level, the aging state of individual SAPs or SDPs or VXLAN instance is ignored.

The **no** form of this command enables aging on the VPLS service.

Default

no disable-aging

Except for VXLAN instances, where the **disable-aging** is the default mode

Platforms

7705 SAR Gen 2

disable-aging

Syntax

[**no**] **disable-aging**

Context

[Tree] (config>service>pw-template disable-aging)

Full Context

configure service pw-template disable-aging

Description

This command disables MAC address aging across a service.

The **no** form of this command enables aging.

[Tree] (config>service>vprn>bgp disable-communities)

Full Context

configure service vprn bgp group neighbor disable-communities

configure service vprn bgp group disable-communities

configure service vprn bgp disable-communities

Description

This command configures BGP to disable sending standard, extended, or large communities to specific peers.

By default, all communities that are attached to a BGP route (any address family) are not stripped from the route when it is advertised to any type of peer: IBGP, EBGP or confed-EBGP.

Default

no disable-communities

Parameters

standard

Specifies that standard 4-byte communities should be removed.

extended

Specifies that 8-byte extended communities (of all types) should be removed.

large

Specifies that 12-byte large communities should be removed.

Platforms

7705 SAR Gen 2

8.93 disable-explicit-null

disable-explicit-null

Syntax

[**no**] **disable-explicit-null**

Context

[Tree] (config>router>bgp>label-allocation>label-ipv6 disable-explicit-null)

Full Context

configure router bgp label-allocation label-ipv6 disable-explicit-null

Description

This command controls the allocation and use of explicit null MPLS labels with labeled-unicast ipv6 routes.

When this command is enabled (**no disable-explicit-null**), the following behaviors apply:

- during the times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to IPv6 explicit null (value 2), forcing a POP behavior for received packets.
- received label-unicast IPv6 routes never create tunnels in TTM that can be used to resolve other BGP routes (with an IPv6 next-hop).

- a received label-unicast IPv6 route can be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)

When this command is disabled (**disable-explicit-null**), the following behaviors apply:

- during those times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to a proper value in the dynamic label range and programs a POP or SWAP operation for that label, depending on the origin of the route and various import policy actions that could apply to the route
- received label-unicast IPv6 routes that have a prefix length of 128 bits are automatically installed in TTM so that they can be used to resolve other (non-labeled-unicast) BGP routes (with an IPv6 next-hop)
- a received label-unicast ipv6 route cannot be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)
- the label-ipv6 routes used for ECMP towards an IPv6 destination cannot be a mix of routes with regular label values and routes with special (IPv6 explicit null) label values

Changes in the operational status do not cause the BGP sessions of the base router to reset.

Full Context

configure service vpls spoke-sdp disable-learning

configure service vpls disable-learning

configure service vpls sap disable-learning

configure service template vpls-template disable-learning

Description

This command disables learning of new MAC addresses in the VPLS forwarding database (FDB) for the service instance, SAP instance, spoke-SDP instance, or VXLAN instance.

When **disable-learning** is enabled, new source MAC addresses are not entered in the VPLS service forwarding database. This applies for both local and remote MAC addresses.

When **disable-learning** is disabled, new source MAC addresses are learned and entered into the VPLS forwarding database.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

Default

no disable-learning

Normal MAC learning is enabled. The default mode for VXLAN instances is **disable-learning**.

Platforms

7705 SAR Gen 2

disable-learning

Syntax

[**no**] **disable-learning**

Context

[Tree] (config>service>pw-template disable-learning)

Full Context

configure service pw-template disable-learning

Description

This command enables learning of new MAC addresses.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

Default

no disable-learning (Normal MAC learning is enabled)

Platforms

7705 SAR Gen 2

8.98 disable-route-table-install

disable-route-table-install

Syntax

[**no**] **disable-route-table-install**

Context

[Tree] (config>router>bgp disable-route-table-install)

Full Context

configure router bgp disable-route-table-install

Description

This command disables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

Configuring this command prevents the advertisement of all IPv4, label-ipv4, IPv6 and label-ipv6 routes if there is a change of the BGP next-hop to one of the router's own addresses. Typically, this is only useful on a router that is a control-plane route reflector (not in the datapath).

The **no** form of the command enables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

Default

no disable-route-table-install

Platforms

7705 SAR Gen 2

disable-route-table-install

Syntax

[**no**] **disable-route-table-install**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action disable-route-table-install)

[Tree] (config>router>policy-options>policy-statement>default-action disable-route-table-install)

Full Context

configure router policy-options policy-statement entry action disable-route-table-install

configure router policy-options policy-statement default-action disable-route-table-install

Description

This command specifies that BGP routes (IPv4, IPv6, label-ipv4, label-ipv6) matching the policy entry (or, depending on the context, the policy's default-action) should not be installed in the route table, tunnel table (in the case of label-ipv4 routes), or IP FIB table.

This policy action has an effect only in BGP peer import policies. This policy action does not prevent the matched routes from contributing toward aggregate routes and does not prevent the matched routes from being advertised, even if next-hop-self has been applied. This means that incorrect use of this feature can blackhole traffic.

Marking label-ipv4 routes with this action does not prevent label-swap (ILM) entries from being programmed when such routes are re-advertised with a new BGP next-hop and label.

The **no** form of this command provides the default behavior of installing routes that are selected as the best path, ECMP path or backup path, depending on the circumstances.

Default

no disable-route-table-install

Platforms

7705 SAR Gen 2

8.99 disable-router-alert-check

disable-router-alert-check

Syntax

[**no**] **disable-router-alert-check**

Context

[Tree] (config>router>igmp>if disable-router-alert-check)

Full Context

configure router igmp interface disable-router-alert-check

Description

This command disables router alert checking for IGMP/MLD messages received on this interface.

The **no** form of this command enables router alert checking.

Platforms

7705 SAR Gen 2

disable-router-alert-check

Syntax

8.100 disable-stickiness

disable-stickiness

Syntax

[**no**] **disable-stickiness**

Context

[Tree] (config>aaa>radius-srv-plcy>servers disable-stickiness)

Full Context

configure aaa radius-server-policy servers disable-stickiness

Description

This command disables a subscriber RADIUS accounting session from sticking with a single server under normal working conditions. If a direct algorithm is used, all subscriber RADIUS sessions will go directly to the server with the lowest configured index. If a failure occurs, a new in-service server with the next lowest index is used. When the original server recovers, if stickiness is not disabled, all existing sessions will continue to use the new server. This command disables stickiness, and as a result, the recovered original RADIUS server will again service every subscriber. If a round-robin algorithm is used and stickiness is not disabled, an accounting session for a particular subscriber (or host, depending on the accounting mode) will stay with the same server. This command removes the stickiness and all subscriber accounting messages will go through the list of servers in a round-robin manner.

Platforms

7705 SAR Gen 2

8.101 disable-targeted-session

disable-targeted-session

Syntax

[**no**] **disable-targeted-session**

Context

[Tree] (config>router>ldp>targ-session disable-targeted-session)

Full Context

configure router ldp targeted-session disable-targeted-session

Description

This command disables support for SDP triggered automatic generated targeted sessions. Targeted sessions are LDP sessions between non-directly connected peers. The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

The **no** form of this command enables the set up of any targeted sessions.

Default

no disable-targeted-session

Platforms

7705 SAR Gen 2

8.102 disallow-igp

disallow-igp

Syntax

[**no**] **disallow-igp**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop disallow-igp)

Full Context

configure router static-route-entry indirect tunnel-next-hop disallow-igp

Description

This optional command determines if the associated static route can be resolved via an IGP next-hop in the RTM if no tunnel next-hops are found in TTM.

When configured, the associated static route will not be resolved to an available IGP route in the RTM.

The **no** form of this command returns the behavior to the default, which allows the static route to be resolved via an IGP route in the RTM if no tunnel next-hop can be found in the TTM.

Default

no disallow-igp

Platforms

7705 SAR Gen 2

8.103 disallow-sequence-keys

disallow-sequence-keys

Syntax

disallow-sequence-keys *number-of-characters*

no disallow-sequence-keys

Context

[Tree] (config>system>sec>passwd>compl disallow-sequence-keys)

Full Context

configure system security password complexity-rules disallow-sequence-keys

Description

This command configures the number of consecutive characters that are not allowed to be entered as part of the password on a U.S. English or Korean keyboard. These characters can be lowercase or uppercase letters, or numbers. Special characters are not taken into account. These consecutive characters can be horizontal (left to right) or (right to left) or diagonal (up to bottom or bottom to top). If the number of consecutive characters is equal to or larger than the configured value, the password is disallowed.

For example, if the user attempts to use the password "dsalkjhgfdsa", with this command configured to 8, the system rejects the password because the first consecutive sequence “dsa” is 3 lowercase letters, which passes the check, but the second consecutive sequence is “lkjhgfdsa”, which consists of 9 consecutive lowercase letters and this does not pass the check.

The **no** form of this command removes the restriction on the number of characters.

Default

no disallow-sequence-keys

Parameters

number-of-characters

Specifies the number of characters.

Values 2 to 8

Platforms

7705 SAR Gen 2

8.104 discard

discard

Syntax

discard [**now**]

Context

[Tree] (candidate discard)

Full Context

candidate discard

Description

This command deletes the entire contents of the candidate configuration and exits the edit-cfg mode. Undo cannot be used to recover a candidate that has been discarded with **candidate discard**.

Parameters

now

Avoids a confirmation prompt for the discard.

Platforms

7705 SAR Gen 2

8.105 discard-changes

discard-changes

Syntax

[**no**] **discard-changes**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization discard-changes)

Full Context

configure system security profile netconf base-op-authorization discard-changes

Description

This command enables the NETCONF <discard-changes> RPC.

The **no** form of this command disables the RPC.

Default

no discard-changes

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

8.106 discard-rx-pause-frames

discard-rx-pause-frames

Syntax

[**no**] **discard-rx-pause-frames**

Context

[Tree] (config>port>ethernet discard-rx-pause-frames)

Full Context

configure port ethernet discard-rx-pause-frames

Description

This command discards received pause frames. Pause frames are used for local link flow control.

The **no** form of this command processes pause frames upon reception and the transmit side of the receiving port pauses in its transmissions.

Default

no discard-rx-pause-frames

Platforms

7705 SAR Gen 2

8.107 discard-unknown

discard-unknown

Syntax

[**no**] **discard-unknown**

Context

[Tree] (config>service>template>vpls-template discard-unknown)

[Tree] (config>service>vpls discard-unknown)

Full Context

configure service template vpls-template discard-unknown

configure service vpls discard-unknown

Description

By default, packets with unknown destination MAC addresses are flooded. If **discard-unknown** is enabled at the VPLS level, packets with unknown destination MAC address will be dropped instead (even when configured FDB size limits for VPLS or SAP are not yet reached).

The **no** form of this command allows flooding of packets with unknown destination MAC addresses in the VPLS.

Default

no discard-unknown

Platforms

7705 SAR Gen 2

8.108 discard-unknown-source

discard-unknown-source

Syntax

[**no**] **discard-unknown-source**

Context

[Tree] (config>service>template>vpls-sap-template discard-unknown-source)

[Tree] (config>service>vpls>sap discard-unknown-source)

[Tree] (config>service>vpls>spoke-sdp discard-unknown-source)

Full Context

configure service template vpls-sap-template discard-unknown-source

configure service vpls sap discard-unknown-source

configure service vpls spoke-sdp discard-unknown-source

Description

When this command is enabled, packets received on a SAP, a spoke-SDP, or a static VXLAN instance with an unknown source MAC address will be dropped only if the maximum number of MAC addresses for that SAP or spoke-SDP (see **max-nbr-mac-addr** [**config>service>vpls>sap max-nbr-mac-addr**, **config>service>vpls>spoke-sdp max-nbr-mac-addr**]) has been reached. If **max-nbr-mac-addr** has not been set for the SAP or spoke-SDP, enabling **discard-unknown-source** has no effect.

When disabled, the packets are forwarded based on the destination MAC addresses.

The **no** form of this command causes packets with an unknown source MAC addresses to be forwarded by destination MAC addresses in VPLS.

Default

no discard-unknown-source

Platforms

7705 SAR Gen 2

discard-unknown-source

Syntax

[**no**] **discard-unknown-source**

Context

[Tree] (config>service>pw-template discard-unknown-source)

Full Context

configure service pw-template discard-unknown-source

Description

When this command is enabled, packets received with an unknown source MAC address will be dropped only if the maximum number of MAC addresses have been reached.

When disabled, the packets are forwarded based on the destination MAC addresses.

The **no** form of this command causes packets with an unknown source MAC addresses to be forwarded by destination MAC addresses.

Default

no discard-unknown-source

Platforms

7705 SAR Gen 2

8.109 disconnect

disconnect

Syntax

disconnect [**address** *ip-address* | **session-id** *session-id* | **username** *user-name* | {**console** | **bluetooth** | **telnet** | **ftp** | **ssh** | **netconf** | **grpc**}]

Context

[Tree] (admin disconnect)

Full Context

admin disconnect

Description

This command disconnects a user from a session.

Issuing the **disconnect** command without any parameters disconnects the session in which the command was executed.

If any of the session type options (for example, **console, bluetooth, telnet, FTP, SSH**) are specified, only the respective sessions are affected.

If no session type options are specified, all sessions from the IP address or from the specified user are disconnected.

Any task that the user is executing is terminated. FTP files accessed by the user are not removed.

A major severity security log event is created specifying what was terminated and by whom.

By default, no disconnect options are configured.

Parameters

ip-address

Specifies the IP address to disconnect, specified in dotted decimal notation.

Values

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

session-id

The model-driven session ID. Can be obtained using the **show system management-interface datastore-locks** [**detail**] command.

user-name

Specifies the name of the user. The name can be up to 32 characters.

console

Disconnects the console session.

bluetooth

Disconnects the Bluetooth session.

telnet

Disconnects the Telnet session.

ftp

Disconnects the FTP session.

ssh

Disconnects the SSH session.

netconf

Disconnects the NETCONF session.

grpc

Disconnects the gRPC session.

Platforms

7705 SAR Gen 2

8.110 discovery-interval

discovery-interval

Syntax

discovery-interval *interval-secs* [**boot** *interval-secs*]

no discovery-interval

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ipsec discovery-interval)

Full Context

configure redundancy multi-chassis peer mc-ipsec discovery-interval

Description

This command specifies the time interval of tunnel-group stays in the Discovery state. Interval-1 is used as discovery-interval when a new tunnel-group is added to multi-chassis redundancy (mp-ipsec); interval-2 is used as discovery-interval when the system boots up, it is optional, when it is not specified, the interval-1 will be used.

Default

discovery-interval 300 boot 300

Parameters

interval-secs

Specifies the maximum duration, in seconds, of the discovery interval during which a newly activated multi- chassis IPsec tunnel-group will remain dormant while trying to contact its redundant peer. Groups held dormant in this manner will neither pass traffic nor negotiate security keys. This interval ends when either the redundant peer is contacted and a master election occurs, or when the maximum duration expires.

Values 1 to 1800

boot *interval-secs*

Specifies the maximum duration of an interval immediately following system startup. When the normal discovery interval for a group would expire while the post-boot discovery interval is still active, then the group's discovery interval is extended until the post-boot discovery interval expires. This allows an extension to the normal discovery stage of groups following a chassis reboot, to account for the larger variance in routing.

Values 1 to 1800

Platforms

7705 SAR Gen 2

8.111 disjointness-reference

disjointness-reference

Syntax

[no] disjointness-reference

Context

[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-reference)

Full Context

configure router pcep pcc pce-associations diversity disjointness-reference

Description

This command configures the value conveyed in the P-flag of the DISJOINTNESS-CONFIGURATION TLV. When enabled, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID.

The **no** form of this command sets the P-flag to false.

Default

P-flag to false

Platforms

7705 SAR Gen 2

8.112 disjointness-type

disjointness-type

Syntax

disjointness-type {**loose** | **strict**}

no disjointness-type

Context

[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-type)

Full Context

configure router pcep pcc pce-associations diversity disjointness-type

Description

This command configures the disjointness type for the association group.

The **no** form of this command reverts to the default value.

Default

disjointness-type loose

Parameters

loose

Keyword to specify the loose disjointness type.

strict

Keyword to specify the strict disjointness type.

Platforms
7705 SAR Gen 2

8.113 dispersion

dispersion

Syntax
dispersion *dispersion*

Context
[Tree] (config>port>dwdm>coherent dispersion)

Full Context
configure port dwdm coherent dispersion

Description
This command configures the residual chromatic dispersion to be compensated when the coherent receiver is operating in manual dispersion control mode.

Default
0

Parameters
dispersion
Specifies the dispersion compensation.

Values -50000 to 50000

Platforms
7705 SAR Gen 2

8.114 display

display

Syntax
display type {*type*} *url-string* **format** {*format*} [**password** [*32 chars max*]]

Context

[Tree] (admin>certificate display)

Full Context

admin certificate display

Description

This command displays the content of an input file in plain text.

The following list summarizes the formats supported by this command:

- System
  - system format
  - PKCS #12
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - RFC 4945
- Certificate Request
  - PKCS #10
- Key
  - system format
  - PKCS #12
- CRL
  - system format
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - RFC 4945

Parameters

url-string

Specifies the local CF card url of the input file.

Values

url-string	<local-url> [up to 99 characters]
local-url	<cflash-id>/<file-path>
cflash-id	cf1: | cf2: | cf3:

type

Specifies the type of input file.

Values cert, key, crl, cert-request

format

Specifies the format of input file.

Values pkcs10, pkcs12, pkcs7-der, pkcs7-pem, pem, der

password

Specifies the password to decrypt the input file in case that it is an encrypted PKCS#12 file, up to 99 characters.

Platforms

7705 SAR Gen 2

8.115 display-config

display-config

Syntax

display-config [**detail** | **index**]

Context

[Tree] (admin display-config)

Full Context

admin display-config

Description

This command displays the system's running configuration.

By default, only non-default settings are displayed.

Specifying the **detail** option displays all default and non-default configuration parameters.

Parameters

detail

Displays default and non-default configuration parameters.

index

Displays only persistent-indices.

Platforms

7705 SAR Gen 2

8.116 display-key

display-key

Syntax

display-key type {**ike** | **esp**} **gateway name** *name* **dynamic-tunnel** *ip-address*: *port*

display-key type {**ike** | **esp**} **tunnel** *ipsec-tunnel-name*

Context

[Tree] (admin>ipsec display-key)

Full Context

admin ipsec display-key

Description

This command displays existing IKE-SA or CHILD-SA keys..

Note:
This command does not work if **config>ipsec>no show-ipsec-keys** or **no max-history-{esp|ike}-key-records** is configured under corresponding **ipsec-gw** or **ipsec-tunnel**.

Parameters

name

The name, up to 32 characters.

ip-address

The IP address of the remote client.

Values	<ip-address>	ip-address	a.b.c.d
		ipv6-address	x:x:x:x:x:x:x:x
			x:x:x:x:x:x:d.d.d.d
			x - [0 to FFFF]H
			d - [0 to 255]D

port

The port of the remote client.

Values 0 to 65535

ipsec-tunnel-name

The IPsec tunnel name, up to 32 characters.

Platforms

7705 SAR Gen 2

Output

The following outputs are examples of the **admin ipsec display-key** command.

Output Example

```

8.117 dist-cpu-protection

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>epipe>sap dist-cpu-protection)

Full Context

configure service epipe sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid existing DCP policy can be assigned to a SAP or a network interface (this rule does not apply to templates, such as an **msap-policy** template).

If no dist-cpu-protection policy is assigned to a SAP, then the default access DCP policy (_default-access-policy) is used.

If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>vpls>sap dist-cpu-protection)

Full Context

configure service vpls sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid existing DCP policy can be assigned to a SAP or a network interface (this rule does not apply to templates, such as an msap-policy template).

Default

If no dist-cpu-protection policy is assigned to a SAP, then the default access DCP policy (_default-access-policy) is used. If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>ies>if>sap dist-cpu-protection)

Full Context

configure service ies interface sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid DCP policy can be assigned to a SAP or a network interface. This rule does not apply to templates such as an msap-policy.

Default

If no dist-cpu-protection policy is assigned to an SAP, then the default access DCP policy (default-access-policy) is used. If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>vprn>nw-if dist-cpu-protection)

Full Context

configure service vprn network-interface dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the network interface. Only a valid created DCP policy can be assigned to a network interface (this rule does not apply to templates such as an msap-policy).

Default

If no dist-cpu-protection policy is assigned to the VPRN network interface, then the default network DCP policy (_default-network-policy) is used.

If no DCP functionality is required on the VPRN network interface then an empty DCP policy can be created and explicitly assigned to the VPRN network interface.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>service>vprn>if>sap dist-cpu-protection)

Full Context

configure service vprn interface sap dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (This rule does not apply to templates such as an msap-policy).

Default

If no dist-cpu-protection policy is assigned to an SAP policy, then the default access DCP policy (default-access-policy) is used. If no DCP functionality is required on the SAP policy, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

dist-cpu-protection

Syntax

dist-cpu-protection *policy-name*

no dist-cpu-protection

Context

[Tree] (config>router>if dist-cpu-protection)

Full Context

configure router interface dist-cpu-protection

Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (note that this rule does not apply to templates such as an msap-policy).

If the user does not assign a DCP policy to a router interface, the system uses the default network DCP policy.

Default

no dist-cpu-protection

Parameters

policy-name

Specifies the name of the DCP policy, up to 32 characters in length

Platforms

7705 SAR Gen 2

8.118 distinguisher

distinguisher

Syntax

distinguisher *id*

no distinguisher

Context

[Tree] (conf>router>segment-routing>sr-policies>policy distinguisher)

Full Context

configure router segment-routing sr-policies static-policy distinguisher

Description

This command associates a distinguisher value with a statically defined segment routing policy. This is a mandatory parameter and configuration command for non-local segment routing policies (for which the **head-end** parameter is set to a value other than "local”). Every non-local segment routing policy must have a unique distinguisher value. When a non-local static segment routing policy is imported into BGP and originated as a BGP route, the configured distinguisher value is copied into the NLRI of the route.

The **no** form of this command removes the distinguisher association.

Default

no distinguisher

Parameters

id

Specifies the distinguisher ID.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

distinguisher

Syntax

distinguisher *distinguisher-id*

no distinguisher

Context

[Tree] (config>router>policy-options>policy-statement>entry>from distinguisher)

Full Context

configure router policy-options policy-statement entry from distinguisher

Description

This command configures an SR Policy distinguisher as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the distinguisher ID match criterion from the configuration.

Parameters

distinguisher-id

Specifies the SR policy distinguisher ID.

Values 0 to 4294967295

Platforms

7705 SAR Gen 2

8.119 diversity

diversity

Syntax

[no] diversity *association-name*

Context

[Tree] (config>router>pcep>pcc>pce-assoc diversity)

Full Context

configure router pcep pcc pce-associations diversity

Description

This command creates a named diversity association from which the parameters for the specified diversity association are configured.

The **no** form of the command deletes the specified diversity association.

Parameters

association-name

Specifies the name of the diversity association, up to 32 characters.

Platforms

7705 SAR Gen 2

diversity

Syntax

[no] diversity *diversity-assoc-name*

Context

[Tree] (config>router>mpls>lsp>pce-assoc diversity)

Full Context

configure router pcep pcc pce-associations diversity diversity-type

Description

This command configures the diversity type for the association group. This command is mandatory. If the command is not configured, the system does not validate the association configuration.

The **no** form of the command reverts to the default value.

Default

no diversity-type

Parameters

link

Keyword to specify the link diversity type.

node

Keyword to specify the node diversity type.

srlg-link

Keyword to specify the SRLG-link diversity type.

srlg-node

Keyword to specify the SRLG-node diversity type.

Syntax

[**no**] **do-not-fragment**

Context

[Tree] (config>oam-pm>session>ip do-not-fragment)

Full Context

configure oam-pm session ip do-not-fragment

Description

This command configures the Do Not Fragment (DF) bit in the IPv4 header of the TWAMP Light test packet in order to prevent packet fragmentation. This is only applicable to IPv4. IPv6 does not include the bit as part of the specification. This parameter is ignored but not blocked when the address is IPv6.

The **no** form of this command allows packet fragmentation.

Platforms

7705 SAR Gen 2

8.127 dod-label-distribution

dod-label-distribution

Syntax

[**no**] **dod-label-distribution**

Context

[Tree] (config>router>ldp>session-params>peer dod-label-distribution)

Full Context

configure router ldp session-parameters peer dod-label-distribution

Description

This command enables the use of the LDP Downstream-on-Demand (DoD) label distribution procedures.

When this option is enabled, LDP will set the A-bit in the Label Initialization message when the LDP session to the peer is established. When both peers set the A-bit, they will both use the DoD label distribution method over the LDP session (RFC 5036).

This feature can only be enabled on a link-level LDP session and therefore will apply to prefix labels only, not service labels.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router will immediately send a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages.

However, the router will not advertise any <FEC, label> bindings, including the FEC of its own LSR-id, unless the DoD peer requested it using a Label Request Message.

When the DoD peer sends a label request for any FEC prefix, the router will reply with a <FEC, label> binding for that prefix if the FEC was already activated on the router. If not, the router replies with a notification message containing the status code of "no route." The router will not attempt in the latter case to send a label request to the next-hop for the FEC prefix when the LDP session to this next-hop uses the DoD label distribution mode. Hence the reference to single-hop LDP DoD procedures.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router immediately sends a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages. Peer address has to be the peer LSR-ID address.

The **no** form of this command disables the DoD label distribution with an LDP neighbor.

Default

no dod-label-distribution

[Tree] (config>service>vprn>bgp-ipvpn>mpls domain-id)

[Tree] (config>service>vprn>bgp-evpn>mpls domain-id)

Full Context

configure service epipe bgp-evpn mpls domain-id

configure service vprn bgp-ipvpn mpls domain-id

configure service vprn bgp-evpn mpls domain-id

Description

This command specifies the domain ID that identifies the network from which a BGP route was received before that route is exported to a different neighbor. The domain ID is part of a domain, represented as *domain-id*:*isf_safi_type* in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

In the following example, consider that a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The command is also supported in Epipe services with two instances. As in the case of multi-instance VPRN services, the configured domain ID in an Epipe instance is prepended to the AD per EVI route redistributed to the other instance.

The **no** form of this command removes the configured domain ID.

Default

no domain-id

Parameters

global-field:local-field

Specifies the domain ID.

Values *4byte-GlobalAdminValue:2byte-LocalAdminValue*

4byte-GlobalAdminValue: 0 to 4294967295

2byte-LocalAdminValue 0 to 65535

configure service vprn dhcp local-dhcp-server pool options domain-name

configure router dhcp6 local-dhcp-server pool prefix options domain-name

configure service vprn dhcp6 local-dhcp-server pool prefix options domain-name

Description

This command configures the default domain for a DHCP client that the router uses to complete unqualified host names (without a dotted-decimal domain name).

The **no** form of this command removes the name from the configuration.

Parameters

domain-name

Specifies the domain name for the client, up to 127 characters.

Platforms

7705 SAR Gen 2

8.131 dot1p

dot1p

Syntax

dot1p *dot1p-priority* [**fc** *fc-name*] [**priority** {**low** | **high**}]

no dot1p *dot1p-priority*

Context

[Tree] (config>qos>sap-ingress dot1p)

Full Context

configure qos sap-ingress dot1p

Description

This command explicitly sets the forwarding class or subclass or enqueuing priority when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override the forwarding class and enqueuing priority based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The **no** form of this command removes the explicit dot1p classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

dot1p-priority

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the fc-name is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

priority

This parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Default Inherits the priority defined by the default-priority statement.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

7705 SAR Gen 2

dot1p

Syntax

dot1p *dot1p-value* [*dot1p-mask*]

no dot1p

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match dot1p)

Full Context

configure qos sap-ingress mac-criteria entry match dot1p

Description

The IEEE 802.1p value to be used as the match criterion.

Use the **no** form of this command to remove the dot1p value as the match criterion.

Default

no dot1p

Parameters

dot1p-value

Specifies the IEEE 802.1p value in decimal.

Values 0 to 7

dot1pmask

This 3-bit mask can be configured using the following formats.

Table 23: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	D	4
Hexadecimal	0xH	0x4

Format Style	Format Syntax	Example
Binary	0bBBB	0b100

To select a range from 4 up to 7, specify *p-value* of 4 and a *mask* of 0b100 for value and mask.

Values 0 to 7 (decimal hex or binary)

Default 7

Platforms

7705 SAR Gen 2

dot1p

Syntax

dot1p *dot1p-value* [**fc** *fc-name*] [**profile** {**in** | **out** | **use-de** | **exceed** | **inplus**}]

no dot1p *dot1p-value*

Context

[Tree] (config>qos>sap-egress dot1p)

Full Context

configure qos sap-egress dot1p

Description

This command defines a specific dot1p value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified dot1p value, the forwarding class or profile may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The dot1p priority is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The reclassification actions from a dot1p reclassification rule may be overridden by a DSCP, IP precedence, or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new FC, the FC from the dot1p match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the

new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the dot1p match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

Parameters

dot1p-value

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the FC name is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

profile {in | out | use-de | exceed | inplus}

Specifies the profile reclassification action is optional. When specified, packets matching the dot1p value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a DSCP, IP precedence, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified dotp1 value, the **dot1p** command must be re-executed without the profile reclassification action defined.

Values **in** — Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out — Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

use-de — Specifies that the DE bit is used to determine the profile of the packet (in-profile is used when DE = 0 and out-of-profile is used when DE = 1).

exceed — Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus — Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Syntax

dot1p {*dot1p-value* | **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]}

no dot1p

Context

[Tree] (config>qos>sap-egress>fc dot1p)

Full Context

configure qos sap-egress fc dot1p

Description

This command explicitly defines the egress IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of *fc-name* that have either an IEEE 802.1q or IEEE 802.1p encapsulation use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, the dot1p command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters added to the existing **dot1p** command adds the capability to mark on an egress SAP the in, out, and exceed-profile status via a certain dot1p combination, similarly with the DE options. All inplus-profile traffic is marked with the same value as in-profile traffic.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic.

The command with the additional structure may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a tag exists. If a new tag is added, the related DE bit is set to 0.

When the previous command (**dot1p** *dot1p-value*) is used without the new structure, it means that the dot1p value is used for the entire forwarding class, as it did before. The two versions of the command are mutually exclusive.

The in-profile or out-of-profile/exceed-profile status may be indicated via the DE bit setting if the **de-mark** command is used. The DE value used for exceed-profile is the same as that used for out-of-profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The commands **dot1p-inner** and **dot1p-outer** take precedence over the **dot1p** command if both are specified in the same policy.

The **no** form of this command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p

Parameters

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

out-profile *dot1p-value*

Specifies the 802.1p value to set for out-profile frames in this forwarding class.

Values 0 to 7

exceed-profile *dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

Values 0 to 7

Platforms

7705 SAR Gen 2

dot1p

Syntax

dot1p *dot1p-priority* **fc** *fc-name* **profile** {**in** | **out** | **use-de**}

no dot1p

Context

[Tree] (config>qos>network>ingress dot1p)

Full Context

configure qos network ingress dot1p

Description

This command explicitly sets the forwarding class or enqueuing priority and profile of the packet when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override and be assigned to the forwarding class and enqueuing priority and profile of the packet, based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior.

The **no** form of this command removes the explicit dot1p classification rule from the policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

dot1p-priority

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

Values 0 to 7

fc-name

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out | use-de}

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command or will use the DE bit to determine the profile of the packets (in-profile is used when DE = 0 and out-of-profile is used when DE = 1). In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

dot1p

Syntax

dot1p *dot1p-priority*

no dot1p

Context

[Tree] (config>qos>network>egress>fc dot1p)

Full Context

configure qos network egress fc dot1p

Description

This command is used whenever the dot1p bits are set to a common value regardless of the internal profile of the packets. Although it is not mandatory, this command should be used in combination with the **de-mark** command to enable the marking of the DE bit according to the internal profile of the packet.

This command acts as a shortcut for configuring the two existing commands with the same dot1p priority.

The **dot1p** *dot1p-priority* command is saved in the configuration as **dot1p-in-profile** *dot1p-priority* and **dot1p-out-profile** *dot1p-priority*. The inplus-profile traffic is marked with the same value as in-profile traffic. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

8.133 dot1p-inner

dot1p-inner

Syntax

dot1p-inner *dot1p-value*

dot1p-inner in-profile*dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]

no dot1p-inner

Context

[Tree] (config>qos>sap-egress>fc dot1p-inner)

Full Context

configure qos sap-egress fc dot1p-inner

Description

This command explicitly configures the egress inner VLAN tag IEEE 802.1p (dot1p) bits marking for the forwarding class name. When the marking is set, all packets of the forwarding class name that have either an inner IEEE 802.1q or IEEE 802.1p encapsulation on a QinQ SAP will use the explicitly defined *dot1p-value*. If the egress packets for the forwarding class are not IEEE 802.1q or IEEE 802.1p QinQ encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value*, **out-profile** *dot1p-value*, and **exceed-profile** *dot1p-value* parameters on the **dot1p-inner** command add the capability to mark the in-profile and out-of-profile status on an egress QinQ SAP. The command with the additional parameters may be used on the SAP when the internal in-profile, out-of-profile, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit. When the in-profile keyword is added, the rest of the structure must be specified. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if an inner tag exists. If a new inner tag is added, the related DE bit is set to 0. The inplus/in, out, or exceed-profile status may be indicated using the DE bit setting if the **de-mark** or **de-mark-inner** command is used.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **configure qos sap-ingress dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **dot1p-inner** command in the policy; that is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured. The marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system.

The **no** form of this command sets the inner IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p-inner

Parameters

dot1p-value

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

out-profile *dot1p-value*

Specifies the 802.1p value to set for out-of-profile frames in this forwarding class.

Values 0 to 7

exceed-profile *dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

Values 0 to 7

Platforms

7705 SAR Gen 2

8.135 dot1p-outer

dot1p-outer

Syntax

dot1p-outer {*dot1p-value* | **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]}

no dot1p-outer

Context

[Tree] (config>qos>sap-egress>fc dot1p-outer)

Full Context

configure qos sap-egress fc dot1p-outer

Description

This command explicitly defines the egress outer or single VLAN tag IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of fc-name that have either an outer or single IEEE 802.1q or IEEE 802.1p encapsulation on a qinq or a dot1p SAP, respectively, will use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters on the dot1p-outer command add the capability to mark the in, out, and exceed-profile status on an egress qinq or dot1p SAP. The command with the additional parameters may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a single or outer tag exists. If a new tag is added, the related DE bit is set to 0. The in, out, or exceed-profile status may be indicated via the setting of the DE bit setting if the **de-mark(-outer)** command is used. The DE value used for inplus is the same as that used for in-profile and the one used for exceed-profile is the same as that used for out of profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The **no** form of the command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

Default

no dot1p-outer

Parameters

dot1p-value

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

Values 0 to 7

out-profile *dot1p-value*

Specifies the 802.1p value to set for out-of-profile frames in this forwarding class.

Values 0 to 7

exceed-profile *dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

Full Context

configure service ies interface hold-time down

configure router interface hold-time down

configure service vprn network-interface hold-time down

configure service vprn interface hold-time down

configure service vpls interface hold-time down

Description

This command causes a delay in the activation of the associated IP interface by the specified number of seconds. The delay is invoked whenever the system attempts to bring the associated IP interface up, unless the **init-only** option is configured. If the **init-only** option is configured, the delay is only applied when the IP interface is first configured or after a system reboot.

The **no** form of this command removes the command from the active configuration and removes the delay in activating the associated IP interface. If the configuration is removed during a delay period, the currently running delay will continue until it completes.

Default

no down ip

Parameters

seconds

The time delay, in seconds, to make the interface operational.

Values 1 to 1200

init-only

Specifies that the **down** delay is only applied when the interface is configured or after a reboot.

Values 1 to 1200

Platforms

7705 SAR Gen 2

8.139 down-on-internal-error

down-on-internal-error

Syntax

down-on-internal-error [**tx-disable**]

no down-on-internal-error

Context

[Tree] (config>port>ethernet down-on-internal-error)

Full Context

configure port ethernet down-on-internal-error

Description

This command configures the system to bring a port operationally down in the event the system has detected internal MAC transmit errors (Int MAC Tx Errs).

Default

no down-on-internal-error

Parameters

tx-disable

Specifies that the laser should be disabled if an internal MAC transmit error is encountered. When used, this option requires that the operator explicitly cycle the admin state of the port to clear the error and re-enable the laser.

Platforms

7705 SAR Gen 2

8.140 down-timeout

down-timeout

Syntax

[**no**] **down-timeout**

Context

[Tree] (config>aaa>radius-srv-plcy>servers>health-check down-timeout)

Full Context

configure aaa radius-server-policy servers health-check down-timeout

Description

This command determines the interval to wait for a RADIUS reply message from the RADIUS server before a RADIUS server is declared out-of-service. By default, the value of the down-timeout is the number of retries multiplied by the timeout interval. Each host will use the configured timeout and retry value under the AAA RADIUS server policy.

timeout refers to the waiting period before the next retry attempt.

retry refers the number of times the host will attempt to contact the RADIUS server.

If a RADIUS server is declared out-of-service, the host pending retry attempts will move on to the next RADIUS server.

The **no** form of this command reverts to the default.

Parameters

minutes

Specifies the timer to wait, in minutes, before declaring the RADIUS server that is down.

Values 1 to 5

seconds

Specifies the timer to wait, in seconds, before declaring the RADIUS server that is down.

Values 1 to 59

Platforms

7705 SAR Gen 2

8.141 downstream-ip-filter

downstream-ip-filter

Syntax

downstream-ip-filter *filter-id*

no downstream-ip-filter

Context

[Tree] (config>router>nat>outside downstream-ip-filter)

[Tree] (config>service>vprn>nat>outside downstream-ip-filter)

Full Context

configure router nat outside downstream-ip-filter

configure service vprn nat outside downstream-ip-filter

Description

This command specifies a filter to apply to the downstream traffic after routing in the outside virtual router instance and before the NAT function; it is useful for traffic that bypasses the egress filters applied in the inside virtual router instance, such as DS-Lite traffic.

The **no** form of the command removes the filter from the configuration.

Default

no downstream-ip-filter

Parameters

filter-id

Specifies a filter up to 64 characters.

Platforms

7705 SAR Gen 2

8.142 dpd

dpd

Syntax

dpd [**interval** *interval*] [**max-retries** *max-retries*] [**reply-only**]

no dpd

Context

[Tree] (config>ipsec>ike-policy dpd)

Full Context

configure ipsec ike-policy dpd

Description

This command controls the dead peer detection mechanism.

The **no** form of this command removes the parameters from the configuration.

Default

no dpd

Parameters

interval

Specifies the DPD interval, in seconds. Since more time is necessary to determine if there is incoming traffic, the actual time needed to bring down the tunnel is larger than the DPD interval multiplied by max-retries.

Values 10 to 300

Default 30

max-retries

Specifies the maximum number of retries before the tunnel is removed.

Values 2 to 5

Default 3

reply-only

Specifies whether to initiate a DPD request if there is an incoming ESP or IKE packet. Issuing the command without the reply-only keyword does not initiate a DPD request if there is an incoming ESP packet.

Platforms

7705 SAR Gen 2

8.143 drain

drain

Syntax

[**no**] **drain**

Context

[Tree] (config>service>vprn>dhcp>server>pool>subnet drain)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet drain

Description

This command means no new leases can be assigned from this subnet and existing leases are cleaned up upon renew/rebind.

The **no** form of this command means the subnet is active and new leases can be assigned from it.

Platforms

7705 SAR Gen 2

drain

Syntax

[**no**] **drain**

Context

[Tree] (config>service>vprn>nat>outside>pool>address-range drain)

[Tree] (config>router>nat>outside>pool>address-range drain)

Full Context

configure service vprn nat outside pool address-range drain

configure router nat outside pool address-range drain

Description

This command starts or stops draining this NAT address range. When an address-range is being drained, it will not be used to serve new hosts. Existing hosts, however, will still be able to use the address that was assigned to them even if it is being drained. An address-range can only be deleted if the parent pool is shut down or if the range itself is effectively drained (hosts are no longer using the addresses).

Platforms

7705 SAR Gen 2

8.144 drop

drop

Syntax

drop

drop packet-length {**lt** | **gt** | **eq**} *packet-length-value*

drop packet-length range *packet-length-value packet-length-value*

drop pattern expression *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

drop ttl {**lt** | **gt** | **eq**} *ttl-value*

drop ttl range *ttl-value ttl-value*

Context

[Tree] (config>filter>ip-filter>entry>action drop)

Full Context

configure filter ip-filter entry action drop

Description

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *pkt-length*, *packet-length range*, *ttl*, *ttl range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, and not the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

packet-length

Specifies drop packets matching both the filter entry match criteria and the *packet-length value* defined in the **drop** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **drop** action statement, are implicitly forwarded with no further match in the following filter entries.

Values lt — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

packet-length-value

Specifies the packet length value for the rate limit action.

Values 0 to 65535

range

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

ttl-value

Specifies drop packets matching both the filter entry match criteria and the TTL value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

Values 0 to 255

Platforms

7705 SAR Gen 2

drop

Syntax

drop

drop hop-limit {**lt** | **gt** | **eq**} *hop-limit-value*

drop hop-limit range hop-limit-value *hop-limit-value*

drop pattern expression *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

drop payload-length {**lt** | **gt** | **eq**} *payload-length-value*

drop payload-length range *payload-length-value payload-length-value*

Context

[Tree] (config>filter>ipv6-filter>entry>action drop)

Full Context

configure filter ipv6-filter entry action drop

Description

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *payload-length*, *payload-length range*, *hop-limit*, *hop-limit range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria

Parameters

hop-limit

Specifies the hop-limit value for the drop action.

Values lt — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

eq — Specifies "equal to”.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

hop-limit-value

Specifies the hop-limit value for the drop action.

Values 0 to 255

range

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

payload-length

Specifies drop packets matching both the filter entry match criteria and the payload-length-value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the payload-length-value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

Values lt — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

payload-length-value

Specifies the payload length value for the drop action.

Values 0 to 65535

Full Context

configure service vprn static-route-entry indirect cpe-check drop-count

configure service vprn static-route-entry next-hop cpe-check drop-count

Description

This optional parameter specifies the number of consecutive ping-replies that must be missed to declare the CPE down and to deactivate the associated static route.

Default

drop-count 3

Parameters

count

An integer count value.

Values 1 to 255

Platforms

7705 SAR Gen 2

drop-count

Syntax

drop-count *consecutive-failures* [**hold-down** *seconds*]

no drop-count

Context

[Tree] (config>filter>redirect-policy>dest>ping-test drop-count)

Full Context

configure filter redirect-policy destination ping-test drop-count

Description

This command specifies the number of consecutive requests that must fail for the destination to be declared unreachable and the time to hold destination unreachable before repeating tests.

Default

drop-count 3 hold-down 0

Parameters

consecutive-failures

Specifies the number of consecutive ping test failures before declaring the destination down.

Values 1 to 60

hold-down *seconds*

Specifies the amount of time, in seconds, that the system should be held down if any of the test has marked it unreachable.

Values 0 to 86400

Platforms

7705 SAR Gen 2

configure router static-route-entry next-hop cpe-check drop-count

configure router static-route-entry indirect cpe-check drop-count

Description

This optional parameter specifies the number of consecutive ping-replies that must be missed to declare the CPE down and to deactivate the associated static route.

Default

drop-count 3

Parameters

count

Specifies the integer count value.

Values 1 to 255

Platforms

7705 SAR Gen 2

drop-count

Syntax

drop-count *count*

no drop-count

Context

[Tree] (config>vrrp>policy>priority-event>host-unreachable drop-count)

Full Context

configure vrrp policy priority-event host-unreachable drop-count

Description

This command configures the number of consecutively sent ICMP echo request messages that must fail before the host unreachable priority control event is set.

The **drop-count** command is used to define the number of consecutive message send attempts that must fail for the **host-unreachable** priority event to enter the set state. Each unsuccessful attempt increments the event's consecutive message drop counter. With each successful attempt, the event's consecutive message drop counter resets to zero.

If the event's consecutive message drop counter reaches the **drop-count** value, the **host-unreachable** priority event enters the set state.

The event's **hold-set** value defines how long the event must stay in the set state even when a successful message attempt clears the consecutive drop counter. The event is not cleared until the consecutive drop counter is less than the **drop-count** value and the **hold-set** timer has a value of zero (expired).

The **no** form of the command reverts to the default value.

Default

drop-count 3 — 3 consecutive ICMP echo request failures are required before the host unreachable priority control event is set.

Parameters

count

The number of ICMP echo request message attempts that must fail for the event to enter the set state. It also defines the threshold so a lower consecutive number of failures can clear the event state.

Values 1 to 60

no dsap

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match dsap)

Full Context

configure qos sap-ingress mac-criteria entry match dsap

Description

Configures an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

Use the **no** form of this command to remove the dsap value as the match criterion.

Default

no dsap

Parameters

dsap-value

The 8-bit dsap match criteria value in hexadecimal.

Values 0x00 to 0xFF (hex)

dsap-mask

This is optional and can be used when specifying a range of dsap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 25: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0

Format Style	Format Syntax	Example

[Tree] (config>router>sgt-qos dscp)

Full Context

configure service vprn sgt-qos dscp

configure router sgt-qos dscp

Description

This command creates a mapping between the DiffServ Code Point (DSCP) of the self-generated traffic and the forwarding class.

Self-generated traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DSCPs to the forwarding class.

All DSCP names that define a DSCP value must be explicitly defined.

The **no** form of this command removes the DSCP-to-forwarding class association.

Parameters

dscp-name

Specifies the name of the DSCP to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

fc *fc-name*

Specifies the forwarding class name. All packets with a DSCP value or MPLS EXP bit that are not defined will be placed in this forwarding class.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

7705 SAR Gen 2

dscp

Syntax

dscp

Syntax

dscp *dscp-name*

dscp resolve

Context

[Tree] (config>oam-pm>session>ip dscp)

Full Context

configure oam-pm session ip dscp

Description

This command can be used to explicitly configure the DSCP value to the specified *dscp-name*, or to use the configured **fc** and **profile** values to derive the DSCP value from the egress network QoS policy 1.

Default

dscp resolve

Parameters

dscp-name

Specifies the Diffserv code point name.

Values be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

resolve

Specifies to use the configured **fc** and **profile** values to derive the DSCP value from the egress network QoS policy 1.

Platforms

7705 SAR Gen 2

dscp

Syntax

dscp *dscp-name* [*dscp-name*] **fc** *fc-name* [**priority** {**low** | **high**}]

no dscp *dscp-name* [*dscp-name*]

Context

[Tree] (config>qos>sap-ingress dscp)

Full Context

configure qos sap-ingress dscp

Description

This command explicitly sets the forwarding class or subclass or enqueuing priority when a packet is marked with the DiffServ Code Point (DSCP) value contained in the *dscp-name*. A list of up to eight dscp-names can be entered on a single command. The lists of dscp-names within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight dscp-names with the same parameters (**fc**, **priority**) will result in multiple lists being created. Conversely, multiple lists with the same parameters (fc, priority) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, then a new list will be created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

Adding a DSCP rule on the policy forces packets that match the DSCP value specified to override the forwarding class and enqueuing priority based on the parameters included in the DSCP rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The DSCP value (referred to here by *dscp-name*) is derived from the most significant six bits in the IPv4 header ToS byte field (DSCP bits) or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed. The six DSCP bits define 64 DSCP values used to map packets to per-hop Quality of Service (QoS) behavior. The most significant three bits in the IP header ToS byte field are also commonly used in a more traditional manner to specify an IP precedence value, causing an overlap between the precedence space and the DSCP space. Both IP precedence and DSCP classification rules are supported.

DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the specified the *dscp-names* from the explicit DSCP classification rule in the SAP ingress policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with the same parameters (up to eight per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, then the command is aborted at that point with an error message displayed; any DSCP names in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

Removing the *dscp-name* from the policy immediately removes the DSCP name on all ingress SAPs using the policy.

Parameters

dscp-name

The DSCP name is a required parameter that specifies the unique IP header ToS byte DSCP bits value that will match the DSCP rule. If the command is executed multiple times with the same *dscp-name*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of 64 DSCP rules are allowed on a single policy and a maximum of eight *dscp-names* can be specified in a single statement.

The specified name must exist as a *dscp-name*. SR OS software provides names for the well-known code points; these can be shown using the **show qos dscp-table** command.

fc *fc-name*

The value given for *fc-name* must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a preexisting subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values

fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Default Inherit (when **fc** *fc-name* is not defined, the rule preserves the previous forwarding class of the packet).

priority

This parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Default Inherits the priority defined by the default-priority statement.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

Context

[Tree] (config>qos>sap-egress dscp)

Full Context

configure qos sap-egress dscp

Description

This command defines IP Differentiated Services Code Point (DSCP) names that must be matched to perform the associated reclassification actions. The specified name must exist as a DSCP name. SR OS software provides names for the well-known code points. A list of up to eight DSCP names can be entered on a single command. The lists of DSCP names within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight DSCP names with the same parameters (**fc** and **profile**) results in multiple lists being created. Conversely, multiple lists with the same parameters (**fc** and **profile**) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, a new list is created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

If an egress packet on the SAP matches an IP DSCP value corresponding to a specified DSCP name, the forwarding class, profile egress queue accounting behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions. Matching a DSCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the traffic class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The reclassification actions from a DSCP reclassification rule may be overridden by an IP flow match event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If an IP criteria match occurs after the DSCP match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the dscp match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If an IP criteria match occurs after the DSCP match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the DSCP match will be used.

The **no** form of this command removes the specified the *dscp-names* from the reclassification rule in the SAP egress QoS policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with

the same parameters (up to 8 per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, the command is aborted at that point with an error message displayed. Any *dscp-names* in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

Parameters

dscp-name

The *dscp-name* parameter is required when defining a DSCP reclassification rule. The specified name must exist as a DSCP name. A maximum of eight DSCP names can be specified in a single statement. SR OS software provides names for the well-known code points, which can be shown using the **show qos dscp-table** command.

***fc-name*:**

The **fc** reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by an IP criteria reclassification match. The **fc** name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified DSCP value, the **dscp** command must be re-executed without the **fc** reclassification action defined.

Values be, l1, af, l2, h1, ef, h2 or nc

counter-id

Specifies the counter ID.

profile

The profile reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by an IPv6 criteria or IP criteria reclassification match. To remove the profile reclassification action for the specified *dscp-name*, the **dscp** command must be re-executed without the profile reclassification action defined.

in

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

Specifies that when **exceed** is specified, any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

dscp

Syntax

dscp {*dscp-name* | **in-profile** *dscp-name* **out-profile** *dscp-name* [**exceed-profile** *dscp-name*]}

no dscp

Context

[Tree] (config>qos>sap-egress>fc dscp)

Full Context

configure qos sap-egress fc dscp

Description

This command configures a DSCP to be used for remarking packets from the specified FC. If the optional **exceed-profile**, **in-profile**, or **out-profile** keyword is specified, the command will remark different DSCP depending on whether the packet was classified to be exceed, in-profile, or out-of-profile ingress to the node. All inplus-profile traffic is marked with the same value as in-profile traffic.

Default

no dscp

Parameters

dscp-name

Specifies a DSCP name that has been previously mapped to a value using the **dscp-name** command. The DSCP can only be specified by its name.

Values be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

exceed-profile *dscp-name*

This optional parameter specifies the DSCP name to be used to remark the traffic that is exceed-profile. If not specified, this defaults to the same value configured for **out-profile** parameter.

in-profile *dscp-name*

Specifies the DSCP name to be used to remark the traffic that is in-profile.

out-profile *dscp-name*

Specifies the DSCP name to be used to remark the traffic that is out-of-profile.

Context

[Tree] (config>qos>network>ingress dscp)

Full Context

configure qos network ingress dscp

Description

This command creates a mapping between the DiffServ Code Point (DSCP) of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DiffServ code points to the forwarding class. For undefined code points, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the DiffServ code point-to-forwarding class association. The **default-action** then applies to that code point value.

Parameters

dscp-name

The name of the DiffServ code point to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

The system-defined names available are as follows. The system-defined names must be referenced as all lowercase, exactly as shown in the first column in Table 27: Default DSCP Names to DSCP Value Mapping and Table 28: Default Class Selector Code Points to DSCP Value Mapping.

Additional names-to-code point value associations can be added using the '**dscp-name** *dscp-name dscp-value*' command.

The actual mapping is being done on the *dscp-value*, not the *dscp-name* that references the *dscp-value*. If a second *dscp-name* that references the same *dscp-value* is mapped within the policy, an error will occur. The second name will not be accepted until the first name is removed.

Table 27: Default DSCP Names to DSCP Value Mapping

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
nc1	48	0x30	0b110000
nc2	56	0x38	0b111000
ef	46	0x2e	0b101110
af41	34	0x22	0b100010
af42	36	0x24	0b100100
af43	38	0x26	0b100110
af31	26	0x1a	0b011010
af32	28	0x1c	0b011100
af33	30	0x1d	0b011110
af21	18	0x12	0b010010
af22	20	0x14	0b010100
af23	22	0x16	0b010110
af11	10	0x0a	0b001010
af12	12	0x0c	0b001100
af13	14	0x0e	0b001110
default	0	0x00	0b000000

Table 28: Default Class Selector Code Points to DSCP Value Mapping

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
cs7	56	0x38	0b111000
cs6	48	0X30	0b110000
cs5	40	0x28	0b101000
cs4	32	0x20	0b100000
cs3	24	0x18	0b011000
cs2	16	0x10	0b010000

DSCP Name	DSCP Value Decimal	DSCP Value Hexadecimal	DSCP Value Binary
cs1	08	0x8	0b001000

fc-name

Enter this required parameter to specify the *fc-name* with which the code point will be associated.

Values be, l2, af, l1, h2, ef, h1, nc

profile {in | out}

Enter this required parameter to indicate whether the DiffServ code point value is the in-profile or out-of-profile value. For every DSCP value defined, the profile must be indicated. If a DSCP value is not mapped, the default-action forwarding class and profile state will be used for that value.

DSCP values mapping to forwarding classes Expedited (ef), High-1 (h1) and Network-Control (nc) can only be set to in-profile.

DSCP values mapping to forwarding class "be" can only be set to out-of-profile.

Values in, out

Full Context

configure qos network egress dscp

Description

This command configures an IP Differentiated Services Code Point (DSCP) value that must be matched to perform the associated reclassification actions. If an egress packet on an IES/VPRN interface spoke SDP, on a CSC network interface in a VPRN, or on a network interface that the network QoS policy is applied to, matches the specified IP DSCP value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet are derived from ingress classification and profiling functions. Matching a DHCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The configuration of egress DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence- and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface. The CLI will block the application of a network QoS policy with the egress reclassification commands to the spoke SDP part of a Layer 2 service.

Conversely, the CLI will not allow the user to add the egress reclassification commands to a network QoS policy if the policy is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue group succeeds. For example, the following CLI command would be successful:

config>**service**>**vprn**>**if**>**spoke-sdp**>**egress**> **qos** *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

config>**service**>**ies**>**if**>**spoke-sdp>egress**> **qos** *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

config>service>vprn>nw-if>qos *network-policy-id* **port-redirect-group** *queue-group-name* **instance** *instance-id*

If the redirection command fails, the PW will use the network QoS policy assigned to the network IP interface, however any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

Parameters

dscp-name

be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

fc fc-name

be, l2, af, l1, h2, ef, h1, nc

***profile* {*in* | *out* | *exceed* | *inplus*}**

The profile reclassification action is mandatory. When specified, packets matching the DSCP value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified DSCP value, the **no dscp** command must be executed.

in - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

no dscp-in-profile

Context

[Tree] (config>qos>network>egress>fc dscp-in-profile)

Full Context

configure qos network egress fc dscp-in-profile

Description

This command specifies the in-profile DSCP name for the forwarding class. The corresponding DSCP value will be used for all IP packets that require marking at egress on this forwarding class queue, and that are in-profile. The inplus-profile traffic is marked with the same value as in-profile traffic.

When multiple DSCP names are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default in-profile DSCP name setting for *policy-id* 1.

Parameters

dscp-name

Specifies the system- or user-defined, case-sensitive *dscp-name.*

Values Any defined system- or user-defined *dscp-name*

Platforms

7705 SAR Gen 2

configure qos sap-ingress ip-criteria entry match dst-ip

configure qos sap-egress ip-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv4 destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 address match criterion.

Default

no dst-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

dst-ip

configure qos sap-egress ipv6-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv6 destination address, specify the address and its associated mask, for example, 2001:db8:1000::/64.

The **no** form of this command removes the destination IPv6 address match criterion.

Default

no dst-ip

Parameters

ipv6-address

Specifies the IPv6 address for the IP match criterion in hexadecimal digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

prefix-length

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the IPv6 address mask.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

ipv6-prefix-list-name

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

dst-ip

Syntax

configure qos network egress ip-criteria entry match dst-ip

configure qos network ingress ipv6-criteria entry match dst-ip

configure qos network ingress ip-criteria entry match dst-ip

configure qos network egress ipv6-criteria entry match dst-ip

Description

This command configures a destination address range to be used as a network QoS policy match criterion.

To match on the destination address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the destination IP address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

configure filter ip-filter entry match dst-ip

Description

This command configures a destination address range to be used as a filter policy match criterion.

To match on the destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 or IPv6 address match criterion.

Default

no dst-ip

Parameters

ip-address

Specifies the destination IPv4 address in dotted decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-listor ipv6-prefix-list prefix-list-name

Specifies to use a list of IP prefixes, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

prefix-length

Specifies the IPv6 prefix length for the *ipv6-address* as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

configure qos sap-ingress mac-criteria entry match dst-mac

Description

Configures a destination MAC address or range to be used as a Service Ingress QoS policy match criterion.

The **no** form of this command removes the destination MAC address as the match criterion.

Default

no dst-mac

Parameters

ieee-address

The MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

A 48-bit mask to match a range of MAC address values.

This 48-bit mask can be configured using the following formats.

Table 29: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0xFFFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

All packets with a source MAC OUI value of 00-03-FA, subject to a match condition, should be specified as: 0003FA000000 0x0FFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

configure qos sap-egress ipv6-criteria entry match dst-port

configure qos sap-ingress ipv6-criteria entry match dst-port

configure qos sap-ingress ip-criteria entry match dst-port

Description

This command configures a destination TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the destination port match criterion.

Default

no dst-port

Parameters

{lt | gt | eq} *dst-port-number*

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the destination port value, specified as a decimal integer.

Values 1 to 65535 (decimal)

range *startend*

The range of TCP or UDP port values to match, specified as between the *start* and *end* destination port values inclusive.

Values 1 to 65535 (decimal)

Platforms

7705 SAR Gen 2

dst-port

Syntax

configure qos network egress ipv6-criteria entry match dst-port

configure qos network ingress ipv6-criteria entry match dst-port

configure qos network egress ip-criteria entry match dst-port

configure qos network ingress ip-criteria entry match dst-port

Description

This command configures a destination TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the destination port match criterion.

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the destination port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the destination port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the destination port value.

dst-port-number

Specifies the TCP or UDP port numbers to match, specified as less than (lt), greater than (gt), or equal to (eq) the destination port value, specified as a decimal integer.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP port values to match.

Values 1 to 65535

Platforms

7705 SAR Gen 2

dst-port

Syntax

dst-port {**lt** | **gt** | **eq**} *dst-port-number*

[Tree] (config>filter>ip-exception>entry>match dst-port)

Full Context

configure filter ip-filter entry match dst-port

configure filter ipv6-filter entry match dst-port

configure filter ipv6-exception entry match dst-port

configure filter ip-exception entry match dst-port

Description

This command configures a destination TCP, UDP, or SCTP port number or port range for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing the "**dst-port eq** 0" match criterion, may match non-initial fragments when the destination port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the destination port match criterion.

Default

no dst-port

Parameters

lt

Specifies that all port numbers less than the *dst-port-number* match.

gt

Specifies that all port numbers greater than the *dst-port-number* match.

eq

Specifies that the *dst-port-number* must be an exact match.

dst-port-number

Specifies the destination port number to be used as a match criteria expressed as a decimal integer, as well as in hexadecimal or binary format. The following value is for decimal integer format only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

dst-port-number dst-port-number

Specifies inclusive port range between two *dst-port-number* values.

Platforms

7705 SAR Gen 2

Full Context

configure system security management-access-filter ip-filter entry dst-port

configure system security management-access-filter ipv6-filter entry dst-port

Description

This command configures a destination TCP or UDP port number or port range for a management access filter match criterion.

The **no** form of this command removes the destination port match criterion.

Parameters

value

Specifies the destination TCP or UDP port number as match criteria.

Values 1 **to** 65535 (decimal)

mask

Specifies the mask used to specify a range of destination port numbers as the match criterion.

This 16 bit mask can be configured using the formats described in Table 30: Format Styles to Configure Mask:

Table 30: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDD	63488
Hexadecimal	0xHHHH	0xF800
Binary	0bBBBBBBBBBBBBBBB	0b1111100000000000

To select a range from 1024 up to 2047, specify 1024 0xFC00 for value and mask.

Default **65535** (exact match)

Values 1 to 65535 (decimal)

Platforms

7705 SAR Gen 2

8.155 dst-zone

dst-zone

Syntax

[**no**] **dst-zone** {*std-zone-name* | *non-std-zone-name*}

Context

[Tree] (config>system>time dst-zone)

Full Context

configure system time dst-zone

Description

This command configures the start and end dates and offset for summer time or daylight savings time to override system defaults or for user defined time zones.

When configured, the time is adjusted by adding the configured offset when summer time starts and subtracting the configured offset when summer time ends.

If the time zone configured is listed in the Time Zones section, then the starting and ending parameters and offset do not need to be configured with this command unless it is necessary to override the system defaults. The command returns an error if the start and ending dates and times are not available either the Time Zones section on or entered as optional parameters in this command.

Up to five summer time zones may be configured, for example, for five successive years or for five different time zones. Configuring a sixth entry will return an error message. If no summer (daylight savings) time is supplied, it is assumed no summer time adjustment is required.

The **no** form of the command removes a configured summer (daylight savings) time entry.

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters need to be provided unless it is necessary to override the system defaults for the time zone.

Values ADT, NDT, AKDT, CDT, CEST, EDT, EEST, MDT, NZDT, PDT, WEST

non-std-zone-name

Specifies the non-standard time zone name. Create a user-defined name created using the zone. The name can be a maximum of 5 characters in length.

8.156 duid-en

duid-en

Syntax

duid-en *hex-string*

no duid-en

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident duid-en)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification duid-en

Description

This command configures the hexadecimal value for use in matching against the concatenation of enterprise number and identifier fields of DHCPv6 option CLIENTID (1) with DUID type = 2 (assigned by the vendor based on the enterprise number) in the DHCPv6 client message.

The **no** form of this command removes the client ID type duid-en from the configuration.

Default

no duid-en

Parameters

hex-string

Specifies the string in hexadecimal format, up to 254 hex nibbles.

Values 0x0 to 0xFFFFFFFF

Platforms

7705 SAR Gen 2

8.157 duid-ll-llt

duid-ll-llt

Syntax

duid-ll-llt *ieee-address*

no duid-ll-llt

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident duid-ll-llt)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification duid-ll-llt

Description

This command configures the value for use in matching against the link-layer address field of DHCPv6 option CLIENTID (1) with DUID type = 3 (based on link-layer address) or DUID type = 1 (based on link-layer address plus time) and hardware type = 1 (Ethernet) in the DHCPv6 client message. For DUID type = 1, the time field is ignored.

The **no** form of this command removes the client ID type duid-ll-llt from the configuration.

Default

no duid-ll-llt

Parameters

ieee-address

Specifies the unicast MAC address of the client ID. This value cannot be all zeros.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7705 SAR Gen 2

8.158 dup-detect

dup-detect

Syntax

dup-detect [**anti-spoof-mac** *mac-address*] **window** *minutes* **num-moves** *count* **hold-down** [*minutes* | **max**]

dup-detect anti-spoof-mac *mac-address* **window** *minutes* **num-moves** *count* **hold-down** [*minutes* | **max**] [**static-black-hole**]

Context

[Tree] (config>service>vpls>proxy-nd dup-detect)

[Tree] (config>service>vpls>proxy-arp dup-detect)

Full Context

configure service vpls proxy-nd dup-detect

configure service vpls proxy-arp dup-detect

Description

This command enables a mechanism that detects duplicate IPs and ARP/ND spoofing attacks. Attempts (relevant to dynamic and EVPN entry types) to add the same IP (different MAC) are monitored for **window** <*minutes*>. When <*count*> is reached within that **window**, the proxy-ARP/ND entry for the suspected IP is marked as duplicate. An alarm is also triggered. This condition is cleared when **hold-down** time expires (max does not expire) or a **clear** command is issued.

If the **anti-spoof-mac** is configured, the proxy-ARP/ND offending entry's MAC is replaced with this <*mac-address*> and advertised in an unsolicited GARP/NA for local SAP/SDP-bindings, and in EVPN to remote PEs. This mechanism assumes that the same **anti-spoof-mac** is configured in all the PEs for the same service and that traffic with destination **anti-spoof-mac** received on SAPs/SDP-bindings will be dropped. An ingress **mac-filter** may be configured to drop traffic to the **anti-spoof-mac**.

The **anti-spoof-mac** can also be combined with the **static-black-hole** option. To use a black-hole MAC entry for the **anti-spoof-mac** function in a proxy-ARP/ND service, the following must be configured:

- **static-black-hole** option for the **anti-spoof-mac**
- a static black-hole MAC using the same MAC address used for the **anti-spoof-mac: static-mac mac** <*mac-address*> **create black-hole** command.

When both **anti-spoof-mac** and **static-black-hole** commands are configured, the MAC is advertised in EVPN as Static. Locally, the MAC will be shown in the FDB as CStatic and associated with a black-hole.

The combination of the **anti-spoof-mac** and the **static-black-hole** options ensures that any frame arriving in the system with MAC DA=**anti-spoof-mac** will be discarded, regardless of the ingress endpoint type (SAP/SDP-binding or EVPN) and without the need for a filter.

If the user wants to redirect the traffic with MAC DA=**anti-spoof-mac** instead of discarding it, redirect filters should be configured on SAPs/SDP-bindings instead of the **static-black-hole** option.

If the **static-black-hole** option is not configured for the **anti-spoof-mac**, the behavior is as follows:

- The **anti-spoof-mac** is not programmed in the FDB.
- Any attempt to add a Static MAC (or any other MAC) with the **anti-spoof-mac** value will be rejected by the system.
- A mac-filter is needed to discard traffic with MAC DA=**anti-spoof-mac**.

Any changes to the configuration of **anti-spoof-mac** require proxy-arp or proxy-nd to first be shut down. Refer to "ARP/ND Snooping and Proxy Support" in the *7705 SAR Gen 2 Layer 2 Services and EVPN Guide* for more information.

Default

dup-detect window 3 num-moves 5 hold-down 9

Parameters

window *minutes*

Specifies the window size in minutes.

Values 1 to 15

Default 3

count

Specifies the number of moves required so that an entry is declared duplicate.

Values 3 to 10

Default 5

hold-down *minutes*

Specifies the hold-down time for a duplicate entry.

Values 2 to 60

Default 9

hold-down max

Specifies permanent hold-down time for a duplicate entry.

mac-address

Specifies the optional anti-spoof-mac to use.

8.161 dynamic

dynamic

Syntax

dynamic *ip-address* [**create**]

no dynamic *ip-address*

Context

[Tree] (config>service>vpls>proxy-nd dynamic)

[Tree] (config>service>vpls>proxy-arp dynamic)

Full Context

configure service vpls proxy-nd dynamic

configure service vpls proxy-arp dynamic

Description

This command creates a dynamic IP that can be associated to a MAC list. The configured dynamic IP is only converted to a dynamic entry when the resolve process for the IP has passed successfully.

A summary of the IP resolution process is as follows:

- A resolve message is sent for the configured IP as soon as the dynamic IP is configured. The message is sent with a configurable frequency of 1 to 60 minutes (using the **resolve** command); the default value is 5 minutes. The actual resolve interval is a "tittered" value of the configured interval.
- The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service, irrespective of the status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands. The router sends resolve messages at the configured frequency until a dynamic entry for the IP is created in the proxy-ARP or proxy-ND table. The IP entry is created only if all of the following conditions are true.
  - An ARP, GARP, or NA message is received for the configured IP.
  - The associated MAC exists in the configured MAC list for the IP.

    If the MAC list is empty or not configured, the router does not create an entry for the IP.
- After a dynamic entry is created in the proxy-ARP or proxy-ND table, the IP->MAC entry is advertised in the EVPN.

The **no** form of the command deletes the dynamic IP and the associated proxy-ARP or proxy-ND entry, if it exists.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values ip-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

8.162 dynamic-arp-populate

dynamic-arp-populate

Syntax

[**no**] **dynamic-arp-populate**

Context

[Tree] (config>service>vpls>proxy-arp dynamic-arp-populate)

Full Context

configure service vpls proxy-arp dynamic-arp-populate

Description

This command enables the addition of dynamic entries to the proxy-ARP table (disabled by default). When executed, the system will populate proxy-ARP entries from snooped GARP/ARP messages on SAPs/SDP-bindings. These entries will be shown as dynamic.

When disabled, dynamic-arp entries will be flushed from the proxy-ARP table. Enabling dynamic-arp-populate is only recommended in networks with a consistent configuration of this command in all the PEs.

Default

no dynamic-arp-populate

Platforms

7705 SAR Gen 2

8.163 dynamic-bgp

dynamic-bgp

Syntax

[**no**] **dynamic-bgp**

Context

[Tree] (config>router>static-route-entry>black-hole dynamic-bgp)

Full Context

configure router static-route-entry black-hole dynamic-bgp

Description

This optional command controls the behavior of the associated static route so that if a matching BGP route to the same exact prefix is present in BGP, the static route's nexthop is set to the BGP's nexthop value. If there is no matching active BGP route, the static route's nexthop is set to be a black-hole nexthop.

Default

no dynamic-bgp

Platforms

7705 SAR Gen 2

8.164 dynamic-bypass

dynamic-bypass

Syntax

dynamic-bypass [**enable** | **disable**]

no dynamic-bypass

Context

[Tree] (config>router>mpls dynamic-bypass)

Full Context

configure router mpls dynamic-bypass

Description

This command disables the creation of dynamic bypass LSPs in FRR. One or more manual bypass LSPs must be configured to protect the primary LSP path at the PLR nodes.

Default

dynamic-bypass enable

Platforms

7705 SAR Gen 2

8.165 dynamic-cost

dynamic-cost

Syntax

[**no**] **dynamic-cost**

Context

[Tree] (config>lag dynamic-cost)

Full Context

configure lag dynamic-cost

Description

This command enables OSPF or ISIS costing of a Link Aggregation Group (LAG) based on the available aggregated, operational bandwidth.

The path cost is dynamically calculated based on the interface bandwidth. OSPF path cost can be changed through the interface metric or the reference bandwidth.

If dynamic cost is configured, then costing is applied based on the total number of links configured and the cost advertised is inversely proportional to the number of links available at the time. This is provided that the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if, and at what cost, this LAG will be advertised.

For example: Assume a physical link in OSPF has a cost associated with it of 100, and the LAG consists of four physical links. The cost associated with the logical link is 25. If one link fails then the cost would automatically be adjusted to 33.

If dynamic cost is not configured and OSPF autocost is configured, then costing is applied based on the total number of links configured. This cost will remain static provided the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if and at what cost this LAG will be advertised.

If dynamic-cost is configured and OSPF autocost is not configured, the cost is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

If neither dynamic-cost nor OSPF autocost are configured, the cost advertised is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

The **no** form of this command removes dynamic costing from the LAG.

Default

no dynamic-cost

[Tree] (config>service>epipe>bgp-evpn>mpls dynamic-egress-label-limit)

[Tree] (config>service>vprn>bgp-evpn>mpls dynamic-egress-label-limit)

[Tree] (config>service>vprn>bgp-ipvpn>mpls dynamic-egress-label-limit)

Full Context

configure service vpls bgp-evpn mpls dynamic-egress-label-limit

configure service epipe bgp-evpn mpls dynamic-egress-label-limit

configure service vprn bgp-evpn mpls dynamic-egress-label-limit

configure service vprn bgp-ipvpn mpls dynamic-egress-label-limit

Description

This command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

The **no** form of this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default

no dynamic-egress-label-limit

Platforms

7705 SAR Gen 2

8.167 dynamic-enforcement-policer-pool

dynamic-enforcement-policer-pool

Syntax

[**no**] **dynamic-enforcement-policer-pool** *number-of-policers*

Context

[Tree] (config>card>fp>ingress>dist-cpu-protection dynamic-enforcement-policer-pool)

Full Context

configure card fp ingress dist-cpu-protection dynamic-enforcement-policer-pool

Description

This command reserves a set of policers for use as dynamic enforcement policers for the Distributed CPU Protection (DCP) feature. Policers are allocated from this pool and instantiated as per-object-per-protocol dynamic enforcement policers after a local monitor is triggered for an object (such as a SAP or Network Interface). Any change to this configured value automatically clears the high water mark, timestamp, and failed allocation counts as seen under "show card x fp y dist-cpu-protection" and in the tmnxFpDcpDynEnfrcPlcrStatTable in the TIMETRA-CHASSIS-MIB. Decreasing this value to below the currently used/allocated number causes all dynamic policers to be returned to the free pool (and traffic returns to the local monitors).

Default

no dynamic-enforcement-policer-pool

Parameters

number-of-policers

specifies the number of policers to be reserved.

Values 1000 to 32000

Platforms

7705 SAR Gen 2

configure ipsec ipsec-transport-mode-profile dynamic-keying

Description

This command enables dynamic keying for the IPsec tunnel.

The **no** form of this command disables dynamic keying.

Platforms

7705 SAR Gen 2

8.169 dynamic-mbs

dynamic-mbs

Syntax

[**no**] **dynamic-mbs**

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue dynamic-mbs)

Full Context

configure qos queue-group-templates egress queue-group queue dynamic-mbs

Description

This command enables support for dynamically modifying the MBS size of a queue using HQoS in order to maintain the maximum latency for traffic in the queue based on the queue's configured MBS and the ratio of its operational PIR to its administrative PIR. As the HQoS algorithm updates the operational PIR, by reducing or increasing it, the MBS of the queue is adjusted accordingly.

The configuration of dynamic MBS and the configuration of queue depth monitoring (**monitor-queue-depth** command) are mutually exclusive. Queue depth monitoring is an override on the queue where the queue group is applied.

The **no** form of this command disables dynamic MBS resizing.

Default

no dynamic-mbs

Platforms

7705 SAR Gen 2

8.170 dynamic-nd-populate

dynamic-nd-populate

Syntax

[**no**] **dynamic-nd-populate**

Context

[Tree] (config>service>vpls>proxy-nd dynamic-nd-populate)

Full Context

configure service vpls proxy-nd dynamic-nd-populate

Description

This command enables the addition of dynamic entries to the proxy-ND table. The command is disabled by default. When executed, the system will populate proxy-ND entries from snooped Neighbor Advertisement (NA) messages on SAPs/SDP-bindings, in addition to the entries coming from EVPN (if the EVPN is enabled). These entries will be shown as dynamic, as opposed to EVPN entries or static entries.

When disabled, dynamic-ND entries will be flushed from the proxy-ND table. Enabling **dynamic-nd-populate** is only recommended in networks with a consistent configuration of this command in all the PEs.

Default

no dynamic-nd-populate

configure router bgp group dynamic-neighbor-limit

Description

This command configures the maximum number of dynamic BGP sessions that will be accepted from remote peers associated with the entire BGP instance or a specific peer group. If accepting a new dynamic session would cause either the group limit or the instance limit to be exceeded, then the new session attempt is rejected and a Notification message is sent back to the remote peer.

The **no** form of this command removes the limit on the number of dynamic sessions.

Default

no dynamic-neighbor-limit

Parameters

peers

Specifies the maximum number of dynamic BGP sessions.

Values 1 to 8192

Platforms

7705 SAR Gen 2

8.173 dynamic-parameters

dynamic-parameters

Syntax

dynamic-parameters

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol dynamic-parameters)

Full Context

configure system security dist-cpu-protection policy protocol dynamic-parameters

Description

The dynamic-parameters are used to instantiate a dynamic enforcement policer for the protocol when the associated **local-monitoring-policer** is considered as exceeding its rate parameters (at the end of a minimum monitoring time of 60 seconds).

Platforms

7705 SAR Gen 2

8.174 dynamic-tunnel-redundant-next-hop

dynamic-tunnel-redundant-next-hop

Syntax

dynamic-tunnel-redundant-next-hop *ip-address*

no dynamic-tunnel-redundant-next-hop

Context

[Tree] (config>service>vprn>if dynamic-tunnel-redundant-next-hop)

[Tree] (config>service>ies>if dynamic-tunnel-redundant-next-hop)

Full Context

configure service vprn interface dynamic-tunnel-redundant-next-hop

configure service ies interface dynamic-tunnel-redundant-next-hop

Description

This command specifies redundant next-hop address on a public or private IPsec interface (with public or private tunnel-sap) for dynamic IPsec tunnel. The specified next-hop address is used by a standby node to shunt traffic to master in case it receives the address.

The next-hop address is resolved in the routing table of a corresponding service.

Default

no dynamic-tunnel-redundant-next-hop

Parameters

ip-address

Specifies the dynamic ISA tunnel redundant next-hop address.

Platforms

7705 SAR Gen 2

8.175 dynmldp

dynmldp

Syntax

dynmldp [**detail**]

no dynmldp

Context

[Tree] (debug>router>pim dynmldp)

Full Context

debug router pim dynmldp

Description

This command enables debugging for dynamic MLDP.

The **no** form of this command disables dynamic MLDP debugging.

Parameters

detail

Debugs detailed dynamic MLDP information.

Platforms

7705 SAR Gen 2

9 e Commands

9.1 e-counters

e-counters

Syntax

e-counters [**all**]

no e-counters

Context

[Tree] (config>log>acct-policy>cr>ref-queue e-counters)

[Tree] (config>log>acct-policy>cr>queue e-counters)

[Tree] (config>log>acct-policy>cr>ref-policer e-counters)

[Tree] (config>log>acct-policy>cr>policer e-counters)

Full Context

configure log accounting-policy custom-record ref-queue e-counters

configure log accounting-policy custom-record queue e-counters

configure log accounting-policy custom-record ref-policer e-counters

configure log accounting-policy custom-record policer e-counters

Description

This command configures egress counter parameters for this custom record.

The **no** form of this command reverts all egress counters to their default value.

Default

e-counters

Parameters

all

Specifies that all egress counters should be included.

Platforms

7705 SAR Gen 2

9.2 eapol-destination-address

eapol-destination-address

Syntax

eapol-destination-address *mac*

no eapol-destination-address

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port eapol-destination-address)

Full Context

configure port ethernet dot1x macsec sub-port eapol-destination-address

Description

The EAPoL destination MAC address uses a destination multicast MAC address of 01:80:C2:00:00:03. Some networks cannot tunnel this packet over the network and consume these packets, causing the MKA session to fail. This command can change the destination MAC of the EAPoL to the unicast address of the MACsec peer, and as such, the EAPoL and MKA signaling will be unicasted between two peers.

The **no** form of this command returns the value to the default.

Default

no eapol-destination-address

Parameters

mac

Specifies the desired destination MAC address to be used by the EAPOL MKA packets of this sub-port.

Values aa:bb:cc:dd:ee:ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers.

Platforms

7705 SAR Gen 2

9.3 ebgp-default-reject-policy

ebgp-default-reject-policy

Syntax

ebgp-default-reject-policy [**import**] [**export**]

no ebgp-default-reject-policy

Context

[Tree] (config>service>vprn>bgp ebgp-default-reject-policy)

[Tree] (config>service>vprn>bgp>group ebgp-default-reject-policy)

Full Context

configure service vprn bgp ebgp-default-reject-policy

configure service vprn bgp group neighbor ebgp-default-reject-policy

configure service vprn bgp group ebgp-default-reject-policy

Description

This command configures the default import and export policy behavior for EBGP neighbors.

The **no** form of this command removes the default import and export policy behavior.

Default

no ebgp-default-reject-policy

Parameters

import

Specifies the default reject import policy for EBGP neighbors.

export

Specifies the default reject export policy for EBGP neighbors.

Platforms

7705 SAR Gen 2

ebgp-default-reject-policy

Syntax

ebgp-default-reject-policy [**import**] [**export**]

no ebgp-default-reject-policy

Context

[Tree] (config>router>bgp>group>neighbor ebgp-default-reject-policy)

[Tree] (config>router>bgp>group ebgp-default-reject-policy)

Full Context

configure router bgp ebgp-default-reject-policy

configure router bgp group neighbor ebgp-default-reject-policy

configure router bgp group ebgp-default-reject-policy

Description

This command configures the default import and export policy behavior for EBGP neighbors.

The **no** form of this command removes the default import and export policy behavior.

Default

no ebgp-default-reject-policy

Parameters

import

Specifies the default reject import policy for EBGP neighbors.

export

Specifies the default reject export policy for EBGP neighbors.

Platforms

7705 SAR Gen 2

9.4 ebgp-ibgp-equal

ebgp-ibgp-equal

Syntax

ebgp-ibgp-equal [**ipv4**] [**ipv6**] [**label-ipv4**] [**label-ipv6**]

no ebgp-ibgp-equal

Context

[Tree] (config>service>vprn>bgp>best-path-selection ebgp-ibgp-equal)

Full Context

configure service vprn bgp best-path-selection ebgp-ibgp-equal

Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load-balancing in a multipath scenario.

The operator can apply the behavior selectively to only certain types of routes by specifying one or more address family names in the command.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

Default

no ebgp-ibgp-equal

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

label-ipv4

Specifies that the command should be applied to labeled IPv4 routes.

label-ipv6

Specifies that the command should be applied to labeled IPv6 routes.

Platforms

7705 SAR Gen 2

ebgp-ibgp-equal

Syntax

ebgp-ibgp-equal [**ipv4**] [**ipv6**] [**label-ipv4**] [**label-ipv6**] [**vpn-ipv4**] [**vpn-ipv6**]

[**evpn**]

no ebgp-ibgp-equal

Context

[Tree] (config>router>bgp>best-path-selection ebgp-ibgp-equal)

Full Context

configure router bgp best-path-selection ebgp-ibgp-equal

Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load balancing in a multipath scenario.

The behavior can be applied selectively to only certain types of routes by specifying one or more address family names in the command. If no families are specified, this command applies to IPv4, IPv6, label-IPv4, label-IPv6, VPN-IPv4, VPN-IPv6, and EVPN routes.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

Default

no ebgp-ibgp-equal

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

label-ipv4

Specifies that the command should be applied to labeled unicast IPv4 routes.

label-ipv6

Specifies that the command should be applied to labeled unicast IPv6 routes.

vpn-ipv4

Specifies that the command should be applied to IPv4 VPN routes.

vpn-ipv6

Specifies that the command should be applied to IPv6 VPN routes.

evpn

Specifies that the command should be applied to EVPN routes.

9.5 ecdsa

ecdsa

Syntax

ecdsa

Context

[Tree] (config>system>security>user>public-keys ecdsa)

Full Context

configure system security user public-keys ecdsa

Description

This command allows the user to enter the context to configure ECDSA public keys.

Platforms

7705 SAR Gen 2

9.6 ecdsa-key

ecdsa-key

Syntax

ecdsa-key *key-id* [**create**]

no ecdsa-key *key-id*

Context

[Tree] (config>system>security>user>public-keys>ecdsa ecdsa-key)

Full Context

configure system security user public-keys ecdsa ecdsa-key

Description

This command creates an ECDSA public key and associates it with the username. Multiple public keys can be associated with the user. The key ID is used to identify these keys for the user.

Parameters

create

Keyword used to create an ECDSA key. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

key-id

Specifies the key identifier.

Values 1 to 32

Platforms

7705 SAR Gen 2

9.7 echo

echo

Syntax

echo [*text-to-echo*] [*extra-text-to-echo*] [*more-text*]

Context

[Tree] (echo)

Full Context

echo

Description

This command echoes arguments on the command line. The primary use of this command is to allow messages to be displayed to the screen in files executed with the **exec** command.

Parameters

text-to-echo

Specifies a text string to be echoed, up to 256 characters.

extra-text-to-echo

Specifies more text to be echoed, up to 256 characters.

more-text

Specifies more text to be echoed, up to 256 characters.

Platforms

7705 SAR Gen 2

9.8 echo-receive

echo-receive

Syntax

echo-receive *echo-interval*

no echo-receive

Context

[Tree] (config>router>bfd>bfd-template echo-receive)

Full Context

configure router bfd bfd-template echo-receive

Description

This command sets the minimum echo receive interval, in milliseconds, for a session. This is not used by a BFD session for MPLS-TP.

The **no** form of this command reverts to the default value.

Default

echo-receive 100

Parameters

echo-interval

Specifies the echo receive interval.

Values 100 ms to 100,000 ms in 1 ms increments

Default 100

Platforms

7705 SAR Gen 2

9.9 ecmp

ecmp

Syntax

ecmp *max-ecmp-routes*

Context

[Tree] (config>service>epipe>bgp-evpn>mpls>auto-bind-tunnel ecmp)

[Tree] (config>service>vpls>bgp-evpn>mpls>auto-bind-tunnel ecmp)

Full Context

configure service epipe bgp-evpn mpls auto-bind-tunnel ecmp

configure service epipe bgp-evpn mpls ecmp

configure service vpls bgp-evpn mpls auto-bind-tunnel ecmp

Description

When configured in a VPLS service, this command controls the number of paths that are allowed to reach a specified MAC address when that MAC in the FDB is associated to a remote all-active multi-homed ES.

The configuration of two or more ECMP paths to a specified MAC enables the aliasing function described in RFC 7432.

When used in an Epipe service, this command controls the number of paths that are allowed to reach a specified remote Ethernet tag that is associated to an ES destination.

Default

ecmp 1

Parameters

max-ecmp-routes

Specifies the number of paths allowed to the same multi-homed MAC address or Ethernet tag.

Values 1 to 32

Platforms

7705 SAR Gen 2

ecmp

Syntax

ecmp *max-ecmp-routes*

no ecmp

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel ecmp)

[Tree] (config>service>vprn>bgp-evpn>mpls>auto-bind-tunnel ecmp)

Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel ecmp

configure service vprn bgp-evpn mpls auto-bind-tunnel ecmp

Description

This command configures the maximum number of tunnels that may be used as ECMP next-hops for the VPRN. This value overrides any values that are configured using the **config**>**service**>**vprn**>**ecmp** command.

The **no** form of this command removes the configured overriding value, and the value configured using the **config**>**service**>**vprn**>**ecmp** command is used.

Default

ecmp 1

Parameters

max-ecmp-routes

Specifies the maximum number of tunnels that may be used as ECMP next-hops for the VPRN.

Values 1 to 32

Default 1

Platforms

7705 SAR Gen 2

ecmp

Syntax

ecmp *max-ecmp-routes*

no ecmp

Context

[Tree] (config>router ecmp)

Full Context

configure router ecmp

Description

This command enables ECMP and configures the number of routes for path sharing; for example, the value 2 means two equal cost routes are used for cost sharing.

ECMP can be used only for routes with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the route with the lowest next-hop IP address is used.

Default

no ecmp

Parameters

max-ecmp-routes

Specifies the maximum number of equal cost routes allowed on this routing table instance, expressed as a decimal integer. Setting ECMP *max-ecmp-routes* to 1 yields the same result as entering **no ecmp**.

Values 1 to 64

Platforms

7705 SAR Gen 2

ecmp

Syntax

ecmp *max-ecmp-routes*

no ecmp

Context

[Tree] (config>service>vprn ecmp)

Full Context

configure service vprn ecmp

Description

This command enables equal-cost multipath (ECMP) and configures the number of routes for path sharing. For example, the value of 2 means that 2 equal cost routes are used for cost sharing.

ECMP groups form when the system routes to the same destination with equal cost values. Routing table entries can be entered manually (as static routes), or they can be formed when neighbors are discovered and routing table information is exchanged by routing protocols. The system can balance traffic across the groups with equal costs.

ECMP can only be used for routes learned with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the newly updated route is used.

Default

no ecmp

Parameters

max-ecmp-routes

Specifies the maximum number of routes for path sharing.

Values 1 to 64

Platforms

7705 SAR Gen 2

ecmp

Syntax

ecmp

Context

[Tree] (config>service>vprn>auto-bind-tunnel ecmp)

9.10 ecmp-unequal-cost

ecmp-unequal-cost

Syntax

[**no**] **ecmp-unequal-cost**

Context

[Tree] (config>service>vprn ecmp-unequal-cost)

Full Context

configure service vprn ecmp-unequal-cost

Description

This command relaxes the constraint that ECMP multipaths must have the same IGP cost to reach the BGP next-hop. When VPN routes for the same IP prefix are imported into a VPRN service, they are eligible to be used as multipaths. The resulting route is programmed as an ECMP IP route.

The BGP best path selection algorithm is the basis for choosing the set of imported VPN routes that can be combined to form an ECMP route. Normally (unless an **ignore-nh-metric** command is configured), the BGP decision process gives higher preference to VPN routes with a lower next-hop cost if other, more significant criteria, are tied. In these circumstances, a VPN route cannot be an eligible multipath if it does not have the same next-hop cost as the best VPN route. Configuring this command removes this restriction and allows the multipaths to have different (meaning lower) next-hop costs than the best route. This broadens the applicability of multipath and can result in better load balancing in the network.

This command applies only to the following types of routes imported by a VPRN.

- vpn-ipv4
- vpn-ipv6
- mcast-vpn-ipv4
- mcast-vpn-ipv6

The **no** form of this command restores the default behavior that requires next-hop costs of multipaths to be equal, unless the next-hop cost is completely removed from the BGP decision process.

Default

ecmp-unequal-cost

9.11 edge-port

edge-port

Syntax

[**no**] **edge-port**

Context

[Tree] (config>service>template>vpls-sap-template>stp edge-port)

[Tree] (config>service>vpls>spoke-sdp>stp edge-port)

[Tree] (config>service>vpls>sap>stp edge-port)

Full Context

configure service template vpls-sap-template stp edge-port

configure service vpls spoke-sdp stp edge-port

configure service vpls sap stp edge-port

Description

This command configures the SAP or SDP as an edge or non-edge port. If **auto-edge** is enabled for the SAP, this value will be used only as the initial value.

Note:
The function of the **edge-port** command is similar to the **rapid-start** command. It tells RSTP that it is on the edge of the network (for example, there are no other bridges connected to that port) and, as a consequence, it can immediately transition to a forwarding state if the port becomes available.

RSTP, however, can detect that the actual situation is different from what **edge-port** may indicate.

Initially, the value of the SAP or spoke-SDP parameter is set to edge-port. This value will change if:

- A BPDU is received on that port. This means that after all there is another bridge connected to this port. Then the edge-port becomes disabled.
- If auto-edge is configured and no BPDU is received within a certain period of time, RSTP concludes that it is on an edge and enables the edge-port.

The **no** form of this command returns the edge port setting to the default value.

Default

no edge-port

Platforms

7705 SAR Gen 2

edge-port

Syntax

[**no**] **edge-port**

Context

[Tree] (config>service>pw-template>stp edge-port)

9.12 edit

edit

Syntax

edit [**exclusive**]

Context

[Tree] (candidate edit)

Full Context

candidate edit

Description

This command enables the edit-cfg mode where changes can be made to the candidate configuration and sets the edit-point to the end of the candidate. In edit-cfg mode the CLI prompt contains **edit-cfg** near the root of the prompt. Commands in the **candidate** CLI branch, except **candidate edit**, are available only when in edit-cfg mode.

Parameters

exclusive

Allows a user to exclusively create a candidate configuration by blocking other users (and other sessions of the same user) from entering edit-cfg mode. Exclusive edit-cfg mode can

only be entered if the candidate configuration is empty and no user is in edit-cfg mode. Once a user is in exclusive edit-cfg mode no other users/sessions are allowed in edit-cfg mode. The user must either commit or discard the exclusive candidate before leaving exclusive edit-cfg mode. If the CLI session times out while a user is in exclusive edit-cfg mode then the contents of the candidate are discarded. The **admin disconnect** command can be used to force a user to disconnect (and to clear the contents of the candidate) if they have the candidate locked.

[Tree] (config>port>access egress)

[Tree] (config>card>mda>access egress)

Full Context

configure port network egress

configure card mda network egress

configure port access egress

configure card mda access egress

Description

Commands in this context configure egress buffer pool parameters which define the percentage of the pool buffers that are used for CBS calculations and specify the slope policy that is configured in the **config>qos>slope-policy** context.

On the MDA level, network and access egress pools are only allocated on channelized MDAs.

Full Context

configure mirror mirror-dest sap egress

Description

This command enables access to the context to associate an egress SAP Quality of Service (QoS) policy with a mirror destination SAP.

If no QoS policy is defined, the system default SAP egress QoS policy is used for egress processing.

Platforms

7705 SAR Gen 2

egress

Syntax

egress

Context

[Tree] (config>qos>network egress)

Full Context

configure qos network egress

Description

This command is used to enter the CLI node that creates or edits egress policy entries that specify the forwarding class queues to be instantiated when this policy is applied to the network port.

The forwarding class and profile state mapping to in- and out-of-profile DiffServ Code Points (DSCPs), dot1p, and MPLS EXP bits mapping for all labeled packets are also defined in this context.

All service packets are aggregated into DiffServ-based egress queues on the network interface. The service packets are transported either with IP GRE encapsulation or over a MPLS LSP. The exception is with the IES service. In this case, the actual customer IP header has the DSCP field mapped.

All out-of-profile service packets are marked with the corresponding out-of-profile DSCP, dot1p, or the EXP bit value at network egress. All the in-profile service ingress packets are marked with the corresponding in-profile DSCP, dot1p, or EXP bit value based on the forwarding class to which they belong. The exceed-profile traffic is marked with the same value as out-of-profile traffic and the inplus-profile traffic is marked with the same value as in-profile traffic.

Platforms

7705 SAR Gen 2

egress

Syntax

egress

Context

[Tree] (config>qos>queue-group-templates egress)

9.17 egress-amplifier-gain

egress-amplifier-gain

Syntax

egress-amplifier-gain *egress-amplifier-gain*

no egress-amplifier-gain

Context

[Tree] (configure>port>transceiver>optical-line-system egress-amplifier-gain)

Full Context

configure port transceiver optical-line-system egress-amplifier-gain

Description

This command configures the gain for the egress amplifier.

The **no** form of this command sets the gain for the egress amplifier to the default.

Default

no egress-amplifier-gain

Parameters

egress-amplifier-gain

Specifies the gain for the amplifier in decibels.

Values 0 to 25.00 dB

Default 25.00 dB

Platforms

7705 SAR Gen 2

9.18 egress-engineering

egress-engineering

Syntax

egress-engineering

no egress-engineering

Context

[Tree] (config>router>bgp>group>neighbor egress-engineering)

[Tree] (config>router>bgp>group egress-engineering)

Full Context

configure router bgp group neighbor egress-engineering

configure router bgp group egress-engineering

Description

Commands in this context configure egress engineering on a specific neighbor or all neighbors in a BGP group.

If egress engineering is not configured in the neighbor context, the configuration is inherited from the group context.

The **no** form of this command removes the egress engineering configuration.

Default

no egress-engineering

Platforms

7705 SAR Gen 2

9.19 egress-fc

egress-fc

Syntax

egress-fc *fc-name*

no egress-fc

Context

[Tree] (config>qos>sap-ingress>fc egress-fc)

Full Context

configure qos sap-ingress fc egress-fc

Description

This command configures the forwarding class to be used by the egress QoS processing. It overrides the forwarding class determined by ingress classification but not the QoS Policy Propagation via BGP.

The forwarding class or forwarding subclass can be overridden.

The new egress forwarding class is applicable to both SAP egress and network egress.

Default

no egress-fc

Parameters

fc-name

Specifies the forwarding class name to be used by the egress QoS processing.

Values be, l2, af, l1, h2, ef, h1, nc

Platforms

7705 SAR Gen 2

9.20 egress-peer-engineering

egress-peer-engineering

Syntax

egress-peer-engineering

no egress-peer-engineering

Context

[Tree] (config>router>bgp egress-peer-engineering)

Full Context

configure router bgp egress-peer-engineering

Description

Commands in this context configure EPE parameters in BGP.

The **no** form of this command removes the EPE parameters from the BGP context.

Default

no egress-peer-engineering

Platforms

7705 SAR Gen 2

9.21 egress-peer-engineering-label-unicast

egress-peer-engineering-label-unicast

Syntax

[**no**] **egress-peer-engineering-label-unicast**

Context

[Tree] (config>router>bgp>group>neighbor egress-peer-engineering-label-unicast)

[Tree] (config>router>bgp>group egress-peer-engineering-label-unicast)

Full Context

configure router bgp group neighbor egress-peer-engineering-label-unicast

configure router bgp group egress-peer-engineering-label-unicast

Description

This command enables the generation of a label-unicast route for each /32 or /128 prefix that corresponds to the BGP neighbor or group address in the scope of the command. These routes can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. They support the Egress Peer Engineering (EPE) use case.

The **no** form of this command disables the generation of EPE label-unicast routes.

Default

no egress-peer-engineering-label-unicast

Platforms

7705 SAR Gen 2

9.22 egress-rate

egress-rate

Syntax

egress-rate *sub-rate*

no egress-rate

Context

[Tree] (config>port>ethernet egress-rate)

Full Context

configure port ethernet egress-rate

Description

This command configures the rate of traffic leaving the network. The configured *sub-rate* uses packet-based accounting. An event log is generated each time the egress rate is modified unless the port is part of a LAG.

The **no** form of this command returns the value to the default.

Default

no egress-rate

Parameters

sub-rate

Specifies the egress rate in kb/s.

Values 1 to 100000000

Platforms

7705 SAR Gen 2

9.23 egress-scheduler-override

egress-scheduler-override

Syntax

egress-scheduler-override [**create**]

no egress-scheduler-override

Context

[Tree] (config>port>ethernet egress-scheduler-override)

Full Context

configure port ethernet egress-scheduler-override

Description

This command applies egress scheduler overrides. When a port scheduler is associated with an egress port, it is possible to override the following parameters:

- The **max-rate** allowed for the scheduler.
- The maximum **rate** for each priority level 8 through 1.
- The CIR associated with each priority level 8 through 1.

See the *7705 SAR Gen 2 Quality of Service Guide* for command syntax and usage for the **port-scheduler-policy** command.

The **no** form of this command removes all override parameters from the egress port or channel scheduler context. Once removed, the port scheduler reverts all rate parameters back to the parameters defined on the port-scheduler-policy associated with the port.

Parameters

create

Mandatory while creating an entry.

Platforms

7705 SAR Gen 2

9.24 egress-scheduler-policy

egress-scheduler-policy

Syntax

egress-scheduler-policy *port-scheduler-policy-name*

no egress-scheduler-policy

Context

[Tree] (config>port>ethernet egress-scheduler-policy)

Full Context

configure port ethernet egress-scheduler-policy

Description

This command enables the provisioning of an existing port-scheduler-policy to a port or channel.

The egress-scheduler-override node allows for the definition of the scheduler overrides for a specific port or channel.

When a port scheduler is active on a port or channel, all queues and intermediate service schedulers on the port are subject to receiving bandwidth from the scheduler. Any policers, queues, or schedulers with port-parent associations are mapped to the appropriate port priority levels based on the port-parent command parameters. Any policers, queues, or schedulers that do not have a port-parent or valid intermediate scheduler parent defined are treated as orphaned and are handled based on the port scheduler policies default or explicit orphan behavior.

The port scheduler maximum rate and priority level rate parameters may be overridden to allow unique values separate from the port-scheduler-policy-name attached to the port or channel. Use the **egress-scheduler-override** command to specify the port or channel specific scheduling parameters.

The **no** form of this command removes a port scheduler policy from an egress port or channel. Once the scheduler policy is removed, all orphaned policers, queues, and schedulers revert to a free running state governed only by the local queue or scheduler parameters. This includes any queues or schedulers with a port-parent association.

Parameters

port-scheduler-policy-name

Specifies an existing port-scheduler-policy configured in the **config>qos** context. The name can be up to 32 characters.

Platforms

7705 SAR Gen 2

9.25 egress-statistics

egress-statistics

Syntax

[**no**] **egress-statistics**

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy egress-statistics)

Full Context

configure router mpls forwarding-policies forwarding-policy egress-statistics

Description

This command configures egress statistics in an MPLS forwarding policy.

The **no** form of this command removes any egress statistics in a forwarding policy.

Default

no egress-statistics

Platforms

7705 SAR Gen 2

9.26 eibgp-loadbalance

eibgp-loadbalance

Syntax

[**no**] **eibgp-loadbalance**

Context

[Tree] (config>service>vprn>bgp eibgp-loadbalance)

Full Context

configure service vprn bgp eibgp-loadbalance

Description

This command enables eiBGP load sharing so routes with both MP-BGP and IPv4 next-hops can be used simultaneously.

In order for this command to be effective, the **ecmp** and **multipath** commands for the associated VPRN instance must also be configured to allow for multiple routes to the same destination.

The **no** form of this command used at the global level reverts to default values.

Default

no eibgp-loadbalance

Platforms

7705 SAR Gen 2

9.27 embed-filter

embed-filter

Syntax

embed-filter *ip-filter-id* [**offset** *offset*] [{**active** | **inactive**}]

no embed-filter *ip-filter-id*

embed-filter *ipv6-filter-id* [**offset** *offset*] [{**active** | **inactive**}]

no embed-filter *ipv6-filter-id*

embed-filter flowspec [**group** *group-id*] [**router** {*router-instance* | **service-name** *vprn-service-name*}] [**offset** *offset*] [{**active** | **inactive**}]

no embed-filter flowspec [**group** *group-id*]

embed-filter open-flow *ofs-name* [{**system** | **service** {*service-id* | *service-name*} | **sap** *sap-id*}] [**offset** *offset*] [{**active** | **inactive**}]

no embed-filter open-flow *ofs-name* [{**system** | **service** {*service-id* | *service-name*} | **sap** *sap-id*}]

Context

[Tree] (config>filter>ipv6-filter embed-filter)

[Tree] (config>filter>ip-filter embed-filter)

Full Context

configure filter ipv6-filter embed-filter

configure filter ip-filter embed-filter

Description

This command embeds a previously defined IPv4, IPv6, or MAC embedded filter policy or Hybrid OpenFlow switch instance into this exclusive, template, or system filter policy at the specified offset value. Rules derived from the BGP FlowSpec can also be embedded into template filter policies only.

The **embed-filter open-flow** *ofs-name* form of this command enables OpenFlow (OF) in GRT either by embedding the specified OpenFlow switch (OFS) instance with **switch-defined-cookie** disabled, or by

embedding rules with sros-cookie:type "grt-cookie”, value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be deployed in GRT context or be unassigned.

The **embed-filter open-flow** *ofs-name* **system** form of this command enables OF in system filters by embedding rules with sros-cookie:type "system-cookie”, value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be of scope **system**.

The **embed-filter open-flow** *ofs-name* **service** {*service-id* | *service-name*} form of this command enables OF in VPRN/VPLS filters by embedding rules with sros-cookie:type "service-cookie”, value **service-id**, from the specified OFS instance with **switch-defined-cookie** enabled—per service rules. The embedding filter can only be deployed in the specified VPRN/VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **embed-filter open-flow** *ofs-name* **sap** *sap-id* form of this command enables OF in VPLS SAP filters by embedding rules with sros-cookie:type "service-cookie”, value *service-id* and flow match conditions specifying the sap-id from the specified OFS instance with **switch-defined-cookie** enabled—per SAP OF rules. The embedding filter must be of type exclusive and can only be deployed on the specified SAP in the context of the specified VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **no embed-filter open-flow** *ofs-name* form of this command removes the OF embedding for the GRT context.

The **embed-filter flowspec** form of this command enables the embedding of rules derived from BGP FlowSpec routes into the filter policy that is being configured. The optional **group** parameter specifies that only FlowSpec routes tagged with an interface-set extended community containing this group ID should be selected for embedding. The optional **router** parameter specifies the routing instance source of the BGP FlowSpec routes; if the parameter is not specified, the routing instance is derived automatically from the context in which the filter policy is applied.

The **no embed-filter flowspec** form of this command removes the FlowSpec filter embedding from this filter policy.

The **no embed-filter** *filter-id* form of this command removes the embedding from this filter policy.

See the description of embedded filter policies in this guide for further operational details.

Parameters

ip-filter-id

Specifies a previously defined IPv4 policy for embedding in this filter.

ipv6-filter-id

Specifies a previously defined IPv6 policy for embedding in this filter.

offset

Specifies that an embedded filter entry X will have an entry X + offset in the embedding filter.

Values 0 to 2097151

Default 0

active

Specifies that embedded filter entries are to be included in this embedding filter policy and activated on applicable line cards—default if no keyword is specified and omitted from **info** command output (but not **info detail**), or when saving the configuration.

inactive

Specifies that no embedded filter policy entries are to be included in this embedding filter policy. The embedding is configured but will not do anything.

flowspec

This keyword indicates that rules derived from BGP FlowSpec routes should be embedded into (or removed from, in case of the **no** form) the filter.

group-id

Specifies that only FlowSpec routes with an interface-set extended community with this value of *group-id* should be selected for embedding.

Values 0 to 16383

router-instance

Specifies a router instance.

vprn-service-name

Specifies the VPRN service name used for embedding FlowSpec rules.

open-flow

Indicates that rules derived from OpenFlow should be embedded into (or removed from, in case of the **no** form) the filter.

ofs-name

Specifies the name of the currently configured Hybrid OpenFlow Switch (OFS) instance.

Not including the **system**, **service** or **sap** parameters will specify OF in a GRT instance context by default. This allows embedding of OF rules into filters deployed in GRT instances from OFS with **switch-defined-cookie** disabled, or embedding rules from OFS with **switch-defined-cookie** enabled, when the FlowTable cookie encodes sros-cookie:type "grt-cookie”.

system

Used for OF control of system filters. Allows embedding of OF rules into system filters from OFS with **switch-defined-cookie** enabled. Only the rules with cookie value encoding "system-cookie” are embedded.

service-id

Specifies an existing VPRN or VPLS service ID that the embedding filter can be used for.

service-name — Specifies an existing VPRN or VPLS service name that the embedding filter can be used for.

Values 1 to 2147483647

service-name

Specifies an existing VPRN or VPLS service name up to 64 characters that the embedding filter can be used for.

sap-id

Used for OF control of VPLS services when a PortID and VLAN ID match is required. Allows embedding of OF rules with a PortID and VLAN ID match into exclusive VPLS SAP filters. Only the rules with cookie value encoding the VPLS service, and flow table match

encoding the specified SAP, are embedded into the filter. The embedding filter can only be deployed in the context of the specified SAP.

sap-id — Specifies an existing SAP that the embedding filter can be used for.

Platforms

7705 SAR Gen 2

9.28 embedded-rp

embedded-rp

Syntax

embedded-rp

Context

[Tree] (config>service>vprn>pim>rp>ipv6 embedded-rp)

Full Context

configure service vprn pim rp ipv6 embedded-rp

Description

This command enables context to configure IPv6 embedded RP parameters.

Platforms

7705 SAR Gen 2

embedded-rp

Syntax

[**no**] **embedded-rp**

Context

[Tree] (config>router>pim>rp>ipv6 embedded-rp)

Full Context

configure router pim rp ipv6 embedded-rp

Description

Commands in this context configure embedded RP parameters.

Embedded RP is required to support IPv6 inter-domain multicast because there is no MSDP equivalent in IPv6.

The detailed protocol specification is defined in RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*. This RFC describes a multicast address allocation policy in which the address of the RP is encoded in the IPv6 multicast group address, and specifies a PIM-SM group-to-RP mapping to use the encoding, leveraging, and extending unicast-prefix-based addressing. This mechanism not only provides a simple solution for IPv6 inter-domain ASM but can be used as a simple solution for IPv6 intra-domain ASM with scoped multicast addresses as well. It can also be used as an automatic RP discovery mechanism in those deployment scenarios that would have previously used the Bootstrap Router protocol (BSR).

The **no** form of this command disables embedded RP.

Platforms

7705 SAR Gen 2

9.29 emulated-server

emulated-server

Syntax

emulated-server *ip-address*

no emulated-server

Context

[Tree] (config>service>vprn>if>dhcp>proxy-server emulated-server)

[Tree] (config>service>ies>if>dhcp>proxy-server emulated-server)

[Tree] (config>service>vpls>sap>dhcp>proxy-server emulated-server)

Full Context

configure service vprn interface dhcp proxy-server emulated-server

configure service ies interface dhcp proxy-server emulated-server

configure service vpls sap dhcp proxy-server emulated-server

Description

This command configures the IP address which is used as the DHCP server address in the context of the SAP. Typically, the configured address should be in the context of the subnet represented by the service.

The **no** form of this command reverts to the default setting. The local proxy server will not become operational without the emulated-server address being specified.

The **no** form of this command reverts to the default.

Parameters

ip-address

Specifies the emulated server's IP address. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Platforms

7705 SAR Gen 2

9.30 enable-admin

enable-admin

Syntax

enable-admin

Context

[Tree] (enable-admin)

Full Context

enable-admin

Description

See the description for the **admin-password** command. If the **admin-password** is configured in the **config>system>security>password** context, then any user can enter a special administrative mode by entering the **enable-admin** command.

enable-admin is in the default profile. By default, all users are given access to this command.

Once the **enable-admin** command is entered, the user is prompted for a password. If the password matches, the user is given unrestricted access to all the commands.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

The following shows a password configuration example:

```
A:ALA-1>config>system>security# info
----------------------------------------------
...
            password
                aging 365
                minimum-length 8
                attempts 5 time 5 lockout 20
                admin-password "rUYUz9XMo6I" hash
            exit
...
----------------------------------------------
A:ALA-1>config>system>security#
```

There are two ways to verify that a user is in the enable-admin mode:

- show users — administrator can know which users are in this mode
- Enter the **enable-admin** command again at the root prompt and an error message will be returned.

```
*A:node-1# show users

9.39 enable-origin-validation

enable-origin-validation

Syntax

enable-origin-validation [**ipv4**] [**ipv6**] [**label-ipv4**]

no enable-origin-validation

Context

[Tree] (config>service>vprn>bgp>group enable-origin-validation)

[Tree] (config>service>vprn>bgp>group>neighbor enable-origin-validation)

Full Context

configure service vprn bgp group enable-origin-validation

configure service vprn bgp group neighbor enable-origin-validation

Description

When this command is added to the configuration of a group or neighbor, it causes every inbound IPv4, IPv6, and label-IPv4 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when no family parameter is present in the command) or when all the family options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), and unicast IPv6 (AFI2/SAFI1) routes are evaluated to determine their origin validation states. When only a subset of the family options are present, then only the corresponding address family routes are evaluated.

This command applies to all types of VPRN BGP peers, generally, it should only be applied to EBGP peers and groups that contain only EBGP peers.

The **no** form of this command disables the inspection of received routes from the peer to determine origin validation state.

Default

no enable-origin-validation

Parameters

ipv4

Enables origin validation processing for unlabeled unicast IPv4 routes.

ipv6

Enables origin validation processing for unlabeled unicast IPv6 routes.

label-ipv4

Enables origin validation processing for labeled IPv4 routes.

Platforms

7705 SAR Gen 2

enable-origin-validation

Syntax

enable-origin-validation [**ipv4**] [**ipv6**] [**label-ipv4**] [**label-ipv6**]

no enable-origin-validation

Context

[Tree] (config>router>bgp>group>neighbor enable-origin-validation)

[Tree] (config>router>bgp>group enable-origin-validation)

Full Context

configure router bgp group neighbor enable-origin-validation

configure router bgp group enable-origin-validation

Description

When the **enable-origin-validation** command is added to the configuration of a group or neighbor, it causes every inbound IPv4 or IPv6 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when neither the ipv4 or ipv6 option is present in the command) or when both the ipv4 and ipv6 options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), unicast IPv6 (AFI2/SAFI1), and label-IPv6 (AFI2/SAFI4) routes are evaluated to determine their origin validation states. When only the ipv4 or ipv6 option is present, only the corresponding address family routes (unlabeled and labeled) are evaluated.

The **enable-origin-validation** command applies to all types of BGP peers, but as a general rule, it should only be applied to EBGP peers and groups that contain only EBGP peers.

Default

no enable-origin-validation

Parameters

ipv4

Enables origin validation processing for unlabeled unicast IPv4 routes.

ipv6

Enables origin validation processing for unlabeled unicast IPv6 routes.

label-ipv4

Enables origin validation processing for labeled IPv4 routes.

label-ipv6

Enables origin validation processing for labeled IPv6 routes.

[Tree] (config>service>vprn>bgp>group enable-peer-tracking)

Full Context

configure service vprn bgp enable-peer-tracking

configure service vprn bgp group neighbor enable-peer-tracking

configure service vprn bgp group enable-peer-tracking

Description

This command enables BGP peer tracking.

Default

no enable-peer-tracking

Platforms

7705 SAR Gen 2

enable-peer-tracking

Syntax

[**no**] **enable-peer-tracking**

Context

[Tree] (config>router>bgp>group enable-peer-tracking)

[Tree] (config>router>bgp>group>neighbor enable-peer-tracking)

[Tree] (config>router>bgp enable-peer-tracking)

Full Context

configure router bgp group enable-peer-tracking

configure router bgp group neighbor enable-peer-tracking

configure router bgp enable-peer-tracking

Description

This command enables BGP peer tracking. BGP peer tracking allows a BGP peer to be dropped immediately if the route used to resolve the BGP peer address is removed from the IP routing table and there is no alternative available. The BGP peer will not wait for the holdtimer to expire; therefore, the BGP re-convergence process is accelerated.

The **no** form of this command disables peer tracking.

Default

no enable-peer-tracking

Platforms

7705 SAR Gen 2

9.41 enable-rr-vpn-forwarding

enable-rr-vpn-forwarding

Syntax

[**no**] **enable-rr-vpn-forwarding**

Context

[Tree] (config>router>bgp enable-rr-vpn-forwarding)

Full Context

configure router bgp enable-rr-vpn-forwarding

Description

When this command is configured all received VPN-IP routes, regardless of route target, are imported into the dummy VRF, where the BGP next-hops are resolved. The **label-route-transport-tunnel** under **config>router>bgp>next-hop-resolution** determines what types of tunnels are eligible to resolve the next-hops. If a received VPN-IP route from IBGP peer X is resolved and selected as best so that it can be re-advertised to an IBGP peer Y, and the BGP next-hop is modified towards peer Y (by using the next-hop-self command in Y's group or neighbor context or by using a next-hop action in an export policy applied to Y) then BGP allocates a new VPRN service label value for the route, signals that new label value to Y and programs the IOM to do the corresponding label swap operation. The supported combinations of X and Y are outlined below:

- from X (client) to Y (client)
- from X (client) to Y (non-client)
- from X (non-client) to Y (client)

The **no** form of this command causes the re-advertisement of a VPN-IP route between one IBGP peer and another IBGP peer does not cause a new VPRN service label value to be signaled and programmed even if the BGP next-hop is changed through group/neighbor configuration or policy.

Nokia recommends leaving this command disabled for scaling and convergence reasons.

Default

no enable-rr-vpn-forwarding

Platforms

7705 SAR Gen 2

9.42 enable-subconfed-vpn-forwarding

enable-subconfed-vpn-forwarding

Syntax

[**no**] **enable-subconfed-vpn-forwarding**

Context

[Tree] (config>router>bgp enable-subconfed-vpn-forwarding)

Full Context

configure router bgp enable-subconfed-vpn-forwarding

Description

This command configures BGP to keep VPN-IPv4 and VPN-IPv6 routes within a subconfederation and allow a **next-hop-self** command to create label swap forwarding entries.

When this is enabled, the base router BGP instance retains all received VPN-IPv4 and VPN-IPv6 routes, even those with route targets not matching any VRF import policy of any locally configured VPRN. In addition, when this leaf is enabled and base router BGP is configured to apply a **next-hop-self** command to a peer of any type (EBGP, IBGP, or confed-EBGP), the VPN-IPv4 and VPN-IPv6 routes are advertised to the peer with a new BGP label and next-hop, and a label-swap forwarding entry is programmed.The preceding behaviors are applied when the **enable-inter-as-vpn** or the **enable-rr-vpn-forwarding** commands, both under the **configure router bgp** context, are also enabled in the same BGP instance and regardless of whether the base router has a confederation configuration.

The **no** form of this command disables subconfederation VPN forwarding.

Default

no enable-subconfed-vpn-forwarding

9.44 encap-match

encap-match

Syntax

encap-match {**all-encap** | **double-tag** *encap-value* | **single-tag** *encap-value* | **untagged**}

no encap-match

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port encap-match)

Full Context

configure port ethernet dot1x macsec sub-port encap-match

Description

This command defines the sub-set of traffic on this port affected by this MACsec sub-port.

In order to establish an end-to-end communication between the remote MACsec peers encrypting VLAN-tagged traffic, the MKA packets have to be able to travel over the network following the same path as the encrypted traffic. MKA packets are generated with specific tags depending on the traffic match criteria configured, as shown in Table 31: MKA Packet Generation .

The **no** form of this command removes all traffic sub-set definitions from the MACsec sub-port.

Table 31: MKA Packet Generation

Configuration	Config Example (<s-tag>.<c-tag>)	MKA Packet Generation	Traffic pattern match/behavior
PORT all-encap	Config>port>ethernet>dot1x>macsec Sub-port 10 encap-match all-encap ca-name 10	untagged MKA packet	Matches all traffic on the port, including untagged, single-tag, double-tag. This is the Release 15.0 default behavior.
Untagged	Config>port>ethernet>dot1x>macsec Sub-port 1 encap-match untagged ca-name 2	untagged MKA packet	Matches only untagged traffic on the port
802.1Q single S-TAG (specific S-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 2 encap-match dot1q 1	MKA packet generated with S-TAG=1	Matches only single-tag traffic on port with tag ID of 1

Configuration	Config Example (<s-tag>.<c-tag>)	MKA Packet Generation	Traffic pattern match/behavior
	ca-name 3		
802.1Q single S-TAG (any S-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 3 encap-match dot1q * ca-name 4	untagged MKA packet	Matches any single-tag traffic on port
802.1ad double tag (both tag have specific TAGs)	Config>port>ethernet>dot1x>macsec Sub-port 4 encap-match qinq 1.1 ca-name 5	MKA packet generated with S-tag=1 and C-TAG=1	Matches only double-tag traffic on port with service tag of 1 and customer tag of 1
802.1ad double tag (specific S-TAG, any C-TAG)	Config>port>ethernet>dot1x>macsec Sub-port 6 encap-match qinq 1.* ca-name 7	MKA packet generated with S-TAG=1	Matches only double-tag traffic on port with service tag of 1 and customer tag of any
802.1ad double tag (any S-TAG, any C-TAG	Config>port>ethernet>dot1x>macsec Sub-port 7 encap-match double-tag *.* ca-name 8	untagged MKA packet	Matches any double-tag traffic on port

Default

encap-match all-encap

Parameters

all-encap

Specifies that all traffic patterns are matched including untagged, single-tag or double-tag, and all will be encrypted.

untagged

Specifies that only untagged traffic are matched and encrypted.

single-tag

Specifies that only dot1q traffic are matched. Either all single tag traffic can be matched, by using *, or a specific dot1q tag can be matched.

double-tag

Specifies that only qinq traffic are matched. The service tag can be specifically matched or a wild card match (*.*) can be used.

encap-value

Specifies the type and value of the packet encapsulation to match for this MACsec sub-port.

Type	Parameter
all-encap	—
untagged	—
dot1q	[*| s] (s = 0..4094)
qinq	[*.*| s.*| s.c] (s and c = 0..4094)

where:

- S = service tag
- C = customer tag

9.45 encap-type

encap-type

Syntax

encap-type {**dot1q** | **null** | **qinq**}

no encap-type

Context

[Tree] (config>port>ethernet encap-type)

Full Context

configure port ethernet encap-type

Description

This command configures the encapsulation method used to distinguish customer traffic on an Ethernet access port, or different VLANs on a network port.

The **no** form of this command restores the default.

Default

encap-type null

Parameters

dot1q

Ingress frames carry 802.1Q tags where each tag signifies a different service.

null

Ingress frames will not use any tags to delineate a service. As a result, only one service can be configured on a port with a null encapsulation type.

qinq

Specifies QinQ encapsulation.

Platforms

7705 SAR Gen 2

encap-type

Syntax

encap-type {**dot1q** | **null** | **qinq**}

no encap-type

Context

[Tree] (config>lag encap-type)

Full Context

configure lag encap-type

Description

This command configures the encapsulation method used to distinguish customer traffic on a LAG. The encapsulation type is configurable on a LAG port. The LAG port and the port member encapsulation types must match when adding a port member.

If the encapsulation type of the LAG port is changed, the encapsulation type on all the port members will also change. The encapsulation type can be changed on the LAG port only if there is no interface associated with it. If the MTU is set to a non-default value, it will be reset to the default value when the encap type is changed.

The **no** form of this command restores the default.

Default

encap-type null — All traffic on the port belongs to a single service or VLAN.

Parameters

dot1q

Ingress frames carry 802.1Q tags where each tag signifies a different service.

null

Ingress frames will not use any tags to delineate a service. As a result, only one service can be configured on a port with a null encapsulation type.

qinq

Specifies QinQ encapsulation.

configure system telemetry persistent-subscriptions subscription encoding

Description

This command configures the encoding type that is used for telemetry notifications in accordance with the definitions in the gNMI OpenConfig standard.

Default

encoding json

Parameters

encoding

Specifies the encoding type.

Values json, bytes, proto

Platforms

7705 SAR Gen 2

9.48 encrypt

encrypt

Syntax

encrypt {**on** | **off**}

Context

[Tree] (bof encrypt)

Full Context

bof encrypt

Description

This command enables and disables encryption of the BOF using AES256 and SHA256.

When the BOF is encrypted on the compact flash, it is still reachable using the BOF interactive menu during node startup, and fields can be modified using the BOF interactive menu.

Default

encrypt off

Parameters

on

Enables BOF encryption

off

Disables BOF encryption

Platforms

7705 SAR Gen 2

9.49 encryption-key

encryption-key

Syntax

encryption-key *key* [**hash** | **hash2** | **custom**]

no encryption-key

Context

[Tree] (bof encryption-key)

Full Context

bof encryption-key

Description

This command creates a key to be used by AES256 and SHA256 for configuration file encryption and hashing. This key is used for all configuration files (primary, secondary, and tertiary).

After creating or deleting a key, use the **admin save** command to save the configuration file with the current encryption key state.

The **no** form of this command deletes the encryption key.

Default

no encryption-key

Parameters

key

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

hash

Keyword to specify that the key is entered in an encrypted form.

hash2

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

custom

Keyword to specify that the key uses custom encryption.

Platforms

7705 SAR Gen 2

encryption-key

Syntax

encryption-key *key* [**hash** | **hash2** | **custom**]

no encryption-key

Context

[Tree] (config>log encryption-key)

Full Context

configure log encryption-key

Description

This command specifies the encryption key used by AES-256-CTR for log file encryption. The encryption key is used for all local log files on the system.

The **no** form of this command deletes the encryption key.

Default

no encryption-key

Parameters

key

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

hash

Keyword to specify that the key is entered in an encrypted form.

hash2

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

custom

Keyword to specify that the key uses custom encryption.

9.50 encryption-keygroup

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* **direction** {**inbound** | **outbound**}

no encryption-keygroup direction {**inbound** | **outbound**}

Context

[Tree] (config>router>if>group-encryption encryption-keygroup)

Full Context

configure router interface group-encryption encryption-keygroup

Description

This command is used to bind a key group to a router interface for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the router use the **active-outbound-sa** associated with the configured key group. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group.

The **no** form of this command removes the key group from the router interface in the specified direction.

Default

no encryption-keygroup direction inbound

no encryption-keygroup direction outbound

Parameters

keygroup-id

The ID number of the key group being configured.

Values 1 to 127, *keygroup-name* (64 characters maximum)

inbound

Binds the key group in the inbound direction.

outbound

Binds the key group in the outbound direction.

Platforms

7705 SAR Gen 2

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* [**create**]

no encryption-keygroup *keygroup-id*

Context

[Tree] (config>grp-encryp encryption-keygroup)

Full Context

configure group-encryption encryption-keygroup

Description

This command is used to create a key group. Once the key group is created, use the command to enter the key group context or delete a key group.

The **no** form of the command removes the key group. Before using the **no** form, the key group association must be deleted from all services that are using this key group.

Parameters

keygroup-id

The number or name of the key group being referenced.

Values 1 to 15, or *keygroup-name* (up to 64 characters)

create

Creates a key group.

Platforms

7705 SAR Gen 2

encryption-keygroup

Syntax

encryption-keygroup *keygroup-id* **direction** {**inbound** | **outbound**}

no encryption-keygroup direction {**inbound** | **outbound**}

Context

[Tree] (config>service>vprn encryption-keygroup)

[Tree] (config>service>sdp encryption-keygroup)

[Tree] (config>service>pw-template encryption-keygroup)

Full Context

configure service vprn encryption-keygroup

configure service sdp encryption-keygroup

configure service pw-template encryption-keygroup

Description

This command is used to bind a key group to an SDP, VPRN service, or PW template for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the node use the **active-outbound-sa** associated with the key group configured. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group. Services using the SDP will be encrypted.

The encryption (enabled or disabled) configured on an SDP used to terminate a Layer 3 spoke SDP of a VPRN always overrides any VPRN-level configuration for encryption.

Encryption is enabled after the outbound direction is configured.

For PW template changes, the following **tools** command must be executed after the configuration changes are made: **tools**>**perform**>**service**>**eval-pw-template**>**allow-service-impact**. This command applies the changes to services that use the PW template.

The **no** form of the command removes the key group from the SDP or service in the specified direction (inbound or outbound).

Parameters

keygroup-id

Specifies the number of the key group being configured.

Values 1 to 15 or *keygroup-name* (up to 64 characters)

direction {inbound | outbound}

Specifies the direction of the service that the key group will be bound to.

Platforms

7705 SAR Gen 2

9.51 encryption-offset

encryption-offset

Syntax

encryption-offset *encryption-offset*

no encryption-offset

Context

[Tree] (config>macsec>connectivity-association encryption-offset)

Full Context

configure macsec connectivity-association encryption-offset

Description

This command specifies the offset of the encryption in MACsec packet.

The encryption-offset is distributed by MKA (Key-server) to all parties.

It is signaled via MACsec capabilities. There are four basic settings for this. Table 32: MACsec Basic Settings breaks down the settings.

Table 32: MACsec Basic Settings

Setting	Description
0	MACsec is not implemented
1	Integrity without confidentiality
2	The following are supported: • Integrity without confidentiality • Integrity and confidentiality with a confidentiality offset of 0
3	The following are supported: • Integrity without confidentiality • Integrity and confidentiality with a confidentiality offset of 0, 30, or 50

Note:

1. SR OS supports setting (3) Integrity without confidentiality and Integrity and confidentiality with a confidentiality offset of 0, 30, or 50.

The **no** form of this command rejects all arriving traffic whether MACsec is secured or not.

Default

encryption-offset 0

Parameters

encryption-offset

Specifies the encryption.

Values 0 — encrypt the entire payload
30 — leave the IPv4 header in clear
50 — leave the IPv6 header in clear

Platforms

7705 SAR Gen 2

9.52 end

end

Syntax

end *end-week end-day end-month hours-minutes*

Context

[Tree] (config>system>time>dst-zone end)

Full Context

configure system time dst-zone end

Description

This command configures start of summer time settings.

Default

end first sunday january 00:00

Parameters

end-week

Specifies the starting week of the month when the summer time ends.

Values first, second, third, fourth, last

Default first

end-day

Specifies the starting day of the week when the summer time ends.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday

Default sunday

end-month

Specifies the starting month of the year when the summer time takes effect.

Values january, february, march, april, may, june, july, august, september, october, november, december

Default january

hours-minutes

Specifies the time at which the summer time ends, in hh:mm format.

Values hours: 00 to 23

minutes: 00 to 59

9.53 end-of-data

end-of-data

Syntax

[**no**] **end-of-data**

Context

[Tree] (debug>router>rpki-session>packet end-of-data)

Full Context

debug router rpki-session packet end-of-data

Description

This command enables debugging for end of data RPKI packets.

The **no** form of this command disables debugging for end of data RPKI packets.

Platforms

7705 SAR Gen 2

9.54 end-time

end-time

Syntax

end-time [*date* | *day-name*] *time*

no end-time

Context

[Tree] (config>system>cron>sched end-time)

Full Context

configure system cron schedule end-time

Description

This command is used concurrently with type **periodic** or **calendar**. Using the type of **periodic**, end-time determines at which interval the schedule will end. Using the type of **calendar**, end-time determines on which date the schedule will end.

When **no end-time** is specified, the schedule runs forever.

Default

no end-time

Parameters

date

Specifies the date to schedule a command.

Values YYYY:MM:DD in year:month:day number format

day-name

Specifies the day of the week to schedule a command.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday

time

Specifies the time of day to schedule a command.

Values hh:mm

Platforms

7705 SAR Gen 2

end-time

Syntax

end-time *date hours-minutes* [**UTC**]

end-time {**now** | **forever**}

no end-time

Context

[Tree] (config>system>security>keychain>direction>uni>receive>entry end-time)

Full Context

configure system security keychain direction uni receive entry end-time

Description

This command specifies the calendar date and time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream.

Default

end-time forever

Parameters

date

Specifies the calendar date after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the YYYY/MM/DD format. When no year is specified the system assumes the current year.

hours-minutes

Specifies the time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the hh:mm[:ss] format. Seconds are optional, and if not included, assumed to be 0.

UTC

Indicates that time is given with reference to Coordinated Universal Time in the input.

now

Specifies a time equal to the current system time.

forever

Specifies that the key is always active.

7705 SAR Gen 2

9.55 endpoint

endpoint

Syntax

endpoint *endpoint-name* [**create**]

no endpoint *endpoint-name*

Context

[Tree] (config>service>epipe endpoint)

Full Context

configure service epipe endpoint

Description

This command configures a service endpoint.

Parameters

endpoint-name

Specifies an endpoint name.

Platforms

7705 SAR Gen 2

endpoint

Syntax

endpoint *endpoint-name* [**create**]

no endpoint

Context

[Tree] (config>service>vpls endpoint)

Full Context

configure service vpls endpoint

Description

This command configures a service endpoint.

Parameters

endpoint-name

Specifies an endpoint name up to 32 characters in length

create

This keyword is mandatory while creating a service endpoint

Platforms

7705 SAR Gen 2

endpoint

Syntax

endpoint *endpoint-name* [**create**]

no endpoint *endpoint-name*

Context

[Tree] (config>mirror>mirror-dest endpoint)

Full Context

configure mirror mirror-dest endpoint

Description

This command configures a service end point. A mirror service supports two implicit endpoints managed internally by the system. The following applies to endpoint configurations.

Up to two named endpoints may be created per service mirror or LI service. The endpoint name is locally significant to the service mirror or LI service.

- Objects (SAPs or SDPs) may be created on the service mirror or LI with the following limitations:
  - two implicit endpoint objects (without explicit endpoints defined)
  - one implicit and multiple explicit object with the same endpoint name
  - multiple explicit objects each with one of two explicit endpoint names
- All objects become associated implicitly or indirectly with the implicit endpoints 'x' and 'y'.
- Objects may be created without an explicit endpoint defined.
- Objects may be created with an explicit endpoint defined.
- Objects without an explicit endpoint may have an explicit endpoint defined without deleting the object.
- Objects with an explicit endpoint defined may be dynamically moved to another explicit endpoint or may have the explicit endpoint removed.

Creating an object without an explicit endpoint:

- If an object on a mirror or LI service has no explicit endpoint name associated, the system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association.

- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the object cannot be created.

Creating an object with an explicit endpoint name:

- The endpoint name must exist on the mirror or LI service.
- If this is the first object associated with the endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be created
  - the implicit endpoint is now associated with the named endpoint
  - f this is not the first object associated with the endpoint name:
  - the object is associated with the named endpoint's implicit association

Changing an object’s implicit endpoint to an explicit endpoint name

- If the explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint
- If the object is the first to be associated with the explicit endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated (except this one)
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be moved to the explicit endpoint
  - if moved, the implicit endpoint is now associated with the named endpoint

Changing an object’s explicit endpoint to another explicit endpoint name

- If the new explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint
- If the object is the first to be associated with the new explicit endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated (except this one)
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be moved to the new endpoint
  - if moved, the implicit endpoint is now associated with the named endpoint

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB sdp is allowed. The ICB sdp cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB sdp.

An explicitly named endpoint which does not have a SAP object can have a maximum of four SDPs which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

The user can only add a SAP configured on a MC-LAG instance to this endpoint. Conversely, the user will not be able to change the mirror service type away from mirror service without first deleting the MC-LAG SAP.

The **no** form of this command removes the association of a SAP or an SDP with an explicit endpoint name. When removing an objects explicit endpoint association:

- The system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association (except this one).
- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the explicit endpoint cannot be removed.

Parameters

endpoint-name

Specifies the endpoint name.

create

Mandatory keyword to create this entry.

Platforms

7705 SAR Gen 2

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (conf>router>segment-routing>sr-policies>policy endpoint)

Full Context

configure router segment-routing sr-policies static-policy endpoint

Description

This command associates an IPv4 or IPv6 endpoint address with a statically-defined segment routing policy. This association is mandatory when enabling an SR segment-routing policy.

The endpoint address 0.0.0.0 is a special value that matches all BGP next-hops. To use it, the BGP route must have a color-extended community with the color-only bits set to '01' or '10'.

The **no** form of this command removes the endpoint association.

Default

no endpoint

Parameters

ip-address

Specifies the endpoint IP address to be associated with the statically-defined segment-routing policy.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Platforms

7705 SAR Gen 2

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (config>router>policy-options>policy-statement>entry>from endpoint)

Full Context

configure router policy-options policy-statement entry from endpoint

Description

This command configures an SR Policy endpoint address as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the endpoint IP match criterion from the configuration.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x [-interface]
- x:x:x:x:x:x:d.d.d.d [-interface]

- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

7705 SAR Gen 2

endpoint

Syntax

endpoint *ip-address*

no endpoint

Context

[Tree] (config>oam-pm>session>ip>tunnel>mpls>sr-policy endpoint)

Full Context

configure oam-pm session ip tunnel mpls sr-policy endpoint

Description

This command configures the unicast IPv4 or globally routable IPv6 address endpoint of the tunnel.

The **no** form of this command removes IPv4 or IPv6 address.

Default

no endpoint

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values		
	ipv4-address	- a.b.c.d
	ipv6-address	- x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

9.56 enforce-first-as

enforce-first-as

Syntax

enforce-first-as

Context

[Tree] (config>service>vprn>bgp>group enforce-first-as)

[Tree] (config>service>vprn>bgp>group>neighbor enforce-first-as)

[Tree] (config>service>vprn>bgp enforce-first-as)

Full Context

configure service vprn bgp group enforce-first-as

configure service vprn bgp group neighbor enforce-first-as

configure service vprn bgp enforce-first-as

Description

When this command is configured so that it applies to an EBGP session, all routes (belonging to all address families) that are received from the EBGP peer are checked to ensure that the most recent autonomous system number (ASN) in the AS_PATH attribute of each route matches the configured **peer-as** of the session; if it does not match, then either the session is reset (if **update-fault-tolerance** is not enabled) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is enabled).

Enabling or disabling this command on a session that is already up does not flap the session. When **enforce-first-as** is enabled, previously received routes are not checked for compliance with the rule. Enforcement applies only to routes received after the command is enabled and stops when the command is disabled.

Platforms

7705 SAR Gen 2

9.58 enforce-test-session-start-time

enforce-test-session-start-time

Syntax

[**no**] **enforce-test-session-start-time**

Context

[Tree] (config>test-oam>twamp>server enforce-test-session-start-time)

Full Context

configure test-oam twamp server enforce-test-session-start-time

Description

This command configures the router to check the signalled test-session start time against the server time and discard TWAMP test packets that arrive before the negotiated test-session start time.

The **no** form of this command configures the router to process all TWAMP test packets without checking the test-session start time against the server time.

Default

enforce-test-session-start-time

Platforms

7705 SAR Gen 2

9.59 enforce-unique-if-index

enforce-unique-if-index

Syntax

[**no**] **enforce-unique-if-index**

Context

[Tree] (config>system>ip enforce-unique-if-index)

Full Context

configure system ip enforce-unique-if-index

Description

This command enables the options to force the creation of IP interface indexes so that they are globally unique across all routing contexts. In addition, the command ensures that any interface created using SNMP also has a system-wide unique IP interface index.

If this command is issued but the system has previously existing interface indexes that conflict, the command will be rejected until all the conflicts are removed. Pre-existing persistency tables should also be removed before enabling this system option.

The **no** form of the command disables this option and returns the system to the default behavior.

Default

no enforce-unique-if-index

Platforms

7705 SAR Gen 2

9.60 enforce-untagged-route

enforce-untagged-route

Syntax

enforce-untagged-route {**none** | **untagged-tunnel**}

Context

[Tree] (config>router>bgp>next-hop-res>lbl-routes>transport-tunn>family enforce-untagged-route)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel family enforce-untagged-route

Description

This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services.

Default

enforce-untagged-route none

Parameters

none

Keyword to specify that untagged routes can bind to tagged or untagged LSPs.

untagged-tunnel

Keyword to specify that untagged routes can only bind to LSPs with no administrative tags configured. If both tagged and untagged tunnels to the next hop exist, the system only considers untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes also fails. This keyword may be used in combination with the **enforce-strict-tunnel-tagging** command, in which case tagged routes resolve to tagged LSPs and untagged routes only resolve to untagged LSPs.

Platforms

7705 SAR Gen 2

enforce-untagged-route

Syntax

enforce-untagged-route {**none** | **untagged-tunnel**}

Context

[Tree] (config>router>bgp>next-hop-res>shortcut-tunn>family enforce-untagged-route)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel family enforce-untagged-route

Description

This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services.

Default

enforce-untagged-route none

Parameters

none

Keyword to specify that untagged routes can bind to tagged or untagged LSPs.

untagged-tunnel

Keyword to specify that untagged routes can only bind to LSPs with no administrative tags configured. If both tagged and untagged tunnels to the next hop exist, the system only considers untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes also fails. 9.61 enforcement

enforcement

Syntax

enforcement {**static** *policer-name* | **dynamic** {*mon-policer-name* | **local-mon-bypass**}}

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol enforcement)

Full Context

configure system security dist-cpu-protection policy protocol enforcement

Description

This command configures the enforcement method for the protocol.

Default

enforcement dynamic local-mon-bypass

Parameters

static

Specifies that the protocol is always enforced using a **static-policer**. Multiple protocols can reference the same **static-policer**. Packets of protocols that are statically enforced bypass any local monitors.

policer name

Specifies which **static-policer** to use.

dynamic

Specifies that a specific enforcement policer for this protocol for this SAP/object is instantiated when the associated **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds to reduce thrashing).

mon-policer-name

Specifies which **local-monitoring-policer** to use.

local-mon-bypass

This parameter is used to not include packets from this protocol in the local monitoring function, and when the local-monitor "trips", do not instantiate a dynamic enforcement policer for this protocol.

Platforms

7705 SAR Gen 2

9.62 engineID

engineID

Syntax

[**no**] **engineID** *engine-id*

Context

[Tree] (config>system>snmp engineID)

Full Context

configure system snmp engineID

Description

This command sets the SNMP engine ID that uniquely identifies the SNMPv3 node.If unconfigured, the system uses an engine ID based on the information from the system backplane.If the SNMP engine ID is changed, the current configuration must be saved and a reboot must be executed. Otherwise, the previously configured SNMP communities and logger trap-target notify communities will not be valid for the new engine ID.

Note:
Changing the SNMP engine ID invalidates all SNMPv3 MD5 and SHA security digest keys, which may render the node unmanageable.

When replacing a chassis, configure the new router to use the same engine ID as the previous router. This preserves SNMPv3 security keys and allows management stations to use their existing authentication keys for the new router.

Ensure that the engine ID of each router is unique. A management domain can only maintain one instance of a specific engine ID.

The **no** form of the command configures the router to use the default value.

Parameters

engine-id

Specifies an identifier from 10 to 64 hexadecimal digits (5 to 32 octet number), uniquely identifying this SNMPv3 node. This string is used to access this node from a remote host with SNMPv3.

Platforms

7705 SAR Gen 2

9.63 enroll

enroll

Syntax

enroll est-profile *name* **key** *key-filename* **output** *output-cert-filename* [**hash-alg** *hash algorithm*] **subject-dn** *subject-dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* **|** *ipv6-address*] [**validate-cert-chain**] [**force**]

Context

[Tree] (admin>certificate>est enroll)

Full Context

admin certificate est enroll

Description

This command enrolls a new certificate with Certificate Authority (CA) by the EST protocol specified with the **est-profile** *name* parameter with a imported private key specified by the **key** *key-filename* parameter.

The **est-profile** *name* specifies the authentication between the system and EST server.

The **hash-alg** *hash-algorithm*, **subject-dn** *subject-dn*, **domain-name** *domain-names*, and **ip-addr** *ip-address* parameters are used to generate the Certificate Signing Request (CSR) in the EST request message. The **domain-name** *domain-names* and **ip-addr** *ip-address* parameters are used as subject alternative names.

If **validate-cert-chain** is specified, the system validates the certificate’s chain of result certificate before importing it. The "certificate chain” is the chain of all the certificates from the result certificate to the issuing CA. The "result certificate” is the new certificate returned by EST server.

The result certificate is imported and saved with the filename specified by the **output** *output-cert-filename*. If **force** is specified, the system overwrites the existing file with same name as the *output-cert-filename*.

Parameters

name

Specifies EST profile name, up to 32 characters

key-filename

Specifies the filename of a key, up to 95 characters

output-cert-filename

Specifies the output certificate filename, up to 200 characters

hash-algorithm

Specifies the hash algorithm used in a certificate request.

Values sha1, sha224, sha256, sha384, sha512

subject-dn

Specifies the distinguish name, up to 256 characters, used as the subject in a certificate request, including:

- C-Country
- ST-State
- O-Organization name
- OU-Organization Unit name
- CN-common name

This parameter is formatted as a text string including any of the preceding attributes. The attribute and its value is linked by using "=", and "," is used to separate different attributes.

For example: C=US,ST=CA,O=ALU,CN=SR12

Values attr1=val1,attr2=val2

where: attrN={C | ST | O | OU | CN}, up to 256 characters

domain-names

Specifies domain names, up to 512 characters, separated by commas

ip-address

Specifies an IPv4 or IPv6 address string, up to 64 characters

validate-cert-chain

Specifies that the system validates the certificate's chain of result certificate before importing it

force

Specifies that the system overwrites the existing file with same *output-cert-filename*

no entry *entry-id*

Context

[Tree] (config>service>vprn>log>filter entry)

Full Context

configure service vprn log filter entry

Description

This command is used to create or edit an event filter entry. Multiple entries may be created using unique *entry-id* values. The SR OS implementation exits the filter on the first match found and executes the action in accordance with the action command.

Comparisons are performed in an ascending entry ID order. When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Matching ceases when a packet matches an entry. The entry action is performed on the packet, either drop or forward. To be considered a match, the packet must meet all the conditions defined in the entry.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and are rendered inactive.

By default, no filter entries are defined. Entries must be explicitly configured.

The **no** form of this command removes the specified entry from the event filter. Entries removed from the event filter are immediately removed from all log-id's where the filter is applied.

Default

No event filter entries are defined. An entry must be explicitly configured.

Parameters

entry-id

The entry ID uniquely identifies a set of match criteria corresponding action within a filter. Entry ID values should be configured in staggered increments so you can insert a new entry in an existing policy without renumbering the existing entries.

Values 1 to 999

name entry-name

Configures an optional entry name for the event filter, up to 64 characters, that can be used to refer to the entry after it is created.

configure qos sap-ingress ip-criteria entry

configure qos sap-ingress mac-criteria entry

configure qos sap-egress ip-criteria entry

configure qos sap-ingress ipv6-criteria entry

configure qos sap-egress ipv6-criteria entry

Description

This command is used to create or edit an IP, IPv6, or MAC criteria entry for the policy. Multiple entries can be created using unique *entry-id* numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the egress packet, the system stops matching the packet against the list and performs the

matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on egress packets. If the action command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow reclassification entry that the packet matched and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services where that policy is applied.

Parameters

entry-id

The *entry-id,* expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc** *fc-name* for it to be considered complete. Entries without the action keyword will be considered incomplete and, therefore, will be rendered inactive.

Values 1 to 65535

create

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

configure qos network ingress ipv6-criteria entry

configure qos network ingress ip-criteria entry

configure qos network egress ipv6-criteria entry

configure qos network egress ip-criteria entry

Description

This command is used to create or edit an IP or IPv6 criteria entry for the policy. Multiple entries can be created using unique entry numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the packet, the system stops matching the packet against the list and performs the matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on ingress packets. If the **action** command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow reclassification entry that the packet matched, and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The configuration of egress prec/DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

Network QoS policies containing egress **ip-criteria** or **ipv6-criteria entry** statements are only applicable to network interfaces. Configuration of **ip-criteria** or **ipv6-criteria entry** statements in a network egress QoS policy and the application of the policy on any object other than a GRT network interface are mutually exclusive.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services to which that policy is applied.

Parameters

entry-id

The entry identifier, expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given entry identifiers in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc fc-name profile** *profile* for it to be considered complete. Entries without the action keyword will be considered incomplete and will be rendered inactive.

Values 1 to 65535

create

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled, and an object name is mistyped

when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

configure system security management-access-filter mac-filter entry

configure system security management-access-filter ipv6-filter entry

configure system security management-access-filter ip-filter entry

Description

This command is used to create or edit a management access IP(v4), IPv6, or MAC filter entry. Multiple entries can be created with unique *entry-id* numbers. The OS exits the filter upon the first match found and executes the actions according to the respective action command. For this reason, entries must be sequenced correctly from most to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** defined to be considered complete. Entries without the **action** keyword are considered incomplete and inactive.

The **no** form of this command removes the specified entry from the management access filter.

Parameters

entry-id

Specifies an entry ID uniquely identifies a match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.

Values 1 to 9999

Platforms

7705 SAR Gen 2

entry

Syntax

[**no**] **entry** *entry-id*

Context

[Tree] (config>system>security>profile entry)

Full Context

configure system security profile entry

Description

This command is used to create a user profile entry.

More than one entry can be created with unique *entry-id* numbers. Exits when the first match is found and executes the actions according to the accompanying **action** command. Entries should be sequenced from most explicit to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** for it to be considered complete.

The **no** form of this command removes the specified entry from the user profile.

Parameters

entry-id

Specifies an entry-id that uniquely identifies a user profile command match criteria and a corresponding action. If more than one entry is configured, the *entry-ids* should be numbered in staggered increments to allow users to insert a new entry without requiring renumbering of the existing entries.

Values 1 to 9999

Platforms

7705 SAR Gen 2

entry

Syntax

entry *entry-id* [**key** *authentication-key* | *hash-key* | *hash2-key* | *custom-key*] [**hash** | **hash2** | **custom**] **algorithm** *algorithm*]

no entry *entry-id*

[Tree] (config>system>security>keychain>direction>bi entry)

[Tree] (config>system>security>keychain>direction>uni>send entry)

[Tree] (config>system>security>keychain>direction>uni>receive entry)

Full Context

configure system security keychain direction bi entry

configure system security keychain direction uni send entry

configure system security keychain direction uni receive entry

Description

This command defines a particular key in the keychain. Entries are defined by an entry ID. A keychain must have valid entries for the TCP Enhanced Authentication mechanism to work.

If the entry is the active entry for sending, then this causes a new active key to be selected (if one is available using the youngest key rule). If it is the only possible key to send, then the system rejects the command with an error indicating the configured key is the only available send key.

If the key is one of the eligible keys for receiving, it will be removed. If the key is the only possible eligible key, then the command is accepted, and an error indicating that this is the only eligible key will be generated.

The **no** form of this command removes the entry from the keychain.

Parameters

entry-id

Specifies an entry that represents a key configuration to be applied to a keychain.

Values 0 to 63, null-key

key

Specifies a key ID which is used along with *keychain-name* and **direction** to uniquely identify this particular key entry.

authentication-key

Specifies the *authentication-key* that is used by the encryption algorithm. The key is used to sign and authenticate a protocol packet.

The *authentication-key* can be any combination of letters or numbers.

Values A key must be 160 bits for algorithm hmac-sha-1-96 and must be 128 bits for algorithm aes-128-cmac-96. If the key given with the entry command amounts to less than this number of bits, then it is padded internally with zero bits up to the correct length.

algorithm

Specifies an enumerated integer that indicates the encryption algorithm to be used by the key defined in the keychain.

Values aes-128-cmac-96 — Specifies an algorithm based on the AES standard for TCP authentication as described in RFC 4494 for BGP and LDP.

aes-128-cmac-128 — Specifies an algorithm based on the AES standard as described in RFC 4493 for NTP.

aes-128-gcm-16 — Specifies an algorithm used for MCS.

hmac-sha-1-96 — Specifies an algorithm based on SHA-1 for RSVP-TE and TCP authentication.

message-digest — MD5 hash used for TCP authentication.

hmac-md5 — MD5 hash used for IS-IS and RSVP-TE.

password – Specifies a simple password authentication for OSPF, IS-IS, and RSVP-TE.

hmac-sha-1 — Specifies the sha-1 algorithm for OSPF, IS-IS, and RSVP-TE.

hmac-sha-256 — Specifies the sha-256 algorithm for OSPF and IS-IS.

hash-key | hash2-key | custom-key

Specifies the hash key. The key can be any combination of ASCII characters up to 33 for the *hash-key* and 96 characters for the *hash2-key* (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies a custom hash version is used while saving the configuration files.

7705 SAR Gen 2

entry

Syntax

entry *entry-id* [**create**]

no entry *entry-id*

Context

[Tree] (config>system>security>tls>cert-profile entry)

Full Context

configure system security tls cert-profile entry

Description

This command configures an entry for the TLS certificate profile. A certificate profile may have up to eight entries. Currently, TLS uses the entry with the smallest ID number when responding to server requests.

The **no** form of the command deletes the specified entry.

Parameters

entry-id

Specifies the identification number of the TLS certificate profile entry.

Values 1 to 8

create

Keyword used to create the TLS certificate profile entry.

Platforms

7705 SAR Gen 2

entry

Syntax

entry *entry-id* **expression** *regular-expression*

no entry *entry-id*

Context

[Tree] (config>router>policy-options>as-path-group entry)

Full Context

configure router policy-options as-path-group entry

Description

This command creates the context to edit route policy entries within an autonomous system path group.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the autonomous system path group.

Parameters

entry-id

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. Nokia recommends that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

Values 1 to 128

regular-expression

Specifies the AS path group regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

An AS path in a BGP route matches an AS path group, if the pattern of the path matches the concatenation of all regular expressions in the group. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .

- *
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

Context

[Tree] (config>router>policy-options>policy-statement entry)

Full Context

configure router policy-options policy-statement entry

Description

This command creates the context to edit route policy entries within the route policy statement.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must have at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the route policy statement.

Parameters

entry-id

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

epipe *service-id* [**test**] [**create**] [**name** *name*] [**flexible-cross-connect**]

no epipe *service-id*

Context

[Tree] (config>service epipe)

Full Context

configure service epipe

Description

This command configures an Epipe service instance. This command is used to configure a point-to-point epipe service. An Epipe connects two endpoints defined as Service Access Points (SAPs). Both SAPs may be defined in one 7705 SAR Gen 2 or they may be defined in separate devices connected over the service provider network. When the endpoint SAPs are separated by the service provider network, the far end SAP is generalized into a service destination point (SDP). This SDP describes a destination and the encapsulation method used to reach it.

No MAC learning or filtering is provided on an Epipe.

When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. After a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

After a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

By default, no epipe services exist until they are explicitly created with this command.

The **no** form of this command deletes the epipe service instance with the specified *service-id*. The service cannot be deleted until the service has been shut down.

Parameters

service-id

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7705 SAR Gen 2 on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: up to 64 characters

customer-id

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN ID. If this parameter is not specified, the VPN ID uses the same service ID number.

Values 1 to 2147483647

Default null (0)

vc-switching

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

test

Specifies a unique test service type for the service context which will contain only a SAP configuration. The test service can be used to test the throughput and performance of a path for MPLS-TP PWs.

create

Keyword used to create the service instance. The **create** keyword requirement can be enabled/disabled in the **environment**>**create** context.

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Values *name*: up to 64 characters

flexible-cross-connect

Keyword to specify the Flexible Cross Connect (FXC) mode, which allows the configuration of two or more SAPs on the same Epipe.

7705 SAR Gen 2

9.71 esp-auth-algorithm

esp-auth-algorithm

Syntax

esp-auth-algorithm {**null** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **aes-xcbc** | **auth-encryption**}

no esp-auth-algorithm

Context

[Tree] (config>ipsec>transform esp-auth-algorithm)

Full Context

configure ipsec ipsec-transform esp-auth-algorithm

Description

This command specifies which hashing algorithm should be used for the authentication function Encapsulating Security Payload (ESP). Both ends of a manually configured tunnel must share the same configuration parameters for the IPsec tunnel to enter the operational state.

The **no** form of this command disables the authentication.

Default

esp-auth-algorithm sha1

Parameters

null

This is a very fast algorithm specified in RFC 2410, which provides no authentication.

md5

This parameter configures ESP to use the **hmac-md5** algorithm for authentication.

sha1

This parameter configures ESP to use the **hmac-sha1** algorithm for authentication.

sha256

This parameter configures ESP to use the **sha256** algorithm for authentication.

sha384

This parameter configures ESP to use the **sha384** algorithm for authentication.

sha512

This parameter configures ESP to use the **sha512** algorithm for authentication.

aes-xcbc

Specifies the **aes-xcbc** algorithm for authentication.

auth-encryption

This parameter must be configured when **esp-encryption-algorithm** is either **aes-gcm** or **aes-gmac**.

Platforms

7705 SAR Gen 2

esp-auth-algorithm

Syntax

esp-auth-algorithm {**sha256** | **sha512**}

no esp-auth-algorithm

Context

[Tree] (config>grp-encryp>encryp-keygrp esp-auth-algorithm)

Full Context

configure group-encryption encryption-keygroup esp-auth-algorithm

Description

This command specifies the hashing algorithm used to perform authentication on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must be deleted before the **no** form of the command may be entered or the **esp-auth-algorithm** value changed from its current value.

The **no** form of the command reverts to the default value.

Default

esp-auth-algorithm sha256

Parameters

sha256

Configures the ESP to use the HMAC-SHA-256 algorithm for authentication.

sha512

Configures the ESP to use the HMAC-SHA-512 algorithm for authentication.

Platforms

7705 SAR Gen 2

9.72 esp-encryption-algorithm

esp-encryption-algorithm

Syntax

esp-encryption-algorithm {**null** | **des** | **3des** | **aes128** | **aes192** | **aes256**| **aes128-gcm8** | **aes128-gcm12** | **aes128-gcm16** | **aes192-gcm8** | **aes192-gcm12** | **aes192-gcm16** | **aes256-gcm8** | **aes256-gcm12** | **aes256-gcm16** | **null-aes128-gmac** | **null-aes192-gmac** | **null-aes256-gmac**}

no esp-encryption-algorithm

Context

[Tree] (config>ipsec>ipsec-transform esp-encryption-algorithm)

Full Context

configure ipsec ipsec-transform esp-encryption-algorithm

Description

This command specifies the encryption algorithm to use for the IPsec session. Encryption only applies to esp configurations. If encryption is not defined, esp will not be used.

For IPsec tunnels to come up, both ends need to be configured with the same encryption algorithm.

The **no** form of this command removes the specified encryption algorithm.

Note:
When **aes-gcm** or **aes-gmac** is configured:

- **esp-auth-algorithm** must be set to **auth-encryption**
- the system will not include the authentication algorithm in the ESP proposal of the SA payload
- **ipsec-transform** cannot be used for manual keying

Default

esp-encryption-algorithm aes128

Parameters

null

This parameter configures the high-speed null algorithm, which does nothing. This is the same as not having encryption turned on.

des

This parameter configures the 56-bit des algorithm for encryption. This is an older algorithm, with relatively weak security. Although slightly better than no encryption,

it should only be used where a strong algorithm is not available on both ends at an acceptable performance level.

3des

This parameter configures the 3-des algorithm for encryption. This is a modified application of the des algorithm which uses multiple des operations to make things more secure.

aes128

This parameter configures the aes algorithm with a block size of 128 bits. This is the mandatory implementation size for aes. As of today, this is a very strong algorithm choice.

aes192

This parameter configures the aes algorithm with a block size of 192 bits. This is a stronger version of aes.

aes256

This parameter configures the aes algorithm with a block size of 256 bits. This is the strongest available version of aes.

aes128-gcm8

Configures ESP to use aes-gcm with a 128-bit key size and an 8-byte ICV for encryption and authentication.

aes128-gcm12

Configures ESP to use aes-gcm with a 128-bit key size and a 12-byte ICV for encryption and authentication.

aes128-gcm16

Configures ESP to use aes-gcm with a 128-bit key size and a 16-byte ICV for encryption and authentication.

aes192-gcm8

Configures ESP to use aes-gcm with a 192-bit key size and an 8-byte ICV for encryption and authentication.

aes192-gcm12

Configures ESP to use aes-gcm with a 192-bit key size and a 12-byte ICV for encryption and authentication.

aes192-gcm16

Configures ESP to use aes-gcm with a 192-bit key size and a 16-byte ICV for encryption and authentication.

aes256-gcm8

Configures ESP to use aes-gcm with a 256-bit key size and an 8-byte ICV for encryption and authentication.

aes256-gcm12

Configures ESP to use aes-gcm with a 256-bit key size and a 12-byte ICV for encryption and authentication.

aes128-gcm16

Configures ESP to use aes-gcm with a 256-bit key size and a 16-byte ICV for encryption and authentication.

null-aes128gmac

Configures ESP to use aes-gmac with a 128-bit key size for authentication only.

null-aes192gmac

Configures ESP to use aes-gmac with a 192-bit key size for authentication only.

null-aes256gmac

Configures ESP to use aes-gmac with a 256-bit key size for authentication only.

Platforms

7705 SAR Gen 2

esp-encryption-algorithm

Syntax

esp-encryption-algorithm {**aes128** | **aes256**}

no esp-encryption-algorithm

Context

[Tree] (config>grp-encryp>encryp-keygrp esp-encryption-algorithm)

Full Context

configure group-encryption encryption-keygroup esp-encryption-algorithm

Description

This command specifies the encryption algorithm used to perform encryption on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must be deleted before the **no** form of the command may be entered or the **esp-encryption-algorithm** value changed from its current value.

The **no** form of the command resets the parameter to the default value.

Default

esp-encryption-algorithm aes128

Parameters

aes128

Configures the AES algorithm with a block size of 128 bits—a very strong algorithm choice.

aes256

Configures the AES algorithm with a block size of 256 bits—the strongest available version of AES.

Platforms

9.73 esp-ext-hdr

esp-ext-hdr

Syntax

esp-ext-hdr {**true** | **false**}

no esp-ext-hdr

Context

[Tree] (config>filter>ipv6-filter>entry>match esp-ext-hdr)

Full Context

configure filter ipv6-filter entry match esp-ext-hdr

Description

This command enables match on existence of ESP Extension Header in the IPv6 filter policy.

The **no** form of this command ignores ESP Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

Default

no esp-ext-hdr

Parameters

true

Matches a packet with an ESP Extension Header.

false

Matches a packet without an ESP Extension Header.

9.75 eth-tag

eth-tag

Syntax

eth-tag *tag-value*

no eth-tag

Context

[Tree] (config>service>epipe>bgp-evpn>remote-attachment-circuit eth-tag)

[Tree] (config>service>epipe>bgp-evpn>local-attachment-circuit eth-tag)

Full Context

configure service epipe bgp-evpn remote-attachment-circuit eth-tag

configure service epipe bgp-evpn local-attachment-circuit eth-tag

Description

This command configures the Ethernet tag value. When configured in the **local-attachment-circuit** context, the system uses the value in the advertised AD per-EVI route sent for the attachment circuit. When configured in the **remote-attachment-circuit** context the system compares that value with the eth-tag value of the imported AD per-EVI routes for the service. If there is a match, the system creates an EVPN destination for the Epipe.

Parameters

tag-value

Specifies the Ethernet tag value of the attachment circuit.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

9.76 ethernet

ethernet

Syntax

ethernet

Context

[Tree] (config>port ethernet)

Full Context

configure port ethernet

Description

This command the context to configure Ethernet port attributes.

This context can only be used when configuring Fast Ethernet, gigabit or 10-G Fast Ethernet or Ethernet LAN ports on an appropriate MDA.

Platforms

7705 SAR Gen 2

9.77 ethernet-ctag

ethernet-ctag

Syntax

[**no**] **ethernet-ctag**

Context

[Tree] (config>qos>sap-egress ethernet-ctag)

Full Context

configure qos sap-egress ethernet-ctag

Description

This command specifies that the top customer tag should be used for egress reclassification based on dot1p criteria. This command applies to all dot1p criteria configured in a given SAP egress QoS policy.

The **no** form of this command means that a service delimiting tag will be used for egress reclassification based on dot1p criteria.

Default

no ethernet-ctag

Platforms

7705 SAR Gen 2

9.78 etype

etype

Syntax

etype *etype-value*

no etype

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match etype)

Full Context

configure qos sap-ingress mac-criteria entry match etype

Description

Configures an Ethernet type II value to be used as a service ingress QoS policy match criterion.

The Ethernet type field is a 2-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap, or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The no form of this command removes the previously entered etype field as the match criteria.

Default

no etype

Parameters

etype-value

The Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

Values 0x0600 to 0xFFFF

Platforms

7705 SAR Gen 2

etype

Syntax

etype *0x0600xx0xffff*

no etype

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match etype)

Full Context

configure system security management-access-filter mac-filter entry match etype

Description

Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7705 SAR Gen 2 Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

The **no** form of this command removes the previously entered etype field as the match criteria.

Default

no etype

Parameters

ethernet-type

Specifies the Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

Values 0x0600 to 0xFFFF

Platforms

7705 SAR Gen 2

9.79 event

event

Syntax

event *event-type* [**create**]

no event *event-type*

Context

[Tree] (config>card>mda event)

Full Context

configure card mda event

Description

This command allows the user to control the action to be taken when a specific hardware error event is raised against the target MDA.

If no event action has been created for a specific event type, then the hardware errors related to that event type are ignored by the management plane of the router.

The log event raised for any event type (for example, soft-error, memory-error) is tmnxEqHwEventDetected.

The **no** form of this command clears any action defined for the event.

Parameters

event-type

Specifies the event type, up to 32 characters.

Values soft-error — Defines the action to be taken when soft errors are detected on the MDA

internal-frame-loss — System detected frame loss in the traffic transiting the MDA.

memory-error — Provides the user options to handle MDA memory error events on MDAs. This feature is supported on FP2- and FP3-based Ethernet MDAs and IMMs.

data-link-error — Provides the user options to handle datapath link errors on an MDA.

create

Keyword used to create an event.

Platforms

7705 SAR Gen 2

event

Syntax

[**no**] **event**

Syntax

[**no**] **event**

Context

[Tree] (debug>router>ip event)

Full Context

debug router ip event

Description

This command enables debugging for specific IP events.

The **no** form of this command disables debugging for the specified IP events.

Platforms

7705 SAR Gen 2

event

Syntax

event *rmon-event-id* [*event-type*] [**description** *description-string*] [**owner** *owner-string*]

no event *rmon-event-id*

Context

[Tree] (config>system>thresholds>rmon event)

Full Context

configure system thresholds rmon event

Description

The event command configures an entry in the RMON-MIB event table. The event command controls the generation and notification of threshold crossing events configured with the alarm command. When a threshold crossing event is triggered, the **rmon>event** configuration optionally specifies if an entry in the RMON-MIB log table should be created to record the occurrence of the event. It may also specify that an SNMP notification (trap) should be generated for the event. The RMON-MIB defines two notifications for threshold crossing events: Rising Alarm and Falling Alarm.

Creating an event entry in the RMON-MIB log table does not create a corresponding entry in the SR OS event logs. However, when the **event-type** is set to trap, the generation of a Rising Alarm or Falling Alarm notification creates an entry in the SR OS event logs and that is distributed to all the SR OS log destinations that are configured: CONSOLE, session, memory, file, syslog, or SNMP trap destination.

The SR OS logger message includes a rising or falling threshold crossing event indicator, the sample type (absolute or delta), the sampled value, the threshold value, the RMON-alarm-id, the associated RMON-event-id and the sampled SNMP object identifier.

Use the **no** form of this command to remove an rmon-event-id from the configuration.

Parameters

rmon-event-id

Specifies an identifier for this event. Alarm ID values above 65400 are used for dynamic system threshold commands and should be avoided.

Values 1 to 65535

rmon-event-type

Specifies the type of notification action to be taken when this event occurs.

Values **log** — An entry is made in the RMON-MIB log table for each event occurrence.

This does **not** create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

Default both

description-string

Specifies a user configurable string that can be used to identify the purpose of this event. This is an optional parameter and can be up to 80 characters long. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

owner-string

Specifies the owner string; the owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not normally be configured by CLI users and can be up 80 characters long.

Default TiMOS CLI

Configuration example:

```
event 5 rmon-event-type both description "alarm testing" owner "TiMOS CLI"
```

Platforms

7705 SAR Gen 2

event

Syntax

[**no**] **event** *application-id event-name-id*

Context

[Tree] (config>log>event-trigger event)

Full Context

configure log event-trigger event

Description

This command configures a specific log event as a trigger for one or more EHS handlers. Further matching criteria can be applied to only trigger certain handlers with certain instances of the log event.

The **no** form of this command removes the specified trigger event.

Parameters

application-id

Specifies the type of application that triggers the event.

Values adp, application_assurance, auto_prov, bfd, bgp, bier, bmp, calltrace, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm_oam, elmi, ering, eth_cfm, etun, filter, fpe, gsmp, gtp, igmp, igmp_snooping, ip, ipfix, ipsec, ipsec_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, maffilter, macsec, mcac, mcpath, mc_redundancy, mgmt_core, mirror, mld, mld_snooping, mpls, mpls_tp, mpls_lmgr, mrp, msdp, nat, nge, ntp, oam, open_flow, ospf, pcap, pcep, pfcp, pim, pim_snooping, port, pppoe, pppoe_clnt, profile, ptp, pxc, python, qos, radius, rib_api, rip, rip_ng, route_next_hop, route_policy, rpki, rsvp, satellite, security, sflow, snmp, sr_mpls, sr_policy, srv6, stp, subscr_mgmt, sub_host_trk, svcmgr, system, telemetry, tip, tls, tree_sid, user, user_db, video, vrrp, vrtr, wlan_gw, wpp

event-name-id

Specifies the name or numerical identifier of the event.

Values 0 to 4294967295 | *event-name*: 32 characters max

Platforms

7705 SAR Gen 2

9.80 event-control

event-control

Syntax

event-control *application-id* [*event-name* | *event-number*] [**generate**] [*severity-level*] [**throttle**] [**specific-throttle-rate** *events-limit* **interval** *seconds* | **disable-specific-throttle**] [**repeat** | **no-repeat**]

event-control *application-id* [*event-name* | *event-number*] **suppress**

no event-control *application-id* [*event-name* | *event-number*]

Context

[Tree] (config>log event-control)

Full Context

configure log event-control

Description

This command is used to specify that a particular event or all events associated with an application is either generated or suppressed.

Events are generated by an application and contain an event number and description explaining the cause of the event. Each event has a default designation which directs it to be generated or suppressed.

Events are generated with a default severity level that can be modified by using the *severity-level* option.

Events that are suppressed by default are typically used for debugging purposes. Events are suppressed at the time the application requests the event's generation. No event log entry is generated regardless of the destination. While this feature can save processor resources, there may be a negative effect on the ability to troubleshoot problems if the logging entries are squelched. In reverse, indiscriminate application may cause excessive overhead.

The rate of event generation can be throttled by using the **throttle** parameter.

The **no** form of this command reverts the parameters to the default setting for events for the application or a specific event within the application. The severity, generate, suppress, and throttle options will also be reset to the initial values.

Default

Each event has a set of default settings. To display a list of all events and the current configuration use the **event-control** command.

Parameters

application-id

The application whose events are affected by this event control filter.

Values A valid application name. Use the **show log applications** command to display a list of valid application names. Examples of valid applications are **bgp**, **chassis**, **efm_oam**, **filter**, **security**, **system**, and **vrrp**.

event-name

To generate, suppress, or revert to default for a single event, enter the specific event short name up to 32 characters. If no event name is specified, the command applies to all events in the application. To display a list of all event short names use the **event-control** command.

event-number

To generate, suppress, or revert to default for a single event, enter the specific number. If no event number is specified, the command applies to all events in the application.

Values 0 to 4294967295

generate

Specifies that logger event is created when this event occurs. The generate keyword can be used with two optional parameters, *severity-level* and **throttle**.

Default generate

severity-level

An ASCII string representing the severity level to associate with the specified generated events

Default The system-assigned severity name

Values cleared, indeterminate, critical, major, minor, warning

throttle

Specifies whether or not events of this type will be throttled. By default, event throttling is on for most event types.

suppress

This keyword indicates that the specified events will not be logged. If the **suppress** keyword is not specified then the events are generated by default. For example on the 7705 SAR Gen 2, **event-control bgp suppress** will suppress all BGP events. If a log event is a raising event for a Facility Alarm, and the associated Facility Alarm is raised, then changing the log event to **suppress** clears the associated Facility Alarm.

Default generate

specific-throttle-rate *events-limit*

The log event throttling rate can be configured independently for each log event using this keyword. This specific-throttle-rate overrides the globally configured throttle rate (**config**>**log**>**throttle-rate**) for the specific log event.

Values 1 to 20000

interval *seconds*

Specifies the number of seconds that the specific throttling intervals lasts.

Values 1 to 1200

disable-specific-throttle

Specifies to disable the **specific-throttle-rate**.

repeat

Specifies that the log event should be repeated every minute until the underlying condition is cleared. Only supported for the following log events: BGP tBgpMaxNgPfxLmtThresholdReached and PORT tmnxEqPortEtherCrcAlarm (for **degrade** threshold only)

Platforms

7705 SAR Gen 2

9.81 event-damping

event-damping

Syntax

[**no**] **event-damping**

Context

[Tree] (config>log event-damping)

Full Context

configure log event-damping

Description

This command allows the user to set the event damping algorithm to suppress QoS or filter change events.

The **no** form of this command removes the event damping algorithm.

Note:
While this event damping is original behavior for some modules such as service manager, QoS, and filters, it can result in the NMS system database being out of sync because of missed change events. On the other hand, if the damping is disabled (**no event-damping**), it may take much longer to **exec** a large CLI configuration file after system bootup.

Platforms

7705 SAR Gen 2

9.82 event-handler

event-handler

Syntax

event-handler *event-handler*

no event-handler

Context

[Tree] (config>log>event-trigger>event>trigger-entry event-handler)

Full Context

configure log event-trigger event trigger-entry event-handler

Description

This command configures the event handler to be used for this trigger entry.

The **no** form of this command removes the event handler configuration.

Parameters

event-handler

Specifies the name of the event handler, up to 32 characters.

Platforms

7705 SAR Gen 2

event-handler

Syntax

event-handler

Context

[Tree] (config>system>security>cli-script>authorization event-handler)

Full Context

configure system security cli-script authorization event-handler

Description

Commands in this context configure authorization for the Event Handling System (EHS). EHS allows user-controlled programmatic exception handling by allowing a CLI script to be executed upon the detection of a log event.

Platforms
7705 SAR Gen 2

9.83 event-handling

event-handling

Syntax
event-handling

Context
[Tree] (config>log event-handling)

Full Context
configure log event-handling

Description
Commands in this context configure event handling within the Event Handler System (EHS).

9.86 event-type

event-type

Syntax
[**no**] **event-type** {**arp** | **config-change** | **oper-status-change** | **neighbor-discovery**}

Context
[Tree] (debug>service>id>sap event-type)

Full Context
debug service id sap event-type

Description
This command enables a particular debugging event type.

The **no** form of this command disables the event type debugging.

Parameters

arp

Displays ARP events.

config-change

Debugs configuration change events.

oper-status-change

Debugs service operational status changes.

neighbor-discovery

Displays the status of IPv6 neighbor discovery for the sap or the spoke-sdp.

Platforms

7705 SAR Gen 2

Output

The following output is an example of event-type information.

Output Example

```
A:bksim180# debug service id 1000 sap 1/7/1 event-type arp
DEBUG OUTPUT show on CLI is as follows:

Full Context

debug service id sdp event-type

Description

This command enables a particular debugging event type.

The **no** form of this command disables the event type debugging.

Parameters

config-change

Debugs configuration change events.

oper-status-change

Debugs service operational status changes.

neighbor-discovery

Displays the status of IPv6 neighbor discovery for the sap or the spoke-sdp.

control-channel-status

Debugs control channel status events.

Platforms

7705 SAR Gen 2

event-type

Syntax

events

Syntax

events [**neighbor** *ip-address* | **group** *name*]

no events

Context

[Tree] (debug>router>bgp events)

Full Context

debug router bgp events

Description

This command logs all events changing the state of a BGP peer.

The **no** form of this command disables the debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

7705 SAR Gen 2

events

Syntax

[**no**] **events** [**neighbor** *ip-int-name* | *ip-addr*]

Context

[Tree] (debug>router>rip events)

Full Context

debug router rip events

Description

This command enables debugging for RIP events.

Parameters

ip-int-name* | *ip-address

Debugs the RIP events sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

9.88 evi

evi

Syntax

evi *value*

no evi

Context

[Tree] (config>service>vpls>bgp-evpn evi)

[Tree] (config>service>epipe>bgp-evpn evi)

Full Context

configure service vpls bgp-evpn evi

configure service epipe bgp-evpn evi

Description

This command allows the configuration of a 2-byte EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers.

If not specified, the value is zero and no route distinguisher or route targets are auto-derived from it. If the *evi* value is specified and no other **route-distinguisher** or **route-target** is configured in the service, the following rules apply:

- the route distinguisher is derived from <system_ip>:evi
- the route target is derived from <autonomous-system>:evi

If VSI import and export policies are configured, the route target must be configured in the policies and those values take preference over the auto-derived route targets. If **bgp-ad>vpls-id** and **bgp-evpn>evi** are both configured on the same service, the VPLS ID auto-derived route target or route distinguisher takes precedence over the values auto-derived from the EVI. The operational route target for a service is displayed in the **show service id bgp** command.

The **no** form of this command sets the EVI value back to zero.

Parameters

value

Specifies the EVPN instance.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

evi

Syntax

evi *value*

no evi

Context

[Tree] (config>service>vprn>bgp-evpn>mpls evi)

Full Context

configure service vprn bgp-evpn mpls evi

Description

This command configures a 2-byte EVPN instance (EVI) unique in the system.

The router uses the EVI to identify the BGP EVPN instance in a VPRN (for the EVPN-IFL model) or an R-VPLS (for the EVPN-IFF model) that is associated with the Layer 3 Ethernet Segment (ES), for the purpose of IP Aliasing. This configuration is required on the PEs attached to the ES as well as on the remote PEs that need to create ES destinations to the multihoming Layer 3 ES.

The **no** form of this command removes the EVI value.

Default

no evi

Parameters

value

Specifies the EVPN instance.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

9.89 evi-three-byte-auto-rt

evi-three-byte-auto-rt

Syntax

Context

[Tree] (config>service>vpls>bgp-evpn>mpls evi-three-byte-auto-rt)

[Tree] (config>service>epipe>bgp-evpn>mpls evi-three-byte-auto-rt)

Full Context

configure service vpls bgp-evpn mpls evi-three-byte-auto-rt

configure service epipe bgp-evpn mpls evi-three-byte-auto-rt

Description

This command specifies that the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID).

Where:

- Global Administrator — is the configured 2-octet AS Number. If the configured ASN exceeds the 2 byte limit, the low order 16-bit value will be taken.
- A=0 (for auto-derivation)
- Type=4 (EVI-based route target)
- D-ID= [1..2] — encodes the BGP instance. This allows the auto-derivation of different route targets in multi-instance services. The value is inherited from the corresponding BGP instance.
- Service ID= 3-octet EVI

The **no** form of this command disallows the derivation of the route target.

Default

no evi-three-byte-auto-rt

Platforms

7705 SAR Gen 2

[Tree] (config>router>bgp>group>neighbor>add-paths evpn)

Full Context

configure router bgp group add-paths evpn

configure router bgp add-paths evpn

configure router bgp group neighbor add-paths evpn

Description

This command configures the Add-Paths capability for EVPN routes.

The **no** form of this command disables Add-Paths support for EVPN routes. This causes sessions that are established using Add-Paths for EVPN to go down and come back up without the Add-Paths capability.

Default

no evpn

Parameters

send-limit

Specifies the maximum number of EVPN paths to send.

Values 1 to 16, none, multipaths

receive

Keyword used to allow multiple EVPN paths per prefix from a peer.

none

Keyword used to specify that the router does not negotiate to receive multiple unlabeled unicast routes per EVPN prefix.

Platforms

7705 SAR Gen 2

9.91 evpn-etree-leaf-label

evpn-etree-leaf-label

Syntax

evpn-etree-leaf-label [[*32..524256*]]

no evpn-etree-leaf-label

Context

[Tree] (config>service>system>bgp-evpn evpn-etree-leaf-label)

Full Context

configure service system bgp-evpn evpn-etree-leaf-label

Description

This command enables EVPN Ethernet-Tree (E-Tree) VPLS services on the router (not B-VPLS). It allocates an E-Tree leaf label for the Provider Edge (PE) device and configures the ILM entry.

The command ensures that in-flight traffic can perform an ILM entry lookup at any time, and avoid the discards during **shutdown** or **no shutdown** services (or at least reduce the timing window so that it does not occur during normal operation or configuration).

The E-Tree leaf label can optionally be statically configured with a value. The label value must be in the static label range of the system.

Note:
The **evpn-etree-leaf-label** command must be configured to execute **bgp-evpn mpls no shutdown**.

The **no** form of this command removes the value from the configuration.

Default

no evpn-etree-leaf-label

Parameters

32..524256

Specifies the E-Tree leaf label

Values 32 to 524256

Platforms
7705 SAR Gen 2

evpn-mpls

Syntax
[**no**] **evpn-mpls**

Context
[Tree] (debug>service>id>igmp-snooping evpn-mpls)

Full Context
debug service id igmp-snooping evpn-mpls

Description

This command shows IGMP packets for EVPN-MPLS destinations. The **no** form of this command disables the debugging for EVPN-MPLS destinations

Platforms

7705 SAR Gen 2

9.94 evpn-nd-advertise

evpn-nd-advertise

Syntax

evpn-nd-advertise {**host** | **router** | **router-host**}

Context

[Tree] (config>service>vpls>proxy-nd evpn-nd-advertise)

Full Context

configure service vpls proxy-nd evpn-nd-advertise

Description

This command enables the advertisement of static or dynamic entries that are learned as host, router, or host and router, (only one option is possible in a specified service). It also determines the R flag (host or router) when sending Neighbor Advertisement (NA) messages for existing EVPN entries in the proxy-ND table.

The **router-host** command option is only possible when the ARP/ND extended community is advertised along with the MAC/IP routes. It determines that both host and router (dynamic and static) entries are advertised in MAC/IP routes, with an indication whether the entry is host or router in the R flag. These EVPN entries are installed as host or router entries depending on the R flag of the route, and NA messages for them are sent with the proper host or router indication.

To modify this command you must shutdown the proxy ND.

```
configure service vpls proxy-nd shutdown
```

Default

evpn-nd-advertise router

Parameters

host

Enables the advertisement of static or dynamic entries that are learned as host.

router

Enables the advertisement of static or dynamic entries that are learned as routers.

router-host

Enables the advertisement of static or dynamic entries that are learned as router or host.

Platforms

7705 SAR Gen 2

9.95 evpn-route-tag

evpn-route-tag

Syntax

evpn-route-tag *tag*

no evpn-route-tag

Context

[Tree] (config>service>vpls>proxy-arp evpn-route-tag)

[Tree] (config>service>vpls>proxy-nd evpn-route-tag)

Full Context

configure service vpls proxy-arp evpn-route-tag

configure service vpls proxy-nd evpn-route-tag

Description

This command configures a local route tag that can be used on export policies to match MAC/IP routes generated by the proxy-ARP or proxy-ND module. For example, if a new active dynamic proxy-ARP entry is added to the proxy-ARP table and **evpn-route-tag** is 10, an export policy that matches on tag 10 and adds a site-of-origin community SOO-1, allows the router to advertise the MAC/IP route for the proxy-ARP entry with community SOO-1.

The **no** form of this command removes the route tag for the generated EVPN MAC/IP routes.

Parameters

tag

Specifies the route tag, in either decimal or hexadecimal form.

Values 1 to 255

Platforms

7705 SAR Gen 2

9.96 evpn-tunnel

evpn-tunnel

Syntax

evpn-tunnel [**ipv6-gateway-address** {**ip** | **mac**}] [**supplementary-broadcast-domain**]

no evpn-tunnel

Context

[Tree] (config>service>vprn>if>vpls evpn-tunnel)

Full Context

configure service vprn interface vpls evpn-tunnel

Description

This command sets the evpn-tunnel mode for the attached R-VPLS. When enabled for an IPv4 interface, no IPv4 address is required under the same interface. When enabled on an IPv6 interface, the **ipv6-gateway-address** parameter can be configured as **ip** or **mac**.

When configured as **evpn-tunnel ipv6-gateway-address ip** or simply **evpn-tunnel**, then:

- on transmission, the router populates the GW IP field of the route type 5 with a Link-Local-Address (LLA) if an explicit global IPv6 address is not configured. Otherwise, the configured IPv6 address is used.
- on reception of routes type 5 for IPv6 prefixes, only routes with non-zero GW IP are processed; the rest of the routes will be **treated-as-withdraw**.

When configured as **evpn-tunnel ipv6-gateway-address mac,** then:

- on transmission, the router sends routes type 5 with zero GW IP field, and a MAC extended community of the router, containing the VPRN interface MAC.
- on reception of IPv6 prefix routes, only routes with zero GW IP and non-zero router's MAC are processed; the rest of the routes will be **treated-as-withdraw**.

The **supplementary-broadcast-domain** option instructs the data path to exclude EVPN destinations in the Layer 3 lookup for packets coming from an RVPLS SAP and configures the entire set of VPRN as well as attached RVPLS services in OISM mode. Only one SBD RVPLS can exist in a given VPRN. In order to add or remove the **supplementary-broadcast-domain** option, the entire **evpn-tunnel** command must first be removed.

The configuration of **evpn-tunnel** without options is equivalent to the **ipv6-gateway-address ip** option.

The **no** form of this command disables the evpn-tunnel mode.

Default

no evpn-tunnel

Parameters

ipv6-gateway-address

Indicates whether the IPv6 Prefix route uses a GW IP or a GW MAC as gateway.

Values **ip, mac**

supplementary-broadcast-domain

Specifies to use the EVPN tunnel as a Supplementary Broadcast Domain (SBD). The SBD is used in EVPN OISM to advertise the SMET routes and receive the multicast traffic on egress PEs that are not attached to the source R-VPLS service.

Platforms

7705 SAR Gen 2

9.97 evpn-type

evpn-type

Syntax

evpn-type *type*

no evpn-type

Context

[Tree] (config>router>policy-options>policy-statement>entry>from evpn-type)

Full Context

configure router policy-options policy-statement entry from evpn-type

Description

This command matches BGP routes based on the EVPN route type. The route types supported in SR OS are the following:

- Type 1 or Auto-Discovery Ethernet Tag route, including both the AD per-ES and AD per-EVI routes Type 2 or MAC/IP route
- Type 2 or MAC/IP route
- Type 3 or IMET route, including Multicast Ethernet Tag
- Type 4 or ES (Ethernet Segment) route Type 5 of IP-prefix route, including IPv4 and IPv6 prefixes
- Type 6 or Selective Multicast Ethernet Tag route, including IPv4 and IPv6 multicast groups
- Type 7 or Multicast Join Synch route, including IPv4 and IPv6 multicast group
- Type 8 or Multicast Leave Synch route, including IPv4 and IPv6 multicast groups

The **no** form of this command removes the **evpn-type** matching.

Parameters

name

Specifies the EVPN route type.

Values 1 to 8

Platforms

7705 SAR Gen 2

9.99 exceed-action

exceed-action

Syntax

exceed-action {**discard** | **low-priority** | **none**}

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>local-monitoring-policer exceed-action)

Full Context

configure system security dist-cpu-protection policy local-monitoring-policer exceed-action

Description

This command controls the action performed upon the extracted control packets when the configured policer rates are exceeded.

Default

exceed-action none

Parameters

discard

Discards packets that are nonconforming.

low-priority

Marks packets that are nonconforming as low-priority (discard eligible or out-profile). If there is congestion in the control plane of the SR OS then unmarked (green, hi-prio or in-profile) control packets are given preferential treatment.

none

no hold-down

Platforms

7705 SAR Gen 2

exceed-action

Syntax

exceed-action {**discard** [**hold-down** *seconds*] | **low-priority** [**hold-down** *seconds*] | **none**}

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters exceed-action)

Full Context

configure system security dist-cpu-protection policy static-policer exceed-action

configure system security dist-cpu-protection policy protocol dynamic-parameters exceed-action

Description

This command controls the action performed upon the extracted control packets when the configured policer rates are exceeded.

Default

exceed-action none

Parameters

discard

Discards packets that are nonconforming.

low-priority

Marks packets that are nonconforming as low-priority (for example, discard eligible or out-profile). If there is congestion in the control plane of the SR OS then unmarked (for example, green, hi-prio or in-profile) control packets are given preferential treatment.

hold-down *seconds*

When this optional parameter is specified, it causes the following "hold-down" behavior.

When the SR OS software detects that an enforcement policer has marked or discarded one or more packets (software may detect this some time after the packets are actually discarded), and an optional **hold-down** *seconds* value has been specified for the **exceed-action**, then the policer will be set into a "mark-all" or "drop-all" mode that cause the following:

- the policer state to be updated as normal
- all packets to be marked (if the action is "low-priority") or dropped (action = discard) regardless of the results of the policing decisions/actions/state.

The **hold-down** is cleared after approximately the configured time in seconds after it was set. The **hold-down** *seconds* option should be selected for protocols that receive more than one packet in a complete handshake/negotiation (for example, DHCP, PPP). **hold-down** is not applicable to a local monitoring policer. The "detection-time" will only start after any **hold-down** is complete. During the **hold-down** (and the detection-time), the policer

is considered as in an "exceed" state. The policer may re-enter the hold-down state if an exceed packet is detected during the detection-time countdown.

Configuring the **indefinite** parameter value will cause hold down to remain in place until the operator clears it manually using a tools command (**tools perform security dist-cpu-protection release-hold-down**) or removes the dist-cpu-protection policy from the object.

Configuring the **none** parameter value will disable hold down.

Values 1 to 10080, indefinite, none

9.107 exclude

exclude

Syntax

exclude

Context

[Tree] (config>service>vprn>isis>loopfree-alternates exclude)

Full Context

configure service vprn isis loopfree-alternates exclude

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The user can exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless of whether the user has explicitly added the statement "default-action reject" to the prefix policy, a prefix that does not match any entry in the policy is accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default

no exclude

[Tree] (config>service>vprn>ospf>loopfree-alternates exclude)

Full Context

configure service vprn ospf3 loopfree-alternates exclude

configure service vprn ospf loopfree-alternates exclude

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

[Tree] (config>router>mpls>lsp-template exclude)

Full Context

configure router mpls lsp exclude

configure router mpls lsp secondary exclude

configure router mpls lsp primary exclude

configure router mpls lsp-template exclude

Description

This command specifies the admin groups to be excluded when an LSP is set up. Up to five groups per operation can be specified, up to 32 maximum. The admin groups are defined in the **config>router>if-attribute>admin-group** context.

Use the **no** form of this command to remove the exclude command.

Default

no exclude

Parameters

group-name

Specifies the existing group-name to be excluded when an LSP is set up.

Platforms

7705 SAR Gen 2

exclude

Syntax

[**no**] **exclude** *tag*

Context

[Tree] (config>router>admin-tags>route-admin-tag-policy exclude)

9.108 exclude-addresses

exclude-addresses

Syntax

[**no**] **exclude-addresses** *start-ip-address* [*end-ip-address*]

Context

[Tree] (config>service>vprn>dhcp>server>pool>subnet exclude-addresses)

[Tree] (config>router>dhcp>server>pool>subnet exclude-addresses)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet exclude-addresses

configure router dhcp local-dhcp-server pool subnet exclude-addresses

Description

This command specifies a range of IP addresses that excluded from the pool of IP addresses in this subnet.

The **no** form of the removes the parameters from the configuration.

Parameters

start-ip-address

Specifies the start address of this range to exclude. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

end-ip-address

Specifies the end address of this range to exclude. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

7705 SAR Gen 2

9.109 exclude-from-avg

exclude-from-avg

Syntax

exclude-from-avg {**forward** | **backward** | **round-trip**} **bins** *bin-numbers*

no exclude-from-avg (**forward** | **backward** | **round-trip**}

Context

[Tree] (config>oam-pm>bin-group>bin-type exclude-from-avg)

Full Context

configure oam-pm bin-group bin-type exclude-from-avg

Description

This optional command allows the results from probes that map to the specified bins within the bin type to be excluded from the average calculation. Individual counters are incremented in the bin, but the average is not affected by the value of the excluded delay metric for the individual probes in this bin. The bin group does not allow this command to be added, modified, or deleted when a test is actively referencing the bin group. Sessions that reference the bin group must have the bin group and tests shut down before changes can be made.

The **no** form of this command removes the exclusion, and all bins are included in the average calculation.

Default

no exclude-from-avg forward

no exclude-from-avg backward

no exclude-from-avg round-trip

Parameters

forward

Specifies the forward direction bin.

backward

Specifies the backward direction bin.

round-trip

Specifies the round-trip direction bin.

bin-numbers

Specifies the bin numbers to be excluded from the average calculation. The values typically represent, but are not restricted to, the highest and lowest configured bins in order to eliminate outlying results that are not representative of network performance.

A hyphen can be entered between bin numbers to include a continuous sequence of bins; for example, entering 7-9 would specify bins 7, 8, and 9. Commas can be entered between bin numbers to include separate or non-continuous bins; for example, entering 0,8,9 would specify bins 0, 8, and 9. Both hyphens and commas can be used in this manner in the same configuration; for example, entering 0,7-9 would include bins 0, 7, 8, and 9. All bin numbers specified as part of this command must be configured. If a specified bin does not exist, the command fails.

Values 0 to 9

Platforms

7705 SAR Gen 2

9.110 exclude-group

exclude-group

Syntax

[**no**] **exclude-group** *ip-admin-group-name*

Context

[Tree] (config>router>route-next-hop-policy>template exclude-group)

Full Context

configure router route-next-hop-policy template exclude-group

Description

This command configures the admin group constraint into the route next-hop policy template.

Each group is entered individually. The **include-group** statement instructs the LFA SPF selection algorithm to pick up a subset of LFA next-hops among the links that belong to one or more of the specified admin groups. A link that does not belong to at least one of the admin-groups is excluded. However, a link can still be selected if it belongs to one of the groups in an include-group statement but also belongs to other groups that are not part of any include-group statement in the route next-hop policy.

The **pref** option is used to provide a relative preference for the admin group to select. A lower preference value means that LFA SPF will first attempt to select an LFA backup next-hop that is a member of the corresponding admin group. If none is found, then the admin group with the next highest preference value is evaluated. If no preference is configured for a given admin group name, then it is supposed to be the least preferred, that is, numerically the highest preference value.

When evaluating multiple **include-group** statements within the same preference, any link that belongs to one or more of the included admin groups can be selected as an LFA next-hop. There is no relative preference based on how many of those included admin groups the link is a member of.

The **exclude-group** statement simply prunes all links belonging to the specified admin group before making the LFA backup next-hop selection for a prefix.

If the same group name is part of both include and exclude statements, the exclude statement will win. It other words, the exclude statement can be viewed as having an implicit preference value of zero (0).

The admin-group criteria are applied before running the LFA next-hop selection algorithm.

The **no** form deletes the admin group constraint from the route next-hop policy template.

Parameters

ip-admin-group-name

Specifies the name of the group, up to 32 characters.

Platforms

7705 SAR Gen 2

9.111 exclude-mac-policy

exclude-mac-policy

Syntax

exclude-mac-policy *mac-policy-id*

no exclude-mac-policy

Context

[Tree] (config>port>ethernet>dot1x>macsec exclude-mac-policy)

Full Context

configure port ethernet dot1x macsec exclude-mac-policy

Description

This command specifies the MAC policy to be excluded from MACsec encryption.

The **no** form of this command removes the policy from the MACsec and allows all destination MAC addresses.

Default

no exclude-mac-policy

Parameters

mac-policy-id

Specifies the MAC policy to exclude from the configuration.

Values 0 to 4294967295

Platforms

7705 SAR Gen 2

9.112 exclude-node

exclude-node

Syntax

exclude-node *ip-address*

no exclude-node

Context

[Tree] (config>router>mpls>lsp exclude-node)

Full Context

configure router mpls lsp exclude-node

Description

This command enables the option to include XRO object in the bypass LSP PATH message object. The exclude-node option is required for manual bypass LSP with XRO to FRR protect ABR node in a multi-vendor network deployment. This command must be configured on the PLR node that protects the ABR node. The ABR node IP address must be configured as exclude-node.

Default

no exclude-node

Platforms

7705 SAR Gen 2

9.113 exclude-prefix

exclude-prefix

Syntax

[**no**] **exclude-prefix** *ipv6-prefix/prefix-length*

Context

[Tree] (config>service>vprn>dhcp6>server>pool exclude-prefix)

[Tree] (config>router>dhcp6>server>pool exclude-prefix)

Full Context

configure service vprn dhcp6 local-dhcp-server pool exclude-prefix

configure router dhcp6 local-dhcp-server pool exclude-prefix

Description

This command defines a prefix that to be excluded from available prefix in the pool for DHCP6. The typical use case is to exclude the interface address.

- A held lease is deleted if it got excluded by an exclude prefix.
- An exclude range can never exclude only a part of an existing lease. If for example a /63 PD is assigned, an exclude of /64 which belongs to this /63 cannot be configured.
- A single exclude prefix can never exclude a whole include prefix.
- When applying or removing an exclude prefix, the threshold stats are adjusted to reflect the actual address space and its usage.

The **no** form of this command removes the prefix that is to be excluded from available prefix in the pool.

Parameters

ipv6-prefix/prefix-length

Specifies an IPv6 prefix and prefix length.

Values

ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x - [0 to FFFF]H	
	d - [0 to 255]D	
prefix-length	0 to 128	

Platforms

7705 SAR Gen 2

9.114 exclude-protocol

exclude-protocol

Syntax

[**no**] **exclude-protocol** {*protocol-name*}

Context

[Tree] (config>port>ethernet>dot1x>macsec exclude-protocol)

Full Context

configure port ethernet dot1x macsec exclude-protocol

Description

Specifies protocols whose packets are not secured using Media Access Control Security (MACsec) when MACsec is enabled on a port.

When this option is enabled in a connectivity association that is attached to an interface, MACsec is not enabled for all packets of the specified protocols that are sent and received on the link.

When this option is enabled on a port where MACsec is configured, packets of the specified protocols are sent and accepted in cleartext.

The **no** form of this command secures the packets of the specified protocol.

Default

no exclude-protocol

Parameters

protocol-name

Specifies the protocol name.

Values **cdp**, **lacp**, **lldp**, **eapol-start**, **efm-oam**, **eth-cfm**, **ptp**, **ubfd**

Platforms

7705 SAR Gen 2

9.115 exclusive-lock-time

exclusive-lock-time

Syntax

exclusive-lock-time *seconds*

no exclusive-lock

Context

[Tree] (config>router>policy-options exclusive-lock-time)

Full Context

configure router policy-options exclusive-lock-time

Description

This command specifies the inactivity timer for the exclusive lock time for policy editing. When a session is idle for greater than this time, the lock is removed and the configuration changes is aborted.

Default

exclusive-lock-time 300

Parameters

seconds

Specifies the duration the session with exclusive lock may be inactive.

Values Values: 1 to 3600

Platforms

7705 SAR Gen 2

9.116 exec

exec

Syntax

exec [**-echo**] [**-syntax**] {*file-name* | *eof-marker-string*} [**-argument** [*256 chars max*] [[*256 chars max*]]

Context

[Tree] (exec)

Full Context

exec

Description

This command executes the contents of a text file as if they were CLI commands entered at the console.

exec commands do not have **no** versions.

Related Commands:

boot-bad-exec: Use this command to configure a URL for a CLI script to exec following a failed configuration boot.

boot-good-exec: Use this command to configure a URL for a CLI script to exec following a successful configuration boot.

stdin can be used as the source of commands for the **exec** command. When **stdin** is used as the **exec** command input, the command list is terminated with <Ctrl-C>, "EOF<Return>" or "*eof_string*<Return>".

If an error occurs entering an exec file sourced from stdin, all commands after the command returning the error will be silently ignored. The **exec** command will indicate the command error line number when the stdin input is terminated with an end-of-file input.

Example:

Assume the *test.cfg* file has the following commands:

echo $(1)

echo $(2)

echo $(3)

Enter the following command:

exec test.cfg –arguments 10 20 30

The output from this command will be:

```
10
20
30
```

Parameters

-echo

Echoes the contents of the **exec** file to the session screen as it executes.

Default echo disabled

-syntax

Performs a syntax check of the file without executing the commands. Syntax checking will be able to find invalid commands and keywords, but it will not be able to validate erroneous user- supplied parameters.

Default execute file commands

file-name

Specifies the text file with CLI commands to execute, up to 256 characters.

eof-marker-string

Specifies the ASCII printable string used to indicate the end of the exec file when stdin is used as the exec file source. <Ctrl-C> and "EOF" can always be used to terminate an exec file sourced from stdin up to 254 characters.

Default EOF

-argument

Specifies up to five arguments, each up to 256 characters.

Platforms

7705 SAR Gen 2

9.117 exit

exit

Syntax

exit [**all**]

Context

[Tree] (exit)

Full Context

exit

Description

This command returns to the context from which the current level was entered. For example, to navigate to the current level on a context by context basis, then the **exit** command only moves the cursor back one level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1>config>router# exit
A:ALA-1>config# exit
```

When navigating to the current level by entering a command string, the **exit** command returns the cursor to the context in which the command was initially entered.

```
A:ALA-1# configure router ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1#
```

The **exit all** command moves the cursor all the way back to the root level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit all
A:ALA-1#
```

Parameters

all

Exits back to the root CLI context.

Platforms

7705 SAR Gen 2

9.118 expire-time

expire-time

Syntax

expire-time {*seconds* | **forever**}

Context

[Tree] (config>system>script-control>script-policy expire-time)

Full Context

configure system script-control script-policy expire-time

Description

This command is used to configure the maximum amount of time to keep the run history status entry from a script run.

Default

expire-time 3600

Parameters

seconds

Specifies the time to keep the run history status entry, in seconds.

Values 0 to 21474836

Default 3600 (1 hour)

forever

Specifies to keep the run history status entry indefinitely.

Platforms

7705 SAR Gen 2

9.119 exponential-backoff

exponential-backoff

Syntax

[**no**] **exponential-backoff**

Context

[Tree] (config>system>login-control exponential-backoff)

Full Context

configure system login-control exponential-backoff

Description

This command enables the exponential-backoff of the login prompt. The exponential-backoff command is used to deter dictionary attacks, when a malicious user can gain access to the CLI by using a script to try **admin** with any conceivable password.

The **no** form of this command disables exponential-backoff.

Default

no exponential-backoff

Platforms

7705 SAR Gen 2

9.120 exponential-backoff-retry

exponential-backoff-retry

Syntax

exponential-backoff-retry

no exponential-backoff-retry

Context

[Tree] (config>router>mpls exponential-backoff-retry)

Full Context

configure router mpls exponential-backoff-retry

Description

This command enables the use of an exponential back-off timer when re-trying an LSP. When an LSP path establishment attempt fails, the path is put into retry procedures and a new attempt will be performed at the expiry of the user-configurable retry timer (config>router>mpls>lsp>retry-timer). By default, the retry time is constant for every attempt. The exponential back-off timer procedures will double the value of the user configured retry timer value at every failure of the attempt to adjust to the potential network congestion that caused the failure. An LSP establishment fails if no Resv message was received and the Path message retry timer expired or a PathErr message was received before the timer expired.

[Tree] (config>service>vprn>bgp export)

Full Context

configure service vprn bgp group neighbor export

configure service vprn bgp group export

configure service vprn bgp export

Description

This command is used to specify route policies that control how outbound routes transmitted to certain peers are handled. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in a peer-group) or neighbor level (only applies to the specified peer). The most specific level is used.

The **export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **export** commands are issued, the last command entered overrides the previous command.

When an export policy is not specified, BGP-learned routes are advertised by default; non-BGP routes are not advertised.

The **no** form of this command removes the policy association.

Default

no export

Parameters

plcy-or-long-expr

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

plcy-or-expr

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

export

Syntax

[**no**] **export** *policy-name* [*policy-name* **...up to 5 max**]

Context

[Tree] (config>service>vprn>isis export)

Full Context

configure service vprn isis export

Description

This command configures export routing policies that determine the routes exported from the routing table to IS-IS.

If no export policy is defined, non IS-IS routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of this command removes the specified *policy-name* or all policies from the configuration if no *policy-name* is specified.

Default

no export — No export policy name is specified.

Parameters

policy-name

The export policy name. Up to five *policy-name* arguments can be specified.

configure service vprn rip export

Description

This command specifies the export route policies used to determine routes that are exported to RIP. If no export policy is specified, non-RIP routes will not be exported from the routing table manager to RIP; RIP-learned routes will be exported to RIP neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

Default

no export

Parameters

policy-name

The export route policy name. Allowed values are any string up to 32 characters in length and composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the string must be enclosed between double quotes. The specified names must already be defined.

Platforms

7705 SAR Gen 2

export

Syntax

export *policy-name* [*policy-name*]

no export

Context

[Tree] (config>router>ldp export)

Full Context

configure router ldp export

Description

This command specifies the export route policies used to determine which routes are exported to LDP. Policies are configured in the **config>router>policy-options** context.

If no export policy is specified, non-LDP routes will not be exported from the routing table manager to LDP. LDP-learned routes will be exported to LDP neighbors. Present implementation of export policy (outbound filtering) can be used "only" to add FECs for label propagation. The export policy does not control propagation of FECs that an LSR receives from its neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of 5 policy names can be specified.

The **no** form of this command removes all policies from the configuration.

Default

no export — No export route policies specified.

Parameters

policy-name

Specifies up to five export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

[Tree] (config>router>bgp>group>neighbor export)

[Tree] (config>router>bgp export)

Full Context

configure router bgp group export

configure router bgp group neighbor export

configure router bgp export

Description

This command specifies route policies that control the handling of outbound routes transmitted to all peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level is used.

The export command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters; the remaining 14 objects have a maximum length of 64 characters each.

When multiple export commands are issued, the last command entered overrides the previous command.

When an export policy is not specified, BGP-learned routes are advertised by default and non-BGP routes are not advertised.

The **no** form of this command removes the policy association.

Default

no export

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters long). Allowed values are any string up to 255 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

plcy-or-expr

Specifies up to 14 route policy names (up to 64 characters each) or a policy logical expression (up to 64 characters long). Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

export

Syntax

[**no**] **export** *policy-name* [*policy-name*]

Context

[Tree] (config>router>isis export)

Full Context

configure router isis export

Description

This command configures export routing policies that determine the routes exported from the routing table to IS-IS.

If no export policy is defined, non IS-IS routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of this command removes the specified *policy-name* or all policies from the configuration if no *policy-name* is specified.

Parameters

policy-name

Specifies up to five export policy names.

Platforms

7705 SAR Gen 2

export

Syntax

export *policy-name* [*policy-name*]

no export

Context

[Tree] (config>router>ospf3 export)

[Tree] (config>router>ospf export)

Full Context

configure router ospf3 export

configure router ospf export

Description

This command associates export route policies to determine which routes are exported from the route table to OSPF. Export polices are only in effect if OSPF is configured as an ASBR.

If no export policy is specified, non-OSPF routes are not exported from the routing table manager to OSPF.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

Default

no export

Parameters

policy-name

Specifies up to 5 export route policy names. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. The specified names must already be defined.

export

Syntax

[**no**] **export**

Context

[Tree] (config>service>vprn>bgp-ipvpn>attribute-set export)

Full Context

configure service vprn bgp-ipvpn attribute-set export

Description

This command configures the router to add an ATTR_SET path attribute to all VPN-IP routes that come from the VRF export of BGP routes advertised by PE-CE peers of the VPRN. This attribute contains an exact copy of all BGP path attributes (post-import policy) of the PE-CE BGP route, excluding the NEXT_HOP, MP_REACH, and MP_UNREACH attributes, as well as the AS4_PATH or AS4_AGGREGATOR attributes. The origin AS in the ATTR_SET encodes the ASN (or confederation ID, if configured) of the exporting VPRN service. Neither the VRF export policy nor a regular BGP export policy is allowed to modify the contents of the ATTR_SET.

The **no** form of this command configures the router to not add an ATTR_SET path attribute to VPN-IP routes exported by the VPRN. Nokia recommends using the **no** form of this command, unless there is a requirement for the VPRN to deliver an independent domain Layer 3 VPN service.

Default

no export

7705 SAR Gen 2

9.124 export-inactive-bgp

export-inactive-bgp

Syntax

[**no**] **export-inactive-bgp**

Context

[Tree] (config>service>vprn export-inactive-bgp)

Full Context

configure service vprn export-inactive-bgp

Description

This command allows the preferred BGP route learned by a VPRN to be exported as the VPN route, even when if it is inactive in the route table because a preferred BGP VPRN route from another PE is present. This overrides the default state in which the VPRN cannot export an inactive BGP route.

For the BGP route to be exported, the VRF export policy must accept it.

This command applies to both MPLS VPN and SRv6 VPN routes. In SRv6 VPN routes the advertised instruction is an End.DT, while in MPLS VPN routes the advertised label is a per-next-hop label.

This "best-external" type of route advertisement is useful in active/standby multi-homing scenarios because it ensures that all PEs know about the backup path provided by the standby PE.

Default

no export-inactive-bgp

Platforms

7705 SAR Gen 2

9.125 export-inactive-bgp-enhanced

export-inactive-bgp-enhanced

Syntax

[**no**] **export-inactive-bgp-enhanced**

Context

[Tree] (config>service>vprn export-inactive-bgp-enhanced)

Full Context

configure service vprn export-inactive-bgp-enhanced

Description

This command configures the router to allow a BGP route that is inactive (because a better non-BGP route for the same prefix is present) to be exportable as a VPN-IP route.

A BGP route learned from a VPRN BGP peer is exportable as a VPN-IP route, only if it is the best route for the prefix and is installed in the route table of the VPRN. If the **export-inactive-bgp** command is enabled in the VPRN configuration, this rule is relaxed, and the best inactive VPRN BGP route is exportable as a VPN-IP route, provided that the active installed route for the prefix is an imported VPN-IP route.

The rule described in the preceding paragraph can be relaxed even further by enabling this command. When this command is enabled, the best inactive VPRN BGP route (best amongst all routes received from all CEs) is exportable as a VPN-IP route, regardless of the route type of the active installed route.

The configuration of this command overrides the **export-inactive-bgp** command. If this command is already enabled, do not enable the **export-inactive-bgp** command.

The **no** form of this command disables the router from allowing an inactive BGP route in the presence of a better non-BGP route to be exportable as a VPN-IP route.

Default

no export-inactive-bgp-enhanced

[**no**] **export-prefixes** *policy-name*

Context

[Tree] (config>router>ldp>session-params>peer export-prefixes)

Full Context

configure router ldp session-parameters peer export-prefixes

Description

This command specifies the export route policy used to determine which prefixes received from other LDP and T-LDP peers are re-distributed to this LDP peer via the LDP/T-LDP session to this peer. A prefix that is filtered out (deny) is not exported. A prefix that is filtered in (accept) will be exported.

If no export policy is specified, all FEC prefixes learned will be exported to this LDP peer. This policy is applied in addition to the global LDP policy and targeted session policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified. Peer address has to be the peer LSR-ID address.

The **no** form of this command removes the policy from the configuration.

Default

no export-prefixes - no export route policy is specified

Parameters

policy-name

Specifies up to five export-prefix route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

9.128 export-tunnel-table

export-tunnel-table

Syntax

export-tunnel-table *policy-name* [*policy-name*...(up to 5 max)]

no export-tunnel-table

Context

[Tree] (config>router>ldp export-tunnel-table)

Full Context

configure router ldp export-tunnel-table

Description

This command enables exports BGP label route and SR tunnels from the TTM into LDP for the purpose of stitching an LDP FEC to a BGP or SR tunnel for the same destination prefix.

To enable route stitching between LDP and BGP, separately configure tunnel table route export policies in both protocols and enable the advertisement of RFC 8277, *Using BGP to Bind MPLS Labels to Address Prefixes*, formatted labeled routes for prefixes learned from LDP FECs.

The BGP route export policy instructs BGP to listen to LDP route entries in the CPM Tunnel Table. If a /32 LDP FEC prefix matches an entry in the export policy, BGP originates a BGP labeled route, stitches it to the LDP FEC, and re-distributes the BGP labeled route to its Interior Border Gateway Protocol (IBGP) neighbors.

Using the following commands to add LDP FEC prefixes with the **from protocol ldp** statement in the existing BGP export policy configuration at the global level, peer-group level, or peer level:

- **config>router>bgp>export** *policy-name*
- **config>router>bgp>group>export** *policy-name*
- **config>router>bgp>group>neighbor>export** *policy-name*

To indicate to BGP to evaluate the entries with the **from protocol ldp** statement in the export policy when applied to a specific BGP neighbor, use commands:

- **config>router>bgp>group>neighbor>family label-ipv4** and
- **config>router>bgp>group>neighbor>advertise-ldp-prefix**

Without the latter configuration, only core IPv4 routes learned from RTM are advertised as BGP labeled routes to the neighbor. No stitching of LDP FEC to the BGP labeled route will be performed for this neighbor even if the same prefix was learned from LDP.

The LDP tunnel table route export policy instructs LDP to listen to BGP route entries in the CPM Tunnel Table. If a /32 BGP labeled route matches a prefix entry in the export policy, LDP originates an LDP FEC for the prefix, stitches it to the BGP labeled route, and re-distributes the LDP FEC to its IBGP neighbors.

The user can add BGP labeled route prefixes with the **from protocol bgp** statement in the configuration of the LDP tunnel table export policy. The **from protocol** statement is applied only when the protocol value is **ldp**. Policy entries with protocol values of **rsvp**, **bgp**, or any value other than **ldp** are ignored at the time the policy is applied to LDP.

In the LDP-to-SR data path direction, LDP listens to SR tunnel entries in the TTM. The user can restrict the export of SR tunnels to LDP from a specific prefix list. The user can also restrict the export to a specific IGP instance by optionally specifying the instance ID in the "from protocol” statement. The statement has an effect only when the protocol value is **isis** or **bgp**. Policy entries with any other protocol value are ignored at the time the policy is applied. If the user configures multiple **from protocol** statements in the same policy or does not include the **from protocol** statement but adds a default action of accept, then LDP will follow the TTM selection rules to select a tunnel to which it will stitch the LDP ILM:

1. LDP selects the tunnel from the lowest TTM preference protocol.
2. If two or more of IS-IS or OSPF protocol instances and BGP protocol have the same preference, then LDP selects the protocol using the default TTM protocol preference.
3. Within the same IGP protocol, LDP selects the lowest instance ID.

If an LDP FEC primary next-hop cannot be resolved using an RTM route and a SR tunnel of type SR-ISIS to the same destination prefix matches a prefix entry in the export policy, LDP programs an LDP ILM and stitches it to the SR node-SID tunnel endpoint. LDP also originates an FEC for the prefix and re-distributes

it to its LDP peers. When an LDP FEC is stitched to a SR tunnel, packets forwarded benefit from the protection of the LFA/remote LFA backup next-hop of the SR tunnel.

When resolving a FEC, LDP will prefer RTM over TTM when both resolutions are possible. That is, swapping the LDP ILM to a LDP NHLFE is preferred over stitching it to an SR tunnel endpoint.

Nokia recommends that the user should enable the bfd-enable option on the interfaces in LDP, IGP instance, and BGP contexts to speed up failure detection and activation of the SR LFA/remote-LFA backup next-hop or the BGP backup, depending on the stitching operation.

This feature is limited to IPv4 /32 prefixes in LDP, BGP and SR.

The **no** form of this command disables the export of BGP and SR tunnels to LDP.

Default

no export-tunnel-table

Parameters

policy-name

Specifies up to five export-tunnel-table route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

export-tunnel-table

Syntax

export-tunnel-table ldp

no export-tunnel-table

Context

[Tree] (config>router>isis>segment-routing export-tunnel-table)

Full Context

configure router isis segment-routing export-tunnel-table

Description

This command exports the LDP tunnels to an IGP instance for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to

stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next-hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. That is, swapping the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

Nokia recommends that the user should enable the bfd-enable option on the interfaces in both LDP and IGP instance contexts to speed up the failure detection and the activation of the LFA/remote-LFA backup next-hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

Exports LDP tunnels from the tunnel table into an IGP instance.

Platforms

7705 SAR Gen 2

export-tunnel-table

Syntax

[**no**] **export-tunnel-table ldp**

Context

[Tree] (config>router>ospf>segm-rtng export-tunnel-table)

Full Context

configure router ospf segment-routing export-tunnel-table

Description

This command enables exporting, to an IGP instance, the LDP tunnels for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs that the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to

stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. In other words, the swapping of the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

It is recommended to enable the **bfd-enable** option on the interfaces in both LDP and IGP instance contexts, to speed up the failure detection and the activation of the LFA/remote-LFA backup next hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

Description

This command configures a route policy AS path regular expression statement to use in the route policy entries.

An AS path in a BGP route matches an AS path regular expression, if the path matches the pattern of the regular expression. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- *
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

The **no** form of this command deletes the AS path regular expression statement.

Parameters

regular-expression

The AS path regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at signs (@); for example, "@variable@”.

null

The AS path expressed as an empty regular expression string.

Platforms

7705 SAR Gen 2

expression

Syntax

expression *expression* [**exact**]

no expression

Context

[Tree] (config>router>policy-options>community expression)

Full Context

configure router policy-options community expression

Description

This command creates a logical expression to match a route policy community.

The **no** form of this command deletes the logical expression.

Default

no expression

Parameters

expression *expression*

Specifies a logical expression containing terms and operators. It can contain sub-expressions enclosed in round brackets.

Values up to 900 characters

<expression> is one of the following: <expression> {AND| OR} <expression> [NOT] (<expression>) [NOT] <comm-id>

For example:

from community expression "[community list A] OR ([community list B] AND [community list C])"

exact

All the communities indicated by the expression must be present in the route in order for a match to occur.

Full Context

configure router bgp group neighbor outbound-route-filtering extended-community

configure router bgp group outbound-route-filtering extended-community

configure router bgp outbound-route-filtering extended-community

Description

The extended-community command opens the configuration tree for sending or accepting extended-community based BGP filters.

For the **no** version of the command to work, all sub-commands (**send-orf**, **accept-orf**) must be removed first.

Default

no extended-community

Platforms

7705 SAR Gen 2

9.132 extended-lsa

extended-lsa

Syntax

extended-lsa {**sparse** | **only**}

no extended-lsa

Context

[Tree] (config>router>ospf3 extended-lsa)

Full Context

configure router ospf3 extended-lsa

Description

This command configures the use of extended LSA format in OSPFv3, as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

Prior to this feature, SR OS used the fixed format LSA to carry the prefix and link information as described in RFC 5340, *OSPF for IPv6*. The fixed format is not extensible and the TLV format of the extended LSA must be used.

With this feature, the default mode of operation for OSPFv3 is referred to as **sparse** mode, meaning that the router will always advertise the fixed format for existing LSAs and will add the TLV-based extended LSA only when it needs to advertise new sub-TLVs. This mode of operation is similar to the way OSPFv2 advertises the segment routing information. It sends the prefix in the original fixed-format prefix LSA and then follows with the extended prefix TLV which is sent in an extended prefix opaque LSA containing the prefix SID sub-TLV.

The **extended-lsa only** value enables the full extended LSA mode. This causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and re-establish all adjacencies.

The **no** form of this command at the OSPFv3 instance level reverts the OSPFv3 instance to the default **sparse** mode of operation.

Default

extended-lsa sparse

Parameters

sparse

Enables the sparse mode of operation in an OSPFv3 instance.

only

Enables the full extended LSA mode of operation in an OSPFv3 instance.

Platforms

7705 SAR Gen 2

extended-lsa

Syntax

extended-lsa {**inherit** | **only**}

no extended-lsa

Context

[Tree] (config>router>ospf3>area extended-lsa)

Full Context

configure router ospf3 area extended-lsa

Description

This command configures the use of extended LSA format in a OSPFv3 area as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

By default, the area inherits the instance-level configuration. The latter defaults to the **sparse** mode of operation. The **extended-lsa only** value enables the full extended LSA mode, which causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and reestablish all adjacencies.

The **no** form of this command at the area level returns the area to the default mode of inheriting the mode from the OSPFv3 instance level.

Default

extended-lsa inherit

Parameters

inherit

Configures the area to inherit the mode of operation enabled at the OSPFv3 instance level.

only

Enables the full extended LSA mode of operation in an OSPFv3 area.

[Tree] (config>service>vprn>bgp>group>neighbor extended-nh-encoding)

Full Context

configure service vprn bgp extended-nh-encoding

configure service vprn bgp group extended-nh-encoding

configure service vprn bgp group neighbor extended-nh-encoding

Description

This command configures BGP to advertise (at session OPEN) the capability to receive IPv4 or IPv4 routes with IPv4 or IPv6 next hops from the VPRN BGP peers included in the scope of the command. These peers should not send these routes unless they receive the capability. If the SR OS router receives an IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and causes either a session reset or treat as withdraw behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

Default

no extended-nh-encoding

Parameters

ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

Platforms

7705 SAR Gen 2

extended-nh-encoding

Syntax

[Tree] (config>router>bgp extended-nh-encoding)

Full Context

configure router bgp group extended-nh-encoding

configure router bgp group neighbor extended-nh-encoding

configure router bgp extended-nh-encoding

Description

This command configures BGP to advertise (at session OPEN) the capability to receive label IPv4, VPN IPv4 routes, or IPv6 next hops from the peers. These peers should not send such routes unless they receive notification of this capability. If the SR OS router receives a label IPv4 or VPN IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and this will cause either session reset or **treat-as-withdraw** behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

Default

no extended-nh-encoding

Parameters

label-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=4, and next-hop AFI=2.

vpn-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=128, and next-hop AFI=2.

ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=1 and next-hop AFI=2.

[Tree] (config>service>vprn>ospf3 external-db-overflow)

Full Context

configure service vprn ospf external-db-overflow

configure service vprn ospf3 external-db-overflow

Description

This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.

The *limit* value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the *limit*, the table is in an overflow state. When in an overflow state, the router does not originate any new AS-external-LSAs and it withdraws all self-originated non-default external LSAs.

The *interval* specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period, which prevents the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.

The **external-db-overflow** must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.

The **no** form of this command disables limiting the number of non-default AS-external-LSA entries.

Default

no external-db-overflow — No limit on non-default AS-external-LSA entries.

Parameters

limit

The maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer.

Values -1 to 2147483647

Note:
Setting a value of -1 is equivalent to **no external-db-overflow**.

interval

The number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer.

Values 0 to 2147483647

Platforms

7705 SAR Gen 2

external-preference

Syntax

external-preference *preference*

no external-preference

Context

[Tree] (config>service>vprn>isis>level external-preference)

Full Context

configure service vprn isis level external-preference

Description

This command configures the external route preference for the IS-IS level.

The **external-preference** command configures the preference level of either IS-IS level 1 or IS-IS level 2 external routes. By default, the preferences are as listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference decides the route to use.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is dependent on the default preference table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of the route to use is determined by the configuration of the **ecmp** in the **config>router** context.

Default

Default preferences are listed in Table 33: Default Preferences.

Table 33: Default Preferences

Route Type	Preference	Configurable
Direct attached	0	No
Static route	5	Yes
MPLS	7	—
OSPF internal routes	10	No
IS-IS Level 1 internal	15	Yes
IS-IS Level 2 internal	18	Yes
OSPF external	150	Yes
IS-IS Level 1 external	160	Yes
IS-IS Level 2 external	165	Yes
BGP	170	Yes
BGP	170	Yes

Note:

1. Internal preferences are changed using the **preference** command in the **config>router>isis>level** *level-number* context.

Parameters

preference

The preference for external routes at this level as expressed.

Values 1 to 255

Platforms

7705 SAR Gen 2

external-preference

Syntax

external-preference *preference*

no external-preference

Context

[Tree] (config>service>vprn>ospf3 external-preference)

[Tree] (config>service>vprn>ospf external-preference)

10 f Commands

10.1 facility

facility

Syntax

facility *syslog-facility*

no facility

Context

[Tree] (config>service>vprn>log>syslog facility)

Full Context

configure service vprn log syslog facility

Description

This command configures the facility code for messages sent to the syslog target host.

Multiple syslog IDs can be created with the same target host but each syslog ID can only have one facility code. If multiple facility codes are entered, the last *facility-code* entered overwrites the previous facility-code.

If multiple facilities need to be generated for a single syslog target host, then multiple **log-id** entries must be created, each with its own filter criteria to select the events to be sent to the syslog target host with a given facility code.

The **no** form of this command reverts to the default value.

Default

local7 — Syslog entries are sent with the local7 facility code.

Parameters

syslog-facility

Specifies syslog facility name represents a specific numeric facility code. The code should be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

Values kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

Valid responses per RFC 3164, *The BSD syslog Protocol,* are listed in Table 37: Syslog Facility Codes.

Table 37: Syslog Facility Codes

10.2 fail-on-error

fail-on-error

Syntax

[**no**] **fail-on-error**

Context

[Tree] (config>card fail-on-error)

Full Context

configure card fail-on-error

Description

This command controls the behavior of the card when any one of a specific set of card level errors is encountered in the system. When the **fail-on-error** command is enabled, and any one (or more) of the specific errors is detected, then the Operational State of the card is set to Failed. This Failed state will persist until the clear card command is issued (reset) or the card is removed and re-inserted (re-seat). If the condition persists after re-seating the card, then Nokia support should be contacted for further investigation.

Enabling **fail-on-error** is only recommended when the network is designed to be able to route traffic around a failed card (redundant cards, nodes or other paths exist).

The list of specific errors includes:

- CHASSIS event ID# 2063 – tmnxEqCardPChipMemoryEvent
- CHASSIS event ID# 2076 – tmnxEqCardPChipCamEvent
- CHASSIS event ID# 2059 – tmnxEqCardPChipError (for ingress Ethernet only)
- CHASSIS event ID# 2098 – tmnxEqCardQChipBufMemoryEvent
- CHASSIS event ID# 2099 – tmnxEqCardQChipStatsMemoryEvent
- CHASSIS event ID# 2101 – tmnxEqCardQChipIntMemoryEvent
- CHASSIS event ID# 2103 – tmnxEqCardChipIfCellEvent

On platforms without independent IOM/IMM and CPM cards, the node is rebooted if fail-on-error is enabled and one of the card level errors is encountered.

The tmnxEqCardPChipError is only considered as a trigger for card fail-on-error for ingress FCS errors (not egress FCS errors), and only for Ethernet MDAs or IMMs.

Note that upon the detection of the event/error in the system, the reporting of the event (logs) and the **fail-on-error** behavior of the card are independent. Log event control configuration will determine whether the events are reported in logs (or SNMP traps, and so on) and the **fail-on-error** configuration will determine the behavior of the card. This implies that the card can be configured to **fail-on-error** even if the events are suppressed (some may be suppressed in the system by default). In order to facilitate post-failure analysis, Nokia recommends that you enable the reporting of the specific events/errors (**configure log event-control**) when **fail-on-error** is enabled.

Default

no fail-on-error

Platforms

7705 SAR Gen 2

fail-on-error

Syntax

[**no**] **fail-on-error**

Context

[Tree] (config>card>mda fail-on-error)

Full Context

configure card mda fail-on-error

Description

This command enables the fail-on-error feature. If an MDA is experiencing too many Egress XPL Errors, this feature causes the MDA to fail. This can force an APS switchover or **traffic re-route**. The purpose of this feature is to avoid situations where traffic is forced to use a physical link that suffers from errors but is still technically operational.

The feature uses values configured in the **config>card>mda>egress-xpl** context. When this feature is enabled on a MDA, if *window* consecutive minutes pass in which the MDA experiences more than *threshold* Egress XPL Errors per minute, then the MDA will be put in the *failed* state.

The **no** form of this command disables the feature on the MDA.

[Tree] (config>service>vpls>site failed-threshold)

Full Context

configure service vpls site failed-threshold

Description

This command defines the number of objects should be down for the site to be declared down. Both administrative and operational status must be evaluated and if at least one is down, the related object is declared down.

Default

failed-threshold all

Parameters

1 to 1000

Specifies the threshold for the site to be declared down.

Platforms

7705 SAR Gen 2

10.4 failover

failover

Syntax

failover

Context

[Tree] (config>service>vprn>dhcp>server>pool failover)

10.5 fallback-path-computation-method

fallback-path-computation-method

Syntax

fallback-path-computation-method {**none** | **local-cspf**}

no fallback-path-computation-method

Context

[Tree] (config>router>mpls>lsp fallback-path-computation-method)

[Tree] (config>router>mpls>lsp-template fallback-path-computation-method)

Full Context

configure router mpls lsp fallback-path-computation-method

configure router mpls lsp-template fallback-path-computation-method

Description

This command specifies the fallback path computation method used if all configured PCEs are down or the signaling overload and the redelegation timer has expired. This method is used regardless of whether the LSP is PCE-controlled and PCE-computed, or just PCE-computed.

The **no** form of this command removes the fallback path computation method used.

Default

fallback-path-computation-method none

Parameters

none

Specifies to fall back to using the named path for RSVP-TE LSPs.

local-cspf

Specifies to fall back to using local CSPF computation.

Platforms

7705 SAR Gen 2

10.6 family

family

Syntax

family *family*

Context

[Tree] (config>service>vprn>bgp>convergence family)

Full Context

configure service vprn bgp convergence family

Description

This command specifies the convergence family used for route convergence.

Parameters

family

Specifies the convergence family used for route convergence

Values ipv4, ipv6

Platforms

7705 SAR Gen 2

family

Syntax

[**no**] **family** {**ipv4** | **ipv6** | **label-ipv4** | **flow-ipv4** | **flow-ipv6**}

Context

[Tree] (config>service>vprn>bgp>group>graceful-restart>long-lived family)

[Tree] (config>service>vprn>bgp>graceful-restart>long-lived family)

[Tree] (config>service>vprn>bgp>group>neighbor>graceful-restart>long-lived family)

Full Context

configure service vprn bgp group graceful-restart long-lived family

configure service vprn bgp graceful-restart long-lived family

configure service vprn bgp group neighbor graceful-restart long-lived family

Description

This command configures family-specific LLGR parameters for BGP peers.

Default

no family

Parameters

ipv4

Specifies the IPv4 family.

ipv6

Specifies the IPv6 family.

label-ipv4

Specifies the label IPv4 family.

flow-ipv4

Specifies the flow IPv4 family.

flow-ipv6

Specifies the flow IPv6 family.

Platforms

7705 SAR Gen 2

family

Syntax

family [**ipv4**] [**label-ipv4**] [**ipv6**] [**mcast-ipv4**] [**flow-ipv4**] [**mcast-ipv6**] [**flow-ipv6**]

no family

Context

[Tree] (config>service>vprn>bgp family)

[Tree] (config>service>vprn>bgp>group>neighbor family)

[Tree] (config>service>vprn>bgp>group family)

Full Context

configure service vprn bgp family

configure service vprn bgp group neighbor family

configure service vprn bgp group family

Description

This command configures the set of BGP address families (AFI plus SAFI) to be supported by the applicable VPRN BGP sessions.

The **no** form of this command restores the default, which is equivalent to configuring unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

Default

no family

Parameters

ipv4

Keyword to advertise support for the IPv4 unicast (unlabeled) address family.

label-ipv4

Keyword to advertise support for the IPv4 unicast (labeled) address family.

ipv6

Keyword to advertise support for the IPv6 unicast (unlabeled) address family.

mcast-ipv4

Keyword to advertise support for the IPv4 multicast SAFI address family.

flow-ipv4

Keyword to advertise support for the IPv4 FlowSpec address family.

mcast-ipv6

Keyword to advertise support for the IPv6 multicast SAFI address family.

flow-ipv6

Keyword to advertise support for the IPv6 FlowSpec address family.

Platforms

7705 SAR Gen 2

family

Syntax

family [**ipv4** | **ipv6**]

Context

[Tree] (config>router>mpls>lsp-template family)

Full Context

configure router mpls lsp-template family

Description

This command specifies if the lsp-template is for use in IPv4 or IPv6 SR-TE LSP.

This command is optional in a IPv4 SR-TE auto-LSP but must be set to **ipv6** value in a IPv6 SR-TE auto-LSP. By default, this command is set to **ipv4** value for backward compatibility.

When establishing both IPv4 and IPv6 SR-TE mesh auto-LSPs with the same parameters and constraints, a separate LSP template of type **mesh-p2p-srte** must be configured for each address family with the **family** CLI leaf set to the IPv4 or IPv6 value. SR-TE one-hop auto-LSPs can only be established for either IPv4 or IPv6 family, but not both. The **family** leaf in the LSP template of type **one-hop-p2p-srte** should be set to the desired IP family value.

The **no** form of this command reverts to the default value.

Default

family ipv4

Parameters

ipv4

Specifies the lsp-template is for use in IPv4 SR-TE LSP.

ipv6

Specifies the lsp-template is for use in IPv6 SR-TE LSP.

Platforms

7705 SAR Gen 2

family

Syntax

family *family*

Context

[Tree] (config>router>bgp>convergence family)

Full Context

configure router bgp convergence family

Description

This command configures the IP family used for route convergence.

Parameters

family

Specifies the convergence family.

Values ipv4, ipv6, vpn-ipv4, vpn-ipv6, label-ipv4, label-ipv6

Platforms

7705 SAR Gen 2

family

Syntax

family [**ipv4**] [**label-ipv4**] [**vpn-ipv4**] [**ipv6**] [**label-ipv6**] [**vpn-ipv6**] [**mcast-ipv4**] [**l2-vpn**] [**mvpn-ipv4**] [**mvpn-ipv6**] [**mdt-safi**] [**ms-pw**] [**flow-ipv4**] [**flow-ipv6**] [**route-target**] [**mcast-vpn-ipv4**] [**evpn**] [**bgp-ls**] [**mcast-ipv6**] [**mcast-vpn-ipv6**] [**sr-policy-ipv4**] [**sr-policy-ipv6**] [**flow-vpn-ipv4**] [**flow-vpn-ipv6**]

no family

Context

[Tree] (config>router>bgp family)

[Tree] (config>router>bgp>group>neighbor family)

[Tree] (config>router>bgp>group family)

Full Context

configure router bgp family

configure router bgp group neighbor family

configure router bgp group family

Description

This command configures the set of BGP address families (AFI/SAFI) to be supported by the base router BGP sessions.

The **no** form of this command restores the default, which corresponds to unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

Default

family ipv4

Parameters

ipv4

Keyword to advertise MP-BGP support for the IPv4 unicast (unlabeled) address family.

label-ipv4

Keyword to advertise MP-BGP support for the IPv4 unicast (labeled) address family.

vpn-ipv4

Keyword to advertise MP-BGP support for the IPv4 VPN (SAFI 128) address family.

ipv6

Keyword to advertise MP-BGP support for the IPv6 unicast (unlabeled) address family.

label-ipv6

Keyword to advertise MP-BGP support for the IPv6 unicast (labeled) address family.

vpn-ipv6

Keyword to advertise MP-BGP support for the IPv6 VPN (SAFI 128) address family.

mcast-ipv4

Keyword to advertise MP-BGP support for the IPv4 multicast SAFI address family.

l2-vpn

Keyword to advertise MP-BGP support for the L2 VPN address family.

mvpn-ipv4

Keyword to advertise MP-BGP support for the IPv4 multicast VPN address family.

mvpn-ipv6

Keyword to advertise MP-BGP support for the IPv6 multicast VPN address family.

mdt-safi

Keyword to advertise MP-BGP support for the MDT SAFI address family.

ms-pw

Keyword to advertise MP-BGP support for the multi-segment pseudowire address family.

flow-ipv4

Keyword to advertise MP-BGP support for the IPv4 FlowSpec address family.

flow-ipv6

Keyword to advertise MP-BGP support for the IPv6 FlowSpec address family.

route-target

Keyword to advertise MP-BGP support for RT constraint routes.

mcast-vpn-ipv4

Keyword to advertise MP-BGP support for the IPv4 VPN multicast (SAFI 129) address family.

evpn

Keyword to advertise MP-BGP support for the EVPN address family.

bgp-ls

Keyword to advertise MP-BGP support for the BGP-LS address family.

mcast-ipv6

Keyword to advertise MP-BGP support for the IPv6 multicast SAFI address family.

mcast-vpn-ipv6

Keyword to advertise MP-BGP support for the IPv6 multicast routes from a VPRN over the provider network. This family is only applicable in the base BGP routing context.

sr-policy-ipv4

Keyword to advertise MP-BGP support for AFI1/SAFI73 IP address families for BGP routes that encode a segment-routing policy to an IPv4 destination.

sr-policy-ipv6

Keyword to advertise MP-BGP support for AF12/SAF173 IP address families for BGP routes that encode a segment-routing policy to an IPv6 destination.

flow-vpn-ipv4

Keyword to advertise support for the FlowSpec-VPN IPv4 address family (AFI 1, SAFI 134).

flow-vpn-ipv6

Keyword to advertise support for the FlowSpec-VPN IPv6 address family (AFI 2, SAFI 134).

Platforms

7705 SAR Gen 2

family

Syntax

[**no**] **family** {**ipv4** | **ipv6** | **label-ipv4** | **label-ipv6** | **vpn-ipv4** | **vpn-ipv6** | **l2-vpn** | **route-target** | **flow-ipv4** | **flow-ipv6** | **flow-vpn-ipv4** | **flow-vpn-ipv6**}

Context

[Tree] (config>router>bgp>group>neighbor>graceful-restart>long-lived family)

[Tree] (config>router>bgp>graceful-restart>long-lived family)

[Tree] (config>router>bgp>group>graceful-restart>long-lived family)

Full Context

configure router bgp group neighbor graceful-restart long-lived family

configure router bgp graceful-restart long-lived family

configure router bgp group graceful-restart long-lived family

Description

This command configures family-specific LLGR parameters for BGP peers.

The **no** form of this command deletes the context.

Default

no family

Parameters

ipv4

Keyword to specify the IPv4 family.

ipv6

Keyword to specify the IPv6 family.

label-ipv4

Keyword to specify the label IPv4 family.

label-ipv6
Keyword to specify the label IPv6 family.

vpn-ipv4
Keyword to specify the VPN IPv4 family.

vpn-ipv6
Keyword to specify the VPN IPv6 family.

l2-vpn
Keyword to specify the Layer 2 VPN family.

route-target
Keyword to specify the route target family.

flow-ipv4
Keyword to specify the flow IPv4 family.

flow-ipv6
Keyword to specify the flow IPv6 family.

flow-vpn-ipv4
Keyword to specify the FlowSpec-VPN IPv4 address family.

flow-vpn-ipv6
Keyword to specify the FlowSpec-VPN IPv6 address family.

Platforms
7705 SAR Gen 2

family

Syntax
family {**label-ipv4** | **label-ipv6** | **vpn**}

Context
[Tree] (config>router>bgp>next-hop-resolution>labeled-routes>transport-tunnel family)

Full Context
configure router bgp next-hop-resolution labeled-routes transport-tunnel family

Description
This command configures the address family context for configuring next-hop resolution of BGP label routes.

Parameters
label-ipv4
Enters the context for configuring next-hop-resolution options for labeled-unicast IPv4 routes.

label-ipv6

Enters the context for configuring next-hop-resolution options for labeled-unicast IPv6 routes.

vpn

Enters the context for configuring next-hop-resolution options for VPN-IPv4 and VPN-IPv6 routes when they are not imported into any VPRN service.

Platforms

7705 SAR Gen 2

family

Syntax

family {**ipv4** | **ipv6**}

Context

[Tree] (config>router>bgp>next-hop-res>shortcut-tunnel family)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel family

Description

This command creates the context to configure next-hop resolution of unlabeled IPv4 or unlabeled IPv6 routes by certain tunnel types in the tunnel table.

Parameters

ipv4

Specifies that the configuration applies to unlabeled IPv4 BGP routes.

ipv6

Specifies that the configuration applies to unlabeled IPv6 BGP routes.

Platforms

7705 SAR Gen 2

family

Syntax

family {**ipv4** | **ipv6** | **srv4** | **srv6**}

Context

[Tree] (config>router>isis>igp-shortcut>tunnel-next-hop family)

Full Context

configure router isis igp-shortcut tunnel-next-hop family

Description

Commands in this context configure the resolution of IGP IPv4 and IGP IPv6 prefix families, as well as SR-ISIS IPv4 and SR-ISIS IPv6 tunnel families using IGP shortcuts.

Parameters

ipv4

Selects the IPv4 address family.

ipv6

Selects the IPv6 address family.

srv4

Selects the SR-ISIS IPv4 tunnel family.

srv6

Selects the SR-ISIS IPv6 tunnel family.

Platforms

7705 SAR Gen 2

family

Syntax

family {**ipv4** | **ipv6**}

no family

Context

[Tree] (config>router>isis>segment-routing>adjacency-set family)

Full Context

configure router isis segment-routing adjacency-set family

Description

This command specifies the address family of an adjacency set in IS-IS.

The **no** form of this command reverts to the default.

Default

family ipv4

Parameters

ipv4

Specifies a family of IPv4.

ipv6

Specifies a family of IPv6.

Platforms

7705 SAR Gen 2

family

Syntax

family {**ipv4** | **srv4**}

Context

[Tree] (config>router>ospf>igp-shortcut>tunnel-next-hop family)

Full Context

configure router ospf igp-shortcut tunnel-next-hop family

Description

Commands in this context configure the resolution of the IGP IPv4 prefix family or SR-OSPF IPv4 tunnel using IGP shortcuts.

Parameters

ipv4

Selects the IPv4 address family.

srv4

Selects the SR-OSPF IPv4 tunnel family.

Platforms

7705 SAR Gen 2

family

Syntax

family ipv6

Context

[Tree] (config>router>ospf3>igp-shortcut>tunnel-next-hop family)

Full Context

configure router ospf3 igp-shortcut tunnel-next-hop family

Description

Commands in this context configure the resolution of the IGP IPv6 prefix family using IGP shortcuts.

Parameters

ipv6

Selects the IPv6 address family.

Platforms

7705 SAR Gen 2

family

Syntax

family [**ipv4**] [**label-ipv4**] [**vpn-ipv4**] [**ipv6**] [**label-ipv6**] [**vpn-ipv6**] [**mcast-ipv4**] [**l2-vpn**] [**mvpn-ipv4**] [**mvpn-ipv6**] [**mdt-safi**] [**ms-pw**] [**flow-ipv4**] [**flow-ipv6**] [**route-target**] [**mcast-vpn-ipv4**] [**evpn**] [**bgp-ls**] [**mcast-ipv6**] [**mcast-vpn-ipv6**] [**sr-policy-ipv4**] [**sr-policy-ipv6**] [**flow-vpn-ipv4**] [**flow-vpn-ipv6**]

no family

Context

[Tree] (config>router>policy-options>policy-statement>entry>from family)

Full Context

configure router policy-options policy-statement entry from family

Description

This command specifies address families as matching conditions.

The **no** form of the command configures the router to use the default value.

Default

no family

Parameters

ipv4
