[Tree] (config>router>ospf>area>interface passive)

[Tree] (config>router>ospf3>area>interface passive)

Full Context

configure router ospf area interface passive

configure router ospf3 area interface passive

Description

This command adds the passive property to the OSPF interface where passive interfaces are advertised as OSPF interfaces but do not run the OSPF protocol.

By default, only interface addresses that are configured for OSPF will be advertised as OSPF interfaces. The **passive** parameter allows an interface to be advertised as an OSPF interface without running the OSPF protocol.

While in passive mode, the interface will ignore ingress OSPF protocol packets and not transmit any OSPF protocol packets.

The **no** form of this command removes the passive property from the OSPF interface.

Default

no passive

Platforms

7705 SAR Gen 2

21.19 passive-mode

passive-mode

Syntax

[**no**] **passive-mode**

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep passive-mode)

Full Context

configure redundancy multi-chassis peer mc-endpoint passive-mode

Description

This command configures the passive mode behavior for the MC-EP protocol. When in passive mode the MC-EP pair will be dormant until two of the pseudowires in a MC-EP will be signaled as active by the remote PEs, being assumed that the remote pair is configured with regular MC-EP. As soon as more than one pseudowire is active, dormant MC-EP pair will activate. It will use the regular exchange to select the best pseudowire between the active ones and it will block the Rx and Tx directions of the other pseudowires.

The **no** form of this command will disable the passive mode behavior.

Default

no passive-mode

Platforms

7705 SAR Gen 2

21.20 password

password

Syntax

password

Context

[Tree] (password)

Full Context

password

Description

This operational command changes the local user password.

This command is automatically invoked when a user logs in after the administrator uses the **new-password-at-login** command to force a new password, or the password has expired (**aging**). At this time, the user is prompted to enter the old password, new password, and then the new password again to verify the input.

If the user fails to create a new password, CLI access is denied.

A user cannot configure a nonconforming password using the global **password** command. In this case, the CLI displays an error message and the password change fails. To configure a password value that does not conform to the minimum length or other password complexity rules, use the **config>system>security>user>password** command (for example, executed by an administrator).

password

Syntax

password *password* [**hash** | **hash2** | **custom**]

no password

Context

[Tree] (config>ipsec>rad-auth-plcy password)

Full Context

configure ipsec radius-authentication-policy password

Description

This command specifies the password that is used in the RADIUS access requests.

The **no** form of this command resets the password to its default of **ALU** and will be stored using hash/hash2 encryption.

Default

no password

Parameters

password

Specifies a password string up to 64characters.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7705 SAR Gen 2

password

Syntax

password [*password*]

Context

[Tree] (config>system>security>user password)

Full Context

configure system security user password

Description

This command configures the user password for console and FTP access.

The password is stored in an encrypted format in the configuration file when specified. Passwords should be encased in double quotes (" ") at the time of the password creation. The double quote character (") is not accepted inside a password. It is interpreted as the start or stop delimiter of a string.

The password can be entered as plain text or a hashed value. SR OS can distinguish between hashed passwords and plain text passwords and take the appropriate action to store the password correctly.

```
config>system>security>user# password testuser1
```

The password is hashed by default.

For example:

```
config>system>security# user testuser1
config>system>security>user$ password xyzabcd1
config>system>security>user# exit
```

```
config>system>security# info
----------------------------------
...
            user "testuser1"
                password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
            exit
...
----------------------------------
config>system>security#
```

The **password** command allows you also to enter the password as a hashed value.

For example:

```
config>system>security# user testuser1
config>system>security>user$ password "$2y$10$pFoehOg/tCbBMPDJ/
kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
config>system>security>user# exit
config>system>security# info
----------------------------------
...
user "testuser1"
password "$2y$10$pFoehOg/tCbBMPDJ/kqpu.8af0AoVGY2xsR7WFqyn5fVTnwRzGmOK"
exit
...
----------------------------------
config>system>security#
```

Parameters

password

This is the password for the user that must be entered by this user during the login procedure. The minimum length of the password is determined by the **minimum-length** command. The maximum length can be up to 20 chars if unhashed, 32 characters if hashed. The complexity requirements for the password is determined by the **complexity-rules** command and must be followed; otherwise, the password will not be accepted.

All password special characters (#, ?, space) must be enclosed within double quotes.

For example: config>system>security>user# password "south#bay?”

The question mark character (?) cannot be directly inserted as input during a telnet connection because the character is bound to the **help** command during a normal Telnet/ console connection.

To insert a # or ? characters, they must be entered inside a notepad or clipboard program and then cut and pasted into the Telnet session in the password field that is encased in the double quotes as delimiters for the password.

If a **password** is entered without any parameters, a password length of zero is implied: (carriage return).

Platforms

7705 SAR Gen 2

password

Syntax

password *password* [**hash** | **hash2** | **custom**]

no password

Context

[Tree] (bof password)

Full Context

bof password

Description

This command configures the password to access the BOF interactive menu at startup.

If a password is configured, the BOF interactive menu is accessible only when the correct password is entered. If the correct password is not entered in 30 s, the node reboots.

The **no** form of this command removes the configured password.

Default

no password

Parameters

password

Specifies the password.

If the **hash**, **hash2**, or **custom** parameter is not configured, the password is entered in plaintext and the password length must be between 8 and 32 characters. A plaintext password cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the password is hashed and the password length must be between 1 and 64 characters.

hash

Keyword to specify that the password is entered in an encrypted form.

hash2

Keyword to specify that the password is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the password cannot be transferred between nodes.

custom

Keyword to specify that the password uses custom encryption.

21.21 password-history

password-history

Syntax

password-history {**user** *user-name* | **all**}

Context

[Tree] (admin>clear password-history)

Full Context

admin clear password-history

Description

This command is used to clear old passwords used by a specific user, or for all users.

Parameters

user-name

Clears the password history information about the specified user, up to 32 characters.

all

Clears the password history information for all users.

Platforms

7705 SAR Gen 2

21.22 path

path

Syntax

path *name*

no path

Context

[Tree] (config>service>epipe>spoke-sdp-fec path)

Full Context

configure service epipe spoke-sdp-fec path

Description

This command specifies the explicit path, containing a list of S-PE hops, that should be used for this spoke SDP. The path-name should correspond to the name of an explicit path configured in the **config>service>pw-routing** context.

If no path is configured, then each next-hop of the MS-PW used by the spoke SDP will be chosen locally at each T-PE and S-PE.

Default

no path

Parameters

name

The name of the explicit path to be used, as configured under the **config>service>pw-routing** context.

Platforms

7705 SAR Gen 2

path

Syntax

[**no**] **path** *path-name*

Context

[Tree] (config>router>mpls path)

Full Context

configure router mpls path

Description

This command creates the path to be used for an LSP. A path can be used by multiple LSPs. A path can specify some or all hops from ingress to egress and they can be either **strict** or **loose**. A path can also be empty (no *path-name* specified) in which case the LSP is set up based on IGP (best effort) calculated shortest path to the egress router. Paths are created in a **shutdown** state. A path must be shutdown before making any changes (adding or deleting hops) to the path. When a path is shutdown, any LSP using the path becomes operationally down.

To create a strict path from the ingress to the egress router, the ingress and the egress routers must be included in the path statement.

The **no** form of this command deletes the path and all its associated configuration information. All the LSPs that are currently using this path will be affected. Additionally all the services that are actively using these LSPs will be affected. A path must be **shutdown** and unbound from all LSPs using the path before it can be deleted. The **no path** *path-name* command will not result in any action except a warning message on the console indicating that the path may be in use.

Parameters

path-name

Specifies a unique case-sensitive alphanumeric name label for the LSP path up to 32 characters in length.

Platforms

7705 SAR Gen 2

path

Syntax

path [**detail**]

no path

Context

[Tree] (debug>router>rsvp>event path)

Full Context

debug router rsvp event path

Description

This command debugs path-related events.

The **no** form of the command disables the debugging.

Parameters

7705 SAR Gen 2

path

Syntax

path *name* [**create**]

no path *name*

Context

[Tree] (config>service>pw-routing path)

Full Context

configure service pw-routing path

Description

This command configures an explicit path between this T-PE and a remote T-PE. For each path, one or more intermediate S-PE hops must be configured. A path can be used by multiple multi-segment pseudowires. Paths are used by a 7705 SAR Gen 2 T-PE to populate the list of Explicit Route TLVs included in the signaling of a dynamic MS-PW.

A path may specify all or only some of the hops along the route to reach a T-PE.

The **no** form of the command removes a specified explicit path from the configuration.

Parameters

path-name

Specifies a locally-unique case-sensitive alphanumeric name label for the MS-PW path of up to 32 characters in length.

Platforms

7705 SAR Gen 2

path

Syntax

path *path-name* [**create**]

no path *name*

Context

[Tree] (config>system>telemetry>sensor-groups>sensor-group path)

Full Context

configure system telemetry sensor-groups sensor-group path

Description

This command configures a sensor path for the specified sensor-group. Multiple sensor paths can be defined for a single sensor-group. The path is defined in the form of an XML Path (XPath) syntax that refers to single or multiple objects within the YANG model.

The **no** form of the command removes the specified explicit path from the configuration.

Parameters

path-name

Specifies a sensor path, up to 512 characters.

create

Keyword used to create the sensor path.

Platforms

7705 SAR Gen 2

21.23 path-computation-method

path-computation-method

Syntax

path-computation-method *path-computation-method*

no path-computation-method

Context

[Tree] (config>router>mpls>lsp path-computation-method)

[Tree] (config>router>mpls>lsp-template path-computation-method)

Full Context

configure router mpls lsp path-computation-method

configure router mpls lsp-template path-computation-method

Description

This command configures the path computation method of a RSVP-TE or SR-TE LSP.

The user can select among the **hop-to-label** translation, the local CSPF or the PCE for a configured SR-TE LSP. For SR-TE LSP templates, the PCE option is supported with the SR-TE LSP template type **on-demand-p2p-srte** and not other template types.

The user can select among the IGP-based path, the local CSPF, or the PCE for a configured RSVP-TE LSP. The PCE option is not supported with the RSVP-TE LSP template.

By default, the IGP-based path is used for an RSVP-TE LSP and the **hop-to-label** path computation method is used for an SR-TE LSP.

The **no** form of this command returns to the default path computation method for the type of LSP.

Default

no path-computation-method

Parameters

path-computation-method

Specifies the path computation method for the LSP.

Values local-cspf — Selects the local router CSPF for path computation.

pce — Selects the PCE for path computation.

Platforms

7705 SAR Gen 2

21.24 path-cost

path-cost

Syntax

path-cost *sap-path-cost*

no path-cost [*sap-path-cost*]

Context

[Tree] (config>service>vpls>sap>stp path-cost)

[Tree] (config>service>template>vpls-sap-template>stp path-cost)

[Tree] (config>service>vpls>spoke-sdp>stp path-cost)

Full Context

configure service vpls sap stp path-cost

configure service template vpls-sap-template stp path-cost

configure service vpls spoke-sdp stp path-cost

Description

This command configures the Spanning Tree Protocol (STP) path cost for the SAP or spoke-SDP.

The path cost is used by STP to calculate the path cost to the root bridge. The path cost in BPDUs received on the root port is incremented with the configured path cost for that SAP or spoke-SDP. When BPDUs are sent out of other egress SAPs or spoke-SDPs, the newly calculated root path cost is used. These are the values used for CIST when running MSTP.

STP suggests that the path cost is defined as a function of the link bandwidth. Since SAPs and spoke-SDPs are controlled by complex queuing dynamics, in the 7705 SAR Gen 2 the STP path cost is a purely static configuration.

The **no** form of this command returns the path cost to the default value.

Parameters

path-cost

The path cost for the SAP or spoke-SDP

Values 1 to 200000000 (1 is the lowest cost)

Default 10

Platforms

7705 SAR Gen 2

path-cost

Syntax

path-cost *sap-path-cost*

no path-cost

Context

[Tree] (config>service>pw-template>stp path-cost)

Full Context

configure service pw-template stp path-cost

Description

This command configures the Spanning Tree Protocol (STP) path cost for the SAP or spoke SDP.

The path cost is used by STP to calculate the path cost to the root bridge. The path cost in BPDUs received on the root port is incremented with the configured path cost for that SAP or spoke SDP. When BPDUs are sent out other egress SAPs or spoke SDPs, the newly calculated root path cost is used. These are the values used for CIST when running MSTP.

STP suggests that the path cost is defined as a function of the link bandwidth. Since SAPs and spoke SDPs are controlled by complex queuing dynamics, the STP path cost is a purely static configuration.

The **no** form of this command returns the path cost to the default value.

Default

Parameters

path-cost

Specifies the path cost for the SAP or spoke SDP.

Values 1 to 200000000 (1 is the lowest cost)

Default 10

Platforms

7705 SAR Gen 2

21.25 path-destination

path-destination

Syntax

path-destination *ip-address* **interface** *if-name*

path-destination *ip-address* [**next-hop** *ip-address*]

no path-destination

Context

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy path-destination)

Full Context

configure saa test type-multi-line lsp-ping sr-policy path-destination

Description

This command configures the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

The **no** form of this command removes the configuration.

Parameters

ip-address

Specifies the IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

if-name

Specifies the name of an IP interface, up 32 characters, to send the MPLS echo request to. The name must already exist in the **config>router>interface** context.

Platforms

7705 SAR Gen 2

21.26 path-mtu

path-mtu

Syntax

path-mtu [*bytes*]

no path-mtu *bytes*

Context

[Tree] (config>service>pw-template path-mtu)

[Tree] (config>service>sdp path-mtu)

Full Context

configure service pw-template path-mtu

configure service sdp path-mtu

Description

This command configures the Maximum Transmission Unit (MTU) in bytes that the SDP can transmit to the far-end device router without packet dropping or IP fragmentation overriding the SDP-type default MTU.

The SDP-type default path-mtu can be overridden on a per SDP basis. Dynamic maintenance protocols on the SDP, like RSVP, may override this setting.

If the physical MTU on an egress interface indicates the next hop on an SDP path cannot support the current path-mtu, the system modifies the operational path-mtu on that SDP to a value that can be transmitted without fragmentation.

The **no** form of this command removes any path-mtu configured on the SDP, and the SDP uses the system default for the SDP type.

Default

the default **path-mtu** defined on the system for the type of SDP

Parameters

bytes

Specifies the bytes.

Values 576 to 9800

Platforms

7705 SAR Gen 2

21.27 path-mtu-discovery

path-mtu-discovery

Syntax

[**no**] **path-mtu-discovery**

Context

[Tree] (config>router>ldp>tcp-session-params>peer-transport path-mtu-discovery)

Full Context

configure router ldp tcp-session-parameters peer-transport path-mtu-discovery

Description

This command enables Path MTU discovery for the associated TCP connections. When enabled, the MTU for the associated TCP session is initially set to the egress interface MTU. The DF bit is also set so that if a router along the path of the TCP connection cannot handle a packet of a particular size without fragmenting, it sends back an ICMP message to set the path MTU for the given session to a lower value that can be forwarded without fragmenting.

If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR-ID value, the user must add each of the transport addresses to the path MTU discovery configuration as a separate peer. This means when the TCP connection is bootstrapped by a given Hello adjacency, the path MTU discovery can operate over that specific TCP connection by using its specific transport address.

Default

no path-mtu-discovery

Platforms

7705 SAR Gen 2

path-mtu-discovery

Syntax

[**no**] **path-mtu-discovery**

Context

[Tree] (config>router>bgp>group path-mtu-discovery)

[Tree] (config>router>bgp>group>neighbor path-mtu-discovery)

[Tree] (config>router>bgp path-mtu-discovery)

Full Context

configure router bgp group path-mtu-discovery

configure router bgp group neighbor path-mtu-discovery

configure router bgp path-mtu-discovery

Description

This command enables Path MTU Discovery (PMTUD) for the associated TCP connections.

When enabled, PMTUD is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint.

When PMTUD is disabled and there is no **tcp-mss** configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration), the router advertises a TCP MSS option of only 1024 bytes, limiting received TCP segments to that size.

The **no** form of this command disables PMTUD.

Default

no path-mtu-discovery

Platforms

7705 SAR Gen 2

21.28 path-preference

path-preference

Syntax

path-preference *value*

no path-preference

Context

[Tree] (config>router>mpls>lsp>secondary path-preference)

Full Context

configure router mpls lsp secondary path-preference

Description

This command enables the use of path preference among configured standby secondary paths per LSP. If all standby secondary paths have a default path-preference value then a non-standby secondary path will remain the active path while a standby secondary is available. A standby secondary path configured with the highest priority (for example, the lowest path-preference value) is made the active path when the primary is not in use. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the highest up-time. Path preference can only be configured on the standby secondary paths.

The **no** form of this command resets the path-preference to the default value.

Default

path-preference 255

Parameters

value

Specifies an alternate path for the LSP if the primary path is not available.

Values 1 to 255

Platforms

7705 SAR Gen 2

21.29 path-profile

path-profile

Syntax

path-profile *profile-id* [**path-group** *group-id*]

no path-profile *profile-id*

Context

[Tree] (config>router>mpls>lsp-template path-profile)

[Tree] (config>router>mpls>lsp path-profile)

Full Context

configure router mpls lsp-template path-profile

configure router mpls lsp path-profile

Description

This command configures the PCE path profile and path group ID.

The PCE supports the computation of disjoint paths for two different LSPs originating and/or terminating on the same or different PE routers. To indicate this constraint to the PCE, the user must configure the PCE path profile ID and path group ID to which the PCE computed or PCE controlled LSP belongs to. These parameters are passed transparently by the PCC to the PCE and are thus opaque data to the router.

The association of the optional path-group ID is to allow the PCE to determine the profile ID that must be used with this path-group ID. One path-group ID is allowed per profile ID. The user can, however, enter the same path-group ID with multiple profile IDs by executing this command multiple times. A maximum of five **path-profile** [**path-group**] entries can be associated with the same LSP.

The **no** form of this command removes the path profile association with the LSP.

Parameters

profile-id

Specifies the profile ID.

Values 1 to 4294967295

path-group ***group-id***

Specifies the path group ID.

Values 0 to 4294967295

Platforms

7705 SAR Gen 2

21.30 path-type

path-type

Syntax

path-type {**ibgp** | **ebgp**}

no path-type

Context

[Tree] (config>router>policy-options>policy-statement>entry>from path-type)

Full Context

configure router policy-options policy-statement entry from path-type

Description

This command matches BGP routes based on their path type (EBGP or IBGP). A route learned from an EBGP peer has path-type **ebgp**. A route learned from an IBGP or confed-EBGP peer has path-type **ibgp**.

A non-BGP route does not match a policy entry if it contains the **path-type** command.

Default

no path-type

Parameters

ibgp

Matches routes from internal BGP peers.

ebgp

Matches routes from external BGP peers.

Platforms

7705 SAR Gen 2

pbr-down-action-override *filter-action*

no pbr-down-action-override

Context

[Tree] (config>filter>ipv6-filter>entry pbr-down-action-override)

[Tree] (config>filter>ip-filter>entry pbr-down-action-override)

Full Context

configure filter ipv6-filter entry pbr-down-action-override

configure filter ip-filter entry pbr-down-action-override

Description

This command allows overriding the default action that is applied for entries with PBR/PBF action defined, when the PBR/PBF target is down.

The **no** form of the command preserves default behavior when PBR/PBF target is down.

Default

no pbr-down-action-override

Parameters

filter-action

Specifies the packets matching the entry.

drop — Specifies that packets matching the entry will be dropped if PBR/PBF target is down.

forward — Specifies that packets matching the entry will be forwarded if PBR/PBF target is down.

filter-default-action — Specifies that packets matching the entry will be processed as per **default-action** configuration for this filter if PBR/PBF target is down.

[Tree] (config>router>mpls>lsp-template pce-control)

Full Context

configure router mpls lsp pce-control

configure router mpls lsp-template pce-control

Description

This command enables a PCE controlled LSP mode of operation. The **pce-control** option means the router delegates full control of the LSP to the PCE (PCE controlled). Enabling it means the PCE is acting in stateful-active mode for this LSP and the PCE will be able to reroute the path following a failure or re-optimize the path and update the router without a request from the router.

The user can delegate CSPF and non-CSPF LSPs, or LSPs that have the **path-computation-method pce** option enabled or disabled. The LSP maintains its latest active path computed by PCE or the router at the time it is delegated. The PCE only makes an update to the path at the next network event or reoptimization.

When configured to no, the PCE controlled mode of operation for the LSP has not effect.

Default

no pce-control

21.40 pce-report

pce-report

Syntax

pce-report rsvp-te {**enable** | **disable**}

pce-report sr-te {**enable** | **disable**}

Context

[Tree] (config>router>mpls pce-report)

Full Context

configure router mpls pce-report

Description

This command separately configures the reporting modes to a PCE for RSVP-TE or SR-TE LSPs. The PCC LSP database is synchronized with the PCE LSP database using the PCEP PCRpt (PCE Report) message for PCC-controlled, PCE-computed, and PCE-controlled LSPs.

The global MPLS level **pce-report** command can be used to enable or disable PCE reporting for all SR-TE LSPs or RSVP-TE LSPs during PCE LSP database synchronization. This configuration is inherited by all LSPs of the specified type. The PCC reports both CSPF and non-CSPF LSPs. The default value is disabled for both types of LSP. This default value is meant to control the introduction of the PCE into an existing network and to let the operator decide if all LSPs of a particular type need to be reported.

The LSP-level **pce-report** command overrides the global configuration for the reporting of LSPs to the PCE. The default value is to inherit the global MPLS level value. The **enable** or **disable** value allows for the override of the inherited value. The **inherit** value explicitly resets the LSP to inherit the global configuration for that LSP type.

If PCE reporting is disabled for the LSP, either due to inheritance or due to LSP-level configuration, then enabling the **pce-control** option for the LSP has no effect.

Default

pce-report rsvp-te disable

pce-report sr-te disable

Parameters

rsvp-te

Specifies the PCE reporting mode for all TE LSPs of RSVP-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of RSVP-TE type

disable — disables PCE reporting for all TE LSPs of RSVP-TE type

sr-te

Specifies the PCE reporting mode for all TE LSPs of SR-TE type.

Values **enable** — enables PCE reporting for all TE LSPs of SR-TE type

disable — disables PCE reporting for all TE LSPs of SR-TE type

Platforms

7705 SAR Gen 2

pce-report

Syntax

pce-report {**enable** | **disable** | **inherit**}

Context

[Tree] (config>router>mpls>lsp-template pce-report)

[Tree] (config>router>mpls>lsp pce-report)

Full Context

configure router mpls lsp-template pce-report

configure router mpls lsp pce-report

Description

This command separately configures the reporting modes to a PCE for RSVP-TE or SR-TE LSPs.

The PCC LSP database is synchronized with the PCE LSP database using the PCEP PCRpt (PCE Report) message for PCC-controlled, PCE-computed and PCE-controlled LSPs.

The global MPLS-level **pce-report** command can be used to enable or disable PCE reporting for all SR-TE LSPs or RSVP-TE LSPs during PCE LSP database synchronization. This configuration is inherited by all LSPs of the specified type. The PCC reports both CSPF and non-CSPF LSPs. The default value is disabled for both types of LSP. This default value is meant to control the introduction of the PCE into an existing network and to let the operator decide if all LSPs of a particular type need to be reported.

The LSP-level **pce-report** command overrides the global configuration for the reporting of LSP to the PCE. The default value is to inherit the global MPLS level value. The **enable** or **disable** value allows for the override of the inherited value. The **inherit** value explicitly resets the LSP to inherit the global configuration for that LSP type.

If PCE reporting is disabled for the LSP, either due to inheritance or due to LSP-level configuration, then enabling the **pce-control** option for the LSP has no effect.

Default

pce-report inherit

Parameters

enable

Enables PCE reporting.

disable

Disables PCE reporting.

inherit

Inherits the global configuration for PCE reporting.

21.42 pe-id-mac-flush-interop

pe-id-mac-flush-interop

Syntax

[**no**] **pe-id-mac-flush-interop**

Context

[Tree] (config>router>ldp>session-params>peer pe-id-mac-flush-interop)

Full Context

configure router ldp session-parameters peer pe-id-mac-flush-interop

Description

This command enables the addition of the PE-ID TLV in the LDP MAC withdrawal (mac-flush) message, under certain conditions, and modifies the mac-flush behavior for interoperability with other vendors that do not support the flush-all-from-me vendor-specific TLV. This flag can be enabled on a per LDP peer basis and allows the flush-all-from-me interoperability with other vendors. When the pe-id-mac-flush-interop flag is enabled for a given peer, the current mac-flush behavior is modified in terms of mac-flush generation, mac-flush propagation and behavior upon receiving a mac-flush.

The mac-flush generation will be changed depending on the type of event and according to the following rules:

- Any all-from-me mac-flush event will trigger a mac-flush all-but-mine message (RFC 4762 compliant format) with the addition of a PE-ID TLV. The PE-ID TLV contains the IP address of the sending PE.
- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITHOUT the addition of the PE-ID TLV, as long as the source spoke SDP is not part of an end-point.
- Any all-but-mine mac-flush event will trigger a mac-flush all-but-mine message WITH the addition of the PE-ID TLV, if the source spoke SDP is part of an end-point and the spoke-sdp goes from down/standby state to active state. In this case, the PE-ID TLV will contain the IP address of the PE to which the previous active spoke-sdp was connected to.

Any other case will follow the existing mac-flush procedures.

When the pe-id-mac-flush-interop flag is enabled for a given LDP peer, the mac-flush ingress processing is modified according to the following rules:

- Any received all-from-me mac-flush will follow the existing mac-flush all-from-me rules regardless of the existence of the PE-ID.
- Any received all-but-mine mac-flush will take into account the received PE-ID, that is all the mac addresses associated to the PE-ID will be flushed. If the PE-ID is not included, the mac addresses associated to the sending PE will be flushed.
- Any other case will follow the existing mac-flush procedures.

When a mac-flush message has to be propagated (for an ingress sdp-binding to an egress sdp-binding) and the pe-id-mac-flush-interop flag is enabled for the ingress and egress TLDP peers, the following behavior is observed:

- If the ingress and egress bindings are spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- If the ingress binding is an spoke SDP and the egress binding a mesh SDP, the PE will propagate the mac-flush message without modifying the PE-ID included in the PE-ID TLV.
- If the ingress binding is a mesh SDP and the egress binding an spoke SDP, the PE will propagate the mac-flush message with its own PE-ID.
- When ingress and egress bindings are mesh-sdp, the mac-flush message is never propagated. This is the behavior regardless of the pe-id-mac-flush-interop flag configuration.

The PE-ID TLV is never added when generating a mac-flush message on a B-VPLS if the **send-bvpls-flush** command is enabled in the I-VPLS. In the same way, no PE-ID is added when propagating mac-flush from a B-VPLS to a I-VPLS when the **propagate-mac-flush-from-bvpls** command is enabled. Mac-flush messages for peers within the same I-VPLS or within the same B-VPLS domain follow the procedures described above.

Default

no pe-id-mac-flush-interop

Full Context

configure router dhcp6 local-dhcp-server failover peer

configure router dhcp6 local-dhcp-server pool failover peer

configure router dhcp local-dhcp-server pool failover peer

configure router dhcp local-dhcp-server failover peer

Description

This command creates a sync tag. DHCP leases can be synchronized per DHCP server or DHCP pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. MCS link is a logical link (IP, or MPLS).

MCS runs over TCP, port 45067 and it is using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5sec, MCS will send its own keepalive to the peer. If a reply is **not** received within three sec, MCS will declare its operation state as DOWN and the DB Sync state as out-of-sync. MCS will consequently notify its clients (DHCP Server being one of them) of this. It can take up to three seconds before the DHCP client realizes that the inter-chassis communication link has failed.

The inter-chassis communication link failure does not necessarily assume the same failed fate for the access links. The two redundant nodes can become isolated from each other in the network. This occurs when only the intercommunication (MCS) link fails. It is important that this MCS link be highly redundant.

The **no** form of this command reverts to the default.

Parameters

ip-address

Specifies the IPv4 or IPv6 address of the peer.

Values

ipv4-address:	a.b.c.d	
:	x:ipv6-addressx:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Syntax

peer *ip-address* [**preference** *preference*]

no peer *ip-address*

Context

[Tree] (config>router>pcep>pcc peer)

Full Context

configure router pcep pcc peer

Description

This command configures the IP address of a peer PCEP speaker. The address is used as the destination address in the PCEP session messages to a PCEP peer.

The **preference** parameter allows the PCC to select the preferred PCE when both have their PCEP sessions successfully established. A maximum of two PCEP peers is supported.

The PCE peer that is not in overload is always selected by the PCC as the active PCE. However, if neither of the PCEs are signaling the overload state, the PCE with the higher numerical preference value is selected, and in case of a tie, the PCE with the lower IP address is selected.

Note:
The system does not support two or more simultaneously active PCEs.

The **no** form of the command removes the specified peer PCEP speaker.

Parameters

ip-address

The IP address of the PCEP peer to be used as the destination address in the PCEP session.

preference

The preference value of the peer.

Values 0 to 100

Default 1

Platforms

7705 SAR Gen 2

peer

Syntax

peer [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

no peer [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address*}

Context

[Tree] (config>system>time>ntp peer)

Full Context

configure system time ntp peer

Description

This command configures symmetric active mode for an NTP peer. It is recommended to configure authentication and to only configure known time servers as peers. Peers may exist within a VPRN service.

Note:
For symmetric peering to operate correctly with a peer accessible through a VPRN, local NTP server functionality must be enabled within the VPRN using the **configure service vprn ntp** command.

The **no** form of the command removes the configured peer.

Parameters

router-instance

Specifies the routing context that contains the interface.

Values *router-name* — Base | Management

service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address

Configures the IPv4 address of the peer that requires a peering relationship to be set up.

Values a.b.c.d

ipv6-address

Configures the IPv6 address of the peer that requires a peering relationship to be set up.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

key-id

Specifies the key ID. Successful authentication requires that both peers must have the same authentication key-id, type, and key value.

Specify the *key-id* that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP peer. If an NTP packet is received by these nodes, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event or trap is generated.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Specifies the NTP version number that is generated by this node. This parameter does not need to be configured when in client mode, in which case all versions are accepted.

Values 2 to 4

Default 4

prefer

When configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

Platforms

7705 SAR Gen 2

Context

[Tree] (config>router>ldp>targeted-session peer-template-map)

Full Context

configure router ldp targeted-session peer-template-map

Description

This command enables the automatic creation of a targeted Hello adjacency and LDP session to a discovered peer. The user configures a targeted session peer parameter template and binds it to a peer prefix policy.

Each application of a targeted session template to a given prefix in the prefix list will result in the establishment of a targeted Hello adjacency to an LDP peer using the template parameters as long as the prefix corresponds to a router-id for a node in the TE database. As a result of this, the user must enable the traffic-engineering option in ISIS or OSPF. The targeted Hello adjacency will either trigger a new LDP session or will be associated with an existing LDP session to that peer.

Up to 5 peer prefix policies can be associated with a single peer template at all times. Also, the user can associate multiple templates with the same or different peer prefix policies. Thus multiple templates can match with a given peer prefix. In all cases, the targeted session parameters applied to a given peer prefix are taken from the first created template by the user. This provides a more deterministic behavior regardless of the order in which the templates are associated with the prefix policies.

Each time the user executes the above command, with the same or different prefix policy associations, or the user changes a prefix policy associated with a targeted peer template, the system re-evaluates the prefix policy. The outcome of the re-evaluation will tell LDP if an existing targeted Hello adjacency needs to be torn down or if an existing targeted Hello adjacency needs to have its parameters updated on the fly.

If a /32 prefix is added to (removed from) or if a prefix range is expanded (shrunk) in a prefix list associated with a targeted peer template, the same prefix policy re-evaluation described above is performed.

The template comes up in the **no shutdown** state and as such it takes effect immediately. Once a template is in use, the user can change any of the parameters on the fly without shutting down the template. In this case, all targeted Hello adjacencies are updated.

The SR OS supports multiple ways of establishing a targeted Hello adjacency to a peer LSR:

- User configuration of the peer with the targeted session parameters inherited from the **config>router>ldp>targeted-session** in the top level context or explicitly configured for this peer in the **config>router>ldp>targ-session>peer** context and which overrides the top level parameters shared by all targeted peers. Let us refer to the top level configuration context as the global context. Some

parameters only exist in the global context; their value will always be inherited by all targeted peers regardless of which event triggered it.

- User configuration of an SDP of any type to a peer with the signaling tldp option enabled (default configuration). In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129) PW template binding in a BGP-VPLS service. In this case the targeted session parameter values are taken from the global context.
- User configuration of a (FEC 129 type II) PW template binding in a VLL service (dynamic multi-segment PW). In this case the target session parameter values are taken from the global context
- User configuration of a mapping of a targeted session peer parameter template to a prefix policy when the peer address exists in the TE database (this feature). In this case, the targeted session parameter values are taken from the template.

Since the above triggering events can occur simultaneously or in any arbitrary order, the LDP code implements a priority handling mechanism in order to decide which event overrides the active targeted session parameters. The overriding trigger will become the owner of the targeted adjacency to a given peer. The following is the priority order:

- Priority 1: manual configuration of session parameters
- Priority 2: mapping of targeted session template to prefix policy.
- Priority 3: auto-tx parameters
- Priority 4: auto-rx parameters
- Priority 5: manual configuration of SDP, PW template binding in BGP-AD VPLS and in FEC 129 VLL.

Any parameter value change to an active targeted Hello adjacency caused by any of the above triggering events is performed on the fly by having LDP immediately send a Hello message with the new parameters to the peer without waiting for the next scheduled time for the Hello message. This allows the peer to adjust its local state machine immediately and maintains both the Hello adjacency and the LDP session in UP state. The only exceptions are the following:

- The triggering event caused a change to the local-lsr-id parameter value. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session. A new Hello adjacency and LDP session will then get established to the peer using the new value of the local LSR ID.
- The triggering event caused the targeted peer shutdown option to be enabled. In this case, the Hello adjacency is brought down which will also cause the LDP session to be brought down if this is the last Hello adjacency associated with the session.

Finally, the value of any LDP parameter which is specific to the LDP/TCP session to a peer is inherited from the **config>router>ldp>session-params>peer** context. This includes MD5 authentication, LDP prefix per-peer policies, label distribution mode (DU or DOD), and so on.

The **no** form of this command deletes the binding of the template to the peer prefix list and brings down all Hello adjacencies to the discovered LDP peers.

21.50 peer-tracking-policy

peer-tracking-policy

Syntax

peer-tracking-policy *policy-name*

no peer-tracking-policy

Context

[Tree] (config>service>vprn>bgp peer-tracking-policy)

Full Context

configure service vprn bgp peer-tracking-policy

Description

This command specifies the name of a policy statement to use with the BGP peer-tracking function on the BGP sessions where this is enabled. The policy controls which IP routes in RTM are eligible to indicate reachability of IPv4 and IPv6 BGP neighbor addresses. If the longest matching route in RTM for a BGP neighbor address is an IP route that is rejected by the policy, or it is a BGP route accepted by the policy, or if there is no matching route, the neighbor is considered unreachable and BGP tears down the peering session and holds it in the idle state until a valid route is once again available and accepted by the policy.

The default peer-tracking policy (when the **no peer-tracking-policy** command is configured) is to use the longest matching active route in RTM that is not an LDP shortcut route or an aggregate route.

Note:
When **peer-tracking** is configured, the peer-tracking policy should only permit one of **direct-interface** or **direct** routes to be advertised to a BGP peer. Advertising both routes will cause the best route to oscillate.

Default

no peer-tracking-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

Platforms

7705 SAR Gen 2

peer-tracking-policy

Syntax

peer-tracking-policy *policy-name*

no peer-tracking-policy

Context

[Tree] (config>service>vprn>radius-server>server pending-requests-limit)

Full Context

configure router radius-server server pending-requests-limit

configure service vprn radius-server server pending-requests-limit

Description

This command specifies the per-server maximum number of outstanding requests sent to the RADIUS server. If the maximum number is exceeded, the next RADIUS server in the pool is selected.

The **no** form of this command removes the limit value from the configuration.

Default

pending-requests-limit 4096

Parameters

limit

Specifies the maximum number of outstanding requests sent to the RADIUS server.

Values 1 to 4096

Platforms

7705 SAR Gen 2

21.53 per-host-authentication

per-host-authentication

Syntax

[**no**] **per-host-authentication**

Context

[Tree] (config>port>ethernet>dot1x per-host-authentication)

Full Context

configure port ethernet dot1x per-host-authentication

Description

This command enables dot1x authenticating per host source mac or VLAN. The port does not allow traffic from any hosts or any MAC. When a host is authenticated via RADIUS policy, its source mac is then allowed through the port, while the port is closed for any other mac. Any traffic from the allowed host is forwarded on the port, including untagged and tagged traffic.

Default

no per-host-authentication

Platforms

7705 SAR Gen 2

21.54 per-peer-queuing

per-peer-queuing

Syntax

[**no**] **per-peer-queuing**

Context

[Tree] (config>system>security per-peer-queuing)

Full Context

configure system security per-peer-queuing

Description

This command enables CPM hardware queuing per peer. This means that when a peering session is established, the router will automatically allocate a separate CPM hardware queue for that peer.

The **no** form of this command disables CPM hardware queuing per peer.

Default

per-peer-queuing

Platforms

7705 SAR Gen 2

21.55 per-user

per-user

Syntax

per-user user-directory *dir-url* **file-name** *file-name*

no per-user

Context

[Tree] (config>system>login-control>login-scripts per-user)

Full Context

configure system login-control login-scripts per-user

Description

This command allows users to define their own login scripts that can be executed each time they first login to a CLI session. The command executes the script " *file-url* / *username* / *file-name*" when the user *username* logs into a CLI session (authenticated by any means including local user database, TACACS+, or RADIUS).

For example:

per-user user-directory "cf1:/local/users" file-name "login-script.txt"

would search for the following script when user "admin" logs in and authenticates via RADIUS:

cf1:/local/users/admin/login-script.txt

The per user login script is executed after any global script executes and before any login-exec script configured against a local user is executed. This allows users, for example, who are authenticated via TACACS+ or RADIUS to define their own login scripts.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

The **no** form of this command disables the execution of any per user login-scripts.

Default

no per-user

Parameters

dir-url

Specifies the path or directory name.

file-name

Specifies the name of the file (located in the *dir-url* directory) including the extension.

Platforms

7705 SAR Gen 2

no percent-rate

Context

[Tree] (config>service>epipe>sap>egress>queue-override>queue percent-rate)

Full Context

configure service epipe sap egress queue-override queue percent-rate

Description

The percent-rate command within the SAP ingress and egress QoS policy enables supports for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate or of its parent scheduler's rate.

When the rates are expressed as a port-limit, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QOS policy to be used on SAPs on different ports without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a local-limit, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QOS policy to be used on SAPs with different parent scheduler rates without needing to use SAP based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR rates will be recalculated based on the defined percentage value.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a percent-rate if the associated QoS policy was also defined as percent-rate).

Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QOS policy.

When no percent-rate is defined within a SAP ingress or egress queue-override, the queue reverts to the defined shaping and CIR rates within the SAP ingress and egress QOS policy associated with the queue.

Parameters

percent-of-line-rate

The percent-of-line-rate parameter is used to express the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the port-limit or local-limit.

Values 0.00 to 100.00

Default 100.00

[Tree] (config>service>vpls>sap>egress>queue-override>queue percent-rate)

Full Context

configure service vpls sap ingress queue-override queue percent-rate

configure service vpls sap egress queue-override queue percent-rate

Description

The **percent-rate** command supports a queue’s shaping rate and CIR rate as a percentage of the egress port’s line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group queue-id will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue’s rates will be 10 times greater on the 10-Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port based queue overrides to modify a queue’s rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the percent-rate command and the **rate** command is executed, the percent-rate values are deleted. In a similar fashion, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

An egress port queue group queue rate override may be expressed as either a percentage or an explicit rate independent on how the queue's template rate is expressed.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns the queue to its default shaping **rate** and **cir** rate. When **no percent-rate** is defined within a port egress queue group queue override, the queue reverts to the defined shaping and CIR rates within the egress queue group template associated with the queue.

Parameters

pir-percent

Specifies the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.00 to 100.00

Default 100.00

configure service ies interface sap ingress queue-override queue percent-rate

configure service ies interface sap egress queue-override queue percent-rate

Description

The **percent-rate** command supports a queue's shaping rate and CIR rate as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group queue-id will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gigabit and a 10-Gigabit Ethernet port, the queue's rates will be 10 times greater on the 10 Gigabit port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

The rate and percent-rate commands override one another. If the current rate for a queue is defined using the percent-rate command and the rate command is executed, the percent-rate values are deleted. In a similar fashion, the percent-rate command causes any rate command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at anytime.

An egress port queue group queue rate override may be expressed as either a percentage or an explicit rate independent on how the queue's template rate is expressed.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns the queue to its default shaping rate and cir rate. When **no percent-rate** is defined within a port egress queue group queue override, the queue reverts to the defined shaping and CIR rates within the egress queue group template associated with the queue.

Parameters

pir-percent

Specifies the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation. The line rate may also be affected by an egress port scheduler defined max-rate.

Values 0.01 to 100.00

configure qos sap-ingress queue percent-rate

Description

This command configures a queue's PIR and CIR as a percentage of the ingress port line rate or as a percentage of its parent scheduler rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port’s speed changes after the queue is created, the queue’s PIR, CIR, and FIR rates will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR, CIR, and FIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form configured in the QoS policy (for example, a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a **rate** (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When no **percent-rate** is defined within a SAP ingress queue-override, the queue uses the defined shaping rate, CIR, and FIR within the SAP ingress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate, CIR, and FIR.

Parameters

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.00 to 100.00

Default 100.00

fir-percent

Specifies the queue's FIR as a percentage dependent on the use of the **port-limit** or **local-limit**. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0.00 to 100.00

Default 100.00

police

Keyword used to specify that traffic feeding into the physical queue instance above the specified PIR rate is dropped. When the **police** keyword is defined, only the PIR rate may be overridden. The **police** keyword is only applicable to SAP ingress.

port-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the port (including the ingress-rate setting) to which the queue is attached. The **port-limit** is the default.

local-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the queue's parent scheduler rate. If there is no parent scheduler rate, or its rate is **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configured PIR, CIR, and FIR percentages are relative to the rate of the reference port (including the ingress-rate setting) to which the queue is attached.

Platforms

7705 SAR Gen 2

percent-rate

Syntax

percent-rate *pir-percent* [**cir** *cir-percent*] [{**port-limit** | **local-limit** | **reference-port-limit**}]

no percent-rate

Context

[Tree] (config>qos>sap-egress>queue percent-rate)

Full Context

configure qos sap-egress queue percent-rate

Description

This command configures a queue's PIR and CIR as a percentage of the egress port line rate or as a percentage of its parent scheduler rate or **agg-rate** rate. When the rates are expressed as a **port-limit**, the actual rates used per instance of the queue will vary based on the port speed. For example, when the same QoS policy is used on a 1 Gb and a 10 Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same QoS policy to be used on SAPs on different ports without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

When the rates are expressed as a **local-limit**, the actual rates used per instance of the queue are relative to the queue's parent scheduler rate or **agg-rate** rate. This enables the same QoS policy to be used on SAPs with different parent scheduler rates without needing to use SAP-based queue overrides to modify a queue's rate to get the same relative performance from the queue. If the parent scheduler rate changes after the queue is created, the queue's PIR and CIR will be recalculated based on the defined percentage value.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

Queue rate overrides can only be specified in the form as configured in the QoS policy (a SAP override can only be specified as a **percent-rate** if the associated QoS policy was also defined as percent-rate). Likewise, a SAP override can only be specified as a rate (kb/s) if the associated QoS policy was also defined as a rate. Queue-overrides are relative to the limit type specified in the QoS policy.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **percent-rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

When no **percent-rate** is defined within a SAP egress queue-override, the queue uses the defined shaping rate and CIR within the SAP egress QoS policy associated with the queue.

The **no** form of this command returns the queue to its default shaping rate and CIR.

Parameters

pir-percent

Specifies the queue's PIR as a percentage dependent on the use of the **port-limit** or **local-limit**.

Values 0.01 to 100.00

Default 100.00

cir-percent

Specifies the queue's CIR as a percentage dependent on the use of the **port-limit** or **local-limit.**

Values 0.00 to 100.00

Default 100.00

port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

Full Context

configure qos queue-group-templates egress queue-group queue percent-rate

Description

The **percent-rate** command within the egress queue group template enables support for a queue's PIR and CIR rate to be configured as a percentage of the egress port's line rate. When the rates are expressed as a percentage within the template, the actual rate used per instance of the queue group *queue-id* will vary based on the port speed. For example, when the same template is used to create a queue group on a 1-Gb and a 10-Gb Ethernet port, the queue's rates will be 10 times greater on the 10 Gb port due to the difference in port speeds. This enables the same template to be used on multiple ports without needing to use port-based queue overrides to modify a queue's rate to get the same relative performance from the queue.

If the port's speed changes after the queue is created, the queue's shaping and CIR rates will be recalculated based on the defined percentage value.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case the configuration of the rate is performed under the **hs-wrr-group** within the egress queue group template.

The **rate** and **percent-rate** commands override one another. If the current rate for a queue is defined using the **percent-rate** command and the **rate** command is executed, the **percent-rate** values are deleted. Similarly, the **percent-rate** command causes any **rate** command values to be deleted. A queue's rate may dynamically be changed back and forth from a percentage to an explicit rate at any time.

The **no** form of this command returns the queue to its default shaping rate and CIR rate.

Parameters

pir-percent

Expresses the queue's shaping rate as a percentage of line rate. The line rate associated with the queue's port may dynamically change due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

cir-percent

The **cir** keyword is optional and when defined, the required *pir-percent* parameter expresses the queue's committed scheduling rate as a percentage of line rate. The line rate associated with the queue's port may change dynamically due to configuration or auto-negotiation and the egress rate setting.

Values 0.01 to 100.00 percent

Default 100.0

port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the port (including the **egress-rate** setting) to which this queue connects. The **port-limit** is the default.

local-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the queue's parent scheduler **rate** or **agg-rate** rate at egress. If there is no parent scheduler rate or **agg-rate** rate, or those rates are **max**, the **port-limit** is used.

reference-port-limit

Keyword used to specify that the configure PIR and CIR percentages are relative to the rate of the reference port (including the **egress-rate** setting) to which this queue connects.

21.61 persist

persist

Syntax

persist {**on** | **off**}

Context

[Tree] (bof persist)

Full Context

bof persist

Description

This command specifies whether the system will preserve system indexes when a **save** command is executed in classic or mixed configuration mode. During a subsequent boot, the index file is read along with the configuration file. As a result, a number of system indexes are preserved between reboots, including the interface index, LSP IDs, path IDs, and so on. This reduces resynchronizations of the Network Management System (NMS) with the affected network element.

This command is ignored in model-driven configuration mode. In model-driven mode, system indices are always saved and they are embedded in the configuration file.

In the event that persist is **on** and the reboot with the appropriate index file fails in classic or mixed configuration mode, SNMP is operationally shut down to prevent the management system from accessing and possibly synchronizing with a partially booted or incomplete network element. To enable SNMP access, enter the **config>system>snmp>no shutdown** command.

If **persist** is enabled and the **admin save** *url* command is executed with an FTP path used as the *url* parameter, two FTP sessions simultaneously open to the FTP server. The FTP server must be configured to allow multiple sessions from the same login, otherwise, the configuration and index files will not be saved correctly.

Note:

- In classic or mixed configuration mode, persistency files (.ndx) are saved on the same disk as the configuration files and the image files.
- When an operator sets the location for the persistency file in classic or mixed configuration mode, the system will check to ensure that the disk has enough free space. If there is not enough free space, the persistency will not become active and a trap will be generated. Then, it is up to the operator to free adequate disk space. In the meantime, the system will perform a space availability check every 30 seconds. As soon as the space is available the persistency will become active on the next (30 second) check.

Default

persist off

Parameters

on

Enables the system index saves between reboots.

off

Disables the system index saves between reboots.

Platforms

7705 SAR Gen 2

configure system persistence

Description

Commands in this context configure persistence parameters on the system.

The persistence feature enables state information learned through applications such as subscriber management, DHCP server, or application assurance to be retained across reboots.

Platforms

7705 SAR Gen 2

persistence

Syntax

persistence [*persistence-client*]

no persistence

Context

[Tree] (debug>system persistence)

Full Context

debug system persistence

Description

This command displays persistence debug information.

Parameters

persistence-client

Displays persistence debug information.

Values		
	ancp	ANCP
	application-assurance	application-assurance
	dhcp-server	local DHCP server
	nat-fwds	NAT port forwarding
	python-policy-cache	Python Cache
	submgt	subscriber management

Platforms
7705 SAR Gen 2

21.63 persistent-subscriptions

persistent-subscriptions

Syntax
persistent-subscriptions

21.64 pfs

pfs

Syntax
pfs [**dh-group** {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}]

no pfs

Context

[Tree] (config>ipsec>ike-policy pfs)

Full Context

configure ipsec ike-policy pfs

Description

This command enables perfect forward secrecy on the IPsec tunnel using this policy. PFS provides for a new Diffie-Hellman key exchange each time the SA key is renegotiated. After that SA expires, the key is forgotten and another key is generated (if the SA remains up). This means that an attacker who cracks part of the exchange can only read the part that used the key before the key changed. There is no advantage in cracking the other parts if they attacker has already cracked one.

The **no** form of this command disables PFS. If this it turned off during an active SA, when the SA expires and it is time to re-key the session, the original Diffie-Hellman primes will be used to generate the new keys.

Default

no pfs

Parameters

dh-group {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits

Group 2: 1024 bits

Group 5: 1536 bits

Group 14: 2048 bits

Group 15: 3072 bits

Group 19: P-256 ECC Curve, 256 bits

Group 20: P-384 ECC Curve, 384 bits

Group 21: P-512 ECC Curve, 512 bits

Platforms

7705 SAR Gen 2

21.65 pfs-dh-group

pfs-dh-group

Syntax

pfs-dh-group {**1** | **2** | **5** | **14** | **15** | **19** | **20** | **21**}

pfs-dh-group inherit

no pfs-dh-group

Context

[Tree] (config>ipsec>ipsec-transform pfs-dh-group)

Full Context

configure ipsec ipsec-transform pfs-dh-group

Description

This command specifies the Diffie-Hellman group to be used for Perfect Forward Secrecy (PFS) computation during CHILD_SA rekeying.

The **no** form of this command reverts to the default.

Default

pfs-dh-group inherit

Parameters

{1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies the Diffie-Hellman group to achieve PFS.

inherit

Specifies that the value of the DH group used by the system is inherited from the IPsec gateway or IPsec tunnel.

Platforms

7705 SAR Gen 2

21.66 phone

phone

Syntax

[**no**] **phone** *phone-number*

Context

[Tree] (config>service>cust phone)

Full Context

configure service customer phone

Description

This command adds telephone number information for a customer ID. The **no** form of this command removes the phone number value from the customer ID.

Parameters

string

Specifies the customer phone number entered as an ASCII string up to 80 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Any printable, seven bit ASCII characters may be used within the string.

Platforms

7705 SAR Gen 2

21.67 pim

pim

Syntax

[**no**] **pim**

Context

[Tree] (config>service>vprn pim)

Full Context

configure service vprn pim

Description

This command configures a Protocol Independent Multicast (PIM) instance in the VPRN service. When an PIM instance is created, the protocol is enabled. PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router supports PIM sparse mode (PIM-SM).

The **no** form of this command deletes the PIM protocol instance removing all associated configuration parameters.

Platforms

7705 SAR Gen 2

pim

Syntax

[**no**] **pim**

Context

[Tree] (config>router pim)

Full Context

configure router pim

Description

This command enables a Protocol Independent Multicast (PIM) instance.

PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router OS supports PIM sparse mode (PIM-SM).

The **no** form of this command disables the PIM instance.

Default

no pim

Platforms

7705 SAR Gen 2

22 p Commands – Part II

22.1 pim-ssm-scaling

pim-ssm-scaling

Syntax

[**no**] **pim-ssm-scaling**

Context

[Tree] (config>router>pim pim-ssm-scaling)

Full Context

configure router pim pim-ssm-scaling

Description

This command enables an increase of PIM SSM (S,G) scaling to a maximum of 256kper system. The per-complex (FP) multicast scaling limit is still in place, but multiple complexes can be used to achieve the 256k per-system (S,G) scaling.

The **no** form of this command disables the increase in PIM SSM scaling.

Default

no pim-ssm-scaling

Platforms

7705 SAR Gen 2

22.2 ping

ping

Syntax

ping *ip-address* | *dns-name* [**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}] [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**source** *ip-address*] [**count** *requests*] [**detail** | **rapid**] [**do-not-fragment**] [**fc** *fc-name*] [**interval centisecs** | **secs**] [**pattern** *pattern*] [**size** *bytes*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

ping *ipv4-address* **subscriber-id** *sub-ident-string* [{**router** *router-or-service*} | {**router-instance** *router-instance*} | {**service-name** *service-name*}] [**source** *ip-address*] [**count** *requests*] [**detail** | **rapid**] [**do-not-fragment**] [**fc** *fc-name*] [**interval centisecs** | **secs**] [**pattern** *pattern*] [**size** *bytes*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

ping srv6-policy color *color* **endpoint** *ipv6-address* [**segment-list** *segment-list*] [**candidate-path protocol-owner static** | **bgp** [**preference** *preference*] [**distinguisher** *distinguisher*]] [**count** *requests*] [**detail** | **rapid**] [**do-not-fragment**] [**fc** *fc-name*] [**interval centisecs** | **secs**] [**pattern** *pattern*] [**size** *bytes*] [**timeout** *timeout*] [**tos** *type-of-service*] [**ttl** *time-to-live*]

Context

[Tree] (ping)

Full Context

ping

Description

This command sends a ping to a destination to verify IP reachability.

Use the **ping** {*ip-address* | *dns-name*} [{**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}}] command syntax to send a generic ping. This is the basic TCP/IP utility to verify IP reachability.

Use the **ping** *ipv4-address* **subscriber-id** *sub-ident-string* command syntax to send a ping to verify L2-Aware remote host reachability.

The L2-Aware form of this command can be initiated from the gateway IPv4 address in the inside routing context or from any IPv4 address in the outside routing context. If the gateway IPv4 address is used as the source address, it must be explicitly specified in conjunction with the L2-Aware syntax.

Any source address can be used for the ping to test the relevant NAT policy. If the source address refers to a policy that is not configured on the router, the message "MINOR: OAM #2160 router ID is not an outside router for this subscriber" is displayed. The source address does not need to belong to the system.

If the outside routing context is not specified, by default, the Base router is selected. If the specified or default Base router instance is not the outside routing context for the subscriber, the L2-Aware form of this command fails to execute, and the message "MINOR: OAM #2160 router ID is not an outside router for this subscriber" is displayed.

The NAT application shares query IDs between L2-Aware pings and ICMP or GRE traffic that has undergone NAT and is destined for a DMZ host. If there is query ID space exhaustion, ICMP or GRE flows destined for DMZ hosts are deleted, so their query IDs can be reused for the requested L2-Aware pings.

Use the **ping srv6-policy color** *color* **endpoint** *ipv6-address* command syntax to launch a ping for an SRv6 policy matching a specific color and endpoint. The ping probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the ping probe is sent on the lowest available segment list.

Parameters

bypass-routing

Specifies whether to send the ping request to a host on a directly attached network, bypassing the routing table.

bytes

Specifies the request packet size in bytes, expressed as a decimal integer.

Values 0 to 16384

Default 56

candidate-path

Specifies a candidate path of the SRv6 policy to ping. The candidate path does not need to be the currently active candidate path.

centiseconds

Sets the interval in centiseconds.

Values 1 to 10000 centiseconds if **rapid** is selected.

Default 1 centisecond if **rapid** is selected.

detail

Displays detailed information.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the ping probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

do-not-fragment

Sets the DF (Do Not Fragment) bit in the ICMP ping packet (does not apply to ICMPv6).

dns-name

Specifies the DNS name of the far-end device on which to send the **svc-ping** request message, expressed as a character string.

fc-name

Specifies the forwarding class of the MPLS echo request packets.

Values be, l2, af, l1, h2, ef, h1, nc

Default nc

interface-name

Specifies the name of an IP interface. The name must already exist in the **configure router interface** context.

ip-address

Specifies the far-end IP address, in dotted decimal notation, on which to send the **svc-ping** request message.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x: [0 to FFFF]H

d: [0 to 255]D

interface: up to 32 characters, mandatory for link local addresses

next-hop *ip-address*

Displays only static routes with the specified next hop IP address.

Values

ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]

pattern

Specifies that the date portion in a ping packet that is filled with the pattern value specified. If not specified, position information is filled instead.

Values 0 to 65535

Default system-generated sequential pattern

preference

Specifies the preference of the SRv6 policy candidate path to send the ping probe on.

Values 0 to 4294967295

Default 100

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to ping.

Values bgp — Specifies a BGP SRv6 policy.

static — Specifies a locally configured static SRv6 policy.

rapid

Specifies that packets be generated as fast as possible instead of the default 1 per second. Changes the units for the **interval** command from seconds to centiseconds.

requests

Specifies the number of times to perform an OAM ping probe operation. Each OAM echo message request must either time out or receive a reply before the next message request is sent.

Values 1 to 100000

Default 5

router-instance

Specifies the preferred method for entering a service name. Stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, *cpm-vr-name*, vpls-management

vprn-svc-name: The service name, up to 64 characters

cpm-vr-name: The CPM VR name, up to 32 characters

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is preferred for specifying the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

seconds

Overrides the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Default 5

Values 1 to 10

secs

Sets the interval in seconds.

Values 1 to 1000 seconds if **secs** is selected.

Default 1 second if **secs** is selected.

service-name

Specifies the alias function that allows the service-name to be used, converted, and stored as a service ID.

sub-ident-string

Specifies the L2-Aware NAT subscriber to which ICMP-ping is sent, up to 32 characters. The **subscriber-id** keyword serves as a differentiator between the subscribers with the same IP address in the same routing context (which is allowed in L2-Aware NAT). The **subscriber-id** keyword is mandatory for L2-Aware IPv4 ping, but optional in generic ping framework.

source *ip-address*

Specifies the IP address to be used.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

timeout

Specifies the time out, in seconds.

Values 1 to 10

Default 5

type-of-service

Specifies the service type.

Values 0 to 255

Default 0

time-to-live

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

Values 1 to 128

Default 64

srv6-policy

Keyword to specify that the ping probe is applied to an SRv6 policy.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

endpoint *ipv6-address*

Specifies an endpoint as the target of the ping.

Values

ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

segment-list

Specifies the segment list to trace.

Values 1 to 32

22.3 ping-reply

ping-reply

Syntax

[**no**] **ping-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp ping-reply)

Full Context

configure service ies interface ipv6 vrrp ping-reply

Description

This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The ping request can be received on any routed interface.

Ping must not have been disabled at the management security level (either on the parental Ip interface or based on the ping source host address). when ping-reply is not enabled, icmp Echo Requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests regardless of the setting of ping-reply configuration.

The ping-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ping-reply command is not executed, ICMP echo requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

Default

no ping-reply

ping-reply

Syntax

[**no**] **ping-reply**

Context

[Tree] (config>router>if>vrrp ping-reply)

[Tree] (config>router>if>ipv6>vrrp ping-reply)

Full Context

configure router interface vrrp ping-reply

configure router interface ipv6 vrrp ping-reply

Description

This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router

IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

SR OS allows this access limitation to be selectively lifted for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ping-reply** command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The Ping request can be received on any routed interface. Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address).

When **ping-reply** is not enabled, ICMP echo requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests regardless of the **ping-reply** setting.

The **ping-reply** command is only available in non-owner **vrrp** nodal context.

By default, ICMP echo requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command configures discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

Default

no ping-reply — ICMP echo requests to the virtual router instance IP addresses are discarded.

configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big

configure ipsec tunnel-template icmp6-generation pkt-too-big

configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big

configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big

Description

This command enables the system to send ICMPv6 PTB (Packet Too Big) messages on the private side and optionally specifies the rate.

With this command configured, the system sends PTB back if it received an IPv6 packet on the private side that is bigger than 1280 bytes and also exceeds the private MTU of the tunnel.

The **ip-mtu** command (under **ipsec-tunnel** or **tunnel-template**) specifies the private MTU for the ipsec-tunnel or dynamic tunnel.

The **no** form of this command reverts **interval** and **message-count** values to their default values.

22.10 policer

policer

Syntax

policer *policer-id* [**create**]

no policer *policer-id*

Context

[Tree] (config>card>fp>ingress>network>qgrp>policer-over policer)

[Tree] (config>card>fp>ingress>access>qgrp>policer-over policer)

Full Context

configure card fp ingress network queue-group policer-override policer

configure card fp ingress access queue-group policer-override policer

Description

This command creates, modifies or deletes a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping fails.

The **no** form of this command deletes a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters

policer-id

Specifies that the *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 32

Platforms

7705 SAR Gen 2

policer

Syntax

policer *policer-id* [**create**]

no policer *policer-id*

Context

[Tree] (config>service>epipe>sap>egress>policer-over policer)

Full Context

configure service epipe sap egress policer-override policer

Description

This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

Parameters

policer-id

The *policer-id* parameter is required when executing the policer command within the policer-overrides context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the policer-id.

create

The create keyword is required when a **policer** policer-id override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

Syntax

policer *policer-id* [**fp-redirect-group**]

no policer

Context

[Tree] (config>qos>sap-ingress>fc policer)

Full Context

configure qos sap-ingress fc policer

Description

Within a sap-ingress QoS policy forwarding class context, the **policer** command is used to map packets that match the forwarding class and are considered unicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination. If ingress forwarding logic has resolved a unicast destination (the packet does not need to be sent to multiple destinations), it is considered to be a unicast packet and will be mapped to either an ingress queue (using the **queue** *queue-id* or **queue** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**policer** *policer-id*). The **queue** and **policer** commands within the forwarding class context are mutually exclusive. By default, the unicast forwarding type is mapped to the SAP ingress default queue (queue 1). If the **policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

When the unicast forwarding type within a forwarding class is mapped to a policer, the unicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unicast forwarding type within the forwarding class to the default queue. If all forwarding class forwarding types had been removed from the default queue, the queue will not exist on the SAPs or subscriber or multiservice sites associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the unicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7705 SAR Gen 2

policer

Syntax

policer *policer-id* [**create**]

no policer *policer-id*

Context

[Tree] (config>qos>sap-ingress policer)

Full Context

configure qos sap-ingress policer

Description

This command is used in the sap-ingress and sap-egress QoS policies to create, modify, or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may be defined to have up to 63 policers (numbered 1 through 63) while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers or multiservice sites associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

When a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet, based on a defined number of bytes.

When a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscriber or multiservice sites associated with the QoS policy when all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

Parameters

policer-id

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

Values 1 to 63

Platforms

7705 SAR Gen 2

policer

Syntax

policer *policer-id* [{[**port-redirect-group-queue**] [**queue** *queue-id*] | **group** *group-name* [**instance** *instance-id*] [**queue** *queue-id*]}]

no policer

Context

[Tree] (config>qos>sap-egress>fc policer)

Full Context

configure qos sap-egress fc policer

Description

Within a sap-egress QoS policy forwarding class context, the policer command is used to map packets that match the forwarding class to the specified policer-id. The specified policer-id must already exist within the sap-egress QoS policy. The forwarding class of the packet is first discovered at ingress, based on the ingress classification rules. When the packet arrives at egress, the sap-egress QoS policy may match a forwarding class reclassification rule that overrides the ingress derived forwarding class. The forwarding

class context within the sap-egress QoS policy is then used to map the packet to an egress queue (using the queue queue-id, or port-redirect-group queue queue-id, or group queue-group-name instance instance-id queue queue-id commands) or an egress policer (policer policer-id). The queue and policer commands within the forwarding class context are mutually exclusive. By default, the forwarding class is mapped to the SAP egress default queue (queue 1). If the **policer** *policer- id* command is executed, any previous policer mapping or queue mapping for the forwarding class is overridden if the policer mapping is successful.

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.
- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-**

egress QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default

no policer

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

Values 1 to 63

port-redirect-group-queue

Used to override the forwarding class default egress queue destination to an egress port queue group. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the SAP. Therefore, this parameter is only valid if SAP-based redirection is required.

queue *queue-id*

This parameter overrides the forwarding class default egress queue destination to a specified *queue-id*. If port-redirect-group is not configured, this will be a local SAP queue of that *queue-id*. A queue of ID *queue-id* must exist within the egress QoS policy. If **port-redirect-group-queue** is configured, the **queue** *queue-id* in the egress port queue group instance is used.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition.

group *group-name*

The **group** *queue-group-name* is optional and is used to override the forwarding class's default egress queue destination. If the queue group-queue-id parameter is not specified, the forwarding class map within the specified group's template is used to derive which queue within the group will receive the forwarding class's packets. An egress queue group template must exist for the specified queue-group-name or the policer command will fail. The specified queue-group-name must also exist as an egress queue group on the ports

where SAPs and subscribers associated with the sap-egress policy are applied or the policer command will fail.

Values Any qualifying egress queue group name

Default policer-output-queues

queue *queue-id*

The **queue** *group-queue-id* is optional when the group queue-group-name parameter is specified and is used to override the forwarding class mapping within the group's egress queue group template. The specified group-queue-id must exist within the group's egress queue group template or the policer command will fail.

Values 1 to 8

Default Derived from forwarding class assignment in queue-group definition

instance *instance-id*

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 40960

Default 1

7705 SAR Gen 2

policer

Syntax

policer *policer-id* [**create**]

no policer

Context

[Tree] (config>qos>sap-egress policer)

Full Context

configure qos sap-egress policer

Description

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.
- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group queue-group-name is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template queue-group- name, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed

from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

Default

no policer

Parameters

policer-id

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

[Tree] (cfg>qos>qgrps>egr>queue-group policer)

Full Context

configure qos queue-group-templates ingress queue-group policer

configure qos queue-group-templates egress queue-group policer

Description

This command is used in ingress and egress queue-group templates to create, modify, or delete a policer.

Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. While a policer may be defined in a queue-group template, it is not actually created until the queue-group template is instantiated on the ingress context of a forwarding plane or on the egress context of a port.

When a policer is created, the policer's metering rate and profiling rates may be defined, as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

When a policer is created, it cannot be deleted from the queue-group template unless any forwarding classes that are redirected to the policer are first removed.

The **no** version of this command deletes the policer.

Parameters

policer-id

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the **create** keyword to actually add the new policer ID to the QoS policy) and the system enters that new policer's context for possible parameter modification.

[Tree] (config>service>ies>if>sap>egress policer-control-override)

Full Context

configure service ies interface sap ingress policer-control-override

configure service ies interface sap egress policer-control-override

Description

This command, within the SAP ingress or egress contexts, creates a CLI node for specific overrides to the applied policer-control-policy. A policy must be applied for a policer-control-overrides node to be created. If the policer-control-policy is removed or changed, the policer-control-overrides node is automatically deleted from the SAP.

The **no** form of this command removes any existing policer-control-policy overrides and the policer-control-overrides node from the SAP.

Default

no policer-control-override

Parameters

create

The create keyword is required when the policer-control-overrides node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

configure service epipe sap egress policer-control-policy

configure service epipe sap ingress policer-control-policy

Description

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied.

When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis.

For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As previously stated, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated in the Tier 1 and Tier 2 Arbiter subsection, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still

higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

Each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

Parameters

policy-name

Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

create

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

configure service vpls sap egress policer-control-policy

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine

how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's

discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

create

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

configure service ies interface sap egress policer-control-policy

configure service ies interface sap ingress policer-control-policy

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is

parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy

instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

[Tree] (config>service>vprn>if>sap>egress policer-control-policy)

Full Context

configure service vprn interface sap ingress policer-control-policy

configure service vprn interface sap egress policer-control-policy

Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must

be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

Parameters

policy-name

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

Full Context

configure service customer multi-service-site ingress policer-control-policy

configure service customer multi-service-site egress policer-control-policy

Description

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and not subject to bandwidth control by the policy instance.

Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and thus the root arbiter’s parent policer.

Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet’s child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution

capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

Fair and Unfair Bandwidth Control

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

Parent Policer Priority Level Thresholds

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-

unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

Root Arbiter's Parent Policer's Priority Aggregate Thresholds

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

In order to derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of the command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

Parameters

policy-name

Specifies the policy name up to 32 characters in length. Each policer-control-policy must be created with a unique policy name. The name must adhere to the system policy ASCII naming requirements. If the defined policy name already exists, the system will enter that policy's context for editing purposes. If policy name does not exist, the system will attempt to create a policy with the specified name.

policy

Syntax

policy *vrrp-policy-id*

no policy

Context

[Tree] (config>service>ies>if>ipv6>vrrp policy)

Full Context

configure service ies interface ipv6 vrrp policy

Description

This command creates VRRP control policies. The VRRP policy ID must be created by the policy command prior to association with the virtual router instance.

The policy command provides the ability to associate a VRRP priority control policy to a virtual router instance. The policy may be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base-priority dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority may eventually be restored to the base-priority value.

The policy command is only available in the non-owner **vrrp** *virtual-router-id* nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the policy command is not executed, the base-priority will be used as the in-use priority.

The **no** form of this command removes any existing VRRP priority control policy association from the virtual router instance. All such associations must be removed prior to the policy being deleted from the system.

Parameters

vrrp-policy-id

The vrrp-policy-id parameter associated the corresponding VRRP priority control policy-id with the virtual router instance. The vrrp-policy-id must already exist in the system for the policy command to be successful.

Values 1 to 9999

policy

Syntax

policy *policy-name*

no policy

Context

[Tree] (config>service>vprn>bgp>next-hop-res policy)

Full Context

configure service vprn bgp next-hop-resolution policy

Description

This command specifies the name of a policy statement to use with the BGP next-hop resolution process. The policy controls which IP routes in RTM are eligible to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next-hops to MPLS tunnels. If a BGP next-hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved; if the route N is accepted by the policy then it becomes the resolving route for R.

The default next-hop resolution policy (when the **no policy** command is configured) is to use the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

Default

no policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

Context

[Tree] (config>router>if>ipv6>vrrp policy)

[Tree] (config>router>if>vrrp policy)

Full Context

configure router interface ipv6 vrrp policy

configure router interface vrrp policy

Description

This command adds a VRRP priority control policy association with the virtual router instance.

To further augment the virtual router instance base priority, VRRP priority control policies can be used to override or adjust the base priority value depending on events or conditions within the chassis.

The policy can be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority can eventually be restored to the base **priority** value.

The **policy** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the **policy** command is not executed, the base **priority** is used as the in-use priority.

The **no** form of the command removes existing VRRP priority control policy associations from the virtual router instance. All associations must be removed prior to deleting the policy from the system.

Default

no policy — No VRRP priority control policy is associated with the virtual router instance.

Parameters

vrrp-policy-id

The policy ID of the VRRP priority control expressed as a decimal integer. The *vrrp-policy-id* must already exist for the command to function.

Values 1 to 9999

Platforms

7705 SAR Gen 2

policy

Syntax

policy *policy-id* **context** *context-value*

policy *policy-id* **context name** *name*

no policy *policy-id*

Context

[Tree] (config>vrrp policy)

Full Context

configure vrrp policy

Description

This command creates the context to configure a VRRP priority control policy which is used to control the VRRP in-use priority based on priority control events. It is a parental node for the various VRRP priority control policy commands that define the policy parameters and priority event conditions.

The virtual router instance **priority** command defines the initial or base value to be used by non-owner virtual routers. This value can be modified by assigning a VRRP priority control policy to the virtual router instance. The VRRP priority control policy can override or diminish the base priority setting to establish the actual in-use priority of the virtual router instance.

The **policy** *policy-id* command must be created first, before it can be associated with a virtual router instance.

Because VRRP priority control policies define conditions and events that must be maintained, they can be resource intensive. The number of policies is limited to 1000.

The *policy-id* do not have to be consecutive integers. The range of available policy identifiers is from 1 to 9999.

The **no** form of the command deletes the specific *policy-id* from the system. The *policy-id* must be removed first from all virtual router instances before the **no policy** command can be issued. If the *policy-id* is associated with a virtual router instance, the command will fail.

Parameters

policy-id

The VRRP priority control ID expressed as a decimal integer that uniquely identifies this policy from any other VRRP priority control policy defined on the system. Up to 1000 policies can be defined.

Values 1 to 9999

context-value

Specifies the service ID to which this policy applies. A value of zero (0) means that this policy does not apply to a service but applies to the base router instance.

Values 1 to 2147483647

Platforms

7705 SAR Gen 2

policy

Syntax

Full Context

configure system security dist-cpu-protection policy

Description

This command configures one of the maximum 18 Distributed CPU Protection (DCP) policies. These policies can be applied to objects such as SAPs, network interfaces or ports.

Parameters

policy-name

Specifies the name of the policy, up to 32 characters.

create

Keyword used to create a new policy.

type

Specifies the Distributed CPU protection type for the policy.

Values access-network — Specifies this is a distributed CPU protection policy for access or network interfaces.

port — Specifies this is a distributed CPU protection policy for ports.

Default access-network

Platforms

7705 SAR Gen 2

policy

Syntax

policy *policy-name*

no policy

Context

[Tree] (config>router>bgp>next-hop-resolution policy)

Full Context

configure router bgp next-hop-resolution policy

Description

This command specifies the policy statement name to use with the BGP next-hop resolution process. The policy determines the eligibility of IP routes in the RTM to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next hops to MPLS tunnels.

For example, if a BGP next hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved. If the route N is accepted by the policy, it becomes the resolving route for R.

The **no** form of this command reverts to the default next-hop resolution policy, which uses the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

Default

no policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

Platforms

7705 SAR Gen 2

policy

Syntax

policy *plcy-or-long-expr*

no policy

Context

[Tree] (config>router>policy-options>policy-statement>entry>from policy)

Full Context

configure router policy-options policy-statement entry from policy

Description

This command is used to call another policy by name and evaluate it as a subroutine, or to evaluate a logical expression of subroutine policies.

If the result of the subroutine evaluation is an 'accept', then the route is considered to match the entry in the parent policy that called the subroutine. If the result of the subroutine evaluation is a 'reject', then the route is considered a non-match of the entry in the parent policy that called the subroutine.

Up to 3 levels of subroutine calls are supported. If a subroutine at maximum depth has this command, it is automatically considered a non-match of all routes.

The **no** form of this command removes the policy statement as a match criterion.

Default

no policy

Parameters

plcy-or-long-expr

Specifies the name of a single **policy-statement** (up to 64 characters in length) or a policy logical expression (up to 255 characters in length) consisting of **policy-statement** names (enclosed in square brackets), logical operations ('and', 'or', 'not'), and parentheses for grouping.

policy-statement

Syntax

[**no**] **policy-statement** *name*

Context

[Tree] (config>router>policy-options policy-statement)

Full Context

configure router policy-options policy-statement

Description

This command creates the context to configure a route policy statement.

Route policy statements control the flow of routing information to and from a specific protocol, set of protocols, or to a specific BGP neighbor.

The **policy-statement** is a logical grouping of match and action criteria. A single **policy-statement** can affect routing in one or more protocols and/or one or more protocols peers/neighbors. A single **policy-statement** can also affect both the import and export of routing information.

The **no** form of this command deletes the policy statement.

Default

no policy-statement

Parameters

name

Specifies the route policy statement name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

configure router nat outside pool

Description

This command creates a NAT pool in the outside routing context. The NAT pool defines the parameters that will be used for IP address and port translation within the pool.

Parameters

nat-pool-name

Specifies the NAT pool name, up to 32 characters.

nat-group-id

Specifies the NAT group ID.

Values 1 to 4

create

Creates the instance.

pool-type

Species the pool type.

Values large-scale, l2-aware, wlan-gw-anchor

applications

This creation-time parameter configures the NAT pool for protocol agnostic operation. The IP addresses are translated in 1:1 fashion regardless of the protocol. No ports are translated for TCP or UDP traffic. Traffic through the pool can be initiated from inside or outside. When nat-pool is configured in agnostic mode, certain parameters in the pool are pre-set and cannot be changed:

- mode one-to-one

- port-forwarding-range 0
- port-reservation blocks 1
- subscriber-limit 1
- deterministic port-reservation 65536.

This pool is used to configure static 1:1 NAT, where the operator have the control of the mapping between the inside and outside IP addresses. The static IP address mapping is using CLI constructs used in deterministic NAT (prefix and map deterministic NAT commands in the inside routing context).

ALG for TCP/UDP is supported in the protocol agnostic pool.

Values agnostic

Full Context

configure service nat nat-policy pool

Description

This command configures the NAT pool of this policy.

Parameters

nat-pool-name

Specifies the name of the NAT pool, up to 32 characters.

router-instance

Specifies the router instance the pool belongs to, either by router name or service ID.

Values 1 to 2147483647 svc-name — a string up to 64 characters.

Values *router-name*: "Base" | "management"

Default Base

service-name

Specifies the name of the service, up to 64 characters.

[Tree] (config>service>ies>if>arp-host-route populate)

Full Context

configure service vprn interface ipv6 nd-host-route populate

configure service vprn interface arp-host-route populate

configure service ies interface arp-host-route populate

Description

This command enables the creation of ARP/ND host-route entries in the route-table out of a certain ARP/ND entry type.

The **no** form of this command reverts to the default.

Default

no populate

Parameters

evpn

Enables the creation of ARP-ND host routes in the route table out of EVPN ARP/ND entries (entries learned from EVPN MAC/IP routes).

dynamic

Enables the creation of ARP-ND host routes in the route table out of dynamic ARP/ND entries (learned from received ARP/ND messages from the hosts).

static

Enables the creation of ARP-ND host routes in the route table out of configured static ARP/ND entries.

route-tag [*1..255*]

Specifies the route tag that is added in the route table for ARP-ND host routes of type **evpn**, **dynamic**, or **static**. This tag can be matched on BGP VRF export and BGP peer export policies.

Platforms

7705 SAR Gen 2

22.25 port

port

Syntax

no port *port-id*]

Context

[Tree] (config>redundancy>multi-chassis>peer>sync port)

Full Context

configure redundancy multi-chassis peer sync port

Description

This command specifies the port to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

Parameters

port-id

Specifies the port to be synchronized with the multi-chassis peer.

Values

port-id	slot/mda/port	
lag-id	lag-id	
	lag	keyword
	id	1 to 200
pw-id	pw-*id*	
	pw	keyword
	id	1 to 10239

sync-tag

Specifies a synchronization tag, up to 32 characters in length, to be used while synchronizing this port with the multi-chassis peer.

create

Creates an entry; mandatory while creating an entry.

Platforms

7705 SAR Gen 2

port

Syntax

[**no**] **port** {*port-id* | *aps-id* | *connector-port-id*}

Context

[Tree] (config port)

Full Context

configure port

Description

This command enables access to the context to configure ports, multilink bundles, and bundle protection groups (BPGs). Before a port can be configured, the chassis slot must be provisioned with a valid card type and the MDA parameter must be provisioned with a valid MDA type.

Default

No ports are configured. All ports must be explicitly configured and enabled.

Parameters

port-id

Specifies the physical port ID in the following format:

Values *slot*/*mda*/*port* [.*channel*]

for GNSS RF ports:

A/gnss or **B/gnss**

aps-id

This option configures APS on unbundled SONET/SDH ports. All SONET-SDH port parameters, with certain exceptions, for the working and protection circuit ports must be configured in the **config>port>aps-id** context. The working and protection circuit ports inherit all those parameters configured. The exception parameters for the working and protect circuits can be configured in the **config>port>sonet-sdh** context. Exception list commands include:

- clock-source
- [no] loopback
- [no] report-alarm
- section-trace
- [no] threshold

When an **configure port aps-id** is created all applicable parameters under the port CLI tree (including parameters under any submenus) assume **aps-id** defaults, or when those are not explicitly specified, default to SONET/SDH port defaults for any SONET port.

All but a few exception SONET/SDH parameters for the working channel port must be configured in the **configure port sonet-sdh** context. The protection channel inherits all the configured parameters. The exception parameters for the protection channel can be configured in the **configure port sonet-sdh** context.

Signal failure (SF) and signal degrade (SD) alarms are not enabled by default on POS interfaces. It is recommended to change the default alarm notification configuration for POS ports that belong to APS groups in order to be notified of SF/SD occurrences to be able to interpret the cause for an APS group to switch the active line.

For path alarms, modify the logical line aps-id in the **configure port aps-***id* **<sonet-sdh>path report-alarm** context. For example:

configure port **aps-1** sonet-sdh path report-alarm p-ais

For line alarms, separately, modify the 2 physical ports that are members of the logical aps-id port (the working and protect lines). APS reacts only to line alarms, not path alarms. For example:

configure port **1/2/3** sonet-sdh report-alarm lb2er-sd

configure port **4/5/6** sonet-sdh report-alarm lb2er-sd

If the SD and SF threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command deletes an aps-*group-id* or bundle-aps-group-id. In order for an aps- *group-id* to be deleted,

The same rules apply for physical ports, bundles deletions apply to APS ports/bundles deletions (for example an aps-group-id must be shutdown, have no service configuration on it, and no path configuration on it). In addition working and protection circuits must be removed before an aps-group-id may be removed.

Values **port aps**-*group-id* **aps**: keyword where *group-id*: 1 to 64

Example: **port aps**-64

connector-port-id

Specifies the physical port of a connector in the following format.

Values *slot*/*mda*/*connector*/*port*

Platforms

7705 SAR Gen 2

port

Syntax

port *port-id*

no port

Context

[Tree] (config>port-xc>pxc port)

Full Context

configure port-xc pxc port

Description

This command configures the referenced Ethernet port as a loopback or a cross-connect port (PXC). When this command is executed, the system automatically creates two PXC subports under this Ethernet port.

The physical PXC port does not require any external connectivity or optical transceivers to function properly. Consequently, all optic-related alarms are disabled on the port.

The physical PXC port is automatically configured as a hybrid port. The MTU is preset to 9212 bytes, the encapsulation type is set to dot1q, and dot1x tunneling is turned on.

A single physical port can be associated with more than one PXC. In other words, multiple PXCs are supported per physical port. Because PXC subports use a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

Since the PXC uses a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

The following rules apply to PXC port configurations:

- Only unused physical ports (not associated with an interface or SAP) can be referenced inside of a PXC ID configuration.
- The physical port cannot be removed from a PXC ID configuration if the corresponding PXC subports are currently in use.
- A physical port cannot be used outside the configured PXC context. For example, a regular IP interface cannot use this physical port, or a SAP on that port cannot be associated with a service.

The **no** form of this command removes the port ID from the configuration.

Parameters

port-id

Specifies the physical port in the *slot*/*mda*/*port* format.

Platforms

7705 SAR Gen 2

port

Syntax

port *port-id* [*port-id*] [**priority** *priority*] [**sub-group** *sub-group-id*] [**hash-weight** *weight*]

no port *port-id* [*port-id*]

Context

[Tree] (config>lag port)

Full Context

configure lag port

Description

This command adds ports to a Link Aggregation Group (LAG).

The port configuration of the first port added to the LAG is used as a basis to compare to subsequently added ports. If a discrepancy is found with a newly added port, that port will not be added to the LAG.

Multiple (space separated) ports can be added or removed from the LAG link assuming the maximum of number of ports is not exceeded.

Ports that are part of a LAG must be configured with auto-negotiate limited or disabled.

The **no** form of this command removes ports from the LAG.

Default

No ports are defined as members of a LAG.

Parameters

port-id

Specifies the port ID.

The maximum number of ports in a LAG depends on the platform type, the hardware deployment, and the SR OS software release. Adding a port over the maximum allowed per given router or switch is blocked. Some platforms support double port scale for specific port types on LAGs with LAG ID in the range of 1 to 64 inclusive. Up to 16 ports can be specified in a single statement, up to 64 ports total.

priority

Specifies the port priority used by LACP. The port priority is also used to determine the primary port. The port with the lowest priority is the primary port. In the event of a tie, the smallest port ID becomes the primary port.

Values 1 to 65535

sub-group-id

Identifies a LAG subgroup. When using subgroups in a LAG, they should only be configured on one side of the LAG, not both. Only having one side perform the active/standby selection guarantees a consistent selection and fast convergence. The active or

standby selection is signaled through LACP to the other side. The hold time should be configured when using subgroups to prevent the LAG going down when switching between active and standby subgroup since momentarily all ports are down in a LAG (break-before-make).

Values 1 to 8 identifies a LAG subgroup The **auto-iom** subgroup is defined based on the IOM (all ports of the same IOM are assigned to the same subgroup). The **auto-mda** subgroup is defined based on the MDA. (all ports of the same MDA are assigned to the same subgroup).

weight

Specifies the flow hashing distribution between LAG ports.

Values 1 to 100000, port-speed

[Tree] (config>service>vprn>aaa>rmt-srv>radius port)

Full Context

configure service vprn aaa remote-servers radius port

Description

This command configures the UDP port number to contact the RADIUS server.

The **no** form of this command reverts to the default value.

Default

port 1812 (as specified in RFC 2865, *Remote Authentication Dial In User Service* (*RADIUS*))

Parameters

port

Specifies the UDP port number to contact the RADIUS server.

Values 1 to 65535

Platforms

7705 SAR Gen 2

port

Syntax

port *value*

no port

Context

[Tree] (config>service>vprn>log>syslog port)

Full Context

configure service vprn log syslog port

Description

This command configures the UDP port that will be used to send syslog messages to the syslog target host.

The port configuration is needed if the syslog target host uses a port other than the standard UDP syslog port 514.

Only one port can be configured. If multiple **port** commands are entered, the last entered port overwrites the previously entered ports.

The **no** form of this command reverts to default value.

Default

no port

Parameters

value

The value is the configured UDP port number used when sending syslog messages.

Values 1 to 65535

Platforms

7705 SAR Gen 2

port

Syntax

port {*port-id* | **lag** *lag-id*} [**egress**] [**ingress**]

no port {*port-id* | **lag** *lag-id*} {[**egress**] [**ingress**]}

Context

[Tree] (config>mirror>mirror-source port)

Full Context

configure mirror mirror-source port

Description

This command enables mirroring of traffic ingressing or egressing a port (Ethernet port, SONET/SDH channel, TDM channel, or Link Aggregation Group (LAG)).

The **port** command associates a port or LAG to a mirror source. The port is identified by the *port-id*. The defined port may be Ethernet, Access or network, SONET/SDH, or TDM channel access. A network port may be a single port or a Link Aggregation Group (LAG) ID. When a LAG ID is given as the *port-id*, mirroring is enabled on all ports making up the LAG. If the port is a SONET/SDH interface, the *channel-id* must be specified to identify which channel is being mirrored. Either a LAG port member *or* the LAG port can be mirrored.

The port is only referenced in the mirror source for mirroring purposes. The mirror source association does not need to be removed before deleting the card to which the port belongs. If the port is removed from the system, the mirroring association will be removed from the mirror source.

The same port may not be associated with multiple mirror source definitions with the **ingress** parameter defined. The same port may not be associated with multiple mirror source definitions with the **egress** parameter defined.

If a SAP is mirrored on an access port, the SAP mirroring will have precedence over the access port mirroring when a packet matches the SAP mirroring criteria. Filter and label mirroring destinations will also precedence over a port-mirroring destination.

If the port is not associated with a **mirror-source**, packets on that port will not be mirrored. Mirroring may still be defined for a SAP, label or filter entry, which will mirror based on a more specific criteria.

The encapsulation type on an access port or channel cannot be changed to Frame Relay if it is being mirrored.

The **no port** command disables port mirroring for the specified port. Mirroring of packets on the port may continue due to more specific mirror criteria. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition will be removed.

Parameters

port-id

Specifies the port ID.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

bgrp-id	bpgrp-*type-bpgrp-num*	
	bgrp	keyword
	type	ima, ppp

[Tree] (config>filter>ip-filter>entry>match port)

Full Context

configure filter ipv6-filter entry match port

configure filter ipv6-exception entry match port

configure filter ip-filter entry match port

Description

This command configures a TCP/UDP/SCTP source or destination port match criterion in IPv4 and IPv6 CPM (SCTP not supported) and/or ACL filter policies. A packet matches this criterion if the packet TCP/UDP/SCTP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port-list.

Operational Note: This command is mutually exclusive with src-port and dst-port commands. Configuring "port eq 0", may match non-initial fragments where the source/destination port values are not present in a packet fragment if other match criteria are also met.

The **no** form of this command deletes the specified port match criterion.

Default

no port

Parameters

lt | gt | eq

Specifies the operator to use relative to *port-number* for specifying the port number match criteria.

lt

Specifies that all port numbers less than *port-number* match.

gt

Specifies that all port numbers greater than *port-number* match.

eq

Specifies that the *port-number* must be an exact match.

port-number

Specifies a source or destination port to be used as a match criterion. The port number can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows a decimal integer only.

Values 0 to 65535

port-list *port-list-name*

Specifies an inclusive range of source or destination port values to be used as match criteria.

range *port-number port-number*

Specifies an inclusive range of source or destination port values to be used as match criteria.

no port

Context

[Tree] (config>router>if port)

Full Context

configure router interface port

Description

This command creates an association with a logical IP interface and a physical port.

An interface can also be associated with the system (loopback address).

The command returns an error if the interface is already associated with another port or the system. In this case, the association must be deleted before the command is re-attempted. The *port-id or port-id for* Ethernet ports can be in one of the following forms:

Ethernet interfaces

If the card in the slot has MDAs/XMAs, *port-id* is in the *slot_number*/MDA or XMA *_number*/*port_number* format; for example, **1/1/3** specifies port 3 of the MDA/XMA installed in MDA/XMA slot 1 on the card installed in chassis slot 1.

SONET/SDH interfaces

When the *port-id* represents a POS interface, the *port-id* must include the *channel-id.* The POS interface must be configured as a **network** port.

The **no** form of this command deletes the association with the port. The **no** form of this command can only be performed when the interface is administratively down.

Default

no port

Parameters

port-name

The physical port identifier to associate with the IP interface.

Values

Table 74: Port Names

port-name	port-id[:encap-val]	
	encap-val	0 for null
		[0 to 4094] for dot1q
		[0 to 4094].* [1 to 4094].[0to 4094] for qinq
port-id	slot/mda/port[.channel]	
	aps-id	aps-<group-id>[.channel]
	aps	keyword

7705 SAR Gen 2

port

Syntax

port *port*

no port

Context

[Tree] (config>system>netconf>listen port)

Full Context

configure system netconf listen port

Description

This command specifies the port on which the SR OS NETCONF server listens for new connections. Only one port can be configured for NETCONF management.

The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port. The SR OS NETCONF server errors if a port, different from the configured port, is used to SSH to the SR OS NETCONF server. For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the port used to establish the connections is changed. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the port used to establish the connections is changed.

The **no** form of this command resets the port on which the SR OS NETCONF server listens to the default port of 830.

Parameters

port

Specifies the port on which NETCONF listens for new connections.

Values 22, 830

Default 830

Platforms

7705 SAR Gen 2

port

Syntax

port *port*

no port

Context

[Tree] (config>system>security>radius port)

Full Context

configure system security radius port

Description

This command configures the TCP port number to contact the RADIUS server.

The **no** form of this command reverts to the default value.

Default

port 1812 (as specified in RFC 2865, *Remote Authentication Dial In User Service* (*RADIUS*))

Parameters

port

Specifies the TCP port number to contact the RADIUS server.

Values 1 to 65535

Platforms

7705 SAR Gen 2

port

Syntax

port *port*

no port

Context

[Tree] (config>system>grpc-tunnel>tunnel>handler port)

Full Context

configure system grpc-tunnel tunnel handler port

Description

This command assigns the TCP port number that the handler listens to internally.

The **no** form of this command disables the handler from listening to a TCP port.

Default

no port

Parameters

port

Specifies the TCP port number.

Values 1 to 65535

Platforms

7705 SAR Gen 2

22.26 port-control

port-control

Syntax

port-control [**auto** | **force-auth** | **force-unauth**]

Context

[Tree] (config>port>ethernet>dot1x port-control)

Full Context

configure port ethernet dot1x port-control

Description

This command configures the 802.1x authentication mode.

The **no** form of this command returns the value to the default.

Default

port-control force-auth

Parameters

force-auth

Disables 802.1x authentication and causes the port to transition to the authorized state without requiring any authentication exchange. The port transmits and receives normal traffic without requiring 802.1x-based host authentication.

force-unauth

Causes the port to remain in the unauthorized state, ignoring all attempts by the hosts to authenticate. The switch cannot provide authentication services to the host through the interface.

auto

Enables 802.1x authentication. The port starts in the unauthorized state, allowing only EAPoL frames to be sent and received through the port. Both the router and the host can initiate an authentication procedure. The port will remain in unauthorized state (no traffic except EAPoL frames is allowed) until the first client is authenticated successfully. After this, traffic is allowed on the port for all connected hosts.

Platforms

7705 SAR Gen 2

22.27 port-down

port-down

Syntax

[**no**] **port-down** *port-id*

Context

[Tree] (config>vrrp>policy>priority-event port-down)

Full Context

configure vrrp policy priority-event port-down

Description

This command configures a port down priority control event that monitors the operational state of a port or SONET/SDH channel. When the port or channel enters the operational down state, the event is considered set. When the port or channel enters the operational up state, the event is considered cleared.

Multiple unique **port-down** event nodes can be configured within the **priority-event** context up to the overall limit of 32 events. Up to 32 events can be defined in any combination of types.

The **port-down** command can reference an arbitrary port or channel. The port or channel does not need to be preprovisioned or populated within the system. The operational state of the **port-down** event is set as follows:

- Set – non-provisioned
- Set – not populated
- Set – down
- Cleared – up

When the port or channel is provisioned, populated, or enters the operationally up or down state, the event operational state is updated appropriately.

When the event enters the operationally down, non-provisioned, or non-populated state, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from cleared to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

When the event enters the operationally up state, the event is considered to be cleared. Once the events **hold-set** expires, the effects of the events **priority** value are immediately removed from the in-use priority of all associated virtual router instances.

The actual effect on the virtual router instance in-use priority value depends on the defined event priority and its delta or explicit nature.

The **no** form of the command deletes the specific port or channel monitoring event. The event may be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances will be re-evaluated. The events **hold-set** timer has no effect on the removal procedure.

Default

no port-down — No port down priority control events are defined.

Parameters

port-id

The port ID of the port monitored by the VRRP priority control event.

The *port-id* can only be monitored by a single event in this policy. The port can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

Values

slot/*mda*/*port*[.*channel*]		
eth-sat-id	esat-*id*/*slot*/*port*	
	esat	keyword
	id	1 to 20
pxc-id	pxc-*id*.*sub-port*	
	pxc	keyword
	id	1 to 64
	sub-port	a, b
aps-id	aps-*group-id*[.*channel*]	
	aps	keyword
	group-id	1 to 64
ccag-id	ccag-*id*. *path-id*[*cc-type*]	
	ccag	keyword

configure service nat port-forwarding

Description

Commands in this context configure NAT port forwarding parameters.

Platforms

7705 SAR Gen 2

22.29 port-forwarding-dyn-block-reservation

port-forwarding-dyn-block-reservation

Syntax

[**no**] **port-forwarding-dyn-block-reservation**

Context

[Tree] (config>router>nat>outside>pool port-forwarding-dyn-block-reservation)

[Tree] (config>service>vprn>nat>outside>pool port-forwarding-dyn-block-reservation)

Full Context

configure router nat outside pool port-forwarding-dyn-block-reservation

configure service vprn nat outside pool port-forwarding-dyn-block-reservation

Description

This command will enable the reservation of the dynamic port blocks when the first port forward for the subscriber is created. The dynamic port bloc allocation is logged only if the block is being utilized (mapping are created). In other words, dynamic port block reservation due to the port forward creation but without any dynamic mapping, will not be logged.

The reserved port block will be released only when the last mapping in the block expires and there is not port forward associated with the subscriber. The de-allocation log (syslog or Radius) will be generated when the dynamic port block is completely released.

Dynamic port block reservation can be enabled only if the configured maximum number of subscriber per outside IP address is less or equal then the maximum number of configured port blocks per outside IP address.

Default

no port-forwarding-dyn-block-reservation

Platforms

7705 SAR Gen 2

22.30 port-forwarding-range

port-forwarding-range

Syntax

port-forwarding-range [*range-start*] *range-end*

no port-forwarding-range

Context

[Tree] (config>router>nat>outside>pool port-forwarding-range)

[Tree] (config>service>vprn>nat>outside>pool port-forwarding-range)

Full Context

configure router nat outside pool port-forwarding-range

configure service vprn nat outside pool port-forwarding-range

Description

This command configures the lower and upper limit for port forwards in the ephemeral port space (wildcard port space) of all IP addresses in a NAT pool. A well-known port range (ports 1 to 1023) is always enabled for port forwards, and it cannot be disabled for pools in NAPT mode.

Pools in 1:1 mode do not support configured port forwards. These pools do not perform port translation and they automatically forward traffic initiated on the outside toward the inside.

Port 0 is always excluded from the port forwarding range.

The upper bound of the wildcard port range is reserved for port forwards. If the value for the *range-start* is not provided, the wildcard port range implicitly starts at 1024.

range-start 0 cannot be configured by an operator because it is reserved for 1:1 pools that do not support configured port forwards.

If you configure *port-forwarding-range 3000*, configures ports 1 to 3000 as port forwards. This implies that the well-known ports and wildcard ports are contiguous. If you configure *port-forwarding-range 2000 3000*, the router implicitly includes ports 1 to 1023, plus enables the wildcard port range 2000 to 3000, which is now disjoined from the well-known ports.

The *range-start* parameter has additional values that are configurable in the CLI. 0 is reserved for pools that do not support configured port forwards (those are 1:1 pools).

range-start 1 means that well-known ports and wildcard port forwards are contiguous. This is configured by omitting the *range-start* parameter and only configuring the *range-end* parameter.

The **no** form of this command disables the port forwards capability in the wildcard port range of all IP addresses in a NAT pool.

Default ranges in the *range-start* and *range-end* parameters in the MIB for the NAT pools that support port forwarding ranges are set to include only well-known ports, *range-start 1* and *range-end 1023*.

Parameters

range-start

Specifies the lower boundary of the wildcard port range reserved for port forwards. When configured, the value must be less than the *range-end* value.

Values 0, 1, 1025 to 65535

Default 1

range-end

Specifies the upper boundary of the wildcard port range reserved for port forwards.

Values 0, 1023 to 65535

Default 1023

Platforms

7705 SAR Gen 2

22.31 port-id

port-id

Syntax

[**no**] **port-id**

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option port-id)

Full Context

configure router interface dhcp option vendor-specific-option port-id

Description

This command enables sending of the port-id in the Nokia vendor specific suboption of the DHCP relay packet

The **no** form of this command disables the sending.

Default

no port-id

Platforms

7705 SAR Gen 2

22.32 port-id-subtype

port-id-subtype

Syntax

port-id-subtype {**tx-if-alias** | **tx-if-name** | **tx-local**}

Context

[Tree] (config>port>ethernet>lldp>dstmac port-id-subtype)

Full Context

configure port ethernet lldp dest-mac port-id-subtype

Description

This command specifies how to encode the PortID TLV transmit to the peer. The default setting **tx-local** (ifindex value) is required by some versions of the NSP NSM-P to properly build the Layer 2 topology map using LLDP. Changing this value to transmit the ifname (**tx-if-name**) or ifAlias (**tx-if-alias**) in place of the ifindex (**tx-local**) may affect the ability of the NSP NFM-P to build the Layer 2 topology map using LLDP.

Default

port-id-subtype tx-local

Parameters

tx-if-alias

Transmits the ifAlias String (subtype 1) that describes the port as stored in the IF-MIB, either user configured or the default entry (i.e. 10/100/Gig Ethernet SFP).

tx-if-name

Transmits the ifName string (subtype 5) that describes the port as stored in the IF-MIB ifName info.

tx-local

The interface ifIndex value (subtype 7) as the PortID.

Platforms

7705 SAR Gen 2

port-id-subtype

Syntax

port-id-subtype {**tx-if-alias** | **tx-if-name** | **tx-local**}

Context

[Tree] (config>lag>lldp-member-template>dstmac port-id-subtype)

Full Context

configure lag lldp-member-template dest-mac port-id-subtype

Description

This command configures the encoding of the PortID TLV that is transmitted to the peer. Some versions of the NSP NFM-P require the default setting **tx-local** (ifIndex value) to properly build the Layer 2 topology map using LLDP. Changing this value to transmit the ifName (**tx-if-name**) or ifAlias (**tx-if-alias**) in place of the ifIndex (**tx-local**) may affect the ability of the NSP NFM-P to build the Layer 2 topology map using LLDP.

Default

port-id-subtype tx-local

Parameters

tx-if-alias

Keyword to transmit the ifAlias String (subtype 1), which describes the port as stored in the IF-MIB, either user configured or the default entry (for example, 10/100/Gig Ethernet SFP).

tx-if-name

Keyword to transmit the ifName string (subtype 5), which describes the port as stored in the IF-MIB ifName information.

tx-local

Keyword to transmit the interface ifIndex value (subtype 7) as the port ID.

22.34 port-list

port-list

Syntax

port-list *port-list-name* [**create**]

no port-list *port-list-name*

Context

[Tree] (config>filter>match-list port-list)

Full Context

configure filter match-list port-list

Description

This command creates a list of TCP/UDP/SCTP port values or ranges for match criteria in IPv4 and IPv6 ACL and CPM filter policies.

The **no** form of this command deletes the specified list.

Operational notes:

SCTP port match is supported in ACL filter policies only.

A port-list must contain only TCP/UDP/SCTP port values or ranges.

A TCP/UDP/SCTP port match list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

Parameters

port-list-name

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

22.35 port-num

port-num

Syntax

port-num *virtual-port-number*

no port-num [*virtual-port-number*]

Context

[Tree] (config>service>vpls>sap>stp port-num)

[Tree] (config>service>vpls>spoke-sdp>stp port-num)

Full Context

configure service vpls sap stp port-num

configure service vpls spoke-sdp stp port-num

Description

This command configures the virtual port number which uniquely identifies a SAP within configuration bridge protocol data units (BPDUs). The internal representation of a SAP is unique to a system and has a reference space much bigger than the 12 bits definable in a configuration BPDU. STP takes the internal representation value of a SAP and identifies it with its own virtual port number that is unique to every other SAP defined on the TLS. The virtual port number is assigned at the time that the SAP is added to the TLS. Since the order that the SAP was added to the TLS is not preserved between reboots of the system, the virtual port number may change between restarts of the STP instance.

The virtual port number cannot be administratively modified.

Platforms

7705 SAR Gen 2

22.36 port-parent

port-parent

Syntax

port-parent [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

no port-parent

Context

[Tree] (config>qos>sap-egress>queue port-parent)

Full Context

configure qos sap-egress queue port-parent

Description

This command specifies whether this queue feeds off a port-level scheduler. When configured, this SAP egress queue is parented by a port-level scheduler. This object is mutually exclusive with SAP egress queue parent. Only one kind of parent is allowed.

The **port-parent** command defines a child/parent association between an egress queue and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the queue or scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command is mutually exclusive to the **parent** command (used to create a parent/child association between a queue and an intermediate scheduler). Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy queue may cause a SAP or subscriber or multiservice site context of the queue (policy associated with a SAP or subscriber profile or multiservice site) to enter an orphaned state. If an instance of a queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the queue has a port-parent association, the queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the queue as having a non-existent intermediate scheduler parent, the queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port on which the queue or scheduler instance exists, the queue or scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

Default

no port-parent

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 100

Default 0

cir-level *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 8 (8 is the highest priority)

Default 0

Platforms

7705 SAR Gen 2

port-parent

Syntax

port-parent [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

no port-parent

Context

[Tree] (config>qos>network-queue>queue port-parent)

Full Context

configure qos network-queue queue port-parent

Description

This command specifies whether this queue feeds off a port-level scheduler. For the network-queue policy context, only the port-parent command is supported. When a port scheduler exists on the port, network queues without a port-parent association will be treated as an orphan queue on the port scheduler and treated according to the current orphan behavior on the port scheduler. If the port-parent command is defined for a network queue on a port without a port scheduler defined, the network queue will operate as if a parent association does not exist. When a port scheduler policy is associated with the egress port, the port-parent command will come into effect.

When a network-queue policy is associated with an FP for ingress queue definition, the port-parent association of the queues is ignored.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port then the queue or scheduler instance exists, the queue or scheduler will become orphaned.

Default

no port-parent

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight ***cir-weight***

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter is used.

Values 0 to 100

Default 0

cir-level ***cir-level***

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

no port-parent

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue port-parent)

Full Context

configure qos queue-group-templates egress queue-group queue port-parent

Description

This command defines the port scheduling parameters used to control the queue's behavior when a virtual egress port scheduling is enabled where the egress queue group template is applied. The **port-parent** command follows the same behavior and provisioning characteristics as the **parent** command in the SAP egress QoS policy. The **port-parent** command and the **parent** command are mutually exclusive.

The **no** form of this command removes the values from the configuration.

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the **cir-level** parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

Values 0 to 100

Default 0

cir-level *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

Default 0

Platforms

7705 SAR Gen 2

port-parent

Syntax

port-parent [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

no port-parent

Context

[Tree] (config>qos>scheduler-policy>tier>scheduler port-parent)

Full Context

configure qos scheduler-policy tier scheduler port-parent

Description

The **port-parent** command defines a child/parent association between an egress scheduler and a port-based scheduler, or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command and the **parent** command (used to create a parent/child association to an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy policer or queue may cause a SAP or subscriber context of the policer or queue (policy associated with a SAP or subscriber profile) to enter an orphaned state. If an instance of a policer or queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the policer queue has a port-parent association, the policer or queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer or queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the policer or queue as having a non-existent intermediate scheduler parent, the policer or queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the scheduler. If a port scheduler is defined on the port that the scheduler instance exists, the scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

Default

no port-parent

Parameters

weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the **level** parameter).

Values 0 to 100

Default 1

level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

Values 1 to 8 (8 is the highest priority)

Default 1

cir-weight ***cir-weight***

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter comes into play.

Values 0 to 100

Default 0

cir-level ***cir-level***

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

Values 0 to 8 (8 is the highest priority)

Default 0

22.37 port-redirect-group

port-redirect-group

Syntax

port-redirect-group {**queue** *queue-id* | **policer** *policer-id* [**queue** *queue-id*]}

no port-redirect-group

Context

[Tree] (config>qos>network>egress>fc port-redirect-group)

Full Context

configure qos network egress fc port-redirect-group

Description

This command is used to redirect the FC of a packet of a pseudowire (PW) or network IP interface to an egress port queue group.

It defines the mapping of an FC to a queue ID or a policer ID and a queue ID and redirects the lookup of the queue or policer of the same ID in some egress port queue-group instance. However, the queue-group name and instance are explicitly provided only at the time the network QoS policy is applied to egress context of a spoke-sdp or a network IP interface.

The **no** version of this command removes the redirection of the FC.

Parameters

queue-id

This parameter must be specified when executing the **port-redirect-group** command. The specified *queue-id* must exist within the egress port queue group on each IP interface where the network QoS policy is applied.

Values 1 to 8

policer id

The specified policer-id must exist within the queue-group template applied to the ingress context of the forwarding plane.

Values 1 to 8

Platforms

7705 SAR Gen 2

22.40 port-scheduler-policy

port-scheduler-policy

Syntax

port-scheduler-policy *port-scheduler-name* [**create**]

no port-scheduler-policy *port-scheduler-name*

Context

[Tree] (config>qos port-scheduler-policy)

Full Context

configure qos port-scheduler-policy

Description

When a port scheduler has been associated with an egress port, it is possible to override the following parameters:

- The max-rate allowed for the scheduler
- The maximum rate for each priority level (1 to 8)
- The cir associated with each priority level (1 to 8)

The orphan priority level (level 0) has no configuration parameters and cannot be overridden.

The **no** form of this command removes a port scheduler policy from the system. If the port scheduler policy is associated with an egress port or channel, the command will fail.

Parameters

port-scheduler-name

Specifies an existing port scheduler name. Each port scheduler must be uniquely named within the system and can be up to 32 ASCII characters.

Platforms

7705 SAR Gen 2

22.41 port-state

port-state

Syntax

[**no**] **port-state**

Context

[Tree] (debug>service>id>stp port-state)

22.42 port-threshold

port-threshold

Syntax

port-threshold *value* [**action** { **dynamic-cost** | **static-cost** | **down**}] [**cost** *static-cost*]

no port-threshold

Context

[Tree] (config>lag port-threshold)

Full Context

configure lag port-threshold

Description

This command configures the behavior for the Link Aggregation Group (LAG) if the number of operational links is equal to or below a threshold level.

Nokia recommends that operators use the **weight-threshold** or **hash-weight-threshold** command instead of the **port-threshold** command to control LAG operational status. For example, when 1GE and 10GE ports are mixed in a LAG, each 1GE port will have a weight of 1, while each 10GE port will have a weight of 10.

The **weight-threshold** or **hash-weight-threshold** command can also be used for LAGs with all ports of equal speed to allow a common operational model. For example, each port has a weight of 1 to mimic **port-threshold** and its related configuration.

The **no** form of this command reverts to the default values.

Default

port-threshold 0 action down

Parameters

value

Specifies the decimal integer threshold number of operational links for the LAG at or below which the configured action is invoked. If the number of operational links exceeds the **port-threshold** value, any action taken for being below the threshold value will cease.

Values 0 to 63

action

Specifies the action to take if the number of active links in the LAG is at or below the threshold value.

dynamic-cost

Specifies that dynamic costing is activated. As a result, the LAG remains operationally up with a cost relative to the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

static-cost

Specifies that static costing is activated. As a result, the LAG remains operationally up with the configured cost, regardless of the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

down

Specifies that LAG is brought operationally down if the number of operational links is equal to or less than the configured threshold value. The LAG is only regarded as up once the number of operational links exceeds the configured threshold value.

static-cost

Specifies decimal integer static cost of the LAG.

Values 1 to 16777215

Full Context

configure ipsec ppk-list ppk-id

Description

This command configures the attributes for a PPK entry within the list.

The **no** form of this command deletes the PPK entry from the list.

Parameters

ppk-id

Specifies a unique ID for the PPK, up to 64 characters.

value-string

Specifies the PPK value.

ascii

Keyword to specify that the PPK value is formatted as an ASCII string, up to 64 characters.

hex

Keyword that specifies the PPK value is formatted as a hexadecimal string, up to 128 hex nibbles.

Values 0x0 to 0xFFFFFFFF...

hash

Keyword that specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Keyword that specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Keyword that specifies the custom encryption to the management interface.

configure ipsec ike-policy ppk-required

Description

This command configures the mandatory use of PPKs for the IKEv2 key derivation process in the IKE policy.

The **no** form of this command configures the use of PPKs for IKEv2 as optional. The router can fall back to derive keys without PPK.

Default

no ppk-required

Platforms

7705 SAR Gen 2

22.48 pre-login-message

pre-login-message

Syntax

pre-login-message *login-text-string* [**name**]

no pre-login-message

Context

[Tree] (config>system>login-control pre-login-message)

Full Context

configure system login-control pre-login-message

Description

This command configures a message to display before logging in to the router using Telnet, SSH, or the console port.

Only one message can be configured. If a new pre-login message is configured, the new message overwrites the previous message.

Note: The pre-login message is displayed on both active and standby systems.

The **no** form of this command removes the pre-login message.

Default

no pre-login-message

Parameters

login-text-string

Specifies the pre-login message text, up to 900 characters. Any printable, 7-bit ASCII characters can be used. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Some special characters can be used to format the message text. Use the newline (\n) character to create multiline messages. A newline (\n) character in the message moves to the beginning of the next line by sending ASCII/UTF-8 characters 0xA (LF) and 0xD (CR) to the client terminal. A carriage return (\r) character in the message sends the ASCII/UTF-8 character 0xD (CR) to the client terminal.

name

Displays the configured system name before the pre-login message. To remove the system name from the pre-login message, remove the current message and configure a new message without using the **name** parameter.

Platforms

7705 SAR Gen 2

22.49 pre-shared-key

pre-shared-key

Syntax

pre-shared-key *pre-shared-key-index* [**encryption-type** *encryption-type*] [**create**]

no pre-shared-key *pre-shared-key-index*

Context

[Tree] (config>macsec>conn-assoc>static-cak pre-shared-key)

Full Context

configure macsec connectivity-association static-cak pre-shared-key

Description

This command specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode. This command also specifies the encryption algorithm used for encrypting the SAK.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). The pre-shared key-the CKN and CAK-must match on both ends of a link.

A pre-shared key is configured on both devices at each end of point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the successful MKA liveliness negotiation.

The encryption-type is used for encrypting the SAK and authenticating the MKA packet. The symmetric encryption key SAK (Security Association Key) needs to be encrypted (wrapped) via the MKA protocols. The AES key is derived via pre-shared-key.

The **no** form of this command removes the index.

Parameters

pre-shared-key-index

Specifies the index of this pre-shared-key.

Values 1, 2

encryption-type

Specifies the type of encryption.

Values **aes-128-cmac**, **aes-256-cmac**

create

Mandatory to create an entry.

Platforms

7705 SAR Gen 2

pre-shared-key

Syntax

Full Context

configure ipsec client-db client credential pre-shared-key

Description

This command specifies a pre-shared key used to authenticate peers.

The **no** form of this command reverts to the default.

Default

no pre-shared-key

Parameters

key

An ASCII string to use as the pre-shared key for dynamic keying. When the **hash** or **hash2** parameters are not used, the key is a clear text key; otherwise, the key text is encrypted.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

22.51 prec

prec

Syntax

prec *ip-prec-value* [**fc** *fc-name*] [**priority** {**high** | **low**}]

no prec *ip-prec-value*

Context

[Tree] (config>qos>sap-ingress prec)

Full Context

configure qos sap-ingress prec

Description

This command explicitly sets the forwarding class or enqueuing priority when a packet is marked with an IP precedence value (*ip-prec-value)*. Adding an IP precedence rule on the policy forces packets that match the specified *ip-prec-value* to override the forwarding class and enqueuing priority based on the parameters included in the IP precedence rule.

When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy.

When the enqueuing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueuing priority derived from earlier matches in the classification hierarchy.

The *ip-prec-value* is derived from the most significant three bits in the IP header ToS byte field (precedence bits). The three precedence bits define eight Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior. The precedence bits are also part of the DiffServ Code Point (DSCP) method of mapping packets to QoS behavior. The DSCP uses the most significant six bits in the IP header ToS byte and so overlaps with the precedence bits. Both IP precedence and DSCP classification rules are supported. DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the explicit IP precedence classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

Parameters

ip-prec-value

The *ip-prec-value* is a required parameter that specifies the unique IP header ToS byte precedence bits value that will match the IP precedence rule. If the command is executed more than once with the same *ip-prec-value*, the previous forwarding class and enqueuing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueuing priority parameter is missing.

A maximum of eight IP precedence rules are allowed on a single policy.

The precedence is evaluated from the lowest to highest value.

Values 0 to 7

fc *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the

default-fc command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

Values fc: *class*[.*subclass*]

class: be, l2, af, l1, h2, ef, h1, nc

subclass: 29 characters max

Default Inherit (When **fc** is not defined, the rule preserves the previous forwarding class of the packet.)

priority

The priority parameter overrides the default enqueuing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueuing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueuing priority is inherited based on previous rule matches.

Values high, low

Default Inherits the priority defined by the default-priority statement.

high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **high** for a packet increases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueuing parameter to **low** for a packet decreases the likelihood of enqueuing the packet when the ingress queue is congested. Ingress enqueuing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueuing priority is lost.

7705 SAR Gen 2

prec

Syntax

prec {*ip-prec-value* | **in-profile** *ip-prec-value* **out-profile** *ip-prec-value* [**exceed-profile** *ip-prec-value*]}

no prec

Context

[Tree] (config>qos>sap-egress>fc prec)

Full Context

configure qos sap-egress fc prec

Description

This command defines a value to be used for remarking packets for the specified FC. If the optional in/out/exceed-profile is specified, the command will remark different IP precedence values depending on whether the packet was classified to be in, exceed, or out-of-profile. All inplus-profile traffic is marked with the same value as in-profile traffic.

Parameters

ip-prec-value

This parameter specifies the IP precedence to be used to remark all traffic.

Values 0 to 7

exceed-profile *ip-prec-value*

This optional parameter specifies the IP precedence to be used to remark traffic that is exceed-profile. If not specified, this defaults to the same value configured for the **out-profile** parameter.

Values 0 to 7

in-profile *ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is in-profile.

Values 0 to 7

out-profile *ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is out-of-profile.

Values 0 to 7

7705 SAR Gen 2

prec

Syntax

prec *ip-prec-value* [**fc** *fc-name*] [**profile** {**in** | **out** | **exceed** | **inplus**}]

no prec *ip-prec-value*

Context

[Tree] (config>qos>sap-egress prec)

Full Context

configure qos sap-egress prec

Description

This command defines a specific IP precedence value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified IP precedence value, the forwarding class, or profile behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against precedence reclassification rules come from the Type of Service (ToS) field within the IPv4 header. If the packet does not have an IPv4 header, precedence-based matching is not performed.

The reclassification actions from a precedence reclassification rule may be overridden by a DSCP or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, ipv6-criteria, or ip-criteria match occurs after the IP precedence match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the IP precedence match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IPv6 criteria, or IP criteria match occurs after the IP precedence match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the IP precedence match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

Parameters

fc *fc-name*

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. The FC name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified precedence value, the **prec** command must be re-executed without the **fc** parameter defined.

Values be, l1, af, l2, h1, ef, h2 or nc

profile {in | out | exceed | inplus}

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified precedence value, the **prec** command must be re-executed without the **profile** parameter defined.

in

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed

Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

Platforms

7705 SAR Gen 2

prec

Syntax

prec *ip-prec-value* **fc** *fc-name* **profile** {**in** | **out** | **exceed** | **inplus**}

no prec *ip-prec-value*

Context

[Tree] (config>qos>network>egress prec)

Full Context

configure qos network egress prec

Description

This command defines a specific IP precedence value that must be matched in order to perform the associated reclassification actions. If an egress packet on an IES/VPRN interface spoke SDP, on a CSC network interface in a VPRN, or network interface that the network QoS policy is applied to, matches the specified IP precedence value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against the reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, IP precedence-based matching is not performed.

The configuration of egress prec classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence-based and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface.

This command will block the application of a network QoS policy with the egress reclassification commands to a spoke SDP part of a Layer 2 service. Conversely, this command will not allow the user to add the egress reclassification commands to a network QoS policy if it is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue-group succeeds. For example, the following commands will succeed:

```
    -
 config>service>vprn>if>
spoke-sdp>egress>qos network-policy-id port-redirect-
group
queue-group-name instance instance-id
    - config>service>ies>if>spoke-
sdp>
egress>qos network-policy-id port-redirect-group queue-group-
name
instance instance-id
    - config>service>vprn>nw-if> qos network-policy-id port-redirect-
group
queue-group-name instance instance-id
```

When the redirection command fails in CLI, the PW will use the network QoS policy assigned to the network IP interface; however, any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

Parameters

ip-prec-value

0 to 7

fc fc-name

be, l2, af, l1, h2, ef, h1, nc

profile {in | out | exceed | inplus}

The profile reclassification action is mandatory. When specified, packets matching the IP precedence value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified IP precedence value, the **no prec** command must be executed.

This value may be overwritten by an explicit profile action in an DSCP reclassification match.

in - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

out - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

exceed - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

inplus - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

22.52 precedence

precedence

Syntax

precedence [*precedence-value* | **primary**]

no precedence

Context

[Tree] (config>service>epipe>spoke-sdp precedence)

Full Context

configure service epipe spoke-sdp precedence

Description

This command specifies the precedence of the SDP binding when there are multiple SDP bindings attached to one service endpoint. The value of zero can only be assigned to one SDP bind making it the primary SDP bind. When an SDP binding goes down, the next highest precedence SDP binding will begin to forward traffic.

The **no** form of this command returns the precedence value to the default.

Default

precedence 4

Parameters

precedence-value

Specifies the spoke SDP precedence.

Values 1 to 4

primary

Assigns primary precedence to the spoke SDP.

Platforms

7705 SAR Gen 2

precedence

Syntax

precedence *prec-value*

precedence primary

no precedence

Context

[Tree] (config>service>epipe>spoke-sdp-fec precedence)

Full Context

configure service epipe spoke-sdp-fec precedence

Description

This command specifies the precedence of the SDP binding when there are multiple SDP bindings attached to one service endpoint. The value of zero can only be assigned to one SDP bind making it the primary SDP bind. When an SDP binding goes down, the next highest precedence SDP binding will begin to forward traffic.

The **no** form of this command returns the precedence value to the default.

Default

precedence 42

Parameters

prec-value

Specifies the spoke SDP precedence.

Values 1 to 4

primary

Assigns primary precedence to this spoke SDP.

Platforms

7705 SAR Gen 2

precedence

Syntax

precedence [*precedence-value* | **primary**]

no precedence

Context

[Tree] (config>service>vpls>spoke-sdp precedence)

Full Context

configure service vpls spoke-sdp precedence

Description

This command configures the precedence of this SDP bind when there are multiple SDP binds attached to one service endpoint. When an SDP bind goes down, the next highest precedence SDP bind begins forwarding traffic.

Parameters

precedence-value

Specifies the precedence of this SDP bind

Values 1 to 4

primary

Assigns this as the primary spoke-SDP

Platforms

7705 SAR Gen 2

precedence

Syntax

precedence {*precedence-value* | **primary**}

no precedence

Context

[Tree] (config>mirror>mirror-dest>spoke-sdp precedence)

Full Context

configure mirror mirror-dest spoke-sdp precedence

Description

This command indicates that the SDP is of type secondary with a specific precedence value or of type primary.

The mirror or LI service always uses the primary type as the active pseudowire and only switches to a secondary pseudowire when the primary is down. The mirror service switches the path back to the primary pseudowire when it is back up. The user can configure a timer to delay reverting back to primary or to never revert back.

If the active pseudowire goes down, the mirror service switches the path to a secondary sdp with the lowest precedence value. That is, secondary SDPs which are operationally up are considered in the order of their precedence value, 1 being the lowest value and 4 being the highest value. If the precedence value is the same, then the SDP with the lowest SDP ID is selected.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

An SDP is created with type secondary and with the lowest precedence value of 4.

Parameters

precedence-value

Specifies the precedence of the SDP.

Values 1 to 4

primary

Specified that a special value of the precedence which assigns the SDP the lowest precedence and enables the revertive behavior.

7705 SAR Gen 2

22.53 preempt

preempt

Syntax

[**no**] **preempt**

Context

[Tree] (config>service>ies>if>ipv6>vrrp preempt)

Full Context

configure service ies interface ipv6 vrrp preempt

Description

The preempt mode value controls whether a specific backup virtual router preempts a lower priority master.

When preempt is enabled, the virtual router instance overrides any non-owner master with an "in use" message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

The IP address owner will always become master when available. Preempt mode cannot be disabled on the owner virtual router.

The **no** form of this command disables preempt mode.

Default

preempt

Platforms

7705 SAR Gen 2

preempt

Syntax

[**no**] **preempt**

Context

[Tree] (config>service>ies>if>vrrp preempt)

Full Context

configure service ies interface vrrp preempt

Description

The preempt command provides the ability of overriding an existing non-owner master to the virtual router instance. Enabling preempt mode is almost required for proper operation of the base-priority and vrrp-policy-id definitions on the virtual router instance. If the virtual router cannot preempt an existing non-owner master, the effect of the dynamic changing of the in-use priority is greatly diminished.

The preempt command is only available in the non-owner vrrp virtual-router-id nodal context. The owner may not be preempted due to the fact that the priority of non-owners can never be higher than the owner. The owner will always preempt all other virtual routers when it is available.

Non-owner virtual router instances will only preempt when preempt is set and the current master has an in-use message priority value less than the virtual router instances in-use priority.

A master non-owner virtual router will only allow itself to be preempted when the incoming VRRP Advertisement message Priority field value is one of the following:

- Greater than the virtual router in-use priority value
- Equal to the in-use priority value and the source IP address (primary IP address) is greater than the virtual router instance primary IP address

The **no** form of this command prevents a non-owner virtual router instance from preempting another, less desirable virtual router. Use the preempt command to restore the default mode.

Default

preempt

Platforms

7705 SAR Gen 2

preempt

Syntax

[**no**] **preempt**

Context

22.54 preemption-timer

preemption-timer

Syntax

preemption-timer *seconds*

no preemption-timer

Context

[Tree] (config>router>rsvp preemption-timer)

Full Context

configure router rsvp preemption-timer

Description

This parameter configures the time in seconds a node holds to a reservation for which it triggered the soft preemption procedure.

The preempting node starts a separate preemption timer for each preempted LSP path. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A value of zero means the LSP should be preempted immediately; hard preempted.

The **no** form of this command reverts to the default value.

Default

preemption-timer 300

Parameters

seconds

Specifies the time (in s), of the preemption timer.

Values 0 to 1800 seconds

Platforms

7705 SAR Gen 2

22.55 prefer-local-time

prefer-local-time

Syntax

[**no**] **prefer-local-time**

Context

[Tree] (config>system>time prefer-local-time)

Full Context

configure system time prefer-local-time

Description

This command sets the preference to use local or UTC time in the system. This preference is applied to objects such as log file names, created and completed times reported in log files, NETCONF and gRPC date-and-time leafs, and rollback times displayed in **show** routines.

Note:
The operator may force the timezone used for **show** outputs during a CLI session using an environment variable in the **environment**>**time-display {utc | local}** command.

Note:
The preference for CLI output is set with the **environment time-display** command.

Note:
The format used for the date-time strings may change when the **prefer-local-time** option is enabled. For example, when enabled, all date-time strings include a suffix of three to five characters that indicates the timezone used for the presentation. This suffix may not be present if the option in not enabled.

Note:
The time format for timestamps on log events is controlled on a per-log basis using the **config**>**log**>**log-id**>**time-format {utc | local}** CLI command and not via **prefer-local-time**.

The **no** form of this command indicates preference for UTC time.

Default

no prefer-local-time

7705 SAR Gen 2

23 p Commands – Part III

23.1 prefer-tunnel-in-tunnel

prefer-tunnel-in-tunnel

Syntax

[**no**] **prefer-tunnel-in-tunnel**

Context

[Tree] (config>router>ldp prefer-tunnel-in-tunnel)

Full Context

configure router ldp prefer-tunnel-in-tunnel

Description

This command specifies to use tunnel-in-tunnel over a simple LDP tunnel. Specifically, the user packets for LDP FECs learned over this targeted LDP session can be sent inside an RSVP LSP which terminates on the same egress router as the destination of the targeted LDP session. The user can specify an explicit list of RSVP LSP tunnels under the Targeted LDP session or LDP will perform a lookup in the Tunnel Table Manager (TTM) for the best RSVP LSP. In the former case, only the specified LSPs will be considered to tunnel LDP user packets. In the latter case, all LSPs available to the TTM and which terminate on the same egress router as this target ed LDP session will be considered. In both cases, the metric specified under the LSP configuration is used to control this selection.

The lookup in the TTM will prefer a LDP tunnel over an LDP-over-RSVP tunnel if both are available. Also, the tunneling operates on the dataplane only. Control packets of this targeted LDP session are sent over the IGP path.

23.2 preference

preference

Syntax

[**no**] **preference** *preference*

Context

[Tree] (config>service>vprn>bgp preference)

[Tree] (config>service>vprn>bgp>group preference)

Full Context

configure service vprn bgp preference

configure service vprn bgp group preference

Description

This command configures the route preference for routes learned from the configured peer(s).

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The lower the preference the higher the chance of the route being the active route. The OS assigns BGP routes highest default preference compared to routes that are direct, static or learned via MPLS or OSPF.

The **no** form of this command, if used at the global level, reverts to default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

preference 170

Parameters

preference

Specifies the route preference, expressed as a decimal integer.

Values 1 to 255

Platforms

7705 SAR Gen 2

7705 SAR Gen 2

preference

Syntax

preference *preference*

no preference

Context

[Tree] (config>service>vprn>isis>level preference)

Full Context

configure service vprn isis level preference

Description

This command configures the preference level of either IS-IS Level 1 or IS-IS Level 2 internal routes. By default, the preferences are listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the table below. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision what route to use is determined by the configuration of the **ecmp** in the config>router context.

Default

Default preferences are listed in Table 76: Default Preferences.

Table 76: Default Preferences

Route Type	Preference	Configurable
Direct attached	0	No
Static route	5	Yes
MPLS	7	—
OSPF internal routes	10	No
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes

Route Type	Preference	Configurable
OSPF external	150	Yes
IS-IS level 1 external	160	Yes[5]
IS-IS level 2 external	165	Yes[5]
BGP	170	Yes

Parameters

preference

The preference for external routes at this level expressed as a decimal integer.

configure router ospf loopfree-alternates multi-homed-prefix preference

configure router isis loopfree-alternates multi-homed-prefix preference

8 Preference for OSPF internal routes is configured with the **preference** command.

Description

This command configures the preference for the multihomed prefix LFA backup path. This knob can be enabled at a LFA computing node to force the programming of the multihomed prefix LFA backup path which, in some topologies, can avoid transiting using the best ABR or ASBR.

The **no** form of this command reverts to the default value.

Default

preference none

Parameters

none

Specifies the preference for an LFA, TI-LFA, or RLFA backup path over the multihomed prefix LFA backup path. The multihomed prefix LFA is only programmed in cases where the prefix is not protected by LFA, RLFA, or TI-LFA.

all

Specifies the forced programming of the multihomed prefix LFA backup path regardless of the outcome of the LFA, TI-LFA, or RLFA backup path computation.

Context

[Tree] (conf>router>segment-routing>sr-policies>policy preference)

Full Context

configure router segment-routing sr-policies static-policy preference

Description

This command associates a preference value with a statically defined-segment routing policy. This is an optional parameter.

When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process (which considers both static local policies and BGP signaled policies), the policy with the highest preference value is preferred over all policies with a lower preference value.

The **no** form of this command reverts to the default value.

Default

preference 100

Parameters

preference

Specifies the preference ID.

Values 0 to 4294967295

Platforms

7705 SAR Gen 2

preference

Syntax

preference *preference*

no preference

Context

[Tree] (config>router>policy-options>policy-statement>entry>action preference)

Full Context

configure router policy-options policy-statement entry action preference

Description

This command assigns a route preference to routes matching the route policy statement entry.

If no preference is specified, the default Route Table Manager (RTM) preference for the protocol is used.

The **no** form of this command disables setting an RTM preference in the route policy entry.

Note:
This command is supported with the following protocols: RIP import, BGP import, VPRN VRF import (**vrf-import**), and VPRN GRT lookup export (**export-grt**).

Default

no preference

Parameters

preference

Specifies the route preference expressed as a decimal integer.

Values 1 to 255 (0 represents unset - MIB only)

name — The preference parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

Platforms

7705 SAR Gen 2

preference

Syntax

preference

Context

[Tree] (config>ipsec>tnl-temp>rev-route preference)

Full Context

configure ipsec tunnel-template reverse-route preference

Description

This command configures the route preference assigned to the DL2L tunnel reverse routes. The system uses this preference when selecting a route to install in the route table.

Default

preference 0

Parameters

preference

Specifies the preference value for reverse routes.

Values 0 to 255

Platforms

7705 SAR Gen 2

23.3 preferred-lifetime

preferred-lifetime

Syntax

preferred-lifetime [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no preferred-lifetime

Context

[Tree] (config>service>vprn>dhcp6>server>pool>prefix preferred-lifetime)

Full Context

configure service vprn dhcp6 local-dhcp-server pool prefix preferred-lifetime

configure router dhcp6 local-dhcp-server pool prefix preferred-lifetime

Description

This command configures the preferred lifetime.

The **no** form of this command reverts to the default value.

Default

preferred-lifetime hrs 1

Parameters

preferred-lifetime

Specifies the preferred time for a prefix.

Values

days:	0 to 3650
hours:	0 to 23
minutes:	0 to 59
seconds	0 to 59

Platforms

7705 SAR Gen 2

preferred-lifetime

Syntax

[**no**] **preferred-lifetime** {*seconds* | **infinite**}

Context

[Tree] (config>router>router-advert>if>prefix preferred-lifetime)

Full Context

configure service vprn router-advertisement interface prefix preferred-lifetime

configure router router-advertisement interface prefix preferred-lifetime

Description

This command configures the remaining length of time in seconds that this prefix will continue to be preferred, such as, time until deprecation. The address generated from a deprecated prefix should not be used as a source address in new communications, but packets received on such an interface are processed as expected.

Default

preferred-lifetime 604800

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be preferred.

Values 0 to 4294967294

infinite

Specifies that the prefix will always be preferred. A value of 4,294,967,295 represents infinity.

Platforms

7705 SAR Gen 2

23.4 prefix

prefix

Syntax

prefix *ipv6-addr/prefix-length* [**failover** {**local** | **remote** | **access-driven**}] [**pd**] [**wan-host**] [**create**]

no prefix *ipv6-addr/prefix-length*

Context

[Tree] (config>service>vprn>dhcp6>server>pool prefix)

Full Context

configure router dhcp6 local-dhcp-server pool prefix

configure service vprn dhcp6 local-dhcp-server pool prefix

Description

This command allocates a prefix to a pool from which Prefix Delegation prefixes and or WAN addresses can be assigned for DHCP6.

The **no** form of this command removes the prefix parameters from the configuration.

Default

prefix failover local

Parameters

prefix ipv6-addr/prefix-length

Specifies the prefix.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D

prefix-length 1 to 128

failover {local | remote | access-driven}

This command designates a prefix as local, remote, or access-driven. This is used when multi-chassis synchronization is enabled.

Values **local** — An IPv6 prefix designated as local is used for new lease grants or to renew the existing lease grants. Local prefix designation should be always paired with the remote designation of the same prefix on the peering node.

The IPv6 prefix configured as local on one node can only be configured as remote on the other node. No other combination is allowed between the two nodes for an IPv6 prefix that is configured as local.

The DHCPv6 relay could point to both IPv6 DHCP server addresses — the one hosting the local IPv6 prefix and the one hosting the corresponding remote IPv6 prefix. Under normal circumstances the new lease will always be allocated from the local IPv6 prefix while the leases can be renewed from either IPv6 prefix (local or remote). Under network failure, the remote IPv6 prefix can be taken over according to the intercommunication link state transitions and associated timers.

remote — A prefix designated as remote is used only to renew the existing DHCP leases. The new leases are assigned from it only after the **maximum-client-lead-time** and **partner-down-delay** *time* elapses.

To ensure faster takeover, the partner-down-delay can be set to 0 and the MCLT time can be ignored. Extra caution should be exercised when enabling this mode of operation, as described in the configuration guides.

The IPv6 prefix configured as remote on one node can only be configured as local on the other node. No other combination is allowed between the two nodes for an IP address ranges that is configured as remote.

access-driven — A prefix designated as access-driven is like local (a new prefix assignment as well as a renewal). However, as the prefix is shared between the redundant server pair, the following additional conditions should be met to avoid duplicate address allocations:

- A dual home access protection mechanism such as SRRP or MC-LAG must ensure a single active path from the

  DHCP client to the server.
- The DHCP relay should point to the local server only.

pd

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

wan-host

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

create

Keyword used to create the prefix configuration. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

prefix

Syntax

prefix *low-order-vsi-id*

no prefix

Context

[Tree] (config>service>vpls>bgp-ad>vsi-id prefix)

Full Context

configure service vpls bgp-ad vsi-id prefix

Description

This command specifies the low-order 4 bytes used to compose the Virtual Switch Instance Identifier (VSI-ID) to use for NLRI in BGP auto-discovery in this VPLS service.

If no value is set, the system IP address will be used.

Default

no prefix

Parameters

low-order-vsi-id

Specifies a unique VSI ID

Values 0— 4294967295

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ip-prefix*/*prefix-length*

Context

[Tree] (config>service>vprn>bgp>group>dynamic-neighbor>match prefix)

Full Context

configure service vprn bgp group dynamic-neighbor match prefix

Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

Parameters

ip-prefix/prefix-length

Specifies a prefix from which to accept dynamic BGP sessions.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)

ipv4-prefix-length — 0 to 32

ipv6-prefix — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — [0 to FFFF]H

d — [0 to 255]D

ipv6-prefix-length — 0 to 128

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ipv6-prefixIprefix-length*

Context

[Tree] (config>service>vprn>router-advert>if prefix)

Full Context

configure service vprn router-advertisement interface prefix

Description

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

Parameters

ipv6-prefix

Specifies the IP prefix for prefix list entry in dotted decimal notation.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

prefix-length

Specifies a route must match the most significant bits and have a prefix length.

Values 1 to 128

Platforms

7705 SAR Gen 2

prefix

Syntax

prefix *ip-prefix/prefix-length* [**create**]

no prefix *ip-prefix/prefix-length*

Context

[Tree] (config>test-oam>twamp>server prefix)

Full Context

configure test-oam twamp server prefix

Description

This command configures an IP address prefix containing one or more TWAMP clients. For a TWAMP client to connect to the TWAMP server (and subsequently conduct tests) it must establish the control connection using an IP address that is part of a configured prefix.

Parameters

ip-prefix/prefix-length

Specifies an IPv4 or IPv6 address prefix.

Values

ipv4-prefix:	a.b.c.d (host bits must be 0)
ipv4-prefix-le:	0 to 32
ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-le:	0 to 128

prefix length

Specifies the prefix length.

Values 0 to128

create

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

prefix

Syntax

prefix *ip-prefix/prefix-length* [**create**]

no prefix *ip-prefix/prefix-length*

Context

[Tree] (config>service>vprn>twamp-light>reflector prefix)

[Tree] (config>router>twamp-light>reflector prefix)

Full Context

configure service vprn twamp-light reflector prefix

configure router twamp-light reflector prefix

Description

This command defines which TWAMP Light packet prefixes the reflector processes.

The **no** form of this command with the specific prefix removes the accepted source.

Parameters

ip-prefix/prefix-length

Specifies the IPv4 or IPv6 address and length.

Values

ipv4-prefix:	a.b.c.d (host bits must be 0)
ipv4-prefix-le:	0 to 32
ipv6-prefix:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-le:	0 to 128

create

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ip-prefix/prefix-length*

Context

[Tree] (config>qos>match-list>ip-prefix-list prefix)

Full Context

configure qos match-list ip-prefix-list prefix

Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

To add a set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv4 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

Parameters

ip-prefix

A valid IPv4 address prefix in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (host bit must be 0)

prefix-length

Length of the entered IP prefix

Values 1 to 32

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ipv6-prefix/prefix-length*

Context

[Tree] (config>qos>match-list>ipv6-prefix-list prefix)

Full Context

configure qos match-list ipv6-prefix-list prefix

Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv6 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

Parameters

ipv6-prefix

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

prefix-length

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

Values 1 to 128

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ip-prefix/prefix-length*

Context

[Tree] (config>filter>match-list>ip-prefix-list prefix)

Full Context

configure filter match-list ip-prefix-list prefix

Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

Operational Notes:

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv4 address prefix list.

Parameters

ip-prefix

Specifies a valid IPv4 address prefix in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (host bit must be 0)

prefix-length

Specifies the length of the entered IPv4 prefix.

Values 0 to 32

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ipv6-prefix/prefix-length*

Context

[Tree] (config>filter>match-list>ipv6-prefix-list prefix)

Full Context

configure filter match-list ipv6-prefix-list prefix

Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

Operational Notes:

To add set of different prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv6 address prefix list.

Parameters

ipv6-prefix/prefix-length

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

Values 1 to 128

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ip-prefix/ip-prefix-length*

Context

[Tree] (config>router>bgp>group>dynamic-neighbor>match prefix)

Full Context

configure router bgp group dynamic-neighbor match prefix

Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

Parameters

ip-prefix/ip-prefix-length

Specifies a prefix from which to accept dynamic BGP sessions.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)

ipv4-prefix-length — 0 to 32

ipv6-prefix — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — [0 to FFFF]H

d — [0 to 255]D

ipv6-prefix-length — 0 to 128

Platforms

7705 SAR Gen 2

prefix

Syntax

[**no**] **prefix** *ip-prefix/prefix-length* [**exact** | **longer** | **through** *length* | **prefix-length-range** *length1-length2* | **to** *ip-prefix/prefix-length* | **address-mask** *mask-pattern*]

Context

[Tree] (config>router>policy-options>prefix-list prefix)

Full Context

configure router policy-options prefix-list prefix

Description

This command creates a prefix entry in the route policy prefix list.

The **no** form of this command deletes the prefix entry from the prefix list.

Parameters

ip-prefix/prefix-length

Specifies the IP prefix and length for the prefix list entry in dotted decimal notation.

Values ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ipv6-prefix-length: [0 to 128]

exact

Specifies the prefix list entry only matches the route with the specified *ip-prefix* and prefix *mask* (length) values.

longer

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values equal to or greater than the specified mask.

through *length*

Specifies the prefix list entry matches any route that matches the specified ip-prefix and has a prefix length between the specified *length* values inclusive.

Values 0 to 32

prefix-length-range *length1 - length2*

Specifies a route must match the most significant bits and have a prefix length with the given range. The range is inclusive of start and end values.

Values 0 to 32, *length2* > *length1*

to *ip-prefix/prefix-length*

Specifies a second IP prefix and length used in route policy prefix lists. A route matches prefix1 to prefix2 if it matches prefix1 and prefix2 according to their respective prefix lengths and if the route's own prefix length is between the prefix lengths of prefix1 and prefix2. It could take many individual 'exact' match prefix entries to reproduce the same logic.

mask-pattern

Specifies the address mask to use for matching entries to this prefix entry. A route matches a prefix and address mask combination if the bitwise logical AND of this prefix and the

mask equals the bitwise logical AND of the route's address and the same mask and, additionally, the prefix length of the route matches the prefix length of the prefix entry.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

23.6 prefix-exclude

prefix-exclude

Syntax

prefix-exclude *policy-name* [*policy-name*]

no prefix-exclude

Context

[Tree] (config>router>ldp>aggregate-prefix-match prefix-exclude)

Full Context

configure router ldp aggregate-prefix-match prefix-exclude

Description

This command specifies the policy name containing the prefixes to be excluded from the aggregate prefix match procedures. In this case, LDP will perform an exact match of a specific FEC element prefix as

opposed to a longest match of one or more LDP FEC element prefixes, against this prefix when it receives a FEC-label binding or when a change to this prefix occurs in the routing table.

The **no** form of this command removes all policies from the configuration.

Default

no prefix-exclude

Parameters

policy-name

Specifies the route policy name, up to five. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

Platforms

7705 SAR Gen 2

23.9 prefix-limit

prefix-limit

Syntax

prefix-limit *family limit* [**threshold** *percentage*] [**idle-timeout** {*minutes* | **forever**} | **log-only** | **hold-excess** *percentage*] [**post-import**]

no prefix-limit *family*

Context

[Tree] (config>service>vprn>bgp>group>neighbor prefix-limit)

[Tree] (config>service>vprn>bgp>group prefix-limit)

Full Context

configure service vprn bgp group neighbor prefix-limit

configure service vprn bgp group prefix-limit

Description

This command configures the maximum number of BGP routes received from a peer before administrative action is taken. The administrative action can include generating a log or taking the session down. If a session is taken down, configure the **idle-timeout** parameter to bring it back up automatically after a specific duration. Alternatively, it can be configured to stay down indefinitely, until the user performs a reset.

No prefix limits for any address family are configured by default.

This command allows the user to apply a separate limit to each address family. A set of address family limits can be applied to one neighbor or to all neighbors in a group.

The **no** form of this command removes the **prefix-limit**.

Parameters

threshold *percentage*

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 1 to 100

family

Specifies the address family to which the limit applies.

Values ipv4, label-ipv4, ipv6, mcast-ipv4, flow-ipv4, flow-ipv6, mcast-ipv6

limit

Specifies the number of routes that can be learned from a peer expressed as a decimal integer.

Values 1 to 4294967295

idle-timeout *minutes*

Specifies the duration in minutes before automatically re-establishing a session.

Values 1 to 1024

idle-timeout forever

Specifies that the session is re-established only after the **clear router bgp** command is executed.

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is reached. However, the BGP session is not taken down.

post-import

Specifies that the limit should be applied only to the number of routes that are accepted by import policies.

hold-excess *percentage*

Specifies the percentage of maximum routes that are allowed to be installed in the route table. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding or advertisement to other peers. If the **post-import** parameter is configured, only routes not rejected by import policies count toward the limit. A BGP route in the overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This parameter is mutually exclusive with the **idle-timeout** and **log-only** parameters.

Platforms

prefix-limit

Syntax

prefix-limit *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** { *seconds* | **forever**}]

no prefix-limit

Context

[Tree] (config>service>vprn>isis prefix-limit)

Full Context

configure service vprn isis prefix-limit

Description

This command configures the maximum number of prefixes that IS-IS can learn, and use to protect the system from a router that has accidentally advertised a large number of prefixes. If the number of prefixes reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, IS-IS will go into overload.

The **overload-timeout** option controls the length of time that IS-IS is in the overload state when the prefix limit is reached. The system automatically attempts to restart IS-IS at the end of this duration. If the **overload-timeout forever** option is used, IS-IS is not restarted automatically and stays in overload until the condition is manually cleared by the administrator. This is also the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **prefix-limit**.

Default

prefix-limit overload-timeout forever

Parameters

limit

Specifies the number of prefixes that can be learned, expressed as a decimal integer.

Values 1 to 4294967296

log-only

Enables a warning message to be sent at the specified threshold percentage and also when the limit is exceeded. However, overload is not set when this parameter is configured.

percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

overload-timeout

Keyword used to control the length of time that IS-IS is in the overload state when the prefix limit is reached.

seconds

Specifies the time in minutes before IS-IS is restarted.

Values 1 to 1800

forever

Specifies that IS-IS should be restarted only after the execution of the **clear router isis overload prefix-limit** command.

Platforms

7705 SAR Gen 2

prefix-limit

Syntax

Full Context

configure service vprn static-route-entry indirect prefix-list

configure service vprn static-route-entry black-hole prefix-list

configure service vprn static-route-entry next-hop prefix-list

Description

This command associates a constraint to the associated static route such that the static route is only active if **any**, **none**, or **all** of the routes in the prefix list are present and active in the route table.

If the conditional static route is configured in a VPRN and the *router-instance-name* is configured as “Base”, the activation of the static route is dependent on the existence of routes in the Base router; the prefix-list and flag are evaluated in this context.

No router instance is specified by default, and the conditional static route is dependent on the existence of routes in the same router instance as the static route itself, subject to the details of the prefix list and the flag setting.

Entries in a referenced prefix list that are not match type ‘exact’ are interpreted as though they are ‘exact’.

The **no** form of this command disables these constraints on the static route.

Default

no prefix-list

Parameters

prefix-list-name

Specifies the name of a currently configured prefix list.

all

Specifies that the static route condition is met if all prefixes in the prefix list are present in the active static route.

none

Specifies that the static route condition is met if none of the prefixes in the named prefix-list are present in the active static route.

any

Specifies that the static route condition is met if any prefixes in the prefix list are present in the active static route.

router-instance-name

Specifies the name of the router instance. Must be "Base".

prefix-list

Syntax

[**no**] **prefix-list** *name*

Context

[Tree] (config>router>policy-options prefix-list)

Full Context

configure router policy-options prefix-list

Description

This command creates a context to configure a prefix list to use in route policy entries.

The **no** form of this command deletes the named prefix list.

Parameters

name

Specifies the prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

An empty prefix list can be configured for pre-provisioning. This empty prefix list will not find a match when referred to by a policy. When removing member prefixes from a prefix list, the prefix list will not be automatically removed when the last member is removed. If required, an empty prefix list must be explicitly removed using the **no** form of this command.

[Tree] (config>router>policy-options>policy-statement>entry>from prefix-list)

Full Context

configure router policy-options policy-statement entry to prefix-list

configure router policy-options policy-statement entry from prefix-list

Description

This command configures a prefix list as a match criterion for a route policy statement entry.

If no prefix list is specified, any network prefix is considered a match.

An empty prefix list will evaluate as if 'no match' was found.

The prefix lists specify the network prefix (this includes the prefix and length) a specific policy entry applies.

A maximum of 28 prefix names can be specified.

The **no** form of this command removes the prefix list match criterion.

Default

no prefix-list

Parameters

name

Specifies the prefix list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".

Full Context

configure router policy-options policy-statement entry from prefix-list-override

Description

This command converts a prefix list to a specific match type. The routing policy uses the converted list as a match condition.

The prefix list to be converted can be specified by its name, as an expression containing the name of a global variable that holds the name of the prefix list, or as an expression containing the name of a subroutine variable that holds the name of the prefix list.

Parameters

name

Specifies the prefix list to be converted, up to 64 characters.

exact

Keyword to convert all entries in the specified prefix list to the exact match type.

longer

Keyword to convert all entries in the specified prefix list to the longer match type.

length1-length2

Specifies the start and end length of the prefix range.

Values 0 to 128

Note: *length2* (end length) must be equal to or greater than *length1* (start length).

length

Specifies the through length of the prefix.

Values 0 to 128

Note: Configure the through length of the prefix to a value higher than the prefix length configured in the **configure router policy-options prefix-list prefix** command.

Platforms

7705 SAR Gen 2

[Tree] (config>router>nat>inside>deterministic prefix-map)

Full Context

configure service vprn nat inside deterministic prefix-map

configure router nat inside deterministic prefix-map

Description

This command is applicable to deterministic NAT and static 1:1 NAT. It is used to configure source IP prefixes on the inside and their association with outside deterministic NAT pools via the NAT policy. Hosts within the source IP prefix are deterministically mapped to outside IP addresses and port ranges in the associated deterministic NAT pool.

Multiple source IP prefixes within an inside routing instance can be defined and they can reference different NAT policies (and therefore, outside deterministic NAT pools and routing instances). Source IP prefixes from multiple routing instances can share the same deterministic NAT pool.

With this command, multiple NAT policies based on a destination prefix or filter criteria can be used together with deterministic NAT.

Non-deterministic NAT can be used simultaneously with deterministic NAT within the same inside routing instance. However, they cannot share the same NAT pool.

Source IP prefixes can be added or removed as long as the associated deterministic NAT pool is in a **no shutdown** mode.

Removing a prefix or modifying the map statement under it requires that the source IP prefix be in a **shutdown** mode.

Parameters

ip-prefix/length

Specifies source IP prefix on the inside whose hosts is deterministically mapped to an outside IP address and port block in the corresponding deterministic NAT pool.

Values

<ip-prefix/ip-pref*> <ipv4-prefix>/<ipv4-prefix-length>

	<ipv6-prefix>/<ipv6-prefix-length>
<ipv4-prefix>	a.b.c.d (host bits must be 0)
<ipv4-prefix-length>	0 to 32
<ipv6-prefix>	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
<ipv6-prefix-length>	0 to 128

nat-sub-type

Specifies the subscriber type.

Values classic-lsn-sub: LSN44 subscriber

dslit-lsn-sub: DT-lite subscriber

nat-policy-name

Specifies a NAT policy, up to 32 characters, that points to an outside pool and outside routing instance.

create

Keyword used to create the particular prefix instance.

Context

[Tree] (config>router>isis>loopfree-alternates>exclude prefix-policy)

Full Context

configure router isis loopfree-alternates exclude prefix-policy

Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation in this IS-IS instance.

Note:
Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

Default

no prefix-policy

Parameters

prefix-policy prefix-policy

Specifies the name of the prefix policy, up to 32 characters. Up to five prefix policies can be specified. The specified name must have been already defined.

Full Context

configure router bgp segment-routing prefix-sid-range

Description

This command configures the label block that BGP segment routing is allowed to use.

The s**tart-label** and **max-index** parameters specify that BGP should be restricted to a subrange of the SRGB, with the subrange starting at **start-label** and ending at **max-index**.

It is not possible to enable segment routing (perform a **no shutdown**) unless the **prefix-sid-range** is configured using the **global** keyword or using the **start-label** and **max-index** parameters.

The **no** form of the command allocates no labels for BGP segment-routing.

Default

no prefix-sid-range

Parameters

global

Specifies that BGP is allowed to allocate labels from the entire space of the SRGB, as defined under **config**>**router**>**mpls-labels**>**sr-labels**.

start-label

Specifies the first label value that is available to BGP in a contiguous range of labels.

Values 0 to 524287

max-index

Specifies the last label value that is available to BGP in a contiguous range of labels.

Values 1 to 524287

Platforms

no prefix-sid-range

Context

[Tree] (config>router>isis>segment-routing prefix-sid-range)

Full Context

configure router isis segment-routing prefix-sid-range

Description

This command configures the prefix SID index range and offset label value for a given IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value which this IGP instance will use. Since each prefix SID represents a network global IP address, the SID index for a prefix must be network-wide unique. Thus, all routers in the network are expected to configure and advertise the same prefix SID index range for a given IGP instance. However, the label value used by each router to represent this prefix; that is, the label programmed in the ILM can be local to that router by the use of an offset label, referred to as a start label:

Local Label (Prefix SID) = start-label + {SID index}

The label operation in the network becomes thus very similar to LDP when operating in the independent label distribution mode (RFC 5036, *LDP Specification*) with the difference that the label value used to forward a packet to each downstream router is computed by the upstream router based on advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. Once one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. Once the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In the per-instance mode of operation, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user thus configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index} must be within the SRGB or the configuration will be failed. Furthermore, the code checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce that these ranges do not overlap. The user must shutdown the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. In addition, any range change will be failed if an already allocated SID index/label goes out of range. The user can however change the SRGB on the fly as long as it does not reduce the current per IGP instance SID index/label range defined with the

prefix-sid-range. Otherwise, the user must shutdown the segment routing context of the IGP instance and delete and re-configure the **prefix-sid-range** command.

Default

no prefix-sid-range

Parameters

label-value

Specifies the label offset for the SR label range of this IGP instance.

Values 0 to 524287

index-value

Specifies the maximum value of the prefix SID index range for this IGP instance.

Values 1 to 524287

configure router ospf segment-routing prefix-sid-range

Description

This command configures the prefix SID index range and offset label value for an IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value that this IGP instance will use. Because each prefix SID represents a network global IP address, the SID index for a prefix must be unique network-wide. Therefore, all routers in the network are expected to configure and advertise the same prefix SID index range for an IGP instance. However, the label value used by each router to represent this prefix, that is, the label programmed in the ILM, can be local to that router by the use of an offset label, referred to as a start label:

Local Label (Prefix SID) = start-label + {SID index}

The label operation in the network is very similar to LDP when operating in independent label distribution mode (RFC 5036, *LDP Specification*), with the difference being that the label value used to forward a

packet to each downstream router is computed by the upstream router based on the advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. After one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. After the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In per-instance mode, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will fail. The 7705 SAR Gen 2 checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce no overlapping of these ranges. The user must shut down the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. A range change will fail if an already allocated SID index/label goes out of range. The user can change the SRGB without shutting down the segment routing context as long as it does not reduce the current per-IGP instance SID index/label range defined with the **prefix-sid-range** command. Otherwise, shut down the segment routing context of the IGP instance, and disable and re-enable the **prefix-sid-range** command.

Default

no prefix-sid-range

Parameters

label-value

Specifies the label offset for the SR label range of this IGP instance.

Values 0 to 524287

index-value

Specifies the maximum value of the prefix SID index range for this IGP.

Values 1 to 524287

23.18 primary

primary

Syntax

primary *path-name*

no primary

Context

[Tree] (config>router>mpls>lsp primary)

Full Context

configure router mpls lsp primary

Description

This command specifies a preferred path for the LSP. This command is optional only if the **secondary** *path-name* is included in the LSP definition. Only one primary path can be defined for an LSP.

Some of the attributes of the LSP such as the bandwidth, and hop-limit can be optionally specified as the attributes of the primary path. The attributes specified in the **primary path** *path-name* command, override the LSP attributes.

The **no** form of this command deletes the association of this *path-name* from the LSP *lsp-name*. All configurations specific to this primary path, such as record, bandwidth, and hop limit, are deleted. The primary path must be shutdown first in order to delete it. The **no primary** command will not result in any action except a warning message on the console indicating that the primary path is administratively up.

Parameters

path-name

Specifies the case-sensitive alphanumeric name label for the LSP path up to 64 characters in length.

Platforms

7705 SAR Gen 2

primary

Syntax

primary *mda-id*

no primary

Context

[Tree] (config>isa>tunnel-grp primary)

Full Context

configure isa tunnel-group primary

Description

This command assigns an ISA IPsec module configured in the specified slot to this IPsec group. The backup ISA IPsec provides the IPsec group with warm redundancy when the primary ISA IPsec in the group is configured. Primary and backup ISA IPsec have equal operational status and when both MDAs are coming up, the one that becomes operational first becomes the active ISA IPsec.

All configuration information is pushed down to the backup MDA from the CPM once the CPM gets notice that the primary module has gone down. This allows multiple IPsec groups to use the same backup module. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is supported.

The operator is notified through SNMP events when:

- When the ISA IPsec service goes down (all modules in the group are down) or comes back up (a module in the group becomes active).

- When ISA IPsec redundancy fails (one of the modules in the group is down) or recovers (the failed module comes back up).
- When an ISA IPsec activity switch took place.

The **no** form of this command removes the specified primary ID from the group's configuration.

Default

no primary

Parameters

mda-id

Specifies the card/slot identifying a provisioned IPsec ISA.

Platforms

7705 SAR Gen 2

Description

This command specifies the primary and secondary CVS methods used to verify the revocation status of the peer's certificate.

OCSP or CRL uses the corresponding configuration in the CA profile of the issuer of the certificate in question.

Default

primary crl

Parameters

primary

Specifies the primary CSV method used to verify the revocation status of the peer's certificate.

Values **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

crl — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

Default crl

secondary

Specifies the secondary CSV method used to verify the revocation status of the peer's certificate.

Values **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

crl — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

none — Specifies that no secondary method of CSV is used.

Default none

23.19 primary-config

primary-config

Syntax

primary-config *file-url*

no primary-config

Context

[Tree] (bof primary-config)

Full Context

bof primary-config

Description

This command specifies the name and location of the primary configuration file.

The system attempts to use the configuration specified in **primary-config**. If the specified file cannot be located, the system automatically attempts to obtain the configuration from the location specified in **secondary-config** and then the **tertiary-config**.

If an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **primary-config** configuration.

Parameters

file-url

Specifies the primary configuration file location, expressed as a file URL.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

23.21 primary-image

primary-image

Syntax

primary-image *file-url*

no primary image

Context

[Tree] (bof primary-image)

Full Context

bof primary-image

Description

This command specifies the primary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **primary-image** configuration.

Parameters

file-url

Specifies the *file-url* can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

no primary-ip-address

Context

[Tree] (config>router>bgp>orr>location primary-ip-address)

Full Context

configure router bgp optimal-route-reflection location primary-ip-address

Description

This command specifies the primary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the primary IP address information.

Default

no primary-ip-address

Parameters

ipv4-address

Specifies the primary IPv4 address of a location expressed in dotted decimal notation.

Values a.b.c.d

Platforms

7705 SAR Gen 2

configure service vpls stp priority

configure service template vpls-sap-template stp priority

Description

The bridge-priority command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values are truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

Default

priority 4096

Parameters

bridge-priority

Specifies the bridge priority for the STP instance

Values Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

7705 SAR Gen 2

priority

Syntax

priority *stp-priority*

no priority

Context

[Tree] (config>service>vpls>spoke-sdp>stp priority)

[Tree] (config>service>vpls>sap>stp priority)

Full Context

configure service vpls spoke-sdp stp priority

configure service vpls sap stp priority

Description

This command configures the Nokia Spanning Tree Protocol (STP) priority for the SAP or spoke SDP.

STP priority is a configurable parameter associated with a SAP or spoke SDP. When configuration BPDUs are received, the priority is used in some circumstances as a tie breaking mechanism to determine whether the SAP or spoke SDP be designated or blocked.

In traditional STP implementations (802.1D-1998), this field is called the port priority and has a value of 0 to 255. This field is coupled with the port number (0 to 255 also) to create a 16 bit value. In the latest STP standard (802.1D-2004) only the upper 4 bits of the port priority field are used to encode the SAP or spoke SDP priority. The remaining 4 bits are used to extend the port ID field into a 12 bit virtual port number field. The virtual port number uniquely references a SAP or spoke SDP within the STP instance.

STP computes the actual priority by taking the input value and masking out the lower four bits. The result is the value that is stored in the SDP priority parameter. For instance, if a value of 0 is entered, masking out the lower 4 bits results in a parameter value of 0. If a value of 255 is entered, the result is 240.

The **no** form of this command returns the STP priority to the default value.

Default

priority 128

Parameters

stp-priority

Specifies the STP priority value for the SAP or spoke SDP. 0 is the highest priority. The actual value used for STP priority (and stored in the configuration) is the result of masking out the lower 4 bits, therefore the actual value range is 0 to 240 in increments of 16.

Values 0 to 255

Description

This command configures the priority of the OSPF interface that is used to elect the designated router (DR) on the subnet.

This parameter is only used if the interface is of type **broadcast**. The router with the highest priority interface becomes the DR. A router with priority 0 is not eligible to be the designated router or backup designated router.

The **no** form of this command resets the interface priority to the default value.

Default

priority 1

Parameters

number

The interface priority expressed as a decimal integer. A value of 0 indicates the router is not eligible to be the Designated Router of Backup Designated Router on the interface subnet.

Values 0 to 255

Platforms

7705 SAR Gen 2

priority

Syntax

priority *dr-priority*

no priority

Context

[Tree] (config>service>vprn>pim>if priority)

Full Context

configure service vprn pim interface priority

Description

This command sets the priority value to become the rendezvous point (RP) that is included in bootstrap messages sent by the router. The RP is sometimes called the bootstrap router. The **priority** command indicates whether the router is eligible to be a bootstrap router.

The **no** form of this command disqualifies the router to participate in the bootstrap election.

Default

priority 1 (The router is the least likely to become the designated router.)

Parameters

dr-priority

Specifies the priority to become the designated router. The higher the value, the higher the priority.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

priority

Syntax

priority *bootstrap-priority*

Full Context

configure router mpls lsp-template priority

configure router mpls lsp secondary priority

configure router mpls lsp primary priority

Description

This command enables the soft preemption procedures for this LSP path. The operator enables the soft preemption mechanism on a specific LSP name by explicitly configuring the setup and holding priorities for the primary path at the head-end node. The operator can similarly configure priority values for a secondary path for this LSP name. Different values could be used for the primary and for any of the secondary paths. In the absence of explicit user configuration, the setup priority is internally set to the default value of 7 and the holding priority is set to the default value of 0.

Note:
Valid user-entered values for these two parameters require that the holding priority be numerically lower than or equal to the setup priority, otherwise preemption loops can occur.

Preemption is effected when a router preempting node processes a new RSVP session reservation and there is not enough available bandwidth on the RSVP interface, or the Class Type (CT) when Diff-Serv is enabled, to satisfy the bandwidth in the FlowSpec object while there exist other session reservations for LSP paths with a strictly lower holding priority (numerically higher holding priority value) than the setup priority of the new LSP reservation. If enough available bandwidth is freed on the link or CT to accommodate the new reservation by preempting one or more lower priority LSP paths, the preempting node allows temporary overbooking of the RSVP interface and honors the new reservation.

The preempting node will immediately set the 'Preemption pending' flag (0x10) in the IPv4 Sub-Object in the RRO object in the Resv refresh for each of the preempted LSP paths. The IPv4 Sub-Object corresponds to the outgoing interface being used by the preempting and preempted LSP paths; however, the bandwidth value in the FlowSpec object is not changed. The Resv flag must also be set if the preempting node is a merge point for the primary LSP path and the backup bypass LSP or detour LSP and the backup LSP is activated.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority value) to the holding priority just below the setup priority of the new reservation. A new reservation cannot preempt a reservation which has a value of the holding priority equal to the new reservation setup priority.

When Diff-Serv is enabled on the preempting node and the MAM bandwidth allocation model is used, a new reservation can only preempt a reservation in the same Class Type (CT).

LSP paths which were not flagged at the head-end for soft preemption will be hard preempted. LSP paths with the default holding priority of 0 cannot be preempted. LSP paths with zero bandwidth do not preempt other LSP paths regardless of the values of the path setup priority and the path holding priority. They can also not be preempted.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority) to the holding priority just below the setup priority of the new reservation. There is no specific order in which the reservations in the same holding priority are considered.

The preempting node starts a preemption timer for each of the preempted LSP paths. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A head-end node upon receipt of the Resv refresh message with the 'Preemption pending' flag must immediately perform a make-before-break on the affected adaptive CSPF LSP. Both IGP metric and TE metric based CSPF LSPs are included. If an alternative path that excludes the flagged interface is not found, then the LSP is put on a retry in a similar way to the Global Revertive procedure at a head-end node. However, the number of retries and the retry timer are governed by the values of the **retry-limit** and **retry-timer** parameters: **config>router>mpls>lsp>retry-limit**; **config>router>mpls>lsp>retry-timer**.

MPLS will keep the address list of flagged interfaces for a maximum of 60 s (not user-configurable) from the time the first Resv message with the 'Preemption pending' flag is received. This actually means that MPLS will request CSPF to find a path that excludes the flagged interfaces in the first few retries until success or until 60 s have elapsed. Subsequent retries after the 60 s will not exclude the flagged interfaces as it is assumed IGP has converged by then and the Unreserved Bandwidth sub-TLV for that priority, or TE Class, in the TE database will show the updated value taking into account the preempting LSP path reservation or a value of zero if overbooked.

If the LSP has a configured secondary standby which is operationally UP, the router will switch the path of the LSP to it and then start the MBB. If no standby path is available and a secondary non-standby is configured, the router will start the MBB and signal the path of the secondary. The LSP path will be switched to either the secondary or the new primary, whichever comes up first.

The **no** form of this command reverts the LSP path priority to the default values and results in setting the setup priority to 7, in setting the hold priority to 0, and in clearing the 'soft preemption desired' flag in the RRO in the Resv refresh message.

Default

no priority

Parameters

setup-priority

Specifies the priority of the reservation for this session at setup time.

Values 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

Default 7 — This session does not preempt any other session.

holding-priority

Specifies the priority of the reservation for this session at preemption action.

Values 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

Default 0 — This session does not get preempted by any other session.

7705 SAR Gen 2

priority

Syntax

priority *priority*

no priority

Context

[Tree] (config>router>fad>flex-algo priority)

Full Context

configure router flexible-algorithm-definitions flex-algo priority

Description

This command configures the priority of the FAD. This priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.

Every router that is configured to participate in a particular flexible algorithm uses the same tie-breaker logic to select the winning FAD. This allows for consistent FAD definition selection in cases where routers advertise different definitions for a specific flexible algorithm. The following rules apply to the breaker mechanism.

- From the advertisements of the FAD in the area (including both locally generated advertisements and received advertisements), select the one with the highest priority value.
- If there are multiple advertisements of the FAD with the same highest priority, select the one that is originated from the router with either the highest system ID or router ID.

The **no** form of this command sets the priority to the default value.

Default

priority 100

Parameters

priority

Configures the priority of this FAD.

Values 0 to 255

Default 100

Context

[Tree] (config>router>if>ipv6>vrrp priority)

[Tree] (config>router>if>vrrp priority)

Full Context

configure router interface ipv6 vrrp priority

configure router interface vrrp priority

Description

This command configures the base router priority for the virtual router instance used in the master election process.

The priority is the most important parameter set on a non-owner virtual router instance. The priority defines a virtual router's selection order in the master election process. Together, the priority value and the **preempt** mode allow the virtual router with the best priority to become the master virtual router.

The *base-priority* is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

The **priority** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed.

For non-owner virtual router instances, the default base priority value is 100.

The **no** form of the command reverts to the default value.

Default

priority 100

Parameters

priority

The base priority used by the virtual router instance expressed as a decimal integer. If no VRRP priority control policy is defined, the *base-priority* is the in-use priority for the virtual router instance.

Values 1 to 254

Platforms

7705 SAR Gen 2

priority

Syntax

priority *priority-level* [{**delta** | **explicit**}]

configure vrrp policy priority-event lag-port-down number-down priority

configure vrrp policy priority-event lag-port-down weight-down priority

configure vrrp policy priority-event host-unreachable priority

Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

Default

no priority

Parameters

priority-level

The priority level adjustment value expressed as a decimal integer.

Values 0 to 254

delta

Configures what effect the *priority-level* will have on the base priority value. The default base priority value is **delta**.

When **delta** is specified, the *priority-level* value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event *priority-level* values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value. If the **delta** priority event is cleared, the *priority-level* is no longer used in the in-use priority calculation.

explicit

Configures what effect the *priority-level* will have on the base priority value.

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

Platforms

7705 SAR Gen 2

priority

Syntax

priority *priority-level* **explicit**

no priority

Context

[Tree] (config>vrrp>policy>priority-event>mc-ipsec-non-forwarding priority)

Full Context

configure vrrp policy priority-event mc-ipsec-non-forwarding priority

Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

Default

no priority

Parameters

priority-level

The priority level adjustment value expressed as a decimal integer.

Values 0 to 254

explicit

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

Platforms

7705 SAR Gen 2

priority

Syntax

priority *bridge-priority*

no priority

Context

[Tree] (config>service>pw-template>stp priority)

Full Context

configure service pw-template stp priority

Description

The **bridge-priority** command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values will be truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

Default

priority 4096

Parameters

bridge-priority

Specifies the bridge priority for the STP instance.

Values Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

no private-service

Context

[Tree] (config>ipsec>client-db>client private-service)

Full Context

configure ipsec client-db client private-service

Description

This command specifies the private service ID that is used for tunnel setup.

The **no** form of this command reverts to the default.

Default

no private-service

Parameters

service-id

Specifies the service ID of the tunnel delivery service.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **private-service name** *service-name* variant can be used in all configuration modes.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

name service-name

Identifies the service, up to 64 characters.

configure router interface ipsec ipsec-tunnel private-tcp-mss-adjust

configure ipsec tunnel-template private-tcp-mss-adjust

configure service ies interface sap ip-tunnel private-tcp-mss-adjust

configure service ies interface ipsec ipsec-tunnel private-tcp-mss-adjust

configure service vprn interface sap ip-tunnel private-tcp-mss-adjust

configure service vprn interface ipsec ipsec-tunnel private-tcp-mss-adjust

configure service vprn interface sap ipsec-tunnel private-tcp-mss-adjust

Description

This command enables TCP MSS to adjust for L2TPv3 tunnels, IPsec, or IP tunnels on the private side. When the command is configured, the system updates the TCP MSS option to the value of the received TCP SYN packet on the private side.

The **no** form of this command disables TCP MSS adjust on the private side.

Default

no private-tcp-mcc-adjust

Parameters

bytes

Specifies the new TCP MSS value in bytes.

Values 512 to 9000

octets

Specifies the new TCP MSS value in octets.

Values 512 to 9000

7705 SAR Gen 2

23.34 probe-fail-enable

probe-fail-enable

Syntax

[**no**] **probe-fail-enable**

Context

[Tree] (config>saa>test>trap-gen probe-fail-enable)

Full Context

configure saa test trap-gen probe-fail-enable

Description

This command enables the generation of an SNMP trap when the consecutive probe failure threshold (configured using the **probe-fail-threshold** command) is reached during the execution of the SAA ping test. This command is not applicable to SAA trace route tests.

The **no** form of this command disables the generation of an SNMP trap.

Platforms

7705 SAR Gen 2

23.35 probe-fail-threshold

probe-fail-threshold

Syntax

probe-fail-threshold *threshold*

no probe-fail-threshold

Context

[Tree] (config>saa>test>trap-gen probe-fail-threshold)

Full Context

configure saa test trap-gen probe-fail-threshold

Description

This command configures the threshold for trap generation after ping probe failure.

This command has no effect when **probe-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

Default

probe-fail-threshold 1

Parameters

threshold

Specifies the number of consecutive ping probe failures required to generate a trap.

Values 0 to 15

Platforms

7705 SAR Gen 2

23.36 probe-history

probe-history

Syntax

probe-history {**keep** | **drop** | **auto**}

Context

[Tree] (config>saa>test probe-history)

Full Context

configure saa test probe-history

Description

Specifies history probe behavior. Defaults are associated with various configured parameters within the SAA test. Auto (keep) is used for test with probe counts of 100 or less, and intervals of 1 second and above. Auto (drop) only maintains summary information for tests marked as continuous with file functions, probe counts more than 100 and intervals of less than 1 second. SAA tests that are not continuous with a write to file defaults to Auto (keep). The operator is free to change the default behaviors for each type. Each test that maintains per probe history consumes more system memory. When per probe entries are required, the probe history is available at the completion of the test.

Default

probe-history auto

Parameters

auto

An auto selector that determines the storage of the history information.

drop

Stores summarized min/max/avg data not per probe information for test runs. This may be configured for all tests to conserve memory.

keep

Stores per probe information for tests. This consumes significantly more memory than summary information and should only be used if necessary.

Platforms

7705 SAR Gen 2

23.37 process-arp-probes

process-arp-probes

Syntax

[**no**] **process-arp-probes**

Context

[Tree] (config>service>vpls>proxy-arp process-arp-probes)

Full Context

configure service vpls proxy-arp process-arp-probes

Description

This command enables router proxy ARP function replies to Duplicate Address Detection (DAD) ARP probes upon a successful proxy ARP table lookup.

The **no** form of this command disables the router from replying to DAD ARP probes.

Default

process-arp-probes

Platforms

7705 SAR Gen 2

23.38 process-cpm-traffic-on-sap-down

process-cpm-traffic-on-sap-down

Syntax

[**no**] **process-cpm-traffic-on-sap-down**

Context

[Tree] (config>service>vpls>sap process-cpm-traffic-on-sap-down)

Full Context

configure service vpls sap process-cpm-traffic-on-sap-down

Description

This command is applicable to simple SAPs configured on LAGs that are not part of any "endpoint" configurations or complicated resiliency schemes like MC-LAG with inter-chassis-backup (ICB) configurations. When configured, a simple LAG SAP is not removed from the forwarding plane and flooded traffic (unknown unicast, broadcast and multicast) is dropped on egress. This allows applicable control traffic that is extracted at the egress interface to be processed by the CPM. This command will not prevent a VPLS service from entering an operationally down state if it is the last active connection to enter a nonoperational state. By default, without this command, when a SAP on a LAG enters a nonoperational state, it is removed from the forwarding plane and no forwarding occurs to the egress.

The **no** form of this command removes a SAP over a LAG that is not operational from the forwarding process.

Default

no process-cpm-traffic-on-sap-down

Platforms

7705 SAR Gen 2

23.39 process-dad-neighbor-solicitations

process-dad-neighbor-solicitations

Syntax

[**no**] **process-dad-neighbor-solicitations**

Context

[Tree] (config>service>vpls>proxy-nd process-dad-neighbor-solicitations)

Full Context

configure service vpls proxy-nd process-dad-neighbor-solicitations

Description

This command enables the router proxy ND replies to Duplicate Address Detection (DAD) neighbor solicitations upon a successful proxy ND table lookup.

The **no** form of this command disables the router from replying to DAD neighbor solicitations.

Default

process-dad-neighbor-solicitations

Platforms

7705 SAR Gen 2

23.40 process-received-upa

process-received-upa

Syntax

[**no**] **process-received-upa**

Context

[Tree] (config>router>isis>upa process-received-upa)

Full Context

configure router isis prefix-unreachable process-received-upa

Description

This command enables processing of UPAs received from other routers. When configured, received UPAs are inserted into the unicast routing table as unreachable prefixes. When configured on an Area Boundary Router (ABR), received UPAs are inserted into the unreachable prefix table and redistributed into the other areas.

The **no** form of this command disables the processing of UPAs received from other routers. When disabled, received UPAs are ignored by the router.

Default

no process-received-upa

Platforms

7705 SAR Gen 2

23.41 profile

profile

Syntax

[**no**] **profile** *user-profile-name*

Context

[Tree] (config>system>security profile)

Full Context

configure system security profile

Description

This command creates a context to create user profiles for command authorization and other functions associated with a user.

Profiles can be used to deny or permit user access to entire command branches or to specific commands.

Once the profiles are created, the **user** command assigns users to one or more profiles. You can define up to 16 user profiles but a maximum of 8 profiles can be assigned to a user.

The **no** form of this command deletes a user profile.

Parameters

user-profile-name

Specifies the user profile name entered as a character string. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

Platforms

7705 SAR Gen 2

profile

Syntax

profile {**in** | **out**}

no profile

Context

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy profile)

[Tree] (config>saa>test>type-multi-line>lsp-ping profile)

Full Context

configure saa test type-multi-line lsp-ping sr-policy profile

configure saa test type-multi-line lsp-ping profile

Description

This command configures the profile state of the MPLS echo request packet.

The **no** form of this command reverts to the default value.

Default

profile out

Parameters

in

Specifies "in” as the profile state of the MPLS echo request packet.

out

Specifies "out” as the profile state of the MPLS echo request packet.

Platforms

7705 SAR Gen 2

profile

Syntax

profile {**in** | **out**}

no profile

Context

[Tree] (config>oam-pm>session>ip profile)

Full Context

configure oam-pm session ip profile

Description

This command defines whether the TWAMP Light PDU packet should be treated as in-profile or out-of-profile. The default has been selected because the forwarding class defaults to best effort.

The **no** form of this command restores the default value.

Default

profile out

Parameters

in

Specifies that the TWAMP Light PDU packet is sent as in-profile.

out

Specifies that the TWAMP Light PDU packet is sent as out-of-profile.

Platforms

7705 SAR Gen 2

profile

Syntax

profile {**in** | **out**}

no profile

Context

[Tree] (config>qos>sap-ingress>fc profile)

Full Context

configure qos sap-ingress fc profile

Description

This command places a forwarding class or subclass into a color aware profile mode. Normally, packets associated with a class are considered in-profile or out-of-profile solely based on the dynamic rate of the ingress queue relative to its CIR. Explicitly defining a class as in-profile or out-of-profile overrides this function by handling each packet with the defined profile state.

The profile command may only be executed when the forwarding class or the parent forwarding class (for a subclass) is mapped to a queue that has been enabled to support color aware profile packets. The queue may only be configured for profile-mode at the time the queue is created in the SAP ingress QoS policy.

A queue operating in profile-mode may support in-profile, out-of-profile, and non-profiled packets simultaneously. However, the high- and low-priority classification actions are ignored when the queue is in profile-mode.

The **no** form of this command removes an explicit in-profile or out-of-profile configuration on a forwarding class or subclass.

Default

no profile — The default profile state of a forwarding class or subclass is not to treat ingress packets as color aware. An explicit definition for in-profile or out-of-profile must be specified on the forwarding class or subclass.

Parameters

in

The **in** keyword is mutually exclusive to the **out** keyword. When the profile in command is executed, all packets associated with the class will be handled as in-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. In-profile packets will count against the CIR of the queue, diminishing the amount of CIR available to other classes using the queue that are not configured with an explicit profile.

out

The **out** keyword is mutually exclusive to the **in** keyword. When the profile out command is executed, all packets associated with the class will be handled as out-of-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. Out-of-profile packets will not count against the CIR of the queue, allowing other classes using the queue that are not configured with an explicit profile to be measured against the full CIR.

Description

This command configures a **certificate-update-profile** to reference the update behavior.

Parameters

cert-update-profile

Specifies the certificate profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

23.42 profile-capped

profile-capped

Syntax

[**no**] **profile-capped**

Context

[Tree] (config>qos>sap-ingress>policer profile-capped)

[Tree] (config>qos>sap-egress>policer profile-capped)

Full Context

configure qos sap-ingress policer profile-capped

configure qos sap-egress policer profile-capped

Description

Profile-capped mode enforces an overall in-profile burst limit to the CIR bucket for ingress undefined, ingress explicit in-profile, egress soft-in-profile, and egress explicit in-profile packets. The default behavior when profile-capped mode is not enabled is to ignore the CIR output state when an explicit in-profile packet is handled by an ingress or egress policer.

The profile-capped mode makes two changes:

- At egress, soft-in-profile packets (packets received from ingress as in-profile) are treated the same as explicit in-profile (unless explicitly reclassified as out-of-profile) and have an initial policer state of in-profile.

- At both ingress and egress, any packet output from the policer with a non-conforming CIR state are treated as out-of-profile (out-of-profile state is ignored for initial in-profile packets when profile-capped mode is not enabled).

Default

no profile-capped

Platforms

7705 SAR Gen 2

23.47 propagate-admin-group

propagate-admin-group

Syntax

[**no**] **propagate-admin-group**

Context

[Tree] (config>router>mpls>lsp-template>fast-reroute propagate-admin-group)

[Tree] (config>router>mpls>lsp>fast-reroute propagate-admin-group)

Full Context

configure router mpls lsp-template fast-reroute propagate-admin-group

configure router mpls lsp fast-reroute propagate-admin-group

Description

The command enables the signaling of the primary LSP path admin-group constraints in the FRR object at the ingress.

When this command is executed, the admin-group constraints configured in the context of the P2P LSP primary path, or the ones configured in the context of the LSP and inherited by the primary path, are copied into the FAST_REROUTE object. The admin-group constraints are copied into the 'include-any' or 'exclude-any' fields.

The ingress LER thus propagates these constraints to the downstream nodes during the signaling of the LSP to allow them to include the admin-group constraints in the selection of the FRR backup LSP for protecting the LSP primary path.

The ingress LER inserts the FAST_REROUTE object by default in a primary LSP path message. If the user disables the object using the following command, the admin-group constraints will not be propagated: **config>router>mpls>no frr-object**.

Note that the same admin-group constraints can be copied into the Session Attribute object. They are intended for the use of an LSR, typically an ABR, to expand the ERO of an inter-area LSP path. They are also used by any LSR node in the path of a CSPF or non-CSPF LSP to check the admin-group constraints against the ERO regardless if the hop is strict or loose. These are governed strictly by the command:

config>router>mpls>lsp>propagate-admin-group

In other words, the user may decide to copy the primary path admin-group constraints into the FAST_REROUTE object only, or into the Session Attribute object only, or into both. Note, however, that the PLR rules for processing the admin-group constraints can make use of either of the two object admin-group constraints.

This feature is supported with the following LSP types and in both intra-area and inter-area TE where applicable:

- Primary path of a RSVP P2P LSP.
- S2L path of an RSVP P2MP LSP instance

- LSP template for an S2L path of an RSVP P2MP LSP instance.

The **no** form of this command disables the signaling of administrative group constraints in the FRR object.

Default

no propagate-admin-group

Platforms

7705 SAR Gen 2

propagate-admin-group

Syntax

[**no**] **propagate-admin-group**

Context

[Tree] (config>router>mpls>lsp propagate-admin-group)

[Tree] (config>router>mpls>lsp-template propagate-admin-group)

Full Context

configure router mpls lsp propagate-admin-group

configure router mpls lsp-template propagate-admin-group

Description

This command enables propagation of session attribute object with resource affinity (C-type 1) in PATH message. If an LSR receives a session attribute with resource affinity, then it will check the compatibility of admin-groups received in PATH message against configured admin-groups on the egress interface of LSP.

To support admin-group for inter-area LSP, the ingress node must configure propagating admin-groups within the session attribute object. If a PATH message is received by an LSR node that has the **cspf-on-loose-hop** option enabled and the message includes admin-groups, then the ERO expansion by CSPF to calculate the path to the next loose hop includes the admin-group constraints received from ingress node.

If this option is disabled, then the session attribute object without resource affinity (C-Type 7) is propagated in PATH message and CSPF at the LSR node does not include admin-group constraints.

This admin group propagation is supported with a P2P LSP, a P2MP LSP instance, and an LSP template.

The user can change the value of the **propagate-admin-group** option on the fly. A RSVP P2P LSP performs a Make-Before-Break (MBB) on changing the configuration. A S2L path of an RSVP P2MP LSP performs a Break-Before-Make on changing the configuration.

The **no** form of this command reverts to the default value.

Default

no propagate-admin-group

Platforms
7705 SAR Gen 2

configure service vpls propagate-mac-flush

Description
This command enabled propagation of mac-flush messages received from the specified T-LDP on all spoke and mesh-SDPs within the context of the VPLS service. The propagation will follow split-horizon principles and any data-path blocking in order to avoid looping of these messages.

Default
no propagate-mac-flush

Platforms
7705 SAR Gen 2

23.49 propagate-metric

propagate-metric

Syntax
[**no**] **propagate-metric**

Context
[Tree] (config>service>vprn>rip propagate-metric)

Full Context
configure service vprn rip propagate-metric

Description

This command enables the BGP MED to be used to configure the RIP metric at the BGP to RIP transition on egress routers. BGP always configures the BGP MED to the RIP metric at the ingress router. When **propagate-metric** is configured, the RIP metric at egress routers is configured as the BGP MED attribute added to the optional value configured with the **metric-out** command.

The **no** version of this command sets the RIP metric to the optional value configured with the **metric-out** command plus 1.

Default

no propagate-metric

23.52 protection-type

protection-type

Syntax

protection-type {**link** | **node**}

no protection-type

Context

[Tree] (config>router>route-next-hop-policy>template protection-type)

Full Context

configure router route-next-hop-policy template protection-type

Description

This command configures the protection type constraint into the route next-hop policy template.

The user can select if link protection or node protection is preferred in the selection of an LFA next-hop for all IP prefixes and LDP FEC prefixes to which a route next-hop policy template is applied. The default in SR OS implementation is node protection. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the protection type preference specified in the template.

The **no** form deletes the protection type constraint from the route next-hop policy template.

Default

protection-type node

Parameters

{link | node}

Specifies the two possible values for the protection type.

Default node

Platforms

7705 SAR Gen 2

Context

[Tree] (config>ipsec>ts-list>remote>entry protocol)

[Tree] (config>ipsec>ts-list>local>entry protocol)

Full Context

configure ipsec ts-list remote entry protocol

configure ipsec ts-list local entry protocol

Description

This command specifies the protocol and port range in the IKEv2 traffic selector.

The SR OS supports OPAQUE ports and port ranges for the following protocols:

- TCP
- UDP
- SCTP
- ICMP
- ICMPv6
- MIPv6

For ICMP and ICMPv6, the *port* value takes the form *icmp-type*/*icmp-code*. For MIPv6, the *port* value is the mobility header type. For other protocols, only the **port any** configuration can be used.

Default

no protocol

Parameters

protocol-id

Specifies the protocol ID. The value can be a number, a protocol name, or **any**.

begin-port-id

Specifies the beginning of the port range.

Values For TCP, UDP, and SCTP, the value is the port number.

For ICMP and ICMPv6, the value takes the form *icmp-type*/*icmp-code*; for example, 0/0.

For MIPv6, the value is the mobility header type.

end-port-id

Specifies the end of the port range

Values For TCP, UDP, and SCTP, the value is the port number.

For ICMP and ICMPv6, the value takes the form *icmp-type*/*icmp-code*; for example, 0/0.

For MIPv6, the value is the mobility header type.

opaque

Specifies OPAQUE ports.

any

Specifies any port.

protocol

Syntax

[**no**] **protocol** *protocol-id*

Context

[Tree] (config>filter>match-list>protocol-list protocol)

Full Context

configure filter match-list protocol-list protocol

Description

This command adds a protocol to the match protocol list.

The **no** form of this command removes the protocol from the **protocol-list**.

Parameters

protocol-id

protocol-number, *protocol-name*

protocol-number

Specifies the protocol number value to be added or removed from the protocol list. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

Values [0 to 255]D

[0x0 to 0xFF]H

[0b0 to 0b11111111]B

protocol-name

Specifies the protocol name to be added or removed from the protocol list.

Values icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp.

Platforms

7705 SAR Gen 2

protocol

Syntax

protocol *protocol*

no protocol [*protocol*]

Context

[Tree] (config>vrrp>policy>priority-event>route-unknown protocol)

Full Context

configure vrrp policy priority-event route-unknown protocol

Description

This command adds one or more route sources to match the route unknown IP route prefix for a route unknown priority control event.

If the route source does not match one of the defined protocols, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **protocol** command is optional. If the **protocol** command is not executed, the comparison between the RTM prefix return and the **route-unknown** IP route prefix will not include the source of the prefix. The **protocol** command cannot be executed without at least one associated route source parameter.

All parameters are reset each time the **protocol** command is executed and only the explicitly defined protocols are allowed to match.

The **no** form of the command removes protocol route source as a match criteria for returned RTM route prefixes.

To remove specific existing route source match criteria, execute the **protocol** command and include only the specific route source criteria. Any unspecified route source criteria is removed.

Default

no protocol — No route source for the route unknown priority event is defined.

Parameters

protocol

Explicitly defined protocols

Values **bgp** - This parameter defines BGP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp** parameter, a returned route prefix with a source of BGP will not be considered a match and will cause the event to enter the set state.

bgp-vpn - This parameter defines **bgp-vpn** as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp-vpn** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp-vpn** parameter, a returned route prefix with a source of **bgp-vpn** will not be considered a match and will cause the event to enter the set state.

ospf - This parameter defines OSPF as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **ospf** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **ospf** parameter, a returned route prefix with a source of OSPF will not be considered a match and will cause the event to enter the set state.

is-is - This parameter defines IS-IS as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **is-is** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **is-is** parameter, a returned route prefix with a source of IS-IS will not be considered a match and will cause the event to enter the set state.

rip - This parameter defines RIP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **rip** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **rip** parameter, a returned route prefix with a source of RIP will not be considered a match and will cause the event to enter the set state.

static - This parameter defines a static route as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **static** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **static** parameter, a returned route prefix with a source of static route will not be considered a match and will cause the event to enter the set state.

Platforms

7705 SAR Gen 2

protocol

Syntax

protocol *protocol-id*

no protocol

Context

[Tree] (config>system>security>mgmt-access-filter>ip-filter>entry protocol)

Full Context

configure system security management-access-filter ip-filter entry protocol

Description

This command configures an IP protocol type to be used as a management access filter match criterion.

The protocol type, such as TCP, UDP, and OSPF, is identified by its respective protocol number. Well-known protocol numbers include ICMP (1), TCP (6), and UDP (17).

The **no** form the command removes the protocol from the match criteria.

Parameters

protocol

Specifies the protocol number for the match criterion.

Values 1 to 255 (decimal)

Platforms

7705 SAR Gen 2

protocol

Syntax

[**no**] **protocol** *name* [**create**]

Context

[Tree] (config>sys>security>dist-cpu-protection>policy protocol)

Full Context

configure system security dist-cpu-protection policy protocol

Description

This command creates the control protocol for the policy.

The **no** form of this command means packets of the specified protocol are not monitored or enforced (although they count in the FP protocol queue) on the objects to which this DCP policy is assigned. The packets are treated as part of the **all-unspecified** protocol if the protocol is created in the policy.

Parameters

names

Signifies the protocol name.

The following explanatory notes for specific protocols apply:

- bfd-cpm - includes all BFD handled on the CPM, including the cpm-np type, single hop and multi hop, and MPLS-TP CC and CV BFD
- dhcp - includes DHCP for IPv4 and IPv6
- eth-cfm - 802.1ag and includes Y.1731. ETH-CFM packets on port and LAG-based facility MEPs are not included (but packets on tunnel MEPs are)
- icmp - includes IPv4 and IPv6 ICMP (including RS/RA/Redirect), except NS/NA Neighbor Discovery packets that are classified as a separate NDIS protocol
- icmp-ping-check - includes packets associated with ping-template functions
- isis - includes IS-IS used for SPBM
- ldp - includes LDP and T-LDP
- mpls-ttl - includes MPLS packets that are extracted because of an expired MPLS-TTL field
- ndis - includes IPv6 NS/NA Neighbor Discovery (not including RS/RA/Redirect which are classified as part of the ICMP protocol)
- ospf - includes all OSPFv2 and OSPFv3 packets
- pppoe-pppoa - includes PADx, LCP, PAP/CHAP, and NCPs
- ssh - includes TCP port 22 or a user-configured SSH server port
- vrrp - includes VRRP and SRRP packets
- multi-chassis - includes SR OS Multi-Chassis UDP port 1025 packets
- multi-chassis-sync - includes SR OS Multi-Chassis Sync TCP port 45067 packets
- all-unspecified - a special aggregate entry for protocols that are not explicitly specified. When configured, this option treats all extracted control packets that are not explicitly configured in the DCP policy as a single aggregate flow (or virtual protocol). It lumps together remaining control traffic to allow it to be rate limited as one flow. It includes all control traffic of all protocols that are extracted and sent to the CPM (including protocols that cannot be explicitly configured with the distributed CPU protection feature). Control

packets that are both forwarded and copied for extraction are not included. If a user later explicitly configures a protocol, that protocol is suddenly no longer part of the **all-unspecified** flow. This protocol must be explicitly configured to operate.

Values all-unspecified, arp, bfd-cpm, bgp, dhcp, eth-cfm, http-redirect, icmp, icmp-ping-check, igmp, isis, ldp, mld, mpls-ttl, multi-chassis, multi-chassis-sync, ndis, ospf, pim, pppoe-pppoa, radius, rsvp, ssh, vrrp

create

Mandatory keyword to create the protocol.

Platforms

7705 SAR Gen 2

protocol

Syntax

protocol *protocol* [**all** | { **instance** *instance*}]

protocol *protocol2* [*protocol2* (up to 5 max)]

no protocol

Context

[Tree] (config>router>policy-options>policy-statement>entry>from protocol)

Full Context

configure router policy-options policy-statement entry from protocol

Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending how it is used.

The **protocol direct-interface** route type matches the specific direct interface host IPv4 /32 and IPv6 /128 routes. The **protocol direct** route type matches direct routes and does not match the specific /32 or /128 interface route itself.

Note:
The **instance** command cannot be used if multiple protocol names are specified for the *protocol2* parameter.

The **no** form of this command removes the protocol match criterion.

Default

no protocol

Parameters

protocol

Specifies the protocol name for the match criterion.

Values direct, static, bgp, isis, ospf, rip, aggregate, bgp-vpn, igmp, pim, ospf3, ldp, sub-mgmt, mld, managed, vpn-leak, nat, periodic, ipsec, dhcpv6-pd, dhcpv6-na, dhcpv6-ta, dhcpv6-pd-excl, ripng, bgp-label, direct-interface, arp-nd, rib-api, evpn-ifl, evpn-iff, srv6

instance

Specifies the OSPF, OSPFv3, or IS-IS protocol instance.

Values isis-inst — 0 to 127

ospf-inst — 0 to 31

ospf3-inst — 0 to 31, 64 to 95

protocol2

Specifies up to five protocol names to match on.

Values direct, static, isis, aggregate, bgp, bgp-label, direct-interface

all

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

Platforms

7705 SAR Gen 2

protocol

Syntax

protocol *protocol* [**all** | **instance** *instance*]

protocol bgp bgp-label

no protocol

Context

[Tree] (config>router>policy-options>policy-statement>entry>to protocol)

Full Context

configure router policy-options policy-statement entry to protocol

Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending how it is used.

The **no** form of this command removes the protocol match criterion.

Default

no protocol

Parameters

protocol

Specifies the protocol name to match on.

Values bgp, isis, ospf, rip, bgp-vpn, ospf3, vpn-leak, ldp, ripng, bgp-label

instance

Specifies the OSPF, OSPFv3, or IS-IS instance.

Values isis-inst — 0 to 127
ospf-inst — 0 to 31
ospf3-inst — 0 to 31, 64 to 95

all

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

Platforms

protocol-list

Syntax

protocol-list *protocol-list-name* [**create**]

no protocol-list *protocol-list-name*

Context

[Tree] (config>filter>match-list protocol-list)

Full Context

configure filter match-list protocol-list

Description

This command creates a list of IP protocols that can be used in line card IP and IPv6 filters.

The **no** form of this command removes the IP protocol list.

Default

no protocol-list

Parameters

protocol-list-name

Specifies the name of the protocol list.

create

This keyword is required to create the protocol list. After it is created, the protocol list can be enabled with or without the **create** keyword.

Platforms

7705 SAR Gen 2

23.56 protocol-version

protocol-version

Syntax

protocol-version *TLS version*

no protocol-version

Context

[Tree] (config>system>security>tls>client-tls-profile protocol-version)

Full Context

configure system security tls client-tls-profile protocol-version

Description

This command configures the TLS version to be negotiated between the client and server.

When configured, the client adds the specified version as a supported version in its Hello message to the server. If **tls-version-all** is specified, the client adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

Default

protocol-version tls-version12

Parameters

TLS version

Specifies the TLS version to include in the client Hello message.

Values tls-version12, tls-version13, tls-version-all

Platforms

7705 SAR Gen 2

protocol-version

Syntax

protocol-version *TLS version*

no protocol-version

Context

[Tree] (config>system>security>tls>server-tls-profile protocol-version)

Full Context

configure system security tls server-tls-profile protocol-version

Description

This command configures the TLS version to be negotiated between the server and client.

When configured, the server adds the specified version as a supported version in its Hello message to the client. If **tls-version-all** is specified, the server adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

Default

protocol-version tls-version12

Parameters

TLS version

Specifies the TLS version to include in the server Hello message.

Values tls-version12, tls-version13, tls-version-all

[Tree] (config>service>ies>if proxy-arp-policy)

Full Context

configure service vprn interface proxy-arp-policy

configure service ies interface proxy-arp-policy

Description

This command specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a neighbor.

The **no** form of this command disables the proxy ARP capability.

Parameters

policy-name

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

The specified name must already be defined.

Platforms

7705 SAR Gen 2

proxy-arp-policy

Syntax

proxy-arp-policy *policy-name* [*policy-name*]

no proxy-arp-policy

Context

[Tree] (config>router>if proxy-arp-policy)

Full Context

configure router interface proxy-arp-policy

Description

This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a specific neighbor. The policy-name is configured in the **config>router>policy-options** context.

Use proxy ARP so the router responds to ARP requests on behalf of another device. Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.

Default

no proxy-arp-policy

Parameters

policy-name

Specifies the export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified in a single statement. The specified policy names must already be defined.

configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure service ies interface sap ip-tunnel public-tcp-mss-adjust

Description

This command enables the Maximum Segment Size (MSS) for the TCP traffic in an IPsec tunnel which is sent from the public network to the private network. The system may use this value to adjust or insert the MSS option in TCP SYN packet.

If the **auto** parameter is specified, the system derives the new MSS value based on the public MTU and IPsec overhead.

The **no** form of this command disables TCP MSS adjust on the public side.

Default

no public-tcp-mss-adjust

Parameters

auto

Derive the new MSS value based on the public MTU and IPsec overhead.

bytes

Specifies the new TCP MSS value in bytes.

Values 512 to 9000

octets

Specifies the new TCP MSS value in octets

Values 512 to 9000

Platforms

7705 SAR Gen 2

23.69 purge-timer

Syntax

purge-timer *minutes*

no purge-timer

Context

[Tree] (config>router>bgp purge-timer)

Full Context

configure router bgp purge-timer

Description

When the system sends a VPN-IP Route-Refresh to a peer it sets all the VPN-IP routes received from that peer (in the RIB-IN) to stale and starts the purge-timer. If the routes are not updated (refreshed) before the purge-timer has expired then the routes are removed.

The BGP purge timer configures the time before stale routes are purged.

The **no** form of this command reverts to the default.

Default

purge-timer 10

Parameters

minutes

Specifies the maximum time before stale routes are purged.

Values 1 to 60

Platforms

7705 SAR Gen 2

23.70 push

push

Syntax

push {*label* | **implicit-null-label**} **nexthop** *ip-address*

no push {*out-label* | **implicit-null-label**}

Context

[Tree] (config>router>mpls>static-lsp push)

Full Context

configure router mpls static-lsp push

Description

This command specifies the label to be pushed on the label stack and the next hop IP address for the static LSP.

The **no** form of this command removes the association of the label to push for the static LSP.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the push operation.

label

The label to push on the label stack. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment

- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address of the next hop towards the LSP egress router. If an ARP entry for the next hop exists, then the static LSP is marked operational. If ARP entry does not exist, software sets the operational status of the static LSP to down and continues to ARP for the configured nexthop. Software continuously tries to ARP for the configured nexthop at a fixed interval.

Platforms

7705 SAR Gen 2

23.71 pw-routing

pw-routing

Syntax

pw-routing

Context

[Tree] (config>service pw-routing)

Full Context

configure service pw-routing

Description

Commands in this context configure dynamic multi-segment pseudowire (MS-PW) routing. Pseudowire routing must be configured on each node that will be a T-PE or an S-PE.

Platforms

7705 SAR Gen 2

23.72 pw-status-signaling

pw-status-signaling

Syntax

[**no**] **pw-status-signaling**

Context

[Tree] (config>service>epipe>spoke-sdp pw-status-signaling)

Full Context

configure service epipe spoke-sdp pw-status-signaling

Description

This command enables pseudowire status signaling for this spoke SDP binding.

The **no** form of this command disables the status signaling.

Default

pw-status-signaling

Platforms

7705 SAR Gen 2

pw-status-signaling

Syntax

[**no**] **pw-status-signaling**

Context

[Tree] (config>service>vpls>spoke-sdp pw-status-signaling)

Full Context

configure service vpls spoke-sdp pw-status-signaling

Description

This command specifies the type of signaling used by this multi-segment pseudowire provider-edge for this service.

When no pw-status-signaling is enabled, the 7705 SAR Gen 2 will not include the pseudowire status TLV in the initial label mapping message of the pseudowire used for a spoke-SDP. This will force both 7705 SAR Gen 2 PEs to use the pseudowire label withdrawal method for signaling pseudowire status.

If pw-status-signaling is configured, the node will include the use of the pseudowire status TLV in the initial label mapping message for the pseudowire.

Platforms

7705 SAR Gen 2

23.73 pw-template

pw-template

Syntax

pw-template *policy-id* [**use-provisioned-sdp** | [**prefer-provisioned-sdp**] [**auto-gre-sdp**]][**create**] [**name** *name*]

no **pw-template** *policy-id*

Context

[Tree] (config>service pw-template)

Full Context

configure service pw-template

Description

This command configures an SDP template.

Parameters

policy-id

Specifies a number that uniquely identifies a template for the creation of an SDP.

Values *policy-id*: 1 to 2147483647

use-provisioned-sdp

Specifies whether to use an already provisioned SDP. When specified, the tunnel manager is consulted for an existing active SDP (with a matching far-end address), and the SDP with the lowest metric is chosen. If there are multiple SDPs with the same metric, then the highest SDP identifier that is oper-up is chosen. The choice of SDP can be configured by applying **sdp-include/exclude** in the PW template together with an sdp-group in the provisioned SDPs. This option, and the **auto-gre-sdp** option, are mutually exclusive.

prefer-provisioned-sdp

Specifies that if an existing matching SDP that conforms to any restrictions defined in the **pw-template** is found (for example, **sdp-include**/**exclude** *group*), then it will be used, following the same logic as for the **use-provisioned-sdp** parameter. Otherwise, the command will automatically create an SDP in the same manner as if the user did not specify any option. This option and the **use-provisioned-sdp** option are mutually exclusive.

auto-gre-sdp

Specifies that an SDP should automatically be created using a GRE tunnel. This option and the **use-provisioned-sdp** option are mutually exclusive. The PW template parameters **hash-label**, **entropy-label** and **sdp-include/exclude** are ignored when an GRE SDP is auto-created.

auto-mpls-sdp

Specifies that an SDP should automatically be created using an MPLS tunnel. This is the default.

create

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

name name

A name of the operator's choice, up to 64 characters. The name is saved as part of the configuration.

If a name is not specified at creation time, then SR OS assigns a string version of the policy-id as the name.

Values *name*: 64 characters maximum

7705 SAR Gen 2

23.74 pw-template-bind

pw-template-bind

Syntax

pw-template-bind *policy-id*

no pw-template-bind

Context

[Tree] (config>service>epipe>spoke-sdp-fec pw-template-bind)

Full Context

configure service epipe spoke-sdp-fec pw-template-bind

Description

This command binds includes the parameters included in a specific PW template to a spoke SDP.

The **no** form of this command removes the values from the configuration.

Parameters

policy-id

Specifies the existing policy ID.

Values 1 to 2147483647

Platforms

7705 SAR Gen 2

23.75 pw-template-binding

pw-template-binding

Syntax

pw-template-binding *policy-id* [**import-rt** { *ext-community* [*ext-community*]}] [**endpoint** *endpoint-name*]

no pw-template-binding *policy-id*

Context

[Tree] (config>service>epipe>bgp pw-template-binding)

Full Context

configure service epipe bgp pw-template-binding

Description

This command binds the advertisements received with the route targets (RT) that match the configured list (either the generic or the specified import) to a specific pw-template. If the RT list is not present, or if multiple matches are found, the numerically lowest pw-template is used.

The pw-template-binding applies to BGP-VPWS when enabled in the Epipe.

For BGP VPWS, the following additional rules govern the use of pseudowire-template:

- On transmission, the settings for the L2-Info extended community in the BGP updates are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified for the same VPWS instance the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP updates are compared with the settings from the corresponding pseudowire template bindings. The following steps are used to determine the local pw-template:
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to **pw-template-binding** with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest.
  - If no pw-template-binding matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the value used for Layer 2 MTU (unless the value zero is received), or control word does not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flags is not zero the pseudowire is not created.

The **tools perform** commands can be used to control the application of changes in pw-template for BGP-VPWS.

The **no** form of this command removes the values from the configuration.

Parameters

policy-id

Specifies an existing policy ID.

Values 1 to 2147483647

import-rt ext-comm

Specifies the communities, up to five, allowed to be accepted from remote PE neighbors. An extended BGP community in the type:x:y format. The value x can be an integer or IP address. The type can be the target or origin.

Values target:{*ip-addr*:*comm-val* | *2byte-asnumber*:*ext-comm-val*| *4byte-snumber*:*comm-val*}

ip-addr	a.b.c.d
comm-val	0 to 65535
2byte-asnumber	0 to 65535
ext-comm-val	0 to 4294967295
4byte-asnumber	0 to 4294967295

endpoint-name

Specifies the name of the endpoint the BGP PW template is associated with, up to 32 characters. When the configured endpoint is associated to the **pw-template-binding** of a BGP VPWS service, EVPN MPLS can also be configured and associated to the same endpoint in the same Epipe service. Modifying this element causes the parent element to be recreated automatically in order for the new value to take effect.

Platforms

7705 SAR Gen 2

pw-template-binding

Syntax

pw-template-binding *policy-id* [**split-horizon-group** *group-name*] [**import-rt** {*ext-community*}]

no pw-template-bind *policy-id*

Context

[Tree] (config>service>vpls>bgp pw-template-binding)

Full Context

configure service vpls bgp pw-template-binding

Description

This command binds the advertisements received with the route target (RT) that matches the configured list (either the generic or the specified import) to a specific PW template. If the RT list is not present the pw-template is used for all of them.

The **pw-template-binding** applies to both BGP-AD and BGP-VPLS if these features are enabled in the VPLS.

For BGP VPLS the following additional rules govern the use of pseudowire-template.

- On transmission, the settings for the L2-Info extended community in the BGP update are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified, the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP update are compared with the settings from the corresponding pw-template. The following steps are used to determine the local pw-template.
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to pw-template-binding with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest
  - If no pw-templates matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the values used for Layer 2 MTU (unless the value zero is received) or control word flag do not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flags is not zero, the pseudowire is not created.

The tools perform commands can be used to control the application of changes in pw-template for both BGP-AD and BGP-VPLS.

The **no** form of this command removes the values from the configuration.

Parameters

policy-id

Specifies an existing policy ID

Values 1 to 2147483647

group-name

The specified group-name overrides the split horizon group template settings

import-rt ext-comm

Specifies communities allowed to be accepted from remote PE neighbors. An extended BGP community in the **type**:**x**:**y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers. A maximum of five *import-rt ext-com* can be specified.

Values target:{*ip-addr:comm-val*| *2byte-asnumber:ext-comm-val*| *4byte-asnumber:comm-val*}

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-as-number: [0 to 4294967295]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [0 to 4294967295]

23.76 pw-template-id-range

pw-template-id-range

Syntax

pw-template-id-range start *pw-template-id* **end** *pw-template-id*

no pw-template-id-range

Context

[Tree] (config>service>md-auto-id pw-template-id-range)

Full Context

configure service md-auto-id pw-template-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to PW templates that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A PW template created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD-CLI interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no pw-template-id-range

Parameters

start *pw-template-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

end *pw-template-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 2147483647

Platforms

7705 SAR Gen 2

23.77 pwc

pwc

Syntax

pwc [**previous**]

Context

[Tree] (pwc)

Full Context

pwc

Description

This command displays the present or previous working context of the CLI session. The **pwc** command provides a user who is in the process of dynamically configuring a chassis a way to display the current or previous working context of the CLI session. The **pwc** command displays a list of the CLI nodes that hierarchically define the current context of the CLI instance of the user.

The following shows an output example:

```
A:ALA-1>config>router>bgp>group# pwc
------------------------------------------------
Present Working Context :
------------------------------------------------
<root>
  configure
  router Base
  bgp
  group test
  ospf
```

```
  area 1
-----------------------------------------------
A:ALA-1>config>router>bgp>group#
```

When the **previous** keyword is specified, the previous context displays. This is the context entered by the CLI parser upon execution of the **exit** command. The current context of the CLI is not affected by the **pwc** command.

Parameters

previous

Displays the previous present working context.

Platforms

7705 SAR Gen 2

23.78 pxc

```
pxc
```

Syntax

pxc *pxc-id* [**create**]

[Tree] (config>service>vpls>sap>egress qos)

Full Context

configure service vprn interface sap egress qos

configure service ies interface sap egress qos

configure service vpls sap egress qos

Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP) or IP interface.

QoS egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy ID does not exist, an error is returned.

The **qos** command associates both ingress and egress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress and egress policies on SAP or IP interface egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

Values 1 to 65535

port-redirect-group

This keyword associates a SAP egress with an instance of a named queue group template on the egress port of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

queue-group-name

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under config>port>ethernet>access>egress.

instance *instance-id*

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

Values 1 to 40960

no qos

Context

[Tree] (config>service>vpls>sap>egress qos)

Full Context

configure service vpls sap egress qos

Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an egress QoS policy is associated with an IES IP interface that has been bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the egress QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface- binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

port-redirect-group

Associates a SAP egress with an instance of a named queue group template on the egress port of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

queue-group-name

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under *config>port>ethernet>access>egress*.

instance *instance-id*

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA

[Tree] (config>service>vprn>if>sap>ingress qos)

Full Context

configure service ies interface sap ingress qos

configure service vprn interface sap ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy ID does not exist, an error is returned.

The **qos** command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

1 to 65535

shared-queuing

Specifies the ingress shared queue policy used by this SAP. When the value of this object is null it means that the SAP uses individual ingress QoS queues instead of the shared ones.

multipoint-shared

Specifies that this queue-id is for multipoint forwarded traffic only. This queue-id can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. Attempting to map forwarding class unicast traffic to a multipoint queue generates an error; no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The multipoint designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the multipoint keyword, an error is generated and the command is not executed.

The multipoint keyword can be entered in the command line on a preexisting multipoint queue to edit queue ID parameters.

Default Present (the queue is created as non-multipoint).

Values **Multipoint** or not present.

fp-redirect-group

Creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command fails.

queue-group-name

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters. The queue-group-name must correspond to a valid ingress queue group template name, configured in the **config>qos>queue-group-templates** context.

instance-id

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

Platforms

7705 SAR Gen 2

no qos [*policy-id*]

Context

[Tree] (config>service>epipe>sap>egress qos)

Full Context

configure service epipe sap egress qos

Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the *policy-id* does not exist, an error will be returned.

The **qos** command, when used under the egress context, is used to associate egress QoS policies.

The **qos** command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The egress policy ID to associate with SAP on egress. The policy ID must already exist.

Values 1 to 65535

queue-group-name

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under *config>port>ethernet>access>egress*.

instance-id

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

Values 1 to 40960

Default 1

Context

[Tree] (config>service>epipe>sap>ingress qos)

Full Context

configure service epipe sap ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The **qos** command, when used under the ingress context, is used to associate ingress QoS policies. The **qos** command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. The shared-queuing keyword specifies the shared queue policy will be used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

fp-redirect-group

This keyword can only be used on SAP ingress and associates a SAP ingress with an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and **instance** *instance-id* are mandatory parameters when executing the command.

queue-group-name

Specifies the name of the queue group to be instance on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The *queue-group-name* must correspond to a valid ingress forwarding plane queue group, created under **config**>**card**>**fp**>**ingress**>**access**.

instance-id

Specifies the instance of the named queue group on the IOM/IMM/XMA ingress forwarding plane.

configure service vpls mesh-sdp egress qos

configure service epipe spoke-sdp egress qos

Description

This command is used to redirect pseudowire (PW) packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-sdp inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that

an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:

- When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
- When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the PW packet is forwarded.

The **no** version of this command removes the redirection of the PW to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length.

instance-id

Specifies the optional identification of a specific instance of the queue-group.

configure service ies interface spoke-sdp egress qos

configure service vprn interface spoke-sdp egress qos

Description

This command is used to redirect pseudowire packets to an egress port queue-group for the purpose of shaping.

The egress pseudowire shaping provisioning model allows the mapping of one or more pseudowires to the same instance of queues, or policers and queues, which are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface on which the pseudowire packets can be forwarded. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service or to the egress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a pseudowire FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface on which the pseudowire packet is forwarded. This queue can be a queue-group queue, or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a pseudowire packet.
2. When a pseudowire FC is redirected to use a queue or a policer, and a queue in a queue-group and the queue-group name exists, but the policer-id and/or the queue-id is not defined in the queue-group

template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the pseudowire packet is forwarded on.

3. When a pseudowire FC is redirected to use a queue, or a policer and a queue in a queue-group, and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports which have network IP interfaces. The handling of this is dealt with in the data path as follows:
   a. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
   b. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the pseudowire packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a pseudowire, any pseudowire FC, which is not explicitly redirected in the network QoS policy, will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the pseudowire is redirected to exists and the redirection succeeds, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP is performed; according to the relevant mappings of the (FC, profile) in the egress context of the network QoS policy applied to the pseudowire. This is true regardless, whether an instance of the queue-group exists or not on the egress port to which the pseudowire packet is forwarded. If the packet profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet DEI/dot1p and the tunnel DEI/dot1p/EXP, and the DSCP/prec will be remarked if e**nable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the pseudowire packet is forwarded.

configure service vprn interface spoke-sdp ingress qos

configure service ies interface spoke-sdp ingress qos

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast, broadcast, unknown, or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the

ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:

the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.

a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group (csc-policing). The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1.p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

configure service pw-template egress qos

Description

This command is used to redirect PW packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue- group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.

4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model.

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
   - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
   - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/ dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface the PW packet is forwarded to.

The **no** version of this command removes the redirection of the PW to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *network-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

name network-policy-name

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:

- the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
- a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1-p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length

instance-id

Specifies the identification of a specific instance of the queue-group

Values 1 to 16384

Full Context

configure service pw-template ingress qos

Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC which needs to be redirected and optionally for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface which the pseudowire packets can be received on. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-sdp inside a service or to the ingress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

- When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as "policer-output-queues”.
- When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

4. If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
5. If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
   - the ingress network shared queue for the packet’s FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
   - a queue-group policer followed by the per-FP ingress shared queues referred to as "policer-output-queues” Good received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from a R-VPLS spoke-sdp which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet’s FC defined in the network-queue policy applied to the ingress of the FP is used. When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless if an instance of the named policer queue-group exists on the ingress FP the pseudowire packet is received on. The user can apply a QoS filter matching the dot1p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload’s IP header if the user enabled the ler-use-dscp option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface the pseudowire packet is received on.

The no version of this command removes the redirection of the pseudowire to the queue-group.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *network-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

queue-group-name

Specifies the name of the queue group template up to 32 characters in length.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

name network-policy-name

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

7705 SAR Gen 2

qos

Syntax

qos *policy-id* [**shared-queuing** | **multipoint-shared**]

qos name *sap-ingress-policy-name* [**shared-queuing** | **multipoint-shared**]

no qos [*policy-id*]

Context

[Tree] (config>service>template>vpls-sap-template>ingress qos)

Full Context

configure service template vpls-sap-template ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) for the Epipe SAP template.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *sap-ingress-policy-name* variant can be used in all configuration modes.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

multipoint-shared

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

Values Multipoint or not present

Default Present (the queue is created as non-multipoint)

sap-ingress-policy-name

The SAP ingress QoS policy name to associate with the SAP on ingress, up to 64 characters.

Platforms

7705 SAR Gen 2

qos

Syntax

Context

[Tree] (config>service>vpls>sap>ingress qos)

Full Context

configure service vpls sap ingress qos

Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an ingress QoS policy is defined on IES ingress IP interface that is bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface-binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

Parameters

policy-id

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

Values 1 to 65535

shared-queuing

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

multipoint-shared

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

Values Multipoint or not present

Default Present (the queue is created as non-multipoint)

fp-redirect-group

Creates an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command will fail.

queue-group-name

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid ingress queue group template name, configured under the **configure qos queue-group-templates** context.

instance-id

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

Context

[Tree] (config>service>vprn>nw-if qos)

Full Context

configure service vprn network-interface qos

Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). (This is only applicable to interfaces on IOM4 and later cards.) The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.
- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

Default

no qos

Parameters

network-policy-id

An existing network policy ID to associate with the IP interface.

Values 1 to 65535

port-redirect-group *queue-group-name*

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

egress-instance *instance-id*

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which particular instance to associate with this particular network IP interface.

Values 1 to 16384

fp- redirect-group *queue-group-name*

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue-group-name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

ingress-instance *instance-id*

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which particular instance to associate with this particular network IP interface.

Values 1 to 16384

Platforms

7705 SAR Gen 2

qos

Syntax

qos *network-policy-id* **fp-redirect-group** *queue-group-name instance instance-id*

no qos

Context

[Tree] (config>service>vprn>network>ingress qos)

Full Context

configure service vprn network ingress qos

Description

This command is used to redirect unicast packets arriving on an automatically (using the **auto-bind-tunnel** command) or manually configured (using a **spoke-sdp** command, but not the **spoke-sdp** command under the VPRN IP interface) binding in a VPRN to a policer in an ingress forwarding plane queue-group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

1. The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
2. The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command fails if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VPRN binding unicast traffic arrives then this traffic uses the ingress network queues related to the network interface, however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy; any **fp-redirect-group multicast-policer, broadcast-policer** or **unknown-policer** commands are ignored for this traffic. Multicast traffic would use the ingress network queues or queue group related to the network interface.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and exp classification is based on the outer Ethernet header and MPLS label whereas the DSCP applies to the outer IP header if the tunnel encapsulation is GRE, or the DSCP in the first IP header in the payload if **ler-use-dscp** is enabled in the ingress section of the referenced network QoS policy.

When this command is applied, it overrides the QoS applied to the related network interfaces for unicast traffic arriving on bindings in that VPRN.

The **no** version of this command removes the redirection of VPRN binding traffic to the queue-group policers.

Parameters

network-policy-id

Specifies the network policy identification. The value uniquely identifies the policy on the system.

Values 1 to 65535

fp-redirect-group *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

Platforms

7705 SAR Gen 2

configure router interface qos

Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.
- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

Default

no qos

Parameters

network-policy-id

Specifies an existing network policy ID to associate with the IP interface.

Values 1 to 65535

egress-port-redirect-group *queue-group-name*

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

egress-instance *instance-id*

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which instance to associate with this specific network IP interface.

Values 1 to 16384

ingress-fp- redirect-group *queue-group-name*

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue-group-name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

ingress-instance *instance-id*

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which instance to associate with this specific network IP interface.

Values 1 to 16384

Platforms

7705 SAR Gen 2

[Tree] (config>qos>md-auto-id qos-policy-id-range)

Full Context

configure qos md-auto-id qos-policy-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to QoS policies that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A QoS policy created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed which will cause any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>eth-cfm md-auto-id** command for further details.

Default

no qos-policy-id-range

Parameters

start ***policy-id***

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 65535

end ***policy-id***

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 65535

Platforms

7705 SAR Gen 2

Description

This command configures the IGMP query interval. If the **send-queries** command is enabled, this parameter specifies the interval between two consecutive general queries sent by the system on this SAP or SDP.

The configured query-interval must be greater than the configured query-response-interval.

If send-queries is not enabled on this SAP or SDP, the configured query-interval value is ignored.

Default

query-interval 125

Parameters

seconds

Specifies the time interval, in seconds, that the router transmits general host-query messages.

Values 2 to 1024

Platforms

7705 SAR Gen 2

24.6 query-last-listener-interval

query-last-listener-interval

Syntax

query-last-listener-interval *seconds*

no query-last-listener-interval

Context

[Tree] (config>router>mld>if query-last-listener-interval)

Full Context

configure router mld interface query-last-listener-interval

Description

This command configures the frequency at which the querier router sends a group-specific query messages, including the messages sent in response to leave-group messages and is only applicable when the group interface is configured with the **no sub-hosts-only** command. The shorter the interval, the faster the loss of the last listener of a group can be detected. If nothing is configured, by default, the **query-last-listener-interval** takes the value defined in the **config>router>mld** context or in the **config>service>vprn>mld** context.

The **no** form of this command reverts to the default value.

Default

query-last-listener-interval 1

Parameters

seconds

Specifies the frequency, in seconds, at which query messages are sent.

Values 1 to 1023

Platforms

7705 SAR Gen 2

query-last-listener-interval

Syntax

query-last-listener-interval *seconds*

no query-last-listener-interval

Context

[Tree] (config>service>vprn>mld query-last-listener-interval)

[Tree] (config>service>vprn>mld>if query-last-listener-interval)

Full Context

configure service vprn mld query-last-listener-interval

configure service vprn mld interface query-last-listener-interval

Description

This command specifies the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages, and is also the amount of time between Group-Specific Query messages. This value may be tuned to modify the leave latency of the network. A reduced value results in reduced time to detect the loss of the last member of a group.

The **no** form of this command reverts to the default value.

Default

query-last-listener-interval 1

Parameters

seconds

Specifies the frequency, in seconds, at which Group-Specific-Query packets are transmitted.

Values 1 to 1023

Platforms

7705 SAR Gen 2

24.7 query-last-member-interval

query-last-member-interval

Syntax

query-last-member-interval *seconds*

no query-last-member-interval

Context

[Tree] (config>router>igmp query-last-member-interval)

[Tree] (config>router>igmp>if query-last-member-interval)

Full Context

configure router igmp query-last-member-interval

configure router igmp interface query-last-member-interval

Description

This command configures the frequency at which the querier sends group-specific query messages including messages sent in response to leave-group messages. The lower the interval, the faster the detection of the loss of the last member of a group.

Default

query-last-member-interval 1

Parameters

seconds

Specifies the frequency, in seconds, at which query messages are sent.

Values 1 to 1023

Platforms

7705 SAR Gen 2

query-last-member-interval

Syntax

query-last-member-interval *seconds*

Context

[Tree] (config>service>vprn>igmp query-last-member-interval)

Full Context

configure service vprn igmp query-last-member-interval

Description

This command configures the frequency at which the querier sends group-specific query messages including messages sent in response to leave-group messages. The lower the interval, the faster the detection of the loss of the last member of a group.

Default

query-last-member-interval 1

Parameters

seconds

Specifies the frequency, in seconds, at which query messages are sent.

Values 1 to 1023

Platforms

7705 SAR Gen 2

24.8 query-response-interval

query-response-interval

Syntax

query-response-interval *seconds*

Context

[Tree] (config>service>vpls>spoke-sdp>igmp-snooping query-response-interval)

[Tree] (config>service>vpls>sap>mld-snooping query-response-interval)

[Tree] (config>service>vpls>spoke-sdp>mld-snooping query-response-interval)

[Tree] (config>service>vpls>mesh-sdp>mld-snooping query-response-interval)

Full Context

configure service vpls spoke-sdp igmp-snooping query-response-interval

configure service vpls sap mld-snooping query-response-interval

configure service vpls sap igmp-snooping query-response-interval

configure service vpls mesh-sdp igmp-snooping query-response-interval

configure service vpls spoke-sdp mld-snooping query-response-interval

configure service vpls mesh-sdp mld-snooping query-response-interval

Description

This command configures the IGMP query response interval. If the **send-queries** command is enabled, this parameter specifies the maximum response time advertised in IGMPv2 or IGMPv3 queries.

The configured query response interval must be smaller than the configured query interval.

If **send-queries** is not enabled on this SAP or SDP, the configured query response interval value is ignored.

The **no** form of this command reverts to the default value.

Default

query-response-interval 10

Parameters

seconds

Specifies the length of time to wait to receive a response to the host-query message from the host.

Values 1 to 1023

Platforms

7705 SAR Gen 2

query-response-interval

Syntax

query-response-interval *seconds*

no query-response-interval

Context

[Tree] (config>service>vprn>igmp query-response-interval)

Full Context

configure service vprn igmp query-response-interval

Description

This command configures the query response interval on when the group interface is configured with the **no sub-hosts-only** command. If nothing is configured, by default, the **query-response-interval** takes the value defined in the **config>router>igmp** (or **mld**) context or in the **config>service>vprn>igmp** (or **mld**) context.

The **no** form of this command reverts to the default value.

Default

query-response-interval 10

Parameters

seconds

Specifies the length of time to wait to receive a host-query message response from the host.

Values 1 to 1023

Platforms

7705 SAR Gen 2

query-response-interval

Syntax

query-response-interval *seconds*

no query-response-interval

Context

configure service pw-template igmp-snooping query-response-interval

Description

This command configures the IGMP query response interval. If the **send-queries** command is enabled, this parameter specifies the maximum response time advertised in IGMPv2/v3 queries.

The configured **query-response-interval** must be smaller than the configured **query-interval**.

If **send-queries** is not enabled on this SAP or SDP, the configured **query-response-interval** value is ignored.

Default

query-response-interval 10

Parameters

seconds

Specifies the length of time to wait to receive a response to the host-query message from the host.

Values 1 to 1023

Platforms

7705 SAR Gen 2

24.9 query-src-ip

query-src-ip

Syntax

query-src-ip *ip-address*

no query-src-ip

Context

[Tree] (config>service>vpls>igmp-snooping query-src-ip)

Full Context

configure service vpls igmp-snooping query-src-ip

Description

This command configures the IP source address used in IGMP or MLD queries.

The **no** form of this command removes the IP address from this configuration.

Parameters

ip-address

Specifies an IPv4 address in the form of a.b.c.d or an IPv6 address in the following form:

x:x:x:x:x:x:x:x:x:x:x:d.d.d.d

where:

x - [0 to FF]

d - [0 to 255]

Platforms

7705 SAR Gen 2

query-src-ip

Syntax

query-src-ip *ipv6-address*

no query-src-ip

Context

[Tree] (config>service>vpls>mld-snooping query-src-ip)

Full Context

configure service vpls mld-snooping query-src-ip

Description

This command configures the IP source address used in MLD queries.

Parameters

ipv6-address

Specifies an IPv6 address in the following form:

x:x:x:x:x:x:x:x (eight 16-bit pieces)

Platforms

7705 SAR Gen 2

24.10 queue

queue

Syntax

queue *queue-id* [**create**]

no queue *queue-id*

Context

[Tree] (config>service>ies>if>sap>ingress>queue-override queue)

[Tree] (config>service>vpls>sap>ingress>queue-override queue)

[Tree] (config>service>vpls>sap>egress>queue-override queue)

[Tree] (config>service>ies>if>sap>egress>queue-override queue)

Full Context

configure service ies interface sap ingress queue-override queue

configure service vpls sap ingress queue-override queue

configure service vpls sap egress queue-override queue

configure service ies interface sap egress queue-override queue

Description

This command specifies the ID of the queue whose parameters are to be overridden.

The **no** form of this command removes the queue ID from the configuration.

Parameters

queue-id

Specifies the queue ID whose parameters are to be overridden.

Values 1 to 8 for SAP egress

1 to 32 for SAP ingress

create

Keyword used to create the queue ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**create**]

no queue *queue-id*

Context

[Tree] (config>port>ethernet>access>egr>qgrp>qover queue)

[Tree] (config>port>eth>network>egr>qgrp>qover queue)

Full Context

configure port ethernet access egress queue-group queue-overrides queue

configure port ethernet network egress queue-group queue-overrides queue

Description

This command associates a queue for use in a queue group template. The defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object which is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template's name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

The **no** form of this command removes the queue-id from the configuration.

Parameters

queue-id

Specifies the queue ID.

Values 1 to 8

create

Mandatory when creating an entry.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**create**]

no queue *queue-id*

Context

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**group** *queue-group-name*]

no queue

Context

[Tree] (config>qos>sap-ingress>fc queue)

Full Context

configure qos sap-ingress fc queue

Description

This command overrides the default queue mapping for **fc** fc-name. The specified queue-id must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic classified to fc-name on a SAP using this policy.

The **no** form of this command sets the queue-id back to the default queue for the forwarding class.

Default

queue 1

Parameters

queue-id

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

Values 1 — 8

Default 1

group ***queue-group-name***

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**multipoint**] [*queue-type*] [*queue-mode*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>sap-ingress queue)

Full Context

configure qos sap-ingress queue

Description

This command creates the context to configure an ingress SAP QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When an ingress SAP QoS policy with multipoint queues is applied to an Epipe SAP, the multipoint queues are not created. When an ingress SAP QoS policy with multipoint queues is applied to an IES SAP, a multipoint queue will be created when PIM is enabled on the IES interface.

Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the SAP ingress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default non-multipoint (unicast queue)

queue-mode

Specifies the mode in which the queue is operating. This attribute is associated with the queue at the time of creation and cannot be modified thereafter.

Values **profile-mode**: When the queue is operating in the profile mode (or the color aware mode), the queue tries to provide the appropriate bandwidth to the packets with different profiles. The profiles are assigned according to the configuration of the forwarding class or the sub-forwarding class.

priority-mode: The queue is capable of handling traffic differently with two distinct priorities. These priorities are assigned by the stages preceding the queueing framework in the system. In priority mode, the queue does not have the functionality to support the profiled traffic and in such cases the queue will have a degraded performance. However, the converse is not valid and a queue in-profile mode should be capable of supporting the different priorities of traffic.

Default priority-mode

create

Keyword creates an ingress SAP QoS policy queue.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [{**group** *queue-group-name* [**instance** *instance-id*] | **port-redirect-group-queue**}]

no queue

Context

[Tree] (config>qos>sap-egress>fc queue)

Full Context

configure qos sap-egress fc queue

Description

This command overrides the default queue mapping for **fc** fc-name. The specified queue ID must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic is classified to fc-name on a SAP using this policy.

The **no** form of this command sets the queue-id back to the default queue for the forwarding class (queue 1).

Default

no queue

Parameters

queue-id

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

Values 1 to 8

Default 1

queue-group-name

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

instance-id

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 40960

Default 1

port-redirect-group-queue

This keyword is used to mark a given forwarding class queue for redirection to an egress queue group queue. This is only used when the specific queue group instance is assigned at the time the QoS policy is applied to the SAP. This redirection model is known as SAP-based redirection.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>sap-egress queue)

Full Context

configure qos sap-egress queue

Description

This command creates the context to configure an egress service access point (SAP) QoS policy queue.

Explicit definition of an egress queue's type is supported. A single egress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **no** form of this command removes the *queue-id* from the SAP egress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The ID for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

queue-type

Specifies the method that system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values **expedite** - Specifies that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort - Specifies that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite - Allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all

forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

create

Creates an entry for the queue.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**multipoint**] [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>network-queue>fc queue)

Full Context

configure qos network-queue fc queue

Description

Commands in this context configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default Non-multipoint (unicast queue)

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

no queue *queue-id*

Context

[Tree] (config>qos>qgrps>ing>queue-group queue)

Full Context

configure qos queue-group-templates ingress queue-group queue

Description

This command creates a queue for use in a queue group template. When created, the defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object that is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP ingress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

When a queue within a template is mapped by a forwarding class on any object, the queue may be edited, but not deleted.

The **no** form of this command removes a template queue from the queue group template. If the queue is specified as a forwarding class redirection target in any SAP ingress QoS policy, the command will fail.

Parameters

queue-id

This required parameter identifies the queue that will either be created or edited within the queue group template.

Values 1 to 32

multipoint

This optional keyword creates an ingress multipoint queue. Multipoint queues in a queue group may be used by ingress VPLS for forwarding types multicast, broadcast or unknown within a forwarding class. For ingress IES and VPRN access SAPs, only multicast is supported. Multipoint queues are only supported on ingress queue group templates.

Default non-multipoint (unicast queue)

queue-type

The queue types are mutually exclusive.

Values **expedite —** This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

Default best-effort

queue-mode

These keywords are optional and mutually exclusive when creating a new template queue. The keywords specify how the queue manages ingress explicitly profiled packets.

Values **profile-mode** — Overrides the default priority mode of the queue and allows the adoption of color aware profiling within the queue. Forwarding classes and subclasses may be explicitly defined as in-profile or out-of-profile. Out-of-profile classified packets bypass the CIR rate associated with the queue, reserving it for the undefined or in-profile classified packets. If the template queue is not defined as profile-mode and the packet redirected to the queue is explicitly out-of-profile based on the classification rules, the queues within-CIR bandwidth may be consumed by the packet.

priority-mode — Defines that the SAP ingress QoS policy priority classification result will be honored by the queue. Priority mode is the default mode of the queue. High-priority packets are allowed into the queue up to the MBS defined for the queue. Low-priority packets are discarded at the low-priority MBS threshold that is derived from applying the low drop-tail percentage to the queue's MBS.

create

Keyword used to create the queue ID instance.

7705 SAR Gen 2

queue

Syntax

queue *queue-id*

no queue

Context

[Tree] (config>qos>qgrps>egr>qgrp>fc queue)

Full Context

configure qos queue-group-templates egress queue-group fc queue

Description

This command is used to map the forwarding class to the specified *queue-id*. The specified *queue-id* must exist within the egress queue group template. When a queue is defined in a forwarding class mapping, that queue cannot be deleted unless the forwarding class mapping is moved to another queue within the template. Other criteria may also exist preventing the queue from being deleted from the template such as an applied SAP egress QoS policy mapping to the queue.

Parameters

queue-id

The specified *queue-id* must exist within the egress queue group template.

Values 1 to 8

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (cfg>qos>qgrps>egr>queue-group queue)

Full Context

configure qos queue-group-templates egress queue-group queue

Description

This command creates a queue for use in a queue group template. When created, the defined *queue-id* acts as a repository for the default parameters for the queue. The template queue is created on each queue group object that is created with the queue group template name. Each queue is identified within the template by a queue ID. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

Parameters

queue-id

Specifies the queue ID. The specified *queue-id* must exist within the egress queue group template.

Values 1 to 8

queue-type

Specifies the method that the system uses to service the queue from a hardware perspective.

Values expedite, best-effort

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

Default best-effort

Description

This command specifies the queue-id for which counters will be collected in this custom record. The counters that will be collected are defined in egress and ingress counters.

The **no** form of this command reverts to the default value.

Parameters

queue-id

Specifies the queue-id for which counters will be collected in this custom record.

Platforms

7705 SAR Gen 2

queue

Syntax

queue *queue-id* [**multipoint**] [*queue-type*] [**create**]

no queue *queue-id*

Context

[Tree] (config>qos>network-queue queue)

Full Context

configure qos network-queue queue

Description

This command enters the context to configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

Parameters

queue-id

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

Values 1 to 32

multipoint

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

Default Non-multipoint (unicast queue)

queue-type

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

Values expedite, best-effort, auto-expedite

expedite — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

best-effort — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

auto-expedite — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

Default auto-expedite

Platforms

7705 SAR Gen 2

24.11 queue-delay

queue-delay

Syntax

queue-delay *delay*

no queue-delay

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue queue-delay)

Full Context

configure qos queue-group-templates egress queue-group queue queue-delay

Description

This command configures the target queue delay for packets forwarded through the queue. It is used to determine the related queue parameters based on the administrative PIR of the queue. This command and the **mbs** command are mutually exclusive.

In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured.

If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

The **no** form of this command disables the determination of the queue parameters based on the queue delay.

Default

no queue-delay

Parameters

delay

Specifies the target queue delay in ms.

Values 0 to 5000 (decimal)

Platforms

7705 SAR Gen 2

24.12 queue-frame-based-accounting

queue-frame-based-accounting

24.13 queue-group

queue-group

Syntax

queue-group *queue-group-name* **instance** *instance-id* [**create**]

no queue-group *queue-group-name* **instance** *instance-id*

Context

[Tree] (config>card>fp>ingress>access queue-group)

Full Context

configure card fp ingress access queue-group

Description

This command creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM. The queue-group-name and **instance** *instance-id* are mandatory parameters when executing the command.

The named queue group template can contain only policers. If it contains queues, then the command will fail.

The **no** form of this command deletes a specific instance of a queue group.

Parameters

queue-group-name

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM, up to 32 characters. The queue-group-name must correspond to a valid ingress queue group template name, configured under **config>qos>queue-group-templates**.

instance-id

Specifies the instance of the named queue group to be created on the IOM/IMM ingress forwarding plane.

Values 1 to 65535

create

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

queue-group

Syntax

queue-group *queue-group-name* **instance** *instance-id* [**create**]

no queue-group *queue-group-name* **instance** *instance-id*

Context

[Tree] (config>card>fp>ingress>network queue-group)

Full Context

configure card fp ingress network queue-group

Description

This command creates a queue-group instance in the network ingress context of a forwarding plane.

Only a queue-group containing policers can be instantiated. If the queue-group template contains policers and queues, the queues are not instantiated. If the queue-group contains queues only, the instantiation in the data path is failed.

One or more instances of the same policer queue-group name and/or a different policer queue-group name can be created on the network ingress context of a forwarding plane.

The queue-group-name must be unique within all network ingress and access ingress queue groups in the system. The queue-group instance-id must be unique within the context of the forwarding plane.

The **no** form of this command deletes the queue-group instance from the network ingress context of the forwarding plane.

Parameters

queue-group-name

Specifies the name of the queue group template up to 32 characters.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

create

Keyword used to create the queue-group instance.

Platforms

7705 SAR Gen 2

queue-group

Syntax

queue-group *queue-group-name* **instance** *instance-id*

no queue-group

Context

[Tree] (config>port>ethernet>network>egress queue-group)

Full Context

configure port ethernet network egress queue-group

Description

This command configures a queue-group instance in the network egress context of a port.

Queue-groups containing queues only or policers and queues can be instantiated. When a port is a LAG, one instance of the queue-group is instantiated on each member link.

One or more instances of the same queue-group name and/or a different queue-group name can be created in the network egress context of a port.

The queue-group-name must be unique within all network egress and access egress queue groups in the system. The queue-group instance-id must be unique within the context of the port.

The **no** version of this command deletes the queue-group instance from the network egress context of the port.

Parameters

queue-group-name

Specifies the name of the queue group template up to 32 characters.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

Platforms

7705 SAR Gen 2

[**no**] **queue-group** *queue-group-name* [**instance** *instance-id*] [**create**]

Context

[Tree] (config>port>ethernet>access>egr queue-group)

[Tree] (config>port>ethernet>access>ing queue-group)

Full Context

configure port ethernet access egress queue-group

configure port ethernet access ingress queue-group

Description

This command creates an ingress or egress queue group on an Ethernet port. A queue group is a collection of queues identified by a group name. Queue groups created on access ports are used as an alternative queue destination for SAPs.

Within a SAP, a forwarding class may be redirected from the local SAP queue to a port queue group queue. The forwarding classes from multiple SAPs may be redirected to the same queue group which can be used to minimize the number of per-SAP queues.

Queue groups may be created on both access and network oriented ports. When the port is in access mode, the queue groups must be created within the port access node.

Within the access node, queue groups are also configured as ingress or egress. Access ingress queue groups can only be used by ingress SAP forwarding classes and only a single ingress queue group per port is supported. Multiple access egress queue groups may be created on a single port and are used by egress SAP forwarding classes. The instance-id parameter identifies different instances of the same queue group template. Creating multiple queue groups with a different instance ID but the same queue group name results in separate queue groups being created on the port. The instance-id parameter is only valid for egress queue groups on access ports.

When the queue group is created in an ingress port context, the group-name must be an existing ingress queue group template. Similarly, queue groups created in an egress port context must have a group-name of an existing egress queue group template. Two ingress queue groups with the same name cannot be created on the same port. Two egress queue groups can only be created on the same port with the same queue group template name if they have different instance-id values.

The queues defined in the template are created on the queue group. The queue parameters within the template are used as the default queue parameters for each queue in the queue group. The default queue parameters for each queue may be overridden on the queue group with specific queue parameters.

Each queue group supports the application of a scheduler-policy for the purpose of managing the queues within the group into an aggregate SLA. The queues defined within the template may be configured with parent scheduler defining the mapping of a queue to one of the schedulers within the scheduler policy. Egress queue groups also support the **agg-rate** parameter and the queues in the egress template support the port-parent command. Each command is used for configuring egress port virtual scheduling behavior.

Each queue group allows the application of an accounting policy and the ability to enable and disable collecting statistics. The statistics are derived from the queue counters on each queue within the queue

group. The accounting policy defines which queue counters are collected and to which accounting file they will be written.

A queue group does not have an administrative shutdown or no shutdown command. A queue group is considered to be always on once created.

When creating a queue group, the system will attempt to allocate queue resources based on the queues defined in the queue group template. If the appropriate queue resources do not currently exist, the queue group will not be created. Ingress port queue groups do not support the shared-queuing or multipoint-shared queuing behavior.

When the queue group is created on a LAG (Link Aggregation Group), it must be created on the primary port member. The primary port member is the port with the lowest port ID based on the slot, MDA position and port number on the MDA. A queue group created on the primary LAG port will be automatically created on all other port members. If a new port is being added to a LAG with an existing queue group, the queue group must first be created on the port prior to adding the port to the LAG. If the LAG queue group has queue overrides, the queue overrides must also be defined on the port queue group prior to adding the port to the LAG.

A port queue group cannot be removed from the port when a forwarding class is currently redirected to the group. All forwarding class redirections must first be removed prior to removing the queue group.

Parameters

queue-group-name

The group-name parameter is required when executing the port queue-group command. The specified group-name must exist as an ingress or egress queue group template depending on the ingress or egress context of the port queue group. Only a single queue group may be created on an ingress port. Multiple queue groups may be created on an egress port.

instance-id

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

create

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

[Tree] (config>qos>qgrps>ingress queue-group)

Full Context

configure qos queue-group-templates egress queue-group

configure qos queue-group-templates ingress queue-group

Description

This command creates a queue group template. The system does not maintain default queue groups or queue group templates. Each queue group template used in the system must be explicitly created.

The **no** form of this command removes the specified queue group template from the system. If the queue group template is currently in use by an ingress port, the command will fail. If *queue-group-name* does not exist, the command has no effect and does not return an error.

Parameters

queue-group-name

Specifies the name of the queue group template up to 32 characters. Each ingress queue group template must be uniquely named within the system. Multiple ingress queue group templates may not share the same name. An ingress and egress queue group template may share the same name.

create

Keyword used to create the queue group instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

debug router radius

Description

This command enables the debug router RADIUS context.

Platforms

7705 SAR Gen 2

radius

Syntax

radius [**create**]

no radius

Context

[Tree] (config>service>vprn>aaa>rmt-srv radius)

Full Context

configure service vprn aaa remote-servers radius

Description

This command creates the context to configure RADIUS authentication on the VPRN.

Implement redundancy by configuring multiple server addresses for each VPRN.

The **no** form of this command removes the RADIUS configuration.

Parameters

create

Keyword used to create the RADIUS context.

Platforms

7705 SAR Gen 2

radius

Syntax

radius [**detail**] [**hex**]

no radius

Context

[Tree] (debug radius)

Full Context

debug radius

Description

This command enables debugging for RADIUS connections.

The **no** form of the command disables the debug output.

Parameters

detail

Displays detailed output.

hex

Displays the packet dump in hex format.

Platforms

7705 SAR Gen 2

radius

Syntax

[**no**] **radius**

Context

[Tree] (config>system>security radius)

Full Context

configure system security radius

Description

This command creates the context to configure RADIUS authentication on the router.

Implement redundancy by configuring multiple server addresses for each router.

The **no** form of this command removes the RADIUS configuration.

Platforms

7705 SAR Gen 2

25.2 radius-accounting-policy

radius-accounting-policy

Syntax

radius-accounting-policy *policy-name*

no radius-accounting-policy

Context

[Tree] (config>service>vprn>if>sap>ipsec-gw radius-accounting-policy)

[Tree] (config>service>ies>if>sap>ipsec-gw radius-accounting-policy)

Full Context

configure service vprn interface sap ipsec-gw radius-accounting-policy

configure service ies interface sap ipsec-gw radius-accounting-policy

Description

This command configures the RADIUS accounting policy.

The **no** form of this command reverts to the default value.

Default

no radius-accounting-policy

Parameters

policy-name

Specifies the policy name, up to 32 characters.

Platforms

7705 SAR Gen 2

radius-accounting-policy

Syntax

radius-accounting-policy *name* [**create**]

no radius-accounting-policy *name*

Context

[Tree] (config>ipsec radius-accounting-policy)

Full Context

configure ipsec radius-accounting-policy

Description

This command specifies an existing RADIUS accounting policy to use to collect accounting statistics on this subscriber profile by RADIUS. This command is used independently of the **collect-stats** command.

Parameters

name

Specifies an existing RADIUS based accounting policy.

Platforms

7705 SAR Gen 2

25.3 radius-attr

radius-attr

Syntax

radius-attr type *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**]

radius-attr type *attribute-type* [**transaction**] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**] [**encoding** *encoding-type*]

radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**] [**encoding** *encoding-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

no radius-attr type *attribute-type* [**extended-type** *attribute-ext-type*]

no radius-attr type *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

no radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*]

no radius-attr vendor *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} [**value**] *attribute-value*

Context

[Tree] (debug>router>radius radius-attr)

Full Context

debug router radius radius-attr

Description

This command specifies the RADIUS attribute filter of command **debug router radius**.

Parameters

attribute-type

Specifies the RADIUS attribute type.

Values 1 to 255

attribute-ext-type

Specifies the RADIUS attribute extended type (RFC 6929).

Values 1 to 255

address

Specifies the value is a IPv4 or IPv6 address/prefix/subnet.

string

Specifies the value is a ASCII string.

integer

Specifies the value is a integer.

hex

Specifies the value is a binary string in hex format, such as "\0xAB01FE”.

attribute-value

Specifies the value of the RADIUS attribute.

Values

address <ipv4-address> | <ipv6-address> | <ipv6-prefix/prefix-length>

ipv4-address a.b.c.d

ipv6-address x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

ipv6-prefix-length [0 to 128]

hex	[0x0 to 0xFFFFFFFF (up to 506 hex nibbles)]
integer	[0 to 4294967295]
string	ascii-string (up to 253 characters)

transaction

Specifies that the system outputs both request and response packets in the same session even if the response packet does not include the filter attribute.

vendor-id

Specifies the vendor ID for the vendor specific attribute.

Values 0 to 16777215

encoding-type

Specifies the size of the vendor-type and vendor-length in bytes. It is a two digitals string: "xy", x is the size of vendor-type, range from 1 to 4; y is the size of vendor-length, range from 0 to 2; it is "11" by default.

Values type-size:1 to 4, length-size: 0 to 2

Platforms

7705 SAR Gen 2

25.4 radius-authentication-policy

radius-authentication-policy

Syntax

radius-authentication-policy *name*

no radius-authentication-policy

Context

[Tree] (config>service>ies>if>sap>ipsec-gw radius-authentication-policy)

[Tree] (config>service>vprn>if>sap>ipsec-gw radius-authentication-policy)

Full Context

configure service ies interface sap ipsec-gw radius-authentication-policy

configure service vprn interface sap ipsec-gw radius-authentication-policy

Description

This command configures the policy used for the IKEv2 remote-access tunnels terminated on the IPsec gateway. The **radius-authentication-policy** is defined under **config>ipsec** context.

Parameters

name

Specifies the name of an existing RADIUS authentication policy.

Platforms

7705 SAR Gen 2

radius-authentication-policy

Syntax

radius-authentication-policy *name* [**create**]

no radius-authentication-policy *name*

Context

[Tree] (config>ipsec radius-authentication-policy)

Full Context

configure ipsec radius-authentication-policy

Description

This command specifies the RADIUS authentication policy associated with this IPsec gateway.

Parameters

name

Specifies an existing RADIUS authentication policy.

Platforms

7705 SAR Gen 2

25.5 radius-coa-port

radius-coa-port

Syntax

radius-coa-port {*port-number*}

no radius-coa-port

Context

[Tree] (config>aaa radius-coa-port)

Full Context

configure aaa radius-coa-port

Description

This command configures the system-wide UDP port number that RADIUS is listening on for CoA and Disconnect messages.

The **no** form of this command reverts to the default.

Default

radius-coa-port 3799

Parameters

port-number

Specifies the UDP port number for RADIUS CoA and disconnect messages.

Values 1647, 1700, 1812, 3799

Platforms

7705 SAR Gen 2

25.6 radius-plcy

radius-plcy

Syntax

radius-plcy *name*

no radius-plcy

Context

[Tree] (config>port>ethernet>dot1x radius-plcy)

Full Context

configure port ethernet dot1x radius-plcy

Description

This command references the RADIUS policy to be used for 802.1x authentication. An 802.1x RADIUS policy must be configured (**config**>**system**>**security**>**dot1x**) before it is associated to a port. If the RADIUS policy ID does not exist, an error is returned. Only one 802.1x RADIUS policy can be associated with a port at a time.

The **no** form of this command removes the RADIUS policy association.

Default
no radius-plcy

Parameters
name
Specifies an existing 802.1x RADIUS policy name, up to 32 characters.

Platforms
7705 SAR Gen 2

25.7 radius-server

radius-server

Syntax
radius-server

Context
[Tree] (config>router radius-server)
[Tree] (config>service>vprn radius-server)

Full Context
configure router radius-server
configure service vprn radius-server

Description
Commands in this context configure the RADIUS server under router or VPRN service.

Platforms
7705 SAR Gen 2

25.8 radius-server-policy

radius-server-policy

Syntax
radius-server-policy *policy-name* [**create**]
no radius-server-policy *policy-name*

Context

[Tree] (config>aaa radius-server-policy)

Full Context

configure aaa radius-server-policy

Description

This command creates a radius-server-policy.

A RADIUS server policy can be used in

- radius-proxy, for application like EAP authentication for WIFI access
- authentication policy, for Enhanced Subscriber Management authentication
- RADIUS accounting policy, for Enhanced Subscriber Management accounting
- dynamic data service RADIUS accounting
- AAA route downloader

The **no** form of this command removes the policy name from the configuration.

Parameters

policy-name

Specifies the name of the radius-server-policy up to 32 characters.

create

Keyword used to create a radius-server-policy name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

radius-server-policy

Syntax

radius-server-policy *radius-server-policy-name*

no radius-server-policy

Context

[Tree] (config>ipsec>rad-auth-plcy radius-server-policy)

[Tree] (config>ipsec>rad-acct-plcy radius-server-policy)

Full Context

configure ipsec radius-authentication-policy radius-server-policy

configure ipsec radius-accounting-policy radius-server-policy

Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

Default

no radius-server-policy

Parameters

radius-server-policy-name

Specifies the RADIUS server policy.

Platforms

7705 SAR Gen 2

radius-server-policy

Syntax

radius-server-policy *policy-name*

radius-server-policy auth *policy-name-auth*

radius-server-policy acct *policy-name-acct*

radius-server-policy auth *policy-name-auth* **acct** *policy-name-acct*

no radius-server-policy

Context

[Tree] (config>port>ethernet>dot1x radius-server-policy)

Full Context

configure port ethernet dot1x radius-server-policy

Description

This command configures the RADIUS policy with IPv4/IPv6 in base routing and VPRN. The current RADIUS policy can be found under the **configure>aaa>radius-server-policy** context.

The RADIUS servers for the policy are configured under **configure>router>radius-server** or **configure>service>vprn>radius-server** context.

The RADIUS policy is assigned under dot1x using the **radius-server-policy** command. When the RADIUS policy is configured, both authorization and accounting are performed via the same server.

The **no** form of this command allows authorization and accounting via different servers.

Default

no radius-server-policy

Parameters

policy-name

Specifies the RADIUS server policy, up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. When the policy name is configured, both authorization and accounting are done via this server.

policy-name-auth

Specifies the AAA RADIUS server policy for dot1x authorization only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name authorization is used if the user needs a different server for authorization.

policy-name-acct

Specifies the AAA RADIUS server policy for dot1x accounting only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name accounting is used if the user needs a different server for accounting.

Platforms

7705 SAR Gen 2

25.9 range

range

Syntax

range *encap-range* **sync-tag** *sync-tag*

no range *encap-range*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync>port range)

Full Context

configure redundancy multi-chassis peer sync port range

Description

This command configures a range of encapsulation values.

Parameters

encap-range

Specifies a range of encapsulation values on a port to be synchronized with a multi-chassis peer.

Values

Dot1Q	start-tag-end-tag
start-tag	0 to 4094
end-tag	0 to 4094
QinQ	qtag1.start-qtag2-qtag1.end-qtag2-start-qtag1.*-end-qtag1.*
qtag1	1 to 4094
start-qtag1	1 to 4094
en-qtag1	1 to 4094
start-qtag2	0 to 4094
end-qtag2	0 to 4094

sync-tag

Specifies a synchronization tag up to 32 characters to be used while synchronizing this encapsulation value range with the multi-chassis peer.

Platforms

7705 SAR Gen 2

range

Syntax

[**no**] **range** *vlan-range*

Context

[Tree] (config>service>vpls>sap>managed-vlan-list range)

Full Context

configure service vpls sap managed-vlan-list range

Description

This command configures a range of VLANs on an access port that are to be managed by an existing management VPLS.

This command is only valid when the VPLS in which it is entered was created as a management VPLS, and when the SAP in which it was entered was created on an Ethernet port with encapsulation type of dot1q or qinq, or on a SONET/SDH port with encapsulation type of bcp-dot1q.

To modify the range of VLANs, first the new range should be entered and afterwards the old range removed.

The **no** form of this command removes the VLAN range from this configuration.

Parameters

vlan-range

Specifies the VLAN start value and VLAN end value. The end-vlan must be greater than start-vlan. The format is <start-vlan>-<end-vlan>.

Values start-vlan: 1 to 4094

end-vlan: 1 to 4094

Platforms

7705 SAR Gen 2

25.10 rapid-retransmit-time

rapid-retransmit-time

Syntax

rapid-retransmit-time *hundred-milliseconds*

no rapid-retransmit-time

Context

[Tree] (config>router>rsvp rapid-retransmit-time)

Full Context

configure router rsvp rapid-retransmit-time

Description

This command defines the value of the Rapid Retransmission Interval. It is used in the re-transmission mechanism to handle unacknowledged message_id objects and is based on an exponential back-off timer.

Re-transmission interval of a RSVP message with the same message_id = 2 * rapid-retransmit-time interval of time.

The node stops re-transmission of unacknowledged RSVP messages:

- If the updated back-off interval exceeds the value of the regular refresh interval.
- If the number of re-transmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The Rapid Retransmission Interval must be smaller than the regular refresh interval configured in **config>router>rsvp>refresh-time**.

The **no** form of this command reverts to the default value.

Default

rapid-retransmit-time 5

Parameters

hundred-milliseconds

Specifies the rapid retransmission interval, in hundred-milliseconds (for example, enter "6" for a 600 millisecond retransmit time).

Values 1 to 100, in units of 100 ms.

Platforms

7705 SAR Gen 2

25.11 rapid-retry-limit

rapid-retry-limit

Syntax

rapid-retry-limit *number*

no rapid-retry-limit

Context

[Tree] (config>router>rsvp rapid-retry-limit)

Full Context

configure router rsvp rapid-retry-limit

Description

This command defines the value of the Rapid Retry Limit. This is used in the retransmission mechanism based on an exponential backoff timer in order to handle unacknowledged message_id objects. The RSVP message with the same message_id is retransmitted every 2 * rapid-retransmit-time interval of time. The node stops retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The **no** form of this command reverts to the default value.

Default

rapid-retry-limit 3

Parameters

number

Specifies the value of the Rapid Retry Limit.

Values 1 to 6, integer values

Platforms

7705 SAR Gen 2

25.12 rapid-update

rapid-update

Syntax

rapid-update [**l2-vpn**] [**mvpn-ipv4**] [**mvpn-ipv6**] [**mdt-safi**] [**evpn**] [**label-ipv4**] [**label-ipv6**] [**vpn-ipv4**] [**vpn-ipv6**] [**mcast-vpn-ipv4**] [**mcast-vpn-ipv6**]

no rapid-update

Context

[Tree] (config>router>bgp rapid-update)

Full Context

configure router bgp rapid-update

Description

This command enables and disables BGP rapid update for specified address families.

If rapid update is enabled for a set of address families, and a route belonging to a family in that set is received by the router and chosen for propagation to certain BGP peers, the remaining time on the MRAI timer of these peers is ignored and the route is transmitted immediately, along with all other pending routes for these peers (including routes of address families not specified in the **rapid-update** command).

The **rapid-update** command overrides the peer-level **min-route-advertisement** (**config>router>bgp min-route-advertisement**, **config>router>bgp>group min-route-advertisement**, **config>router>bgp>group>neighbor min-route-advertisement**) time and applies the minimum setting (0 seconds) to routes belonging to specified address families; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **no** form of this command disables rapid update for all address families.

Default

no rapid-update

Parameters

l2-vpn

Specifies the BGP rapid update for the 12-byte Virtual Switch Instance identifier (VSI-ID) value consisting of the 8-byte route distinguisher (RD) followed by a 4-byte value.

mvpn-ipv4

Specifies BGP rapid update for the mvpn-ipv4 address family. The mvpn-pv4 address is a variable size value consisting of the 1-byte route type, 1-byte length and variable size that is route type specific. Route type defines encoding for the route type specific field. Length indicates the length in octets of the route type specific field.

mdt-safi

Specifies BGP rapid update for the mdt-safi address family. The address is a 16-byte value consisting of 12-byte route distinguisher (RD) followed by a 4-byte group address.

mvpn-ipv6

Specifies BGP rapid update for the mvpn-ipv6 address family.

evpn

Specifies BGP rapid update for the evpn address family by including or removing EVPN routes from the set of routes that can trigger rapid update.

label-ipv4

Includes or removes label-ipv4 routes from the set of routes that can trigger rapid update.

label-ipv6

Includes or removes label-ipv6 routes from the set of routes that can trigger rapid update.

vpn-ipv4

Includes or removes vpn-ipv4 routes from the set of routes that can trigger rapid update.

vpn-ipv6

Includes or removes vpn-ipv6 routes from the set of routes that can trigger rapid update.

mcast-vpn-ipv4

Includes or removes mcast-vpn-ipv4 routes from the set of routes that can trigger rapid update.

mcast-vpn-ipv6

Includes or removes mcast-vpn-ipv6 routes from the set of routes that can trigger rapid update.

Platforms

7705 SAR Gen 2

25.13 rapid-withdrawal

rapid-withdrawal

Syntax

[**no**] **rapid-withdrawal**

Context

[Tree] (config>service>vprn>bgp rapid-withdrawal)

Full Context

configure service vprn bgp rapid-withdrawal

Description

This command disables the delay (Minimum Route Advertisement) on sending BGP withdrawals. Normal route withdrawals may be delayed up to the minimum route advertisement to allow for efficient packing of BGP updates.

The **no** form of this command removes this command from the configuration and returns withdrawal processing to the normal behavior.

Default

no rapid-withdrawal

Platforms

7705 SAR Gen 2

rapid-withdrawal

Syntax

[**no**] **rapid-withdrawal**

Context

[Tree] (config>router>bgp rapid-withdrawal)

Full Context

configure router bgp rapid-withdrawal

Description

This command disables the delay (Minimum Route Advertisement) on sending BGP withdrawals. Normal route withdrawals may be delayed up to the minimum route advertisement to allow for efficient packing of BGP updates.

The **no** form of this command removes this command from the configuration and returns withdrawal processing to the normal behavior.

Default

no rapid-withdrawal

Platforms

7705 SAR Gen 2

25.14 rate

rate

Syntax

rate *kilobits-per-second*

no rate

Context

[Tree] (config>service>ies>if>sap>egress>agg-rate rate)

Full Context

configure service ies interface sap egress agg-rate rate

Description

This command defines the enforced aggregate rate for all queues associated with the agg-rate context. A rate must be specified for the agg-rate context to be considered to be active on the context's object (SAP, subscriber, Vport, and so on).

The **no** form of this command removes an explicit rate value from the aggregate rate therefore returning it to its default value.

Parameters

kilobits-per-second

Specifies the rate limit for the SAP, in kilobits per second.

Values 1 to 6400000000, **max**

Platforms

7705 SAR Gen 2

rate

Syntax

rate *pir-rate* [**cir** *cir-rate*]

no rate

Context

[Tree] (config>service>ies>if>sap>egress>queue-override>queue rate)

[Tree] (config>service>vpls>sap>ingress>queue-override>queue rate)

[Tree] (config>service>ies>if>sap>ingress>queue-override>queue rate)

[Tree] (config>service>vpls>sap>egress>queue-override>queue rate)

Full Context

configure service ies interface sap egress queue-override queue rate

configure service vpls sap ingress queue-override queue rate

configure service ies interface sap ingress queue-override queue rate

configure service vpls sap egress queue-override queue rate

Description

This command overrides specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (max, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be configured as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

Overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be configured as a positive integer.

Values 0 to 6400000000, **max**

Default 0

Platforms

7705 SAR Gen 2

rate

Syntax

rate *pir-rate* [**cir** *cir-rate*]

no rate

Context

[Tree] (config>service>vpls>sap>egress>sched-override>scheduler rate)

Full Context

configure service vpls sap egress scheduler-override scheduler rate

Description

This command overrides specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its policers, child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Default

rate max cir sum

Parameters

pir-rate

Specifies the PIR rates. The **pir** parameter accepts a step multiplier value that specifies the multiplier used to determine the PIR rate at which the queue operates. A value of 0 to 100000000 or the keyword **max** is accepted. Any other value results in an error without modifying the current PIR rate.

To calculate the actual PIR rate, the rate described by the queue's **rate** is multiplied by the *pir-rate*.

The SAP ingress context for PIR is independent of the defined forwarding class (fc) for the queue. The default **pir** and definable range is identical for each class. The PIR in effect for a queue defines the maximum rate at which the queue is allowed to forward packets in a given second, shaping the queue's output.

The PIR parameter for SAP ingress queues do not have a negate (**no**) function. To return the queue's PIR rate to the default value, that value must be specified as the PIR value.

Values 1 to 6400000000, max

Default max

cir-rate

Specifies the CIR rate. The **cir** parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue operate. A value of 0 to 250 or the keyword max is accepted. Any other value results in an error without modifying the current CIR rate.

To calculate the actual CIR rate, the rate described by the **rate pir** *pir-rate* is multiplied by the *cir-rate*. If the **cir** is set to max, then the CIR rate is set to infinity.

The context for CIR is dependent on the defined forwarding class (fc) for the queue. The default CIR and definable range is different for each class. The CIR in effect for a policer or queue defines both its profile (in or out) marking level as well as the relative importance compared to other queues for scheduling purposes during congestion periods.

Values 0 to 6400000000, max, sum

Default sum

Platforms

7705 SAR Gen 2

rate

Syntax

rate {*rate* | **max**} [**cir** {**max** | *rate*}]

no rate

Context

[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr rate)

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr rate)

Full Context

configure card fp ingress network queue-group policer-override policer rate

configure card fp ingress access queue-group policer-override policer rate

Description

This command configures the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on its packet size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches it's exceeded (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR nor the CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command reverts to the default metering and profiling rate of a policer.

Parameters

{*rate* | max}

Specifying the keyword **max** or an explicit *rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values **max** or 1 to 2000000000

cir {max | *rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Values **max** or 0 to 2000000000

no rate

Context

[Tree] (config>port>ethernet>access>ing>qgrp>qover>q rate)

[Tree] (config>port>ethernet>access>egr>qgrp>qover>q rate)

Full Context

configure port ethernet access ingress queue-group queue-overrides queue rate

configure port ethernet access egress queue-group queue-overrides queue rate

Description

This command specifies the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can

transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0 - The max default specifies the amount of bandwidth in kilobits per second (thousand bits per second). The max value is mutually exclusive to the pir-rate value.

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 200000000, max

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR used by the queue, in kilobits per second. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

Values 0 to 200000000, max

Default 0

[Tree] (config>port>ethernet>access>ing>qgrp>sched-override>scheduler rate)

Full Context

configure port ethernet access egress queue-group scheduler-override scheduler rate

configure port ethernet access ingress queue-group scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The rate command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate, in kilobits per second. Any other value results in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

Specifies the CIR rate, in kilobits per second. If the CIR is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **sum**, **max**

configure service epipe sap egress policer-override policer rate

configure service epipe sap ingress policer-override policer rate

Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** rate command is used to restore the policy defined metering and profiling rate to a policer.

Parameters

rate *rate*

Specifies the policer instance metering rate for the PIR leaky bucket, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

Values 1 to 6400000000

cir *rate*

Specifies the overriding value for the policy-derived profiling rate of the policer, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

Values 0 to 6400000000

max

Uses the maximum policer rate, equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR or CIR used is equivalent to **max**.

configure service epipe sap egress queue-override queue rate

configure service epipe sap ingress queue-override queue rate

Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile and then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has

not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

Parameters

{*rate* | max}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

Values 1 to 6400000000, **max**

cir {max | *rate*}

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following

the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

configure service ies interface sap ingress scheduler-override scheduler rate

Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

The **pir** parameter accepts a value in kilobits per second, or the keyword **max**. Any other value will result in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

This parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue will operate. A value in kilobits per second or the keywords **max** or **sum** is accepted. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to max, then the CIR rate is set to infinity but is restricted by the PIR rate.

The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

configure service vprn interface sap ingress queue-override queue rate

configure service vprn interface sap egress queue-override queue rate

Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

Defines the administrative CIR rate, in kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers and queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate for the scheduler. The **pir** parameter accepts a value in kb/s, or the **max** keyword. Any other value will result in an error without modifying the current PIR rate.

Values 1 to 6400000000, **max**

cir-rate

Specifies the CIR rate for the scheduler. The **cir** parameter accepts a value in kb/s, or the **max** or **sum** keywords. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to **max**, then the CIR rate is set to infinity, but is limited by the *pir-rate*.

If the **cir** is set to **sum**, then the CIR rate is set to the summed CIR values of the children schedulers, policers, or queues.

Values 0 to 6400000000, **max**, **sum**

Syntax

rate *rate*

no rate

Context

[Tree] (config>qos>plcr-ctrl-plcy>tier>arbiter rate)

Full Context

configure qos policer-control-policy tier arbiter rate

Description

This command is used to define the maximum bandwidth an instance of the arbiter can receive from its parent tier 1 arbiter or the root arbiter. The arbiter instance enforces this limit by calculating the bandwidth each of its child policers should receive relative to their offered loads, parenting parameters, and individual rate limits, and using that derived rate as a child PIR decrement rate override. The override will not exceed the child policer's administrative rate limit and the aggregate of all the child PIR decrement rates will not exceed the specified arbiter rate limit.

The arbiter's policy defined rate value may be overridden at the SAP or sub-profile where the **policer-control-policy** is applied. Specifying an override prevents the arbiter from being removed from the policer control policy until the override is removed.

The **no** form of this command is used to remove a rate limit from the arbiter at the policer control policy level. The policy level rate limit for the arbiter will return to the default value of **max**. The **no rate** command has no effect on instances of the arbiter where a rate limit override has been defined.

Default

rate max

Parameters

rate

Enter an integer representing the rate limit in kilobits per second.

Values 1 to 6400000000, **max**

max

When **max** is specified, the arbiter does not enforce a rate limit on its child policers or arbiters other than the individual rate limits enforced at the child level.

Full Context

configure qos sap-ingress policer rate

configure qos sap-egress policer rate

Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

Parameters

{max | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values 1 to 6400000000, **max**

cir {max | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed

as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Values 0 to 6400000000, **max**

configure qos sap-ingress queue rate

Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next-hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the SAP ingress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0, 0).

Default

rate max cir 0 fir 0

Parameters

pir-rate

Defines the administrative PIR, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 0 to 6400000000, **max**

Default 0

fir-rate

The **fir** parameter overrides the default administrative FIR, in kilobits per second, used by the queue. When the **rate** command is executed, an FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

Values 0 to 6400000000, **max**

Default 0

police

Specifies that traffic feeding into the queue instance above the specified PIR rate will be dropped. When the **police** keyword is defined, only the PIR rate may be overridden.

configure qos sap-egress queue rate

Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

Default

rate max cir 0

Parameters

pir-rate

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 6400000000, **max**

Default max

cir-rate

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

Full Context

configure qos network-queue queue rate

Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues) or out of an egress port (for egress queues). Defining a PIR does not necessarily guarantee that

the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The CIR can be used by the queue's **port-parent** commands **cir-level** and **cir-weight** parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent port scheduler.

The FIR defines an additional percentage at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR percentage.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the network queue policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the network queue policy.

The **no** form of the command returns all queues created with the *queue-id* by association with the network queue policy to the default PIR, CIR, and FIR parameters.

Default

rate 100 cir 0 fir 0

Parameters

percent

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the rate allowed for the queue. When the **rate** command is executed, a valid *percent* (PIR setting) must be explicitly defined. When the **rate** command has not been executed, the default PIR of **100** is assumed. Fractional values are not allowed, and the value must be given as a positive integer.

The actual PIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 1 to 100

Default 100

cir ***percent***

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

Values 0 to 100

Default 0

fir *percent*

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

[Tree] (config>qos>qgrps>egr>qgrp>policer rate)

Full Context

configure qos queue-group-templates ingress queue-group policer rate

configure qos queue-group-templates egress queue-group policer rate

Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the

exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

Parameters

{max | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

Values **max**, 1 to 2000000000

cir {max | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

Context

[Tree] (config>qos>scheduler-policy>tier>scheduler rate)

Full Context

configure qos scheduler-policy tier scheduler rate

Description

The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's within-CIR distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir ***pir***

Specifies the PIR rate of the scheduler in kb/s or it can be set to the maximum using the max keyword.

Values 1 to 6400000000, **max**

Default max

cir *cir*

Specifies the CIR rate of the scheduler in kb/s or it can be set to the maximum using the max keyword. The sum keyword can also be used, which sets the CIR to the sum of child CIR values.

Values 0 to 6400000000, **max, sum**

Description

This command overrides specific attributes of the specified scheduler rate.

The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the scheduler's amount of bandwidth to be considered during the parent schedulers 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's to the PIR and CIR parameters to the value configured in the applied scheduler policy.

Parameters

pir-rate

Specifies the PIR rate.

Values 1 to 6400000000, **max**

Default **max**

cir-rate

Specifies the CIR rate.

If the *cir-rate* is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers or queues.

Values 0 to 6400000000, **max**, **sum**

Default **sum**

Platforms

7705 SAR Gen 2

rate

Syntax

rate kbps {*kilobits-per-second* | **max**} [**mbs** *size*] [**bytes** | **kilobytes**]

rate packets {*ppi* | **max**} **within** *seconds* [**initial-delay** *packets*]

no rate

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>local-monitoring-policer rate)

[Tree] (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters rate)

Full Context

configure system security dist-cpu-protection policy local-monitoring-policer rate

configure system security dist-cpu-protection policy protocol dynamic-parameters rate

Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id** *33* **sap** 1/1/3:33 **dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter value is configured as 0, then all packets are considered as nonconforming.

Default

rate packets max within 1 initial-delay 0

Parameters

packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

ppi

Specifies packets per interval.

Values 0 to 255, max

max = disable the policer (always conforming)

packets 0 = all packets considered nonconforming

seconds

Specifies the length of the ppi rate measurement interval.

Values 1 to 32767

packets

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

Values 0 to 255

kilobits-per-second

Specifies the kilobits per second.

Values 1 to 20000000, max

size

Specifies the tolerance for the kbps rate.

Values 0 to 4194304

Default 10

bytes | kilobytes

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

Platforms

7705 SAR Gen 2

rate

Syntax

rate kbps {*kilobits-per-second* | **max**} [**mbs** *size*] [**bytes** | **kilobytes**]

rate packets {*ppi* | **max**} **within** *seconds* [**initial-delay** *packets*]

no rate

Context

[Tree] (config>sys>security>dist-cpu-protection>policy>static-policer rate)

Full Context

configure system security dist-cpu-protection policy static-policer rate

Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id** *33* **sap** 1/1/3:33 **dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter is configured as 0, then all packets are considered as nonconforming.

Default

rate packets max within 1 initial-delay 0

Parameters

packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

ppi

Specifies packets per interval.

Values 0 to 8000, max

max = disable the policer (always conforming)

packets 0 = all packets considered nonconforming

seconds

Specifies the length of the ppi rate measurement interval.

Values 1 to 32767

packets

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

Values 0 to 255

kilobits-per-second

Specifies the kilobits per second.

Values 1 to 20000000, max

size

Specifies the tolerance for the kbps rate.

Values 0 to 4194304

Default 10

bytes | kilobytes

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

25.15 rate-limit

rate-limit

Syntax

rate-limit *value* [**kbps** | **pps**] [**mbs** *mbs-value*]

rate-limit *value* [**kbps** | **pps**] **extracted-traffic**

rate-limit *value* [**kbps** | **pps**] **packet-length** {**lt** | **gt** | **eq**} *packet-length-value*

rate-limit *value* [**kbps** | **pps**] **packet-length range** *packet-length-value packet-length-value*

rate-limit *value* [**kbps** | **pps**] **pattern expression** *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

rate-limit *value* [**kbps** | **pps**] **ttl** {**lt** | **gt** | **eq**} *ttl-value*

rate-limit *value* [**kbps** | **pps**] **ttl range** *ttl-value ttl-value*

Context

[Tree] (config>filter>ip-filter>entry>action rate-limit)

Full Context

configure filter ip-filter entry action rate-limit

Description

This command configures the rate-limit value for traffic matching this filter entry. Rate-limit policers are configured with MBS equals CBS equals 10 ms of the rate and high-prio-only equals 0.

Traffic can also be rate limited based on **extracted-traffic**, **packet-length**, **ttl**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

value

Specifies the **rate-limit** *value* in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

Values 0 to 2000000000 kb/s, max

0 to 100000000 pps, max

mbs-value

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit** *value* unit is **kbps**.

Values 0 to 268435456

extracted-traffic

Specifies rate-limit packets both extracted to the CPM and matching the filter entry match criteria.

packet-length

Specifies rate-limit packets matching both the filter entry match criteria and the *packet-length value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

packet-length-value

Specifies the packet length value for the rate limit action.

Values 0 to 65535

range

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

ttl-value

Specifies rate-limit packets matching both the filter entry match criteria and the TTL value defined in the *rate-limit* action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the *rate-limit* action statement, are implicitly forwarded with no further match in the following filter entries.

Values 0 to 255

Platforms

7705 SAR Gen 2

rate-limit

Syntax

rate-limit *value* [**kbps** | **pps**] [**mbs** *mbs-value*]

rate-limit *value* [**kbps** | **pps**] **extracted-traffic**

rate-limit *value* [**kbps** | **pps**] **hop-limit** {**lt** | **gt** | **eq**} *hop-limit-value*

rate-limit *value* [**kbps** | **pps**] **hop-limit range** *hop-limit-value hop-limit-value*

rate-limit *value* [**kbps** | **pps**] **pattern expression** *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

rate-limit *value* [**kbps** | **pps**] **payload-length** {**lt** | **gt** | **eq**} *payload-length-value*

rate-limit *value* [**kbps** | **pps**] **payload-length range** *payload-length-value payload-length-value*

Context

[Tree] (config>filter>ipv6-filter>entry>action rate-limit)

Full Context

configure filter ipv6-filter entry action rate-limit

Description

This command configures the rate-limit value for traffic matching this filter entry.

Traffic can also be rate-limited based on **extracted-traffic**, **payload-length**, **hop-limit**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card.
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

Parameters

value

Specifies the **rate-limit** *value* in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

Values 0 to 2000000000 kb/s, max

0 to 100000000 pps, max

mbs-value

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit** *value* unit is **kbps**.

Values 0 to 268435456

extracted-traffic

Specifies packets extracted to the CPM.

hop-limit

Specifies the hop limit value for the rate limit action.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

hop-limit-value

Specifies the hop limit value for the rate limit action.

Values 0 to 255

range

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

expression

Specifies the hexadecimal pattern to match; up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

mask

Specifies the mask for the pattern expression, up to eight bytes.

Values 0x0000000000000001 to 0xffffffffffffffff

offset-type

Specifies the starting point reference for the offset-value of this pattern.

Values layer-3, layer-4, data, dns-qtype

offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

Values 0 to 255

payload-length

Specifies rate-limit packets matching both the filter entry match criteria and the *payload-length-value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *payload-length-value,* as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

Values **lt** — Specifies "less than”. The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

gt — Specifies "greater than”. The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

eq — Specifies "equal to”.

payload-length-value

Specifies the payload length value for the rate limit action.

Values 0 to 65535

Platforms

7705 SAR Gen 2

25.16 rd

rd

Syntax

rd *file-url* **rf**

rd *file-url* [**force**]

Context

[Tree] (file rd)

Full Context

file rd

Description

If the directory is empty, the **rd** command is used to remove it. The **force** option executes the command without prompting the user to confirm the action.

If the directory contains files and/or subdirectories, the **rf** parameter must be used to remove the directory.

Example:

```
A:nE1>file cf1:\ # rd test
Are you sure (y/n)? y
Deleting directory cf1:\test ..MINOR: CLI Cannot delete cf1:\test.
A:nE1>file cf1:\ # rd test force
Deleting directory cf1:\test .MINOR: CLI Cannot delete cf1:\test.

A:nE1>file cf1:\ # rd testbase rf
Deleting all subdirectories and files in specified directory. y/n ?y
Deleting directory cf1:\testbase\testbase1 ..OK
Deleting directory cf1:\test .OK
```

Parameters

file-url

Specifies the directory to be removed.

Values		
	local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
	remote-url	[{ftp:// | tftp://}*login*:*pswd*@*remote-locn*/][*file-path*] up to 247 characters directory length up to 99 characters each
	remote-locn	[hostname | ipv4-address | [ipv6-address]]

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*] *x:x:x:x:x:x:d.d.d.d*[*-interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rf

Forces a recursive delete.

force

Forces an immediate deletion of the specified directory. The **rd** *file-url* **force** command executes the command without displaying a user prompt message.

Platforms

7705 SAR Gen 2

25.17 rd-entry

rd-entry

Syntax

rd-entry *rd*

no rd-entry *rd*

Context

[Tree] (config>router>policy-options>route-distinguisher-list rd-entry)

Full Context

configure router policy-options route-distinguisher-list rd-entry

Description

This command creates a route distinguisher (RD) entry in the RD list, containing an IPv4 address or ASN and the assigned number.

The **no** form of the command deletes the RD entry from the list.

Parameters

rd

Specifies a route distinguisher matching an entry in one of the following formats:

- *a.b.c.d*/*m:** – RD in IPv4 format with a wildcard character (such as 10.0.0.0/16:*)
- *a.b.c.d*/*m:n* – RD in IPv4 format with a specific number (such as 10.0.0.2/32:535)
- *asn*:* – RD in ASN format with a wildcard character (such as 65000:*)
- *asn*:*n* – RD in ASN format with a specific number (such as 65000:535)

See the "Route distinguishers" section of the *7705 SAR Gen 2 Layer 3 Services Guide: IES and VPRN* for information about Type values.

25.18 rdnss-lifetime

rdnss-lifetime

Syntax

rdnss-lifetime {*seconds* | **infinite**}

no rdnss-lifetime

Context

[Tree] (config>service>vprn>router-advert>if>dns-options rdnss-lifetime)

[Tree] (config>service>vprn>router-advert>dns-options rdnss-lifetime)

Full Context

configure service vprn router-advertisement interface dns-options rdnss-lifetime

configure service vprn router-advertisement dns-options rdnss-lifetime

Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client. The RDNSS Lifetime must be no more than twice MaxRtrAdvLifetime with a maximum of 3600 seconds.

Default

rdnss-lifetime infinite

Parameters

infinite

Specifies an infinite RDNSS lifetime.

seconds

Specifies the time in seconds.

Values 4to 3600

Platforms

7705 SAR Gen 2

rdnss-lifetime

Syntax

rdnss-lifetime *seconds*

rdnss-lifetime infinite

no rdnss-lifetime

Context

[Tree] (config>router>router-advert>dns-opt rdnss-lifetime)

[Tree] (config>router>router-advert>if>dns-opt rdnss-lifetime)

Full Context

configure router router-advertisement dns-options rdnss-lifetime

configure router router-advertisement interface dns-options rdnss-lifetime

Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client.

Default

rdnss-lifetime infinite

Parameters

seconds

Specifies the time in seconds.

Values 4 to 3600

infinite

Specifies an infinite RDNSS lifetime.

Platforms

7705 SAR Gen 2

25.19 re-auth-period

re-auth-period

Syntax

re-auth-period *seconds*

no re-auth-period

Context

[Tree] (config>port>ethernet>dot1x re-auth-period)

Full Context

configure port ethernet dot1x re-auth-period

Description

This command configures the period after which re-authentication is performed. This value is only relevant if **re-authentication** is enabled.

The **no** form of this command returns the value to the default.

Default

re-auth-period 3600

Parameters

seconds

Specifies the re-authentication delay period in seconds.

Values 1 to 9000

Platforms

7705 SAR Gen 2

25.20 re-authentication

re-authentication

Syntax

[**no**] **re-authentication**

Context

[Tree] (config>port>ethernet>dot1x re-authentication)

Full Context

configure port ethernet dot1x re-authentication

Description

This command enables/disables periodic 802.1x re-authentication.

When **re-authentication** is enabled, the router re-authenticates clients on the port every **re-auth-period**.

The **no** form of this command returns the value to the default.

Default

no re-authentication

Platforms

7705 SAR Gen 2

25.21 reachable-time

reachable-time

Syntax

reachable-time *milli-seconds*

no reachable-time

Context

[Tree] (config>router>router-advert>if reachable-time)

[Tree] (config>service>vprn>router-advert>if reachable-time)

Full Context

configure router router-advertisement interface reachable-time

configure service vprn router-advertisement interface reachable-time

Description

This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.

The configured value is placed in the reachable time field in router advertisement messages sent from this interface.

The **no** form of this command reverts to the default.

Default

reachable-time 0

Parameters

milli-seconds

Specifies the reachable time, in seconds, for advertisements from this interface.

Values 0 to 3600000

Platforms

7705 SAR Gen 2

reachable-time

Syntax

reachable-time *seconds*

no reachable-time

Context

[Tree] (config>service>vprn>if>ipv6 reachable-time)

configure router ipv6 reachable-time

Description

This command configures the neighbor reachability detection timer.

The **no** form of this command reverts to the default value.

Default

reachable-time 30

Parameters

seconds

Specifies the length of time the router should be considered reachable.

Values 30 to 3600

Platforms

7705 SAR Gen 2

reachable-time

Syntax

reachable-time *seconds*

no reachable-time

Context

[Tree] (config>router>if>ipv6 reachable-time)

Full Context

configure router interface ipv6 reachable-time

Description

This command configures the neighbor reachability detection timer.

The **no** form of this command reverts to the default value.

Default

no reachable-time

Parameters

seconds

Specifies the length of time the router should be considered reachable.

Values 30 to 3600

Platforms

7705 SAR Gen 2

25.22 read-algorithm

read-algorithm

Syntax

read-algorithm {**hash** | **hash2** | **custom**| **all-hash**}

no read-algorithm

Context

[Tree] (config>system>security>management-interface>classic-cli read-algorithm)

Full Context

configure system security management-interface classic-cli read-algorithm

Description

This command specifies how encrypted configuration secrets are interpreted, and which encryption types are accepted, when secrets are input into the system or read from a configuration file (for example at system bootup time).

The **no** form of this command reverts to the default value.

Default

read-algorithm all-hash

Parameters

hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the write-algorithm should be **hash** as well.

hash2

Specifies hash2 which is module-specific.

custom

Specifies the custom encryption to management interface.

all-hash

Specifies that the system accepts hash or hash2.

Platforms

7705 SAR Gen 2

25.23 reassemble

reassemble

Syntax

reassemble

Context

[Tree] (config>filter>ip-filter>entry>action reassemble)

Full Context

configure filter ip-filter entry action reassemble

Description

This command sets the filter entry action to reassemble.

Platforms

7705 SAR Gen 2

25.24 reassembly

reassembly

Syntax

reassembly [*wait-msecs*]

no reassembly

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel reassembly)

[Tree] (config>service>ies>if>sap>ip-tunnel reassembly)

Full Context

configure service vprn interface sap ip-tunnel reassembly

configure service ies interface sap ip-tunnel reassembly

Description

This command configures the maximum number of seconds to wait to receive all fragments of a particular IPsec or GRE packet for reassembly.

The **no** form of this commands removes the wait time from the configuration.

Default

no reassembly

Parameters

wait-msecs

Specifies the reassembly wait time in 100 increments.

Values 1 to 5000 ms

Platforms

7705 SAR Gen 2

reassembly

Syntax

reassembly [*wait-msecs*]

no reassembly

Context

[Tree] (config>isa>tunnel-group reassembly)

Full Context

configure isa tunnel-group reassembly

Description

This command configures IP packet reassembly for IPsec and GRE tunnels supported by an MS-ISA. The **reassembly** command at the tunnel-group level configures IP packet reassembly for all IPsec and GRE tunnels associated with the tunnel-group. The **reassembly** command at the GRE tunnel level configures IP packet reassembly for that one specific GRE tunnel, overriding the tunnel-group configuration.

The **no** form of this command disables IP packet reassembly.

Default

no reassembly (tunnel-group level)

reassembly (gre-tunnel level)

Parameters

wait

Specifies the maximum number of milliseconds that the ISA tunnel application will wait to receive all fragments of a particular IPsec or GRE packet. If one or more fragments are still missing when this limit is reached the partially reassembled datagram is discarded and an ICMP time exceeded message is sent to the source host (if allowed by the ICMP configuration of the sending interface). Internally, the configured value is rounded up to the nearest multiple of 100 ms.

Values 1 to 5000

Default 2000 (tunnel-group level)

Platforms

7705 SAR Gen 2

25.25 reassembly-group

reassembly-group

Syntax

reassembly-group *nat-group-id* [**to-base-network**]

no reassembly-group

Context

[Tree] (config>service>vprn reassembly-group)

[Tree] (config>router reassembly-group)

Full Context

configure service vprn reassembly-group

configure router reassembly-group

Description

This command associates a reassembly-group consisting of multiple ISAs with the routing context in which the application requiring reassembly service resides.

Default

no reassembly-group

Parameters

nat-group-id

Specifies the NAT group ID; the NAT group contains up to 10 active ISAs.

Values 1 to 4

to-base-network

Enables the reassembly context to use network interfaces in the base routing context.

Platforms

7705 SAR Gen 2

25.26 rebind-timer

rebind-timer

Syntax

rebind-timer [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no rebind-timer

Context

[Tree] (config>service>vprn>dhcp6>server>pool>prefix rebind-timer)

[Tree] (config>router>dhcp6>server>pool>prefix rebind-timer)

Full Context

configure service vprn dhcp6 local-dhcp-server pool prefix rebind-timer

configure router dhcp6 local-dhcp-server pool prefix rebind-timer

Description

This command configures the lease rebind timer (T2) via LUDB.

The T2 time is the time at which the client contacts any available addressing authority to extend the lifetimes of DHCPv6 leases. T2 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses/prefixes in the IA that the addressing authority is willing to extend, respectively.

The configured rebind timer should always be longer than or equal to the renew timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

Default

rebind-timer min 48

Parameters

rebind-timer

Specifies the preferred lifetime.

Values	**days** *days*	0 to 14
	hrs *hours*	0 to 23
	min *minutes*	0 to 59
	sec *seconds*	0 to 9

Platforms

7705 SAR Gen 2

25.27 reboot

reboot

Syntax

reboot [**active** | **standby** | **upgrade**] [**now**]

Context

[Tree] (admin reboot)

Full Context

admin reboot

Description

This command reboots the router or one CPM and can also be used to force an upgrade of the system boot ROMs.

If no options are specified, the user is prompted to confirm the reboot operation. Answering yes (y) will result in both CPMs and all IOMs rebooting.

```
ALA-1>admin# reboot
Are you sure you want to reboot (y/n)?
```

Parameters

active

Reboots the active CPM.

Default active

standby

Reboots the standby CPM.

Default active

upgrade

Forces card firmware to be upgraded during chassis reboot. This option should only be used if it has been indicated as required in the Release Notes or by Nokia technical support. Normally, the SR OS automatically performs firmware upgrades on CPMs and XCM/IOM cards without the need for the **upgrade** keyword.

When the **upgrade** keyword is specified, a chassis flag is set for the BOOT Loader (boot.ldr) and on the subsequent boot of the OS on the chassis, firmware images on CPMs, XCMs, and IOMs will be upgraded automatically.

Firmware on CPMs, XCMs, or IOMs that are installed in a running chassis will be upgraded automatically. For example, if a card is inserted as the result of a hot swap, and the card has a firmware version that is no longer compatible with the SR OS image running on the chassis, then the firmware on the card will be automatically upgraded before the card is brought online.

If the card firmware is upgraded, a chassis cardUpgraded (event 2032) log event is generated. The corresponding SNMP trap for this log event is tmnxEqCardFirmwareUpgraded.

During any firmware upgrade, automatic or manual, it is imperative that during the upgrade procedure:

- Power must not be switched off or interrupted.
- The system must not be reset.

- No cards are inserted or removed.

Any of the above conditions may render cards inoperable requiring a return of the card for resolution.

The time required to upgrade the firmware on the cards in the chassis depends on the number of cards to be upgraded. The progress of a firmware upgrade can be monitored at the console.

now

Forces a reboot of the router immediately without an interactive confirmation.

7705 SAR Gen 2

25.28 recall

recall

Syntax

[**no**] **recall**

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>history recall)

Full Context

configure system management-interface cli md-cli environment history recall

Description

This command configures command history recall and search execution. When enabled, command history recall (**!**), substitution (**!$**), display (**:p**, **Esc+.**), and backward search (**Ctrl-R**) is enabled.

The **no** form of this command disables history recall and search execution.

Default

no recall

Full Context

configure service vprn rip group neighbor receive

configure service vprn ripng group receive

configure service vprn rip group receive

configure service vprn rip receive

configure service vprn ripng receive

configure service vprn ripng group neighbor receive

Description

This command configures the type(s) of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior accepts and processes both RIPv1 and RIPv2 messages.

The **no** form of this command resets the type of messages accepted to both.

Default

no receive

Parameters

both

Accept RIP updates in either Version 1 or Version 2 format.

none

Do not accept and RIP updates.

version-1

Router should only accept RIP updates in Version 1 format.

version-2

Router should only accept RIP updates in Version 2 format.

Platforms

7705 SAR Gen 2

receive

Syntax

receive

Context

[Tree] (config>system>security>keychain>direction>uni receive)

Full Context

configure system security keychain direction uni receive

Description

This command enables the receive nodal context. Entries defined under this context are used to authenticate TCP segments that are being received by the router.

Platforms

7705 SAR Gen 2

receive

Syntax

receive *option-number*

no receive

Context

[Tree] (config>system>security>keychain>tcp-option-number receive)

Full Context

configure system security keychain tcp-option-number receive

Description

This command configures the TCP option number accepted in TCP packets received.

The **no** form of this command reverts to the default value.

Default

receive 254

Parameters

option-number

Specifies an enumerated integer that indicates the TCP option number to be used in the TCP header.

Values 253, 254, 253&254, tcp-ao

Platforms

7705 SAR Gen 2

receive

Syntax

configure router ripng group neighbor receive

configure router rip group neighbor receive

configure router ripng receive

Description

This command configures the types of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior is to accept and process both RIPv1 and RIPv2 messages.

The **no** form of the command reverts to the default value.

Default

receive both – in the config>router>rip context

receive version-1 – in the config>router>ripng context

Parameters

both

Specifies that RIP updates in either version 1 or version 2 format will be accepted.

none

Specifies that RIP updates will not be accepted.

version-1

Specifies that RIP updates in version 1 format only will be accepted.

version-2

Specifies that RIP updates in version 2 format only will be accepted.

Platforms

25.30 receive-interval

receive-interval

Syntax

receive-interval *receive-interval*

no receive-interval

Context

[Tree] (config>router>bfd>bfd-template receive-interval)

Full Context

configure router bfd bfd-template receive-interval

Description

This command specifies the receive timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default

receive-interval 100

Parameters

receive-interval

Specifies the receive interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

25.36 reclassify-using-qos

reclassify-using-qos

Syntax

reclassify-using-qos *policy-id*

no reclassify-using-qos

Context

[Tree] (config>service>ies>if>vpls>egress reclassify-using-qos)

Full Context

configure service ies interface vpls egress reclassify-using-qos

Description

The reclassify-using-qos command is used to specify a sap-egress QoS policy that will be used to reclassify the forwarding class and profile of egress routed packets on the VPLS or I-VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the sap-egress QoS policy applied to the egress VPLS SAP.

While the specified sap-egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the sap-egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets will not be reclassified on the egress SAPs of the VPLS service attached to the IP interface.

Parameters

policy-id

Specifies the SAP egress QoS policy ID. This parameter is required when executing the reclassify-using-qos command. The specified SAP egress QoS ID must exist within the system or the command fails.

Platforms

7705 SAR Gen 2

reclassify-using-qos

Syntax

reclassify-using-qos *policy-id*

no reclassify-using-qos

Context

[Tree] (config>service>vprn>if>vpls>egress reclassify-using-qos)

Full Context

configure service vprn interface vpls egress reclassify-using-qos

Description

This command specifies a SAP egress QoS policy that is used to reclassify the forwarding class and profile of egress routed packets on the VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the SAP egress QoS policy applied to the egress VPLS SAP.

While the specified SAP egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the SAP egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets is not reclassified on the egress SAPs of the VPLS service attached to the IP interface.

Parameters

policy-id

Specifies the SAP egress QoS policy ID This parameter is required when executing the **reclassify-using-qos** command. The specified SAP egress QoS ID must exist within the system or the command fails.

Platforms

7705 SAR Gen 2

25.37 record

record

Syntax

[**no**] **record**

Context

[Tree] (config>router>mpls>lsp>secondary record)

[Tree] (config>router>mpls>lsp>primary record)

[Tree] (config>router>mpls>lsp-template record)

Full Context

configure router mpls lsp secondary record

configure router mpls lsp primary record

configure router mpls lsp-template record

Description

This command enables recording of all the hops that an LSP path traverses. Enabling **record** increases the size of the PATH and RESV refresh messages for the LSP since this information is carried end-to-end along the path of the LSP. The increase in control traffic per LSP may impact scalability.

The **no** form of this command disables the recording of all the hops for the given LSP. There are no restrictions as to when the **no** command can be used. The **no** form of this command also disables the **record-label** command.

Default

record

Platforms

7705 SAR Gen 2

record

Syntax

[**no**] **record** *record-name*

Context

[Tree] (config>log>accounting-policy record)

Full Context

configure log accounting-policy record

Description

This command adds the accounting record type to the accounting policy that is forwarded to the configured accounting file. A record name can only be used in one accounting policy. To obtain a list of all record types that can be configured, use the **show log accounting-records** command.

To configure an accounting policy for access ports, select a service record (for example, service-ingress-octets). To change the record name to another service record, enter the **record** command with the new record name and it replaces the old record name.

When configuring an accounting policy for network ports, select a network record. To change the record name to another network record, enter the **record** command with the new record name and it replaces the old record name.

If the change required modifies the record from network to service or from service to network, then the old record name must be removed using the **no** form of this command.

Only one record can be configured in a single accounting policy. For example, if an accounting-policy is configured with an **access-egress-octets** record, to change it to a **service-ingress-octets** record, use the **no record** command under the accounting-policy to remove the old record first, and then enter the **service-ingress-octets** record.

Note:
Collecting excessive statistics can adversely affect the CPU utilization and take up large amounts of storage space.

The **no** form of this command removes the record type from the policy.

Default

no record

Parameters

record-name

Specifies the accounting record name.

Platforms

7705 SAR Gen 2

25.38 record-label

record-label

Syntax

[**no**] **record-label**

Context

[Tree] (config>router>mpls>lsp>secondary record-label)

[Tree] (config>router>mpls>lsp-template record-label)

[Tree] (config>router>mpls>lsp>primary record-label)

Full Context

configure router mpls lsp secondary record-label

configure router mpls lsp-template record-label

configure router mpls lsp primary record-label

Description

This command enables recording of all the labels at each node that an LSP path traverses. Enabling the **record-label** command will also enable the **record** command if it is not already enabled.

The **no** form of this command disables the recording of the hops that an LSP path traverses.

Default

record-label

Platforms

7705 SAR Gen 2

25.39 record-stats

record-stats

Syntax

record-stats {**delay** | **loss** | **delay-and-loss**}

no record-stats

Context

[Tree] (config>oam-pm>session>ip>twamp-light record-stats)

Full Context

configure oam-pm session ip twamp-light record-stats

Description

This option provides the ability to determine which statistics are recorded. The TWAMP-Light PDU can report on both delay and loss using a single packet. The operator may choose which statistics they would like to report. Only delay recording is on by default. All other metrics are ignored. In order to change what is being recorded and reported, the TWAMP-Light session must be shutdown. This is required because the single packet approach means the base statistics are shared between the various datasets. Issuing a **no shutdown** command clears previous all non-volatile memory for the session and allocate new memory blocks. All the parameters under this context are mutually exclusive.

The **no** version of the command restores the default "delay" only.

Default

record-stats delay

Parameters

delay

Specifies report on delay using a single packet..

loss

Specifies to report on loss using a single packet..

delay-and-loss

Specifies to report on both delay and loss using a single packet.

Platforms

7705 SAR Gen 2

debug router pcep pcc connection red

debug router pcep pcc red

Description

This command enables debugging for PCC or connection redundancy events.

The **no** form of this command disables debugging.

Parameters

detail

Keyword used to specify detailed information about PCC or connection redundancy events.

Platforms

7705 SAR Gen 2

25.41 redelegation-timer

redelegation-timer

Syntax

redelegation-timer *seconds*

no redelegation-timer

Context

[Tree] (config>router>pcep>pcc redelegation-timer)

Full Context

configure router pcep pcc redelegation-timer

Description

This command configures the redelegation timer for PCE-initiated LSPs.

The **no** form of the command sets this value to the default.

Default

redelegation-timer 90

Parameters

seconds

Specifies the number of seconds before the redelegation timer expires.

Values 1 to 3600

Platforms

7705 SAR Gen 2

25.42 redirect-policy

redirect-policy

Syntax

redirect-policy *redirect-policy-name* [**create**]

no redirect-policy *redirect-policy-name*

Context

[Tree] (config>filter redirect-policy)

Full Context

configure filter redirect-policy

Description

This command, creates a configuration context for the specified redirect policy.

The **no** form of the command removes the redirect policy from the filter configuration only if the policy is not referenced in a filter and the filter is not in use (applied to a service or network interface).

Parameters

redirect-policy-name

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes. There is no limit to the number of redirect policies that can be configured.

create

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

Platforms

7705 SAR Gen 2

redirect-policy

Syntax

redirect-policy *redirect-policy-name* **destination** *ip-address*

no redirect-policy *redirect-policy-name* [**destination** *ip-address*]

Context

[Tree] (config>filter>redirect-policy-binding redirect-policy)

Full Context

configure filter redirect-policy-binding redirect-policy

Description

This command adds the destination (specified by its IP address) of a redirect-policy (specified by its name) to the binding. An error is thrown if either the destination does not exist for the specified redirect-policy or if the redirect-policy does not exist.

The **no** form of the command removes from the binding from all the destinations of the specified redirect-policy, or only the specified destination.

Parameters

redirect-policy-name

Specifies the name of the redirect-policy (up to 32 characters) as the destination that is to be added to the binding.

ip-address

The IP address of the destination. This can be an IPv4 or IPv6 address.

Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

25.43 redirect-policy-binding

redirect-policy-binding

Syntax

redirect-policy-binding *name* [**create**]

no redirect-policy-binding *name*

Context

[Tree] (config>filter redirect-policy-binding)

Full Context

configure filter redirect-policy-binding

Description

This command creates a redirect-policy binding (specified by its name) in case it does not exist and, enters the context associated with it. When a redirect-policy binding is created, no destination is associated to this binding by default and the binding operator is set to AND.

The **no** form of this command deletes the redirect-policy binding and all the associated configuration information.

Parameters

name

Specifies the name of the binding. Possible values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotations.

create

This keyword is required to create the binding if it does not exist. This has no effect when used with an existing binding.

Full Context

configure service ies interface icmp redirects

configure service vprn interface ipv6 icmp6 redirects

configure service vprn network-interface icmp redirects

configure service ies interface ipv6 icmp6 redirects

configure service vprn interface icmp redirects

Description

This command configures the rate for Internet Control Message Protocol (ICMP) redirect messages issued on the router interface.

When routes are not optimal on this router and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

Default

redirects 100 10

Parameters

number

Specifies the maximum number of ICMP redirect messages to send. This parameter must be specified with the *second* parameter.

Values 10 to 1000

seconds

Specifies the time frame in seconds used to limit the *number* of ICMP redirect messages that can be issued.

Values 1 to 60

Platforms

7705 SAR Gen 2

redirects

Syntax

redirects [*number seconds*]

no redirects

Context

[Tree] (config>router>if>icmp redirects)

Full Context

configure router interface icmp redirects

Description

This command enables and configures the rate for ICMP redirect messages issued on the router interface.

When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional *number* and *time* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

Default

redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.

Parameters

number

The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the *time* parameter.

Values 10 to 1000

seconds

The time frame, in seconds, used to limit the *number* of ICMP redirect messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

redirects

Syntax

redirects [*number seconds*]

no redirects

Context

[Tree] (config>router>if>ipv6>icmp6 redirects)

Full Context

configure router interface ipv6 icmp6 redirects

Description

This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available.

The **no** form of this command disables ICMPv6 redirects.

Default

redirects 100 10 (when IPv6 is enabled on the interface)

Parameters

number

Limits the number of redirects issued per the time frame specified in *seconds* parameter.

Values 10 to 1000

seconds

Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.

Values 1 to 60

Platforms

7705 SAR Gen 2

25.47 redistribute-delay

redistribute-delay

Syntax

redistribute-delay *redistribute-delay*

no redistribute-delay

Context

[Tree] (config>router>ospf3>timers redistribute-delay)

[Tree] (config>router>ospf>timers redistribute-delay)

Full Context

configure router ospf3 timers redistribute-delay

configure router ospf timers redistribute-delay

Description

This command sets the internal OSPF hold down timer for external routes being redistributed into OSPF.

Shorting this delay can speed up the advertisement of external routes into OSPF but can result in additional OSPF messages if that source route is not yet stable.

The **no** form of this command resets the timer value back to the default value.

Note:
The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

Default

redistribute-delay 1000

Parameters

redistribute-delay

Specifies the OSPF redistribution hold down time in milliseconds for external routes being advertised into OSPF.

Values 0 to 1000

Platforms

7705 SAR Gen 2

25.48 redistribute-external

redistribute-external

Syntax

[**no**] **redistribute-external**

Context

[Tree] (config>service>vprn>ospf>area>nssa redistribute-external)

[Tree] (config>service>vprn>ospf3>area>nssa redistribute-external)

Full Context

configure service vprn ospf area nssa redistribute-external

configure service vprn ospf3 area nssa redistribute-external

Description

This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.

NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an ABR to the entire OSPF domain.

The **no** form of this command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.

Default

redistribute-external — External routes are redistributed into the NSSA.

25.49 redo

redo

Syntax

redo [*count*]

Context

[Tree] (candidate redo)

Full Context

candidate redo

Description

This command reapplies the changes to the candidate that were removed using a previous undo. All undo or redo history is lost when the operator exits **edit-cfg** mode.

A **redo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the redo.

Parameters

count

Specifies the number of previous changes to reapply.

Values 1 to 50

Default 1

Platforms

7705 SAR Gen 2

25.50 reduced-prompt

reduced-prompt

Syntax

reduced-prompt [*no-of-nodes-in-prompt*]

no reduced-prompt

Context

[Tree] (environment reduced-prompt)

Full Context

environment reduced-prompt

Description

This command configures the maximum number of higher CLI context levels to display in the CLI prompt for the current CLI session. This command is useful when configuring features that are several node levels deep, causing the CLI prompt to become too long. By default, the CLI prompt displays the system name and the complete context in the CLI.

The number of *nodes* specified indicates the number of higher-level contexts that can be displayed in the prompt. For example, if reduced prompt is set to 2, the two highest contexts from the present working context are displayed by name with the hidden (reduced) contexts compressed into a ellipsis ("…").

```
A:ALA-1>environment# reduced-prompt 2
A:ALA-1>config>router# interface to-103
A:ALA-1>...router>if#
```

The setting is not saved in the configuration. It must be reset for each CLI session or stored in an **exec** script file.

The **no** form of the command reverts to the default.

Default

no reduced-prompt

Parameters

no-of-nodes-in-prompt

Specifies the maximum number of higher-level nodes displayed by name in the prompt, expressed as a decimal integer.

Values 0 to 15

Default 2

Platforms

7705 SAR Gen 2

no reference-bandwidth

Context

[Tree] (config>service>vprn>isis reference-bandwidth)

Full Context

configure service vprn isis reference-bandwidth

Description

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

cost = reference – bandwidth # bandwidth

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See **wide-metrics-only** in the **config>router>isis** context.)

If the reference bandwidth is not configured, all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

Default

no reference-bandwidth — No reference bandwidth is defined. All interfaces have a metric of 10.

Parameters

Zetta-bps

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

Values 1 to 18

Exa-bps

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

Values 1 to 999

Peta-bps

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

Values 1 to 999

bandwidth-in-kbps

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

Values 1 to 18446744073709551615

Tera-bps

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

Values 1 to 999

[Tree] (config>service>vprn>ospf3 reference-bandwidth)

Full Context

configure service vprn ospf reference-bandwidth

configure service vprn ospf3 reference-bandwidth

Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference–bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 40 Gb/s link default cost of 2
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

Note:
The default **reference-bandwidth** value must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default **reference-bandwidth** value is used, a metric of 1 is set on all interface speeds ≥ 100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The reference-bandwidth command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>if** *ip-int-name* context.

The **no** form of this command reverts the reference bandwidth to the default value.

Default

reference-bandwidth 100000000

Parameters

bandwidth-in-kbps

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

Values 1 to 4000000000

tbps Tera-bps

Specifies the reference bandwidth in terabits per second expressed as a decimal integer.

Values 1 to 4

gbps *Giga-bps*

Specifies the reference bandwidth in gigabits per second expressed as a decimal integer.

Full Context

configure router ospf3 reference-bandwidth

configure router ospf reference-bandwidth

Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

Note:
The default reference-bandwidth must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default reference-bandwidth is used, a metric of 1 is set on all interface speeds ≥ 100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>interface** *ip-int-name* context.

The **no** form of this command reverts to the default value.

reflector

Syntax

reflector [**udp-port** *udp-port-number*] [**create**]

no reflector

Context

[Tree] (config>service>vprn>twamp-light reflector)

[Tree] (config>router>twamp-light reflector)

Full Context

configure service vprn twamp-light reflector

configure router twamp-light reflector

Description

This command configures a TWAMP Light session reflector parameters and to enable TWAMP Light functionality with the **no shutdow**n command. The **udp-port** keyword and value must be specified with the **create** keyword. An error message is generated if the specific UDP port is unavailable.

Parameters

udp-port-number

Specifies the UDP port number. A strictly enforced restricted range has been introduced. The TWAMP Light session reflector must be brought in line with this new restriction prior upgrading or rebooting from any previous release if there is an active TWAMP Light session reflector configured. Failure to do so prevents an ISSU operation from proceeding and fails to activate any reflector outside of the enforced range.

Note that in the Two-Way Active Measurement Protocol Light (TWAMP Light) section for a complete description. This parameter is required and specifies the destination udp-port that the session reflector uses to listen for TWAMP Light packets. The session controller launching the TWAMP Light packets must be configured with the same destination UDP port as part of the TWAMP Light test. The IES service uses the destination UDP port that is configured under the **router** context. Only one UDP port can be configured per unique context.

25.57 refresh-reduction

refresh-reduction

Syntax

[**no**] **refresh-reduction**

Context

[Tree] (config>router>rsvp>interface refresh-reduction)

Full Context

configure router rsvp interface refresh-reduction

Description

This command enables the use of the RSVP overhead refresh reduction capabilities on this RSVP interface.

When this option is enabled, a node will enable support for three capabilities. It will accept bundles RSVP messages from its peer over this interface, it will attempt to perform reliable RSVP message delivery to its peer, and will use summary refresh messages to refresh path and resv states. The reliable message delivery must be explicitly enabled by the user after refresh reduction is enabled. The other two capabilities are enabled immediately.

A bundle message is intended to reduce overall message handling load. A bundle message consists of a bundle header followed by one or more bundle sub-messages. A sub-message can be any regular RSVP message except another bundle message. A node will only process received bundled RSVP messages but will not generate them.

When reliable message delivery is supported by both the node and its peer over the RSVP interface, an RSVP message is sent with a message_id object. A message_id object can be added to any RSVP message when sent individually or as a sub-message of a bundled message.

if the sender sets the ack_desired flag in the message_id object, the receiver acknowledges the receipt of the RSVP message by piggy-backing a message_ack object to the next RSVP message it sends to its peer. Alternatively, an ACK message can also be used to send the message_ack object. In both cases, one or many message_ack objects could be included in the same message.

The router supports the sending of separate ACK messages only but is capable of processing received message_ack objects piggy-backed to hop-by-hop RSVP messages, such as path and resv.

The router sets the ack_desired flag only in non-refresh RSVP messages and in refresh messages which contain new state information.

A retransmission mechanism based on an exponential backoff timer is supported in order to handle unacknowledged message_id objects. The RSVP message with the same message_id is retransmitted every 2 * rapid-retransmit-time interval of time. The rapid-retransmit-time is referred to as the rapid

retransmission interval as it must be smaller than the regular refresh interval configured in the **config>router>rsvp>refresh-time** context. There is also a maximum number of retransmissions of an unacknowledged RSVP message rapid-retry-limit. The node will stop retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the rapid-retry-limit parameter, whichever comes first. These two parameters are configurable globally on a system in the **config>router>rsvp** context.

Refresh summary consists of sending a summary refresh message containing a message_id list object. The fields of this object are populated each with the value of the message_identifier field in the message_id object of a previously sent individual path or resv message. The summary refresh message is sent every refresh regular interval as configured by the user using the refresh-time command in the **config>router>rsvp** context. The receiver checks each message_id object against the saved path and resv states. If a match is found, the state is updated as if a regular path or resv refresh message was received from the peer. If a specific message_identifier field does not match, then the node sends a message_id_nack object to the originator of the message.

The above capabilities are referred to collectively as "refresh overhead reduction extensions”. When the refresh-reduction is enabled on an RSVP interface, the node indicates this to its peer by setting a "refresh-reduction-capable” bit in the flags field of the common RSVP header. If both peers of an RSVP interface set this bit, all the above three capabilities can be used. Furthermore, the node monitors the settings of this bit in received RSVP messages from the peer on the interface. As soon as this bit is cleared, the router stops sending summary refresh messages. If a peer did not set the "refresh-reduction-capable” bit, a node does not attempt to send summary refresh messages.

However, if the peer did not set the "refresh-reduction-capable” bit, a node, with refresh reduction enabled and reliable message delivery enabled, will still attempt to perform reliable message delivery with this peer. If the peer does not support the message_id object, it returns an error message "unknown object class”. In this case, the node retransmits the RSVP message without the message_id object and reverts to using this method for future messages destined to this peer. The RSVP Overhead Refresh Reduction is supported with both RSVP P2P LSP path and the S2L path of an RSVP P2MP LSP instance over the same RSVP instance.

The **no** form of this command reverts to the default value.

Default

no refresh-reduction

Platforms

7705 SAR Gen 2

25.58 refresh-reduction-over-bypass

refresh-reduction-over-bypass

Syntax

refresh-reduction-over-bypass [**enable** | **disable**]

Context

[Tree] (config>router>rsvp refresh-reduction-over-bypass)

Full Context

configure router rsvp refresh-reduction-over-bypass

Description

This command enables the refresh reduction capabilities over all bypass tunnels originating on this PLR node or terminating on this Merge Point (MP) node.

By default, this is disabled. Since a bypass tunnel may merge with the primary LSP path in a node downstream of the next-hop, there is no direct interface between the PLR and the MP node and it is possible the latter will not accept summary refresh messages received over the bypass.

When disabled, the node as a PLR or MP will not set the "Refresh-Reduction-Capable" bit on RSVP messages pertaining to LSP paths tunneled over the bypass. It will also not send Message-ID in RSVP messages. This effectively disables summary refresh.

Default

refresh-reduction-over-bypass disable

Syntax

refresh-time *seconds* **hold-time** *seconds*

no refresh-time

Context

[Tree] (config>router>origin-validation>rpki-session refresh-time)

Full Context

configure router origin-validation rpki-session refresh-time

Description

This command is used to configure the **refresh-time** and **hold-time** intervals that are used for liveness detection of the RPKI-Router session. The **refresh-time** defaults to 300 seconds and is reset whenever a Reset Query PDU or Serial Query PDU is sent to the cache server. When the timer expires, a new Serial Query PDU is sent with the last known serial number.

The **hold-time** specifies the length of time in seconds that the session is to be considered UP without any indication that the cache server is alive and reachable. The timer defaults to 600 seconds and must be at least 2x the refresh-time (otherwise the CLI command is not accepted). Reception of any PDU from the cache server resets the hold timer. When the **hold-time** expires, the session is considered to be DOWN and the stale timer is started.

Default

no refresh-time

Parameters

seconds

Specifies a time in seconds.

Syntax

refresh-timer *value*

no refresh-timer

Context

[Tree] (config>service>vprn>if>spoke-sdp>control-channel-status refresh-timer)

Full Context

configure service vprn interface spoke-sdp control-channel-status refresh-timer

Description

This command configures the refresh timer for control channel status signaling packets. By default, no refresh packets are sent.

Default

no refresh-timer

Parameters

value

Specifies the refresh timer value.

Values 10 to 65535 seconds

Default 0 (off)

Platforms

7705 SAR Gen 2

25.61 register

register

Syntax

register [**group** *grp-ip-address*] [**source** *ip-address*] [**detail**]

no register

Context

[Tree] (debug>router>pim register)

Full Context

debug router pim register

Description

This command enables debugging for PIM register mechanism.

The **no** form of this command disables debugging for PIM register mechanism.

Parameters

grp-ip-address

Debugs information associated with the specified PIM register.

Values multicast group address (ipv4, ipv6)

ip-address

Debugs information associated with the specified PIM register.

Values source address (ipv4, ipv6)

detail

Debugs detailed register information.

Platforms

7705 SAR Gen 2

25.62 register-message

register-message

Syntax

[**no**] **register-message** {*ip-address* | *ipv6-address*}

Context

[Tree] (config>router>pim>src-address register-message)

[Tree] (config>service>vprn>pim>src-address register-message)

Full Context

configure router pim source-address register-message

configure service vprn pim source-address register-message

Description

This command configures the source IP address for PIM register messages. The IP address can be set to any unicast address, regardless of whether it resides on the node. Ensure that the specified IP address is configured on the router as a loopback or interface IP address.

The **no** form of this command removes the IP address. By default, when no IP address is specified for the PIM instance, the source IP address for register messages is selected by choosing the smallest IP address from available interfaces on the node.

Parameters

ip-address | *ipv6-address*

Specifies the source IPv4 or IPv6 address, up to 64 characters.

Platforms

7705 SAR Gen 2

25.63 reinit-delay

reinit-delay

Syntax

reinit-delay *time*

no reinit-delay

Context

[Tree] (config>system>lldp reinit-delay)

Full Context

configure system lldp reinit-delay

Description

This command configures the time before re-initializing LLDP on a port.

The **no** form of this command reverts to the default value.

Default

no reinit-delay

Parameters

time

Specifies the time, in seconds, before re-initializing LLDP on a port.

Values 1 to 10

Default 2

Platforms

7705 SAR Gen 2

25.64 relay-plain-bootp

relay-plain-bootp

Syntax

configure router interface dhcp relay-plain-bootp

Description

This command enables the relaying of plain BOOTP packets.

The **no** form of this command disables the relaying of plain BOOTP packets.

Default

no relay-plain-bootp

Platforms

7705 SAR Gen 2

25.65 relay-proxy

relay-proxy

Syntax

relay-proxy [**release-update-src-ip**] [**siaddr-override** *ip-address*]

no relay-proxy

Context

[Tree] (config>service>vprn>if>dhcp relay-proxy)

[Tree] (config>service>ies>if>dhcp relay-proxy)

Full Context

configure service vprn interface dhcp relay-proxy

configure service ies interface dhcp relay-proxy

Description

This command enables the DHCPv4 relay proxy function on the interface. The command has no effect when no dhcp servers are configured (DHCPv4 relay not configured). By default, unicast DHCPv4 release messages are forwarded transparently.

A relay proxy enhances the relay such that it also relays unicast client DHCPv4 REQUEST messages (lease renewals).

- In the upstream direction, update the source IP address and add the gateway IP address (gi-address) field before sending the message to the intended DHCP server (the message is not broadcasted to all configured DHCP servers.
- In the downstream direction, remove the gi-address and update the destination IP address to the address of the `yiaddr` (your IP address) field.

The optional **release-update-src-ip** parameter updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

The optional **siaddr-override** *ip-address* parameter enables DHCP server IP address hiding towards the client. This parameter requires that **lease-populate** is enabled on the interface. The DHCP server ip address is required for the address hiding function and is stored in the lease state record. The client interacts with the relay proxy as if it is the DHCP server. In all DHCP messages to the client, the value of following header fields and DHCP options containing the DHCP server IP address is replaced with the configured <*ip-address*>:

- the "source IP address” field in the IP DHCPv4 packet header
- the "siaddr” field in the DHCPv4 header if not equal to zero in the message received from the server
- the Server Identification option (DHCPv4 option 54) if present in the original server message
- the source IP address field in the IP packet header

DHCP OFFER selection during initial binding is done in the relay-proxy. Only the first DHCP OFFER message is forwarded to the client. Subsequent DHCP OFFER messages from different servers are silently dropped.

Parameters

release-update-src-ip

Updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

ip-address

Enables DHCPv4 server address hiding towards the DHCPv4 client and activates DHCPv4 OFFER selection in case multiple DHCP servers are configured. The *ip-address* can be any local address in the same routing instance. If DHCP relay lease-split is enabled, **siaddr-override** *ip-address* has priority over the **emulated-server** *ip-address* configured in the proxy-server and is used as the source IP address.

7705 SAR Gen 2

25.66 relay-unsolicited-cfg-attribute

relay-unsolicited-cfg-attribute

Syntax

relay-unsolicited-cfg-attribute

Context

[Tree] (config>ipsec>ike-policy relay-unsolicited-cfg-attribute)

Full Context

configure ipsec ike-policy relay-unsolicited-cfg-attribute

Description

This command enters relay unsolicited configuration attributes context. With this configuration, the configured attributes returned from source (such as a RADIUS server) will be returned to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG_REQUEST payload.

Platforms

7705 SAR Gen 2

25.67 reliable-delivery

reliable-delivery

Syntax

[**no**] **reliable-delivery**

Context

[Tree] (config>router>rsvp>if>refresh-reduction reliable-delivery)

Full Context

configure router rsvp interface refresh-reduction reliable-delivery

Description

This command enables reliable delivery of RSVP messages over the RSVP interface. When refresh-reduction is enabled on an interface and reliable-delivery is disabled, the router will send a message_id and not set ACK desired in the RSVP messages over the interface. The router does not expect an ACK and but will accept it if received. The node will also accept message ID and reply with an ACK when requested. In this case, if the neighbor set the "refresh-reduction-capable” bit in the flags field of the common RSVP header, the node will enter summary refresh for a specific message_id it sent regardless if it received an ACK or not to this message from the neighbor.

Finally, when 'reliable-delivery’ option is enabled on any interface, RSVP message pacing is disabled on all RSVP interfaces of the system, for example, the user cannot enable the **msg-pacing** option in the **config>router>rsvp** context, and error message is returned in CLI. Conversely, when the **msg-pacing** option is enabled, the user cannot enable the reliable delivery option on any interface on this system. An error message is also generated in CLI after such an attempt.

The **no** form of this command reverts to the default value.

Default

no reliable-delivery

Platforms

7705 SAR Gen 2

25.68 reload

reload

Syntax

reload type {**cert** | **key** | **cert-key-pair**} *filename* **protocol** *protocol* [**key-file** *filename*]

Context

[Tree] (admin>certificate reload)

Full Context

admin certificate reload

Description

This command reloads imported certificate or key file or both at the same time. This command is typically used to update certificate or key file without shutting down **ipsec-tunnel/ipsec-gw/cert-profile/ca-profile**. Note that **type cert** and **type key** is deprecated in a future release. Use **type cert-key-pair** instead. Instead of **type cert** use **type key** instead.

- If the new file exists and valid, then for each tunnel using it:
  - If the key matches the certificate, then the new file is downloaded to the MS-ISA to be used the next time. Tunnels currently up are not affected.
  - If the key does not match the certificate:
    - If **cert** and **key** configuration is used instead of **cert-profile** then the tunnel is brought down.
    - If **cert-profile** is used, then **cert-profile** is brought down. The next authentication fails while the established tunnels are not affected.

If the new file does not exists or somehow invalid (bad format, does not contain right extension, and so on), then this command will abort.

In the case of **type cert-key-pair**, if the new file does not exist or is invalid or **cert** and **key** do not match, then this command aborts with an error message.

Parameters

type

Specifies what item will be reloaded.

cert

Specifies that a certificate cache will be reloaded.

key

Specifies that a key cache will be reloaded.

cert-key-pair

Specifies that a paired certificate and key cache will be reloaded.

filename

Up to 95 characters.

protocol

Specifies which protocol the certificate will be reloaded for.

Values ipsec, tls

Platforms

7705 SAR Gen 2

25.69 remarking

remarking

Syntax

remarking [**force**]

no remarking

Context

[Tree] (config>qos>network>egress remarking)

Full Context

configure qos network egress remarking

Description

This command remarks both customer traffic and egress network IP interface traffic; VPRN customer traffic is not remarked. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy.

Normally, packets that ingress on network ports have either the DSCP or, for MPLS packets, LSP EXP bit set by an upstream router. The packets are placed in the appropriate forwarding class based on the DSCP-to-forwarding class mapping or the LSP EXP-to-forwarding class mapping. The DSCP or LSP EXP bits of such packets are not altered as the packets egress this router, unless **remarking** is enabled.

Remarking can be required if this router is connected to a different DiffServ domain where the DSCP-to-forwarding class mapping is different.

Normally, no remarking is necessary when all router devices are in the same DiffServ domain.

The network QoS policy supports an egress flag that forces remarking of packets that were received on trusted IES and network IP interfaces. This provides the capability of remarking without regard to the ingress state of the IP interface on which a packet was received. The effect of the egress network remark trusted state on each type of ingress IP interface and trust state is listed in Table 82: Ingress IP Interface Type and Trust State Effect on Egress Network Remarking.

The remark trusted state has no effect on packets received on an ingress VPRN IP interface.

Table 82: Ingress IP Interface Type and Trust State Effect on Egress Network Remarking

Ingress IP Interface Type and Trust State	Egress Network IP Interface Trust Remark Disabled (Default)	Egress Network IP Interface Trust Remark Enabled
IES Non-Trusted (Default)	Egress Remarked	Egress Remarked
IES Trusted	Egress Not Remarked	Egress Remarked
VPRN Non-Trusted	Egress Remarked	Egress Remarked

Ingress IP Interface Type and Trust State	Egress Network IP Interface Trust Remark Disabled (Default)	Egress Network IP Interface Trust Remark Enabled
VPRN Trusted (Default)	Egress Not Remarked	Egress Not Remarked
Network Non-Trusted	Egress Remarked	Egress Remarked
Network Trusted (Default)	Egress Not Remarked	Egress Remarked

The **no** form of this command resets the configuration to the default behavior.

Default

no remarking — Remarking disabled in the Network QoS policy.

Parameters

force

Specifies that all IP routed traffic egressing the associated network interface will have its EXP, DSCP, P-bit, and DE bit setting remarked as defined in the associated QoS policy. Only bit fields configured in the QoS policy will be remarked; all others will be left untouched or set based on the default if the fields were not present at ingress.

25.71 remote-age

remote-age

Syntax

remote-age *aging-timer*

no remote-age [*aging-timer*]

Context

[Tree] (config>service>template>vpls-template remote-age)

[Tree] (config>service>vpls remote-age)

Full Context

configure service template vpls-template remote-age

configure service vpls remote-age

Description

This command specifies the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance.

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a service destination point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **remote-age** timer specifies the aging time for remote learned MAC addresses. To reduce the amount of signaling required between switches configure this timer larger than the **local-age** timer.

The **no** form of this command returns the remote aging timer to the default value.

Default

remote-age 900

Parameters

seconds

Specifies the aging time for remote MACs expressed in seconds

Values 60 to 86400

Platforms

7705 SAR Gen 2

25.72 remote-attachment-circuit

remote-attachment-circuit

Syntax

remote-attachment-circuit *ac-name* [**endpoint** *endpoint-name*] [**create**]

no remote-attachment-circuit *ac-name*

Context

[Tree] (config>service>epipe>bgp-evpn remote-attachment-circuit)

Full Context

configure service epipe bgp-evpn remote-attachment-circuit

Description

This command configures the remote attachment circuit.

The **no** form of this command disables the context.

Default

no remote-attachment-circuit

Parameters

ac-name

Specifies the name of the remote attachment circuit, up to 32 characters.

endpoint-name

Specifies the name of the endpoint, up to 32 characters.

create

Keyword used to create the remote AC.

Platforms

7705 SAR Gen 2

no remote-gateway-address

Context

[Tree] (config>router>if>ipsec>ipsec-tunnel remote-gateway-address)

Full Context

configure router interface ipsec ipsec-tunnel remote-gateway-address

Description

This command configures the remote IPsec tunnel endpoint address.

Parameters

ip-address

Specifies a remote unicast IPv4 address, up to 64 characters.

ipv6-address

Specifies a remote unicast global unicast IPv6 address, up to 64 characters.

Platforms

7705 SAR Gen 2

25.74 remote-id

remote-id

Syntax

remote-id hex *hex-string*

remote-id string *ascii-string*

no remote-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident remote-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification remote-id

Description

This command specifies the remote ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP-ID is matched against DHCP option 82.

Note:
This command is used only when **remote-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the remote ID from the configuration.

Parameters

hex-string

Specifies the hexadecimal format for the remote ID.

Values 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

ascii-string

Specifies the string format for the remote ID, up to 255 characters.

Platforms

7705 SAR Gen 2

remote-id

Syntax

remote-id

remote-id mac

remote-id string [*string*]

no remote-id

Context

[Tree] (config>service>vpls>sap>dhcp>option remote-id)

Full Context

configure service ies interface dhcp option remote-id

configure service vprn interface dhcp option remote-id

configure service vpls sap dhcp option remote-id

Description

This command specifies what information goes into the remote-id sub-option in the DHCP relay packet.

If disabled, the **remote-id** sub-option of the DHCP packet is left empty. When the command is configured without any parameters, it equals to the remote-id mac option.

The **no** form of this command reverts to the default.

Parameters

string

Specifies the remote-id, up to 32 characters.

hex-string

Specifies the hex value of this option.

Values 0x0 to 0xFFFFFFFF...(up to 64 hex nibbles)

mac

Specifies that the MAC address of the remote end is encoded in the sub-option.

Platforms

7705 SAR Gen 2

remote-id

Syntax

remote-id [{**mac** | **string** *string*}]

no remote-id

Context

[Tree] (config>router>if>dhcp>option remote-id)

Full Context

configure router interface dhcp option remote-id

Description

When enabled, the router sends the MAC address of the remote end (typically the DHCP client) in the **remote-id** suboption of the DHCP packet. This command identifies the host at the other end of the circuit. If disabled, the **remote-id** suboption of the DHCP packet will be left empty.

The **no** form of this command returns the system to the default.

Default

no remote-id

Parameters

mac

This keyword specifies the MAC address of the remote end is encoded in the suboption.

string

Specifies the remote ID.

Platforms

7705 SAR Gen 2

remote-id

Syntax

remote-id mac

remote-id string <*string*>

no remote-id

Context

[Tree] (config>service>vpls>sap>dhcp6>ldra>options remote-id)

Full Context

configure service vpls sap dhcp6 ldra options remote-id

Description

This command configures the information for the remote ID suboption in the DHCP6 LDRA.

The **no** form of this command reverts to the default.

Default

no remote-id

Parameters

mac

Sets the enterprise number field of the Relay Agent remote ID to 6527 and configures the DHCPv6 client source MAC address as six hexadecimal numbers.

string

Sets the enterprise number field of the Relay-Agent remote ID to 6527 and configures the ASCII-encoded string using up to 32 characters.

Platforms

7705 SAR Gen 2

25.75 remote-ip

remote-ip

Syntax

remote-ip *ip-address*

no remote-ip

Context

[Tree] (config>service>ies>if>sap>ip-tunnel remote-ip)

Full Context

configure service ies interface sap ip-tunnel remote-ip

Description

This command configures the primary destination IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the remote-ip address contains an IPv6 address it must be a global unicast address.

Default

no remote-ip

Parameters

ip-address

An IPv4 address or an IPv6 address.

Platforms

7705 SAR Gen 2

remote-ip

Syntax

remote-ip *ip-address*

no remote-ip

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel remote-ip)

Full Context

configure service vprn interface sap ip-tunnel remote-ip

Description

This command sets the primary destination IPv4 address of GRE encapsulated packets associated with a particular GRE tunnel. If this address is reachable in the delivery service (there is a route) then this is the destination IPv4 address of GRE encapsulated packets sent by the delivery service.

The **no** form of this command deletes the destination address from the GRE tunnel configuration.

Parameters

ip-address

Specifies the destination IPv4 address of the GRE tunnel.

Values 1.0.0.0 to 223.255.255.255

Platforms

7705 SAR Gen 2

remote-ip

Syntax

remote-ip {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

Context

[Tree] (config>router>ipsec>sec-plcy>entry remote-ip)

[Tree] (config>service>vprn>ipsec>sec-plcy>entry remote-ip)

Full Context

configure router ipsec security-policy entry remote-ip

configure service vprn ipsec security-policy entry remote-ip

Description

This command configures the remote (from the tunnel) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

Parameters

ip-prefix

Specifies the destination address of the aggregate route in dotted decimal notation.

Values a.b.c.d (host bits must be 0)

prefix-length 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation.

any

keyword to specify that it can be any address.

remote-lfa

Syntax

remote-lfa [**max-pq-cost** *value*]

no remote-lfa

Context

[Tree] (config>router>isis>loopfree-alternates remote-lfa)

Full Context

configure router isis loopfree-alternates remote-lfa

Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

Default

no remote-lfa

Parameters

value

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

Values 0 to 4294967295

Default 4261412864

Platforms

7705 SAR Gen 2

remote-lfa

Syntax

remote-lfa [**max-pq-cost** *value*]

no remote-lfa

Context

[Tree] (config>router>ospf>loopfree-alternates remote-lfa)

Full Context

configure router ospf loopfree-alternates remote-lfa

Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

Default

no remote-lfa

Parameters

max-pq-cost value

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

Values 0 to 4294967295

Default 4261412864

7705 SAR Gen 2

25.79 remote-proxy-arp

remote-proxy-arp

Syntax

[**no**] **remote-proxy-arp**

Context

[Tree] (config>service>vprn>if remote-proxy-arp)

[Tree] (config>service>ies>if remote-proxy-arp)

Full Context

configure service vprn interface remote-proxy-arp

configure service ies interface remote-proxy-arp

Description

This command enables remote proxy ARP on the interface.

Remote proxy ARP is similar to proxy ARP. It allows the router to answer an ARP request on an interface for a subnet that is not provisioned on that interface. This allows the router to forward to the other subnet on behalf of the requester. To distinguish remote proxy ARP from local proxy ARP, local proxy ARP performs a similar function but only when the requested IP is on the receiving interface.

The **no** form of this command reverts to the default.

Platforms

7705 SAR Gen 2

remote-proxy-arp

25.81 remote-source

remote-source

Syntax

[**no**] **remote-source**

Context

[Tree] (config>mirror>mirror-dest remote-source)

Full Context

configure mirror mirror-dest remote-source

Description

This command is used on a destination router in a remote mirroring solution. The mirroring (packet copy) is performed on the source router and sent via an SDP to the destination router. Remote mirroring requires remote source configuration on the destination router.

Remote mirroring allows a destination router to terminate SDPs from multiple remote source routers. This allows consolidation of packet sniffers or analyzers at a single or small set of points in a network (for example, a sniffer or analyze farm, or lawful interception gateway).

A **remote-source** entry must be configured on the destination router for each source router from which mirrored traffic is being sent via SDPs.

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The emote source configuration is not applicable when routable LI encapsulation is being used on the mirror source router. The remote source configuration is only used when a source router is sending mirrored traffic to a destination router via SDPs.

Two types of remote-source entries can be configured:

- far end
- spoke SDP

Certain remote source types are applicable with certain SDP types. For descriptions of the command usage in the **mirror-dest** context, see the **far-end** and **spoke-sdp** commands.

The **no** form of this command removes all remote-source entries.

25.82 remote-v6-ip

remote-v6-ip

Syntax

remote-v6-ip any

remote-v6-ip *ipv6-prefix/prefix-length*

no remote-v6-ip

Context

[Tree] (config>service>vprn>ipsec>sec-plcy>entry remote-v6-ip)

[Tree] (config>router>ipsec>sec-plcy>entry remote-v6-ip)

Full Context

configure service vprn ipsec security-policy entry remote-v6-ip

configure router ipsec security-policy entry remote-v6-ip

Description

This command specifies the remote v6 prefix for the security-policy entry.

Parameters

ipv6-prefix/prefix-length

Specifies the local v6 prefix and length.

Values	ipv6-address/prefix: ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
		host bits must be 0
		:: not allowed
		prefix-length [1 to 28]

any

A keyword to specify that any address can be used.

Platforms

7705 SAR Gen 2

25.83 remote-ve-name

remote-ve-name

Syntax

[**no**] **remote-ve-name** *name*

Context

[Tree] (config>service>epipe>bgp-vpws remote-ve-name)

Full Context

configure service epipe bgp-vpws remote-ve-name

Description

This command creates or edits a remote-ve-name. A single remote-ve-name can be created per BGP VPWS instance if the service is single-homed or uses a single pseudowire to connect to a pair of dual-homed systems. When the service requires active/standby pseudowires to be created to remote dual-homed systems then two remote-ve-names must be configured.

This context defines the remote PE to which a pseudowire will be signaled.

remote-ve-name commands can be added even if bgp-vpws is not shutdown.

The **no** form of this command removes the configured remote-ve-name from the bgp vpws node. It can be used when the BGP VPWS status is either shutdown or "no shutdown”.

Parameters

name

Specifies a site name up to 32 characters in length.

Platforms

7705 SAR Gen 2

25.84 remove

remove

Syntax

[**no**] **remove**

Context

[Tree] (config>service>vprn>bgp>attribute-set remove)

Full Context

configure service vprn bgp attribute-set remove

Description

This command configures BGP to ignore and silently discard ATTR_SETs in BGP routes received from PE-CE peers of the VPRN. The discarded ATTR_SETs do not affect BGP best-path selection in the VPRN, and they do not appear in the VPN-IP routes that result from the VRF export of the BGP routes. Nokia recommends enabling this command in most deployments.

The **no** form of this command configures BGP to ignore ATTR_SETs in BGP routes received from PE-CE peers of the VPRN without discarding them. This allows the ATTR_SETs to propagate between CE devices connected to the VPRN and to other PE devices when the BGP routes are exported as VPN-IP routes.

Note: If the configuration of this command is changed, ROUTE_REFRESH messages are sent to all PE-CE peers of the VPRN.

Default

no remove

[Tree] (config>service>vprn>bgp remove-private)

Full Context

configure service vprn bgp group remove-private

configure service vprn bgp group neighbor remove-private

configure service vprn bgp remove-private

Description

When this command is configured private AS numbers are removed or replaced when they are found inside the AS path of BGP routes advertised to peers within the scope of the command.

The set of AS numbers that are defined by IANA as private are in the range of 64512 to 65534, and 4200000000 to 4294967294, inclusive. In SR OS, this command also removes ASN 65535 and ASN 4294967295, which are reserved values.

The **no** form of this command (at the BGP instance level) implements the default behavior, private AS numbers are allowed without restriction or modification in routes advertised to peers.

Default

no remove-private

Parameters

limited

This keyword instructs BGP to process private ASNs only up to the first public ASN encountered. Private ASNs beyond that first public AS will not be stripped or replaced.

skip-peer-as

This keyword instructs BGP to not strip or replace a private ASN from the AS-Path if that ASN is the same as the BGP peer AS number.

replace

When this keyword is configured, private ASNs are not stripped. Each occurrence is replaced by the ASN of the advertising BGP router (the ASN the router advertised to its peer in its OPEN message). When the **replace** keyword is not configured, private ASNs are stripped, subject to influence by the other keyword options. This generally results in a shortening of AS_PATH length.

Platforms

7705 SAR Gen 2

25.86 renew

renew

Syntax

renew est-profile *name* **cert** *cert-filename* **key** *key-filename* [**hash-alg** *hash-algorithm*] **output** *output-cert-filename* [**validate-cert-chain**] [**force**]

Context

[Tree] (admin>certificate>est renew)

Full Context

admin certificate est renew

Description

This command renews an imported certificate (specified by the **cert** *cert-filename*) with a Certificate Authority (CA) using the EST protocol specified by the **est-profile** name, with an imported private key specified the key parameter. The key can be either the key of the certificate to be renewed or a new key.

The authentication between system and EST server is specified by the est-profile.

The **hash-alg** *hash-alorithm* parameter is used to generate the CSR (Certificate Signing Request) in the EST request message.

Parameters

name

Specifies EST profile name, up to 32 characters

cert-filename

Specifies the certificate file name, up to 95 characters

key-filename

Specifies the file name of a key, up to 95 characters

hash-algorithm

Specifies the hash algorithm to be used in a certificate request.

Values sha1, sha224, sha256, sha384, sha512

output-cert-filename

Specifies the output cert file name, up to 200 characters

validate-cert-chain

Specifies that the the system validates the certificate chain of the result certificate before importing it

force

Specifies the system to overwrite the existing file with same **output** *output-cert-filename*

Platforms

7705 SAR Gen 2

25.87 renew-timer

renew-timer

Syntax

renew-timer [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no renew-timer

Context

[Tree] (config>router>dhcp6>server>pool>prefix renew-timer)

[Tree] (config>service>vprn>dhcp6>server>pool>prefix renew-timer)

Full Context

configure router dhcp6 local-dhcp-server pool prefix renew-timer

configure service vprn dhcp6 local-dhcp-server pool prefix renew-timer

Description

This command configures the lease renew time (T1) via LUDB.

The T1 is the time at which the client contacts the addressing authority to extend the lifetimes of the DHCPv6 leases (addresses or prefixes). T1 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses in the IA that the addressing authority is willing to extend, respectively.

The configured renew timer should always be smaller than or equal to the rebind timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

Default

renew-timer min 30

Parameters

renew-timer

Specifies the preferred lifetime.

Values	**days** *days*	0 to 7
	hrs *hours*	0 to 23
	min *minutes*	0 to 59
	sec *seconds*	0 to 59

Platforms

7705 SAR Gen 2

configure qos sap-ingress mac-criteria renum

configure qos sap-egress ip-criteria renum

configure qos sap-egress ipv6-criteria renum

configure qos sap-ingress ip-criteria renum

Description

This command renumbers existing QoS policy criteria entries to properly sequence policy entries.

This can be required in some cases since the router exits when the first match is found and executes the actions in accordance with the accompanying action command. This requires that entries be sequenced correctly from most to least explicit.

Parameters

old-entry-id

Enter the entry number of an existing entry.

Values 1 to 65535

new-entry-id

Enter the new entry number to be assigned to the old entry.

Values 1 to 65535

Platforms

7705 SAR Gen 2

renum

Syntax

Full Context

configure system security management-access-filter ipv6-filter renum

configure system security management-access-filter mac-filter renum

configure system security management-access-filter ip-filter renum

Description

This command renumbers existing management access filter entries for an IP(v4), IPv6, or MAC filter to re-sequence filter entries.

The exits on the first match found and executes the actions in accordance with the accompanying **action** command. This may require some entries to be re-numbered differently from most to least explicit.

Parameters

old-entry-number

Specifies the entry number of the existing entry.

Values 1 to 9999

new-entry-number

Specifies the new entry number that will replace the old entry number.

Values 1 to 9999

Platforms

7705 SAR Gen 2

renum

Syntax

renum *old-entry-number new-entry-number*

Context

[Tree] (config>system>security>profile renum)

Full Context

configure system security profile renum

Description

This command renumbers profile entries to re-sequence the entries.

Since the OS exits when the first match is found and executes the actions according to accompanying action command, re-numbering is useful to rearrange the entries from most explicit to least explicit.

Parameters

old-entry-number

Enter the entry number of an existing entry.

Values 1 **to** 9999

new-entry-number

Enter the new entry number.

Values 1 **to** 9999

26 r Commands – Part II

26.1 renumber

renumber

Syntax

renumber from *entry-id* **to** *entry-id*

Context

[Tree] (config>router>policy-options>policy-statement renumber)

Full Context

configure router policy-options policy-statement renumber

Description

This command allows the operator to renumber the existing entry ID to a new entry ID. When performing the renumbering action, the two entry IDs must be different. The existing (**from**) *entry-id* must exist. The new (**to**) *entry-id* must not exist.

Renumbering is not saved in the configuration because it is a performing action.

Parameters

from *entry-id*

Specifies the existing entry ID to be renumbered.

Values 1 to 4294967295

to *entry-id*

Specifies the new entry ID to be assigned.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

26.2 repair

repair

Syntax

repair [*cflash-id*]

Context

[Tree] (file repair)

Full Context

file repair

Description

This command checks a compact flash device for errors and repairs any errors found.

Parameters

cflash-id

Specifies the compact flash slot ID to be repaired. When a specific *cflash-id* is specified, that drive is repaired. If no *flash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

26.3 repeated-characters

repeated-characters

Syntax

repeated-characters *count*

no repeated-characters

Context

[Tree] (config>system>security>password>complexity-rules repeated-characters)

Full Context

configure system security password complexity-rules repeated-characters

Description

The number of times a characters can be repeated consecutively.

The **no** form of this command resets to default.

Default

no repeated-characters

Parameters

count

Specifies the minimum count of consecutively repeated characters.

Values 2 to 8

Platforms

7705 SAR Gen 2

26.4 replace

replace

Syntax

replace [*line*]

Context

[Tree] (candidate replace)

Full Context

candidate replace

Description

This command displays the specified line (a single line only) and allows it to be changed.

Parameters

line

Indicates which line to replace starting at the point indicated by the following options.

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

Platforms

7705 SAR Gen 2

26.5 replay-protection

replay-protection

Syntax

[**no**] **replay-protection**

Context

[Tree] (config>macsec>connectivity-association replay-protection)

Full Context

configure macsec connectivity-association replay-protection

Description

Specifies the size of the replay protection window.

This command must be configured to force packet discard when it has detected a packet that is not within the replay-window-size.

When replay protection is enabled, the sequence of the ID number of the received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay window size, the packet is counted by the receiving port and then discarded. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is counted and discarded because it falls outside the parameters of the replay window size.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

Default

no replay-protection

Platforms

7705 SAR Gen 2

26.6 replay-window

replay-window

Syntax

replay-window *replay-window-size*

no replay-window

configure service ies interface ipsec ipsec-tunnel replay-window

configure service vprn interface sap ipsec-tunnel replay-window

configure ipsec tunnel-template replay-window

configure service vprn interface ipsec ipsec-tunnel replay-window

Description

This command specifies the size of the anti-replay window. The anti-replay window protocol further secures IPsec against an entity that can inject a recorded message in a message stream from a source to a destination computer on the Internet.

Default

no replay-window

Parameters

replay-window-size

Specifies the size of the SA anti-replay window.

Values 32, 64, 128, 256, 512

Platforms

7705 SAR Gen 2

26.7 replay-window-size

replay-window-size

Syntax

replay-window-size *number-of-packet*s

no replay-window-size

Context

[Tree] (config>macsec>connectivity-association replay-window-size)

Full Context

configure macsec connectivity-association replay-window-size

Description

This command specifies the size of the replay protection window.

This command must be configured to enable replay protection. When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving port. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

When the *number-of-packets* variable is set to 0, all packets that arrive out-of-order are dropped.

The **no** form of this command reverts to the default value.

Default

replay-window-size 0

Parameters

number-of-packets

Specifies the window for which the packets can arrive out of order.

Values 0 to 4294967294

Platforms

7705 SAR Gen 2

26.8 report-alarm

report-alarm

Syntax

[**no**] **report-alarm** [**signal-fail**] [**remote**] [**local**] [**no-frame-lock**] [**high-ber**] [**no-block-lock**] [**no-am-lock**] [**duplicate-lane**]

Context

[Tree] (config>port>ethernet report-alarm)

Full Context

configure port ethernet report-alarm

Description

This command specifies when and if to generate alarms and alarm clear notifications for this port.

Note:
For some DWDM transceivers, if the **configure port dwdm coherent rx-los-reaction squelch** command is disabled the signal-fail and no-am-lock alarm conditions are not reported when the media side of the transceiver has an RX LOS condition.

Parameters

signal-fail

Reports an Ethernet signal lost alarm.

remote

Reports remote faults.

local

Reports local faults.

no-frame-lock

Reports a 'not locked on the Ethernet framing sequence' alarm.

high-ber

Reports High Bit Error Rate.

no-block-lock

Reports 40G/100G PCS Lanes Not Block Locked.

no-am-lock

Reports 40G/100G PCS Alignment Marker Loss of Lock.

duplicate-lane

Reports 40G/100G PCS Duplicate Lane Marker.

Platforms

7705 SAR Gen 2

26.9 report-alarms

report-alarms

[**no**] **report-alarms** [**modflt**] [**mod**] [**netrx**] [**nettx**] [**hosttx**]

Context

[Tree] (config>port>dwdm>coherent report-alarms)

Full Context

configure port dwdm coherent report-alarms

Description

This command configures the alarms that will be reported for the coherent module.

Default

modflt mod netrx nettx hosttx

Parameters

modflt

Reports module fault alarm.

mod

Reports module alarm.

netrx

Reports network (optical side) receive alarm.

nettx

Reports network (optical side) transmit alarm.

hosttx

Reports host (electrical side) transmit alarm.

Platforms

7705 SAR Gen 2

26.10 report-path-constraints

report-path-constraints

Syntax

report-path-constraints

no report-path-constraints

Context

[Tree] (config>router>pcep>pcc report-path-constraints)

Full Context

configure router pcep pcc report-path-constraints

Description

This command enables the inclusion of LSP path constraints in the PCE report messages sent from the PCC to a PCE.

In order for the PCE to know about the original constraints for an LSP which is delegated, but for which there is no prior state in its LSP database, such as if no PCReq message was sent for the same PLSP-ID, the following proprietary behavior is observed:

- PCC appends a duplicate of each of the LSPA, METRIC, and BANDWIDTH objects in the PCRpt message. The only difference between two objects of the same type is that the P-flag is set in the common header of the duplicate object to indicate that it is a mandatory object for processing by PCE.
- The value of the metric or bandwidth in the duplicate object contains the original constraint value, while the first object contains the operational value. This is applicable to hop metrics in the METRIC and BANDWIDTH objects only. The SR OS PCC does not support configuring a boundary on the path computation IGP or TE metrics.
- The path computation on the PCE must use the first set of objects when updating a path if the PCRpt contained a single set. If the PCRpt contained a duplicate set, PCE path computation must use the constraints in the duplicate set.

The **no** form of the command disables the above behavior in case of interoperability issues with third-party PCE implementations.

Default

report-path-constraints

Platforms

7705 SAR Gen 2

26.11 report-src-ip

report-src-ip

Syntax

report-src-ip *ip-address*

no report-src-ip

Context

[Tree] (config>service>vpls>igmp-snooping report-src-ip)

Full Context

configure service vpls igmp-snooping report-src-ip

Description

This command configures the source IPv4 address used when generating IGMP reports. According the IGMPv3 standard, a zero source address is allowed in sending IGMP reports. However, for interoperability with some multicast routers, the source IP address of IGMP group reports can be configured using this command.

Default

report-src-ip 0.0.0.0

Parameters

ip-address

Specifies the source IPv4 address in transmitted IGMP reports.

Values a.b.c.d

Platforms

7705 SAR Gen 2

report-src-ip

Syntax

report-src-ip *ipv6-address*

no report-src-ip

Context

[Tree] (config>service>vpls>mld-snooping report-src-ip)

Full Context

configure service vpls mld-snooping report-src-ip

Description

This command configures the source IPv6 address used when generating MLD reports. A zero source address is allowed in sending MLD reports. However, for interoperability with some multicast routers, the source IP address of MLD reports can be configured using this command.

Default

report-src-ip 0:0:0:0:0:0:0:0

Parameters

ipv6-address

Specifies the source IPv6 address in transmitted MLD reports.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

Platforms

7705 SAR Gen 2

request-timer

Syntax

request-timer *timer1* **retry-timer** *timer2* **timeout-multiplier** *multiplier*

no request-timer

Context

[Tree] (config>service>epipe>spoke-sdp>control-channel-status request-timer)

[Tree] (config>service>vpls>spoke-sdp>control-channel-status request-timer)

Full Context

configure service epipe spoke-sdp control-channel-status request-timer

configure service vpls spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command cannot be used with a non-zero refresh-timer value.

Parameters

timer1

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

Values 10 to 65535

timer2

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

Values 0, 3 to 60

multiplier

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

Values 3 to 20

Platforms

7705 SAR Gen 2

request-timer

Syntax

request-timer *request-timer-secs* **retry-timer** *retry-timer-secs* **timeout-multiplier** *multiplier*

no request-timer

Context

[Tree] (config>service>vpls>spoke-sdp>control-channel-status request-timer)

Full Context

configure service vpls spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478, *Pseudowire Status for Static Pseudowires*. This command cannot be used with a non-zero refresh-timer value.

Parameters

request-timer-secs

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

Values 10 to 65535

retry-timer-secs

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

Values 0, 3 to 60

multiplier

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

Values 3 to 20

Platforms

7705 SAR Gen 2

no request-timer

Context

[Tree] (config>service>ies>if>spoke-sdp>control-channel-status request-timer)

Full Context

configure service ies interface spoke-sdp control-channel-status request-timer

Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command is mutually exclusive with a non-zero refresh-timer value.

Parameters

timer1

Specifies the interval at which pseudowire status messages, including a reliable delivery TLV, with the "request" bit set, are sent.

Values 10 to 65535 seconds

retry-timer *timer2*

Specifies the timeout interval if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

Values 0, 3 to 60 seconds

timeout-multiplier *multiplier*

If a requesting node does not receive a valid response to a pseudowire status request within this multiplier times the retry timer, then it will assume the pseudowire is down. This parameter is optional.

Values 3 to 20 seconds

Platforms

7705 SAR Gen 2

configure system security password complexity-rules required

Description

Force the minimum number of different character classes required.

The **no** form of this command resets to default.

Default

required lowercase 0 uppercase 0 numeric 0 special-character 0

Parameters

count

Specifies the minimum count of characters classes.

Values 0 to 10

Platforms

7705 SAR Gen 2

26.16 rescue-location

rescue-location

Syntax

rescue-location *file-url*

no rescue-location

Context

[Tree] (config>system>rollback rescue-location)

Full Context

configure system rollback rescue-location

Description

The location and filename of the rescue configuration is configurable to be local (on compact flash) or remote. The suffix .rc will be automatically appended to the filename when a rescue configuration file is saved. Trivial FTP (TFTP) is not supported for remote locations.

Default

no rescue location

Parameters

file-url

Specifies the URL or filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:
rescue filename	suffixed with .rc during the rescue file creation

26.17 reserved-label-block

reserved-label-block

Syntax

[**no**] **reserved-label-block** *name*

Context

[Tree] (config>router>mpls-labels reserved-label-block)

Full Context

configure router mpls-labels reserved-label-block

Description

Commands in this context configure a block of labels from the dynamic range to be locally assigned for specific applications, such as Segment Routing adjacency SIDs. The reserved label block is not advertised by the IGP.

The **no** form of this command removes a reserved label block.

Parameters

name

Specifies the name of the reserved label block, up to 64 characters

Platforms

7705 SAR Gen 2

reserved-label-block

Syntax

reserved-label-block *name*

no reserved-label-block

Context

[Tree] (config>router>mpls>fwd-policies reserved-label-block)

Full Context

configure router mpls forwarding-policies reserved-label-block

Description

This command specifies the reserved label block to use for all MPLS forwarding policies. The named reserved label block must already have been configured under **config**>**router**>**mpls-labels**.

The **no** form of the command removes the assignment of the reserved label block.

Parameters

name

Specifies the name of the reserved label block, up to 64 characters.

Platforms

7705 SAR Gen 2

reserved-label-block

Syntax

reserved-label-block *name*

no reserved-label-block

Context

[Tree] (config>router>segment-routing>sr-policies reserved-label-block)

Full Context

configure router segment-routing sr-policies reserved-label-block

Description

This command associates a reserved label block with segment routing policies. The *name* must already exist. Reserved label blocks are configured under the **config**>**router**>**mpls-labels** hierarchy.

A locally-targeted segment routing policy (statically configured or BGP signaled) cannot be activated if its binding SID (BSID) is not an available label between the start-label and end-label of the referenced reserved label block.

The **no** form of this command removes any association of segment routing policies with a reserved label block.

Default

no reserved-label-block

Parameters

name

Specifies the name of a **reserved-label-block** that has already been configured, up to 64 characters.

7705 SAR Gen 2

26.18 reset-policy-exclusive

reset-policy-exclusive

Syntax

reset-policy-exclusive

Context

[Tree] (admin reset-policy-exclusive)

Full Context

admin reset-policy-exclusive

Description

This command allows an authorized administrator to reset the exclusive policy editing lock. This will reset the lock flag and end the policy editing session in progress, discarding any policy edits.

Platforms

7705 SAR Gen 2

26.19 reset-query

reset-query

Syntax

[**no**] **reset-query**

Context

[Tree] (debug>router>rpki-session>packet reset-query)

Full Context

debug router rpki-session packet reset-query

Description

This command enables debugging for reset query RPKI packets.

The **no** form of this command disables debugging for reset query RPKI packets.

Platforms

7705 SAR Gen 2

26.20 resignal-on-igp-event

resignal-on-igp-event

Syntax

[**no**] **resignal-on-igp-event**

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-on-igp-event)

Full Context

configure router mpls sr-te-resignal resignal-on-igp-event

Description

This command enables the ad hoc reoptimzation of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of SR-TE LSPs.

Default

no resignal-on-igp-event

Platforms

7705 SAR Gen 2

resignal-on-igp-event

Syntax

[**no**] **resignal-on-igp-event**

Context

[Tree] (config>router>mpls resignal-on-igp-event)

Full Context

configure router mpls resignal-on-igp-event

Description

This command enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

The **no** form of this command disables ad hoc reoptimization of the active RSVP-TE LSPs.

Default

no resignal-on-igp-event

Platforms

7705 SAR Gen 2

26.21 resignal-on-igp-overload

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

Context

[Tree] (config>router>mpls resignal-on-igp-overload)

Full Context

configure router mpls resignal-on-igp-overload

Description

This command enables the resignaling of all RSVP-TE LSPs at the receipt of the IS-IS overload bit in the TE-DB.

Once the re-optimization is triggered, the behavior is the same as the timer-based resignal or the **delay** option of the manual-based resignal. MPLS forces the expiry of the resignal timer and requests the TE-DB to compute a new CSPF for each RSVP-TE LSP active path.

This re-optimization effectively causes the immediate move of transit RSVP-TE LSP paths away from the IS-IS node in overload.

By default, MPLS re-optimizes, using the MBB procedure, the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based resignal is performed for the LSP paths. MPLS does not act immediately on the receipt of the IS-IS overload bit.

Note:
This command and the **retry-on-overload** command are mutually exclusive.

The **no** form of this command results in the MPLS not acting immediately to the request of the IS-IS overload bit.

Default

no resignal-on-overload

Platforms

7705 SAR Gen 2

resignal-on-igp-overload

Syntax

[**no**] **resignal-on-igp-overload**

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-on-igp-overload)

Full Context

configure router mpls sr-te-resignal resignal-on-igp-overload

Description

This command enables the ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the following command to configure the resignal timer for the SR-TE application.

```
configure router mpls sr-te-resignal resignal-timer
```

The **no** form of this command configures MPLS to not act immediately on an IS-IS overload bit from a remote router. MPLS will act on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

Default

no resignal-on-igp-overload

Platforms

7705 SAR Gen 2

26.22 resignal-timer

resignal-timer

Syntax

resignal-timer *minutes*

no resignal-timer

Context

[Tree] (config>router>mpls resignal-timer)

Full Context

configure router mpls resignal-timer

Description

This command specifies the value for the LSP resignal timer. The resignal timer is the time, in minutes, the software waits before attempting to resignal the LSPs.

When the resignal timer expires, if the new computed path for an LSP has a better metric than the current recorded hop list, an attempt is made to resignal that LSP using the make-before-break mechanism. If the attempt to resignal an LSP fails, the LSP continues to use the existing path and a resignal will be attempted the next time the timer expires.

The **no** form of this command disables timer-based LSP resignaling.

Default

no resignal-timer

Parameters

minutes

Specifies the time the software waits before attempting to resignal the LSPs.

Values 30 to 10080

Platforms

7705 SAR Gen 2

resignal-timer

Syntax

resignal-timer *minutes*

no resignal-timer

Context

[Tree] (config>router>mpls>sr-te-resignal resignal-timer)

Full Context

configure router mpls sr-te-resignal resignal-timer

Description

This command specifies the value for the SR-TE LSP resignal timer when the path computation method is set to the local CSPF or the PCE.

The resignal timer is the time, in minutes, MPLS waits before attempting to re-optimize all paths of all SR-TE LSPs. The re-optimization is performed by the local CSPF or the PCE, depending on the value of the parameter **path-computation-method**.

When local CSPF is used and the resignal timer expires, MPLS provides the current path of the SR-TE LSP and TE-DB updates the total IGP or TE metric of the current path and checks the validity of the hops and labels. CSPF then computes a new path for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or

more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

The **no** form of this command disables timer-based LSP resignaling.

Default

no resignal-timer

Parameters

minutes

Specifies the time, in minutes, the software waits before attempting to resignal the SR-TE LSPs.

Values 30 to 10080

Platforms

7705 SAR Gen 2

Description

Commands in this context configure the subset of tunnel types which can be used in the resolution of the IP prefix or SR tunnel family using IGP shortcuts.

Parameters

rsvp

Selects the RSVP-TE tunnel type.

sr-te

Selects the SR-TE tunnel type.

Platforms

7705 SAR Gen 2

resolution-filter

Syntax

resolution-filter

Context

[Tree] (config>router>ospf3>igp-shortcut>tunnel-next-hop>family resolution-filter)

[Tree] (config>router>ospf>igp-shortcut>tunnel-next-hop>family resolution-filter)

Full Context

configure router ospf3 igp-shortcut tunnel-next-hop family resolution-filter

configure router ospf igp-shortcut tunnel-next-hop family resolution-filter

Description

Commands in this context configure the subset of tunnel types that can be used in the resolution of the IP prefix or SR tunnel family using IGP shortcuts.

Platforms

7705 SAR Gen 2

resolution-filter

Syntax

resolution-filter

Context

[Tree] (config>service>vprn>auto-bind-tunnel resolution-filter)

Full Context

configure service vprn auto-bind-tunnel resolution-filter

Description

Note: This command is no longer supported and will be removed in a future release.

Platforms

7705 SAR Gen 2

26.25 resolve

resolve

Syntax

resolve *minutes*

Context

[Tree] (config>service>vpls>proxy-arp>dynamic resolve)

[Tree] (config>service>vpls>proxy-nd>dynamic resolve)

Full Context

configure service vpls proxy-arp dynamic resolve

configure service vpls proxy-nd dynamic resolve

Description

This command configures the frequency at which a resolve message is sent. The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service irrespective of the current status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands.

Default

resolve 5

Parameters

minutes

Specifies the frequency in minutes at which the **resolve** message is issued.

Values 1 to 60

Default 5

Platforms

7705 SAR Gen 2

26.26 resolve-static

resolve-static

Syntax

[**no**] **resolve-static**

Context

[Tree] (config>router>policy-options>policy-statement>entry>action resolve-static)

[Tree] (config>router>policy-options>policy-statement>default-action resolve-static)

Full Context

configure router policy-options policy-statement entry action resolve-static

configure router policy-options policy-statement default-action resolve-static

Description

This command has an affect only in BGP route-table-import policies and applies only to BGP IPv4 and IPv6 routes created by importing static routes with indirect next-hops. When such a route matches a policy entry with this action, the BGP next-hop is the resolved next-hop of the static route.

The **no** form of this command reverts to the default behavior, which copies the indirect next-hop of the static route into the BGP next-hop without resolving it further.

Default

no resolve-static

Platforms

7705 SAR Gen 2

26.27 resolve-v6-prefix-over-shortcut

resolve-v6-prefix-over-shortcut

Syntax

[**no**] **resolve-v6-prefix-over-shortcut**

Context

[Tree] (config>router>ldp>targ-session resolve-v6-prefix-over-shortcut)

Full Context

configure router ldp targeted-session resolve-v6-prefix-over-shortcut

Description

This command allows an IPv6 prefix FEC to be resolved over an IGP shortcut.

The **no** form of this command disables the resolution.

Platforms

7705 SAR Gen 2

26.28 responder-url

responder-url

Syntax

responder-url *url-string*

no responder-url

Context

[Tree] (config>system>security>pki>ca-profile>ocsp responder-url)

Full Context

configure system security pki ca-profile ocsp responder-url

Description

This command specifies HTTP URL of the OCSP responder for the CA, this URL will only be used if there is no OCSP responder defined in the AIA extension of the certificate to be verified.

Default

no responder-url

Parameters

url-string

Specifies the HTTP URL of the OCSP responder

Platforms

7705 SAR Gen 2

26.29 response-signing-cert

response-signing-cert

Syntax

response-signing-cert *filename*

no response-signing-cert

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 response-signing-cert)

Full Context

configure system security pki ca-profile cmpv2 response-signing-cert

Description

This command specifies a imported certificate that is used to verify the CMP response message if they are protected by signature. If this command is not configured, CA's certificate is used.

Default

no response-signing-cert

Parameters

filename

Specifies the filename of the imported certificate.

Platforms

7705 SAR Gen 2

26.30 restart-time

restart-time

Syntax

restart-time *seconds*

no restart-time

Context

[Tree] (config>service>vprn>bgp>group>graceful-restart restart-time)

[Tree] (config>service>vprn>bgp>graceful-restart restart-time)

[Tree] (config>service>vprn>bgp>group>neighbor>graceful-restart restart-time)

Full Context

configure service vprn bgp group graceful-restart restart-time

configure service vprn bgp graceful-restart restart-time

configure service vprn bgp group neighbor graceful-restart restart-time

Description

This command sets the value of the restart-time that is advertised in the router's graceful-restart capability. If this command is not configured, the default is 300.

Default

no restart-time

Parameters

seconds

Specifies the restart-time that is advertised in the router's graceful-restart capability.

Values 0 to 4095 seconds

Default 300

Platforms

7705 SAR Gen 2

restart-time

Syntax

restart-time *seconds*

no restart-time

Context

[Tree] (config>router>bgp>group>graceful-restart restart-time)

[Tree] (config>router>bgp>group>neighbor>graceful-restart restart-time)

[Tree] (config>router>bgp>graceful-restart restart-time)

Full Context

configure router bgp group graceful-restart restart-time

configure router bgp group neighbor graceful-restart restart-time

configure router bgp graceful-restart restart-time

Description

This command sets the value of the restart-time that is advertised in the router's graceful-restart capability. If this command is not configured, the default is 300.

Default

no restart time

Parameters

seconds

Specifies the restart-time that is advertised in the router's graceful-restart capability.

Values 0 to 4095 seconds

Default config>router>bgp>graceful-restart: 120 seconds

config>router>bgp>group>graceful-restart: 300 seconds

config>router>bgp>group>neighbor>graceful-restart: 300 seconds

26.31 restrict-non-configured-ip-address

restrict-non-configured-ip-address

Syntax

restrict-non-configured-ip-address [**sponge-mac** *mac-address*]

no restrict-non-configured-ip-address

Context

[Tree] (config>service>vpls>proxy-arp restrict-non-configured-ip-address)

[Tree] (config>service>vpls>proxy-nd restrict-non-configured-ip-address)

Full Context

configure service vpls proxy-arp restrict-non-configured-ip-address

configure service vpls proxy-nd restrict-non-configured-ip-address

Description

This command configures whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP addresses are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP requests or neighbor solicitations (NS) coming from a unauthorized sender IP addresses are not replied to, unless the **sponge-mac** option is configured.

The **no** form of this command does not drop ARP or ND packets coming from a unauthorized sender IP addresses.

Parameters

sponge-mac

Keyword to specify that ARP requests or NSs from an unauthorized IP address are not learned in the proxy ARP or ND table and ARP requests or NSs from an unauthorized IP address are replied with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and dropped.

mac-address

Specifies the MAC address.

The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7705 SAR Gen 2

26.32 restrict-protected-src

restrict-protected-src

Syntax

restrict-protected-src discard-frame

restrict-protected-src [**alarm-only**]

no restrict-protected-src

Context

[Tree] (config>service>pw-template>split-horizon-group restrict-protected-src)

[Tree] (config>service>pw-template restrict-protected-src)

[Tree] (config>service>vpls>mesh-sdp restrict-protected-src)

[Tree] (config>service>vpls>spoke-sdp restrict-protected-src)

[Tree] (config>service>vpls>split-horizon-group restrict-protected-src)

[Tree] (config>service>vpls>sap restrict-protected-src)

[Tree] (config>service>vpls>endpoint restrict-protected-src)

Full Context

configure service pw-template split-horizon-group restrict-protected-src

configure service pw-template restrict-protected-src

configure service vpls mesh-sdp restrict-protected-src

configure service vpls spoke-sdp restrict-protected-src

configure service vpls split-horizon-group restrict-protected-src

configure service vpls sap restrict-protected-src

configure service vpls endpoint restrict-protected-src

Description

This command indicates how the agent will handle relearn requests for protected MAC addresses, either manually added using the mac-protect command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP is set operationally down. The SAP, spoke SDP or mesh SDP must be shut down and enabled (**no shutdown**) for this state to be cleared.
- **alarm-only** — The packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP or mesh SDP.

- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a given VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with either the **alarm-only** or **discard-frame** parameters, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a given VPLS.

The **no** form of the command reverts to the default.

Default

no restrict-protected-src

Parameters

alarm-only

Specifies that the packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP, or mesh SDP.

Default no alarm-only

discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a given VPLS service.

Default no discard-frame

Platforms

7705 SAR Gen 2

26.33 restrict-unprotected-dst

restrict-unprotected-dst

Syntax

restrict-unprotected-dst

no restrict-unprotected-dst

Context

[Tree] (config>service>vpls>sap restrict-unprotected-dst)

[Tree] (config>service>vpls>split-horizon-group restrict-unprotected-dst)

[Tree] (config>service>pw-template>split-horizon-group restrict-unprotected-dst)

Full Context

configure service vpls sap restrict-unprotected-dst

configure service vpls split-horizon-group restrict-unprotected-dst

configure service pw-template split-horizon-group restrict-unprotected-dst

Description

This command indicates how the system will forward packets destined for an unprotected MAC address, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP or SAPs within a split horizon group (but not spoke or mesh-SDPs) will be verified to contain a protected destination MAC address. If the packet is found to contain a non-protected destination MAC, it will be discarded. Detecting a non-protected destination MAC on the SAP will not cause the SAP to be placed in the operationally down state. No alarms are generated.

If the destination MAC address is unknown, even if the packet is entering a restricted SAP, with **restrict-unprotected-dst** enabled, it will be flooded.

Default

no restrict-unprotected-dst

Platforms

7705 SAR Gen 2

26.34 restricted-to-home

restricted-to-home

Syntax

[**no**] **restricted-to-home**

Context

[Tree] (config>system>security>user restricted-to-home)

[Tree] (config>system>security>user-template restricted-to-home)

Full Context

configure system security user restricted-to-home

configure system security user-template restricted-to-home

Description

This command denies the user from accessing files outside of their home directory. Files can be accessed locally by CLI file commands and output modifiers such as **>** (file redirect), or remotely via FTP and SCP.

When enabled, the system denies all configuration save operations (such as **admin save**) via any management interface (such as CLI and NETCONF) unless **save-when-restricted** is enabled.

When **restricted-to-home** is configured, file access is denied unless the **home-directory** is configured and the directory is created by an administrator.

The **no** form of this command permits the user to access all files on the system.

Default

restricted-to-home

Platforms

7705 SAR Gen 2

26.35 results

results

Syntax

results *file-url*

no results

Context

[Tree] (config>system>script-control>script-policy results)

Full Context

configure system script-control script-policy results

Description

This command is used to specify the location where the system writes the output of an event script's execution.

The **no** form of the command removes the file location from the configuration. Scripts will not execute if there is no result location defined.

Default

no results

Parameters

file-url

Specifies the location to send CLI output from script runs. The *file-url* is a location, directory, and filename prefix to which a data and timestamp suffix is added when the results files are created during a script run, as follows:

*file-url*_YYYYMMDD-hhmmss.uuuuuu.out

where:

YYYYMMDD — date

hhmmss — hours, minutes, and seconds

uuuuuu — microseconds (padded to 6 characters with leading zeros)

Values *local-url* | *remote-url*

local-url — [*cflash-id/*] [*file-path*] 167 chars max, including *cflash-idfile-path* 166 chars max

remote url — [{ftp:// | tftp://}*login*:*password@remote-location/*][*file-path*] 255 characters max directory length 99 characters max each

remote-location — [*hostname* | *ipv4-address* | *ipv6-address*]

ipv4-address — *a.b.c.d*

ipv6-address — x:x:x:x:x:x:x:x[-*interface*] x:x:x:x:x:x:d.d.d.d[-*interface*] x — [0 to FFFF]H d — [0 to 255]D interface — 32 characters max, for link local addresses

cflash-id — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Full Context

configure service vprn ospf3 area interface retransmit-interval

configure service vprn ospf area interface retransmit-interval

configure service vprn ospf area sham-link retransmit-interval

configure service vprn ospf area virtual-link retransmit-interval

configure service vprn ospf3 area virtual-link retransmit-interval

Description

This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.

The value should be longer than the expected round trip delay between any two routers on the attached network. Once the retransmit interval expires and no acknowledgment is received, the LSA is retransmitted.

The **no** form of this command reverts to the default interval.

Default

retransmit-interval 5

Parameters

seconds

The retransmit interval in seconds expressed as a decimal integer.

Values 1 to 3600

Platforms

7705 SAR Gen 2

retransmit-interval

Syntax

retransmit-interval *seconds*

no retransmit-interval

Context

configure router ospf area interface retransmit-interval

configure router ospf area virtual-link retransmit-interval

configure router ospf3 area interface retransmit-interval

Description

This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.

The value should be longer than the expected round trip delay between any two routers on the attached network. After the retransmit-interval expires and no acknowledgment has been received, the LSA will be retransmitted.

The **no** form of this command reverts to the default interval.

Default

retransmit-interval 5

Parameters

seconds

Specifies the retransmit interval in seconds expressed as a decimal integer.

Values 1 to 1800

Platforms

7705 SAR Gen 2

26.40 retransmit-time

retransmit-time

Syntax

retransmit-time *milli-seconds*

no retransmit-time

Context

[Tree] (config>service>vprn>router-advert>if retransmit-time)

[Tree] (config>router>router-advert>if retransmit-time)

Full Context

configure service vprn router-advertisement interface retransmit-time

configure router router-advertisement interface retransmit-time

Description

This command configures the value to be placed in the retransmit timer field in router advertisements sent from this interface.

The **no** form of this command reverts to the default.

Default

retransmit-time 0

Parameters

milli-seconds

Specifies the retransmit time, in milli-seconds, for advertisement from this group-interface.

Values 0 to 1800000

Platforms

7705 SAR Gen 2

26.41 retries

retries

Syntax

retries *count*

no retries

Context

[Tree] (config>system>grpc>tcp-keepalive retries)

Full Context

configure system grpc tcp-keepalive retries

Description

This command configures the number of TCP keepalive probes sent by the router that must be unacknowledged before the connection is closed.

The **no** form of this command reverts to the default value.

Default

retries 4

Parameters

count

Specifies the number of missed keep-alives before the TCP connection is declared down.

Values 3 to 100

Default 4

Platforms

7705 SAR Gen 2

retries

Syntax

retries *count*

no retries

Context

[Tree] (config>system>grpc-tunnel>destination-group>tcp-keepalive retries)

[Tree] (config>system>telemetry>destination-group>tcp-keepalive retries)

Full Context

configure system grpc-tunnel destination-group tcp-keepalive retries

configure system telemetry destination-group tcp-keepalive retries

Description

This command configures the number of missed TCP keepalive probes before the TCP connection is closed and attempts are made to reach other destinations within the same destination group.

The **no** form of this command reverts to the default value.

Default

retries 4

Parameters

count

Specifies the number of missed keep-alives before the TCP connection is declared down.

Values 3 to 100

Default 4

Platforms

7705 SAR Gen 2

26.42 retry

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>aaa>radius-srv-plcy>servers retry)

Full Context

configure aaa radius-server-policy servers retry

Description

This command configures the number of times the router attempts to contact the RADIUS server, if not successful the first time.

The **no** form of this command reverts to the default.

Default

retry 3

Parameters

count

Specifies the number of times a signaling request message is transmitted towards the same peer.

Values 1 to 256

Platforms

7705 SAR Gen 2

retry

Syntax

retry *minutes*

no retry

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication retry)

Full Context

configure service vpls bgp-evpn mac-duplication retry

Description

Specifies the timer after which the MAC in hold-down state is automatically flushed and the mac-duplication process starts again. This value is expected to be equal to two times or more than that of window.

If **no** retry is configured, this implies that, when mac-duplication is detected, MAC updates for that MAC will be held down till the user intervenes or a network event (that flushes the MAC) occurs.

Default

retry 9

Parameters

minutes

Specifies the BGP EVPN MAC duplication retry in minutes.

Values 2 to 60

Platforms

7705 SAR Gen 2

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>service>vprn>aaa>rmt-srv>radius retry)

[Tree] (config>system>security>radius retry)

Full Context

configure service vprn aaa remote-servers radius retry

configure system security radius retry

Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication if there are problems communicating with the server.

The **no** form of this command reverts to the default value.

Default

retry 3

Parameters

count

Specifies the retry count.

Values 1 to 10

Platforms

7705 SAR Gen 2

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>system>file-trans-prof retry)

Full Context

configure system file-transmission-profile retry

Description

This command specifies the number of retries on transport protocol level.

When the virtual router does not receive any data from a server (e.g., FTP or HTTP server) after the configured **timeout** *seconds*, the router may repeat the request to the server. The number of retries specifies the maximum number of repeated requests.

The **no** form of this command disables the retry.

Default

no retry

Parameters

count

Specifies the number of retries.

Values 1 to 256

Platforms

7705 SAR Gen 2

retry

Syntax

retry *count*

no retry

Context

[Tree] (config>system>security>ldap retry)

Full Context

configure system security ldap retry

Description

This command configures the number of retries for the SR OS in its attempt to reach the current LDAP server before attempting the next server.

The **no** form of this command reverts to the default value.

Default

retry 3

Parameters

count

Specifies the number of retransmissions.

Values 1 to 10

Default 3

Platforms

7705 SAR Gen 2

26.43 retry-count

retry-count

Syntax

retry-count *retry-count*

no retry-count

Context

[Tree] (config>service>epipe>spoke-sdp-fec retry-count)

Full Context

configure service epipe spoke-sdp-fec retry-count

Description

This optional command specifies the number of attempts software should make to reestablish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke-sdp is put into the shutdown state.

Use the no shutdown command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

Default

retry-count 30

Parameters

retry-count

The maximum number of retries before putting the spoke-sdp into the shutdown state.

Values 10 to 10000

Platforms

7705 SAR Gen 2

retry-count

Syntax

retry-count [*count*]

no retry-count

Context

[Tree] (config>service>pw-routing retry-count)

Full Context

configure service pw-routing retry-count

Description

This optional command specifies the number of attempts software should make to re-establish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke SDP is put into the shutdown state.

Use the **no shutdown** command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

Default

no retry-count

Parameters

count

Specifies the maximum number of retries before putting the spoke SDP into the shutdown state.

Values 10 to 10000

Platforms

7705 SAR Gen 2

26.44 retry-interval

retry-interval

Syntax

retry-interval *seconds*

no retry-interval

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update retry-interval)

Full Context

configure system security pki ca-profile auto-crl-update retry-interval

Description

This command specifies the interval, in seconds, that the system waits before retrying the configured **url-entry** list when **schedule-type** is **next-update-based** and none of the URLs return a qualified CRL.

The **no** form of this command causes the system to retry immediately without waiting.

Default

retry-interval 3600

Parameters

seconds

Specifies an interval, in seconds, before retrying to update the CRL.

Values 1 to 31622400

Platforms

retry-interval

Syntax

retry-interval *seconds*

Context

[Tree] (config>system>security>pki>cert-upd-prof retry-interval)

Full Context

configure system security pki certificate-update-profile retry-interval

Description

This command configures the retry interval after the update fails.

Default

retry-interval 3600

Parameters

seconds

Specifies a retry interval, in seconds, after a failed update.

Values 60 to 36000

Platforms

7705 SAR Gen 2

26.45 retry-limit

retry-limit

Syntax

retry-limit *number*

no retry-limit

Context

[Tree] (config>router>mpls>lsp-template retry-limit)

[Tree] (config>router>mpls>lsp retry-limit)

Full Context

configure router mpls lsp-template retry-limit

configure router mpls lsp retry-limit

Description

This optional command specifies the number of attempts software should make to re-establish the LSP after it has failed LSP. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the LSP path is put into the **shutdown** state.

Use the config router **mpls lsp** *lsp-name* **no shutdown** command to bring up the path after the retry-limit is exceeded.

For P2MP LSP that are created based on the LSP template, all S2Ls must attempt to retry-limit before the client application is informed of failure.

The **no** form of this command reverts to the default value.

Default

retry-limit 0 (no limit, retries forever)

Parameters

number

Specifies the number of times software will attempt to re-establish the LSP after it has failed. Allowed values are integers in the range of 0 to 10000.

Values 0 to 10000

Platforms

7705 SAR Gen 2

26.46 retry-on-igp-overload

retry-on-igp-overload

Syntax

[**no**] **retry-on-igp-overload**

Context

[Tree] (config>router>mpls retry-on-igp-overload)

Full Context

configure router mpls retry-on-igp-overload

Description

This command allows for the global configuration of the handling in the ingress LER of the LSP paths which transit an LSR that advertised the IS-IS overload bit.

By default, MPLS re-optimizes using make-before-break (MBB) the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based re-signal is performed for the LSP paths. MPLS will not act immediately on the receipt of the IS-IS overload bit.

When this command is enabled, MPLS in the ingress LER immediately tears down and re-signals all LSP paths away from a transit LSR node which advertised the IS-IS overload bit.

LSP paths that terminate on the node that advertised the IS-IS overload bit are not acted on whether this command is enabled or disabled.

The **no** form of this command returns to the default behavior.

Platforms

7705 SAR Gen 2

26.47 retry-timeout

retry-timeout

Syntax

retry-timeout *timeout*

no retry-timeout

Context

[Tree] (config>service>template>vpls-template>mac-move retry-timeout)

[Tree] (config>service>vpls>mac-move retry-timeout)

Full Context

configure service template vpls-template mac-move retry-timeout

configure service vpls mac-move retry-timeout

Description

This indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

It is recommended that the retry-timeout value is larger or equal to 5s * cumulative factor of the highest priority port so that the sequential order of port blocking will not be disturbed by re-initializing lower priority ports.

A zero value indicates that the SAP will not be automatically re-enabled after being disabled. If, after the SAP is re-enabled it is disabled again, the retry timeout is increased with the provisioned retry timeout in order to avoid thrashing. For example, when retry-timeout is set to 15, it increments (15,30,45,60...).

The **no** form of this command reverts to the default value.

Default

retry-timeout 10 (when mac-move is enabled)

Parameters

timeout

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

Values 0 to 120

Platforms

7705 SAR Gen 2

26.48 retry-timer

retry-timer

Syntax

retry-timer *retry-timer*

no retry-timer

Context

[Tree] (config>service>epipe>spoke-sdp-fec retry-timer)

Full Context

configure service epipe spoke-sdp-fec retry-timer

Description

This command specifies a retry-timer for the spoke SDP. This is a configurable exponential back-off timer that determines the interval between retries to reestablish a spoke SDP if it fails and a label withdraw message is received with the status code "AII unreachable”.

The **no** form of this command reverts the timer to its default value.

Default

retry-timer 30

Parameters

retry-timer

The initial retry-timer value in seconds.

Values 10 to 480

Platforms

7705 SAR Gen 2

retry-timer

Syntax

retry-timer *seconds*

no retry-timer

Context

[Tree] (config>router>mpls>lsp retry-timer)

[Tree] (config>router>mpls>lsp-template retry-timer)

Full Context

configure router mpls lsp retry-timer

configure router mpls lsp-template retry-timer

Description

This command configures the time (in s), for LSP re-establishment attempts after it has failed. The retry time is jittered to +/- 25% of its nominal value.

For P2MP LSP created based on LSP template, all S2Ls must attempt to retry-limit before client application is informed of failure.

The **no** form of this command reverts to the default value.

Default

retry-timer 30

Parameters

seconds

Specifies the amount of time (in s), between attempts to re-establish the LSP after it has failed. Allowed values are integers in the range of 1 to 600.

Values 1 to 600

Platforms

7705 SAR Gen 2

retry-timer

Syntax

retry-timer *secs*

no retry-timer

Context

[Tree] (config>service>pw-routing retry-timer)

Full Context

configure service pw-routing retry-timer

Description

This command configures a retry-timer for the spoke-SDP. This is a configurable exponential back-off timer that determines the interval between retries to re-establish a spoke-SDP if it fails and a label withdraw message is received with the status code "AII unreachable”.

The **no** form of this command reverts the timer to its default value.

Default

no retry-timer

Parameters

secs

Specifies initial retry-timer value in seconds.

Values 10 to 480

Platforms

7705 SAR Gen 2

26.49 return-path-label

return-path-label

Syntax

return-path-label *label-value*

no return-path-label

Context

[Tree] (config>router>segment-routing>main-plcy return-path-label)

Full Context

configure router segment-routing maintenance-policy return-path-label

Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

Default

no return-path-label

Parameters

label-value

Specifies the label value.

Values 32 to 1048575

Platforms

7705 SAR Gen 2

26.50 reuse

reuse

Syntax

reuse *integer*

no reuse

Context

[Tree] (config>router>policy-options>damping reuse)

Full Context

configure router policy-options damping reuse

Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

Default

no reuse

Parameters

integer

Specifies the reuse value expressed as a decimal integer.

Values 1 to 20000

Platforms

7705 SAR Gen 2

26.51 reverse-route

reverse-route

Syntax

reverse-route

Context

[Tree] (config>ipsec>tnl-temp reverse-route)

Full Context

configure ipsec tunnel-template reverse-route

Description

Commands in this context configure the dynamic LAN-to-LAN (DL2L) tunnel reverse-route options for the tunnel template.

Platforms

7705 SAR Gen 2

26.52 revert

revert

Syntax

revert {**latest-rb**| *checkpoint-id* | **rescue**} [**now**]

Context

[Tree] (admin>rollback revert)

Full Context

admin rollback revert

Description

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

Values 1 to 9

rescue

Specifies to revert to the rescue checkpoint.

now

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

Platforms

7705 SAR Gen 2

26.53 revert-members

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>service>vprn>isis>link-group>level revert-members)

Full Context

configure service vprn isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

Default

no revert-members *oper-members*

Parameters

1..8

Specifies the number of revert members.

Values 1 to 8

Platforms

7705 SAR Gen 2

revert-members

Syntax

revert-members [*1..8*]

no revert-members

Context

[Tree] (config>router>isis>link-group>level revert-members)

Full Context

configure router isis link-group level revert-members

Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

Default

no revert-members oper-members

Parameters

1..8

Specifies the threshold for revertive members.

Values 1 to 8

Platforms

7705 SAR Gen 2

26.54 revert-time

revert-time

Syntax

revert-time [*revert-time* | **infinite**]

no revert-time

Context

[Tree] (config>service>epipe>endpoint revert-time)

Full Context

configure service epipe endpoint revert-time

Description

This command configures the time to wait before reverting back to the primary spoke SDP defined on this service endpoint, after having failed over to a backup spoke SDP.

Parameters

revert-time

Specifies the time, in seconds, to wait before reverting to the primary SDP.

Values 0 to 600

Default 0

infinite

Causes the endpoint to be non-revertive.

Platforms

7705 SAR Gen 2

revert-time

Syntax

revert-time *revert-time* | **infinite**

no revert-time

Context

[Tree] (config>service>vpls>endpoint revert-time)

Full Context

configure service vpls endpoint revert-time

Description

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

Parameters

revert-time

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

Values 0 to 600

infinite

Specifying this keyword makes endpoint non-revertive

Platforms

7705 SAR Gen 2

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>mirror>mirror-dest>endpoint revert-time)

Full Context

configure mirror mirror-dest endpoint revert-time

Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

Parameters

revert-time

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

Values 0 to 600

infinite

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

Platforms

7705 SAR Gen 2

revert-time

Syntax

revert-time {*revert-time* | **infinite**}

no revert-time

Context

[Tree] (config>service>sdp>mixed-lsp-mode revert-time)

Full Context

configure service sdp mixed-lsp-mode revert-time

Description

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

Default

no revert-time

Parameters

revert-time

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

Values 0 to 600

infinite

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

Platforms

7705 SAR Gen 2

26.55 revert-timer

revert-timer

Syntax

revert-timer *timer-value*

no revert-timer

Context

[Tree] (config>router>mpls>lsp revert-timer)

Full Context

configure router mpls lsp revert-timer

Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

Default

no revert-timer

Parameters

timer-value

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

Values 1 to 4320

Platforms

7705 SAR Gen 2

revert-timer

Syntax

revert-timer *seconds*

no revert-timer

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy revert-timer)

Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

Default

revert-timer 0

Parameters

seconds

Specifies the revert-timer value, in number of seconds.

Values 1 to 600

Platforms

7705 SAR Gen 2

revert-timer

Syntax

revert-timer *revert-timer*

no revert-timer

Context

[Tree] (config>router>segment-routing>maintenance-policy revert-timer)

Full Context

configure router segment-routing maintenance-policy revert-timer

Description

This command configures the revert timer for SR Policy candidate paths.

The revert timer is started when the primary path (for example, the best preference programmed candidate path) recovers (for example, after the number of S-BFD sessions that are up is ≥ **threshold** and the **hold-down-timer** has expired) and switches back when the timer expires.

The **no** form of this command removes the revert timer from the SR policy.

Default

no revert-timer

Parameters

revert-timer

Specifies the revert timer, in minutes.

Values 1 to 4320

Platforms

7705 SAR Gen 2

26.56 revertive

revertive

Syntax

[**no**] **revertive**

Context

[Tree] (config>redundancy>multi-chassis>ipsec-domain revertive)

Full Context

configure redundancy multi-chassis ipsec-domain revertive

Description

This command configures whether to allow a revertive activity state after a designated active state recovers from an ineligibility event. The revertive function allows a router in an N:M domain to automatically take over as the active router in the domain, when it becomes eligible to do so.

The **no** form of this command reverts to the default value.

Default

no revertive

Platforms

7705 SAR Gen 2

26.57 revocation-check

revocation-check

Syntax

revocation-check {**crl** | **crl-optional**}

Context

[Tree] (config>system>security>pki>ca-profile revocation-check)

Full Context

configure system security pki ca-profile revocation-check

Description

This command specifies the revocation method the system uses to check the revocation status of certificate issued by the CA. If the **crl-optional** option is configured, when the user disables the **ca-profile**, the system tries to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load the configured CRL for the following reasons, the system still brings the **ca-profile** operationally up, but leaves the CRL configured as non-existent:

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer
- CRL does not match cert
- Wrong CRL version
- CRL expired

Note:
The **crl-optional** command option makes configuration of a valid CRL in a **ca-profile** optional. However, from a security point of view, it is important to always verify the revocation status of a certificate.

If the system needs to use the CRL of a specific CA profile to check the revocation status of an end-entity certificate, and the CRL is non-existent due to the preceding reasons, the system treats a case like this as being unable to get an answer from CRL and falls back to the next status verify method or default result.

If the system needs to check the revocation of a CA certificate in a certificate chain, and if the CRL is non-existent due to the preceding reasons, the system skips checking the revocation status of the CA certificate. For example, if CA1 is issued by CA2, if the revocation-check for CA2 is **crl-optional** and the CRL for CA2 is non-existent, the system does not check the certificate revocation status of CA1 and it is considered as "good”.

Note:
Users must shut down the **ca-profile** to change the **revocation-check** configuration.

Default

revocation-check crl

Parameters

crl

Specifies to use the configured CRL.

crl-optional

Specifies that the CRL is optional.

Platforms

7705 SAR Gen 2

26.58 revoke-key

revoke-key

Syntax

revoke-key card *cpm-slot* **serial-number** *cpm-serial-number* **confirmation-code** *code*

Context

[Tree] (admin>system>security>secure-boot revoke-key)

Full Context

admin system security secure-boot revoke-key

Description

This command revokes secure boot keys.

Parameters

cpm-slot

Specifies the CPM slot.

Values A,B

cpm-serial-number

Specifies the CPM serial number, up to 256 characters.

code

Specifies the signed software confirmation code, up to 32 characters.

Platforms

rib-priority

Syntax

rib-priority high {*prefix-list-name* | **tag** *tag*}

no rib-priority

Context

[Tree] (config>service>vprn>isis rib-priority)

Full Context

configure service vprn isis rib-priority

Description

This command enabled RIB prioritization for the IS-IS protocol and specifies the prefix list or IS-IS tag value that will be used to select the specific routes that should be processed through the IS-IS route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization.

Default

no rib-priority

Parameters

prefix-list-name

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

tag tag-value

Specifies the tag value that is used to match IS-IS routes that are to be processed at a higher priority through the route calculation process.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

rib-priority

configure service vprn ospf rib-priority

Description

This command enabled RIB prioritization for the OSPF protocol and specifies the prefix list that will be used to select the specific routes that should be processed through the OSPF route calculation process at a higher priority.

The **no** form of **rib-priority** command disables RIB prioritization at the associated level.

Default

no rib-priority

Parameters

prefix-list-name

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

Platforms

7705 SAR Gen 2

rib-priority

Syntax

rib-priority high {*prefix-list-name* | **tag** *tag-value*}

no rib-priority

Context

[Tree] (config>router>isis rib-priority)

Full Context

configure router isis rib-priority

Description

This command enabled RIB prioritization for the IS-IS protocol and specifies the prefix list or IS-IS tag value that will be used to select the specific routes that should be processed through the IS-IS route calculation process at a higher priority.

The no rib-priority form of command disables RIB prioritization.

Default

no rib-priority high

Parameters

prefix-list-name

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

tag tag-value

Specifies the tag value that is used to match IS-IS routes that are to be processed at a higher priority through the route calculation process.

Values 1 to 4294967295

no rib-priority {**high**}

Context

[Tree] (config>router>ospf3 rib-priority)

[Tree] (config>router>ospf rib-priority)

Full Context

configure router ospf3 rib-priority

configure router ospf rib-priority

Description

This command enables RIB prioritization for the OSPF protocol and specifies the prefix list used to select the specific routes that should be processed through the OSPF route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization at the associated level.

Default

no rib-priority high

Parameters

prefix-list-name

Specifies the prefix list, up to 32 characters, which is used to select the routes that are processed at a higher priority through the route calculation process.

Platforms

7705 SAR Gen 2

rib-priority

Syntax

rib-priority {**high**}

no rib-priority

Context

[Tree] (config>router>ospf>area>interface rib-priority)

[Tree] (config>router>ospf3>area>interface rib-priority)

Full Context

configure router ospf area interface rib-priority

configure router ospf3 area interface rib-priority

Description

This command enables RIB prioritization for the OSPF/OSPFv3 protocol. When enabled at the OSPF interface level, all routes learned through the associated OSPF interface are processed through the OSPF route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization at the associated level.

Default

no rib-priority

Parameters

high

Specifies that the name of the prefix list which contains prefixes get high priority for RIB-download. The high priority prefixes are downloaded first to the RIB. In doing so, the convergence time for these prefixes is better.

Platforms

7705 SAR Gen 2

26.61 ring-node

ring-node

Syntax

ring-node *ring-node-name*

no ring-node

Context

[Tree] (config>service>epipe>sap ring-node)

configure service epipe sap ring-node

Description

This command configures a multi-chassis ring-node for this SAP.

The **no** form of this command removes the name from the configuration.

Platforms

7705 SAR Gen 2

26.62 rip

rip

Syntax

[**no**] **rip**

Context

[Tree] (config>service>vprn rip)

Full Context

configure service vprn rip

Description

This command enables the RIP protocol on the given VPRN IP interface.

The **no** form of this command disables the RIP protocol from the given VPRN IP interface.

Default

no rip

Platforms

7705 SAR Gen 2

rip

Syntax

[**no**] **rip**

Context

[Tree] (config>router rip)

Full Context

configure router rip

Description

This command creates the context to configure the RIP protocol instance.

When a RIP instance is created, the protocol is enabled by default. To start or suspend execution of the RIP protocol without affecting the configuration, use the [**no**] **shutdown** command.

The **no** form of the command deletes the RIP protocol instance removing all associated configuration parameters.

Default

no rip

Platforms

7705 SAR Gen 2

26.63 rip-policy

rip-policy

Syntax

rip-policy *policy-name*

no rip-policy

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host rip-policy)

Full Context

configure subscriber-mgmt local-user-db ipoe host rip-policy

Description

This command configures the RIP policy name. This policy is applied to a subscriber IPv4 host to enable the BNG to learn RIP routes from the host. RIP routes are never sent to the hosts.

The **no** form of this command removes the RIP policy name from the configuration.

Parameters

policy-name

Specifies the RIP policy name, up to 32 characters.

Platforms

7705 SAR Gen 2

rip-policy

Syntax

rip-policy *policy-name* [**create**]

no rip-policy *policy-name*

Context

[Tree] (config>subscr-mgmt rip-policy)

Full Context

configure subscriber-mgmt rip-policy

Description

This command creates a RIP policy. This policy is applied to a subscriber IPv4 host to enable the BNG to learn RIP routes from the host. RIP routes are never sent to the hosts.

Parameters

policy-name

Specifies the RIP policy name up to 32 characters.

create

Keyword required to create the configuration context.

Platforms

7705 SAR Gen 2

26.64 ripng

ripng

Syntax

[**no**] **ripng**

Context

[Tree] (config>router ripng)

Full Context

configure router ripng

Description

This command creates the context to configure the RIPng protocol instance.

When a RIPng instance is created, the protocol is enabled by default. To start or suspend execution of the RIP protocol without affecting the configuration, use the [**no**] **shutdown** command.

The **no** form of this command deletes the RIP protocol instance removing all associated configuration parameters.

Default

no ripng

Platforms

7705 SAR Gen 2

26.65 rmon

rmon

Syntax

rmon

Context

[Tree] (config>system>thresholds rmon)

Full Context

configure system thresholds rmon

Description

This command creates the context to configure generic RMON alarms and events.

Generic RMON alarms can be created on any SNMP object-ID that is valid for RMON monitoring (for example, an integer-based datatype).

The configuration of an event controls the generation and notification of threshold crossing events configured with the alarm command.

Platforms

7705 SAR Gen 2

26.66 robust-count

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>service>vpls>mesh-sdp>igmp-snooping robust-count)

[Tree] (config>service>vpls>mesh-sdp>mld-snooping robust-count)

[Tree] (config>service>vpls>sap>igmp-snooping robust-count)

[Tree] (config>service>vpls>igmp-snooping robust-count)

[Tree] (config>service>vpls>sap>mld-snooping robust-count)

[Tree] (config>service>vpls>spoke-sdp>mld-snooping robust-count)

[Tree] (config>service>vpls>spoke-sdp>igmp-snooping robust-count)

Full Context

configure service vpls mesh-sdp igmp-snooping robust-count

configure service vpls mesh-sdp mld-snooping robust-count

configure service vpls sap igmp-snooping robust-count

configure service vpls igmp-snooping robust-count

configure service vpls sap mld-snooping robust-count

configure service vpls spoke-sdp mld-snooping robust-count

configure service vpls spoke-sdp igmp-snooping robust-count

Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count for the SAP or SDP

Values 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

Platforms

7705 SAR Gen 2

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>service>vprn>mld robust-count)

[Tree] (config>service>vprn>igmp robust-count)

Full Context

configure service vprn mld robust-count

configure service vprn igmp robust-count

Description

This command configures the robust count. The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count value.

Values 2 to 10

Platforms

7705 SAR Gen 2

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>router>igmp robust-count)

Full Context

configure router igmp robust-count

Description

This command configures the robust count. The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased.

Default

robust-count 2

Parameters

robust-count

Specify the robust count value.

Values 2 to 10

Platforms

7705 SAR Gen 2

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>router>mld robust-count)

Full Context

configure router mld robust-count

Description

This command configures the robust count. The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased.

Default

robust-count 2

Parameters

robust-count

Specify the robust count value.

Values 2 to 10

Platforms

7705 SAR Gen 2

robust-count

Syntax

robust-count *robust-count*

no robust-count

Context

[Tree] (config>service>pw-template>igmp-snooping robust-count)

Full Context

configure service pw-template igmp-snooping robust-count

Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count.

If send-queries is not enabled, this parameter will be ignored.

Default

robust-count 2

Parameters

robust-count

Specifies the robust count for the SAP or SDP.

Values 2 to 7

Platforms

7705 SAR Gen 2

26.67 rollback

rollback

Syntax

rollback

Context

[Tree] (config>system rollback)

Full Context

configure system rollback

Description

Configure parameters of the classic CLI configuration rollback functionality. Configuration rollback provides the ability to undo configuration and revert back to previous router configuration states.

Platforms

7705 SAR Gen 2

rollback

Syntax

rollback

Context

[Tree] (admin rollback)

Full Context

admin rollback

Description

Commands in this context configure rollback operations.

Platforms

7705 SAR Gen 2

26.68 rollback-location

rollback-location

Syntax

rollback-location *file-url* /*rollback filename*

no rollback-location

Context

[Tree] (config>system>rollback rollback-location)

Full Context

configure system rollback rollback-location

Description

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

Default

no rollback-location

Parameters

file-url

Specifies the URL or rollback filename.

Values

local-url | *remote-url*	
local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each
remote-url	[{ftp://}*login*:*pswd*@ *remote-locn*/][*file-path*] up to 255 characters, directory length of up to 99 characters each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D

	interface - up to 32 characters each, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

rollback-filename

Specifies the rollback file name.

Values suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

Platforms

7705 SAR Gen 2

26.69 rollback-sync

rollback-sync

Syntax

rollback-sync

Context

[Tree] (admin>redundancy rollback-sync)

Full Context

admin redundancy rollback-sync

Description

This command copies the entire set of rollback checkpoint files from the active CPM CF to the standby CPM CF.

Platforms

7705 SAR Gen 2

rollback-sync

Syntax

[**no**] **rollback-sync**

Context

[Tree] (config>redundancy rollback-sync)

Full Context

configure redundancy rollback-sync

Description

The operator can enable automatic synchronization of classic CLI rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a classic CLI **rollback save** causes the new classic CLI checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other checkpoint files are not automatically copied from active to standby but that can be done manually with **admin redundancy rollback-sync**).

Automatic synchronization of classic CLI rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config redundancy synchronize {boot-env | config}** and **admin redundancy synchronize {boot-env | config}** do not apply to classic CLI rollback checkpoint files. These commands do not manually or automatically sync classic CLI rollback checkpoint files. The dedicated **rollback-sync** command must be used to sync classic CLI rollback checkpoint files.

Default

no rollback-sync

Platforms

7705 SAR Gen 2

26.70 rollover

rollover

Syntax

rollover *minutes* [**retention** *hours*]

no rollover

Context

[Tree] (config>log>file-id rollover)

Full Context

configure log file-id rollover

Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

Default

rollover 1440 retention 12

Parameters

minutes

Specifies the rollover time, in minutes.

Values 5 to 10080

retention hours

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation datestamp + rollover time + retention time is less than the current timestamp.

Default 12

Values 1 to 500

Platforms

7705 SAR Gen 2

26.71 root

root

Syntax

root

Context

[Tree] (config>qos>policer-control-policy root)

Full Context

configure qos policer-control-policy root

Description

The **root** node contains the policer control policies configuration parameters for the root arbiter. Within the node, the parent policer's maximum rate limit can be set, the strict priority level, and fair threshold portions may be defined per priority level.

The root node always exists and does not need to be created.

Platforms

7705 SAR Gen 2

26.72 root-guard

root-guard

Syntax

[**no**] **root-guard**

Context

[Tree] (config>service>vpls>sap>stp root-guard)

[Tree] (config>service>vpls>spoke-sdp>stp root-guard)

[Tree] (config>service>template>vpls-sap-template>stp root-guard)

Full Context

configure service vpls sap stp root-guard

configure service vpls spoke-sdp stp root-guard

configure service template vpls-sap-template stp root-guard

Description

This command specifies whether this port is allowed to become an STP root port. It corresponds to the restrictedRole parameter in 802.1Q. If set, it can cause lack of spanning tree connectivity.

Default

no root-guard

Platforms

7705 SAR Gen 2

root-guard

Syntax

[**no**] **root-guard**

Context

[Tree] (config>service>pw-template>stp root-guard)

Full Context

configure service pw-template stp root-guard

Description

This command specifies whether this port is allowed to become an STP root port. It corresponds to the restrictedRole parameter in 802.1Q. If set, it can cause lack of spanning tree connectivity.

Default

no root-guard

Platforms

7705 SAR Gen 2

26.73 route-admin-tag-policy

route-admin-tag-policy

Syntax

[**no**] **route-admin-tag-policy** *policy-name*

Context

[Tree] (config>router>admin-tags route-admin-tag-policy)

Full Context

configure router admin-tags route-admin-tag-policy

Description

This command configures a route admin tag policy.

Up to 2,000 policies can be configured per system.

The **no** form of this command removes the route admin tag policy.

Parameters

policy-name

The name of the route admin tag policy, up to 32 characters.

Platforms

7705 SAR Gen 2

26.74 route-distinguisher

route-distinguisher

Syntax

route-distinguisher auto-rd

no route-distinguisher

route-distinguisher *rd*

Context

[Tree] (config>service>vpls>bgp route-distinguisher)

[Tree] (config>service>epipe>bgp route-distinguisher)

Full Context

configure service vpls bgp route-distinguisher

configure service epipe bgp route-distinguisher

Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for L2VPN and EVPN families. This value will be used for BGP-AD, BGP VPLS and BGP multi-homing NLRI if these features are configured.

If this command is not configured, the RD is automatically built using the BGP-AD VPLS ID. The following rules apply:

- if BGP AD VPLS-id is configured and no RD is configured under BGP node - RD=VPLS-ID
- if BGP AD VPLS-id is not configured then an RD value must be configured under BGP node (this is the case when only BGP VPLS is configured)
- if BGP AD VPLS-id is configured and an RD value is also configured under BGP node, the configured RD value prevails

Values and format (6 bytes, other 2 bytes of type will be automatically generated)

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level. For **BGP-EVPN** enabled VPLS and Epipe services, the **route-distinguisher** value can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is

not configured. See the **config>service>system>bgp-evpn>eth-seg>service-carving>manual evi** command description for more information.

Parameters

ip-addr:comm-val

Specifies the IP address.

Values *ip-addr*: a.b.c.d

comm-val: 0 to 65535

as-number:ext-comm-val

Specifies the AS number.

Values *as-number*: 1 to 65535

ext-comm-val: 0 to 4294967295

auto-rd

The system will generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

Platforms

7705 SAR Gen 2

route-distinguisher

Syntax

route-distinguisher [*ip-addr:comm-val* | *as-number:ext-comm-val*]

no route-distinguisher

Context

[Tree] (config>service>system>bgp-evpn route-distinguisher)

Full Context

configure service system bgp-evpn route-distinguisher

Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for EVPN corresponding to the base EVPN instance (Ethernet Segment routes). If the route-distinguisher component is not configured, the system will use system:ip-address as the default route-distinguisher

Default

no route-distinguisher

Parameters

ip-addr:comm-val

Specifies the IP address.

Values *ip-addr*: a.b.c.d

comm-val: 0 to 65535

as-number:ext-comm-val

Specifies the AS number.

Values *as-number*: 1 to 65535

ext-comm-val: 0 to 4294967295

Platforms

7705 SAR Gen 2

route-distinguisher

Syntax

route-distinguisher *rd*

route-distinguisher auto-rd

no route-distinguisher

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls route-distinguisher)

[Tree] (config>service>vprn>bgp-evpn>mpls route-distinguisher)

Full Context

configure service vprn bgp-ipvpn mpls route-distinguisher

configure service vprn bgp-evpn mpls route-distinguisher

Description

This command specifies an identifier attached to a route, which enables the user to identify the VPN to which the route belongs. Each routing instance must have a unique (within the carrier's domain) route distinguisher (RD) associated with it.

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **configure service system bgp-auto-rd-range** command.

The **no** form of this command removes the RD configuration.

Default

no route-distinguisher

Parameters

auto-rd

Keyword that allows the system to generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

rd

Specifies the route distinguisher.

Values rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-asnumber: [1 to 65535]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [1 to 4294967295]

Platforms

7705 SAR Gen 2

route-distinguisher

Syntax

route-distinguisher

Context

[Tree] (config>service>vprn route-distinguisher)

Full Context

configure service vprn route-distinguisher

Description

Note: This command is no longer supported and will be removed in a future release.

Platforms

7705 SAR Gen 2

26.75 route-distinguisher-list

route-distinguisher-list

Syntax

route-distinguisher-list *name*

no route-distinguisher-list *name*

Context

[Tree] (config>router>policy-options route-distinguisher-list)

Full Context

configure router policy-options route-distinguisher-list

Description

This command creates a list of entries used to match the RD in BGP routes of specific address families.

Parameters

name

Specifies the name of the RD list, up to 64 characters.

Platforms

7705 SAR Gen 2

route-distinguisher-list

Syntax

route-distinguisher-list *name*

no route-distinguisher-list *name*

Context

[Tree] (config>router>policy-options>policy-statement>entry>from route-distinguisher-list)

Full Context

configure router policy-options policy-statement entry from route-distinguisher-list

Description

This command configures a route distinguisher (RD) list as a match criterion for the policy statement entry.

This match condition is supported by policies applied as VRF import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the **route-distinguisher-list**.

BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4 or MVPN-IPv6 routes do not match policy entries with this match criterion.

Parameters

name

Specifies the (possibly parameterized) name of an RD list.

Platforms

7705 SAR Gen 2

26.76 route-exists

route-exists

Syntax

route-exists *expression*

no route-exists

Context

[Tree] (config>router>policy-options>policy-statement>entry>cond-expr route-exists)

Full Context

configure router policy-options policy-statement entry conditional-expression route-exists

Description

This command is used to specify a route existence expression to control evaluation of the policy entry. If the route existence expression evaluates to 'true' the matching and action commands of the policy entry are applied as normal. If the route existence expression evaluates to 'false' the entire policy entry is skipped and processing continues with the next entry; however, conditional expressions are only parsed when the route policy is used as a BGP export policy or VRF export policy.

Default

no route-exists

Parameters

expression

"["<pfx-list-name>"]" [all | none]

If neither the **all** nor the **none** keyword are used the match logic is 'any' – that is, the route expression evaluates as 'true' if any exact match entry in the referenced prefix-list has an active route in the route table associated with the policy.

all – the route expression evaluates as 'true' only if all the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

none – the route expression evaluates as 'true' only if none of the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

Full Context

configure service vpls bgp-evpn mpls route-next-hop

configure service epipe bgp-evpn mpls route-next-hop

Description

This command configures the next hop of the EVPN routes.

Default

route-next-hop system-ipv4

Parameters

system-ipv4

Specifies the system IPv4 address as the next hop for the service EVPN routes.

system-ipv6

Specifies the system IPv6 address as the next hop for the service EVPN routes.

ip-address

Specifies the IPv4 address value as the next hop for the service EVPN.

Values a.b.c.d

Platforms

26.79 route-preference

route-preference

Syntax
route-preference primary {**inband** | **outband**} **secondary** {**inband** | **outband** | **none**}
no route-preference

Context
[Tree] (config>log route-preference)

Full Context
configure log route-preference

Description

This command specifies the primary and secondary routing preference for traffic generated for SNMP notifications and syslog messages. If the remote destination is not reachable through the routing context specified by primary route preference then the secondary routing preference will be attempted.

The **no** form of this command reverts to the default values.

Default

no route-preference

Parameters

primary

Specifies the primary routing preference for traffic generated for SNMP notifications and syslog messages.

Default outband

secondary

Specifies the secondary routing preference for traffic generated for SNMP notifications and syslog messages. The routing context specified by the secondary route preference will be attempted if the remote destination was not reachable by the primary routing preference, specified by primary route preference. The value specified for the secondary routing preference must be distinct from the value for primary route preference.

Default inband

inband

Specifies that the logging utility will attempt to use the base routing context to send SNMP notifications and syslog messages to remote destinations.

outband

Specifies that the logging utility will attempt to use the management routing context to send SNMP notifications and syslog messages to remote destinations.

none

Specifies that no attempt will be made to send SNMP notifications and syslog messages to remote destinations.

Platforms

7705 SAR Gen 2

route-preference

Syntax

route-preference {**both** | **inband** | **outband**}

no route-preference

Context

[Tree] (config>system>security>ldap route-preference)

[Tree] (config>system>security>radius route-preference)

[Tree] (config>system>security>tacplus route-preference)

Full Context

configure system security ldap route-preference

configure system security radius route-preference

configure system security tacplus route-preference

Description

This command specifies the routing preference to reach the AAA server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

Default

route-preference both

Parameters

both

Specifies the use of out-of-band routes before in-band routes.

inband

Specifies the use of in-band routes only.

outband

Specifies the use of out-of-band routes only.

Platforms

7705 SAR Gen 2

route-preference

Syntax

route-preference {**both** | **inband** | **outband**}

no route-preference

Context

[Tree] (config>router>pcep>pcc>peer route-preference)

Full Context

configure router pcep pcc peer route-preference

Description

This command specifies the routing preference to reach the PCE server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

Default

route-preference both

Parameters

both

Specifies the use of out-of-band routes before in-band routes.

inband

Specifies the use of in-band routes only.

outband

Specifies the use of out-of-band routes only.

7705 SAR Gen 2

26.80 route-recovery-wait

route-recovery-wait

Syntax

route-recovery-wait *seconds*

no route-recovery-wait

Context

[Tree] (config>log>app-route-notifications route-recovery-wait)

Full Context

configure log app-route-notifications route-recovery-wait

Description

The time delay that must pass before notifying specific CPM applications after the recovery or change of a route during normal operation.

The **no** form of this command disables the time-delay configuration.

Default

no route-recovery-wait

Parameters

seconds

Time delay in seconds.

Values 1 to 100

Platforms

7705 SAR Gen 2

26.81 route-refresh

route-refresh

Syntax

route-refresh [**neighbor** *ip-address* | **group** *name*]

no route-refresh

Context

[Tree] (debug>router>bgp route-refresh)

Full Context

debug router bgp route-refresh

Description

This command enables debugging for BGP route-refresh.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H

- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

7705 SAR Gen 2

26.82 route-table

route-table

Syntax

route-table [*ip-prefix*/*prefix-length*]

route-table *ip-prefix*/*prefix-length* **longer**

no route-table

Context

[Tree] (debug>router>ip route-table)

Full Context

debug router ip route-table

Description

This command configures route table debugging.

Parameters

ip-prefix/prefix-length

The IP prefix for prefix list entry in dotted decimal notation.

Values			
	ipv4-prefix	a.b.c.d (host bits must be 0)	
	ipv4-prefix-length	0 to 32	
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x:	[0 to FFFF]H
		d:	[0 to 255]D

ipv6-prefix-length 0 to 128

longer

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values greater than the specified *mask*.

Platforms

7705 SAR Gen 2

Full Context

configure service vprn bgp rib-management ipv4 route-table-import

configure service vprn bgp rib-management label-ipv4 route-table-import

configure service vprn bgp rib-management ipv6 route-table-import

Description

This command specifies the name of a route policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

Default

no route-table-import

Parameters

policy-name

Specifies the name of a policy-statement (up to 64 characters).

Platforms

7705 SAR Gen 2

route-table-import

Syntax

route-table-import *policy-name*

no route-table-import

26.84 route-target

route-target

Syntax

route-target {*ext-community* **| {[export** *ext-community***][import** *ext-community***]}}**

no route-target

Context

[Tree] (config>service>epipe>bgp route-target)

[Tree] (config>service>vpls>bgp route-target)

Full Context

configure service epipe bgp route-target

configure service vpls bgp route-target

Description

This command configures the route target (RT) component that will be signaled in the related MP- BGP attribute to be used for BGP auto-discovery, BGP VPLS, BGP multi-homing and EVPN if these features are configured in this VPLS service, or for BGP multi-homing, BGP-VPWS and EVPN in case of Epipe services.

If this command is not used in VPLS services, the RT is built automatically using the VPLS ID. The extended community can have the same two formats as the VPLS ID, a two-octet AS-specific extended community, IPv4 specific extended community. For BGP EVPN enabled VPLS and Epipe services, the route target can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured.

Parameters

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

import *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

Platforms

7705 SAR Gen 2

26.85 route-target-list

route-target-list

Syntax

route-target-list *comm-id* [*comm-id*]]

no route-target-list [*comm-id*]

Context

[Tree] (config>router>bgp route-target-list)

Full Context

configure router bgp route-target-list

Description

This command specifies the route target(s) to be accepted from or advertised to peers. If the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted from or advertised to peers.

The **route-target-list** is assigned at the global level and applies to all peers connected to the system.

This command is only applicable if the router is a route-reflector server.

The **no** form of this command with a specified route target community removes the specified community from the **route-target-list**. The **no** form of this command entered without a route target community removes all communities from the list.

Default

no route-target-list

Parameters

comm-id

Specifies up to 15 route target communities.

Values [**target:** {*ip-address*:*comm-val* | *2byte-asnumber*:*ext-comm-val* | *4byte-asnumber*:*comm-val*}

where:

- *ip-address* — a.b.c.d

- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

Platforms

7705 SAR Gen 2

26.86 route-unknown

route-unknown

Syntax

[**no**] **route-unknown** [{*ip-prefix/mask* | *ipv6-address/prefix-length*}]

Context

[Tree] (config>vrrp>policy>priority-event route-unknown)

Full Context

configure vrrp policy priority-event route-unknown

Description

This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.

The **route-unknown** command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes correct action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.

The command creates a **route-unknown** node identified by *prefix/mask-length* and containing event control commands.

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the event operational states listed in Table 83: Route-unknown Operational States.

Table 83: Route-unknown Operational States

route-unknown Operational State	Description
Set – non-existent	The route does not exist in the route table
Set – inactive	The route exists in the route table but is not being used
Set – wrong next hop	The route exists in the route table but does not meet the **next-hop** requirements
Set – wrong protocol	The route exists in the route table but does not meet the **protocol** requirements
Set – less specific found	The route exists in the route table but does is not an exact match and does not meet any **less-specific** requirements
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the **less-specific** requirements
Cleared – found	The route exists in the route table manager and meets all criteria

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

Default

no route-unknown — No route unknown priority control events are defined for the priority control event policy.

Parameters

ip-prefix/mask

The IP prefix address in dotted decimal notation and the subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

Values

ip-prefix/mask:	ip-prefix	a.b.c.d (host bits must be 0)
	mask	0 to 32

ipv6-address/prefix-length

The IPv6 address of the host for which the specific event will monitor connectivity. The *ipv6-address* can only be monitored by a single event in this policy. The IPv6 address can be monitored by multiple VRRP priority control policies. The IPv6 address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ipv6-address* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0..FFFF]H
prefix-length	0 to 128

26.87 router

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>aaa>radius-srv-plcy>servers router)

Full Context

configure aaa radius-server-policy servers router

Description

This command specifies the virtual router instance applicable for the set of configured RADIUS servers. This value cannot be changed once a RADIUS server is configured for this policy.

The **no** form of this command reverts to the default.

Parameters

router-instance

Specifies the router instance.

Values

service-name	Service name, up to 64 characters.	
	router-instance:	router-name, service-id
	router-name:	Base, management
	service-id:	1 to 2147483647

service-name

Specifies the router name service-id up to 64 characters.

Platforms

7705 SAR Gen 2

router

Syntax

router [*router-instance*] [**create**]

no router [*router-instance*]

Context

[Tree] (config router)

Full Context

configure router

Description

Commands in this context configure router parameters including interfaces, route policies and protocols. This command is also used to create CPM router instances.

For CPM router instances, this command enters or creates a user-created CPM router instance. A CPM router instance is a not a VPRN router instance. VPRN router instances are configured under **configure service vprn**. CPM router instances are the only type of non-VPRN router instances that can be created

by a user, and they have a user-defined name. CPM router instances only use CPM/CCM ethernet ports as interfaces.

Parameters

router-instance

Specifies the router name or CPM router instance.

Values

router-instance : *router name*

router-name	Base | management | *cpm-vr-name*
cpm-vr-name	[32 characters maximum]

Default Base

create

Mandatory keyword when creating a router instance. The create keyword requirement can be enabled or disabled in the **environment**>**create** context.

Platforms

7705 SAR Gen 2

router

Syntax

router [*router-instance*]

router service-name *service-name*

Context

[Tree] (debug router)

Full Context

debug router

Description

Commands in this context enable debugging of various protocols and areas of a *router-instance*.

Parameters

router-instance

Specifies the router name, CPM router instance, or service ID.

Values *router-name* or *service-id*

router-instance : *router-name*

router-name Base | management | *cpm-vr-name*

cpm-vr-name [32 characters maximum]

service-id: 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

Platforms

7705 SAR Gen 2

router

Syntax

router *router-instance*

router service *vprn-service-name*

Context

[Tree] (config>system>file-trans-prof router)

Full Context

configure system file-transmission-profile router

Description

This command specifies the routing instance that the transport protocol uses.

Default

router Base

Parameters

router-instance

Specifies the router instance on which the file transmission connection will be established.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **router service** *vprn-service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

router-name: Base, management

router-name is an alias for input only. The *router-name* gets replaced with

an id automatically by SR OS in the configuration).

vprn-svc-id: 1 to 2147483647

Default Base

service vprn-service-name

Identifies the service, up to 64 characters.

Platforms

7705 SAR Gen 2

Syntax

router *router-instance*

router service *vprn-service-instance*

no router

Context

[Tree] (config>system>management-interface>remote-management router)

Full Context

configure system management-interface remote-management router

Description

This command defines the router instance in which all remote managers are reachable.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command configures management as the router (default).

Default

router management

Parameters

router-instance

Specifies a router instance on which the remote management connection is established, up to 32 characters.

service *vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

Platforms

7705 SAR Gen 2

router

Syntax

router *router-instance*

router service *vprn-service-instance*

no router

Context

[Tree] (config>system>management-interface>remote-management>manager router)

Full Context

configure system management-interface remote-management manager router

Description

This command defines the router instance in which this manager is reachable.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the router to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Default

management

Parameters

router-instance

Specifies the router instance on which the remote management connection is established for this manager, up to 32 characters.

service *vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

Platforms

7705 SAR Gen 2

router

Syntax

router *router-or-service*

router service-name *service-name*

no router

Context

[Tree] (config>oam-pm>session>ip router)

Full Context

configure oam-pm session ip router

Description

This command numerically references the source context from which the TWAMP Light packet is launched. The **router-instance** *router-instance* configuration, under the same context as the **router** command, is the preferred method for referencing. This method references the launch context by name, and not number, or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

Parameters

router-or-service

Specifies the numerical reference to the router instance or service. Well known router-name "Base" is allowed for convenience, but mapped numerically.

Values {*router-name* | *vprn-svc-id*}

router-name: Base

vprn-svc-id: 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

service-name

Specifies the alias function that allows the service-name to be used converted and stored as service ID, up to 64 characters. The parameter *router-instance* is preferred for specifying the router or service.

Platforms

7705 SAR Gen 2

router

Syntax

router *router-instance*

router service-name *service-name*

no router

Context

[Tree] (config>filter>redirect-policy router)

Full Context

configure filter redirect-policy router

Description

This command enhances VRF support in redirect policies. When a router instance is specified, the configured destination tests are run in the specified router instance, and the PBR action is executed in the specified router instance. If no destination is active or if the hardware does not support PBR action "next-hop router", action forward will be executed (i.e. routing will be performed in the context of the incoming interface routing instance).

The **no** form of the command preserves backward-compatibility. Tests always run in the "Base" routing instance context, and the PBR action executes in the routing context of the ingress interface that the filter using this redirect policy is deployed on.

Default

no router

Parameters

router-instance

Specifies a router instance in the form of **router-name** or **service-id**.

Values **router-name** — Base

service-id — Specifies an existing Layer 3 service [1 to 2147483647]

service-name

Specifies the name of a configured Layer 3 service.

Platforms

7705 SAR Gen 2

router

Syntax

router {**eq** | **neq**} *router-instance* [**regexp**]

no router

Context

[Tree] (config>log>filter>entry>match router)

Full Context

configure log filter entry match router

Description

This command specifies the log event matches for the router instance using a special vrtr-name format used by the logging system.

The **no** form of this command removes the log event matches.

Parameters

eq

Determines if the matching criteria should be equal to the specified value.

neq

Determines if the matching criteria should not be equal to the specified value.

router-instance

Specifies a router name, up to 32 characters, to be used in the match criteria. The router-instance in this command is a name for a router instance in a special format used in the logging system (called the vrtr-name). Examples of vrtr-names include **Base** and **vprn101** (where 101 is the service-id of the VPRN service). It represents the router instance that generated the log event.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of the specified router instance. When the **regexp** keyword is specified, the string in the **router** command is a regular expression string that is matched against the vrtr-name string in the log event being filtered.

Platforms

7705 SAR Gen 2

router

Syntax

router service-name *service-name*

[Tree] (config>system>security>mgmt-access-filter>ip-filter>entry router)

[Tree] (config>system>security>mgmt-access-filter>ipv6-filter>entry router)

Full Context

configure system security management-access-filter ip-filter entry router

configure system security management-access-filter ipv6-filter entry router

Description

This command configures a router name or service ID to be used as a management access filter match criterion.

The **no** form the command removes the router name or service ID from the match criteria.

Parameters

router-instance

Specifies one of the following parameters for the router instance:

router-name — Specifies a router name or CPM router instance, up to 32 characters to be used in the match criteria.

Values "Base" | "management" | "vpls-management"

Default Base

vprn-svc-id — Specifies a CPM router instance to be used in the match criteria.

Values 1 to 2147483647

service name

Specifies an existing service name, up to 64 characters.

26.89 router-id

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>service>vprn router-id)

[Tree] (config>service>vprn>ospf router-id)

[Tree] (config>service>vprn>bgp router-id)

Full Context

configure service vprn router-id

configure service vprn ospf router-id

configure service vprn bgp router-id

Description

This command sets the router ID for a specific VPRN context.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config>router** context. The default value for the base instance is inherited from the configuration in the **config>router** context. If the router ID in the **config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command removes the router ID definition from the given VPRN context.

Default

no router-id

Parameters

ip-address

The IP address must be given in dotted decimal notation.

Platforms

7705 SAR Gen 2

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>service>vprn>isis router-id)

Full Context

configure service vprn isis router-id

Description

This command sets the router ID for a specific VPRN context.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

The **no** form of this command removes the router ID definition from the given VPRN context.

Default

no router-id

Parameters

ip-address

The IP address must be given in dotted decimal notation.

Platforms

7705 SAR Gen 2

router-id

Syntax

[**no**] **router-id** *ip*

Context

[Tree] (config>router>mpls>srlg-database router-id)

Full Context

configure router mpls srlg-database router-id

Description

Commands in this context configure the link members of SRLG groups for a specific router in the network. The user must also use this command to enter the local interface SRLG membership into the user SRLG database. Use by CSPF of all interface SRLG membership information of a specific router ID may be temporarily disabled by shutting down the node. If this occurs, CSPF assumes these interfaces have no SRLG membership association.

The **no** form of this command will delete all interface entries under the router ID.

Parameters

ip-address

Specifies the router ID for this system. This must be the router ID configured under the base router instance, the base OSPF instance or the base IS-IS instance.

Platforms

7705 SAR Gen 2

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>router router-id)

Full Context

configure router router-id

Description

This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.

It is possible to configure SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol that uses the router ID, or restart the entire router.

The system uses the system interface address which is also the loopback address. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

The **no** form of this command removes the configured value and the last 32 bits of the chassis MAC address are used.

Default

no router-id

Parameters

ip-address

Specifies the 32 bit router ID expressed in dotted decimal notation or as a decimal value.

Platforms

7705 SAR Gen 2

router-id

Syntax

router-id *ip-address*

no router-id

Context

[Tree] (config>router>bgp router-id)

Full Context

configure router bgp router-id

Description

This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

When no **router-id** is configured for BGP, the system interface IP address is used.

Default

no router-id

Parameters

ip-address

Specifies the router ID, expressed as any non-zero value in the range 0.0.0.1 to 255.255.255.255 (or when converted to decimal it can have any value in the range 1-4294967295). It is recommended to use the system IPv4 address.

Description

This command configures the router ID for the OSPF instance. This command configures the router ID for the OSPF instance.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config**>**router** context.

The default value for the base instance is inherited from the configuration in the **config**>**router** context. If the router ID in the **config**>**router** context is not configured, the following applies:

- the system uses the system interface address (which is also the loopback address)
- if a system interface address is not configured, it uses the last 32 bits of the chassis MAC address

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command to reverts to the default value.

Platforms

7705 SAR Gen 2

26.90 router-instance

router-instance

Syntax

router-instance *router-instance*

no router-instance

Context

[Tree] (config>oam-pm>session>ip router-instance)

Full Context

configure oam-pm session ip router-instance

Description

This command references the source context from which the TWAMP Light packet is launched by name. The **router-instance** *router-instance* configuration is the preferred method for referencing and references the launch context by name, not number or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

Parameters

router-instance

Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes, up to 64 characters.

Platforms

7705 SAR Gen 2

router-instance

Syntax

router-instance *router-instance*

router-instance service *vprn-service-instance*

no router-instance

Context

[Tree] (config>system>telemetry>destination-group>destination router-instance)

[Tree] (config>system>grpc-tunnel>destination-group>destination router-instance)

Full Context

configure system telemetry destination-group destination router-instance

configure system grpc-tunnel destination-group destination router-instance

Description

This command configures the router instance for the destination group.

The **no** form of this command reverts to the default value.

Default

router-instance management

Parameters

router-instance

Specifies the router instance type, up to 32 characters.

Values management, base

vprn-service-instance

Specifies the VPRN service instance, up to 64 characters.

Platforms

7705 SAR Gen 2

router-instance

Syntax

[**no**] **router-instance** *service-id*

Context

[Tree] (config>router>static-route-entry>leak-dest router-instance)

Full Context

configure router static-route-entry leak-destination router-instance

Description

This command configures the static route leak destination router instance.

When a VPRN service is added to the list of VPRNs that receive a leaked copy of the static route, the static route is leaked into that VPRN if the following conditions are met:

- all configured next hops of the static route are direct next hops

- the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed

Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

When a VPRN receives a packet that matches a "VPN Leak" route that leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

The **no** form of this command removes the configuration.

Parameters

service-id

Specifies the service ID.

Values 1 to 2147483647 | svc-name: up to 64 characters

Platforms

7705 SAR Gen 2

26.91 router-lifetime

router-lifetime

Syntax

router-lifetime *seconds*

no router-lifetime

Context

[Tree] (config>service>vprn>router-advert>if router-lifetime)

Full Context

configure router router-advertisement interface router-lifetime

configure service vprn router-advertisement interface router-lifetime

Description

This command sets the router lifetime.

Default

router life-time 1800

Parameters

seconds

The length of time, in seconds, (relative to the time the packet is sent) that the prefix is valid for route determination.

Values 0, 4 to 9000 seconds. 0 means that the router is not a default router on this link.

Platforms

7705 SAR Gen 2

26.92 router-unsolicited-na-flood-evpn

router-unsolicited-na-flood-evpn

Syntax

[**no**] **router-unsolicited-na-flood-evpn**

Context

[Tree] (config>service>vpls>proxy-nd router-unsolicited-na-flood-evpn)

Full Context

configure service vpls proxy-nd router-unsolicited-na-flood-evpn

Description

This command controls whether the system floods router unsolicited Neighbor Advertisements to EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=1.

The **no** form of the command will only flood to local SAPs/binds but not to EVPN destinations. This is only recommended in networks where CEs are routers directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in EVPN to ensure that the remote caches are updated and BGP does not miss the advertisement of these entries.

Default

router-unsolicited-na-flood-evpn

Platforms

7705 SAR Gen 2

26.93 routing-type0

routing-type0

Syntax

routing-type0 {**true** | **false**}

no routing-type0

Context

[Tree] (config>filter>ipv6-filter>entry>match routing-type0)

Full Context

configure filter ipv6-filter entry match routing-type0

Description

This command enables match on existence of Routing Type Extension Header type 0 in the IPv6 filter policy.

The **no** form of this command ignores Routing Type Extension Header type 0 presence/absence in a packet when evaluating match criteria of a given filter policy entry.

Default

no routing-type0

Parameters

true

Specifies whether a packet contains Routing Type Extension Header type 0.

false

Specifies whether a packet does not contain Routing Type Extension Header type 0.

Platforms

7705 SAR Gen 2

26.94 rp

rp

Syntax

rp

Context

[Tree] (config>service>vprn>pim rp)

Full Context

configure service vprn pim rp

Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM protocol instance.

A Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending stop register message(s) to the first hop router. It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

Default

rp enabled when PIM is enabled.

Platforms

7705 SAR Gen 2

rp

Syntax

rp

Context

[Tree] (config>router>pim rp)

Full Context

configure router pim rp

Description

Commands in this context configure rendezvous point (RP) parameters. The address of the root of the group's shared multicast distribution tree is known as its RP. Packets received from a source upstream and join messages from downstream routers rendezvous at this router.

If this command is not enabled, then the router can never become the RP.

Platforms

[Tree] (config>service>vprn>pim>rp>ipv6 rp-candidate)

Full Context

configure service vprn pim rp rp-candidate

configure service vprn pim rp ipv6 rp-candidate

Description

Commands in this context configure the candidate rendezvous point (RP) parameters.

Default

enabled when PIM is enabled

Platforms

7705 SAR Gen 2

rp-candidate

Syntax

rp-candidate

Context

[Tree] (config>router>pim>rp rp-candidate)

[Tree] (config>router>pim>rp>ipv6 rp-candidate)

Full Context

configure router pim rp rp-candidate

configure router pim rp ipv6 rp-candidate

Description

Commands in this context configure the Candidate RP parameters.

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically, these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

Default

rp-candidate shutdown

Platforms

7705 SAR Gen 2

26.96 rp-set-peer

rp-set-peer

Syntax

[**no**] **rp-set-peer** *ip-address*

Context

[Tree] (config>service>vprn>pim>rp>anycast rp-set-peer)

Full Context

configure service vprn pim rp anycast rp-set-peer

Description

This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum of addresses that can be configured in an RP-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

Parameters

ip-address

Specifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

Platforms

7705 SAR Gen 2

rp-set-peer

Syntax

[**no**] **rp-set-peer** *ipv6-address*

Context

[Tree] (config>service>vprn>pim>rp>ipv6>anycast rp-set-peer)

Full Context

configure service vprn pim rp ipv6 anycast rp-set-peer

Description

This command configures an IPv6 peer in the anycast rp-set. The address identifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP- set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this rp-set.

Although there is no set maximum of addresses that can be configured in an rp-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

Parameters

ipv6-address

Specifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

Values

ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D

26.98 rpf-table

rpf-table

Syntax

rpf-table {**rtable-m** | **rtable-u** | **both**}

no rpf-table

Context

[Tree] (config>service>vprn>pim rpf-table)

Full Context

configure service vprn pim rpf-table

Description

This command configures the sequence of route tables used to find an RPF interface for a multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. The user can specify the following options:

- use the unicast route table only
- use the multicast route table only
- use both route tables

The **no** form of this command configures the router to only use the unicast route table.

Default

no rpf-table

Parameters

rtable-m

Keyword to specify that only the multicast route table is used by the multicast protocol (PIM) for IPv4 RPF checks. This route table contains routes submitted by static routes, IS-IS and OSPF.

rtable-u

Keyword to specify that only the unicast route table is used by the PIM for IPv4 RPF checks. This route table contains routes submitted by all the unicast routing protocols.

both

Keyword to specify that the multicast route table is used first by the PIM for checks. If the multicast route table lookup fails, the unicast route table is used.

Platforms

7705 SAR Gen 2

rpf-table

Syntax

rpf-table {**rtable-m** | **rtable-u** | **both**}

no rpf-table

Context

[Tree] (config>router>pim rpf-table)

Full Context

configure router pim rpf-table

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. However, the operator can specify one of the following:

- use the unicast route table only
- use the multicast route table only
- use both the route tables

The **no** form of this command reverts to the default value.

Default

rpf-table rtable-u

Parameters

rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

both

Specifies to always lookup first in the multicast route table and if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

Platforms

7705 SAR Gen 2

26.99 rpf6-table

rpf6-table

Syntax

rpf6-table {**rtable6-m** | **rtable6-u** | **both**}

no rpf6-table

Context

[Tree] (config>service>vprn>pim rpf6-table)

Full Context

configure service vprn pim rpf6-table

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a specific multicast route.

By default, only the unicast route table is looked up to calculate the RPF interface toward the source/rendezvous point. However, the operator can specify to use the following:

- unicast route table only
- multicast route table only
- both route tables

Default

rpf6-table rtable6-u

Parameters

rtable6-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable6-u

Specifies that only the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all unicast routing protocols.

both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for IPv6 RPF checks, then the unicast route table will be used if the multicast route table lookup fails.

Platforms

7705 SAR Gen 2

rpf6-table

Syntax

rpf6-table {**rtable6-m** | **rtable6-u** | **both**}

no rpf6-table

Context

[Tree] (config>router>pim rpf6-table)

Full Context

configure router pim rpf6-table

Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

- use unicast route table only
- use multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default value.

Default

rpf6-table rtable6-u

Parameters

rtable6-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable6-u

Specifies that only the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for IPv6 RPF checks, and then the unicast route table will be used if the multicast route table lookup fails.

26.100 rpfv

rpfv

Syntax

rpfv [**detail**]

no rpfv

Context

[Tree] (debug>router>pim rpfv)

Full Context

debug router pim rpfv

Description

This command enables debugging for PIM RPF vector.

The **no** form of this command disables debugging for PIM RPF vector.

Parameters

detail

Debugs detailed RPF vector information.

Platforms

7705 SAR Gen 2

rpfv

Syntax

rpfv core

rpfv mvpn

rpfv core mvpn

no rpfv [**core**] [**mvpn**]

Context

[Tree] (config>router>pim rpfv)

Full Context

configure router pim rpfv

Description

This command enables RPF Vector processing for Inter-AS Rosen MVPN Option-B and Option-C. The **rpfv** must be enabled on every node for Inter-AS Option B/C MVPN support.

If **rpfv** is configured, MLDP inter-AS resolution cannot be used. These two features are mutually exclusive.

The **no** form of this command reverts to the default.

Default

no rpfv

Parameters

mvpn

Enables MVPN RPF vector processing for Inter-AS Option B/C MVPN based on RFC 5496 and RFC 6513. If a core RPF vector is received, it will be dropped before a message is processed.

core

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

core mvpn

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

The **no** version of this command disables RPF Vector processing. If RPF vector is received in a PIM join message, the vector will be removed before local processing of PIM message starts.

Platforms

7705 SAR Gen 2

26.101 rpki-session

rpki-session

Syntax

[**no**] **rpki-session** *ip-address*

Context

[Tree] (config>router>origin-validation rpki-session)

Full Context

configure router origin-validation rpki-session

Description

This command configures a session with an RPKI local cache server by using the RPKI-Router protocol. It is over these sessions that the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-Router protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-Router session using the base routing table (in-band) or the management router (out-of-band). Configure the command in the **config**>**router management** instance to configure a session using the management port.

Default

no rpki-session

Parameters

ip-address

Specifies the IPv4 address or an IPv6 address. If the IPv6 address is link-local then the interface name must be appended to the IPv6 address after a hyphen (-).

Platforms

7705 SAR Gen 2

rpki-session

Syntax

[**no**] **rpki-session** *ip-address*

Context

[Tree] (debug>router rpki-session)

Full Context

debug router rpki-session

Description

This command enables and configures debugging for RPKI session.

The **no** form of this command disables debugging for RPKI session.

Parameters

ip-address

Debugs the RPKI session associated with the specified IP address.

Values

ipv4-address:	a.b.c.d	
ipv6-address	x:x:x:x:x:x:x:x	[-interface]

x:x:x:x:x:x:d.d.d.d	[-interface]
x:	[0 to FFFF]H
d:	[0 to 255]D
interface	up to 32 characters, mandatory for link local addresses

Full Context

debug router rsvp event rr

Description

This command debugs refresh reduction events.

The **no** form of the command disables the debugging.

Platforms

7705 SAR Gen 2

26.103 rr-use-route-table

rr-use-route-table

Syntax

rr-use-route-table

no rr-use-route-table

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes rr-use-route-table)

Full Context

configure router bgp next-hop-resolution labeled-routes rr-use-route-table

Description

This command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes.

Configure the **disable-route-table-install** command before you configure the **rr-use-route-table** command because forwarding would otherwise be incorrect for cases where label routes are resolved this way.

Default

no rr-use-route-table

Platforms

7705 SAR Gen 2

26.104 rs-fec-mode

rs-fec-mode

Syntax

rs-fec-mode *rs-fec-mode*

no rs-fec-mode

Context

[Tree] (config>port>connector rs-fec-mode)

Full Context

configure port connector rs-fec-mode

Description

This command is used for breakout connectors when all connector ports must use the same **rs-fec-mode** setting.

In all other cases, the **rs-fec-mode** is set using the **configure port ethernet rs-fec-mode** command for each individual connector port.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

Default

no rs-fec-mode

Parameters

rs-fec-mode

Specifies the RS-FEC mode to support.

Values cl91-514-528, cl91-514-544

Platforms

7705 SAR Gen 2

rs-fec-mode

Syntax

rs-fec-mode *rs-fec-mode*

no rs-fec-mode

Context

[Tree] (config>port>ethernet rs-fec-mode)

Full Context

configure port ethernet rs-fec-mode

Description

This command enables RS-FEC on the Ethernet port. RS-FEC Clause 91 is required for QSFP28, CFP4, 100GBase-SR4, 100GBase-ER4 lite, and CWDM4 for the QSFP28 package optics for short-reach optics.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

Default

no rs-fec-mode

Parameters

rs-fec-mode

Specifies the RS-FEC mode to support.

Values cl91-514-528, cl74, cl108

Full Context
configure system security user public-keys rsa rsa-key

Description
This command creates an RSA public key and associates it with the username. Multiple public keys can be associated with the user. The key ID is used to identify these keys for the user.

Parameters

create

Keyword used to create the RSA key. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

key-id

Specifies the key identifier.

Values 1 to 32

Platforms

7705 SAR Gen 2

26.107 rsa-signature

rsa-signature

Syntax

rsa-signature {**pkcs1** | **pss**}

Context

[Tree] (config>ipsec>cert-profile>entry rsa-signature)

Full Context

configure ipsec cert-profile entry rsa-signature

Description

This command specifies the signature scheme for RSA key.

Default

rsa-signature pkcs1

Parameters

pkcs1

Specifies the RSA pkcs#1 v1.5 signature scheme.

pss

Specifies the RSA probabilistic signature scheme.

Platforms

7705 SAR Gen 2

26.108 rsvp

rsvp

Syntax

[**no**] **rsvp**

Context

[Tree] (config>service>vprn>auto-bind-tunnel>res-filter rsvp)

[Tree] (config>service>vprn>bgp-evpn>mpls>auto-bind-tunnel>res-filter rsvp)

[Tree] (config>service>epipe>bgp-evpn>mpls>auto-bind-tunnel>res-filter rsvp)

Full Context

configure service vprn auto-bind-tunnel resolution-filter rsvp

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

Description

This command selects the RSVP-TE tunnel type.

The **rsvp** value instructs BGP to search for the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest **tunnel-id**.

The **no** form of this command removes the RSVP-TE tunnel type.

Default

no rsvp

Platforms

7705 SAR Gen 2

rsvp

Syntax

rsvp

Context

[Tree] (config>service>vprn>auto-bind-tunnel>res-filter rsvp)

Full Context

configure service vprn auto-bind-tunnel resolution-filter rsvp

Description

Note: This command is no longer supported and will be removed in a future release.

Platforms

7705 SAR Gen 2

rsvp

Syntax

[**no**] **rsvp**

Context

[Tree] (config>router rsvp)

Full Context

configure router rsvp

Description

Commands in this context configure RSVP protocol parameters. RSVP is not enabled by default and must be explicitly enabled (**no shutdown**).

RSVP is used to set up LSPs. RSVP should be enabled on all router interfaces that participate in signaled LSPs.

The **no** form of this command deletes this RSVP protocol instance and removes all configuration parameters for this RSVP instance. To suspend the execution and maintain the existing configuration, use the **shutdown** command. RSVP must be shutdown before the RSVP instance can be deleted. If RSVP is not shutdown, the **no rsvp** command does nothing except issue a warning message on the console indicating that RSVP is still administratively enabled.

Default

no shutdown

Platforms

7705 SAR Gen 2

rsvp

Syntax

rsvp [**lsp** *lsp-name*] [**sender** *source-address*] [**endpoint** *endpoint-address*] [**tunnel-id** *tunnel-id*] [**lsp-id** *lsp-id*] [**interface** *ip-int-name*]

no rsvp

Context

[Tree] (debug>router rsvp)

Full Context

debug router rsvp

Description

This command enables and configures debugging for RSVP.

Parameters

lsp *lsp-name*

Specifies the LSP name up to 64 characters in length.

sender *source-address*

Specifies the IP address of the sender.

endpoint *endpoint-address*

Specifies the far-end IP address.

tunnel-id *tunnel-id*

Specifies the RSVP tunnel ID.

Values 0 to 4294967295

lsp-id *lsp-id*

Specifies the LSP ID.

Values 1 to 65535

interface *ip-int-name*

Specifies the interface name. The interface name can be up to 32 characters long and must be unique. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

[Tree] (config>router>bgp>next-hop-res>lbl-routes>transport-tunn>family>res-filter rsvp)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter rsvp

configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter rsvp

Description

This command selects RSVP tunneling for next-hop resolution and specifies RSVP tunnels in a tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next-hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.

Platforms

This command selects the RSVP-TE tunnel type in the resolution of the IP prefix or SR tunnel family using IGP shortcuts.

Platforms

7705 SAR Gen 2

26.109 rsvp-resv-style

rsvp-resv-style

Syntax

rsvp-resv-style [**se** | **ff**]

Context

[Tree] (config>router>mpls>lsp rsvp-resv-style)

Full Context

configure router mpls lsp rsvp-resv-style

Description

This command specifies the RSVP reservation style, shared explicit (se) or fixed filter (ff). A reservation style is a set of control options that specify a number of supported parameters. The style information is part of the LSP configuration.

Default

rsvp-resv-style se

Parameters

ff

Fixed filter is single reservation with an explicit scope. This reservation style specifies an explicit list of senders and a distinct reservation for each of them. A specific reservation request is created for data packets from a particular sender. The reservation scope is determined by an explicit list of senders.

se

Shared explicit is shared reservation with a limited scope. This reservation style specifies a shared reservation environment with an explicit reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. Because each sender is explicitly listed in the RESV message, different labels can be assigned to different sender-receiver pairs, thereby creating separate LSPs.

Description

This command debugs the OSPFv2 RSVP shortcut.

Parameters

ip-address

Specifies the IP address to debug.

Platforms

7705 SAR Gen 2

26.111 rsvp-te

rsvp-te

Syntax

rsvp-te *value*

no rsvp-te

Context

[Tree] (config>router>mpls>tunnel-table-pref rsvp-te)

Full Context

configure router mpls tunnel-table-pref rsvp-te

Description

This command configures the tunnel table preference for RSVP-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default.

Default

rsvp-te 7

Parameters

value

Specifies the tunnel table preference value for RSVP-TE LSP.

Values 1 to 255

Default 7

Platforms

7705 SAR Gen 2

rsvp-te

Syntax

[**no**] **rsvp-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter rsvp-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te

Description

This command enables the use of RSVP-TE sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The rsvp-te value instructs the code to search for the set of lowest metric RSVP-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of RSVP-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of RSVP-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value will be selected.

A P2P auto-lsp that is instantiated via an LSP template can be selected in TTM when resolution is set to any. However, Nokia does not recommend configuring an auto-lsp name explicitly under the rsvp-te node as the auto-generated name can change if the node reboots, which will blackhole the traffic of the static route.

Default

no rsvp-te

26.114 rtr-adv-lsa-limit

rtr-adv-lsa-limit

Syntax

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*]

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout forever**

rtr-adv-lsa-limit [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout** *seconds*

no rtr-adv-lsa-limit

Context

[Tree] (config>service>vprn>ospf rtr-adv-lsa-limit)

Full Context

configure service vprn ospf rtr-adv-lsa-limit

Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time the system automatically attempts to restart OSPF. One possible value for the **overload-timeout** is **forever**, which means OSPF is never restarted automatically and this corresponds to the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

Default

rtr-adv-lsa-limit forever

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

percent

The threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

seconds

Specifies duration in seconds before restarting OSPF.

Values 1 to 1800

Platforms

7705 SAR Gen 2

rtr-adv-lsa-limit

Syntax

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*]

rtr-adv-lsa-limit *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** {*seconds* | **forever**}]

no rtr-adv-lsa-limit

Context

[Tree] (config>router>ospf rtr-adv-lsa-limit)

[Tree] (config>router>ospf3 rtr-adv-lsa-limit)

Full Context

configure router ospf rtr-adv-lsa-limit

configure router ospf3 rtr-adv-lsa-limit

Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time, the system automatically exits overload. One possible value for the **overload-timeout** is **forever**, which means OSPF is never exiting overload.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

Default

no rtr-adv-lsa-limit

Parameters

log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

Values 0 to 100

limit

Specifies the number of LSAs, expressed as a decimal integer, that can be learned.

Values 1 to 4294967295

second

Specifies duration in minutes before restarting OSPF.

Values Values 1 to 1800

forever

Specifies that OSPF is restarted only after the **clear router ospf | ospf3 overload rtr-adv-lsa-limit** command is executed.

Platforms

7705 SAR Gen 2

26.115 rx-los-reaction

rx-los-reaction

Syntax

rx-los-reaction {**squelch**}

no rx-los-reaction

Context

[Tree] (config>port>dwdm>coherent rx-los-reaction)

Full Context

configure port dwdm coherent rx-los-reaction

Description

This command configures the reaction to an RX LOS.

Note:
If **rx-los-reaction squelch** is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if **rx-los-reaction squelch** is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, and no-am-lock), but the port takes longer to return to service after the LOS condition is cleared.

Parameters

squelch

Specifies to squelch (turn off) the transmit signal on RX LOS.

Platforms

7705 SAR Gen 2

26.116 rx-los-thresh

rx-los-thresh

Syntax

rx-los-thresh *threshold*

Context

[Tree] (config>port>dwdm>coherent rx-los-thresh)

Full Context

configure port dwdm coherent rx-los-thresh

Description

This command configures the average input power LOS threshold.

Default

-23.00

Parameters

threshold

Specifies the RX LOS threshold.

Values -30.00 to -13.00

Platforms

7705 SAR Gen 2

26.117 rx-must-be-encrypted

rx-must-be-encrypted

Syntax

[**no**] **rx-must-be-encrypted**

Context

[Tree] (config>port>ethernet>dot1x>macsec rx-must-be-encrypted)

Full Context

configure port ethernet dot1x macsec rx-must-be-encrypted

Description

When the **rx-must-be-encrypted** option is enabled, all traffic that is not MACsec-secured that is received on the port is dropped.

When the **rx-must-be-encrypted** option is disabled, all arriving traffic, whether MACsec secured or not, will be accepted.

Note:
This command is only available on the NULL port level and does not have per-VLAN granularity.

The **no** form of this command disables the **rx-must-be encrypted** option.

Default

rx-must-be-encrypted

Platforms

7705 SAR Gen 2

27.1 s-pmsi

s-pmsi

Syntax

s-pmsi [{*vpnSrcAddr* [*vpnGrpAddr*]} [*mdSrcAddr*]]

no s-pmsi

Context

[Tree] (debug>router>pim s-pmsi)

Full Context

debug router pim s-pmsi

Description

This command enables debugging for PIM selective provider multicast service interface.

The **no** form of this command disables the debugging.

Parameters

vpnSrcAddr

Specifies the VPN source address.

vpnGrpAddr

Specifies the VPN group address.

mdSrcAddr

Specifies the source address of the multicast domain.

Platforms

7705 SAR Gen 2

27.2 sa-mac

sa-mac

Syntax

sa-mac *ieee-address* **da-mac** *ieee-address*

no sa-mac

Context

[Tree] (config>mirror>mirror-dest>sap>egress>ip-mirror sa-mac)

Full Context

configure mirror mirror-dest sap egress ip-mirror sa-mac

Description

This command configures the source and destination MAC addresses for IP mirroring.

The **no** form of this command reverts to the default.

Parameters

sa-mac *ieee-address*

Specifies the source MAC address. Multicast, Broadcast and zeros are not allowed.

da-mac *ieee-address*

Specifies the destination MAC address. Zeros are not allowed.

Platforms

7705 SAR Gen 2

27.3 saa

saa

Syntax

saa

Context

[Tree] (config saa)

Full Context

configure saa

Description

Commands in this context configure the Service Assurance Agent (SAA) tests.

Platforms

7705 SAR Gen 2

saa

Syntax

saa *test-name* [**owner** *test-owner*] {**start** | **stop**} [**no-accounting**]

Context

[Tree] (oam saa)

Full Context

oam saa

Description

This command starts or stops an SAA test that is not configured as continuous.

Parameters

test-name

Specifies the name of the SAA test, up to 32 characters. The test name must already be configured in the **config>saa>test** context.

test-owner

Specifies the owner of an SAA operation, up to 32 characters. If a *test-owner* value is not specified, the default owner is used.

Default "TiMOS CLI"

start

Starts the test. A test cannot be started if the same test is still running.

A test cannot be started if it is in a shut-down state. An error message and log event is generated to indicate a failed attempt to start an SAA test run. A test cannot be started if it is in a continuous state.

stop

Stops a test in progress. A test cannot be stopped if it is not in progress. A log message is generated to indicate that an SAA test run has been aborted. A test cannot be stopped if it is in a continuous state.

no-accounting

Disables the recording results in the accounting policy. When specifying **no-accounting** the MIB record produced at the end of the test is not added to the accounting file. It uses one of the three MIB rows available for the accounting module for collection.

Platforms

7705 SAR Gen 2

saii-type2

Syntax

saii-type2 *global-id:prefix:ac-id*

no saii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec saii-type2)

Full Context

configure service epipe spoke-sdp-fec saii-type2

Description

This command configures the source attachment individual identifier for the spoke-sdp. This is only applicable to FEC129 AII type 2.

Parameters

global-id

A Global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

The prefix on this router T-PE that the spoke-sdp SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

An unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

27.5 same-recipnonce-for-pollreq

same-recipnonce-for-pollreq

Syntax

sample-interval

Syntax

sample-interval *interval*

Context

[Tree] (config>system>telemetry>persistent-subscriptions>subscription sample-interval)

Full Context

configure system telemetry persistent-subscriptions subscription sample-interval

Description

This command configures the sample interval for persistent subscription.

This sampling interval only applies when the **mode** command is set to either **target-defined** or **sample**.

Default

sample-interval 10000

Parameters

interval

Specifies the sample interval, in milliseconds.

Values 1000 to 4294967295

Platforms

7705 SAR Gen 2

27.7 sap

sap

Syntax

sap *sap-id* [**split-horizon-group** *group-name*] [**create**] [**capture-sap**] [**eth-ring** *ring-index*]

sap *sap-id* [**split-horizon-group** *group-name*] [**create**] [**capture-sap**] [**eth-ring** *ring-index*] **leaf-ac**

sap *sap-id* [**split-horizon-group** *group-name*] [**create**] [**capture- sap**] [**eth-ring** *ring-index*] **root-leaf-tag leaf-tag** *leaf-tag*

no sap *sap-id*

Context

[Tree] (config>service>vpls sap)

Full Context

configure service vpls sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the 7705 SAR Gen 2. Each SAP must be unique. All SAPs must be explicitly created within a service or on an IP interface.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command. Channelized TDM ports are always access ports.

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service is discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Ethernet Service (IES), the IP interface must be shut down before the SAP on that interface may be removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number [.channel] format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

group-name

Specifies the name of the split horizon group to which the SAP belongs.

capture-sap

Specifies a capturing SAP in which triggering packets are sent to the CPM. Non-triggering packets captured by the capture SAP are dropped.

create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

root-leaf-tag

Specifies a SAP as a root leaf tag SAP. Only SAPs of the form dot1q (for example, 1/1/1:X) or qinq (for example, 1/1/1:X.Y, 1/1/1:X.*) are supported. The default E-Tree SAP type is a root AC, if *root-leaf-tag* **(**or *leaf-ac***)** is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

leaf-tag-vid

Specifies to replace the outer SAP-ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

leaf-ac

Specifies a SAP as a leaf access (AC) SAP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

Platforms

7705 SAR Gen 2

sap

Syntax

sap *sap-id* [**create**] [**no-endpoint**]

sap *sap-id* [**create**] **endpoint** *endpoint-name*

sap *sap-id* [**create**] [**qtag-normalization**] [[*tag*] | [*s-tag*.*c-tag*]]

no sap *sap-id*

Context

[Tree] (config>service>epipe sap)

Full Context

configure service epipe sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port. Channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support null, dot1q, and qinq is supported for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP will also be deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed.

By default, no SAPs are defined.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP.

port-id

Specifies the physical port ID.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

port-id	*slot*/*mda*/*port* [.*channel*]		
	eth-sat-id	esat-*id*/*slot*/*port*	
		esat	keyword
		id	1 to 20
	pxc-id	pxc-*id*.*sub-port*	
		pxc	keyword
		id	1 to 64
		sub-port	a, b

endpoint

Adds a SAP endpoint association.

no endpoint

Removes the association of a SAP or a spoke SDP with an explicit endpoint name.

create

Keyword to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

qtag-normalization

Keyword to enable Q-tag normalization.

tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 0 to 4094

s-tag

Specifies the value for tag normalization. The tag value is pushed as the S-tag (outer tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized C-tag value are sent to the associated SAP.

Values 0 to 4094

c-tag

Specifies the value for tag normalization. The tag value is pushed as the C-tag (inner tag) into the frames coming from this SAP and sent to EVPN. On network ingress, the inner and outer VLAN tags are looked up and the frames matching this value and the normalized S-tag value are sent to the associated SAP.

Values 0 to 4094

Platforms

7705 SAR Gen 2

Output

The following output is an example of VLL SAP information.

Output Example

```
*A:test>config>service>epipe 200 name "200" customer 1 info detail
------------------------------------------------------------------
            sap 1/1/c5/1:200.200 create
                no shutdown
            exit
            sap pw-21:200.200 create
                no shutdown
            exit
            no shutdown
        exit
    exit
------------------------------------------------------------------
```

Syntax

sap *sap-id* [**create**]

no sap *sap-id*

Context

[Tree] (config>service>ies>if sap)

[Tree] (config>service>vprn>if sap)

Full Context

configure service ies interface sap

configure service vprn interface sap

Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port** *port-id* **ethernet mode access** command. Channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Note:
Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap** *sap-id* command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed. The no form of this command causes the ptp-hw-assist to be disabled.

Default

No SAPs are defined.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

port-id

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot_number/MDA_number/port_number format. For example 61/2/3 specifies port 3 on MDA 2 in slot 61.

Table 84: Port ID Syntax

null	*port-id* | lag-*id*
dot1q	{port-id | lag-id}:{qtag1 | cp-conn-prof-id
qinq	{*port-id* | lag-*id*}:{*qtag1* | cp-*conn-prof-id*}.{*qtag2* | cp-*conn-prof-id*} cp: keyword

	conn-prof-id: 1 to 8000	
port-id	slot/mda/port [.channel]	
	eth-sat-id	esat-id/slot/port
		esat: keyword
		id: 1 to20
	pxc-id	psc-id.sub-port
		pxc psc-id.sub-port
		pxc: keyword
		id: 1 to 64
		sub-port: a, b
lag-id	lag-id	lag: keyword
		id: 1 to 800
qtag1	0 to 4094	
qtag2	* | null | 0 to 4094	

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

Context

[Tree] (config>mirror>mirror-dest sap)

Full Context

configure mirror mirror-dest sap

Description

This command creates a service access point (SAP) within a mirror destination service. The SAP is owned by the mirror destination service ID.

The SAP is defined with port and encapsulation parameters to uniquely identify the (mirror) SAP on the interface and within the box. The specified SAP may be defined on an Ethernet access port with a dot1q, null, or q-in-q encapsulation type.

Only one SAP can be created within a **mirror-dest** service ID. If the defined SAP has not been created on any service within the system, the SAP is created and the context of the CLI will change to the newly created SAP. In addition, the port cannot be a member of a multi-link bundle, APS group or IMA bundle.

If the defined SAP exists in the context of another service ID, **mirror-dest** or any other type, an error is generated.

Mirror destination SAPs can be created on Ethernet interfaces that have been defined as an access interface. If the interface is defined as network, the SAP creation returns an error.

When the **no** form of this command is used on a SAP created by a mirror destination service ID, the SAP with the specified port and encapsulation parameters is deleted.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

no-endpoint

Removes the association of a SAP or a sdp with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

Platforms

7705 SAR Gen 2

no sap *sap-id* [**egress**] [**ingress**]

Context

[Tree] (config>mirror>mirror-source sap)

Full Context

configure mirror mirror-source sap

Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command will not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP will not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts.

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

egress

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

ingress

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

[Tree] (config>service>vpls>proxy-arp>dynamic sap)

Full Context

configure service vpls proxy-nd dynamic sap

configure service vpls proxy-arp dynamic sap

Description

This command configures the proxy ARP or ND entry for creation when the ARP or neighbor advertisement (NA) packet for the configured IP address is received on the configured SAP. This command can be configured in combination with the **configure service vpls proxy-arp dynamic mac-list** or **configure service vpls proxy-nd dynamic mac-list** command for the entry. In this case, the MAC of the ARP or NA message and the SAP on which the ARP or NA packet is received are both checked before creating the entry.

The **no** form of this command removes the SAP as the match criterion.

Default

no sap

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

sap-egress

Syntax

sap-egress {*policy-id* | *policy-name*} [**create**] [**name** *name*]

no sap-egress {*policy-id* | *policy-name*}

Context

[Tree] (config>qos sap-egress)

Full Context

configure qos sap-egress

Description

This command is used to create or edit a Service Egress QoS policy. The egress policy defines the SLA for service packets as they egress on the SAP.

Policies are templates that can be applied to multiple services as long as the scope of the policy is template. The queues defined in the policy are not instantiated until a policy is applied to a service.

Sap-egress policies determine queue mappings based on ingress DSCP, IP precedence, dot1p, and IPv4 or IPv6 match criteria. Multiple queues can be created per forwarding class and each queue can have different CIR or PIR parameters.

Egress SAP QoS policies allow the definition of queues and the mapping of forwarding classes to those queues. Each queue needs to have a relative CIR for determining its allocation of QoS resources during periods of congestion. A PIR can also be defined that forces a hard limit on the packets transmitted through the queue. When the forwarding class is mapped to the queue, a DSCP, IP precedence, or dot1p value can optionally be specified.

The sap-egress policy with *policy-id* 1 is the default sap-egress QoS policy and is applied to service egress SAPs when an explicit policy is not specified or removed. The default sap-egress policy cannot be modified or deleted.

By default, all forwarding classes map to queue 1.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all egress SAPs where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area *policy-id*. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config qos copy** command to maintain policies in this manner.

The **no** form of this command deletes the sap-egress policy. A policy cannot be deleted until it is removed from all service SAPs where it is applied. When a sap-egress policy is removed from a SAP, the SAP will revert to the default sap-egress *policy-id* 1.

Parameters

policy-id

The *policy-id* uniquely identifies the policy on the router.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum.

create

Required parameter when creating a SAP QoS egress policy.

name

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider or administrator to identify and manage sap-egress policies within the SR OS platforms.

All sap-egress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

27.10 sap-ingress

sap-ingress

Syntax

sap-ingress {*policy-id* | *policy-name*} [**create**] [**name** *name*]

no sap-ingress {*policy-id* | *policy-name*}

Context

[Tree] (config>qos sap-ingress)

Full Context

configure qos sap-ingress

Description

This command is used to create or edit the ingress policy. The ingress policy defines the SLA enforcement that service packets receive as they ingress a SAP. SLA enforcement is accomplished through the definition of queues that have Forwarding Class (FC), Fair Information Rate (FIR), Committed Information Rate (CIR), Peak Information Rate (PIR), Committed Burst Size (CBS), and Maximum Burst Size (MBS) characteristics.

Policies in effect are templates that can be applied to multiple services as long as the **scope** of the policy is template. Queues defined in the policy are not instantiated until they are assigned to at least one forwarding class and a policy is applied to a service SAP.

It is possible that a SAP ingress policy will include the **dscp** map command, the **dot1p** map command, and an IP or MAC match criteria. When multiple matches occur for the traffic, the order of precedence will be used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The SAP ingress policy with *policy-id* 1 is a system-defined policy applied to services when no other policy is explicitly specified. The system SAP ingress policy cannot be modified or deleted. The default SAP ingress policy defines one unicast and one multipoint queue associated with all forwarding classes, with an FIR of zero, a CIR of zero, and a PIR of line rate.

Any changes made to the existing policy, using any of the sub-commands, are applied immediately to all services where this policy is applied. For this reason, when many changes are required on a policy, it is recommended that the policy be copied to a work area policy ID. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config>qos>copy** command to maintain policies in this manner.

The **no** form of this command deletes the SAP ingress policy. A policy cannot be deleted until it is removed from all services where it is applied.

Parameters

policy-id

The *policy-id* uniquely identifies the policy.

Values 1 to 65535

policy-name

The *policy-name* uniquely identifies the policy.

Values 64 characters maximum

create

Required parameter when creating a SAP QoS ingress policy.

name *name*

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider and administrator to identify and manage sap-ingress policies within the SR OS platforms.

All sap-ingress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy after it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

no sap-template-binding

Context

[Tree] (config>service>vpls>vpls-group sap-template-binding)

Full Context

configure service vpls vpls-group sap-template-binding

Description

This command configures the binding to a SAP template to be used to instantiate SAPs in the data VPLS using as input variables the VLAN IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related SAP instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group is in no shutdown state. Any changes to the **sap-template-binding** require the **vpls-group** to be in **shutdown** state. New control SAP additions to the management VPLS are allowed as long as data VPLS instantiations/removals for vpls-groups are not in progress. Control SAPs can be removed at any time generating the removal of related data SAPs from the data VPLS. The **shutdown** or **no shutdown** state for the control SAPs does not have any effect on data SAPs instantiated with this command.

Default

no sap-template-binding

Parameters

name

Specifies the name of the VPLS template

Values ASCII character string

id

Specifies the ID of the VPLS template

Values 1 to 8196

Platforms

27.12 save

save

Syntax

save [*cflash-id*]

Context

[Tree] (bof save)

Full Context

bof save

Description

This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of *bof.cfg*.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

Command usage:

- **bof save** — saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B)
- **bof save cf3:** — saves the BOF to cf3: on the active CPM (either in slot A or B)

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify -A or -B option.

Command usage:

- **bof save cf3-A:** — saves the BOF to cf3: on CPM in slot A whether it is active or standby
- **bof save cf3-B:** — saves the BOF to cf3: on CPM in slot B whether it is active or standby

The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

Default

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

Parameters

flash-id

Specifies the compact flash ID where the *bof.cfg* is to be saved.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default cf3:

save *file-url*

Context

[Tree] (candidate save)

Full Context

candidate save

Description

This command saves the current candidate to a file.

Parameters

file-url

Specifies the directory and filename.

Platforms

7705 SAR Gen 2

save

Syntax

save [**comment** *comment*] [**rescue**]

Context

[Tree] (admin>rollback save)

Full Context

admin rollback save

Description

If the optional **rescue** keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of .rb. The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, and so on). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the **rescue** keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue location. The filename will have the suffix .rc appended.

Parameters

comment-string

Specifies a comment, up to 255 characters, that is associated with the checkpoint.

rescue

Saves the rescue checkpoint instead of a normal rollback checkpoint.

Platforms

7705 SAR Gen 2

save

Syntax

save [*file-url*] [**detail**] [**index**]

Context

[Tree] (admin save)

Full Context

admin save

Description

This command saves the running configuration to a configuration file. For example:

```
A:ALA-1>admin# save ftp://test:test@192.168.x.xx/./100.cfg
Saving configuration .........Completed.
```

By default, the running configuration is saved to the primary configuration file.

Parameters

file-url

Specifies the file URL location to save the configuration file.

Values		
	local-url | *remote-url*	
	local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
		directory length 99 chars max each
	remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn*/][*file-path*]
		243 chars max
		directory length 99 chars max each
	remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
	ipv4-address	*a.b.c.d*
	ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
		x:x:x:x:x:x:d.d.d.d[*-interface*]
		x - [0 to FFFF]H
		d - [0 to 255]D
		interface - 32 chars max, for link local addresses

cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the primary configuration file location

detail

Saves both default and non-default configuration parameters.

index

Forces a save of the persistent index file regardless of the persistent status in the BOF file. The index option can also be used to avoid an additional boot required while changing your system to use the persistence indexes.

27.13 save-when-restricted

save-when-restricted

Syntax

[no] save-when-restricted

Context

[Tree] (config>system>security>user save-when-restricted)

[Tree] (config>system>security>user-template save-when-restricted)

Full Context

configure system security user save-when-restricted

configure system security user-template save-when-restricted

Description

This command specifies whether the system permits configuration save operations for all configuration regions (bof, debug, configure, li) via any management interface (such as CLI and NETCONF) even if **restricted-to-home** is enabled.

The configuration for a region can be saved with CLI commands such as **bof save**, **admin debug-save**, **admin save**, or **configure li save**.

The **no** form of this command denies saving the configuration when **restricted-to-home** is enabled.

Default

save-when-restricted

Platforms

7705 SAR Gen 2

27.14 saved-ind-prompt

saved-ind-prompt

Syntax

[**no**] **saved-ind-prompt**

Context

[Tree] (environment saved-ind-prompt)

Full Context

environment saved-ind-prompt

Description

This command enables saved indicator in the prompt. When changes are made to the configuration file a "*" appears in the prompt string indicating that the changes have not been saved. When an **admin save** command is executed the "*" disappears.

```
*A:ALA-48# admin save
Writing file to ftp://192.0.2.43/./sim48/sim48-config.cfg
Saving configuration .... Completed.
A:ALA-48#
```

27.15 schedule

schedule

Syntax

[**no**] **schedule** *schedule-name* [**owner** *schedule-owner*]

Context

[Tree] (config>system>cron schedule)

Full Context

configure system cron schedule

Description

This command configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds).

The **no** form of the command removes the context from the configuration.

Parameters

schedule-name

Specifies the name of the schedule. The name can be up to 32 characters.

schedule-owner

Specifies the owner name of the schedule. The name can be up to 32 characters.

Default TiMOS CLI

Platforms

7705 SAR Gen 2

27.16 schedule-type

schedule-type

Syntax

schedule-type *schedule-type*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update schedule-type)

Full Context

configure system security pki ca-profile auto-crl-update schedule-type

Description

This command specifies the schedule type for auto CRL update. The system supports two types:

- **periodic**: — The system will download a CRL periodically at the interval configured via the **periodic-update-interval** command. For example, if the periodic-update-interval is 1 day, then the system will download a CRL every 1 day. The minimal periodic-update-interval is 1 hour.
- **next-update-based** — The system will download a CRL at the time = Next_Update_of_existing_CRL *minus* pre-update-time. For example, if the Next-Update of the existing CRL is 2015-06-30 06:00 and pre-update-time is 1 hour, then the system will start downloading at 2015-06-30, 05:00.

Default

schedule-type next-update-based

Parameters

schedule-type

Specifies the type of time scheduler to update the CRL.

Values periodic, next-update-based

Platforms

7705 SAR Gen 2

27.17 scheduler

scheduler

Syntax

scheduler *scheduler-name* [**create**]

no scheduler *scheduler-name*

Context

[Tree] (config>service>vpls>sap>egress>sched-override scheduler)

Full Context

configure service vpls sap egress scheduler-override scheduler

Description

This command overrides specific attributes of the specified scheduler name.

A scheduler defines a bandwidth control that limits each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context does not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command does not execute, nor does the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error occurs, the command does not execute, and the CLI context does not change.

The **no** form of this command removes the scheduler name from the configuration.

Parameters

scheduler-name

Specifies name of the scheduler

Values Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

create

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

Platforms

7705 SAR Gen 2

scheduler

Syntax

scheduler *scheduler-name* [**create**]

no scheduler *scheduler-name*

configure service ies interface sap ingress scheduler-policy

configure service vprn interface sap egress scheduler-policy

configure service vpls sap ingress scheduler-policy

configure service ies interface sap egress scheduler-policy

configure service vpls sap egress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the ingress SAP queues and egress SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no scheduler-policy** command is executed, the customer site's ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

Specifies that the *scheduler-policy-name* is applied to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues created on associated SAPs.

Values Any existing valid scheduler policy name.

Platforms

7705 SAR Gen 2

scheduler-policy

Syntax

scheduler-policy *scheduler-policy-name*

no scheduler-policy

Context

[Tree] (config>port>ethernet>network>egress>queue-group scheduler-policy)

[Tree] (config>service>epipe>sap>egress scheduler-policy)

Full Context

configure service epipe sap ingress scheduler-policy

configure service epipe sap egress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created when the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the ingress SAP queues associated with the customer site. Policers or queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

The *scheduler-policy-name* parameter applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and to egress policers managed by HQoS created on associated SAPs.

Platforms

7705 SAR Gen 2

scheduler-policy

Syntax

scheduler-policy *scheduler-policy-name* [**create**]

no scheduler-policy *scheduler-policy-name*

Context

[Tree] (config>qos scheduler-policy)

Full Context

configure qos scheduler-policy

Description

Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations.

The **scheduler-policy** command creates a scheduler policy or allows editing of an existing policy. The policy defines the hierarchy and operating parameters for virtual schedulers. Creating a policy does not create the schedulers; it only provides a template for the schedulers to be created when the policy is associated with a SAP or multiservice site.

Each scheduler policy must have a unique name within the context of the system. Modifications made to an existing policy are executed on all schedulers that use the policy. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If a *scheduler-policy-name* does not exist, it is assumed that an attempt is being made to create a new policy. The success of the command execution is dependent on the following:

1. The maximum number of scheduler policies has not been configured.
2. The provided scheduler-policy-name is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of scheduler policies has been exceeded, a configuration error occurs, the command will not execute, and the CLI context will not change.

If the provided scheduler-policy-name is invalid according to the criteria below, a name syntax error occurs, the command will not execute, and the CLI context will not change.

Parameters

scheduler-policy-name

The name of the scheduler policy.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, etc.), the entire string must be enclosed within double quotes.

Full Context

configure service customer multi-service-site egress scheduler-policy

configure service customer multi-service-site ingress scheduler-policy

Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues or, at egress only, policers associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler.

The SAPs that have ingress queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers and queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

Parameters

scheduler-policy-name

Applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and egress policers managed by HQoS created on associated SAPs.

Values Any existing valid scheduler policy name up to 32 characters in length.

27.20 schema-path

schema-path

Syntax

schema-path *url-string*

no schema-path

Context

[Tree] (config>system>management-interface schema-path)

Full Context

configure system management-interface schema-path

Description

This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files.

If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM.

The **no** form of this command reverts to the default value.

Default

no schema-path

Parameters

url-string

Specifies the schema path URL up to 180 characters. However, Nokia recommends that the string shall not exceed 135 characters to ensure that the <get-schema> request works properly with *all* schema files.

7705 SAR Gen 2

27.21 scope

scope

Syntax

scope {**exclusive** | **template**}

no scope

Context

[Tree] (config>qos>sap-ingress scope)

Full Context

configure qos sap-ingress scope

Description

This command configures the Service Ingress QoS policy scope as exclusive or template.

The policy's scope cannot be changed if the policy is applied to a service.

The **no** form of this command sets the scope of the policy to the default of **template**.

Default

scope template

Parameters

exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to one SAP. If a policy with an exclusive scope is assigned to a second SAP, an error message

is generated. If the policy is removed from the exclusive SAP, it will become available for assignment to another exclusive SAP.

The system default policies cannot be put into the exclusive scope. An error will be generated if scope exclusive is executed in any policies with a policy-id equal to 1.

template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs on the router.

Default QoS policies are configured with template scopes. An error is generated when the template scope parameter to exclusive scope on default policies is modified.

no scope

Context

[Tree] (config>qos>network scope)

Full Context

configure qos network scope

Description

This command configures the network policy scope as exclusive or template. The policy's scope cannot be changed if the policy is applied to an interface.

The **no** form of this command sets the scope of the policy to the default of **template**.

Default

scope template

Parameters

exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to one interface. If a policy with an exclusive scope is assigned to a second interface, an error message is generated. If the policy is removed from the exclusive interface, it will become available for assignment to another exclusive interface.

The system default policies cannot be put into the exclusive scope. An error will be generated if the **scope exclusive** command is executed in any policies with a policy-id equal to 1.

template

When the scope of a policy is defined as template, the policy can be applied to multiple interfaces on the router.

Default QoS policies are configured with template scopes. An error is generated if the template scope parameter is modified to exclusive scope on default policies.

Platforms

7705 SAR Gen 2

[Tree] (config>filter>ipv6-filter scope)

[Tree] (config>filter>ip-filter scope)

Full Context

configure filter ip-exception scope

configure filter ipv6-filter scope

configure filter ip-filter scope

Description

This command configures the filter policy scope as exclusive, template, embedded or system.

The scope of the policy cannot be changed when:

- the scope is **template** and the policy is applied to one or more services or network interfaces
- the scope is **embedded** and the policy is embedded by another policy

Changing the scope to/from system is only allowed when a policy is not active and the policy has no entries configured.

The **no** form of the command sets the scope of the policy to the default of **template**.

Default

scope template

Parameters

exclusive

Specifies that the policy can only be applied to a single entity. Attempting to assign the policy to a second entity will result in an error message.

template

Specifies that the policy can be applied to multiple entities.

embedded

Specifies that the policy cannot be applied directly. The policy defines embedded filter rules, which are embedded by other exclusive/template/system filter policies. The **embedded** scope is supported for IPv4 and IPv6 filter policies only.

system

Specifies that the policy defines system-wide filter rules. To apply system policy rules, activate system filter and chain exclusive/template ACL filter policy to the system filter. The **system** scope is supported for IPv4 and IPv6 filter policies only.

scp *local-file-url destination-file-url* [**force**] **service** *service-name*

Context

[Tree] (file scp)

Full Context

file scp

Description

This command copies a local file to a remote host file system. It uses `ssh` for data transfer, and uses the same authentication and provides the same security as `ssh`. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

Parameters

local-file-url

Specifies the local source file or directory.

Values

[*cflash-id/*] *file-path*	up to 200 characters
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

destination-file-url

Specifies the destination file.

Values

*destination-file-**: *user@hostname:file-path* - up to 255 characters

user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*] *x:x:x:x:x:x:d.d.d.d*[-*interface*] *x* - [0 to FFFF]H *d* - [0 to 255]D *interface* - up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters
file-path	up to 200 characters, directory length up to 99 characters

user

Specifies the SSH user.

hostname

Specifies the remote host IP address of DNS name.

file-path

Specifies the destination path.

router-instance

Specifies the router name or service ID used to specify the router instance.

Values

router-name	"Base", "management", "vpls-management"
vprn-service-id	1 to 2147483647

Default Base

force

Forces an immediate copy of the specified file. The command **file scp** *local-file-url destination-file-url* [**router** *router-instance*] **force** executes the command without displaying a user prompt message.

service-name

Specifies the service name used to identify the router instance. The service name can be a maximum of 64 characters long.

27.26 sd-offset

sd-offset

Syntax

sd-offset *offset-value*

no sd-offset

Context

[Tree] (config>service>vprn>isis>if>level sd-offset)

Full Context

configure service vprn isis interface level sd-offset

Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default

no sd-offset

Parameters

offset-value

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

Values 0 to 16777215

Platforms

7705 SAR Gen 2

sd-offset

Syntax

sd-offset *sd-offset*

no sd-offset

Context

[Tree] (config>router>isis>if>level sd-offset)

Full Context

configure router isis interface level sd-offset

Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default

no sd-offset

Parameters

sd-offset

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

Syntax

sd-threshold *threshold* [**multiplier** *multiplier*]

no sd-threshold

Context

[Tree] (config>port>ethernet>crc-monitor sd-threshold)

Full Context

configure port ethernet crc-monitor sd-threshold

Description

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents M*10E-N a ratio of errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sd-threshold** is specified the multiplier will return to the default value of 1.

Default

no sd-threshold

Parameters

threshold

Specifies the threshold value.

Values 1 to 9

multiplier

Specifies the multiplier value.

Values 1 to 9

sdp

Syntax

sdp *sdp-id* [*delivery-type*] [**create**]

no sdp *sdp-id*

Context

[Tree] (config>service sdp)

Full Context

configure service sdp

Description

This command creates or edits a service destination point (SDP). SDPs must be explicitly configured.

An SDP is a logical mechanism that ties a far-end router to a particular service without having to specifically define far-end SAPs. Each SDP represents a method to reach another router.

One method is IP Generic Router Encapsulation (GRE), which has no state in the core of the network. GRE does not specify a specific path to the far-end router. A GRE-based SDP uses the underlying IGP routing table to find the best next hop to the far-end router.

The second method is Multi-Protocol Label Switching (MPLS) encapsulation. A router supports both signaled and non-signaled Label Switched Paths (LSPs) through the network. Non-signaled paths are defined at each hop through the network. Signaled paths are communicated by protocol from end-to-end using Resource Reservation Protocol (RSVP). Paths may be manually defined or a constraint-based routing protocol (such as OSPF-TE or CSPF) can be used to determine the best path with specific constraints. An LDP LSP can also be used for an SDP when the encapsulation is MPLS. The use of an

LDP LSP type or an RSVP/Static LSP type are mutually exclusive except when the mixed-lsp option is enabled on the SDP.

Segment routing is another MPLS tunnel type and is used to allow service binding to an SR tunnel programmed in TTM by OSPF or IS-IS. The SDP of type **sr-isis** or **sr-ospf** can be used with the **far-end** option. The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-isis** and **sr-ospf** tunnel types.

L2TPv3-over-IPv6 transport is also an option for 7705 SAR Gen 2 Ethernet Pipe (Epipe) Services. Like GRE, L2TPv3 is stateless in the core of the network, as well as on the service nodes as the L2TPv3 control plane functionality is disabled for this SDP type. A unique source and destination IPv6 address combined with TX and RX Cookie values are used to ensure that the SDP is bound to the correct service.

SDPs are created and then bound to services. Many services may be bound to a single SDP. The operational and administrative state of the SDP controls the state of the SDP binding to the service.

If the *sdp-id* does not exist, a new SDP is created. When creating an SDP, either the **gre, mpls, or l2tpv3** keyword must be specified. SDPs are created in the admin down state (**shutdown**) and the **no shutdown** command must be executed once all relevant parameters are defined and before the SDP can be used.

If *sdp-id* exists, the current CLI context is changed to that SDP for editing and modification. For editing an existing SDP, neither the **gre, mpls**, or **l2tpv3** keyword is specified. If a keyword is specified for an existing *sdp-id*, an error is generated and the context of the CLI will not be changed to the specified *sdp-id*.

The **no** form of this command deletes the specified SDP. Before an SDP can be deleted, it must be administratively down (shutdown) and not bound to any services. If the specified SDP is bound to a service, the **no sdp** command will fail generating an error message specifying the first bound service found during the deletion process. If the specified *sdp-id* does not exist an error will be generated.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 32767

gre

Specifies the SDP will use GRE to reach the far-end router. The GRE encapsulation of the MPLS service packet uses the base 4-byte header as per RFC 2890. The optional fields Checksum (plus Reserved field), Key, and Sequence Number are not inserted. Only one GRE SDP can be created to a given destination address. Multiple GRE SDPs to a single destination address serve no purpose as the path taken to reach the far end is determined by the IGP which will be the same for all SDPs to a given destination and there is no bandwidth reservation in GRE tunnels.

mpls

Specifies the SDP will use MPLS encapsulation and one or more LSP tunnels to reach the far-end device. Multiple MPLS SDPs may be created to a given destination device. Multiple MPLS SDPs to a single destination device are helpful when they use divergent paths.

l2tpv3

Specifies the SDP will use L2TPv3-over-IPv6 encapsulation. One SDP is created per service, regardless of whether the far-end node is common or not. Unique local and far-end addresses are configured for every L2TPv3 SDP type. The local address must exist on the local node.

eth-gre-bridged

Configures the SDP as an L2oGRE tunnel that is terminated on an FPE-based PW port. Only the end-points of such a tunnel (the far-end IPv4/IPv6 address or local-end IPv4/IPv6 address) are allowed to be configured under this SDP.

Platforms

7705 SAR Gen 2

27.29 sdp-exclude

sdp-exclude

Syntax

[**no**] **sdp-exclude** *group-name*

Context

[Tree] (config>service>pw-template sdp-exclude)

Full Context

configure service pw-template sdp-exclude

Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The sdp-include and sdp-exclude commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group sdp-include and sdp-exclude constraints will only be reflected in existing spoke-sdps after the following command has been executed:

tools>perform>service>eval-pw-template>allow-service-impact

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the sdp-include and sdp-exclude commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest sdp-id is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no

preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.

- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that makes use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

Parameters

group-name

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

Platforms

7705 SAR Gen 2

27.30 sdp-group

sdp-group

Syntax

sdp-group

Context

[Tree] (config>service sdp-group)

Full Context

configure service sdp-group

Description

This command configures the SDP membership in admin groups.

The user can enter a maximum of one (1) admin group name at once. The user can execute the command multiple times to add membership to more than one admin group. The admin group name must have been configured or the command is failed. Admin groups are supported on an SDP of type GRE and of type MPLS (BGP/RSVP/LDP). They are also supported on an SDP with the mixed-lsp-mode option enabled.

The **no** form of this command removes this SDP membership to the specified admin group.

Platforms

7705 SAR Gen 2

27.31 sdp-include

sdp-include

Syntax

[**no**] **sdp-include** *group-name*

Context

[Tree] (config>service>pw-template sdp-include)

Full Context

configure service pw-template sdp-include

Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The sdp-include and sdp-exclude commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group sdp-include and sdp-exclude constraints will only be reflected in existing spoke-sdps after the following command has been executed:

tools>perform>service>eval-pw-template>allow-service-impact

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the sdp-include and sdp-exclude commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest sdp-id is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that make use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

Parameters

group-name

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

Platforms

7705 SAR Gen 2

27.32 sdp-mtu

sdp-mtu

Syntax

sdp-mtu *orig-sdp-id* **size-inc** *start-octets end-octets* [**step** *step-size*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam sdp-mtu)

Full Context

oam sdp-mtu

Description

Performs MTU Path tests on an SDP to determine the largest path-mtu supported on an SDP. The **size-inc** parameter can be used to easily determine the **path-mtu** of a given SDP-ID. The forwarding class is assumed to be Best-Effort Out-of-Profile. The message reply is returned with IP/GRE encapsulation from the far-end router. OAM request messages sent within an IP/GRE SDP must have the 'DF' IP header bit set to 1 to prevent message fragmentation.

To terminate an **sdp-mtu** in progress, use the CLI break sequence <Ctrl-C>.

Parameters

orig-sdp-id

Specifies the *sdp-id* to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified **sdp-id** is the expected *responder-id* within each reply received. The specified *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable, the SDP echo request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request, if required).

Values 1 to 32767

start-octets

Specifies the beginning size in octets of the first message sent for an incremental MTU test, expressed as a decimal integer.

Values 40 to 9786

end-octets

Specifies the ending size in octets of the last message sent for an incremental MTU test, expressed as a decimal integer. The specified value must be greater than *start-octets*.

Values 40 to 9786

step-size

Specifies the number of octets to increment the message size request for each message sent for an incremental MTU test, expressed as a decimal integer. The next size message is not sent until a reply is received or three messages have timed out at the current size.

If the incremented size exceeds the *end-octets* value, no more messages are sent.

Values 1 to 512

Default 32

timeout

Specifies the *timeout* parameter in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

Values 1 to 10

Default 5

interval

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

Values 1 to 10

Default 1

Platforms

7705 SAR Gen 2

Output

Output Example: SDP MTU Path Test

```
*A:Dut-A# oam sdp-mtu 1201 size-inc 512 3072 step 256
Size    Sent    Response
---------------------------
512     .       Success
768     .       Success
1024    .       Success
1280    .       Success
1536    .       Success
1792    .       Success
2048    .       Success
2304    .       Success
2560    .       Success
2816    .       Success
3072    .       Success

Maximum Response Size: 3072
*A:Dut-A#
```

27.33 sdp-ping

sdp-ping

Syntax

sdp-ping *orig-sdp-id* [**resp-sdp** *resp-sdp-id*] [**fc** *fc-name* [**profile** { **in** | **out**}]] [**size** *octets*] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

Context

[Tree] (oam sdp-ping)

[Tree] (config>saa>test>type sdp-ping)

Full Context

oam sdp-ping

configure saa test type sdp-ping

Description

This command tests SDPs for uni-directional or round trip connectivity and performs SDP MTU Path tests.

The **sdp-ping** command accepts an originating SDP-ID and an optional responding SDP-ID. The size, number of requests sent, message time-out and message send interval can be specified. All **sdp-ping** requests and replies are sent with PLP OAM-Label encapsulation, as a *service-id* is not specified.

For round trip connectivity testing, the **resp-sdp** keyword must be specified. If **resp-sdp** is not specified, a uni-directional SDP test is performed.

To terminate an **sdp-ping** in progress, use the CLI break sequence <Ctrl-C>.

An **sdp-ping** response message indicates the result of the **sdp-ping** message request. When multiple response messages apply to a single SDP echo request/reply sequence, the response message with the highest precedence is displayed. Table 85: sdp-ping Response Messages shows the response messages sorted by precedence.

Table 85: sdp-ping Response Messages

Result of Request	Displayed Response Message	Precedence
Request time out without reply	Request Timeout	1
Request not sent due to non-existent *orig-sdp-id*	Orig-SDP Non-Existent	2
Request not sent due to administratively down *orig-sdp-id*	Orig-SDP Admin-Down	3
Request not sent due to operationally down *orig-sdp-id*	Orig-SDP Oper-Down	4
Request terminated by user before reply or time out	Request Terminated	5
Reply received, invalid *origination-id*	Far End: Originator-ID Invalid	6
Reply received, invalid *responder-id*	Far End: Responder-ID Error	7
Reply received, non-existent *resp-sdp-id*	Far End: Resp-SDP Non-Existent	8
Reply received, invalid *resp-sdp-id*	Far End: Resp-SDP Invalid	9
Reply received, *resp-sdp-id* down (admin or oper)	Far-end: Resp-SDP Down	10
Reply received, No Error	Success	11

Parameters

orig-sdp-id

Specifies the SDP ID to be used by **sdp-ping,** expressed as a decimal integer. The far-end address of the specified SDP-ID is the expected *responder-id* within each reply received. The specified SDP-ID defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable for some reason, the SDP Echo Request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request if required).

Values 1 to 32767

resp-sdp-id

Specifies the return SDP-ID to be used by the far-end router for the message reply for round trip SDP connectivity testing. If *resp-sdp-id* does not exist on the far-end router, terminates on another router different than the originating router, or another issue prevents

the far-end router from using *resp-sdp-id*, the SDP echo reply is sent using generic IP/GRE OAM encapsulation. The received forwarding class (as mapped on the ingress network interface for the far end) defines the forwarding class encapsulation for the reply message.

Values 1 to 32767

Default null. Use the non-SDP return path for message reply.

fc-name

Specifies the parameter to be used to indicate the forwarding class of the SDP encapsulation. The actual forwarding class encoding is controlled by the network egress DSCP or LSP-EXP mappings.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router. This is displayed in the response message output upon receipt of the message reply.

Values be, l2, af, l1, h2, ef, h1, nc

Default be

profile {in | out}

Specifies the profile state of the SDP encapsulation.

Default out

octets

Specifies the **size** parameter in octets. This parameter is used to override the default message size for the **sdp-ping** request. Changing the message size is a method of checking the ability of an SDP to support a **path-mtu**. The size of the message does not include the SDP encapsulation, VC-Label (if applied) or any DLC headers or trailers.

When the OAM message request is encapsulated in an IP/GRE SDP, the IP 'DF' (Do Not Fragment) bit is set. If any segment of the path between the sender and receiver cannot handle the message size, the message is discarded. MPLS LSPs are not expected to fragment the message either, as the message contained in the LSP is not an IP packet.

Values 72 to 9786

Default 72

send-count

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

Values 1 to 100

Default 1

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets is processed for any of those request probes.

Values 1 to 10

Default 5

interval

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

Values 1 to 10

Default 1

Platforms

7705 SAR Gen 2

Output

Single Response Round Trip Connectivity Test Output Example

```
A:router1> sdp-ping 10 resp-sdp 22 fc ef
Request Result: Sent - Reply Received
RTT:30ms

```

Multiple Response Connectivity Tests — When the connectivity test count is greater than one (1), a single line is displayed per SDP echo request send attempt.

The request number is a sequential number starting with 1 and ending with the last request sent, incrementing by one (1) for each request. This should not be confused with the *message-id* contained in each request and reply message.

A response message indicates the result of the message request. Following the response message is the round trip time value. If any reply is received, the round trip time is displayed.

After the last reply has been received or response timed out, a total is displayed for all messages sent and all replies received. A maximum, minimum and average round trip time is also displayed. Error response and timed out requests do not apply towards the average round trip time.

Multiple Response Round Trip Connectivity Test Output Example

```
A:router1> sdp-ping 6 resp-sdp 101size 1514 count 5
Request        Response       RTT
----------     ----------     -------
     1         Success        10ms
     2         Success        15ms
     3         Success        10ms
     4         Success        20ms
     5         Success        5ms
Sent:    5    Received:    5
Min: 5ms       Max: 20ms      Avg: 12ms
```

27.34 search

search

Syntax

search *base-dn*

no search

Context

[Tree] (config>system>security>ldap>server search)

Full Context

configure system security ldap server search

Description

This command configures the LDAP **search** command. The search *base-dn* tells the server which part of the external directory tree to search. The search DN uses the same LDAP attribute as *root-dn*. For example, to search a public-key for an SSH generated for a Nokia vendor, one might use "dc=public-key,dc=nokia,dc=com”.

The **no** version of this command removes the search DN; as such, no search is possible on the LDAP server.

Parameters

base-dn

Specifies the base domain name used in the search, up to 512 characters.

Platforms

7705 SAR Gen 2

27.35 secondary

secondary

Syntax

secondary *ip-address[/mask]* [*netmask* **]** [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

no secondary *ip-address[/mask]*

Context

[Tree] (config>service>ies>if secondary)

Full Context

configure service ies interface secondary

Description

This command assigns a secondary IP address or IP subnet/broadcast address format to the interface.

The **no** form of this command reverts to the default.

Parameters

ip-address

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical and function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

Note:
A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

broadcast

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface. (Default: host-ones)

all-ones

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

host-ones

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface. The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

Signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces are not injected and used as passive interfaces and are not advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces do not source RIP updates.

track-srrp *srrp-instance*

Specifies the SRRP instance ID that this interface route needs to track.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

secondary

Syntax

secondary *ip-address*[/*mask*] [*netmask*] [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

no secondary *ip-address*[/*mask*]

Context

[Tree] (config>service>vprn>nw-if secondary)

[Tree] (config>service>vprn>if secondary)

Full Context

configure service vprn network-interface secondary

configure service vprn interface secondary

Description

This command assigns a secondary IP address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet or broadcast address format.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

Parameters

ip-address

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

broadcast

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is

specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed. This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface. *(Default: host-ones)*

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

igp-inhibit

The optional **igp-inhibit** parameter signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces will not be injected and used as passive interfaces and will not be advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces will not source RIP updates.

track-srrp *srrp-instance*

Specifies the SRRP instance ID that this interface route needs to track.

Platforms

7705 SAR Gen 2

secondary

Syntax

[**no**] **secondary** *path-name*

Context

[Tree] (config>router>mpls>lsp secondary)

Full Context

configure router mpls lsp secondary

Description

This command specifies an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required if the **config router mpls lsp** *lsp-name* **primary** *path-name* command is specified. After the switch over from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the **retry-timer** interval.

For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal and the first available path is used.

The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively shuts down the path. The first successfully established non-standby secondary path is made the active path for the LSP.

The **no** form of this command removes the association between this *path-name* and *lsp-name*. All specific configurations for this association are deleted. The secondary path must be shut down prior to deleting it. The **no secondary** *path-name* command does not result in any action except a warning message on the console indicating that the secondary path is administratively up.

Parameters

path-name

Specifies the case-sensitive alphanumeric name label for the LSP path, up to 64 characters.

Platforms

7705 SAR Gen 2

secondary

Syntax

secondary {*ip-address/mask* | *ip-address netmask*} [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

no secondary {*ip-address/mask* | *ip-address netmask*}

Context

[Tree] (config>router>if secondary)

Full Context

configure router interface secondary

Description

This command assigns additional IP addresses to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

Caution:
Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

Parameters

ip-address

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values 1.0.0.0 to 223.255.255.255

/

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the "*/*" and the *mask-length* parameter. If a forward slash does not immediately follow the *ip-addr*, a dotted decimal mask must follow the prefix.

mask

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1 to 32. A mask length of 32 is reserved for system IP addresses.

Values 1 to 32

netmask

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. A mask of 255.255.255.255 is reserved for system IP addresses.

Values 128.0.0.0 to 255.255.255.255

broadcast

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones,** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

all-ones

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

igp-inhibit

The secondary IP address should not be recognized as a local interface by the running IGP.

srrp-instance

Specifies the SRRP instance ID that this interface route needs to track.

27.36 secondary-config

secondary-config

Syntax

secondary-config *file-url*

no secondary-config

Context

[Tree] (bof secondary-config)

Full Context

bof secondary-config

Description

This command specifies the name and location of the secondary configuration file.

The system attempts to use the configuration as specified in **secondary-config** if the primary config cannot be located. If the **secondary-config** file cannot be located, the system attempts to obtain the configuration from the location specified in the **tertiary-config**.

Note that if an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **secondary-config** configuration.

Parameters

file-url

Specifies the secondary configuration file location, expressed as a file URL.

Values

file-url	[*local-url* | *remote-url*] (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Platforms

7705 SAR Gen 2

27.37 secondary-dns

secondary-dns

Syntax

secondary-dns *ip-address*

no secondary-dns

Context

[Tree] (config>service>vprn>dns secondary-dns)

Full Context

configure service vprn dns secondary-dns

Description

This command configures the secondary DNS server for DNS name resolution. The secondary DNS server is used only if the primary DNS server does not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the secondary DNS server from the configuration.

Default

no secondary-dns — No secondary DNS server is configured.

Parameters

ip-address

The IP or IPv6 address of the secondary DNS server.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface - 32 characters max, for link local addresses.

Platforms

7705 SAR Gen 2

secondary-dns

Syntax

secondary-dns *ip-address*

no secondary-dns [*ip-address*]

Context

[Tree] (bof secondary-dns)

Full Context

bof secondary-dns

Description

This command configures the secondary DNS server for DNS name resolution. The secondary DNS server is used only if the primary DNS server does not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the secondary DNS server from the configuration.

Default

no secondary-dns

Parameters

ip-address

Specifies the IP or IPv6 address of the secondary DNS server.

Values

ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]

27.38 secondary-fast-retry-timer

secondary-fast-retry-timer

Syntax

secondary-fast-retry-timer *seconds*

no secondary-fast-retry-timer

Context

[Tree] (config>router>mpls secondary-fast-retry-timer)

Full Context

configure router mpls secondary-fast-retry-timer

Description

This command specifies the value used as the fast retry timer for a secondary path. If the first attempt to set up a secondary path fails due to a path error, the fast retry timer will be started for the secondary path so that the path can be retried sooner. If the next attempt also fails, further retries for the path will use the configured value for LSP retry timer.

If retry-timer for the LSP is configured to be less than the MPLS secondary-fast-retry-timer, all retries for the secondary path will use the LSP retry-timer.

The **no** form of this command reverts to the default.

Default

no secondary-fast-retry-timer

Parameters

seconds

Specifies the value (in seconds), used as the fast retry timer for a secondary path

Values 1 to 10

Platforms

7705 SAR Gen 2

27.39 secondary-image

secondary-image

Syntax

secondary-image *file-url*

no secondary-image

Context

[Tree] (bof secondary-image)

Full Context

bof secondary-image

Description

This command specifies the secondary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (*.tim files) must be located in the same directory.

The **no** form of this command removes the **secondary-image** configuration.

Parameters

file-url

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]

remote-url	[{ftp://| tftp://} *login:pswd@remote-locn/*][*file-path*]
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

27.40 secondary-ip-address

secondary-ip-address

Syntax

secondary-ip-address *ipv4-address*

no secondary-ip-address

Context

[Tree] (config>router>bgp>orr>location secondary-ip-address)

Full Context

configure router bgp optimal-route-reflection location secondary-ip-address

Description

This command specifies the secondary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the secondary IP address information.

Default

no secondary-ip-address

Parameters

ipv4-address

Specifies the secondary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

Platforms

7705 SAR Gen 2

27.41 secondary-ipv6-address

secondary-ipv6-address

Syntax

secondary-ipv6-address *ipv6-address*

no secondary-ipv6-address

Context

[Tree] (config>router>bgp>orr>location secondary-ipv6-address)

Full Context

configure router bgp optimal-route-reflection location secondary-ipv6-address

Description

This command specifies the secondary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the secondary IPv6 address information.

Default

no secondary-ipv6-address

Parameters

ipv6-address

Specifies the secondary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

configure service ies interface ipsec ipsec-tunnel manual-keying security-association

configure service vprn interface ipsec ipsec-tunnel manual-keying security-association

configure service vprn interface sap ipsec-tunnel manual-keying security-association

Description

This command configures the information required for manual keying SA creation.

The **no** form of this command removes the **security-association** parameters from the configuration.

Parameters

security-entry-id

Specifies the ID of an SA entry.

Values 1 to 16

authentication-key *hex-string*

Specifies an authentication key.

Values none or 0x0 to 0xFFFFFFFF...(max 128 hex nibbles)

encryption-key *hex-string*

Specifies the key used for the encryption algorithm.

Values none or 0x0 to 0xFFFFFFFF...(max 64 hex nibbles)

spi *spi*

Specifies the Security Parameter Index (SPI) used to look up the instruction to verify and decrypt the incoming IPsec packets when the direction is inbound. When the direction is outbound, the SPI that will be used in the encoding of the outgoing packets. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

Values 256 to 16383

transform *transform-id*

Specifies the transform entry that will be used by this SA entry. This object should be specified for all the entries created which are manual SAs. If the value is dynamic, then this value is irrelevant and will be zero.

Values 1 to 2048

direction

Specifies the direction of an IPsec tunnel.

Platforms

7705 SAR Gen 2

security-association

Syntax

security-association spi *spi* **authentication-key** *authentication-key* **encryption-key** *encryption-key* [**crypto**]

no security-association spi *spi*

Context

[Tree] (config>grp-encryp>encryp-keygrp security-association)

Full Context

configure group-encryption encryption-keygroup security-association

Description

This command is used to create a security association for a specific SPI value in a key group. The command is also used to enter the authentication and encryption key values for the security association, or to delete a security association.

The SPI value used for the security association is a node-wide unique value, meaning that no two security associations in any key group on the node may share the same SPI value.

Keys are entered in cleartext. After configuration, they are never displayed in their original, cleartext form. Keys are displayed in an encrypted form, which is indicated by the system-appended **crypto** keyword when an **info** or an **admin>save** command is run. For security reasons, keys encrypted on one node are not usable on other nodes (that is, keys are not exchangeable between nodes).

The **no** form of the command removes the security association and related key values from the list of security associations for the key group. If the **no** form of the command is attempted using the same SPI value that is configured for **active-outbound-sa**, then a warning is issued and the command is blocked. If the **no** form of the command is attempted on the last SPI in the key group and the key group is configured on a service, then the command is blocked.

Parameters

spi

Specifies the SPI ID of the SPI being referenced for the security association.

Values 1 to 127

authentication-key

Specifies the authentication key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 64 or 128, depending on whether the authentication algorithm is set to sha256 or sha512, respectively.

encryption-key

Specifies the encryption key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 32 or 64, depending on whether the encryption algorithm is set to aes128 or aes256, respectively.

crypto

Displays the keys showing on the CLI **info** display in an encrypted form.

27.50 security-policy

security-policy

Syntax

security-policy *security-policy-id* [**create**]

no security-policy *security-policy-id*

Context

[Tree] (config>router>ipsec security-policy)

[Tree] (config>service>vprn>ipsec security-policy)

Full Context

configure router ipsec security-policy

configure service vprn ipsec security-policy

Description

This command configures a security policy to use for an IPsec tunnel.

The **no** form of this command removes the security policy ID from the configuration.

Parameters

security-policy-id

specifies a value to be assigned to a security policy.

Values 1 to 32768

create

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

security-policy

Syntax

security-policy *security-policy-id* [**strict-match**]

no security-policy

Context

[Tree] (config>service>ies>if>ipsec>ipsec-tunnel security-policy)

[Tree] (config>service>vprn>if>ipsec>ipsec-tunnel security-policy)

[Tree] (config>router>if>ipsec>ipsec-tunnel security-policy)

[Tree] (config>service>vprn>if>sap>ipsec-tunnel security-policy)

Full Context

configure service ies interface ipsec ipsec-tunnel security-policy

configure service vprn interface ipsec ipsec-tunnel security-policy

configure router interface ipsec ipsec-tunnel security-policy

configure service vprn interface sap ipsec-tunnel security-policy

Description

This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD_SA for the matched security policy, then the setup fails, and NO_PROPOSAL_CHOSEN.

If there is a match, and there is not CHILD_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD_SA is created.

Default

no security-policy

Parameters

security-policy-id

Specifies the IPsec security policy entry that the tunnel will use.

Values 1 to 32768

strict-match

Enables strict match of security-policy entry.

Platforms

7705 SAR Gen 2

27.51 segment

segment

Syntax

segment [*segment-id*] [**create**]

no segment *segment-id*

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list segment)

Full Context

configure router segment-routing sr-policies static-policy segment-list segment

Description

This command creates the context to configure a segment inside a segment-list of a statically-defined segment routing policy candidate path.

A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**.

A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.

The **no** form of this command deletes the segment context.

Default

no segment

Parameters

segment-id

Specifies the segment ID number.

Values 1 to 11 (for segment ID type **mpls-label**)

1 to 7 (for segment ID type **srv6-sid**) in a classic SRv6 policy candidate path

1 to 24 (for segment ID type **srv6-sid**) in a micro-segment SRv6 policy candidate path

create

Keyword used to create the list.

segment-routing

Syntax

segment-routing

no segment-routing

Context

[Tree] (config>router>isis segment-routing)

Full Context

configure router isis segment-routing

Description

Commands in this context configure segment routing parameters within a given IGP instance.

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

Platforms

7705 SAR Gen 2

segment-routing

Syntax

[**no**] **segment-routing**

Context

[Tree] (config>router>ospf segment-routing)

Full Context

configure router ospf segment-routing

Description

Commands in this context configure segment routing parameters within an IGP instance.

Segment routing adds to IS-IS, OSPF, or OSPF3 routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as a segment ID (SID).

When segment routing is used together with the MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS, OSPF, or OSPF3 instance, the router will perform the following operations:

- Advertise the Segment Routing Capability sub-TLV to routers in all areas or levels of the IGP instance. However, only neighbors with which the IGP instance established an adjacency will interpret the SID and label range information and use it for calculating the label to swap to or push for a particular resolved prefix SID.
- Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node SID flag) set. The segment routing module then programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
- Automatically assign and advertise an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
- Resolve received prefixes, and if a prefix SID sub-TLV exists, the segment routing module programs the ILM with a swap operation and programs an LSP ID to NHLFE (LTN) with a push operation, both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in an IGP instance, the main SPF and LFA SPF are computed normally and the primary next hop and LFA backup next hop for a received prefix are added to the RTM without the label information advertised in the prefix SID sub-TLV.

27.54 sel-mcast-advertisement

sel-mcast-advertisement

Syntax

[**no**] **sel-mcast-advertisement**

Context

[Tree] (config>service>vpls>bgp-evpn sel-mcast-advertisement)

Full Context

configure service vpls bgp-evpn sel-mcast-advertisement

Description

This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes.

The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

Default

no sel-mcast-advertisement

Platforms

7705 SAR Gen 2

27.55 selection-criteria

selection-criteria

Syntax

selection-criteria [**best-port** | **highest-count** | **highest-weight**] [**slave-to-partner**] [**subgroup-hold-time** *hold-time*]

no selection-criteria

Context

[Tree] (config>lag selection-criteria)

Full Context

configure lag selection-criteria

Description

This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

Default

selection-criteria highest-count

Parameters

highest-count

Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to "power-off" mode of operations).

highest-weight

Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to "power-off" mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

best-port

Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

slave-to-partner

The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

hold-time

Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

Values

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

27.56 selective-label-ip

selective-label-ip

Syntax

selective-label-ip {**no-install** | **route-table-install-only**}

no selective-label-ip

Context

[Tree] (config>router>bgp selective-label-ip)

Full Context

configure router bgp selective-label-ip

Description

This command configures **selective-label-ip** for the BGP level.

The **no-install** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors. This option causes BGP-LU routes to be reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables or routing tables for use by local services.

The **route-table-install-only** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors and allows these routes to be used for IP transport, unlike the **no-install** option. When the **route-table-install-only** option is used, learned BGP-LU routes are also reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables for use by local services. These routes are installed to the RTM and used for the best route selection process.

Note: If local services need to use BGP-LU routes, the **no-install** and **route-table-install-only** options should not be used.

The default **no** form of this command installs BGP-LU routes to the datapath for local services and makes them available to the RTM for IP next-hop selection.

Default

no selective-label-ip

Parameters

no-install

Specifies that BGP-LU routes are not installed to local MPLS tables or routing tables.

route-table-install-only

Specifies the installation of BGP-LU routes to the RTM. BGP-LU routes are not installed to local MPLS tables for use by local services.

7705 SAR Gen 2

27.57 selective-label-ip-prioritization

selective-label-ip-prioritization

Syntax

[**no**] **selective-label-ip-prioritization**

Context

[Tree] (config>router>bgp selective-label-ip-prioritization)

Full Context

configure router bgp selective-label-ip-prioritization

Description

This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

The **no** form of this command disables selective-label IP prioritization for BGP.

Default

no selective-label-ip-prioritization

Platforms

7705 SAR Gen 2

27.58 selective-label-ipv4-install

selective-label-ipv4-install

Syntax

[**no**] **selective-label-ipv4-install**

Context

[Tree] (config>router>bgp>group>neighbor selective-label-ipv4-install)

[Tree] (config>router>bgp>group selective-label-ipv4-install)

[Tree] (config>router>bgp selective-label-ipv4-install)

Full Context

configure router bgp group neighbor selective-label-ipv4-install

configure router bgp group selective-label-ipv4-install

configure router bgp selective-label-ipv4-install

Description

This command enables selective download for BGP label-ipv4 routes.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

Default

no selective-label-ipv4-install

Platforms

7705 SAR Gen 2

27.59 selective-learned-fdb

selective-learned-fdb

Syntax

[**no**] **selective-learned-fdb**

Context

[Tree] (config>service>vpls selective-learned-fdb)

Full Context

configure service vpls selective-learned-fdb

Description

This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type "L" or "Evpn" in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type "L" or "Evpn" but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

Default

no selective-learned-fdb

Full Context

configure service vprn ripng group send

configure service vprn rip group send

configure service vprn ripng send

configure service vprn rip send

configure service vprn ripng group neighbor send

configure service vprn rip group neighbor send

Description

This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

The **no** form of this command resets the type of messages sent back to the default value.

Default

no send

Parameters

broadcast

Send RIPv2 formatted messages to the broadcast address.

multicast

Send RIPv2 formatted messages to the multicast address.

none

Do not send any RIP messages (i.e. silent listener).

version-1

Send RIPv1 formatted messages to the broadcast address.

both

Send both RIP v1 & RIP v2 updates to the broadcast address.

27.61 send-chain

send-chain

Syntax

[**no**] **send-chain**

Context

[Tree] (config>ipsec>cert-profile>entry send-chain)

Full Context

configure ipsec cert-profile entry send-chain

Description

Commands in this context configure the send-chain in the **cert-profile entry**.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

Platforms

7705 SAR Gen 2

send-chain

Syntax

[**no**] **send-chain**

Context

[Tree] (config>system>security>tls>cert-profile>entry send-chain)

Full Context

configure system security tls cert-profile entry send-chain

Description

This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config**>**system**>**security**>**pki**>**ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

Default

no send-chain

[Tree] (config>router>bgp>group send-default)

Full Context

configure router bgp send-default

configure router bgp group neighbor send-default

configure router bgp group send-default

Description

This command enables the advertisement of a default route. When this command is configured to apply to an IBGP or EBGP session, the default route for IPv4 or IPv6 is automatically added to the Adj_RIB-OUT of that peer. The advertised default routes are unrelated to any default routes installed in the FIB of the local router.

If a BGP export policy allows an active default route in the FIB of the local router to be advertised and conflict with this command, the artificially generated default route overrides the advertisement of the installed default route.

The artificially generated default route is not matched by BGP export policies. To modify its attributes or decide whether it should be advertised (based on a conditional expression), a route policy must be created and referenced by the **export-policy** parameter. Only conditional entries with an action and no from or to criteria are parsed. If there are no such entries, only the default action is applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels, the default behavior is to inherit the configuration from a higher level. At the instance level, the default behavior is to neither generate nor inject a default route.

Default

no send-default

Parameters

ipv4

Generates and advertises an IPv4 default route (0/0).

ipv6

Generates and advertises an IPv6 default route (::/0).

export-policy

Specifies the name of a route policy, up to 64 characters. Only the route modifications in the matching conditional-expression entry or the default action are applied. These modifications change the attributes of the advertised default routes.

7705 SAR Gen 2

27.64 send-flush-on-failure

send-flush-on-failure

Syntax

[**no**] **send-flush-on-failure**

Context

[Tree] (config>service>vpls send-flush-on-failure)

Full Context

configure service vpls send-flush-on-failure

Description

This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or "operationally down" events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

Default

no send-flush-on-failure

Full Context

configure router bgp group outbound-route-filtering extended-community send-orf

configure router bgp group neighbor outbound-route-filtering extended-community send-orf

configure router bgp outbound-route-filtering extended-community send-orf

Description

This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

Default

no send-orf

Parameters

comm-id

Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

Values [**target:** {*ip-address*:*comm-val* | *2byte-asnumber*:*ext-comm-val* | *4byte-asnumber*:*comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

Full Context

configure service vprn bgp group link-bandwidth send-to-ebgp

configure service vprn bgp group neighbor link-bandwidth send-to-ebgp

Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGP peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGP peer.

Default

no send-to-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

configure router bgp group neighbor link-bandwidth send-to-ebgp

configure router bgp group link-bandwidth send-to-ebgp

Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGP peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGP peer and it should be discarded when received in any route from an EBGP peer. This command overrides the standard behavior.

Up to six families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGP peer.

Default

no send-to-ebgp

Parameters

family

Specifies the address families for which receiving the link-bandwidth extended community from EBGP peers should be supported.

Values ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.

label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.

vpn-ipv4 — Adds a link-bandwidth extended community to IPv4 VPN (SAFI 128) routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

label-ipv6 — Adds a link-bandwidth extended community to labeled-unicast IPv6 routes.

vpn-ipv6 — Adds a link-bandwidth extended community to IPv6 VPN (SAFI 128) routes.

27.71 send-tunnel-encap

send-tunnel-encap

Syntax

send-tunnel-encap [**mpls**] [**mplsoudp**]

no send-tunnel-encap

Context

[Tree] (config>service>epipe>bgp-evpn>mpls send-tunnel-encap)

[Tree] (config>service>vpls>bgp-evpn>mpls send-tunnel-encap)

[Tree] (config>service>vprn>bgp-evpn>mpls send-tunnel-encap)

Full Context

configure service epipe bgp-evpn mpls send-tunnel-encap

configure service vpls bgp-evpn mpls send-tunnel-encap

configure service vprn bgp-evpn mpls send-tunnel-encap

Description

This command configures the encapsulation to be advertised with the EVPN routes for the service. The encapsulation is encoded in RFC 5512-based tunnel encapsulation extended communities.

When used in the **bgp-evpn**>**mpls** context, the supported options are none (**no send-tunnel-encap**), **mpls**, **mplsoudp** or both.

When used in the **bgp-evpn**>**vxlan** context, the supported options are **send-tunnel-encap** (the router signals a VXLAN value) or **no send-tunnel-encap** (no encapsulation extended community is sent).

Default

send-tunnel-encap mpls (in the **config**>**service**>**vpls**>**bgp-evpn**>**mpls** context)

send-tunnel-encap (in the **config**>**service**>**vpls**>**bgp-evpn**>**vxlan** context)

Parameters

mpls

Specifies the MPLS-over-UDP encapsulation value in the RFC 5512 encapsulation extended community.

mplsoudp

Specifies the MPLS encapsulation value in the RFC 5512 encapsulation extended community.

[Tree] (config>service>vprn>radius-server server)

Full Context

configure router radius-server server

configure service vprn radius-server server

Description

This command either specifies an external RADIUS server in the corresponding routing instance or enters configuration context of an existing server. The configured server could be referenced in the radius-server-policy.

The **no** form of this command removes the parameters from the server configuration.

Parameters

server-name

Specifies the name of the external RADIUS server.

ip-address

Specifies the IPv4 or IPv6 IP address of the external RADIUS server.

key

Specifies the shared secret key of the external RADIUS server, up to 64 characters.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

Platforms

7705 SAR Gen 2

server

Syntax

server *index* **address** *ip-address* **secret** *key* [{**hash** | **hash2** | **custom**}] [**port** *port*]

Context

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus server)

[Tree] (config>system>security>tacplus server)

Full Context

configure service vprn aaa remote-servers tacplus server

configure system security tacplus server

Description

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

Default

No TACACS+ servers are configured.

Parameters

index

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

Values 1 to 5

ip-address

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

key

Specifies the secret key, up to 128 characters, for access to the TACACS+ server. This secret key must match the password on the TACACS+ server.

Values Up to 128 characters in length.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

port

Specifies the port ID.

Values 0 to 65535

Platforms

[Tree] (config>service>ies>if>sap>ipsec-gw>dhcp server)

Full Context

configure service vprn interface sap ipsec-gw dhcp server

configure service ies interface sap ipsec-gw dhcp server

Description

This command specifies up to eight DHCPv4 server addresses for DHCPv4-based address assignment. If multiple server addresses are specified, the first advertised DHCPv4 address received is chosen.

Default

no server

Parameters

ip-address

Specifies up to eight unicast IPv4 addresses.

Values ipv4-address a.b.c.d

router-instance

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server** *ip-address* **service-name** *service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

vprn-svc-id: 1 to 2147483647

router-name: *router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

Default Base

service-name

Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

Platforms

7705 SAR Gen 2

configure service vprn interface sap ipsec-gw dhcp6 server

configure service ies interface sap ipsec-gw dhcp6 server

Description

This command specifies up to eight DHCPv6 server addresses for DHCPv6-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

Default

no server

Parameters

ipv6-address

Specifies up to eight unicast global unicast IPv6 addresses.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D

router-instance

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server** *ip-address* **service-name** *service-name* variant can be used in all configuration modes.

Values {router-name | *vprn-svc-id*}

vprn-svc-id:	1 to 2147483647
router-name:	*router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

Description

This command configures the node for TWAMP server functionality.

Platforms

7705 SAR Gen 2

server

Syntax

server *server* [*server*]

Context

[Tree] (config>router>if>dhcp server)

Full Context

configure router interface dhcp server

Description

This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

Default

no server

Parameters

server

Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

Platforms

7705 SAR Gen 2

server

Syntax

server *ipv6-address* [*ipv6-address*]

no server

Context

[Tree] (config>router>router-advert>if>dns-options server)

Full Context

configure router router-advertisement interface dns-options server

configure router router-advertisement dns-options server

Description

This command specifies the IPv6 DNS servers to include in the RDNSS option in Router Advertisements. When specified at the router advertisement level this applies to all interfaces that have **include-dns** enabled, unless the interfaces have more specific **dns-options** configured.

Parameters

ipv6-address

Specifies the IPv6 address of the DNS servers as eight 16-bit hexadecimal pieces. A maximum of four ipv6 addresses can be specified in a single statement.

Platforms

7705 SAR Gen 2

server

Syntax

server [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

no server [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

Context

[Tree] (config>system>time>ntp server)

Full Context

configure system time ntp server

Description

This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, the **prefer** parameter must be specified. After PTP has established a UTC traceable time from an external grandmaster it is always the source for time into NTP, even if PTP goes into time holdover.

Using the internal PTP time source for NTP promotes the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

Parameters

router-instance

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management

service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

ip-address

Configures the IPv4 address of an external NTP server.

Values a.b.c.d

ipv6-address

Configures the IPv6 address of an external NTP server.

Values
- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

key-id

Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event/trap generated. This is an optional parameter.

Values 1 to 255

keychain-name

Identifies the keychain name, up to 32 characters.

version

Configures the NTP version number that is expected by this node. This is an optional parameter.

Values 2 to 4

Default 4

ptp

Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

prefer

Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

Context

[Tree] (config>service>vprn>aaa>rmt-srv>radius server)

[Tree] (config>system>security>radius server)

Full Context

configure service vprn aaa remote-servers radius server

configure system security radius server

Description

This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

Default

no server

Parameters

index

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

Values 1 to 5

ip-address

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D

key

Specifies the secret key to access the RADIUS server, up to 64 characters. This secret key must match the password on the RADIUS server.

hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

custom

Specifies the custom encryption to management interface.

tls-client-profile

Specifies the TLS profile for the RADIUS server.

profile

Specifies the TLS profile name, up to 32 characters.

md5

Specifies the MD5 hash algorithm for the RADIUS server.

sm3

Specifies the SM3 hash algorithm for the RADIUS server.

[**interval** *seconds*]

no server-address *ip-address*

Context

[Tree] (config>system>time>sntp server-address)

Full Context

configure system time sntp server-address

Description

This command creates an SNTP server for unicast client mode.

Parameters

ip-address

Specifies the IP address of the SNTP server.

Values a.b.c.d

version-number

Specifies the SNTP version supported by this server.

Values 1 to 3

Default 3

normal | preferred

Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

Default normal

seconds

Specifies the frequency at which this server is queried.

Values 64 to 1024

Default 64

configure system security ssh server-host-key-list

Description

Commands in this context configure the list of host key algorithms negotiated by the SR OS acting as the SSH server.

Platforms

7705 SAR Gen 2

27.81 server-id

server-id

Syntax

server-id duid-en hex *hex-string*

server-id duid-en string *ascii-string*

server-id duid-ll

no server-id

Context

[Tree] (config>service>vprn>dhcp6>server server-id)

[Tree] (config>router>dhcp6>server server-id)

Full Context

configure service vprn dhcp6 local-dhcp-server server-id

configure router dhcp6 local-dhcp-server server-id

Description

This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

Default

server-id duid-ll

Parameters

hex-string

Specifies a DUID system ID in a hex format.

Values 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

ascii-string

Specifies a DUID system ID in an ASCII format, up to 58 characters.

duid-ll

Specifies that the DUID system ID is derived from the system link layer address.

duid-en

Specifies the enterprise number.

Platforms

7705 SAR Gen 2

27.82 server-kex-list

server-kex-list

Syntax

server-kex-list

Context

[Tree] (config>system>security>ssh server-kex-list)

Full Context

configure system security ssh server-kex-list

Description

This command configures SSH KEX algorithms for SR OS as an SSH server.

An empty list is the default list that the SSH KEX advertises. The default list contains the following:

ecdh-sha2-nistp512

ecdh-sha2-nistp384

ecdh-sha2-nistp256

diffie-hellman-group16-sha512

diffie-hellman-group14-sha256

diffie-hellman-group14-sha1

diffie-hellman-group-exchange-sha1

diffie-hellman-group1-sha1

Platforms

7705 SAR Gen 2

27.83 server-mac-list

server-mac-list

Syntax

server-mac-list

Context

[Tree] (config>system>security>ssh server-mac-list)

Full Context

configure system security ssh server-mac-list

Description

This command allows the user to configure SSH MAC algorithms for SR OS as an SSH server.

Platforms

7705 SAR Gen 2

27.84 server-shutdown

server-shutdown

Syntax

[**no**] **server-shutdown**

Context

[Tree] (config>system>security>ssh server-shutdown)

Full Context

configure system security ssh server-shutdown

Description

This command enables the SSH servers running on the system.

Default

no server-shutdown

Platforms

7705 SAR Gen 2

27.85 server-signature-list

server-signature-list

Syntax

server-signature-list *name* [**create**]

no server-signature-list *name*

Context

[Tree] (config>system>security>tls server-signature-list)

Full Context

configure system security tls server-signature-list

Description

This command configures a list of TLS 1.3-supported signature suite codes for the digital signature that the server sends in a server Hello message.

The **no** form of this command removes the server signature list.

Parameters

name

Specifies the name of the server signature list, up to 32 characters.

create

Keyword used to create the server signature list.

Platforms

7705 SAR Gen 2

27.86 server-timeout

server-timeout

Syntax

server-timeout *seconds*

no server-timeout

Context

[Tree] (config>port>ethernet>dot1x server-timeout)

Full Context

configure port ethernet dot1x server-timeout

Description

This command configures the period during which the router waits for the RADIUS server to respond to its access request message. When this timer expires, the router will re-send the access request message, up to the specified number times.

The **no** form of this command returns the value to the default.

Default

server-timeout 30

Parameters

seconds

Specifies the server timeout period, in seconds.

Values 1 to 300

Platforms

7705 SAR Gen 2

27.87 server-tls-profile

server-tls-profile

Syntax

server-tls-profile *name* [**create**]

no server-tls-profile *name*

Context

[Tree] (config>system>security>tls server-tls-profile)

Full Context

configure system security tls server-tls-profile

Description

This command creates a TLS server profile. This profile can be used by applications that support TLS for encryption. The applications should not send any PDUs until the TLS handshake has been successful.

The **no** form of the command removes the TLS server profile.

Parameters

name

Specifies the name of the TLS server profile, up to 32 characters in length.

create

Keyword used to create the TLS server profile.

Platforms

7705 SAR Gen 2

27.88 servers

servers

Syntax

servers

Context

[Tree] (config>aaa>radius-srv-plcy servers)

Full Context

configure aaa radius-server-policy servers

Description

Commands in this context configure radius-server-policy parameters.

Platforms

7705 SAR Gen 2

27.89 service

service

Syntax

service *service-id*

no service

Context

[Tree] (config>service>vpls>sap>msap-defaults service)

Full Context

configure service vpls sap msap-defaults service

Description

This command sets default service for all subscribers created based on trigger packets received on the given capture SAP in case the corresponding VSA is not included in the RADIUS authentication response. This command is applicable to capture SAP only.

The **no** form of this command reverts to the default.

Parameters

service-id

Specifies the service ID as an integer or a name.

Values *service-id* - 1 to 2147483648

service-name - up to 64 characters

Platforms

7705 SAR Gen 2

service

Syntax

service *service-id* **preference** *preference*

no service *service-id*

Context

[Tree] (config>router>dns>redirect-vprn service)

Full Context

configure router dns redirect-vprn service

Description

This command configures the VPRN DNS redirection for the specified service.

The **no** form of this command removes the service from the VPRN DNS resolution configuration.

Parameters

service-id

Specifies the unique service identification number or string identifying the service in the service domain.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

preference

Specifies the service preference.

Values 0 to 255

Platforms

7705 SAR Gen 2

service

Syntax

[**no**] **service** *service-id*

Context

[Tree] (config>log>services-all-events service)

Full Context

configure log services-all-events service

Description

This command enables access to the entire system-wide set of log events (VPRN and non-VPRN) in the logs configured within the management VPRN specified by the service ID.

The **no** form of the command enables the display of VPRN events only.

Parameters

service-id

Identifies the VPRN.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: up to 64 characters

Platforms

7705 SAR Gen 2

service

Syntax

service *service-id*

service name *service-name*

no service

Context

[Tree] (config>system>security>pki>ca-profile>ocsp service)

Full Context

configure system security pki ca-profile ocsp service

Description

This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

Parameters

service-id

Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

name service-name

Identifies the service, up to 64 characters.

Platforms

7705 SAR Gen 2

27.90 service-id

service-id

Syntax

service-id *service-id*

no service-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident service-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification service-id

Description

This command specifies the service ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

The **no** form of this command removes the service ID from the configuration.

Parameters

service-id

Specifies an existing service ID or service name.

Values *service-id* — 1 to 2147483647

service-name — up to 64 characters

Platforms

7705 SAR Gen 2

service-id

Syntax

[**no**] **service-id**

Context

[Tree] (config>service>vpls>sap>dhcp>option>vendor service-id)

[Tree] (config>service>vprn>if>dhcp>option>vendor service-id)

Full Context

configure service vpls sap dhcp option vendor-specific-option service-id

configure service vprn interface dhcp option vendor-specific-option service-id

Description

This command enables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

The **no** form of this command disables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

Platforms

7705 SAR Gen 2

service-id

Syntax

[**no**] **service-id**

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option service-id)

Full Context

configure router interface dhcp option vendor-specific-option service-id

Description

This command enables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

The **no** form of this command disables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

Default

no service-id

Platforms

7705 SAR Gen 2

service-id

Syntax

service-id *service-id*

no service-id

Context

[Tree] (config>redundancy>mc>peer>mcr>l3-ring>ibc service-id)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring in-band-control-path service-id

Description

This command specifies the service ID if the interface used for the inband control connection belongs to a VPRN service. If not specified, the service-id is zero and the interface must belong to the Base router. This command supersedes the configuration of a service name.

The no form of this command removes the service ID from the IBC configuration.

Parameters

service-id

Specifies a service ID or an existing service name.

Values 1 to 214748364 - Only supported in 'classic' configuration-mode (**configure>system>management-interface>configuration-mode classic**)

Platforms

7705 SAR Gen 2

service-id

Syntax

service-id *service-id*

no service-id

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv service-id)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-id

Description

This command specifies the service ID of the SAP used for the ring-node connectivity verification of this ring node. This command supersedes the configuration of a service name.

The **no** form of the command removes the service ID from the CV configuration.

Default

no service-id

Parameters

service-id

Specifies the service ID or an existing service name.

Values 1 to 2147483647- Only supported in "classic" configuration mode (**configure system management-interface configuration-mode classic**)

Platforms

7705 SAR Gen 2

27.91 service-id-lag-hashing

service-id-lag-hashing

Syntax

[**no**] **service-id-lag-hashing**

Context

[Tree] (config>system>load-balancing service-id-lag-hashing)

Full Context

configure system load-balancing service-id-lag-hashing

Description

This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

Default

no service-id-lag-hashing

Platforms

7705 SAR Gen 2

27.92 service-id-range

service-id-range

Syntax

service-id-range start *service-id* **end** *service-id*

no service-id-range

Context

[Tree] (config>service>md-auto-id service-id-range)

Full Context

configure service md-auto-id service-id-range

Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

Default

no service-id-range

Parameters

start ***service-id***

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

Values 1 to 2147483647

end ***service-id***

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

Values 1 to 2147483647

Platforms

7705 SAR Gen 2

27.93 service-mtu

service-mtu

Syntax

service-mtu *octets*

no service-mtu

Context

[Tree] (config>service>vpls service-mtu)

[Tree] (config>service>template>vpls-template service-mtu)

Full Context

configure service vpls service-mtu

configure service template vpls-template service-mtu

Description

This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

Default

service-mtu 1514

Parameters

octets

The following table displays MTU values for specific VC types.

Table 86: MTU Values

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500

VC-Type	Example Service MTU	Advertised MTU
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

The size of the MTU in octets, expressed as a decimal integer

Values 1 to 9194

Platforms

7705 SAR Gen 2

service-mtu

Syntax

service-mtu *octets*

no service-mtu

Context

[Tree] (config>service>epipe service-mtu)

Full Context

configure service epipe service-mtu

Description

This command configures the service payload in bytes, for the service. The configured Maximum Transmission Unit (MTU) value overrides the service-type default MTU. The **service-mtu** command defines the payload capabilities of the service. It is used by the system to validate the operational state of the SAP and SDP binding within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

Note:
In the **configure**>**service**>**epipe** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE. For more information, see **adv-service-mtu** command.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

By default, if **no service-mtu** is configured, the MTU value is (1514 - 14) = 1500.

Default

no service-mtu 1508 (for Apipe, Fpipe)

no service-mtu 1500 (for Ipipe)

no service-mtu 1524 (for Epipe)

Table 87: MTU Values lists the MTU values for specific VC types.

Table 87: MTU Values

SAP VC-Type	Example: Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

Parameters

octets

Specifies the MTU size in octets, expressed as a decimal integer.

Values 1 to 9782

1 to 9800 (for Epipe only)

Platforms

7705 SAR Gen 2

27.94 service-name

service-name

Syntax

service-name *service-name*

no service-name

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv service-name)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-name

Description

This command specifies the service name of the SAP used for ring-node connectivity verification of this ring node. This command supersedes the configuration of a service ID.

The **no** form of this command removes the service name from the CV configuration.

Default

no service-name

Parameters

service-name

Specifies a service name, up to 64 characters.

Platforms

7705 SAR Gen 2

27.95 service-range

service-range

Syntax

service-range *startid-endid* [**start-vlan-id** *startvid*]

no service-range

Context

[Tree] (config>service>vpls>vpls-group service-range)

Full Context

configure service vpls vpls-group service-range

Description

This command configures the service ID and implicitly the VLAN ID ranges to be used as input variables for related VPLS and SAP templates to pre-provision "data" VPLS instances and related SAPs using the service ID specified in the command. If the **start-vlan-id** is not specified then the service-range values are used for vlan-ids. The data SAPs will be instantiated on all the ports used to specify SAP instances under the related control VPLS.

Modifications of the service id and vlan ranges are allowed with the following restrictions.

- service-range increase can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - By creating a new vpls-group
- service-range decrease can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state; when **shutdown** command is executed the associated service instances are deleted.
  - Allowed when vpls-group is in no shutdown state and has completed successfully instantiating services.
  - In both cases, only the services that do not have user configured SAPs will be deleted. Otherwise the above commands are rejected. Existing declarations or registrations do not prevent service deletion.
- start-vlan-id change can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - At the time of range decrease by increasing the start-vlan-id which can be done when vpls-group is in no shutdown state and has completed successfully instantiating services

The **no** form of this command removes the specified ranges and deletes the pre-provisioned VPLS instances and related SAPs. The command will fail if any of the VPLS instances in the affected ranges have a provisioned SAP.

Default

no service-range

Parameters

startid-endid

Specifies the range of service IDs

Values 1 to 2147483647

startvid

Specifies the starting VLAN ID; it provides a way to set aside a service ID range that is not the same as the VLAN range and allows for multiple MVRP control-VPLSs to control same VLAN range on different ports.

Values 1 to 4094

Platforms

7705 SAR Gen 2

27.96 service-request

service-request

Syntax

[**no**] **service-request**

Context

[Tree] (config>system>security>tacplus service-request)

Full Context

configure service vprn aaa remote-servers tacplus service-request

configure system security tacplus service-request

Description

This command enables Nokia services to be requested from the TACACS+ server.

The **no** form of this command disables Nokia services from being requested from the TACACS+ server.

Default

no service-request

Platforms

7705 SAR Gen 2

27.97 services-all-events

services-all-events

Syntax

services-all-events

Context

[Tree] (config>log services-all-events)

Full Context

configure log services-all-events

Description

Commands in this context control which log events are present in VPRN logs.

By default, the event streams for VPRN logs contain only events that are associated with the particular VPRN.

Access to the entire system-wide set of events (VPRN and non-VPRN) can be enabled using the **services-all-events** command.

Platforms

7705 SAR Gen 2

27.98 session

session

Syntax

session *session-name* [**test-family** [**ethernet** | **ip** | **mpls**] [**session-type** {**proactive** | **on-demand**}] **create**]

no session *session-name*

Context

[Tree] (config>oam-pm session)

Full Context

configure oam-pm session

Description

This command creates the individual session containers that houses the test specific configuration parameters. Since this session context provides only a container abstract to house the individual test functions, it cannot be shut down. Individual tests sessions within the container may be shut down. No values, parameters, or configuration within this context may be changed if any individual test is active. Changes may only be made when all tests within the context are shut down. The only exception to this is the description value.

The **no** form of this command deletes the session.

Parameters

session-name

Specifies the session name, up to 32 characters.

test-family

Indicates the type family and sets the context for the individual parameters.

Values **ethernet** — Specifies that the test is based on the Ethernet layer.

ip — Specifies that the test is based on the IP layer.

mpls — Specifies that the test is based on the MPLS layer.

session-type

Specifies how to set the Type bit in the Flags byte, and influences how different test criteria may be applied to the individual test. Not all test families carry this information in the PDU.

Values **proactive** — Sets the type to always on, with an immediate start and no stop.

on-demand — Sets the type to on-demand, with an immediate start and no stop, or a stop based on the offset.

Default proactive

create

Creates the PM session.

Platforms

7705 SAR Gen 2

27.101 session-sender-type

session-sender-type

Syntax

session-sender-type {**twamp-light** | **stamp**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light session-sender-type)

Full Context

configure oam-pm session ip twamp-light session-sender-type

Description

This command configures the type of test packet format to transmit.

Default

session-sender-type twamp-light

Parameters

twamp-light

Specifies TWAMP-Light transmission, packet formatting, and packet processing. TWAMP-Light test packets do not allow TLVs.

stamp

Specifies STAMP transmission, packet formatting, and packet processing. STAMP test packets support TLVs.

Platforms

7705 SAR Gen 2

27.102 set-time

set-time

Syntax

set-time *date time*

Context

[Tree] (admin set-time)

Full Context

admin set-time

Description

This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

If SNTP or NTP is enabled (no shutdown) then this command cannot be used.

Parameters

date

Specifies the local date and time accurate to the minute in the YYYY/MM/DD format.

Values *YYYY* is the four-digit year

MM is the two-digit month

DD is the two-digit date

time

Specifies the time (accurate to the second) in the *hh*:*mm[:ss]* format. If no seconds value is entered, the seconds are reset to :00.

Values *hh* is the two-digit hour in 24 hour format (00=midnight, 12=noon)*mm* is the two-digit minute

Default 0

Platforms

7705 SAR Gen 2

[Tree] (config>service>vprn>log>filter>entry>match severity)

Full Context

configure service vprn log filter entry match severity

Description

This command adds an event severity level as a match criterion. Only one severity command can be entered per event filter entry. The latest severity command overwrites the previous command.

The **no** form of this command removes the severity match criterion.

Default

no severity

Parameters

eq | neq | lt | lte | gt | gte

Specifies the type of match. Valid operators are listed below.

Values

Table 88: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to
lt	less than
lte	less than or equal to
gt	greater than
gte	greater than or equal to

severity-name

The ITU severity level name. Table 89: Severity Levels lists severity names and corresponding numbers per ITU standards M.3100 X.733 & X.21 severity levels.

Table 89: Severity Levels

Severity Number	Severity Name
1	cleared
2	indeterminate (info)
3	critical
4	major
5	minor
6	warning

Values cleared, intermediate, critical, major, minor, warning

Platforms

27.104 sf-offset

sf-offset

Syntax

sf-offset *offset-value*

no sf-offset

Context

[Tree] (config>service>vprn>isis>if>level sf-offset)

Full Context

configure service vprn isis interface level sf-offset

Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default

no sf-offset

Parameters

offset-value

Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

Values 0 to 16777215

Platforms

7705 SAR Gen 2

sf-offset

Syntax

sf-offset *offset-value*

no sf-offset

Context

[Tree] (config>router>isis>if>level sf-offset)

Full Context

configure router isis interface level sf-offset

Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

Default

no sf-offset

Parameters

offset-value

Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

Values 0 to 16777215

Platforms

7705 SAR Gen 2

27.105 sf-threshold

sf-threshold

Syntax

sf-threshold *threshold* [**multiplier** *multiplier*]

no sf-threshold

Context

[Tree] (config>port>ethernet>crc-monitor sf-threshold)

Full Context

configure port ethernet crc-monitor sf-threshold

Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents M*10E-N errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sf-threshold** is specified the multiplier will return to the default value of 1.

Default

no sf-threshold

Parameters

threshold

Specifies the threshold value.

Values 1 to 9

multiplier

Specifies the multiplier value.

Values 1 to 9

Platforms

7705 SAR Gen 2

27.107 sham-link

sham-link

Syntax

sham-link *ip-int-name ip-address*

Context

[Tree] (config>service>vprn>ospf>area sham-link)

Full Context

configure service vprn ospf area sham-link

Description

This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VPRN link and the backdoor.

Parameters

ip-int-name

The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for **config>router>if**, **config>service>ies>if** and **config>service>vprn>if** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

ip-address

The IP address of the sham-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the sham-link. This is a mandatory parameter and must be a valid IP address.

Platforms

7705 SAR Gen 2

27.108 sham-neighbor

sham-neighbor

Syntax

sham-neighbor [*ip-address*]

no sham-neighbor

Context

[Tree] (debug>router>ospf sham-neighbor)

Full Context

debug router ospf sham-neighbor

Description

This command enables debugging of the OSPFv2 sham-link neighbor.

Parameters

ip-address

Debugs the sham-link neighbor identified by this IP address.

Platforms

7705 SAR Gen 2

27.109 shell

shell

Syntax

shell -password *password*

no shell

Context

[Tree] (environment shell)

Full Context

environment shell

Description

This command allows Nokia technical support to access the **shell** commands. **shell** commands are used only by Nokia technical support for troubleshooting.

The **no** form of this command disables the **shell** commands.

Parameters

password

Specifies the password to access the **shell** commands, up to 256 characters.

Platforms

7705 SAR Gen 2

27.110 shortcut-local-ttl-propagate

shortcut-local-ttl-propagate

Syntax

[**no**] **shortcut-local-ttl-propagate**

Context

[Tree] (config>router>ldp shortcut-local-ttl-propagate)

[Tree] (config>router>mpls shortcut-local-ttl-propagate)

Full Context

configure router ldp shortcut-local-ttl-propagate

configure router mpls shortcut-local-ttl-propagate

Description

This command configures the TTL handling of locally generated packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

Local IP packets include ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. Transit IP packets are all IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut

By default, the feature propagates the TTL from the header of locally generated IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of this command is enabled, TTL propagation is disabled on all locally generated IP packets, including ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

Default

shortcut-local-ttl-propagate

Platforms

7705 SAR Gen 2

27.111 shortcut-transit-ttl-propagate

shortcut-transit-ttl-propagate

Syntax

[**no**] **shortcut-transit-ttl-propagate**

shortcut-transit-ttl-propagate

Platforms

7705 SAR Gen 2

27.112 shortcut-tunnel

shortcut-tunnel

Syntax

shortcut-tunnel

Context

[Tree] (config>router>bgp>next-hop-resolution shortcut-tunnel)

Full Context

configure router bgp next-hop-resolution shortcut-tunnel

Description

This command creates the context to configure the tunnel types that can be used to resolve unlabeled IPv4 and IPv6 BGP routes.

The following tunnel types are supported for resolving IPv4 routes and IPv6 routes with IPv4-mapped IPv6 next-hop addresses: bgp, ldp, rsvp, sr-isis, sr-ospf, sr-policy and sr-te. In this context:

- **bgp** — refers to IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes.
- **ldp** — refers to /32 and shorter length LDP FEC prefixes imported into the tunnel table. For IPv4 NLRI, BGP selects the LDP FEC that is the longest-prefix-match (LPM) of the BGP next-hop address. For IPv6 NLRI, BGP selects the /32 FEC that is an exact match of the BGP next-hop address.

- **rsvp** — refers to RSVP tunnels in the tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next-hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel id.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-ospf** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the OSPF protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPF instance or (in case of a tie) the lowest numbered OSPF instance.
- **sr-policy** — refers to segment routing policies with an IPv4 endpoint that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an unlabeled IPv4 or IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the segment routing policy.
- **sr-te** — refers to traffic engineered (TE) segment routing tunnels. This option allows BGP to use the best metric SR-TE tunnel to the address of the BGP next-hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel id.
- **udp** — refers to MPLSoUDPoIPv4 tunnels set up by action of the BGP import policies.

The following tunnel types are supported for resolving IPv6 routes with IPv6 next-hops that are not IPv4-mapped IPv6 addresses: ldp, sr-isis, and sr-policy. In this context:

- **ldp** — refers to /128 LDP FEC prefixes in the tunnel table. BGP selects the /128 FEC that is an exact match of the BGP next-hop address.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv6 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-policy** — refers to segment routing policies with a null IPv4 endpoint (0.0.0.0) that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv6 route must match the color of the segment routing policy and its color bits must be set to '01' or '10'.

show-request

Syntax

show-request [**ca** *ca-profile-name*]

Context

[Tree] (admin>certificate>cmpv2 show-request)

Full Context

admin certificate cmpv2 show-request

Description

This command displays current the CMPv2 pending request toward the specified CA. If there is no pending request, the last pending request is displayed including the status (success/fail/rejected) and the receive time of last CMPv2 message from server.

The following information is included in the output:

- Request type, original input parameter (password is not displayed), checkAfter and reason in of last PollRepContent, time of original command input.

Parameters

ca-profile-name

Specifies a ca-profile name, up to 32 characters. If not specified, the system will display pending requests of all ca-profiles.

Platforms

7705 SAR Gen 2

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within.

This command is supported on TDM satellite.

The **no** form of this command administratively enables an entity.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>lsp-history shutdown)

Full Context

configure router mpls lsp-history shutdown

Description

This command enables the collection of up to the last 100 significant events for each RSVP-TE and SR-TE LSP.

A shutdown of the **lsp-history** pauses the collection of events, but does not remove previously collected events from memory.

The **no** form of this command disables the collection of significant events for LSPs.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x>macsec>sub-port shutdown)

Full Context

configure port ethernet dot1x macsec sub-port shutdown

Description

This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in cleartext until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

Default

shutdown

Full Context

configure service vpls bgp-evpn mpls shutdown

configure service epipe bgp-evpn mpls shutdown

Description

This command controls the administrative state of EVPN-MPLS, EVPN-VXLAN, or EVPN-SRv6 in the service.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>proxy-nd shutdown)

[Tree] (config>service>vpls>proxy-arp shutdown)

Full Context

configure service vpls proxy-nd shutdown

configure service vpls proxy-arp shutdown

Description

This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>epipe>bgp-vpws shutdown)

Full Context

configure service epipe bgp-vpws shutdown

Description

This command administratively enables/disables the local BGP VPWS instance. On de-activation an MP-UNREACH-NLRI is sent for the local NLRI.

The **no** form of this command enables the BGP VPWS addressing and the related BGP advertisement. The associated BGP VPWS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>bgp-vpls shutdown)

Full Context

configure service vpls bgp-vpls shutdown

Description

This command administratively enables/disables the local BGP VPLS instance. On de-activation an MP-UNREACH-NLRI must be sent for the local NLRI.

The **no** form of this command enables the BGP VPLS addressing and the related BGP advertisement. The associated BGP VPLS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane. RT, RD usage: same as in the BGP AD solution, if the values are not configured here, the value of the VPLS-id from under the bgp-ad node is used. If VPLS-id value is not configured either the MH site cannot be activated – i.e. no shutdown returns an error. Same applies if a pseudowire template is not specified under the BGP node.

configure router ldp aggregate-prefix-match shutdown

configure router ldp interface-parameters interface ipv4 shutdown

configure router ldp shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>ldp>targeted-session>auto-tx>ipv4 shutdown)

[Tree] (config>router>ldp>targeted-session>auto-rx>ipv4 shutdown)

Full Context

configure router ldp targeted-session auto-tx ipv4 shutdown

configure router ldp targeted-session auto-rx ipv4 shutdown

Description

This command administratively disables the capabilities associated with automatically sending targeted Hello messages through the **auto-tx** command or processing targeted Hello messages through the **auto-rx** command.

The **no** form of this command administratively enables the capabilities associated with the **auto-tx** and **auto-rx** commands.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>lsp>secondary shutdown)

[Tree] (config>router>mpls>interface shutdown)

[Tree] (config>router>mpls>lsp>primary shutdown)

Full Context

configure router mpls lsp secondary shutdown

configure router mpls interface shutdown

configure router mpls shutdown

configure router mpls lsp primary shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>pce-initiated-lsp>sr-te shutdown)

Full Context

configure router mpls pce-initiated-lsp sr-te shutdown

Description

This command administratively enables or disables the **sr-te** context for PCE initiated LSPs. A shutdown of the **sr-te** context under **pce-initiated-lsp** causes an error to be generated for new PCInitate messages, and existing PCE-initiated LSPs are taken to the **oper-down** state.

The **no** form of this command administratively enables the **sr-te** context for PCE initiated LSP.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>if>label-map shutdown)

Full Context

configure router mpls interface label-map shutdown

Description

This command disables the label map definition. This drops all packets that match the specified *in-label* specified in the **label-map** *in-label* command.

The **no** form of this command administratively enables the defined label map action.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>lsp-template shutdown)

[Tree] (config>router>mpls>lsp shutdown)

Full Context

configure router mpls lsp-template shutdown

configure router mpls lsp shutdown

Description

This command disables the existing LSP including the primary and any standby secondary paths.

To shutdown only the primary enter the **config router mpls lsp** *lsp-name* **primary** *path-name* **shutdown** command.

To shutdown a specific standby secondary enter the **config router mpls lsp** *lsp-name* **secondary** *path-name* **shutdown** command. The existing configuration of the LSP is preserved.

Use the **no** form of this command to restart the LSP. LSPs are created in a shutdown state. Use this command to administratively bring up the LSP.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>path shutdown)

Full Context

configure router mpls path shutdown

Description

This command disables the existing LSPs using this path. All services using these LSPs are affected. Binding information, however, is retained in those LSPs. Paths are created in the **shutdown** state.

The **no** form of this command administratively enables the path. All LSPs, where this path is defined as primary or defined as standby secondary, are (re)established.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>pcep>pcc shutdown)

Full Context

configure router pcep pcc shutdown

Description

This command administratively disables the PCC or PCE process.

The following PCE parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**

The **unknown-message-rate** PCE parameter can be modified without shutting down the PCEP session.

The following PCC parameters can only be modified when the PCEP session is shut down:

- **local-address**
- **keepalive**
- **dead-timer**
- **peer**

The following PCC parameters can be modified without shutting down the PCEP session:

- **report-path-constraints**
- **unknown-message-rate**

Default

shutdown

[**no**] **shutdown**

Context

[Tree] (config>router>rsvp shutdown)

[Tree] (config>router>rsvp>interface shutdown)

Full Context

configure router rsvp shutdown

configure router rsvp interface shutdown

Description

This command disables the RSVP protocol instance or the RSVP-related functions for the interface. The RSVP configuration information associated with this interface is retained. When RSVP is administratively disabled, all the RSVP sessions are torn down. The existing configuration is retained.

The **no** form of this command administratively enables RSVP on the interface.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy>nh-grp shutdown)

Full Context

configure router mpls forwarding-policies forwarding-policy next-hop-group shutdown

Description

This command shuts down an NHG entry in a forwarding policy.

When an NHG is shut down, it is removed from the data path entry of the forwarding policy.

The **no** form of this command brings up an NHG entry in a forwarding policy.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>mpls>fwd-policies>fwd-policy shutdown)

file shutdown

Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note:
The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

LED Status Indicators

Table 92: LED Status Indicators lists the possible states for the compact flash and their LED status indicators.

Table 92: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.

State	Description
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default

no shutdown

Parameters

cflash-id

Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

active

Specifies that all drives on the active CPM are shutdown or enabled.

standby

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Context

[Tree] (config>system>snmp>streaming shutdown)

Full Context

configure system snmp streaming shutdown

Description

This command administratively disables proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes.

The **no** form of the command administratively re-enables SNMP request/response bundling and TCP-based transport mechanism.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>snmp shutdown)

Full Context

configure system snmp shutdown

Description

This command administratively disables SNMP agent operations. System management can then only be performed using the command line interface (CLI). Shutting down SNMP does not remove or change configuration parameters other than the administrative state. This command does not prevent the agent from sending SNMP notifications to any configured SNMP trap destinations. SNMP trap destinations are configured under the **config>log>snmp-trap-group** context.

This command is automatically invoked in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof persist on** command is enabled.

The **no** form of the command administratively enables SNMP which is the default state.

Default

no shutdown

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>segment-routing>maintenance-policy shutdown)

Full Context

configure router segment-routing maintenance-policy shutdown

Description

This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>segment-routing>sr-policies shutdown)

Full Context

configure router segment-routing sr-policies shutdown

Description

This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

It is necessary to execute this shutdown if you want to make a change to the reserved-label-block reference.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list shutdown)

Full Context

configure router segment-routing sr-policies static-policy segment-list shutdown

Description

This command deactivates a segment-list. If this is done on an active policy with more than one segment list, then traffic forwarded by the policy will be diverted to the remaining segment-lists.

The **no** form of this command enables the segment list so that it can be validated and installed as necessary.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (conf>router>segment-routing>sr-policies>policy shutdown)

Full Context

configure router segment-routing sr-policies static-policy shutdown

Description

This command deactivates the associated static policy and causes another policy for the same (color, endpoint) combination to be promoted as the active path, assuming there is another valid policy.

It is necessary to execute this shutdown if you want to make critical configuration changes to the static policy.

The **no** form of this command enables the static policy so that it can be validated and installed as necessary.

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x>per-host-authentication shutdown)

Full Context

configure port ethernet dot1x per-host-authentication shutdown

Description

This command administratively configures per-host authentication on the port.

The **no** form of this command administratively enables per-host authentication on the port.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>port>ethernet>dot1x shutdown)

Full Context

configure port ethernet dot1x shutdown

Description

This command administratively configures the 802.1x functionality (consisting of packet extraction and processing on the CPM) on the port.

The **no** form of this command administratively enables the 802.1x functionality on the port.

Default

no shutdown

Platforms

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>bgp>egress-peer-engineering shutdown)

Full Context

configure router bgp egress-peer-engineering shutdown

Description

This command administratively enables or disables BGP-EPE. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.

The **no** form of this command places the entity into an administratively enabled state and prevents peer node SIDs and peer adjacency SIDs from being advertised in BGP-LS.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>router>bgp>group>egress-engineering shutdown)

Full Context

configure router bgp group egress-engineering shutdown

Description

This command administratively enables or disable egress engineering on a BGP neighbor or group of neighbors.

If this command is enabled along with the **egress-peer-engineering** command in BGP, SIDs in the form of MPLS labels are allocated for the segments toward the neighbor and to all links (adjacencies). These adjacencies are then advertised in BGP LS.

The **no** form of this command places the entity into an administratively enabled state.

Default

no shutdown

Platforms

7705 SAR Gen 2

28.1 sid

sid

Syntax

sid label *value*

Context

[Tree] (config>router>isis>segm-rtng>adjacency-set sid)

[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

Full Context

configure router isis segment-routing adjacency-set sid

configure router ospf segment-routing adjacency-set sid

Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters

label value

Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms

7705 SAR Gen 2

28.2 sid-map

sid-map

Syntax

sid-map node-sid {**index** *value* [**range** *value*]} **prefix** {{*ip-address*/*mask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** { **1** | **2** | **1/2**}] [**clear-n-flag**]

no sid-map node-sid index *value*

Context

[Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

Full Context

configure router isis segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters

index

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

value

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 65535

ip-address/mask

Specifies the IP address and mask.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)

mask: **0 to 32**

ip-address netmask

Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags

Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2}

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms

7705 SAR Gen 2

sid-map

Syntax

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}

no sid-map node-sid index *index-value*

Context

[Tree] (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context

configure router ospf segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note:
SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default

no prefix-sid-range

Parameters

index index-value

Specifies the index.

Values 0 to 4294967295

range range-value

Specifies the range.

Values 1 to 65535

prefix ip-address/mask

Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask

Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

area area-id

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms

7705 SAR Gen 2

28.3 sid-protection

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>isis>interface sid-protection)

Full Context

configure router isis interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for

a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

Platforms

7705 SAR Gen 2

sid-protection

Syntax

[**no**] **sid-protection**

Context

[Tree] (config>router>ospf>area>interface sid-protection)

Full Context

configure router ospf area interface sid-protection

Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternate** option in IS-IS or OSPF at the LER and LSR. However, may be applications where the user never wants traffic to divert from the strict hop computed by CSPF for an SR-TE LSP. In this case, the user can disable protection for all adjacency SIDs formed over a particular network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

Default

sid-protection

28.4 signaling

signaling

Syntax

signaling *signaling*

Context

[Tree] (config>service>epipe>spoke-sdp-fec signaling)

Full Context

configure service epipe spoke-sdp-fec signaling

Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default

signaling auto

Parameters

signaling

Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms

7705 SAR Gen 2

signaling

Syntax

signaling {**off** | **tldp** | **bgp**}

Context

[Tree] (config>service>sdp signaling)

Full Context

configure service sdp signaling

Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

Note:
If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

Default

signaling tldp

Parameters

off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

28.6 significant-change

significant-change

Syntax

significant-change *delta*

no significant-change

Context

[Tree] (config>log>acct-policy>cr significant-change)

Full Context

configure log accounting-policy custom-record significant-change

Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default

significant-change 0

Parameters

delta

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

Platforms

7705 SAR Gen 2

28.7 single-sfm-overload

single-sfm-overload

Syntax

single-sfm-overload [**holdoff-time** *holdoff-time*]

no single-sfm-overload

Context

[Tree] (config>service>vprn single-sfm-overload)

Full Context

configure service vprn single-sfm-overload

Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The **no** form of this command configures the router to not set overload if an SFM fails.

Default

no single-sfm-overload

Parameters

holdoff-time

Specifies the delay between detecting SFM failures and setting overload.

Values 1 to 600 seconds

Default 0 seconds

Platforms

7705 SAR Gen 2

single-sfm-overload

Syntax

single-sfm-overload [**holdoff-time** *holdoff-time*]

no single-sfm-overload

Context

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-activation-timer)

Full Context

configure redundancy bgp-multi-homing site-activation-timer

Description

This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following event occurs only if the site is operationally up:

- Manual site activation using "no shutdown” at site-id level or at member object(s) level (for example, SAP(s) or PW(s)
- Site activation after a failure

The **no** form of this command sets the value to 2.

Default

no site-activation-timer

Parameters

seconds

Specifies the timer, in seconds.

Values 1 to 100

Platforms

7705 SAR Gen 2

site-activation-timer

Syntax

site-activation-timer *seconds*

no site-activation-timer

Context

Parameters

value

Specifies the site identifier.

Values 1 to 65535

Platforms

7705 SAR Gen 2

28.11 site-min-down-timer

site-min-down-timer

Syntax

site-min-down-timer *seconds*

no site-min-down-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-min-down-timer)

Full Context

configure redundancy bgp-multi-homing site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default

no site-min-down-timer

Parameters

seconds

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms

7705 SAR Gen 2

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>vpls>site site-min-down-timer)

Full Context

configure service vpls site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go

operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms

7705 SAR Gen 2

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>epipe>site site-min-down-timer)

Full Context

configure service epipe site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go

operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The preceding operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the s**ite-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100

Platforms

7705 SAR Gen 2

28.12 site-preference

site-preference

Syntax

site-preference *preference-value*

no site-preference

Context

[Tree] (config>service>epipe>site site-preference)

Full Context

configure service epipe site site-preference

Description

This command defines the value to advertise in the VPLS preference field of the BGP VPWS and BGP Multi-homing NLRI extended community. This value can be changed without having to shutdown the site itself. The site-preference is only applicable to VPWS services.

When not configured, the default is zero, indicating that the VPLS preference is not in use.

Default

no site-preference, value=0

Parameters

preference-value

Specifies the preference value to advertise in the NLRI L2 extended community for this site.

Values 1 to 65535

primary

Sets the site-preference to 65535.

backup

Sets the site-preference to 1.

sleep 1

Parameters

seconds

Specifies the number of seconds for the console session to sleep, expressed as a decimal integer.

Values 1 to 100

Default 1

Platforms

7705 SAR Gen 2

28.15 slice-size

slice-size

Syntax

slice-size *slice-size*

no slice-size

Context

[Tree] (config>mirror>mirror-dest slice-size)

Full Context

configure mirror mirror-dest slice-size

Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

Parameters

slice-size

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

Values 128 to 9216

Platforms

7705 SAR Gen 2

28.16 snap-oui

snap-oui

Syntax

Full Context

configure system security management-access-filter mac-filter entry match snap-oui

Description

This command configures an IEEE 802.3 LLC SNAP Ethernet Frame OUI zero or non-zero value to be used as a MAC filter match criterion.

The **no** form of this command removes the criterion from the match criteria.

Default

no snap-oui

Parameters

zero

Specifies to match packets with the three-byte OUI field in the SNAP-ID set to zero.

non-zero

Specifies to match packets with the three-byte OUI field in the SNAP-ID not set to zero.

Platforms

7705 SAR Gen 2

28.17 snap-pid

snap-pid

Syntax

snap-pid *snap-pid*

no snap-pid

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match snap-pid)

Full Context

configure qos sap-ingress mac-criteria entry match snap-pid

Description

Configures an IEEE 802.3 LLC SNAP Ethernet frame PID value to be used as a service ingress QoS policy match criterion.

This is a 2-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the 3-byte OUI field.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **snap-pid** match criteria is independent of the OUI field within the SNAP header. Two packets with different 3-byte OUI fields, but the same PID field, will both match the same policy entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

Default

no snap-pid

Parameters

snap-pid

The 2-byte snap-pid value to be used as a match criterion in hexadecimal.

Values 0x0000 to 0xFFFF

Platforms

7705 SAR Gen 2

snap-pid

Syntax

snap-pid *snap-pid*

no snap-pid

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match snap-pid)

Full Context

configure system security management-access-filter mac-filter entry match snap-pid

Description

This command configures an IEEE 802.3 LLC SNAP Ethernet Frame PID value to be used as a MAC filter match criterion.

This is a two-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the three-byte OUI field.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7705 SAR Gen 2 Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

Note:
The snap-pid match criterion is independent of the OUI field within the SNAP header. Two packets with different three-byte OUI fields but the same PID field will both match the same filter entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

Default
no snap-pid

Parameters
pid-value

Specifies the two-byte snap-pid value to be used as a match criterion in hexadecimal.

Values 0x0000 to 0xFFFF

28.19 snmp-trap-group

snmp-trap-group

Syntax

snmp-trap-group *log-id* | *log-name* [**name** *log-name*]

no snmp-trap-group *log-id* | *log-name*

Context

[Tree] (config>service>vprn>log snmp-trap-group)

Full Context

configure service vprn log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Parameters

log-id* | *log-name

Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

Platforms

7705 SAR Gen 2

snmp-trap-group

Syntax

snmp-trap-group *log-id* | *log-name* [**name** *log-name*]

no snmp-trap-group *log-id* | *log-name*

Context

[Tree] (config>log snmp-trap-group)

Full Context

configure log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specified *log-id*.

A group specifies the types of SNMP traps and the log ID which that will receive the SNMP trap group. The user must configure a trap to send SNMP traps.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log ID, see the filter command. When alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined at the main event source.

The **no** form of this command deletes the SNMP trap group.

Parameters

log-id* | *log-name

Specifies the log ID or log name (up to 32 characters).

Values *log-id*: 1 to 100

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

28.20 snoop

snoop

Syntax

[**no**] **snoop**

Context

[Tree] (config>service>vpls>sap>dhcp snoop)

[Tree] (config>service>vpls>spoke-sdp>dhcp snoop)

[Tree] (config>service>vpls>mesh-sdp>dhcp snoop)

Full Context

configure service vpls sap dhcp snoop

configure service vpls spoke-sdp dhcp snoop

configure service vpls mesh-sdp dhcp snoop

Description

This command enables snooping of DHCP or DHCP6 messages on the SAP or SDP. Enabling DHCP or DHCP6 snooping on interfaces (SAPs and SDP bindings) is required where DHCP or DHCP6 messages important to lease state table population are received, or where Option 82 information is to be inserted. This includes interfaces that are in the path to receive messages from either DHCP or DHCP6 servers or from subscribers.

The **no** form of this command disables DHCP or DHCP6 snooping on the specified SAP or SDP binding.

Default

no snoop

Platforms

7705 SAR Gen 2

28.21 sntp

sntp

Syntax

[**no**] **sntp**

Context

[Tree] (config>system>time sntp)

Full Context

configure system time sntp

Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

Default

sntp

Platforms

7705 SAR Gen 2

28.22 socket

socket

Syntax

socket [**neighbor** *ip-address* | **group** *name*]

no socket

Context

[Tree] (debug>router>bgp socket)

Full Context

debug router bgp socket

Description

This command logs all TCP socket events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

7705 SAR Gen 2

28.23 solicited-release

solicited-release

Syntax

[**no**] **solicited-release**

Context

[Tree] (config>router>dhcp6>server>lease-hold-time-for solicited-release)

[Tree] (config>router>dhcp>server>lease-hold-time-for solicited-release)

[Tree] (config>service>vprn>dhcp6>server>lease-hold-time-for solicited-release)

[Tree] (config>service>vprn>dhcp>server>lease-hold-time-for solicited-release)

Full Context

configure router dhcp6 local-dhcp-server lease-hold-time-for solicited-release

configure router dhcp local-dhcp-server lease-hold-time-for solicited-release

configure service vprn dhcp6 local-dhcp-server lease-hold-time-for solicited-release

configure service vprn dhcp local-dhcp-server lease-hold-time-for solicited-release

Description

This command enables the server to hold up a lease even in case of solicited release; for example, when the server receives a normal DHCP release message.

The **no** form of this command disables the ability of the server to hold up a lease when a solicited release is received.

Platforms

7705 SAR Gen 2

28.24 source

source

Syntax

configure service vpls mesh-sdp mld-snooping static group source

configure service vpls spoke-sdp mld-snooping static group source

configure service vpls sap igmp-snooping static group source

configure service vpls spoke-sdp igmp-snooping static group source

configure service vpls mesh-sdp igmp-snooping static group source

configure service vpls sap mld-snooping static group source

Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters

ip-address

Specifies the IPv4 unicast address

src-ipv6-address

Specifies the IPv6 unicast address.

Platforms

7705 SAR Gen 2

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>service>ies>if>sap>ip-tunnel source)

[Tree] (config>service>vprn>if>sap>ip-tunnel source)

Full Context

configure service ies interface sap ip-tunnel source

configure service vprn interface sap ip-tunnel source

Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default

no source

Parameters

ip-address

Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
	x	[0..FFFF]H
	d	[0..255]D

Description

This command specifies the source IP address for the group range. Whenever a (*,G) report is received in the range specified by **grp-range** *start* and *end* parameters, it is translated to an (S,G) report with the value of this object as the source address.

The **no** form of this command removes the IPv6 address form the group range configuration.

Parameters

ipv6-address

Specifies the IPv6 address that will be sending data.

Platforms

7705 SAR Gen 2

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>oam-pm>session>ip source)

Full Context

configure oam-pm session ip source

Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets

are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

Parameters

source

Indicates the launch point.

ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>aaa>radius-srv-plcy>servers source-address)

Full Context

configure aaa radius-server-policy servers source-address

Description

This command configures the source address of the RADIUS packet. The system IP address must be configured in order for the RADIUS client to work. See "Configuring a System Interface" in the *7705 SAR Gen 2 Router Configuration Guide*.

Note:
The system IP address must only be configured if the source-address is not specified. When the no source-address command is executed, the source address is determined at the moment the request is sent. This address is also used in the *nas-ip-address* attribute: over there it is set to the system IP address if no source-address was given.

The **no** form of this command reverts to the default value.

Parameters

ip-address

Specifies the source address of RADIUS packet.

Platforms

7705 SAR Gen 2

source-address

Syntax

source-address

Context

[Tree] (config>service>vprn source-address)

Full Context

configure service vprn source-address

Description

Commands in this context specify the source address and application that should be used in all unsolicited packets.

Platforms

source-address

Syntax

source-address [*ip-address*]

no source-address

Context

[Tree] (config>filter>redirect-policy>dest>ping-test source-address)

Full Context

configure filter redirect-policy destination ping-test source-address

Description

This command configures the source address to use in the IP packet of the ping test for this destination.

Default

no source-address

Parameters

ip-address

The source address of the IP packet. This can be IPv4 only for an IPv4 destination and IPv6 only for an IPv6 destination.

Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

Platforms

7705 SAR Gen 2

source-address

Syntax

source-address

Context

[Tree] (config>system>security source-address)

Full Context

configure system security source-address

Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the 7705 SAR Gen 2 or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

Platforms

7705 SAR Gen 2

source-address

Syntax

source-address *ip-address*

source-address prefix-list *prefix-list-name*

no source-address

Context

[Tree] (config>router>policy-options>policy-statement>entry>from source-address)

Full Context

configure router policy-options policy-statement entry from source-address

Description

This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

Default

no source-address

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-list-name

The prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

28.26 source-port

source-port

Syntax

source-port *port*

source-port grpc

no source-port

Context

[Tree] (config>system>management-interface>remote-management source-port)

Full Context

configure system management-interface remote-management source-port

Description

This command configures the TCP port local to this device that NISH uses to send packets to this node.

If this command is also configured for a specific manager in the **config**>**system**> **management-interface**>**remote-management**>**manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the default gRPC port, 57400.

Default

source-port grpc

Parameters

port

Specifies the TCP source port.

Values 1 to 65535

grpc

Keyword that specifies the default gRPC protocol port as the source port.

Platforms

7705 SAR Gen 2

source-port

Syntax

source-port *port*

source-port grpc

no source-port

Context

[Tree] (config>system>management-interface>remote-management>manager source-port)

Full Context

configure system management-interface remote-management manager source-port

Description

This command configures the TCP port local to this device that this NISH manager uses to send packets to this node.

This command takes precedence over the same command configured in the global context (**config**>**system**>**management-interface**>**remote-management**).

The **no** form of this command causes the source port to be inherited from the global context (**config**>**system**>**management-interface**>**remote-management**).

Parameters

port

Specifies the TCP source port.

Values 1 to 65535

Default 57400

grpc

Keyword that specifies the default gRPC protocol port as the source port.

Platforms

7705 SAR Gen 2

28.27 source-udp-port

source-udp-port

Syntax

source-udp-port *udp-port-number*

no source-udp-port

Context

[Tree] (config>oam-pm>session>ip source-udp-port)

Full Context

configure oam-pm session ip source-udp-port

Description

This command should only be used when the source UDP port for the session-sender twamp-test packet must be specified.

The **no** form of this command means the session-sender automatically assigns the source UDP port from the available dynamic (private) UDP range.

Parameters

udp-port-number

Specifies the UDP source port.

Values 64374 to 64383

Platforms

7705 SAR Gen 2

28.28 sp-reverse-route

sp-reverse-route

Syntax

sp-reverse-route [**ignore-default-route**]

no sp-reverse-route

Context

[Tree] (config>ipsec>tnl-temp sp-reverse-route)

Full Context

configure ipsec tunnel-template sp-reverse-route

Description

This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

Default

no sp-reverse-route

Parameters

ignore-default-route

Specifies to ignore any full range traffic selector in TSi.

Platforms

7705 SAR Gen 2

28.29 space

space

Syntax

[**no**] **space**

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>command-completion space)

Full Context

configure system management-interface cli md-cli environment command-completion space

Description

This command enables completion on the space character.

The **no** form of this command reverts to the default value.

Default

space

Platforms

7705 SAR Gen 2

28.30 spe-address

spe-address

Syntax

spe-address *global-id:prefix*

no spe-address

Context

[Tree] (config>service>pw-routing spe-address)

Full Context

configure service pw-routing spe-address

Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default

no spe-address

Parameters

global-id

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values

<global-id:prefix>:	<global-id>:{<prefix>| <ipaddress>}
global-id	1 to 4294967295
prefix	1 to 4294967295

	ipaddress	a.b.c.d

28.31 speed

speed

Syntax

speed {**10** | **100** | **1000** | **10000** | **25000** | **40000** | **50000** | **100000**}

Context

[Tree] (config>port>ethernet speed)

Full Context

configure port ethernet speed

Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default

dependent on port type

Parameters

10

Sets the link to 10 Mb/s speed.

100

Sets the link to 100 Mb/s speed.

1000

Sets the link to 1000 Mb/s speed.

10000

Sets the link to 10000 Mb/s speed.

25000

Sets the link to 25000 Mb/s speed.

40000

Sets the link to 40000 Mb/s speed.

50000

Sets the link to 50000 Mb/s speed.

100000

Sets the link to 100000 Mb/s speed.

Platforms

7705 SAR Gen 2

speed

Syntax

speed *speed*

Context

[Tree] (bof speed)

Full Context

bof speed

Description

This command configures the speed for the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).

If the port is configured to autonegotiate, this parameter is ignored.

Available speed options are dependent on the specific CPM variant in the system.

Default

speed 100

Parameters

speed

Sets the link speed, in Mb/s.

Values 10, 100, 1000

Platforms

7705 SAR Gen 2

28.32 spf

spf

Syntax

[**no**] **spf** [*level-number*] [*system-id*]

Context

[Tree] (debug>router>isis spf)

Full Context

debug router isis spf

Description

This command enables debugging for IS-IS SFP.

The **no** form of the command disables debugging.

Parameters

system-id

When specified, only the specified system-id is debugged. A 6-octet system identifier (xxxx.xxxx.xxxx).

level-number

Specifies the interface level (1, 2, or 1 and 2).

Platforms

7705 SAR Gen 2

spf

Syntax

spf [**type**] [*dest-addr*]

no spf

Context

[Tree] (debug>router>ospf spf)

Full Context

debug router ospf3 spf

debug router ospf spf

Description

This command enables debugging for OSPF SPF. Information regarding overall SPF start and stop times will be shown. To see detailed information regarding the SPF calculation of a given route, the route must be specified as an optional argument.

Parameters

type

Specifies the area to debug.

Values intra-area, inter-area, external

dest-addr

Specifies the destination IP address to debug.

Platforms

7705 SAR Gen 2

28.33 spf-wait

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *initial-wait*] [**spf-second-wait** *second-wait*]

no spf-wait

Context

[Tree] (config>service>vprn>isis>timers spf-wait)

Full Context

configure service vprn isis timers spf-wait

Description

This command configures the maximum interval, in milliseconds, between two consecutive SPF calculations. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs are controlled with this command.

Subsequent SPF runs (if required) occur at exponentially increasing intervals of the **spf-second-wait** interval. For example, if the **spf-second-wait** interval is 1000, the next SPF will run after 2000 milliseconds, and the next SPF after 4000 milliseconds, and so on, until it reaches the **spf-wait** value. The SPF interval remains at the **spf-wait** value until no more SPF runs are scheduled in that interval. After a full interval without any SPF runs, the SPF interval drops back to the **spf-initial-wait** value.

Note:
The timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

The **no** form of this command reverts to the default value.

Default

spf-wait 10000 spf-initial-wait 1000 spf-second-wait 1000

Parameters

spf-wait

Specifies the maximum interval, in milliseconds, between two consecutive SPF calculations.

Values 10 to 120000

initial-wait

Specifies the initial SPF calculation delay, in milliseconds, after a topology change.

Values 10 to 100000

second-wait

Specifies the hold time, in milliseconds, between the first and second SPF calculation.

Values 10 to 100000

Platforms

7705 SAR Gen 2

28.34 spi

spi

Syntax

spi *spi*

no spi

Context

[Tree] (config>ipsec>static-sa spi)

Full Context

configure ipsec static-sa spi

Description

This command configures the SPI key value for an IPsec manual SA.

This command specifies the SPI (Security Parameter Index) used to lookup the instruction to verify and decrypt the incoming IPsec packets when the value of the **direction** command is **inbound**.

The SPI value specifies the SPI that will be used in the encoding of the outgoing packets when the when the value of the **direction** command is **outbound**. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

If **no spi** is selected, then this static SA cannot be used.

The **no** form of this command reverts to the default value.

Default

no spi

Parameters

spi

Specifies the security parameter index for this SA.

Values 256 to 16383

Full Context

configure service vprn bgp group neighbor split-horizon

configure service vprn bgp group split-horizon

configure service vprn bgp split-horizon

Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution:
Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

configure service vprn rip group split-horizon

configure service vprn rip group neighbor split-horizon

configure service vprn ripng group neighbor split-horizon

configure service vprn ripng split-horizon

configure service vprn ripng group split-horizon

Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default

split-horizon enable

Parameters

enable

Enables split horizon and poison reverse.

disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level

(applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

configure router ripng group neighbor split-horizon

configure router rip split-horizon

configure router ripng group split-horizon

configure router ripng split-horizon

configure router rip group neighbor split-horizon

configure router rip group split-horizon

Description

This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

enabled

Parameters

enable

Specifies enable split horizon and poison reverse.

disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

Platforms

7705 SAR Gen 2

28.36 split-horizon-group

split-horizon-group

Syntax

split-horizon-group [*group-name*] [**residential-group**] [**create**]

Context

[Tree] (config>service>vpls split-horizon-group)

Full Context

configure service vpls split-horizon-group

Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default

A split horizon group is by default not created as a residential-group.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)

- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Platforms

7705 SAR Gen 2

split-horizon-group

Syntax

split-horizon-group *name*

no split-horizon-group

Context

[Tree] (config>service>vpls>bgp-evpn>mpls split-horizon-group)

Full Context

configure service vpls bgp-evpn mpls split-horizon-group

Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

Default

no split-horizon-group

Parameters

name

Specifies the split-horizon-group name.

Platforms

7705 SAR Gen 2

split-horizon-group

The **no** form of this command reverts the default.

Default

no split-horizon-group

Parameters

group-name

Specifies a split-horizon group name

Platforms

7705 SAR Gen 2

split-horizon-group

Syntax

split-horizon-group *group-name*

no split-horizon-group

Context

[Tree] (config>service>pw-template split-horizon-group)

Full Context

configure service pw-template split-horizon-group

Description

This command creates a new split horizon group (SGH).

Comparing a "residential" SGH and a "regular" SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs.

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported

- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable on the 7705 SAR Gen 2 (dhcp-lease-states are not supported on spoke SDPs)
- MAC pinning enabled per default (can be disabled)

Platforms

7705 SAR Gen 2

28.37 spoke-sdp

spoke-sdp

Syntax

spoke-sdp *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] **endpoint** [**no-endpoint**] [**root-leaf-tag** | **leaf-ac**]

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing service destination point (SDP). A spoke-SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke-SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

Specifies the SDP identifier

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ether, vlan

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke-SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

group-name

Specifies the name of the split horizon group to which the SDP belongs

endpoint

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no endpoint

Removes the association of a spoke-SDP with an explicit endpoint name

root-leaf-tag

Specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

leaf-ac

Specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

spoke-sdp

Syntax

spoke-sdp *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **ipipe**}] [**create**]

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>ies>if spoke-sdp)

[Tree] (config>service>vprn>if spoke-sdp)

Full Context

configure service ies interface spoke-sdp

configure service vprn interface spoke-sdp

Description

This command binds a service to an existing service destination point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an IES service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down first before it can be deleted from the configuration.

Default

no spoke-sdp

Parameters

sdp-id

Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

Specifies the encapsulation and pseudowire type for the spoke SDP.

Values ether: specifies Ethernet pseudowire as the type of virtual circuit (VC) associated with the SDP binding

ipipe: specifies Ipipe pseudowire as the type of virtual circuit (VC) associated with the SDP binding

Default ether

create

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>epipe spoke-sdp)

Full Context

configure service epipe spoke-sdp

Description

This command binds a service to an existing service destination point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an Epipe, VPLS, VPRN, VPRN service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an EPIPE service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

Parameters

sdp-id

The SDP identifier.

Values 1 to 17407

vc-id

The virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however it must be configured.

Values 1 to 4294967295

vc-type

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding.

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

no-endpoint

Removes the association of a spoke SDP with an explicit endpoint name.

endpoint-name

Specifies the name of the service endpoint.

icb

Specifies the spoke SDP as an inter-chassis backup SDP binding.

Platforms

7705 SAR Gen 2

Context

[Tree] (config>mirror>mirror-dest spoke-sdp)

[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

Full Context

configure mirror mirror-dest spoke-sdp

configure mirror mirror-dest remote-source spoke-sdp

Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters

sdp-id:vc-id

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint

Removes the association of a SAP or a SDP with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

icb

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

spoke-sdp-fec *spoke-sdp-fec-id* [**fec** *fec-type*] [**aii-type** *aii-type*] [**create**] **endpoint** *name* [**icb**]

Context

[Tree] (config>service>epipe spoke-sdp-fec)

Full Context

configure service epipe spoke-sdp-fec

Description

This command binds a service to an existing service destination point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

spoke-sdp-fec-id

An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

fec-type

An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type

An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name

Specifies the name of the service endpoint.

no endpoint

Adds or removes a spoke SDP association.

icb

Configures the spoke SDP as an inter-chassis backup SDP binding.

28.39 spt-switchover-threshold

spt-switchover-threshold

Syntax

spt-switchover-threshold {*grp-ip-address/mask* | *grp-ip-address netmask*} *spt-threshold*

spt-switchover-threshold *grp-ipv6-addr/prefix-length spt-threshold*

no spt-switchover-threshold {*grp-ip-address/mask* | *grp-ip-address netmask*}

no spt-switchover-threshold *grp-ipv6-addr/prefix-length*

Context

[Tree] (config>service>vprn>pim spt-switchover-threshold)

Full Context

configure service vprn pim spt-switchover-threshold

Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

Parameters

grp-ip-address

Specifies the multicast group address.

grp-ipv6-address

Specifies the multicast group address.

prefix-length

Specifies the address prefix length.

Values

grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H

d [0 to 255]D

prefix-length [1 to 128]

mask

Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

Platforms

7705 SAR Gen 2

spt-switchover-threshold

Syntax

spt-switchover-threshold {*grp-ipv4-prefixIipv4-prefix-length* | *grp-ipv4-prefix netmask* | *grp-ipv6-prefixIipv6-prefix-length*} *spt-threshold*

no spt-switchover-threshold {*grp-ipv4-prefixIipv4-prefix-length* | *grp-ipv4-prefix netmask* | *grp-ipv6-prefixIipv6-prefix-length*}

Context

[Tree] (config>router>pim spt-switchover-threshold)

Full Context

configure router pim spt-switchover-threshold

Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters

grp-ipv4-prefix

Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length

Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

grp-ipv6-prefix

Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

ipv6-prefix-length

Specifies the length of the IPv6 prefix.

Values 8 to 128

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

Values 1 to 4294967294, infinity

28.41 sr-label-index

sr-label-index

Syntax

sr-label-index {*value* | *param-name*} [**prefer-igp**]

no sr-label-index

Context

[Tree] (config>router>policy-options>policy-statement>default-action sr-label-index)

[Tree] (config>router>policy-options>policy-statement>entry>action sr-label-index)

Full Context

configure router policy-options policy-statement default-action sr-label-index

configure router policy-options policy-statement entry action sr-label-index

Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note:
Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default

no sr-label-index

Parameters

value

Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

prefer-igp

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

configure router mpls-labels sr-labels

Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default

no sr-labels

Parameters

start-value

Specifies the start label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

end-value

Specifies the end label value in the SRGB

Values 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

sr-maintenance-policy

Syntax

sr-maintenance-policy *maintenance-policy-name*

no sr-maintenance-policy

Context

[Tree] (config>router>policy-options>policy-statement>entry>action sr-maintenance-policy)

[Tree] (config>router>policy-options>policy-statement>default-action sr-maintenance-policy)

Full Context

configure router policy-options policy-statement entry action sr-maintenance-policy

configure router policy-options policy-statement default-action sr-maintenance-policy

Description

This command applies a named segment routing maintenance policy to the matching routes. It is only used for SR policy routes. The named policy must exist under the **config**>**router**>**segment-routing** context.

The **no** form of this command removes the specified maintenance policy.

Parameters

maintenance-policy-name

Specifies the name of the maintenance policy, up to 32 characters and cannot start with a space or underscore.

28.45 sr-mpls-local

sr-mpls-local

Syntax

sr-mpls-local {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-local)

Full Context

configure router ttl-propagate sr-mpls-local

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for CPM originated IP packets. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.

Default

sr-mpls-local all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

Platforms

7705 SAR Gen 2

28.46 sr-mpls-transit

sr-mpls-transit

Syntax

sr-mpls-transit {**none** | **all**}

Context

[Tree] (config>router>ttl-propagate sr-mpls-transit)

Full Context

configure router ttl-propagate sr-mpls-transit

Description

This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command configures TTL or hop-limit propagation for transit IP packets. Transit IP packets are packets of base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.

Default

sr-mpls-transit all

Parameters

none

Keyword to specify that the IP TTL or hop limit is not propagated into the segment routing transport label stack.

all

Keyword to specify that the IP TTL or hop limit is propagated to all labels in the segment routing transport label stack.

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter sr-te

configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-te

Description

This command selects the Segment Routing (SR) Traffic Engineered (SR-TE) LSP programmed in TTM.

The **sr-te** value instructs the system to search for the best metric SR-TE LSP to the address of the BGP next hop. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple SR-TE LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.

The **no** form of this command disables the SR-TE LSP setting for the auto-bind tunnel.

Default

no sr-te

Platforms

7705 SAR Gen 2

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>mpls>pce-initiated-lsp sr-te)

Full Context

configure router mpls pce-initiated-lsp sr-te

Description

This command enables support for SR-TE PCE-initiated LSPs.

The **no** form of this command removes SR-TE PCE-initiated LSP support. All PCE-initiated SR-TE LSPs are deleted.

Platforms

7705 SAR Gen 2

sr-te

Syntax

sr-te *value*

no sr-te

Context

[Tree] (config>router>mpls>tunnel-table-pref sr-te)

Full Context

configure router mpls tunnel-table-pref sr-te

Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

sr-te 8

Parameters

value

Specifies the tunnel table preference value for SR-TE LSP.

Values	1 to 255
Default	8

Platforms

7705 SAR Gen 2

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

Default

no sr-te

Platforms

7705 SAR Gen 2

Full Context

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-te

configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter sr-te

Description

This command selects the Segment Routing (SR) tunnel type programmed by a traffic engineered (TE) instance in TTM for next-hop resolution. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.

Platforms

7705 SAR Gen 2

sr-te

Syntax

sr-te {**legacy** | **application-specific-link-attributes**}

no sr-te

Context

[Tree] (config>router>ospf>traffic-engineering-options sr-te)

Full Context

configure router ospf traffic-engineering-options sr-te

Description

This command configures the advertisement of TE attributes of each link on a per-application basis. Two applications are supported in SR OS: RSVP-TE and SR-TE. Although the **legacy** mode of advertising TE attributes is supported, additional configurations are possible.

The **no** form of this command deletes the context.

Default

no sr-te

Parameters

legacy

Advertises the TE attributes for MPLS-enabled SR links using TE Opaque LSAs.

Note:
Do not configure the **legacy** mode if the network has both RSVP-TE and SR-TE attributes and the links are not congruent.

application-specific-link-attributes

Advertises TE information for MPLS-enabled SR links using the new Application Specific Link Attributes (ASLA) TLVs.

Platforms

7705 SAR Gen 2

28.53 sr-te-lsp

sr-te-lsp

Syntax

[**no**] **sr-te-lsp** *lsp-name*

Context

[Tree] (config>service>sdp sr-te-lsp)

Full Context

configure service sdp sr-te-lsp

Description

This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

28.55 src-access-list

src-access-list

Syntax

src-access-list *list-name*

no src-access-list *list-name*

Context

[Tree] (config>system>security>snmp src-access-list)

Full Context

configure system security snmp src-access-list

Description

This command configures a list of source IP addresses used to validate SNMPv1 and SNMPv2c requests after the list is associated with one or more SNMPv1 and SNMPv2c communities.

A source access list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the community, regardless of the VPRN/VRF interface (or "Base" interface) on which the request arrived. For example, if an SNMP request arrives on an interface in VPRN

"100" but the request is referencing a community, the source IP address in the packet is validated against the source address list configured for the community. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the source IP address of the request message does not match the IP address of any of the **src-host** entries contained in the list, the request is discarded and logged as an SNMP authentication failure.

Caution:
Using source access list validation can impact the time it takes for an SR OS node to reply to an SNMP request. Nokia recommends keeping the lists short by including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named source access list. Users cannot remove a source access list that is referenced by one or more **community** instances.

Parameters

list-name

Specifies the name or key of the source access list. This parameter must begin with a letter (a-z or A-Z).

Platforms

7705 SAR Gen 2

28.56 src-host

src-host

Syntax

[Tree] (config>qos>sap-egress>ip-criteria>entry>match src-ip)

Full Context

configure qos sap-ingress ip-criteria entry match src-ip

configure qos sap-egress ip-criteria entry match src-ip

Description

This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask; for example, 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

prefix-list-name

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

src-ip

Syntax

src-ip {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

no src-ip

Context

[Tree] (config>qos>sap-ingress>ipv6-criteria>entry>match src-ip)

[Tree] (config>qos>sap-egress>ipv6-criteria>entry>match src-ip)

Full Context

configure qos sap-ingress ipv6-criteria entry match src-ip

configure qos sap-egress ipv6-criteria entry match src-ip

Description

This command configures a source IPv6 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv6 address, specify the address and its associated mask, for example, 2001:db8:1000::/64.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

Parameters

ipv6-address

Specifies the IPv6 address for the IP match criterion in hexadecimal digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

prefix-length

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the IPv6 address mask.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D

ipv6-prefix-list-name

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

src-ip

Syntax

src-ip {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *ip-prefix-list-name*}

src-ip {*ipv6-address/mask* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

configure qos network ingress ipv6-criteria entry match src-ip

configure qos network ingress ip-criteria entry match src-ip

configure qos network egress ip-criteria entry match src-ip

configure qos network egress ipv6-criteria entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

Parameters

ip-address

Specifies the source IPv4 address specified in dotted decimal notation.

Values ip-address: a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-list-name

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies the IPv6 prefix for the IP match criterion in hex digits.

Values

ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mask

Specifies the length of the ipv6-address expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

ipv6-prefix-list-name

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

Values A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

[Tree] (config>filter>ip-exception>entry>match src-ip)

Full Context

configure filter ipv6-exception entry match src-ip

configure filter ipv6-filter entry match src-ip

configure filter ip-exception entry match src-ip

Description

This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of the command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-address

Specifies the destination IPv4 address specified in dotted decimal notation.

Values a.b.c.d

mask

Specifies the length in bits of the subnet mask.

Values 1 to 32

ipv4-address-mask

Specifies the subnet mask in dotted decimal notation.

Values a.b.c.d (dotted quad equivalent of mask length)

ip-prefix-listoripv6-prefix-list prefix-list-name

Specifies to use a list of IP prefixes, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

ipv6-address

Specifies an IPv6 prefix for the IP match criterion in hex digits.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

prefix-length

Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

Values 1 to 128

ipv6-address-mask

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

Values x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

Full Context

configure system security management-access-filter ip-filter entry src-ip

Description

This command configures a source IP address range or an IP prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IP address match criterion.

Default

no src-ip

Parameters

ip-prefix

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

mask

Specifies the subnet mask length expressed as a decimal integer.

Values 1 **to** 32 (mask length), 0.0.0.0 **to** 255.255.255.255 (dotted decimal)

netmask

Specifies the dotted quad equivalent of the mask length.

Values 0.0.0.0 to 255.255.255.255

ip-prefix-list-name

Specifies the IP prefix list used as a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

configure system security management-access-filter ipv6-filter entry src-ip

Description

This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values		
	ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D
	prefix-length	1 to 128

ipv6-prefix-list-name

Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

configure saa test type-multi-line lsp-ping src-ip-address

Description

This command configures the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. For example, when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next hop is set to an address other than the system interface address.

The **no** form of this command removes the configuration.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify src-mac

Description

This command specifies the source MAC address used for the ring-node connectivity verification of this ring node.

If all zeros are specified, the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms

7705 SAR Gen 2

src-mac *ieee-address* [*ieee-address-mask*]

no src-mac

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

Full Context

configure qos sap-ingress mac-criteria entry match src-mac

Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Enter the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

This 48-bit mask can be configured using the following formats:

Table 93: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

configure system security management-access-filter mac-filter entry match src-mac

Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Specifies the 48-bit IEEE mac address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

Specifies a 48-bit mask that can be configured using the formats listed in Table 94: ieee-address-mask Formats:

Table 94: ieee-address-mask Formats

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFF000000

Default 0xFFFFFFFFFFFF (exact match)

Values 0x00000000000000 to 0xFFFFFFFFFFFF

Description

This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

Default

no src-port

Parameters

lt

Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

src-port-number

The source port value, specified as a decimal integer.

Values 1 to 65535

port-list-name

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

start

Specifies the starting range of TCP or UDP source port values to match.

Values 1 to 65535

end

Specifies the end range of TCP or UDP source port values to match.

Values 1 to 65535

Full Context

configure filter ip-exception entry match src-port

configure filter ip-filter entry match src-port

configure filter ipv6-exception entry match src-port

configure filter ipv6-filter entry match src-port

Description

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq** 0" match criterion, may match non-initial fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

Default

no src-port

Parameters

lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt specifies that all port numbers less than *src-port-number* match.

gt specifies that all port numbers greater than *src-port-number* match.

eq specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number src-port-number

Specifies inclusive port range between two src-port-number values.

Platforms

7705 SAR Gen 2

Full Context

configure system security management-access-filter ipv6-filter entry src-port

configure system security management-access-filter ip-filter entry src-port

Description

This command restricts ingress management traffic to either the CPM/CCM Ethernet port or any other logical port (for example LAG) on the device.

When the source interface is configured, only management traffic arriving on those ports satisfy the match criteria.

The **no** form of this command reverts to the default value.

Default

no src-port

Parameters

port-id

Specifies the port ID in formats shown below.

Values

slot/*mda*/*port*[.*channel*]		
	aps	keyword
	group-id	1 to 128
ccag-id	**ccag**-*id*. *path-id*[*cc-type*]	
	ccag	keyword
	id	1 to 8
	path-id	**a**, **b**
	cc-type	**.sap-net**, **.net-sap**

cpm

Matches any traffic received on any Ethernet port.

lag-id

Specifies the LAG identifier.

Values 1 to 800

7705 SAR Gen 2

28.64 srlg

srlg

Syntax

[**no**] **srlg**

Context

[Tree] (config>router>mpls>lsp>secondary srlg)

Full Context

configure router mpls lsp secondary srlg

Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).
- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

srlg-enable

Syntax

[**no**] **srlg-enable**

Context

[Tree] (config>router>route-next-hop-policy>template srlg-enable)

Full Context

configure router route-next-hop-policy template srlg-enable

Description

This command configures the SRLG constraint into the route next-hop policy template.

When this command is applied to a prefix, the LFA SPF will attempt to select an LFA next-hop, among the computed ones, which uses an outgoing interface that does not participate in any of the SLRGs of the outgoing interface used by the primary next-hop.

The SRLG criterion is applied before running the LFA next-hop selection algorithm.

The **no** form deletes the SRLG constraint from the route next-hop policy template.

no srlg-enable

Platforms

7705 SAR Gen 2

28.67 srlg-frr

srlg-frr

Syntax

srlg-frr [**strict**]

no srlg-frr

Context

[Tree] (config>router>mpls srlg-frr)

Full Context

configure router mpls srlg-frr

Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The

association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

Default

no srlg-frr

Parameters

strict

Specifies the name of the SRLG group within a virtual router instance.

configure service ies interface if-attribute srlg-group

configure router mpls interface srlg-group

configure router interface if-attribute srlg-group

configure service vprn interface if-attribute srlg-group

Description

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

Platforms

7705 SAR Gen 2

srlg-group

Syntax

srlg-group *group-name* **value** *group-value* [**penalty-weight** *penalty-weight*]

no srlg-group *group-name*

Context

[Tree] (config>router>if-attribute srlg-group)

Full Context

configure router if-attribute srlg-group

Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the

same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

Values 0 to 4294967295

penalty-weight

Specifies the integer value of the penalty weight that is assigned to the SRLG group

Values 0 to 65535

Default 0

Full Context

configure qos sap-ingress mac-criteria entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

The 8-bit ssap match criteria value in hex.

Values 0x00 to 0xFF (hex)

ssap-mask

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 95: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0

Format Style	Format Syntax	Example
Binary	0bBBBBBBBB	0b11110000

Context

[Tree] (ssh)

Full Context

ssh

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate an SSH session, with a key reexchange, based on maximum megabytes or minutes, whichever occurs first. If the reexchange options are not set, the default behavior does not perform a key reexchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for the SSH session.

Parameters

host

Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface: up to 32 characters, mandatory for link local addresses

dns-name up to128 characters

username

Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance

Specifies the router name or service ID.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name "Base", "management", "vpls-management"

vprn-svc-id 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

minutes

Specifies the time interval after which the SSH client will initiate the key reexchange.

Values 1 to 1440 minutes

megabytes

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key reexchange.

Values 1 to 64000 MB

private-key-filename

Specifies the name of the file containing the private key for public-key authentication on the SR OS SSH client, up to 255 characters. (The public key must be provided to the SSH server.) When using the *private-key-filename* option, if the file containing the private key is encrypted, the system asks for the password to decrypt the file.

port

Specifies the listening port for the SR OS SSH client to establish the SSH session with the SSH server.

Values 1 to 65535

configure service vprn interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

7705 SAR Gen 2

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>router>if>vrrp ssh-reply)

Full Context

configure router interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not

have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

configure router ipv6 stale-time

Description

This command configures the time a neighbor discovery cache entry can remain stale before being removed.

The **no** form of this command removes the stale-time value.

Default

stale-time 14400

Parameters

seconds

Specifies the allowed stale time (in seconds) before a neighbor discovery cache entry is removed.

Values 60 to 65535

Platforms

7705 SAR Gen 2

stale-time

Syntax

stale-time *seconds*

no stale-time

Context

[Tree] (config>router>origin-validation>rpki-session stale-time)

Full Context

configure router origin-validation rpki-session stale-time

Description

This command configures the maximum length of time that prefix origin validation records learned from the cache server remain usable after the RPKI-Router session goes down. The default stale-time is 3600 seconds (1 hour). When the timer expires all remaining stale entries associated with the session are deleted.

Default

no stale-time

Parameters

seconds

Specifies a time, in seconds.

Values 60 to 3600

Platforms

7705 SAR Gen 2

stale-time

Syntax

stale-time *seconds*

no stale-time

Context

28.81 standard-multi-instance

standard-multi-instance

Syntax

[**no**] **standard-multi-instance**

Context

[Tree] (config>service>vprn>isis standard-multi-instance)

Full Context

configure service vprn isis standard-multi-instance

Description

This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.

The **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) and **iid-tlv-enable** (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.

The **no** form of this command removes the **standard-multi-instance** configuration.

Default

no standard-multi-instance

Platforms

7705 SAR Gen 2

standard-multi-instance

Syntax

[**no**] **standard-multi-instance**

Context

28.82 standby

standby

Syntax

[**no**] **standby**

Context

[Tree] (config>router>mpls>lsp>secondary standby)

Full Context

configure router mpls lsp secondary standby

Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

Platforms

7705 SAR Gen 2

28.83 standby-forwarding

standby-forwarding

Syntax

[**no**] **standby-forwarding**

Context

Full Context

configure service epipe spoke-sdp-fec standby-signaling-slave

Description

This command enables standby-signaling-slave for an Epipe.

Platforms

7705 SAR Gen 2

standby-signaling-slave

Syntax

[**no**] **standby-signaling-slave**

Context

[Tree] (config>service>epipe>spoke-sdp standby-signaling-slave)

[Tree] (config>service>epipe>endpoint standby-signaling-slave)

Full Context

configure service epipe spoke-sdp standby-signaling-slave

configure service epipe endpoint standby-signaling-slave

Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

Default

no standby-signaling-slave

Platforms

7705 SAR Gen 2

configure router dhcp6 local-dhcp-server pool failover startup-wait-time

configure router dhcp local-dhcp-server pool failover startup-wait-time

configure router dhcp local-dhcp-server failover startup-wait-time

configure router dhcp6 local-dhcp-server failover startup-wait-time

Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

Default

startup-wait-time min 2

Parameters

minutes

Specifies the startup wait time, in minutes.

Values 1 to 59

seconds

Specifies the startup wait time, in seconds.

Values 1 to 59

hours

Specifies the startup wait time, in hours.

Values 1

Platforms

7705 SAR Gen 2

28.91 stat-mode

stat-mode

Syntax

stat-mode *stat-mode*

no stat mode

Context

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)

[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

Full Context

configure card fp ingress access queue-group policer-override policer stat-mode

configure card fp ingress network queue-group policer-override policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats

are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

See the *7705 SAR Gen 2 Router Configuration Guide* for details on the policer stat-mode parameters.

Platforms

7705 SAR Gen 2

stat-mode

Syntax

stat-mode st*at-mode*

no stat-mode

Context

[Tree] (config>service>epipe>sap>ingress>policer-over>plcr stat-mode)

[Tree] (config>service>epipe>sap>egress>policer-over>plcr stat-mode)

Full Context

configure service epipe sap ingress policer-override policer stat-mode

configure service epipe sap egress policer-override policer stat-mode

Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-

of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7705 SAR Gen 2 Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

configure service vprn interface sap egress policer-override policer stat-mode

configure service vprn interface sap ingress policer-override policer stat-mode

Description

The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of this command returns the policer's stat-mode setting to minimal.

Refer to the *7705 SAR Gen 2 Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

configure qos sap-ingress policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 96: Ingress Policer Stat Mode Summary .

Table 96: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-

profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 97: Ingress Accounting Statistics Collected in minimal stat-mode .

	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 98: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

	oof	OutOfProfileOctetsForwarded

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 99: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 100: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

	oof	OutOfProfileOctetsForwarded

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 101: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

Table 101: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 102: Ingress Accounting Statistics Collected in offered-total-cir stat-mode .

Table 102: Ingress Accounting Statistics Collected in offered-total-cir stat-mode

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 103: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 104: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

Table 104: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the "offered undefined" statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 105: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos sap-egress policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 106: Egress Policer Stat-mode Summary.

Table 106: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is reclassified at egress to inplus and/ or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 107: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 108: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 109: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 110: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 111: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded)

the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 112: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 113: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode .

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 114: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode .

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 115: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode .

Full Context

configure qos queue-group-templates ingress queue-group policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 116: Stat Mode Descriptions.

Table 116: Stat Mode Descriptions

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-

profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 117: Ingress Accounting Statistics Collected in minimal stat-mode .

	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 118: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 119: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 120: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 121: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 122: Ingress Accounting Statistics collected in offered-total-cir stat-mode .

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 123: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

	oof	OutOfProfileOctetsForwarded

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 124: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 125: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos queue-group-templates egress queue-group policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 126: Egress Policer Stat Mode Summary.

Table 126: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-profile-cir	4	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In/out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured.
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir**

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified to profile inplus and/ or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 127: Egress Accounting Statistics Collected in minimal stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 128: Egress Accounting Statistics Collected in offered-

profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 129: Egress Accounting Statistics Collected in offered-profile-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 130: Egress Accounting Statistics Collected in offered-total-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 131: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic

reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 132: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 133: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 133: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 134: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could

cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 135: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

29 s Commands – Part III

29.1 state

state

Syntax

state *state*

no state

Context

[Tree] (config>router>policy-options>policy-statement>entry>from state)

Full Context

configure router policy-options policy-statement entry from state

Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default

no state

Parameters

state

Specifies the state.

Values srrp-master — This is used in non-CUPS BNG resiliency to identify routes associated with an active SRRP instance.

srrp-non-master — This is used in non-CUPS BNG resiliency to identify routes associated with a standby SRRP instance.

ipsec-master-with-peer — This is used in stateful multi-chassis IPsec (MC-IPsec) redundancy to identify routes associated with an active MC-IPsec node with a reachable peer.

ipsec-non-master — This is used in stateful MC-IPsec redundancy to identify routes associated with a standby MC-IPsec node.

ipsec-master-without-peer — This is used in stateful MC-IPsec redundancy to identify routes associated with an active MC-IPsec node without a reachable peer.

fsg-active — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the active BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-active-path-restoration — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on an active BNG-UP that is in a headless state. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-standby — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the standby BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

29.2 state-timer

state-timer

Syntax

state-timer *seconds* [**action** *action*]

no state-timer

Context

[Tree] (config>router>pcep>pcc state-timer)

Full Context

configure router pcep pcc state-timer

Description

This command configures the state timer for PCE-initiated LSPs. The state timer must be set to a value greater than the redelegation timer.

The **no** form of the command sets this value to the default.

Default

state-timer 180 action remove

Parameters

seconds

Specifies the number of seconds before the state timer expires.

Values 1 to 3600

action

Specifies the actions that are taken on undelegated LSPs upon the state timer expiration.

Values remove, none

Default remove

Platforms

7705 SAR Gen 2

29.3 static

static

Syntax

static

Context

[Tree] (config>service>vpls>sap>mld-snooping static)

[Tree] (config>service>vpls>spoke-sdp>igmp-snooping static)

[Tree] (config>service>vpls>mesh-sdp>mld-snooping static)

[Tree] (config>service>vpls>mesh-sdp>igmp-snooping static)

[Tree] (config>service>vpls>sap>igmp-snooping static)

[Tree] (config>service>vpls>spoke-sdp>mld-snooping static)

Full Context

configure service vpls sap mld-snooping static

configure service vpls spoke-sdp igmp-snooping static

configure service vpls mesh-sdp mld-snooping static

configure service vpls mesh-sdp igmp-snooping static

configure service vpls sap igmp-snooping static

configure service vpls spoke-sdp mld-snooping static

Description

Commands in this context configure static group addresses. Static group addresses can be configured on a SAP or SDP. When present, either as a (*, g) or a (s,g) entry, multicast packets matching the configuration are forwarded even if no join message was registered for the specific group.

Platforms

7705 SAR Gen 2

static

Syntax

static *ip-address ieee-address*

no static *ip-address*

Context

[Tree] (config>service>vpls>proxy-arp static)

Full Context

configure service vpls proxy-arp static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either learned or CStatic (conditional static MAC) in order to become active.

Parameters

ip-address

Specifies the IPv4 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

Platforms

7705 SAR Gen 2

static

Syntax

static *ipv6-address ieee-address* {**host** | **router**}

no static *ipv6-address*

Context

[Tree] (config>service>vpls>proxy-nd static)

Full Context

configure service vpls proxy-nd static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters

ipv6-address

Specifies the IPv6 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

host

Specifies that the entry is type "host”.

router

Specifies that the entry is type "router”.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>service>vprn>igmp>if static)

Full Context

configure service vprn igmp interface static

Description

This command tests forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>service>vprn>mld>if static)

Full Context

configure service vprn mld interface static

Description

This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>service>vprn>pim>rp static)

Full Context

configure service vprn pim rp static

Description

This command enables access to the context to configure a static rendezvous point (RP) of a PIM-SM protocol instance.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>router>igmp>if static)

Full Context

configure router igmp interface static

Description

This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>router>mld>if static)

Full Context

configure router mld interface static

Description

This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members.

Platforms

7705 SAR Gen 2

static

Syntax

static

Context

[Tree] (config>router>pim>rp static)

[Tree] (config>router>pim>rp>ipv6 static)

Full Context

configure router pim rp static

configure router pim rp ipv6 static

Description

Commands in this context configure static Rendezvous Point (RP) addresses for a multicast group range.

Entries can be created or destroyed. If no IP addresses are configured in the **config>router>pim>rp>static>address** context, then the multicast group to RP mapping is derived from the RP-set messages received from the Bootstrap Router.

Platforms

7705 SAR Gen 2

static

Syntax

static *microseconds*

no static

Context

[Tree] (config>router>if>if-attribute>delay static)

Full Context

configure router interface if-attribute delay static

Description

This command configures the unidirectional link delay. By default there is no configured delay, the link delay metric TLV is pruned in the IGP.

The **no** form of this command removes the configured unidirectional link delay.

Default

no static

Parameters

microseconds

Specifies the unidirectional link delay in microseconds.

Values 1 to 16777214

Platforms

7705 SAR Gen 2

static

Syntax

[**no**] **static**

Context

[Tree] (config>router>bgp>next-hop-res>use-leaked-routes static)

Full Context

configure router bgp next-hop-resolution use-leaked-routes static

Description

This command configures the router to resolve any non-leaked, unlabeled unicast IPv4 or IPv6 route in the base router BGP RIB by using a static route with direct next hops leaked from any VPRN instance. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP.

The **no** form of this command prevents the use of leaked static routes to resolve BGP routes of the base router.

Default

no static

Platforms

7705 SAR Gen 2

static

Syntax

[**no**] **static**

Context

[Tree] (config>service>vprn>bgp>next-hop-res>use-leaked-routes static)

Full Context

configure service vprn bgp next-hop-resolution use-leaked-routes static

Description

This command configures the router to resolve any non-leaked, unlabeled unicast IPv4 or IPv6 route in the VPRN BGP RIB by using a static route with direct next hops leaked from the GRT. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP.

The **no** form of this command prevents the use of leaked static routes to resolve BGP routes of the VPRN.

Default

no static

Platforms

7705 SAR Gen 2

29.4 static-arp

static-arp

Syntax

static-arp *ieee-mac-address* **unnumbered**

static-arp *ip-address ieee-mac-address*

no static-arp [*ieee-mac-address*] **unnumbered**

no static-arp *ip-address* [*ieee-mac-address*]

Context

[Tree] (config>service>ies>if static-arp)

[Tree] (config>service>vprn>if static-arp)

Full Context

configure service ies interface static-arp

configure service vprn interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

7705 SAR Gen 2

static-arp

Syntax

static-arp *ieee-mac-addr* **unnumbered**

static-arp *ip-address ieee-mac-address*

no static-arp [*ieee-mac-addr*] **unnumbered**

no static-arp *ip-address* [*ieee-mac-address*]

Context

[Tree] (config>service>vpls>interface static-arp)

Full Context

configure service vpls interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in dotted decimal notation

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

7705 SAR Gen 2

static-arp

Syntax

static-arp *ip-address ieee-mac-address*

no static-arp *ip-address*

Context

[Tree] (config>service>vprn>nw-if static-arp)

Full Context

configure service vprn network-interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP will appear in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface. If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Platforms

7705 SAR Gen 2

static-arp

Syntax

static-arp *ip-address ieee-address*

no static-arp *ip-address*

static-arp *ieee-address* **unnumbered**

no static-arp unnumbered

Context

[Tree] (config>router>if static-arp)

Full Context

configure router interface static-arp

Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa*-*bb*-*cc*-*dd* -*ee*-*ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

7705 SAR Gen 2

29.5 static-blackhole-first

static-blackhole-first

Syntax

[**no**] **static-blackhole-first**

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel static-blackhole-first)

Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel static-blackhole-first

Description

This command configures the router to use a modified next-hop resolution sequence for each imported VPN-IP route. The router first checks for a static route in the Base routing table that matches the BGP next-hop address. If at least one such static route exists, and the route that is the longest match of the BGP next-hop address is a blackhole static route, the router resolves the VPN-IP route and programs it into the VPRN IP FIB table with a next-hop action that discards all matching packets. If there is no matching static route, or the longest matching static route is not a blackhole, the router resolves the VPN-IP route in the Base routing table as normal, that is, according to the configured VPRN auto-bind filter options.

The **no** form of this command configures the router to resolve VPN-IP routes in the Base routing table according to the configured VPRN auto-bind filter options.

Default

no static-blackhole-first

Platforms

7705 SAR Gen 2

29.6 static-cak

static-cak

Syntax

[**no**] **static-cak**

Context

[Tree] (config>macsec>connectivity-association static-cak)

Full Context

configure macsec connectivity-association static-cak

Description

This command allows the configuration of a Connectivity Association Key (CAK). The CAK is responsible for managing the MKA.

Platforms

7705 SAR Gen 2

29.7 static-entry

static-entry

Syntax

static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number* [{**valid** | **invalid**}]

no static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number*

Context

[Tree] (config>router>origin-validation static-entry)

Full Context

configure router origin-validation static-entry

Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the base router.

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2

Specifies the maximum prefix length.

Values 1 to 128

as-number

Specifies as-number.

Values 0 to 4294967295

valid

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

invalid

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

Platforms

7705 SAR Gen 2

29.8 static-label-range

static-label-range

Syntax

static-label-range *static-range*

no static-label-range

Context

[Tree] (config>router>mpls-labels static-label-range)

Full Context

configure router mpls-labels static-label-range

Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default

static-label-range 18400

Parameters

static-range

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

Values 0 to 262112

Default 18400

Platforms

7705 SAR Gen 2

29.9 static-lsp

static-lsp

Syntax

[**no**] **static-lsp** *lsp-name*

Context

[Tree] (config>router>mpls static-lsp)

Full Context

configure router mpls static-lsp

Description

This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp** *lsp-name* command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

Parameters

lsp-name

Specifies the name that identifies the LSP.

Values Up to 32 alphanumeric characters.

Platforms

7705 SAR Gen 2

29.10 static-lsp-fast-retry

static-lsp-fast-retry

Syntax

static-lsp-fast-retry *seconds*

no static-lsp-fast-retry

Context

[Tree] (config>router>mpls static-lsp-fast-retry)

Full Context

configure router mpls static-lsp-fast-retry

Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default

no static-lsp-fast-retry

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a static LSP.

Values 1 to 30

Platforms

7705 SAR Gen 2

29.11 static-mac

static-mac

Syntax

static-mac *ieee-mac-address* [**create**]

no static-mac *ieee-mac-address*

Context

[Tree] (config>service>vpls>spoke-sdp static-mac)

[Tree] (config>service>vpls>mesh-sdp static-mac)

[Tree] (config>service>vpls>sap static-mac)

Full Context

configure service vpls spoke-sdp static-mac

configure service vpls mesh-sdp static-mac

configure service vpls sap static-mac

Description

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the service destination point (SDP).

In a VPLS service, MAC addresses are associated with a SAP or with an SDP. MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note:
Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

Parameters

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

create

Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

static-mac

Syntax

static-mac

Context

[Tree] (config>service>vpls static-mac)

Full Context

configure service vpls static-mac

Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

Platforms

7705 SAR Gen 2

static-mac

Syntax

static-mac *ieee-address* [**create**]

no static-mac *ieee-address*

Context

[Tree] (config>service>vpls>endpoint static-mac)

Full Context

configure service vpls endpoint static-mac

Description

This command assigns a static MAC address to the endpoint. In the FDB, the static MAC is then associated with the active spoke-SDP.

Parameters

ieee-address

Specifies the static MAC address to the endpoint

Values 6-byte mac-address (xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx) Cannot be all zeros

create

This keyword is mandatory while creating a static MAC

Platforms

7705 SAR Gen 2

29.12 static-policer

static-policer

Syntax

[**no**] **static-policer** *policer-name* [**create**]

Context

[Tree] (config>sys>security>dist-cpu-protection>policy static-policer)

Full Context

configure system security dist-cpu-protection policy static-policer

Description

Configures a static enforcement policer that can be referenced by one or more protocols in the policy. Once this **policer-name** is referenced by a protocol, then this policer will be instantiated for each object (for example, a SAP or network interface) that is created and references this policy. If there is no policer resource available on the associated card or fp then the object is be blocked from being created. Multiple protocols can use the same **static-policer**.

Parameters

policy-name

Specifies the name of the policy, up to 32 characters.

Platforms

7705 SAR Gen 2

29.13 static-policy

static-policy

Syntax

static-policy *name* [**create**]

no static-policy *name*

Context

[Tree] (conf>router>segment-routing>sr-policies static-policy)

Full Context

configure router segment-routing sr-policies static-policy

Description

This command creates a context to configure a segment routing policy. The resulting segment routing policy is targeted for local installation or propagation by BGP to another router.

The **no** form of this command deletes the statically defined segment routing policy.

Default

no static-policy

Parameters

name

Specifies the name assigned to the statically defined segment routing policy, up to 64 characters.

create

Keyword used to create the policy.

Platforms

7705 SAR Gen 2

29.14 static-route

static-route

Syntax

[**no**] **static-route** *route-name*

Context

[Tree] (config>service>pw-routing static-route)

Full Context

configure service pw-routing static-route

Description

This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

static-route 0:0:next_hop_ip_addresss

or

static-route 0:0.0.0.0:next_hop_ip_address

The **no** form of this command removes a previously configured static route.

Parameters

route-name

Specifies the static pseudowire route.

Values

route-name	<global-id>:<prefix>:<next-hop-ip_addr>
global-id	0 to 4294967295
prefix	a.b.c.d | 0 to 4294967295
next-hop-ip_addr	a.b.c.d

Platforms

7705 SAR Gen 2

static-route

Syntax

[**no**] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

Context

[Tree] (bof static-route)

Full Context

bof static-route

Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default

no static-route

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32
	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

mask

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address

Specifies the next hop IP address used to reach the destination.

Platforms

7705 SAR Gen 2

29.15 static-route-entry

static-route-entry

Syntax

static-route-entry *ip-prefixIprefix-length* [**mcast**]

no static-route-entry *ip-prefixIprefix-length* [**mcast**]

Context

[Tree] (config>service>vprn static-route-entry)

Full Context

configure service vprn static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

The destination address of the static route.

Values	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

mcast

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms

7705 SAR Gen 2

static-route-entry

Syntax

[**no**] **static-route-entry** *ip-prefix*/*prefix-length* [**mcast**]

Context

[Tree] (config>router static-route-entry)

Full Context

configure router static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

Specifies the destination address of the static route.

Values	ipv4-prefix	a.b.c.d (host bits must be 0)	
	ipv4-prefix-length	0 to 32	
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x	[0 to FFFF]H
		d	[0 to 255]D
	ipv6-prefix-length	0 to 128	

ip-address

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

mcast

Indicates that static route being configured is used for multicast table only.

Platforms

7705 SAR Gen 2

29.16 static-route-hold-down

static-route-hold-down

Syntax

static-route-hold-down initial *initial* **multiplier** *multiplier* **max-value** *max-value*

no static-route-hold-down

Context

[Tree] (config>router static-route-hold-down)

Full Context

configure router static-route-hold-down

Description

This command enables the hold down time feature globally for static routes in the system.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

This command applies to all static routes in the VPRN and the base router instance in which this hold-down time is configured.

The **no** form of this command disables the hold down time feature globally for static routes in the system.

Default

no static-route-hold-down

Parameters

initial

Specifies the initial value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

multiplier

Specifies the multiplier value of the hold down time feature globally for static routes in the system.

Values 1 to 10

max-value

Specifies the maximum value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

29.18 static-tunnel-redundant-next-hop

static-tunnel-redundant-next-hop

Syntax

static-tunnel-redundant-next-hop *ip-address*

no static-tunnel-redundant-next-hop

Context

[Tree] (config>service>vprn>if static-tunnel-redundant-next-hop)

[Tree] (config>service>ies>if static-tunnel-redundant-next-hop)

Full Context

configure service vprn interface static-tunnel-redundant-next-hop

configure service ies interface static-tunnel-redundant-next-hop

Description

This command specifies redundant next-hop address on public or private IPsec interface (with public or private tunnel-sap) for static IPsec tunnel. The specified next-hop address will be used by standby node to shunt traffic to master in case of it receives them. Refer to the *7705 SAR Gen 2 Multiservice ISA and ESA Guide* for information about IPsec commands and descriptions.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

Parameters

ip-address

Specifies the static ISA tunnel redundant next-hop address.

Platforms

7705 SAR Gen 2

29.19 stats-collection

stats-collection

Syntax

stats-collection

Context

Description

Commands in this context configure Certificate Status Verification (CSV) parameters.

Platforms

7705 SAR Gen 2

status-verify

Syntax

status-verify default-result {revoked | good}

no status-verify

Context

[Tree] (config>system>security>tls>client-tls-profile status-verify)

[Tree] (config>system>security>tls>server-tls-profile status-verify)

Full Context

configure system security tls client-tls-profile status-verify

configure system security tls server-tls-profile status-verify

Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

Default

status-verify default-result revoked

Parameters

good

Specifies that the certificate is considered acceptable.

revoked

Specifies that the certificate is considered revoked.

Platforms

7705 SAR Gen 2

29.21 sticky-dest

sticky-dest

Syntax

sticky-dest *hold-time-up*

sticky-dest no-hold-time-up

no sticky-dest

Context

[Tree] (config>filter>redirect-policy sticky-dest)

[Tree] (config>filter>ip-filter>entry sticky-dest)

[Tree] (config>filter>ipv6-filter>entry sticky-dest)

Full Context

configure filter redirect-policy sticky-dest

configure filter ip-filter entry sticky-dest

configure filter ipv6-filter entry sticky-dest

Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default

no sticky-dest

Parameters

hold-time-up

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

Platforms

7705 SAR Gen 2

29.22 sticky-dr

sticky-dr

Syntax

sticky-dr [**priority** *dr-priority*]

no sticky-dr

Context

[Tree] (config>service>vprn>pim>if sticky-dr)

Full Context

configure service vprn pim interface sticky-dr

Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

Default

no sticky-dr

Parameters

priority *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

sticky-dr

Syntax

sticky-dr [**priority** *dr-priority*]

no sticky-dr

Context

[Tree] (config>router>pim>interface sticky-dr)

29.23 sticky-ecmp

sticky-ecmp

Syntax

sticky-ecmp

no sticky-ecmp

Context

[Tree] (config>router>policy-options>policy-statement>default-action sticky-ecmp)

[Tree] (config>router>policy-options>policy-statement>entry>action sticky-ecmp)

Full Context

configure router policy-options policy-statement default-action sticky-ecmp

configure router policy-options policy-statement entry action sticky-ecmp

Description

This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

Default

no sticky-ecmp

Platforms

7705 SAR Gen 2

29.26 strict-adjacency-check

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

Context

[Tree] (config>service>vprn>isis strict-adjacency-check)

Full Context

configure service vprn isis strict-adjacency-check

Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Default

no strict-adjacency-check

Platforms

7705 SAR Gen 2

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

Context

[Tree] (config>router>isis strict-adjacency-check)

29.27 strict-ero-nhop-direct-resolution

strict-ero-nhop-direct-resolution

Syntax

[**no**] **strict-ero-nhop-direct-resolution**

Context

[Tree] (config>router>mpls strict-ero-nhop-direct-resolution)

Full Context

configure router mpls strict-ero-nhop-direct-resolution

Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

Default

no strict-ero-nhop-direct-resolution

Platforms

7705 SAR Gen 2

29.28 strict-lsa-checking

strict-lsa-checking

configure service vprn interface dhcp option vendor-specific-option string

Description

This command specifies the string in the Nokia vendor-specific sub-option of the DHCP relay packet.

The **no** form of this command reverts to the default.

Parameters

text

Specifies a string that can be any combination of ASCII characters, up to 32 characters. If spaces are used in the string, enclose the entire string in quotation marks (" ").

Platforms

7705 SAR Gen 2

string

Syntax

[**no**] **string** *text*

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option string)

Full Context

configure router interface dhcp option vendor-specific-option string

Description

This command specifies the vendor-specific sub-option string of the DHCP relay packet.

The **no** form of this command returns the default value.

Default

no string

Parameters

text

Specifies a string that can be any combination of ASCII characters, up to 32 characters in length. If spaces are used in the string, enclose the entire string in quotation marks (" ").

Platforms

7705 SAR Gen 2

29.30 stub

stub

Syntax

[**no**] **stub**

Context

[Tree] (config>service>vprn>ospf>area stub)

[Tree] (config>service>vprn>ospf3>area stub)

Full Context

configure service vprn ospf area stub

configure service vprn ospf3 area stub

Description

This command enables access to the context to configure an OSPF stub area and adds/removes the stub designation from the area. External routing information is not flooded into stub areas. All routers in the stub area must be configured with the **stub** command. An OSPF area cannot be both an NSSA and a stub area. Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.

By default, an area is not a stub area.

The **no** form of this command removes the stub designation and configuration context from the area.

Default

no stub — The area is not configured as a stub area.

Platforms

7705 SAR Gen 2

stub

Syntax

[**no**] **stub**

Context

[Tree] (config>router>ospf3>area stub)

[Tree] (config>router>ospf>area stub)

Full Context

configure router ospf3 area stub

configure router ospf area stub

Description

This command enables access to the context to configure an OSPF or OSPF3 stub area and adds/removes the stub designation from the area.

External routing information is not flooded into stub areas. All routers in the stub area must be configured with the **stub** command. An OSPF or OSPF3 area cannot be both an NSSA and a stub area.

Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.

By default, an area is not a stub area.

The **no** form of this command removes the stub designation and configuration context from the area.

Default

no stub

Platforms

7705 SAR Gen 2

29.31 sub-port

sub-port

Syntax

sub-port *port-id* [**create**]

no sub-port *port-id*

Context

[Tree] (config>port>ethernet>dot1x>macsec sub-port)

Full Context

configure port ethernet dot1x macsec sub-port

Description

This command creates a MACsec instance on a physical port, targeting the specific subset of traffic defined by the **encap-match** command.

The **no** form of this command removes the MACsec instance.

Parameters

port-id

Specifies the sub-port id index.

Values 1 to 1023

create

Creates a new sub-port.

Platforms

7705 SAR Gen 2

29.32 subject

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>service>vprn>log>filter>entry>match subject)

Full Context

configure service vprn log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Default

no subject

Parameters

eq | neq

This operator specifies the type of match. Valid operators are listed below.

Values

Table 136: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to

subject

A string used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

7705 SAR Gen 2

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>log>filter>entry>match subject)

Full Context

configure log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

Parameters

eq | neq

Specifies the match type. Valid operators are listed in Table 137: Valid Operators.

Table 137: Valid Operators

Operator	Notes
eq	equal to
neg	not equal to

subject

Specifies a string up to 32 characters, used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered. When the **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

7705 SAR Gen 2

29.33 subnet

subnet

Syntax

subnet {*ip-address*/*mask* | *ip-address netmask*} [**create**]

no subnet {*ip-address*/*mask* | *ip-address netmask*}

Context

[Tree] (config>service>vprn>dhcp>server>pool subnet)

[Tree] (config>router>dhcp>server>pool subnet)

Full Context

configure service vprn dhcp local-dhcp-server pool subnet

configure router dhcp local-dhcp-server pool subnet

Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters

ip-prefix/mask

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d

mask: 8 to 32

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

29.34 subnet-check

subnet-check

Syntax

[**no**] **subnet-check**

Context

[Tree] (config>service>vprn>igmp>if subnet-check)

Full Context

configure service vprn igmp interface subnet-check

Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

The **no** form of this command disables local subnet checking for IGMP.

Platforms

7705 SAR Gen 2

subnet-check

Syntax

[**no**] **subnet-check**

Context

[Tree] (config>router>igmp>if subnet-check)

Full Context

configure router igmp interface subnet-check

Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

Default

subnet-check

Platforms

7705 SAR Gen 2

29.35 subnet-mask

subnet-mask

Syntax

subnet-mask *ip-address*

no subnet-mask

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>options subnet-mask)

[Tree] (config>router>dhcp>server>pool>subnet>options subnet-mask)

Full Context

configure subscriber-mgmt local-user-db ipoe host options subnet-mask

configure router dhcp local-dhcp-server pool subnet options subnet-mask

Description

This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

The **no** form of this command removes the address from the configuration.

Parameters

ip-address

Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

7705 SAR Gen 2

29.36 subscriber-limit

subscriber-limit

Syntax

subscriber-limit *limit*

no subscriber-limit

Context

[Tree] (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context

configure service vprn nat outside pool subscriber-limit

Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

The subscribers are counted per protocol (UDP, TCP and ICMP). For example, in LSN44 a source IPv4 address that uses ports on each of the three protocols (UDP, TCP and ICMP) on an outside IP address count as 3 subscribers on that outside IP address. The ‘no subscriber-limit’ removes the limit for the number of subscribers per outside IP address.

This command is not applicable to pools with:

- arbitrary address pooling enabled
- flexible port allocations (application configured under a pool)

Parameters

limit

Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

Platforms

7705 SAR Gen 2

29.37 subscriber-mgmt

subscriber-mgmt

Syntax

subscriber-mgmt

Context

[Tree] (config subscriber-mgmt)

Full Context

configure subscriber-mgmt

Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

Platforms

7705 SAR Gen 2

29.38 subscription

subscription

Syntax

subscription *percentage*

no subscription

Context

[Tree] (config>router>rsvp>interface subscription)

Full Context

configure router rsvp interface subscription

Description

This command configures the percentage of the link bandwidth that RSVP can use for reservation and sets a limit for the amount of over-subscription or under-subscription allowed on the interface.

When the **subscription** is set to zero, no new sessions are permitted on this interface. If the *percentage* is exceeded, the reservation is rejected and a log message is generated.

The **no** form of this command reverts the *percentage* to the default value.

Default

subscription 100

Parameters

percentage

Specifies the percentage of the interface's bandwidth that RSVP allows to be used for reservations.

Values 0 to 1000

Platforms

7705 SAR Gen 2

subscription

Syntax

subscription *subscription-id* **cancel**

subscription cancel-all

Context

[Tree] (admin>system>telemetry>grpc subscription)

Full Context

admin system telemetry grpc subscription

Description

This command cancels an active telemetry subscription.

Parameters

subscription-id

Specifies the ID of the telemetry subscription to cancel.

Values 0 to 4294967295

Platforms

7705 SAR Gen 2

subscription

Syntax

subscription *name* [**create**]

no subscription *name*

Context

[Tree] (config>system>telemetry>persistent-subscriptions subscription)

Full Context

configure system telemetry persistent-subscriptions subscription

Description

Commands in this context configure persistent subscription commands.

The **no** form of this command removes the configuration.

Parameters

name

Specifies the subscription name, up to 32 characters.

create

Keyword used to create the subscription.

Platforms

7705 SAR Gen 2

29.39 suggest-internal-objects

suggest-internal-objects

Syntax

[**no**] **suggest-internal-objects**

Context

[Tree] (environment suggest-internal-objects)

Full Context

environment suggest-internal-objects

Description

This command enables suggesting of internally created objects while auto completing.

The **no** form of the command disables the command.

Platforms

7705 SAR Gen 2

29.40 summaries

summaries

Syntax

[**no**] **summaries**

Context

[Tree] (config>service>vprn>ospf>area>stub summaries)

[Tree] (config>service>vprn>ospf3>area>nssa summaries)

[Tree] (config>service>vprn>ospf>area>nssa summaries)

Full Context

configure service vprn ospf area stub summaries

configure service vprn ospf3 area nssa summaries

configure service vprn ospf area nssa summaries

Description

This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.

Default

summaries — Summary routes are advertised by the ABR into the stub area or NSSA.

Platforms

7705 SAR Gen 2

summary

Syntax

summary

Context

[Tree] (config>filter>log summary)

Full Context

configure filter log summary

Description

Commands in this context configure log summarization. These settings will only be taken into account when syslog is the log destination.

Platforms

7705 SAR Gen 2

summary

Syntax

summary [*ip-address*]

no summary

Context

[Tree] (debug>router>isis summary)

Full Context

debug router isis summary

Description

This command enables debugging for ISIS summary addresses.

The **no** form of the command disables the debugging.

Parameters

ip-address

When specified, only packets with the specified address are debugged.

Platforms

7705 SAR Gen 2

29.42 summary-address

summary-address

Syntax

summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]} [*level*] [**tag** *tag*]

no summary-address {*ip-prefix/mask* | *ip-prefix* [*netmask*]}

Context

[Tree] (config>service>vprn>isis summary-address)

Full Context

configure service vprn isis summary-address

Description

This command creates summary-addresses for the specified router or VPRN instance.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values		
	ip-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag *tag*

Assigns a route tag to the summary address.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

summary-address

Syntax

summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*]

summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*] **advertise-unreachable** [**match-route-tag** *tag*] [**advertise-route-tag** *tag*]

no summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

Context

[Tree] (config>router>isis summary-address)

Full Context

configure router isis summary-address

Description

This command creates a summary IPv4, IPv6, or SRv6 locator address.

When an IS-IS domain exists out of multiple areas, the user must redistribute IP addresses and SRv6 locators between areas for inter-area SRv6-based transport services.

Scaling may be impacted if all existing IPv4, IPv6, and SRv6 locators are redistributed between all existing areas. SRv6 locators and IP addresses can be summarized when they are redistributed from one area into another area. Summarization reduces the number of entries redistributed, which reduces the size of the Link State Database (LSDB) and increases network stability.

The **no** form of this command reverts to the default.

Default

no summary-address

Parameters

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)

	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes.

Values level-1, level-2, level-1/2

Default level-1/2

tag

Specifies the route tag to assign for the summary address.

Values 1 to 4294967295

algo-id

Specifies the algorithm topology applied for the summary address.

Values 0, 128 to 255

Default 0

match-route-tag *tag*

Specifies the route tag to match the Unreachable Prefix Announcements (UPAs). This selects a subset of summary member prefixes to monitor for reachability.

Values 1 to 4294967295

Default no match-route-tag

advertise-route-tag *tag*

Specifies the route tag to advertise in the UPA. The UPA tag can be used when there are multiple ASBR redistributing prefixes between two IGP areas.

Values 1 to 4294967295

Default no advertise-route-tag

Platforms

7705 SAR Gen 2

29.43 summary-crit

summary-crit

Syntax

summary-crit dst-addr

summary-crit src-addr

no summary-crit

Context

[Tree] (config>filter>log>summary summary-crit)

Full Context

configure filter log summary summary-crit

Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default

summary-crit src-addr

Parameters

dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

Platforms

7705 SAR Gen 2

29.44 super-backbone

super-backbone

Syntax

[**no**] **super-backbone**

Context

[Tree] (config>service>vprn>ospf super-backbone)

Full Context

configure service vprn ospf super-backbone

Description

This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected as either external or NSSA LSAs only.

Default

no super-backbone

Platforms

7705 SAR Gen 2

29.45 supplicant-timeout

supplicant-timeout

Syntax

supplicant-timeout *seconds*

no supplicant-timeout

Context

[Tree] (config>port>ethernet>dot1x supplicant-timeout)

Full Context

configure port ethernet dot1x supplicant-timeout

Description

This command configures the period during which the router waits for a client to respond to its EAPOL messages. When the supplicant-timeout expires, the 802.1x authentication session is considered to have failed.

The **no** form of this command returns the value to the default.

Default

supplicant-timeout 30

Parameters

seconds

Specifies the server timeout period in seconds.

Values 1 to 300

Platforms

7705 SAR Gen 2

29.46 suppress

suppress

Syntax

suppress *integer*

no suppress

Context

[Tree] (config>router>policy-options>damping suppress)

Full Context

configure router policy-options damping suppress

Description

This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is removed from the route table or inclusion in advertisements.

The **no** form of this command removes the suppress parameter from the damping profile.

Default

no suppress

Parameters

integer

Specifies the suppress value expressed as a decimal integer.

Values 1 to 20000

Platforms

7705 SAR Gen 2

29.47 suppress-attached-bit

suppress-attached-bit

Syntax

[**no**] **suppress-attached-bit**

Context

[Tree] (config>service>vprn>isis suppress-attached-bit)

Full Context

configure service vprn isis suppress-attached-bit

Description

This command configures IS-IS to suppress setting the attached bit on originated Level 1 LSPs to prevent all L1 routers in the area from installing a default route to it.

Platforms

7705 SAR Gen 2

suppress-attached-bit

Syntax

[**no**] **suppress-attached-bit**

Context

[Tree] (config>router>isis suppress-attached-bit)

Syntax

[**no**] **suppress-dn-bit**

Context

[Tree] (config>service>vprn>ospf suppress-dn-bit)

[Tree] (config>service>vprn>ospf3 suppress-dn-bit)

Full Context

configure service vprn ospf suppress-dn-bit

configure service vprn ospf3 suppress-dn-bit

Description

This command specifies whether to suppress the setting of the DN bit for OSPF LSA packets generated by this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets generated by this instance of the OSPF router will not be set. When disabled, this instance of the OSPF router will follow the normal procedure to determine whether to set the DN bit.

Default

no suppress-dn-bit

Platforms

7705 SAR Gen 2

29.49 suppress-lsn-events

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (config>isa>nat-group suppress-lsn-events)

Full Context

configure isa nat-group suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time: either the SR OS event logging facility or the RADIUS logging facility. SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility; for example, syslog, assuming that the events are enabled via the event-control command (**configure log event-control nat** *event* **generate**).

By explicitly disabling this command (**no suppress-lsn-events**), the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility, and the RADIUS logging facility.

Default

suppress-lsn-events

Platforms

7705 SAR Gen 2

29.50 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax

[**no**] **suppress-lsn-sub-blks-free**

Context

[Tree] (config>isa>nat-group suppress-lsn-sub-blks-free)

Full Context

configure isa nat-group suppress-lsn-sub-blks-free

Description

This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-blocks) will be stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN will be "LSN subscriber all blocks freed”. The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

Default

no suppress-lsn-sub-blks-free

Platforms

7705 SAR Gen 2

29.51 suppress-standby-signaling

suppress-standby-signaling

Syntax

[**no**] **suppress-standby-signaling**

Context

[Tree] (config>service>vpls>endpoint suppress-standby-signaling)

Full Context

configure service vpls endpoint suppress-standby-signaling

Description

When this command is enabled, the pseudowire standby bit (value 0x00000020) will not be sent to T-LDP peer when the specified spoke is selected as a standby. This allows faster switchover as the traffic will be sent over this SDP and discarded at the blocking side of the connection. This is particularly applicable to multicast traffic.

Default

suppress-standby-signaling

Platforms

7705 SAR Gen 2

29.52 suppress-threshold

suppress-threshold

Syntax

suppress-threshold *suppress-penalties* **reuse-threshold** *reuse-penalties*

Context

[Tree] (config>port>ethernet>dampening suppress-threshold)

Full Context

configure port ethernet dampening suppress-threshold

Description

This command configures the penalties thresholds at which the port state events to the upper layer are dampened (suppress threshold) and then permitted (reuse threshold).

Parameters

suppress-penalties

Specifies the threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again.

Values 1 to 20000

Default 2000

reuse-penalties

Specifies the threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.

Values 1 to 20000

Default 1000

Platforms

7705 SAR Gen 2

29.53 svc-id

svc-id

Syntax

svc-id *service-id*

no svc-id

Context

[Tree] (config>system>security>mgmt-access-filter>mac-filter>entry>match svc-id)

Full Context

configure system security management-access-filter mac-filter entry match svc-id

Description

This command specifies an existing svc-id to use as a match condition.

Parameters

service-id

Specifies a service-id to match.

Values *service-id*: 1 to 2147483647*svc-name*: 64 characters maximum

Platforms

7705 SAR Gen 2

29.54 swap

swap

Syntax

swap {*out-label* | **implicit-null-label**} **nexthop** *ip-address*

no swap

Context

[Tree] (config>router>mpls>if>label-map swap)

Full Context

configure router mpls interface label-map swap

Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services

- label values 131,072 through 1,048,575 are reserved for future use

Values 16 to 1048575

nexthop ***ip-address***

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

Platforms

7705 SAR Gen 2

29.55 sweep

sweep

Syntax

sweep start *dispersion-start* **end** *dispersion-end*

Context

[Tree] (config>port>dwdm>coherent sweep)

Full Context

configure port dwdm coherent sweep

Description

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters

dispersion-start

Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end

Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

Default 2000

Platforms

7705 SAR Gen 2

29.56 switchover-exec

switchover-exec

Syntax

switchover-exec *file-url*

no switchover-exec

Context

[Tree] (config>system switchover-exec)

Full Context

configure system switchover-exec

Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

Default

no switch-over-exec

Parameters

file-url

Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each

remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn/*][*file-path*]
	243 chars max
	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
	x:x:x:x:x:x:d.d.d.d[-*interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

29.58 sync-e

sync-e

Syntax
[**no**] **sync-e**

Context
[Tree] (config>card>mda sync-e)

Full Context
configure card mda sync-e

Description
This command enables synchronous Ethernet on the MDA. Then any port on the MDA can be used as a source port in the sync-if-timing configuration.

The **no** form of this command disables synchronous Ethernet on the MDA.

Platforms
7705 SAR Gen 2

29.59 synchronize

synchronize

Syntax
synchronize {**boot-env** | **config**}

Context
[Tree] (config>redundancy synchronize)

Full Context
configure redundancy synchronize

Description

This command enables the automatic synchronization of the standby CPM's images and/or config files from the active CPM. Either the **boot-env** or **config** parameter must be specified. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPMs have identical software images and configuration files. This includes the saved configuration, saved incremental configuration files in model-driven configuration mode, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

Default

synchronize config

Parameters

boot-env

Synchronizes all files required for the boot process (boot loader, BOF configuration, SR OS images, and all configuration files).

config

Synchronizes the primary, secondary, and tertiary configuration files, SSH keys, the password history and the model-driven commit history.

Default config

Platforms

7705 SAR Gen 2

synchronize

Syntax

synchronize cert

synchronize {**boot-env** | **config**}

Context

[Tree] (admin>redundancy synchronize)

Full Context

admin redundancy synchronize

Description

This command performs a synchronization of the standby CPM's images and/or configuration files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

The **no** form of the command removes the parameter from the configuration.

Default

no synchronize

Parameters

cert

Synchronizes the imported certificate, key, and CRL files.

boot-env

Synchronizes all files required for the boot process (boot loader, BOF, images, and configuration).

config

Synchronizes the primary, secondary, and tertiary configuration files.

Platforms

7705 SAR Gen 2

29.60 synchronous-execution

synchronous-execution

Syntax

synchronous-execution *seconds*

synchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context

configure system management-interface operations global-timeouts synchronous-execution

Description

This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Caution:
This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default

synchronous-execution never

Parameters

seconds

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms

7705 SAR Gen 2

29.61 syslog

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>service>vprn>log syslog)

Full Context

configure service vprn log syslog

Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default

No syslog IDs are defined.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name syslog-name

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

7705 SAR Gen 2

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>log syslog)

Full Context

configure log syslog

Description

Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config**>**log**.

The **no** form of this command removes the Syslog configuration.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 10

name syslog-name

Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

29.63 system-base-mac

system-base-mac

Syntax

system-base-mac *mac-address*

no system-base-mac

Context

[Tree] (bof system-base-mac)

Full Context

bof system-base-mac

Description

This command is used to specify the base MAC address. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

Default

no system-base-mac

Parameters

mac-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7705 SAR Gen 2

29.64 system-filter

system-filter

Syntax

Platforms

7705 SAR Gen 2

29.65 system-id

system-id

Syntax

system-id *system-id*

no system-id

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident system-id)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification system-id

Description

This command specifies the system ID to match for a host lookup. When the LUDB is accessed through a DHCPv4 server, the system ID is matched against the Nokia vendor specific sub-option in DHCP Option 82.

Note:
This command is only used when **system-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the system ID from the configuration.

Parameters

system-id

Specifies the system ID, up to 255 characters

Platforms

7705 SAR Gen 2

system-id

Syntax

[**no**] **system-id**

Context

[Tree] (config>service>vprn>if>dhcp>option>vendor system-id)

[Tree] (config>service>vpls>sap>dhcp>option>vendor system-id)

Full Context

configure service vprn interface dhcp option vendor-specific-option system-id

configure service vpls sap dhcp option vendor-specific-option system-id

Description

This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

The **no** form of this command reverts to the default.

Platforms

7705 SAR Gen 2

system-id

Syntax

system-id *isis-system-id*

no system-id

Context

[Tree] (config>service>vprn>isis system-id)

Full Context

configure service vprn isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default

no system-id

Parameters

isis-system-id

12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

7705 SAR Gen 2

system-id

Syntax

[**no**] **system-id**

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option system-id)

Full Context

configure router interface dhcp option vendor-specific-option system-id

Description

This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

Default

no system-id

Platforms

7705 SAR Gen 2

system-id

Syntax

system-id *isis-system-id*

no system-id

Context

[Tree] (config>router>isis system-id)

Full Context

configure router isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference:

1. **config>router>isis>system-id**
2. **config>router>isis>router-id**
3. **config>router>router-id**
4. **config>router>interface>system> address**

5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, the IS-IS instance must be **shutdown** and then **no shutdown**. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Parameters

isis-system-id

Specifies 12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

7705 SAR Gen 2

29.66 system-mac

system-mac

Syntax

system-mac *mac-address*

no system-mac

Context

[Tree] (config>system>ned>profile system-mac)

Full Context

configure system network-element-discovery profile system-mac

Description

This command configures the MAC address to be advertised.

The **no** form of this command removes any explicitly defined MAC address and chassis MAC address will be advertised.

Default

no system-mac

Parameters

mac-address

Specifies the MAC address to be associated with the profile in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

Platforms

7705 SAR Gen 2

29.67 system-password

system-password

Syntax

system-password admin-password

system-password dynsvc-password

Context

[Tree] (admin>system>security system-password)

Full Context

admin system security system-password

Description

This operational command changes a local system password.

Parameters

admin-password

Specifies to change the administrative password.

dynsvc-password

Specifies to change the dynamic services password.

Platforms

7705 SAR Gen 2

29.68 system-priority

system-priority

Syntax

system-priority *value*

no system-priority

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep system-priority)

Full Context

configure redundancy multi-chassis peer mc-endpoint system-priority

Description

This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

Default

no system-priority

Parameters

value

Specifies the priority assigned to the local MC-EP peer.

Values 1 to 255

Platforms

7705 SAR Gen 2

29.69 system-profile

system-profile

Syntax

system-profile {**profile-a** | **profile-b**}

no system-profile

Context

[Tree] (bof system-profile)

Full Context

bof system-profile

Description

This command configures the system profile in the BOF.

See "System profiles" in the *7705 SAR Gen 2 Basic System Configuration Guide* for more information.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Parameters

profile-a

Specifies that the system profile is for generic deployment scenarios, IP forwarding and MPLS switching use-cases.

profile-b

Specifies that the system profile is primarily intended for applications requiring high packet manipulation and processing (for example, NAT and IPsec).

Platforms

7705 SAR Gen 2

30.2 table-size

table-size

Syntax

table-size *table-size*

Context

[Tree] (config>service>vpls>proxy-arp table-size)

[Tree] (config>service>vpls>proxy-nd table-size)

Full Context

configure service vpls proxy-arp table-size

configure service vpls proxy-nd table-size

Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

Default

table-size 250

Parameters

table-size

Specifies the table-size as number of entries for the service.

Values 1 to 16384

Platforms

7705 SAR Gen 2

30.3 tacplus

tacplus

Syntax

no tacplus

tacplus [**create**]

Context

[Tree] (config>service>vprn>aaa>rmt-srv tacplus)

Full Context

configure service vprn aaa remote-servers tacplus

Description

This command creates the context to configure TACACS+ authentication on the VPRN.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Parameters

create

Keyword to create the TACACS+ configuration.

Platforms

7705 SAR Gen 2

tacplus

Syntax

[**no**] **tacplus**

Context

[Tree] (config>system>security tacplus)

Full Context

configure system security tacplus

Description

This command creates the context to configure TACACS+ authentication on the router.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Platforms

7705 SAR Gen 2

30.4 tacplus-map-to-priv-lvl

tacplus-map-to-priv-lvl

Syntax

tacplus-map-to-priv-lvl [*admin-priv-lvl*]

no tacplus-map-to-priv-lvl

Context

[Tree] (config>system>security>password>enable-admin-control tacplus-map-to-priv-lvl)

Full Context

configure system security password enable-admin-control tacplus-map-to-priv-lvl

Description

When **tacplus-map-to-priv-lvl** is enabled, and tacplus authorization is enabled with the *use-priv-lvl* option, typing **enable-admin** starts an interactive authentication exchange from the node to the TACACS+ server. The start message (service=enable) contains the user-id and the requested *admin-priv-lvl*. Successful authentication results in the use of a new profile (as configured under **config>system>security>tacplus>priv-lvl-map**).

configure router isis interface tag

Description

This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

Default

no tag

Parameters

tag

Specifies a route tag.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

tag

Syntax

tag {**no-tag** | *tag*}

no tag

Context

[Tree] (config>router>policy-options>policy-statement>entry>from tag)

Full Context

configure router policy-options policy-statement entry from tag

Description

This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

Default

no tag

Parameters

tag

Matches the configured tag value.

Values Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

no-tag

Specifies that no tag value is set.

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag*

no tag

Context

[Tree] (config>router>policy-options>policy-statement>default-action tag)

[Tree] (config>router>policy-options>policy-statement>entry>action tag)

Full Context

configure router policy-options policy-statement default-action tag

configure router policy-options policy-statement entry action tag

Description

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default

no tag

Parameters

tag

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:

IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295

RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

30.6 taii-type2

taii-type2

Syntax

taii-type2 *global-id:prefix:ac-id*

no taii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context

configure service epipe spoke-sdp-fec taii-type2

Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters

global-id

Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

30.7 target-name

target-name

Syntax

target-name {node-name | user-agent | custom-string *name***}**

no target-name

Context

[Tree] (config>system>grpc-tunnel>tunnel target-name)

Full Context

configure system grpc-tunnel tunnel target-name

Description

This command assigns a target name that the node will register with.

The **no** form of this command removes the target name.

Default

no target-name

Parameters

node-name

Keyword to register the tunnel with the node name configured using the **configure system name** command.

user-agent

Keyword to register the tunnel with the user agent name string defined as *node-name:vendor:model:software-version*.

custom-string

Assigns an arbitrary string as the target name.

name

Specifies a string, up to 64 characters, that defines the target name.

Platforms

7705 SAR Gen 2

30.8 target-power

target-power

Syntax

target-power *power*

Context

[Tree] (config>port>dwdm>coherent target-power)

Full Context

configure port dwdm coherent target-power

Description

This command configures the target transmit optical power for the port.

Default

target-power 1.00

Parameters

power

Specifies the desired average output power in dBm.

Values -20.00 to 3.00

Platforms

7705 SAR Gen 2

30.9 target-type

target-type

Syntax

target-type {grpc-server | ssh-server | custom-type *type***}**

no target-type

Context

[Tree] (config>system>grpc-tunnel>tunnel>handler target-type)

Full Context

configure system grpc-tunnel tunnel handler target-type

Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default

no target-type

Parameters

grpc-server

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI_GNOI”.

ssh-server

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH”.

custom-type

Keyword that assigns an arbitrary string as the target type.

type

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI_GNOI” or "SSH” can also be used.

Platforms

7705 SAR Gen 2

30.10 targeted-session

targeted-session

Syntax

targeted-session

Context

[Tree] (config>router>ldp targeted-session)

Full Context

configure router ldp targeted-session

Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Platforms

7705 SAR Gen 2

30.11 task

task

Syntax

task [**detail**]

no task

Context

[Tree] (debug>router>pcep>pcc task)

[Tree] (debug>router>pcep>pcc>conn task)

Full Context

debug router pcep pcc task

debug router pcep pcc connection task

Description

This command enables debugging for PCC or connection task events.

The **no** form of this command disables debugging.

Parameters

detail

Keyword used to specify detailed information about PCC or connection task events.

Platforms

7705 SAR Gen 2

30.12 tcp-ack

tcp-ack

Syntax

tcp-ack {**true** | **false**}

no tcp-ack

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-ack)

[Tree] (config>filter>ip-filter>entry>match tcp-ack)

Full Context

configure filter ipv6-filter entry match tcp-ack

configure filter ip-filter entry match tcp-ack

Description

This command configures an IP filter match criterion based on the Acknowledgment (ACK) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

30.13 tcp-cwr

tcp-cwr

Syntax

tcp-cwr {**true** | **false**}

no tcp-cwr

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-cwr)

[Tree] (config>filter>ip-filter>entry>match tcp-cwr)

Full Context

configure filter ipv6-filter entry match tcp-cwr

configure filter ip-filter entry match tcp-cwr

Description

This command configures an IP filter match criterion based on the Congestion Window Reduced (CWR) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-cwr

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

30.14 tcp-ece

tcp-ece

Syntax

tcp-ece {**true** | **false**}

no tcp-ece

Context

[Tree] (config>filter>ip-filter>entry>match tcp-ece)

[Tree] (config>filter>ipv6-filter>entry>match tcp-ece)

Full Context

configure filter ip-filter entry match tcp-ece

configure filter ipv6-filter entry match tcp-ece

Description

This command configures an IP filter match criterion based on the ECN-Echo (ECE) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ece

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

30.15 tcp-established

tcp-established

Syntax

tcp-established [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no tcp-established

Context

[Tree] (config>service>nat>nat-policy>timeouts tcp-established)

Full Context

configure service nat nat-policy timeouts tcp-established

Description

This command configures the idle timeout applied to a TCP session in the established state.

Default

tcp-established hrs 2 min 4

Parameters

hours

Specifies the timeout hours field.

Values 1 to 24

minutes

Specifies the timeout minutes field.

Values 1 to 59

seconds

Specifies the timeout seconds field.

Values 1 to 59

Platforms

7705 SAR Gen 2

tcp-established

Syntax

[**no**] **tcp-established**

Context

[Tree] (config>filter>ipv6-filter>entry>match tcp-established)

[Tree] (config>filter>ip-filter>entry>match tcp-established)

Full Context

configure filter ipv6-filter entry match tcp-established

configure filter ip-filter entry match tcp-established

Description

This command matches packets with the TCP flag ACK or RST.

Default

tcp-established

Platforms

7705 SAR Gen 2

30.16 tcp-fin

tcp-fin

Syntax

tcp-fin {**true** | **false**}

no tcp-fin

Context

[Tree] (config>filter>ip-filter>entry>match tcp-fin)

[Tree] (config>filter>ipv6-filter>entry>match tcp-fin)

Full Context

configure filter ip-filter entry match tcp-fin

configure filter ipv6-filter entry match tcp-fin

Description

This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-fin

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

30.17 tcp-keepalive

tcp-keepalive

Syntax

tcp-keepalive

Context

[Tree] (config>system>grpc tcp-keepalive)

Full Context

configure system grpc tcp-keepalive

Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time** seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

Platforms

7705 SAR Gen 2

tcp-keepalive

Syntax

tcp-keepalive

Context

[Tree] (config>system>grpc-tunnel>destination-group tcp-keepalive)

[Tree] (config>system>telemetry>destination-group tcp-keepalive)

Full Context

configure system grpc-tunnel destination-group tcp-keepalive

configure system telemetry destination-group tcp-keepalive

Description

Commands in this context configure TCP keepalive commands.

Platforms

30.18 tcp-mss

tcp-mss

Syntax

tcp-mss *mss-value*

no tcp-mss

Context

[Tree] (config>service>ies>if>ipv6 tcp-mss)

[Tree] (config>service>ies>if tcp-mss)

Full Context

configure service ies interface ipv6 tcp-mss

configure service ies interface tcp-mss

Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default

no tcp-mss

Parameters

mss-value

The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

Platforms

7705 SAR Gen 2

tcp-mss

Syntax

tcp-mss *mss-value*

no tcp-mss

Context

[Tree] (config>service>vprn>if tcp-mss)

[Tree] (config>service>vprn>if>ipv6 tcp-mss)

[Tree] (config>service>vprn>nw-if tcp-mss)

Full Context

configure service vprn interface tcp-mss

configure service vprn interface ipv6 tcp-mss

configure service vprn network-interface tcp-mss

Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP or network interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default

no tcp-mss

Parameters

mss-value

Specifies the TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9746 = max-IP_MTU (9786)-40

Values 384 to 9746 (IPv4 or network)

1220 to 9726(IPv6)

Platforms

7705 SAR Gen 2

tcp-mss *mss-value*

no tcp-mss

Context

[Tree] (config>service>vprn>bgp tcp-mss)

[Tree] (config>router>bgp tcp-mss)

Full Context

configure service vprn bgp tcp-mss

configure router bgp tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms

7705 SAR Gen 2

configure service vprn bgp group tcp-mss

configure router bgp group tcp-mss

configure router bgp group neighbor tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the TCP MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

ip-stack

This keyword requests that TCP MSS be derived from mechanisms and configurations outside of BGP, including the configuration of **tcp-mss** at the IP interface level. It provides a method to override inheritance within the BGP configuration.

tcp-mss-adjust

Syntax

tcp-mss-adjust *segment-size*

no tcp-mss-adjust

Context

[Tree] (config>service>nat>nat-policy tcp-mss-adjust)

Full Context

configure service nat nat-policy tcp-mss-adjust

Description

This command configures the value to adjust the TCP Maximum Segment Size (MSS) option.

The **no** form of the command returns the segment size to the default.

Default

no tcp-mss-adjust

Parameters

segment-size

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

Values 160 to 10240

Platforms

7705 SAR Gen 2

tcp-mss-adjust

Syntax

tcp-mss-adjust

te-class

Syntax

te-class *te-class-number* **class-type** *ct-number* **priority** *priority*

no te-class te-class-number

Context

[Tree] (config>router>rsvp>diffserv-te te-class)

Full Context

configure router rsvp diffserv-te te-class

Description

This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in Table 138: Default Class Type.

Table 138: Default Class Type

Class Type (CT internal)	LSP Priority
0	7
0	6
0	5
0	4
0	3
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

Parameters

te-class *te-class-number*

Specifies the TE class number.

Values 0 to 7

class-type *ct-number*

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

priority *priority*

Specifies the LSP priority.

Values 0 to 7

30.31 te-down-threshold

te-down-threshold

Syntax

te-down-threshold *threshold-level* [*threshold-level*]

no te-down-threshold

Context

[Tree] (config>router>rsvp>interface te-down-threshold)

[Tree] (config>router>rsvp te-down-threshold)

Full Context

configure router rsvp interface te-down-threshold

configure router rsvp te-down-threshold

Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters

threshold-level

Specifies the threshold level.

Values 0 to 100

Platforms

7705 SAR Gen 2

30.32 te-metric

te-metric

Syntax

te-metric *value*

no te-metric

Context

[Tree] (config>router>mpls>interface te-metric)

Full Context

configure router mpls interface te-metric

Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters

value

Specifies the metric value.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

30.33 te-threshold-update

te-threshold-update

Syntax

[**no**] **te-threshold-update**

Context

[Tree] (config>router>rsvp te-threshold-update)

Full Context

configure router rsvp te-threshold-update

Description

This command is used to control threshold-based IGP TE updates. The **te-threshold-update** command must enable IGP TE update based only on bandwidth reservation thresholds per interface and must block IGP TE update on bandwidth changes for each reservation. Threshold levels can be defined using the **te-up-threshold** and **te-down-threshold** commands at the global RSVP or per-interface level.

The **no** form of this command should reset te-threshold-update to the default value and disable threshold based update.

Default

no te-threshold-update

Platforms

30.35 tech-support

tech-support

Syntax

tech-support [*file-url*]

Context

[Tree] (admin tech-support)

Full Context

admin tech-support

Description

This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

Note:
This command should only be used with authorized direction of Nokia support.

Parameters

file-url

Specifies the file URL location to save the binary file.

Values *local-url* | *remote-url*

local-url	[*cflash-id/*][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn/*][*file-path*]
	199 chars max
remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

30.38 telnet

telnet

Syntax

telnet {*ip-address* | *dns-name*} [*port*] **service-name** *service-name* [**source** *ip-address*]

telnet {*ip-address* | *dns-name*} [*port*] [**router** *router-instance*] [**source** *ip-address*]

Context

[Tree] (telnet)

Full Context

telnet

Description

This command opens a Telnet session to a remote host. In 7705 SAR Gen 2 networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters

ip-address

Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address*
		interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

port

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance

Specifies the router name or service ID used to identify the router instance.

Values

router-instance: *router-name* or *vprn-svc-id*

router-name	"Base", "management", vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

source ip-address

Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

[Tree] (config>router>if>ipv6>vrrp telnet-reply)

Full Context

configure router interface vrrp telnet-reply

configure router interface ipv6 vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

30.43 temp-flooding

temp-flooding

Syntax

temp-flooding flood-time

no temp-flooding

Context

[Tree] (config>service>vpls temp-flooding)

[Tree] (config>service>template>vpls-template temp-flooding)

Full Context

configure service vpls temp-flooding

configure service template vpls-template temp-flooding

Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default

no temp-flooding

Parameters

flood-time

Specifies the flood time, in seconds

Values 3 to 600

template

Syntax

[**no**] **template** *name*

Context

[Tree] (config>router>route-next-hop-policy template)

Full Context

configure router route-next-hop-policy template

Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

Parameters

name

Specifies the name of the template, up to 32 characters.

30.46 tertiary-config

tertiary-config

Syntax

tertiary-config *file-url*

no tertiary-config

Context

[Tree] (bof tertiary-config)

Full Context

bof tertiary-config

Description

This command specifies the name and location of the tertiary configuration file.

The system attempts to use the configuration specified in **tertiary-config** if both the primary and secondary config files cannot be located. If this file cannot be located, the system boots with the factory default configuration.

Note that if an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **tertiary-config** configuration.

Parameters

file-url

Specifies the tertiary configuration file location, expressed as a file URL.

Values

file-url	{*local-url* | *remote-url*} (up to 180 characters)
local-url	[*cflash-id*/][*file-path*]
remote-url	[{ftp://| tftp://} *login:pswd@remote-locn*/][*file-path*]

30.49 tertiary-ip-address

tertiary-ip-address

Syntax

tertiary-ip-address *ipv4-address*

no tertiary-ip-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ip-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

Default

no tertiary-ip-address

Parameters

ipv4-address

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

Platforms

7705 SAR Gen 2

30.50 tertiary-ipv6-address

tertiary-ipv6-address

Syntax

tertiary-ipv6-address *ipv6-address*

no tertiary-ipv6-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ipv6-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ipv6-address

Description

This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

Default

no tertiary-ipv6-address

Parameters

ipv6-address

Specifies the tertiary IPv6 address of a location.

Values ipv6-address:

- x:x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

Platforms

30.51 test

test

Syntax

[**no**] **test** *test-name* [**owner** *test-owner*]

Context

[Tree] (config>saa test)

Full Context

configure saa test

Description

This command identifies a test and enables the context to provide the test parameters for the named test. After the creation of the test instance, the test can be started in the OAM context.

A test can only be modified while it is shut down.

The **no** form of this command removes the test from the configuration. To remove a test, it cannot be active at the time.

Parameters

test-name

Identifies the SAA test name, up to 32 characters.

test-owner

Specifies the owner, up to 32 characters, of an SAA operation. If a value is not specified, the default owner is used.

Default "TiMOS CLI"

Platforms

7705 SAR Gen 2

30.52 test-completion-enable

test-completion-enable

Syntax

[**no**] **test-completion-enable**

Context

[Tree] (config>saa>test>trap-gen test-completion-enable)

Full Context

configure saa test trap-gen test-completion-enable

Description

This command enables the generation of a trap when an SAA test completes.

The **no** form of this command disables the trap generation.

Platforms

7705 SAR Gen 2

30.53 test-duration

test-duration

Syntax

test-duration *seconds*

no test-duration

Context

[Tree] (config>oam-pm>session>ip>twamp-light test-duration)

Full Context

configure oam-pm session ip twamp-light test-duration

Description

This command defines the length of time the test runs before stopping automatically. This optional command is only valid when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration value and allows the TWAMP Light test to execute until it is stopped manually.

Parameters

seconds

Specifies the length of time, in seconds, that the TWAMP Light test runs.

Values 1 to 86400

Platforms

7705 SAR Gen 2

30.54 test-fail-enable

test-fail-enable

Syntax

[**no**] **test-fail-enable**

Context

[Tree] (config>saa>test>trap-gen test-fail-enable)

Full Context

configure saa test trap-gen test-fail-enable

Description

This command enables the generation of a trap when a test fails. In the case of a ping test, the test is considered failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** parameter.

The **no** form of this command disables the trap generation.

Platforms

7705 SAR Gen 2

30.55 test-fail-threshold

test-fail-threshold

Syntax

test-fail-threshold *threshold*

no test-fail-threshold

Context

[Tree] (config>saa>test>trap-gen test-fail-threshold)

Full Context

configure saa test trap-gen test-fail-threshold

Description

This command configures the threshold for trap generation on test failure.

This command has no effect when **test-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

Default

test-fail-threshold 1

Parameters

threshold

Specifies the number of consecutive test failures required to generate a trap.

Values 0 to 15

Platforms

7705 SAR Gen 2

30.56 test-oam

test-oam

Syntax

test-oam

Context

[Tree] (config test-oam)

Full Context

configure test-oam

Description

30.57 third-party-nexthop

third-party-nexthop

Syntax

third-party-nexthop

no third-party-nexthop

Context

[Tree] (config>service>vprn>bgp>group third-party-nexthop)

[Tree] (config>service>vprn>bgp>group>neighbor third-party-nexthop)

[Tree] (config>service>vprn>bgp third-party-nexthop)

Full Context

configure service vprn bgp group third-party-nexthop

configure service vprn bgp group neighbor third-party-nexthop

configure service vprn bgp third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

Default

no third-party-nexthop

Platforms

7705 SAR Gen 2

third-party-nexthop

Syntax

three-way-hello

Syntax

three-way-hello [**compatibility-mode**]

no three-way-hello

Context

[Tree] (config>router>pim>interface three-way-hello)

Full Context

configure router pim interface three-way-hello

Description

This command sets the compatibility mode to enable three-way hello. By default, the value is disabled on all interface which specifies that the standard two-way hello is supported. When enabled, the three-way hello is supported.

The **no** form of this command disables three-way hello.

Default

no three-way-hello

Platforms

7705 SAR Gen 2

30.59 threshold

threshold

Syntax

threshold *threshold*

no threshold

Context

[Tree] (config>router>segment-routing>maintenance-policy threshold)

Full Context

configure router segment-routing maintenance-policy threshold

Description

This command configures the minimum number of S-BFD sessions that must be up in order to consider the SR policy candidate path to which the maintenance template is bound to be up. If it is below this number, then the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.

The **no** form of this command reverts to the default.

Default

threshold 1

Parameters

threshold

Specifies the minimum number of S-BFD sessions that must be up.

Values 1 to 32

Platforms

7705 SAR Gen 2

30.60 thresholds

thresholds

Syntax

30.61 throttle-rate

throttle-rate

Syntax

throttle-rate *events* [**interval** *seconds*]

no throttle-rate

Context

[Tree] (config>log throttle-rate)

Full Context

configure log throttle-rate

Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default

throttle-rate 2000 interval 1

Parameters

events

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds

Specifies the number of seconds that an event throttling interval lasts.

Values 1 to 1200

Default 1

Platforms

7705 SAR Gen 2

30.62 ti-lfa

ti-lfa

Syntax

ti-lfa [**max-sr-frr-labels** *value*] [**max-srv6-frr-sids** *sids-value*]

no ti-lfa

Context

[Tree] (config>router>isis>lfa ti-lfa)

Full Context

configure router isis loopfree-alternates ti-lfa

Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

Default

no ti-lfa

Parameters

value

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

sids-value

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 1

Platforms

7705 SAR Gen 2

ti-lfa

Syntax

ti-lfa [**max-sr-frr-labels** *value*]

no ti-lfa

Context

[Tree] (config>router>ospf>loopfree-alternates ti-lfa)

Full Context

configure router ospf loopfree-alternates ti-lfa

Description

This command enables the use of the Topology Independent Loop-Free Alternate (TI-LFA) algorithm in the LFA SPF calculation for this OSPF or OSPFv3 instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation in this OSPF or OSPFv3 instance.

Default

no ti-lfa

Parameters

max-sr-frr-labels [*value*]]

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

Platforms

7705 SAR Gen 2

30.63 tier

tier

Syntax

tier {**1** | **2**}

Context

[Tree] (config>qos>policer-control-policy tier)

Full Context

configure qos policer-control-policy tier

Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms

7705 SAR Gen 2

tier

Syntax

[**no**] **tier** *tier*

Context

[Tree] (config>qos>scheduler-policy tier)

Full Context

configure qos scheduler-policy tier

Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters

tier

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

Values 1 to 3

Platforms

7705 SAR Gen 2

30.64 time

time

Syntax

time

Context

[Tree] (config>system time)

30.65 time-display

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (environment time-display)

Full Context

environment time-display

Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

Default

time-display local

Parameters

local

Indicates that local time should be used.

utc

Indicates that UTC time should be used.

Platforms

7705 SAR Gen 2

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (config>system>management-interface>cli>md-cli>environment time-display)

Full Context

configure system management-interface cli md-cli environment time-display

Description

This command configures whether the time is displayed in coordinated Universal Time (UTC) or local time (as configured in **config**>**system**>**time**).

Default

time-display local

Parameters

local

Specifies that the local time zone is used.

utc

Specifies that UTC is used.

Platforms

7705 SAR Gen 2

30.66 time-exceeded

time-exceeded

Syntax

time-exceeded [*number seconds*]

no time-exceeded

Context

[Tree] (config>service>ies>if>ipv6>icmp6 time-exceeded)

Full Context

configure service ies interface ipv6 icmp6 time-exceeded

Description

This command specifies whether time-exceeded ICMP messages should be sent. When enabled, ICMPv6 time-exceeded messages are generated by this interface.

When disabled, ICMPv6 time-exceeded messages are not sent.

The **no** form of this command reverts to the default.

Default

time-exceeded 100 10

Parameters

number

Specifies the number of time-exceeded ICMP messages are to be issued in the time frame specified by the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, that is used to limit the number of time-exceeded ICMP message to be issued.

Values 1 to 60

Platforms

7705 SAR Gen 2

time-exceeded

Syntax

time-exceeded [*number seconds*]

no time-exceeded

Context

[Tree] (config>router>if>ipv6>icmp6 time-exceeded)

[Tree] (config>service>vprn>if>ipv6>icmp6 time-exceeded)

Full Context

configure router interface ipv6 icmp6 time-exceeded

configure service vprn interface ipv6 icmp6 time-exceeded

Description

This command configures rate for ICMPv6 time-exceeded messages.

Parameters

number

Limits the number of time-exceeded messages issued per the time frame specified in *seconds* parameter.

Values 10 to 2000

seconds

Determines the time frame, in seconds, that is used to limit the number of time-exceeded messages issued per time frame.

Values 1 to 60

Platforms

7705 SAR Gen 2

30.67 time-format

time-format

Syntax

time-format {**local** | **utc**}

Context

[Tree] (config>service>vprn>log>log-id time-format)

Full Context

configure service vprn log log-id time-format

Description

This command specifies whether the time should be displayed in local or Coordinated Universal Time (UTC) format.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

Platforms

7705 SAR Gen 2

time-format

Syntax

time-format {**local** | **utc**}

Context

[Tree] (config>log>log-id time-format)

Full Context

configure log log-id time-format

Description

This command specifies whether the time should be output in local or Coordinated Universal Time (UTC) format in the following event log locations:

- in the syslog TIMESTAMP field
- in the timestamp of log events inside log files on local storage devices

The timestamp in the filename of event log files is not affected by this command.

The output of **show log log-id** and the output of YANG state under /state/log/log-id are not affected by this command. See the **environment time-display** command.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

Platforms

7705 SAR Gen 2

30.68 time-stamp

time-stamp

Syntax

[**no**] **time-stamp**

Context

[Tree] (environment time-stamp)

Full Context

environment time-stamp

Description

This command specifies whether the time-stamp should be displayed before the prompt.

30.69 timeout

timeout

Syntax

timeout [**sec** *seconds*] [**min** *minutes*]

no timeout

Context

[Tree] (config>aaa>radius-srv-plcy>servers timeout)

Full Context

configure aaa radius-server-policy servers timeout

Description

This command configures the time the router waits for a response from a RADIUS server.

The no form of this command reverts to the default value.

Default

timeout sec 5

Parameters

seconds

Specifies the number of seconds for the timeout.

Values 1 to 59

minutes

Specifies the number of minutes for the timeout.

Values 1 to 5

Values Max. value = 5 min 40 sec

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>service>vprn>aaa>rmt-srv>radius timeout)

[Tree] (config>system>security>radius timeout)

Full Context

configure service vprn aaa remote-servers radius timeout

configure system security radius timeout

Description

This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

Values 1 to 90

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus timeout)

configure service vprn aaa remote-servers tacplus timeout

configure system security tacplus timeout

Description

This command configures the number of seconds the router waits for a response from a TACACS+ server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

Specifies the number of seconds the router waits for a response from a TACACS+ server, expressed as a decimal integer.

Values 1 to 90

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

Context

[Tree] (config>system>file-trans-prof timeout)

Full Context

configure system file-transmission-profile timeout

Description

This command specifies timeout value in seconds for transport protocol. The timeout is the maximum waiting time to receive any data from the server (e.g., FTP or HTTP server).

Default

timeout 60

Parameters

seconds

Specifies the connection timeout (in seconds) for the file transmission.

Values 1 to 3600

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *timeout*

no timeout

Context

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy timeout)

[Tree] (config>saa>test>type-multi-line>lsp-ping timeout)

Full Context

configure saa test type-multi-line lsp-ping sr-policy timeout

configure saa test type-multi-line lsp-ping timeout

Description

This command configures the number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of the request probes.

The **no** form of this command reverts to the default value.

Default

timeout 5

Parameters

timeout

Specifies the timeout value in seconds.

Values 1 to 10

Default 5

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout [*seconds*]

no timeout

Context

[Tree] (config>filter>redirect-policy>dest>ping-test timeout)

Full Context

configure filter redirect-policy destination ping-test timeout

Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default

timeout 1

Parameters

seconds

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>vrrp>policy>priority-event>host-unreachable timeout)

Full Context

configure vrrp policy priority-event host-unreachable timeout

Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default

timeout 1

Parameters

seconds

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *timeout*

no timeout

Context

[Tree] (config>service>sdp>keep-alive timeout)

Full Context

configure service sdp keep-alive timeout

Description

This command configures the time interval that the SDP waits before tearing down the session.

Default

timeout 5

Parameters

timeout

Specifies the timeout time, in seconds.

Values 1 to 10

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

no timeout

Context

[Tree] (config>system>security>ldap timeout)

Full Context

configure system security ldap timeout

Description

The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms

7705 SAR Gen 2

30.70 timeouts

timeouts

Full Context

configure service vprn ripng group neighbor timers

configure service vprn rip group timers

configure service vprn ripng timers

configure service vprn rip group neighbor timers

configure service vprn ripng group timers

configure service vprn rip timers

Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

  Determines how often RIP updates are sent.

- **timeout timer**

  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default

no timers

Parameters

update

The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout

The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush

The RIP flush timer value in seconds.

Values 1 to 1200

Default 120

Platforms

7705 SAR Gen 2

timers

Syntax

timers [**neighbor** *ip-address* | **group** *name*]

no timers

Context

[Tree] (debug>router>bgp timers)

Full Context

debug router bgp timers

Description

This command logs all BGP timer events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

configure router rip group neighbor timers

configure router rip timers

configure router ripng group timers

configure router ripng group neighbor timers

configure router ripng timers

configure router rip group timers

Description

This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. After the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default

timers 30 180 120

Parameters

update

Specifies the RIP update timer value in seconds expressed as a decimal integer.

Values 1 to 600

timeout

Specifies the RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 to 1200

flush

Specifies the RIP flush timer value in seconds expressed as a decimal integer.

30.74 timing

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context

configure oam-pm session ip twamp-light loss timing

Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default

timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters

frames

Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

Values 1 to 9

Default 5

[Tree] (config>log>syslog tls-client-profile)

Full Context

configure service vprn log syslog tls-client-profile

configure log syslog tls-client-profile

Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

Parameters

tls-client-profile

Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

Platforms

7705 SAR Gen 2

tls-client-profile

Syntax

tls-client-profile *profile-name*

no tls-client-profile

Context

[Tree] (config>router>pcep>pcc>peer tls-client-profile)

Full Context

configure router pcep pcc peer tls-client-profile

Description

This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

Default

no tls-client-profile

Parameters

profile-name

Specifies the TLS client profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

30.77 tls-profile

tls-profile

Syntax

tls-profile *tls-profile-name*

no tls-profile

Context

[Tree] (config>system>security>ldap>server tls-profile)

Full Context

configure system security ldap server tls-profile

Description

This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

Parameters

tls-profile-name

Specifies the TLD profile for encryption.

Platforms

7705 SAR Gen 2

30.78 tls-re-negotiate-timer

tls-re-negotiate-timer

Syntax

tls-re-negotiate-timer *timer-min*

no tls-re-negotiate-timer

Context

[Tree] (config>system>security>tls>server-tls-profile tls-re-negotiate-timer)

Full Context

configure system security tls server-tls-profile tls-re-negotiate-timer

Description

This command configures the timed interval after which the server is triggered to send a Hello request message to all clients and force a renegotiation of the symmetric encryption key. When an interval of 0 is configured, the server will never send a hello request message.

Default

tls-re-negotiate-timer 0

Parameters

timer-min

Specifies the interval, in minutes, after which the server is triggered to send a Hello request message.

Values 0 to 65000

Platforms

7705 SAR Gen 2

30.79 tls-server-profile

tls-server-profile

Syntax

tls-server-profile *name*

no tls-server-profile

Context

[Tree] (config>system>grpc tls-server-profile)

Full Context

configure system grpc tls-server-profile

Description

This command adds a configured TLS server profile to the gRPC session. The TLS server is used for encryption of the gRPC session. gRPC will not transmit any PDUs if there is a TLS server profile assigned to it and the TLS connection is down.

The **no** form of this command removes the specified TLS server profile from the gRPC session.

Parameters

name

Specifies the name of the TLS server profile configured under the **config**>**system**>**security**>**tls** context.

Platforms

7705 SAR Gen 2

30.80 tls-wait-timer

tls-wait-timer

Syntax

tls-wait-timer *tls-wait-timer*

no tls-wait-timer

Context

[Tree] (config>router>pcep>pcc>peer tls-wait-timer)

Full Context

configure router pcep pcc peer tls-wait-timer

Description

This command configures the time that the PCC waits before declaring a TLS handshake failure if the handshake is not established.

The **no** form of this command reverts to the default.

Default

tls-wait-timer 60

Parameters

tls-wait-timer

Specifies the time, in seconds.

Values 60 to 255

Platforms

7705 SAR Gen 2

30.84 to

to

Syntax

to [*ip-address* | **node-id** [*a.b.c.d* | *1...4294967295*]]

Context

[Tree] (config>router>mpls>lsp to)

Full Context

configure router mpls lsp to

Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default

no default

Parameters

ip-address

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

Values ipv4-address — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — 0 to FFFF (hexadecimal)

d — 0 to 255 (decimal)

node-id ***a.b.c.d.*** **|** ***1...4294967295***

4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

Platforms

7705 SAR Gen 2

to

Syntax

to *ip-address*

Context

[Tree] (config>router>mpls>static-lsp to)

Full Context

configure router mpls static-lsp to

Description

This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

Parameters

ip-address

Specifies the system IP address of the egress router.

Platforms

7705 SAR Gen 2

to

Syntax

to file *file-id*

Context

[Tree] (config>log>accounting-policy to)

Full Context

configure log accounting-policy to

Description

This command specifies the destination for the accounting records selected for the accounting policy.

Parameters

file-id

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Values 1 to 99

Platforms

7705 SAR Gen 2

to

Syntax

[**no**] **to**

Context

[Tree] (config>router>policy-options>policy-statement>entry to)

Full Context

configure router policy-options policy-statement entry to

Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

Platforms

7705 SAR Gen 2

to

Syntax

to cli [*size*]

to console

to file *log-file-id*

to memory [*size*]

to netconf [*size*]

to session

to snmp [*size*]

to syslog *syslog-id*

Context

[Tree] (config>log>log-id to)

Full Context

configure log log-id to

Description

This command specifies a destination for the log event data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters

cli

Specifies that log events are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools**>**perform**>**log**>**subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console

Specifies that log events events are directed to the console port. If the console is not connected, all the entries are dropped.

file *log-file-id*

Specifies that log events are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config**>**log**>**file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear**>**log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

Values 1 to 99, *name* (up to 64 characters max)

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the

to session configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

size

Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

syslog *syslog-id*

Specifies that log events are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config**>**log**>**syslog** *syslog-id* context.

Values 1 to 10

Platforms

[Tree] (config>service>ies>if tos-marking-state)

Full Context

configure service vprn interface tos-marking-state

configure service ies interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms

7705 SAR Gen 2

tos-marking-state

Syntax

tos-marking-state {**trusted** | **untrusted**}

no tos-marking-state

Context

[Tree] (config>service>vprn>nw-if tos-marking-state)

Full Context

configure service vprn network-interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** tos-marking-state command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

Platforms

7705 SAR Gen 2

tos-marking-state

Syntax

tos-marking-state {**trusted** | **untrusted**}

no tos-marking-state

Context

[Tree] (config>router>if tos-marking-state)

Full Context

configure router interface tos-marking-state

Description

This command is used on a network IP interface to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all IES and network IP interface as untrusted. When the ingress network IP interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing. The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

Specifies that the default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

30.87 traceroute

traceroute

Syntax

Context

[Tree] (traceroute)

Full Context

traceroute

Description

This command determines the route to a destination address. DNS lookups for the responding hosts are enabled by default.

Parameters

candidate-path

Specifies a candidate path of the SRv6 policy to traceroute. The candidate path does not need to be the currently active candidate path.

dest-port-udp-fixed

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

decode

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

detail

Specifies to display additional information about the resulting packet.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the traceroute probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

dns-name

Specifies the DNS name, up to 63 characters, of the far-end device on which to send the traceroute request message.

endpoint *ipv6-address*

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

ip-address

Specifies the far-end IP address on which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

max-ttl

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

Values 1 to 60000

Default 5000

min-ttl

Specifies the IP TTL in the initial traceroute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

no-dns

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

original-datagram

Parse the returned original datagram including any IPv6 and SRH header information.

pad-size

Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

preference

Specifies the preference of the SRv6 policy candidate path to send the traceroute probe on.

Values 0 to 4294967295

Default 100

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to traceroute.

Values bgp — Specifies a BGP SRv6 policy.

static — Specifies a locally configured static SRv6 policy.

protocol udp | tcp

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

router-instance

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, vpls-management

vprn-svc-name: up to 64 characters

service-name

Specifies the alias function that allows the service name to be used, converted, and stored as service ID.

source *ip-address*

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

type-of-service

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

Default 0

srv6-policy

Keyword to specify that the traceroute probe is applied to an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

segment-list

Specifies the SRv6 policy segment list to trace.

Values 1 to 32

Platforms

7705 SAR Gen 2

Output

Table 139: ICMPv4 Type 3 symbols in CLI, Table 140: ICMPv6 Type 1 symbols in CLI, and Table 141: ICMPv6 Type 2 symbols in CLI describe the ICMPv4 Type 3, and the ICMPv6 Type 1 and 2 symbols in the CLI outputs. For references without a symbol in the form !<code>, see www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml.

The following output is an example of traceroute for an IPv4 prefix.

Output Example

```
A:node-2# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
 1  192.168.xx.xx4 0.000 ms  0.000 ms  0.000 ms
```

The following output is an example of traceroute for an IPv4 prefix resolved to an IPv4 SR policy with ICMP tunneling enabled.

Output Example

```
A:node-2# traceroute 11.21.1.6 detail no-dns
traceroute to 11.21.1.6, 30 hops max, 40 byte packets

30.88 traceroute-reply

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context

configure service ies interface ipv6 vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Default

no traceroute-reply

Platforms

7705 SAR Gen 2

traceroute-reply

Syntax

configure service vprn interface vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Default

no traceroute-reply

Platforms

7705 SAR Gen 2

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>router>if>ipv6>vrrp traceroute-reply)

[Tree] (config>router>if>vrrp traceroute-reply)

Full Context

configure router interface ipv6 vrrp traceroute-reply

configure router interface vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).

Default

no traceroute-reply

Platforms

7705 SAR Gen 2

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>service>vprn>pim>if tracking-support)

Full Context

configure service vprn pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to disable Join message suppression.

Default

no tracking-support

Platforms

7705 SAR Gen 2

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>router>pim>interface tracking-support)

Full Context

configure router pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to enable join message suppression. This capability allows for upstream routers to explicitly track join membership.

The **no** form of this command disables tracking support.

Default
no tracking-support

Platforms
7705 SAR Gen 2

[**no**] **traffic-engineering**

Context
[Tree] (config>router>isis traffic-engineering)

Full Context
configure router isis traffic-engineering

Description
This command enables this IS-IS instance to advertise TE link attributes for RSVP-TE and SR-TE enabled interfaces.

Default
no traffic-engineering

Platforms
7705 SAR Gen 2

traffic-engineering

Syntax
[**no**] **traffic-engineering**

Context
[Tree] (config>router>ospf traffic-engineering)

Full Context
configure router ospf traffic-engineering

Description

This command enables the advertisement of the traffic engineering information for the router and its links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering of this router are limited to calculations based on link and nodal constraints.

The **no** form of this command disables the advertisement of the traffic engineering information.

Default

no traffic-engineering

Platforms

7705 SAR Gen 2

Full Context

configure ipsec tunnel-template transform

configure ipsec ipsec-transport-mode-profile dynamic-keying transform

configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform

configure service ies interface ipsec ipsec-tunnel dynamic-keying transform

configure router interface ipsec ipsec-tunnel dynamic-keying transform

Description

This command associates the IPsec transform sets allowed for this the CHILD_SA. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

The **no** form of this command removes the transform ID from the configuration.

Default

no transform

Parameters

transform-id

Specifies a number to identify a tranform used for CHILD_SA negotiation. Up to four transform ID can be specified.

Values 1 to 2048

Platforms

7705 SAR Gen 2

transform

Syntax

transform *transform-id* [*transform-id*]

no transform

Context

30.94 transit

transit

Syntax

transit [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate transit)

Full Context

configure service vprn ttl-propagate transit

Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default

transit inherit

Parameters

inherit

specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

none

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Platforms

7705 SAR Gen 2

configure service vprn ospf area sham-link transit-delay

configure service vprn ospf area virtual-link transit-delay

configure service vprn ospf3 area interface transit-delay

configure service vprn ospf area interface transit-delay

Description

This command configures the estimated time, in seconds, that it takes to transmit a LSA on the interface or virtual link or sham-link.

The **no** form of this command reverts to the default delay time.

Default

transit-delay 1

Parameters

seconds

The transit delay in seconds expressed as a decimal integer.

Values 0 to 3600

Platforms

7705 SAR Gen 2

transit-delay

Syntax

transit-delay *seconds*

no transit-delay

Context

[Tree] (config>router>ospf3>area>virtual-link transit-delay)

Full Context

configure router ospf3 area virtual-link transit-delay

configure router ospf area interface transit-delay

configure router ospf3 area interface transit-delay

configure router ospf area virtual-link transit-delay

Description

This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.

The **no** form of this command reverts to the default delay time.

Default

transit-delay 1

Parameters

seconds

Specifies the transit delay in seconds expressed as a decimal integer.

Values 1 to 1800

Platforms

7705 SAR Gen 2

30.96 transmission-profile

transmission-profile

Syntax

transmission-profile *name*

no transmission-profile

Context

[Tree] (config>system>security>pki>ca-profile>ocsp transmission-profile)

Full Context

configure system security pki ca-profile ocsp transmission-profile

Description

This command specifies the transmission-profile for OCSP. When specified, this configuration overrides the **service** *service-id* or **service** *service-name* configured in the **config>system>security>pki>ca-profile>ocsp** context.

The **no** form of the command removes the profile name from the configuration.

Default

no transmission-profile

Parameters

name

Specifies the file transmission profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

transmission-profile

Syntax

transmission-profile *name*

no transmission-profile

Context

[Tree] (config>system>security>pki>est-profile transmission-profile)

Full Context

configure system security pki est-profile transmission-profile

Description

This command specifies the transmission profile name created in the **config>system file-transmission-profile** context for the EST profile.

The **no** form of the command removes the name from the EST profile configuration.

Default

no transmission-profile

Parameters

name

Specifies the file transmission profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

30.97 transmit-interval

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>bfd>bfd-template transmit-interval)

Full Context

configure router bfd bfd-template transmit-interval

Description

This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms

7705 SAR Gen 2

30.98 transmit-period

transmit-period

Syntax

transmit-period *seconds*

no transmit-period

Context

[Tree] (config>port>ethernet>dot1x transmit-period)

Full Context

configure port ethernet dot1x transmit-period

Description

This command configures the period after which the router sends a new EAPOL request message.

The **no** form of this command returns the value to the default.

Default

transmit-period 30

Parameters

seconds

Specifies the server transmit period in seconds.

Values 1 to 3600

Platforms

7705 SAR Gen 2

30.99 transport

transport

Syntax

transport *transport-protocol*

no transport

Context

[Tree] (config>system>snmp transport)

Full Context

configure system snmp transport

Description

This command configures the transport protocol used by the SNMP agent.

The **no** form of this command removes the transport protocol.

Default

no transport

Parameters

transport-protocol

Specifies the transport protocol.

Values **udp** — Keyword to specify UDP only.
tcp — Keyword to specify TCP only.
both — Keyword to specify TCP and UDP.

Default udp

Platforms

7705 SAR Gen 2

30.100 transport-address

transport-address

Syntax

transport-address {**interface** | **system**}

no transport-address

Context

[Tree] (config>router>ldp>if-params>ipv4 transport-address)

[Tree] (config>router>ldp>if-params>if>ipv4 transport-address)

[Tree] (config>router>ldp>if-params>ipv6 transport-address)

[Tree] (config>router>ldp>if-params>if>ipv6 transport-address)

Full Context

configure router ldp interface-parameters ipv4 transport-address

configure router ldp interface-parameters interface ipv4 transport-address

configure router ldp interface-parameters ipv6 transport-address

configure router ldp interface-parameters interface ipv6 transport-address

Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default

system

Parameters

interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system

Specifies the system IP address is used to set up the LDP session between neighbors.

Description

Commands in this context configure MCS applications that need to encrypt synchronized states for transportation .

Platforms

7705 SAR Gen 2

30.102 transport-tunnel

transport-tunnel

Syntax

transport-tunnel

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

30.104 trap-target

trap-target

Syntax

trap-target name address *ip-address* [**port port**] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]

no trap-target *name*

Context

[Tree] (config>service>vprn>log>snmp-trap-group trap-target)

Full Context

configure service vprn log snmp-trap-group trap-target

Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default

No SNMP trap targets are defined.

Parameters

name

specifies the name of the trap target up to 28 characters in length

address ***ip-address***

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community | security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

Platforms

7705 SAR Gen 2

trap-target

Syntax

trap-target *name* [**address** *ip-address*] [**port** *port*] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]

no trap-target *name*

Context

[Tree] (config>log>snmp-trap-group trap-target)

Full Context

configure log snmp-trap-group trap-target

Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note:
If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters

name

Specifies the name of the trap target, up to 28 characters.

ip-address

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x:d.d.d.d[-interface]
		x: [0..FFFF]H
		d: [0..255]D
		interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1* | *snmpv2c* | *snmpv3

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

community* | *security-name

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there

is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note:
Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under the **config>log>app-route-notifications** context can help reduce the probability of lost events.

Parameters

ip-int-name* | *ip-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

trigger

Syntax

[**no**] **trigger** [**neighbor** *ip-int-name* | *ipv6-address*]

Context

[Tree] (debug>router>ripng trigger)

Full Context

debug router ripng trigger

Description

This command enables debugging for RIP trigger updates.

Parameters

ip-int-name*| *ipv6-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

30.107 trigger-entry

trigger-entry

Syntax

[**no**] **trigger-entry** *entry-id*

Context

[Tree] (config>log>event-trigger>event trigger-entry)

Full Context

configure log event-trigger event trigger-entry

Description

This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

Parameters

entry-id

Specifies the identifier of the EHS event trigger entry.

Values 1 to 1500

Platforms

7705 SAR Gen 2

30.108 triggered-policy

triggered-policy

Syntax

[**no**] **triggered-policy**

Context

[Tree] (config>router triggered-policy)

Full Context

configure router triggered-policy

Description

This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

no triggered-policy

7705 SAR Gen 2

30.109 trust-anchor

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>ipsec>trust-anchor-profile trust-anchor)

Full Context

configure ipsec trust-anchor-profile trust-anchor

Description

This command specifies a CA profile as a trust anchor CA. Up to 8 multiple trust anchors can be specified in a single trust anchor profile.

The **no** form of this command removes the name from the configuration.

Parameters

ca-profile-name

Specifies the name of the trust anchor profile, up to 32 characters.

Platforms

7705 SAR Gen 2

trust-anchor

Syntax

[**no**] **trust-anchor** *ca-profile-name*

Context

[Tree] (config>system>security>tls>trust-anchor-profile trust-anchor)

Full Context

configure system security tls trust-anchor-profile trust-anchor

Description

This command configures a trust anchor with a CA profile used by the TLS profile. Up to eight CA profiles can be configured under the trust anchor. TLS will read the CA profiles one by one to try to authenticate the server certificate.

Parameters

ca-profile-name

Specifies the name of the TLS trust anchor, up to 32 characters.

Platforms

7705 SAR Gen 2

30.110 trust-anchor-profile

trust-anchor-profile

Syntax

trust-anchor-profile *name* [**create**]

no trust-anchor-profile *name*

Context

[Tree] (config>ipsec trust-anchor-profile)

Full Context

configure ipsec trust-anchor-profile

Description

This command specifies the trust anchor profile name for the IPsec tunnel or IPsec GW.

Default

no trust-anchor-profile

Parameters

name

Specifies the name of trust anchor profile up to 32 characters.

Platforms

7705 SAR Gen 2

trust-anchor-profile

Syntax

trust-anchor-profile *name*

no trust-anchor-profile

configure system security tls trust-anchor-profile

Description

This command configures a trust anchor profile to be used in the TLS profile. The trust anchor is used for authentication of the server certificate.

Parameters

name

Specifies the name of the trust anchor profile, up to 32 characters.

create

Keyword used to create the trust anchor profile.

Platforms

7705 SAR Gen 2

30.111 trusted

trusted

Syntax

[**no**] **trusted**

Context

[Tree] (config>router>if>dhcp trusted)

[Tree] (config>service>vprn>if>dhcp trusted)

[Tree] (config>service>ies>if>dhcp trusted)

Full Context

configure router interface dhcp trusted

configure service vprn interface dhcp trusted

configure service ies interface dhcp trusted

Description

This command enables relaying untrusted packets. According to RFC 3046, *DHCP Relay Agent Information Option*, a DHCP request where the giaddr is 0.0.0.0 and which contains an Option 82 field in the packet, should be discarded, unless it arrives on a "trusted" circuit. If the **trusted** mode is enabled on an IP interface, the Relay Agent (the router) modifies the requested giaddr to be equal to the ingress interface and forward the request.

The **no** form of this command reverts to the default.

Default

no trusted

Platforms

7705 SAR Gen 2

30.112 trusted-mac-time

trusted-mac-time

Syntax

trusted-mac-time *range*

Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication trusted-mac-time)

Full Context

configure service vpls bgp-evpn mac-duplication trusted-mac-time

Description

This command determines how long a MAC address needs to stay in the FDB as type learned without being flushed or changed in its type so that the MAC is declared as trusted for the mac-duplication

procedures. If the MAC changes from SAP to SAP within the same VPLS service and node, the MAC does not reset its trusted MAC timer.

Default

trusted-mac-time 5

Parameters

range

Specifies the time, in minutes, before the MAC address can be flushed from the FDB.

Values 1 to 15

Platforms

7705 SAR Gen 2

30.113 ts-list

ts-list

Syntax

ts-list *list-name* [**create**]

no ts-list *list-name*

Context

[Tree] (config>ipsec ts-list)

Full Context

configure ipsec ts-list

Description

This command creates a new traffic selector (TS).

The **no** form of this command removes the list name from the configuration.

Parameters

list-name

Specifies the name of the TS-list.

Platforms

7705 SAR Gen 2

30.114 ts-location

ts-location

Syntax

ts-location *file-url*

no ts-location

Context

[Tree] (config>system>security>tech-support ts-location)

Full Context

configure system security tech-support ts-location

Description

The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the ts-location is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

Default

no ts-location

Parameters

file-url

Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, cf1:\) is blocked for local compact flash destinations. A sub-directory (for example, cf2:\tech-support) must be used if local cf is the location.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*]
	247 chars max

	directory length 99 chars max each
remote-locn	[*hostname* | *ipv4-address* | "["*ipv6-address*"]"]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

configure saa test type-multi-line lsp-ping sr-policy ttl

configure saa test type-multi-line lsp-ping ttl

Description

This command configures a time-to-live value for the MPLS label.

The **no** form of this command reverts to the default value.

Default

ttl 255

Parameters

label-ttl

Specifies the time-to-live value.

Values 1 to 255

Default 255

Platforms

7705 SAR Gen 2

ttl

Syntax

ttl *time-to-live*

no ttl

Context

[Tree] (config>oam-pm>session>ip ttl)

Full Context

configure oam-pm session ip ttl

Description

This command defines the value of the TTL field of the packet header.

The **no** form of this command restores the default value.

Default

ttl 225

Parameters

time-to-live

Specifies the value to be used in the TTL field.

Values 1 to 255

Default 255

Platforms

7705 SAR Gen 2

30.117 ttl-expired

ttl-expired

Syntax

ttl-expired *number seconds*

no ttl-expired [*number seconds*]

Context

[Tree] (config>service>ies>if>icmp ttl-expired)

Full Context

configure service ies interface icmp ttl-expired

Description

This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

Default

ttl-expired 100 10

Parameters

number

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

ttl-expired

Syntax

ttl-expired [*number seconds*]

no ttl-expired

Context

Full Context

configure service vprn network-interface icmp ttl-expired

configure service vprn interface icmp ttl-expired

Description

This command configures the rate of Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface.

Default

ttl-expired 100 10

Parameters

number

Specifies the maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

ttl-expired

Syntax

ttl-expired [*number seconds*]

no ttl-expired

Context

[Tree] (config>router>if>icmp ttl-expired)

Full Context

configure router interface icmp ttl-expired

Description

This command configures the rate that Internet Control Message Protocol (ICMP) Time To Live (TTL) expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of TTL expired messages.

Default

ttl-expired 100 10 — Maximum of 100 TTL expired message in 10 seconds.

Parameters

number

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.

Values 10 to 2000

seconds

The time frame, in seconds, used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

30.118 ttl-propagate

ttl-propagate

Syntax

ttl-propagate

Context

[Tree] (config>service>vprn ttl-propagate)

Full Context

configure service vprn ttl-propagate

Description

Commands in this context configure TTL propagation for transit and locally generated packets in a given VPRN routing context.

Platforms

7705 SAR Gen 2

ttl-propagate

Syntax

ttl-propagate

Context

[Tree] (config>router ttl-propagate)

Full Context

configure router ttl-propagate

Description

Commands in this context configure TTL propagation for transit and locally generated packets in the Global Routing Table (GRT) and VPRN routing contexts

7705 SAR Gen 2

30.119 ttl-security

ttl-security

Syntax

ttl-security *min-ttl-value*

no ttl-security

Context

[Tree] (config>service>vprn>bgp>group>neighbor ttl-security)

[Tree] (config>service>vprn>bgp>group ttl-security)

Full Context

configure service vprn bgp group neighbor ttl-security

configure service vprn bgp group ttl-security

Description

Configure TTL security parameters for incoming packets.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Default 1

Platforms

7705 SAR Gen 2

ttl-security

Syntax

ttl-security *min-ttl-value*

no ttl-security

Context

[Tree] (config>system>login-control>telnet ttl-security)

[Tree] (config>system>login-control>ssh ttl-security)

[Tree] (config>router>ldp>tcp-session-params>peer-transport ttl-security)

[Tree] (config>router>bgp>group ttl-security)

[Tree] (config>router>bgp>group>neighbor ttl-security)

Full Context

configure system login-control telnet ttl-security

configure system login-control ssh ttl-security

configure router ldp tcp-session-parameters peer-transport ttl-security

configure router bgp group ttl-security

configure router bgp group neighbor ttl-security

Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Platforms

7705 SAR Gen 2

30.120 tunnel

tunnel

Syntax

tunnel *ipsec-tunnel-name* [**detail**] [**no-dpd-debug**] [**display-keys**]

no tunnel *ipsec-tunnel-name*

Context

[Tree] (debug>ipsec tunnel)

Full Context

debug ipsec tunnel

Description

This command enables debugging for specified IPsec tunnel.

Note:
Up to 16 IPsec tunnels are allowed, to enable debugging, at a time.

Parameters

ipsec-tunnel-name

Specifies the name of ipsec-tunnel, up to 32 characters.

detail

Displays detailed debug information.

no-dpd-debug

Stops logging IKEv1 and IKEv2 DPD events for less noise during debug.

display-keys

Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

Platforms

7705 SAR Gen 2

tunnel

Syntax

tunnel *name* **[create]**

no tunnel *name*

Context

[Tree] (config>system>grpc-tunnel tunnel)

Full Context

configure system grpc-tunnel tunnel

Description

Commands in this context configure gRPC tunnel parameters for the specified tunnel. There can be multiple tunnels to one or more destinations.

The **no** form of this command removes the specified gRPC tunnel.

Parameters

name

Specifies the tunnel name, up to 32 characters.

create

Keyword used to create a tunnel.

Platforms

7705 SAR Gen 2

tunnel

Syntax

tunnel

Context

[Tree] (config>oam-pm>session>ip tunnel)

Full Context

configure oam-pm session ip tunnel

Description

Commands in this context configure packet tunneling options for the session. This command and the **oam-pm session ip forwarding** command are mutually exclusive.

Platforms

7705 SAR Gen 2

30.121 tunnel-dot1q

tunnel-dot1q

Syntax

[**no**] **tunnel-dot1q**

Context

[Tree] (config>port>ethernet>dot1x tunnel-dot1q)

Full Context

configure port ethernet dot1x tunnel-dot1q

Description

This command configures the tunneling of single tagged (dot1q) dot1x packets arriving on the port. When enabled, the router extracts these packets to the CPM.

The **no** form of this command disables the tunelling of the dot1q dot 1x packets on the port.

Default

tunnel-dot1q

Platforms

7705 SAR Gen 2

30.122 tunnel-down-damp-time

tunnel-down-damp-time

Syntax

tunnel-down-damp-time *seconds*

no tunnel-down-damp-time

Context

[Tree] (config>router>ldp tunnel-down-damp-time)

Full Context

configure router ldp tunnel-down-damp-time

Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

Parameters

seconds

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms

7705 SAR Gen 2

30.123 tunnel-endpoint

tunnel-endpoint

Syntax

tunnel-endpoint [**tunnel-spf**] [**tunnel-leak** *ip-address*]

no tunnel-endpoint

Context

[Tree] (debug>router>isis tunnel-endpoint)

Full Context

debug router isis tunnel-endpoint

Description

This command enables debugging for an ISIS tunnel endpoint.

The **no** form of the command disables the debugging.

Parameters

tunnel-spf

Debugs tunnel SPF information.

ip-address

When specified, only packets with the specified address are debugged.

Platforms

7705 SAR Gen 2

tunnel-endpoint

Syntax

tunnel-endpoint [**tunnel-spf** *ip-address*] [**tunnel-leak** *ip-address*]

Context

[Tree] (debug>router>ospf3 tunnel-endpoint)

[Tree] (debug>router>ospf tunnel-endpoint)

Full Context

debug router ospf3 tunnel-endpoint

debug router ospf tunnel-endpoint

Description

This command enables debugging for OSPF tunnel endpoints.

Parameters

tunnel-spf

Specifies the tunnel SPF IP address.

tunnel-leak

Specifies the tunnel leak IP address.

ip-address

Specifies the IP address.

Platforms

7705 SAR Gen 2

30.124 tunnel-far-end

tunnel-far-end

Syntax

tunnel-far-end *ip-address* | *ipv6-address*

no tunnel-far-end [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>sdp tunnel-far-end)

Full Context

configure service sdp tunnel-far-end

Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default

no tunnel-far-end

Parameters

ip-address* | *ipv6-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

Platforms

7705 SAR Gen 2

30.125 tunnel-group

tunnel-group

Syntax

tunnel-group *tunnel-group-id* [**create**]

tunnel-group *tunnel-group-id* **isa-scale-mode** *isa-scale-mode* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>isa tunnel-group)

Full Context

configure isa tunnel-group

Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type.

The **no** form of this command deletes the specified tunnel group from the configuration

Parameters

tunnel-group-id

Identifies the tunnel group.

Values 1 to 16

isa-scale-mode

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group. When it is not explicitly specified, **isa-scale-mode** has a default value, but that value is different on different platforms.

Values tunnel-limit-2k, tunnel-limit-32k, tunnel-limit-64k, tunnel-limit-8, tunnel-limit-32

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

tunnel-group

Syntax

tunnel-group *tunnel-group-id* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ipsec tunnel-group)

Full Context

configure redundancy multi-chassis peer mc-ipsec tunnel-group

Description

This command enables multi-chassis redundancy for specified tunnel-group; or enters an already configured tunnel-group context. The configured tunnel-group could failover independently.

The **no** form of this command removes the tunnel group ID from the configuration.

Parameters

tunnel-group-id

Specifies the tunnel-group identifier.

Values 1 to 16

Platforms

7705 SAR Gen 2

tunnel-group

Syntax

tunnel-group *tunnel-group-id* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ipsec tunnel-group)

Full Context

configure redundancy multi-chassis peer mc-ipsec tunnel-group

Description

This command enables multi-chassis redundancy for specified tunnel-group; or enters an already configured tunnel-group context. The configured tunnel-group could failover independently.

The **no** form of this command removes the tunnel group ID from the configuration.

Parameters

tunnel-group-id

Specifies the tunnel-group identifier.

Values 1 to 16

Platforms

7705 SAR Gen 2

tunnel-group

Syntax

tunnel-group *tunnel-group-id* **sync-tag** *tag-name* [**create**]

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>redundancy>multi-chassis>peer>sync tunnel-group)

Full Context

configure redundancy multi-chassis peer sync tunnel-group

Description

This command enables multi-chassis synchronization of IPsec states of specified tunnel-groups with a peer. The **sync-tag** parameter is used to match corresponding tunnel-group on both peers. IPsec states will be synchronized between tunnel-groups with same sync-tag.

Parameters

tunnel-group-id

Specifies the ID of the tunnel group.

tag-name

Specifies the name of the sync-tag.

Platforms

7705 SAR Gen 2

tunnel-group

Syntax

tunnel-group *tunnel-group-id*

no tunnel-group

Context

[Tree] (config>redundancy>multi-chassis>ipsec-domain tunnel-group)

Full Context

configure redundancy multi-chassis ipsec-domain tunnel-group

Description

This command specifies the tunnel group ID for the IPsec domain.

The **no** form of this command removes the tunnel group ID from the configuration.

Default

no tunnel-group

Parameters

tunnel-group-id

Specifies the tunnel group ID, up to 64 characters.

Platforms

7705 SAR Gen 2

30.126 tunnel-interface

tunnel-interface

Syntax

[**no**] **tunnel-interface** {**rsvp-p2mp** *lsp-name* | **ldp-p2mp** *p2mp-id* **sender** *sender-address* [**root-node**]}

Context

[Tree] (config>router tunnel-interface)

Full Context

configure router tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters

rsvp-p2mp *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)
1 to 8192 (on root node)

sender *sender-address*

Specifies the sender IP address: a.b.c.d.

Platforms

7705 SAR Gen 2

tunnel-interface

Syntax

tunnel-interface [**rsvp-p2mp** *lsp-name*] [**sender** *ip-address*] [**detail**]

tunnel-interface [**ldp-p2mp** *p2mp-id*] [**sender** *ip-address*] [**detail**]

no tunnel-interface [**rsvp-p2mp** *lsp-name*] [**sender** *ip-address*]

no tunnel-interface [**ldp-p2mp** *p2mp-id*] [**sender** *ip-address*]

Context

[Tree] (debug>router>pim tunnel-interface)

Full Context

debug router pim tunnel-interface

Description

This command enables debugging for PIM tunnel interfaces.

The **no** form of this command disables debugging for PIM tunnel interfaces.

Parameters

lsp-name

Specifies the LSP for RSVP P2MP.

ip-address

Specifies the IP address of the sender.

p2mp-id

Specifies the P2MP ID for LDP P2MP.

detail

Displays detailed information for PIM tunnel interfaces.

Platforms

7705 SAR Gen 2

30.127 tunnel-member-pool

tunnel-member-pool

Syntax

tunnel-member-pool *name* [**create**]

no tunnel-member-pool *name*

Context

[Tree] (config>isa tunnel-member-pool)

Full Context

configure isa tunnel-member-pool

Description

Commands in this context configure associated ESA VM and MDAs.

The **no** form of this command removes the pool name from the configuration.

Parameters

name

Specifies the tunnel member pool name of the command, up to 32 characters.

create

Keyword used to create the command instance.

Platforms

30.128 tunnel-mtu

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>isis>segment-routing tunnel-mtu)

Full Context

configure router isis segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

Platforms

7705 SAR Gen 2

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>ospf>segm-rtng tunnel-mtu)

Full Context

configure router ospf segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)X4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the MTU in bytes.

Values 512 to 9786

7705 SAR Gen 2

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context

configure router isis igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms

7705 SAR Gen 2

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>ospf3>igp-shortcut tunnel-next-hop)

[Tree] (config>router>ospf>igp-shortcut tunnel-next-hop)

Full Context

configure router ospf3 igp-shortcut tunnel-next-hop

configure router ospf igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

30.133 tunnel-table-pref

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ldp tunnel-table-pref)

Full Context

configure router ldp tunnel-table-pref

Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

tunnel-table-pref 9

Parameters

preference

Specifies the preference value.

Values 1 to 255

Default 9

Platforms

7705 SAR Gen 2

7705 SAR Gen 2

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

Full Context

configure router isis segment-routing tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default

tunnel-table-pref 11

Parameters

preference

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

Platforms

7705 SAR Gen 2

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ospf>segm-rtng tunnel-table-pref)

Full Context

configure router ospf segment-routing tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note:
The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default

tunnel-table-pref 10

Parameters

preference

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

[Tree] (config>router>ldp>targ-session>auto-tx>ipv4 tunneling)

Full Context

configure router ldp targeted-session auto-rx ipv4 tunneling

configure router ldp targeted-session auto-tx ipv4 tunneling

Description

This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

The **no** form of this command disables the local system from sending FEC/label bindings.

Default

no tunneling

[Tree] (config>test-oam twamp)

Full Context

configure test-oam twamp

Description

This command enables TWAMP functionality.

Platforms

7705 SAR Gen 2

30.137 twamp-light

twamp-light

Syntax

twamp-light [**test-id** *test-id*] [**create**]

no twamp-light

Context

[Tree] (config>oam-pm>session>ip twamp-light)

Full Context

configure oam-pm session ip twamp-light

Description

This command assigns an identifier to the TWAMP Light test and creates the individual test.

The **no** form of this command removes the TWAMP Light test function from the OAM-PM session.

Parameters

test-id

Specifies the value of the 4-byte local test identifier not sent in the TWAMP Light packets.

Values 0 to 2147483647 | **auto**

auto - automatically assigns a *test-id*

create

Creates the test.

Full Context

configure system lldp tx-credit-max

Description

This command configures the maximum consecutive LLDPDUs transmitted.

The **no** form of this command reverts to the default value.

Default

no tx-credit-max

Parameters

count

Specifies the maximum consecutive LLDPDUs transmitted.

Values 1 to 100

Default 5

Platforms

7705 SAR Gen 2

30.139 tx-dus

tx-dus

Syntax

[**no**] **tx-dus**

Context

[Tree] (config>port>ethernet>ssm tx-dus)

Full Context

configure port ethernet ssm tx-dus

Description

This command forces the QL value transmitted from the SSM channel of the SONET/SDH port or the Synchronous Ethernet port to be set to QL-DUS/QL-DNU. This capability is provided to block the use of the interface from the 7705 SAR Gen 2 for timing purposes.

This command is supported on TDM satellite.

Default

no tx-dus

Platforms

7705 SAR Gen 2

30.140 tx-hold-multiplier

tx-hold-multiplier

Syntax

tx-hold-multiplier *multiplier*

no tx-hold-multiplier

Context

Full Context

configure system lldp tx-hold-multiplier

Description

This command configures the multiplier of the tx-interval.

The **no** form of this command reverts to the default value.

Default

no tx-hold-multiplier

Parameters

multiplier

Specifies the multiplier of the tx-interval.

Values 2 to 10

Default 4

Platforms

7705 SAR Gen 2

30.141 tx-interval

tx-interval

Syntax

tx-interval *interval*

no tx-interval

Context

[Tree] (config>system>lldp tx-interval)

Full Context

configure system lldp tx-interval

Description

This command configures the LLDP transmit interval time.

The **no** form of this command reverts to the default value.

Default

no tx-interval

Parameters

interval

Specifies the LLDP transmit interval time.

Values 5 to 32768

Default 30

Platforms

7705 SAR Gen 2

30.142 tx-mgmt-address

tx-mgmt-address

Syntax

tx-mgmt-address [**system**] [**system-ipv6**] [**oob**] [**oob-ipv6**]

no tx-mgmt-address

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-mgmt-address)

Full Context

configure port ethernet lldp dest-mac tx-mgmt-address

Description

This command specifies which management address to transmit. The operator can choose to send the system IPv4 address, the system IPv6 address, the out-of-band IPv4 address, the out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol in order to send the management address.

The **no** form of the command resets value to the default.

Default

no tx-mgmt-address

Parameters

system

Specifies to use the system IP address. The system address will only be transmitted once it has been configured if this parameter is specified.

system-ipv6

Specifies to use the system IPv6 address. The system address will only be transmitted once it has been configured if this parameter is specified.

oob

Specifies to use the out-of-band IPv4 address for active CPM.

oob-ipv6

Specifies to use the out-of-band IPv6 address for active CPM.

Platforms

7705 SAR Gen 2

tx-mgmt-address

Syntax

tx-mgmt-address [**system**] [**system-ipv6**] [**oob**] [**oob-ipv6**]

no tx-mgmt-address

Context

[Tree] (config>lag>lldp-member-template>dstmac tx-mgmt-address)

Full Context

configure lag lldp-member-template dest-mac tx-mgmt-address

Description

This command configures the management address to transmit. The operator can choose to send the system IPv4 address, system IPv6 address, out-of-band IPv4 address, out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol to send the management address.

The **no** form of this command reverts to the default value.

Default

no tx-mgmt-address

Parameters

system

Keyword to use the system IP address. The system address is only transmitted after it has been configured if this keyword is specified.

system-ipv6

Keyword to use the system IPv6 address. The system address must be configured before it can be transmitted using this keyword.

oob

Keyword to use the out-of-band IPv4 address for active CPM.

oob-ipv6

Keyword to use the out-of-band IPv6 address for active CPM.

30.143 tx-tlvs

tx-tlvs

Syntax

tx-tlvs [**port-desc**] [**sys-name**] [**sys-desc**] [**sys-cap**]

no tx-tlvs

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-tlvs)

Full Context

configure port ethernet lldp dest-mac tx-tlvs

Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default

no tx-tlvs

Parameters

port-desc

Indicates that the LLDP agent should transmit port description TLVs.

sys-name

Indicates that the LLDP agent should transmit system name TLVs.

sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

Platforms

7705 SAR Gen 2

tx-tlvs

Syntax

30.144 type

type

Syntax

type *reflector-type*

Context

[Tree] (config>router>twamp-light>reflector type)

[Tree] (config>service>vprn>twamp-light>refl type)

Full Context

configure router twamp-light reflector type

configure service vprn twamp-light reflector type

Description

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of session senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A session sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

Default

type twamp-light

Parameters

reflector-type

Specifies the type of processing behavior for the reflector.

Values stamp, twamp-light

Platforms

7705 SAR Gen 2

type

Syntax

[**no**] **type** {**internal** | **external**}

Context

[Tree] (config>service>vprn>bgp>group>neighbor type)

[Tree] (config>service>vprn>bgp>group type)

Full Context

configure service vprn bgp group neighbor type

configure service vprn bgp group type

Description

This command designates the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of external indicates that the peer is an EBGP peer.

By default, the OS derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no type

Parameters

internal

Configures the peer as internal.

external

Configures the peer as external.

no type

Type of neighbor is derived on the local AS specified.

Platforms

7705 SAR Gen 2

type

Syntax

type [**hub** | **spoke** | **subscriber-split-horizon**]

no type

Context

[Tree] (config>service>vprn type)

Full Context

configure service vprn type

Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default

no type

Parameters

hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

Platforms

7705 SAR Gen 2

type

Syntax

[**no**] **type**

Context

[Tree] (config>saa>test type)

Full Context

configure saa test type

Description

This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

Platforms

7705 SAR Gen 2

type

Syntax

type *filter-type*

no type

Context

[Tree] (config>qos>sap-ingress>mac-criteria type)

Full Context

configure qos sap-ingress mac-criteria type

Description

This command sets the mac-criteria type.

Default

type normal

Parameters

filter-type

Specifies which type of entries this MAC filter can contain.

Values **normal** — Regular match criteria are allowed; ISID match not allowed.

vid — Configures the VID filter type used to match on ethernet_II frame types. This allows matching VLAN tags for explicit filtering.

Platforms

7705 SAR Gen 2

type

Syntax

configure router bfd bfd-template type

Description

This command selects the CPM network processor as the local termination point for the BFD session. This is enabled by default.

The **no** form of this command reverts to the default behavior.

Default

no type

Platforms

7705 SAR Gen 2

type

Syntax

type *file-url* [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

Context

[Tree] (file type)

Full Context

file type

Description

This command displays the contents of a text file.

Parameters

file-url

Specifies the file contents to display.

Values		
	local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
	remote-url	[{ftp:// | tftp:// | http:// | https://}*login*:*pswd@remote-locn*/][*file-path*]
		up to 247 characters
		directory length up to 99 characters each
	remote-locn	[hostname | ipv4-address | [ipv6-address]]
	ipv4-address	*a.b.c.d*
	ipv6-address	*x:x:x:x:x:x:x:x*[-*interface*]
		x:x:x:x:x:x:d.d.d.d[-*interface*]
		x - [0 to FFFF]H
		d - [0 to 255]D
		interface - up to 32 characters, for link local addresses 255
	cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**> **client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Specifies to automatically refuse any HTTP redirects without prompting the user.

Platforms

7705 SAR Gen 2

type

Syntax

type *schedule-type*

Context

[Tree] (config>system>cron>sched type)

Full Context

configure system cron schedule type

Description

This command specifies how the system should interpret the commands contained within the schedule node.

Default

type periodic

Parameters

schedule-type

Specifies the type of schedule for the system to interpret the commands contained within the schedule node.

Values periodic — Specifies a schedule which runs at a given interval. The interval must be specified for this feature to run successfully.

calendar — Specifies a schedule which runs based on a calendar. The month, weekday, day-of-month, and minute parameters must be specified for this feature to run successfully.

oneshot — Specifies a schedule which runs one time only. As soon as the first event specified in these parameters takes place and the associated event occurs, the schedule enters a shutdown state. The month, weekday, day-of-month, and minute parameters must be specified for this feature to run successfully.

Default periodic

Context

[Tree] (debug>system>grpc type)

Full Context

debug system grpc type

Description

This command enables debugging for all RPCs or a particular RPC.

The **no** form of this command deactivates debugging for all RPCs.

Parameters

all

Specifies that debugging is enabled for all RPCs.

gnmi-capabilities

Specifies that debugging is enabled for gNMI capability RPC.

gnmi-get

Specifies that debugging is enabled for gNMI get RPC.

gnmi-set

Specifies that debugging is enabled for gNMI set RPC.

gnmi-subscribe

Specifies that debugging is enabled for gNMI subscribe RPC.

gnoi-cert-mgmt-rpcs

Specifies that debugging is enabled for gNOI certificate management RPCs.

Platforms

7705 SAR Gen 2

type

Syntax

[**no**] **type** {**internal** | **external**}

Context

[Tree] (config>router>bgp>group type)

[Tree] (config>router>bgp>group>neighbor type)

Full Context

configure router bgp group type

configure router bgp group neighbor type

Description

This command designates the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of external indicates that the peer is an EBGP peer.

By default, the router derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no type

Parameters

internal

Configures the peer as internal.

external

Configures the peer as external.

Platforms

7705 SAR Gen 2

type

Syntax

type {**1** | **2**}

no type

Context

[Tree] (config>router>policy-options>policy-statement>entry>from type)

Full Context

configure router policy-options policy-statement entry from type

Description

This command configures an OSPF type metric as a match criterion in the route policy statement entry.

If no type is specified, any OSPF type is considered a match.

The **no** form of this command removes the OSPF type match criterion.

Default

no type

Parameters

1

Matches OSPF routes with type 1 LSAs.

2

Matches OSPF routes with type 2 LSAs.

Platforms

7705 SAR Gen 2

type

Syntax

type {*type* | *param-name*}

no type

Context

[Tree] (config>router>policy-options>policy-statement>default-action type)

[Tree] (config>router>policy-options>policy-statement>entry>action type)

Full Context

configure router policy-options policy-statement default-action type

configure router policy-options policy-statement entry action type

Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

Default

type 2

Parameters

type

Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

param-name

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

[Tree] (config>service>nat>nat-policy>timeouts udp-initial)

Full Context

configure service nat nat-policy timeouts udp-initial

Description

This command configures the UDP mapping timeout applied to new sessions.

Default

udp-initial sec 15

Parameters

minutes

Specifies the timeout minutes field.

Values 1 to 59

seconds

Specifies the timeout seconds field.

Values 1 to 59

Platforms

7705 SAR Gen 2

31.5 unavailability-event

unavailability-event

Syntax

unavailability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no unavailability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events unavailability-event)

Full Context

configure oam-pm session ip twamp-light loss-events unavailability-event

Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no unavailability-event forward

no unavailability-event backward

no unavailability-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the unavailability counter must be 0.

31.9 undet-availability-event

undet-availability-event

Syntax

undet-availability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no undet-availability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events undet-availability-event)

Full Context

configure oam-pm session ip twamp-light loss-events undet-availability-event

Description

This command sets the threshold to be applied to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined available. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no undet-availability-event forward

no undet-availability-event backward

no undet-availability-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

Platforms

7705 SAR Gen 2

31.10 undet-unavailability-event

undet-unavailability-event

Syntax

undet-unavailability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no undet-unavailability-event {**forward** | **backward** | **aggregate**}

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events undet-unavailability-event)

Full Context

configure oam-pm session ip twamp-light loss-events undet-unavailability-event

Description

This command sets the threshold to be applied to the overall count of the undetermined unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the **clear** *clear-threshold* parameter is not specified the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within measurement interval. If the optional clear threshold is specified the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no undet-unavailable-event forward

no undet-unavailable-event backward

no undet-unavailable-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

31.11 undo

undo

Syntax

undo [*count*]

Context

[Tree] (candidate undo)

Full Context

candidate undo

Description

This command removes the most recent change(s) done to the candidate. The changes can be reapplied using the **redo** command. All undo or redo history is lost when the operator exits the **edit-cfg** mode. Undo can not be used to recover a candidate that has been discarded with **candidate discard**.

An **undo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the undo.

Parameters

count

Specifies the number of previous changes to remove.

Values	1 to 50
Default	1

31.15 unicast-rt-test

unicast-rt-test

Syntax

[**no**] **unicast-rt-test**

Context

[Tree] (config>filter>redirect-policy>dest unicast-rt-test)

Full Context

configure filter redirect-policy destination unicast-rt-test

Description

This command configures a unicast route test for this destination. A destination is eligible for redirect if a valid unicast route to that destination exists in the routing instance specified by **config>filter>redirect-policy>router**. The unicast route test is mutually exclusive with other redirect-policy test types.

The test cannot be configured if **no router** is configured for this redirect policy.

The **no** form of the command disables the test.

Default

no unicast-rt-test

Platforms

7705 SAR Gen 2

31.16 unknown-arp-request-flood-evpn

unknown-arp-request-flood-evpn

Syntax

[**no**] **unknown-arp-request-flood-evpn**

Context

[Tree] (config>service>vpls>proxy-arp unknown-arp-request-flood-evpn)

Full Context

configure service vpls proxy-arp unknown-arp-request-flood-evpn

Description

This command controls whether unknown ARP-requests are flooded into the EVPN network. By default, the system floods ARP-requests, including EVPN (with source squelching), if there is no active proxy-arp entry for the requested IP.

The **no** form of the command will only flood to local SAPs/SDP-bindings and not to EVPN destinations.

Default

unknown-arp-request-flood-evpn

Platforms

7705 SAR Gen 2

31.17 unknown-mac-route

unknown-mac-route

Syntax

[**no**] **unknown-mac-route**

Context

[Tree] (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context

configure service vpls bgp-evpn unknown-mac-route

Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7705 SAR Gen 2 can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Default

no unknown-mac-route

Platforms

7705 SAR Gen 2

31.18 unknown-message-rate

unknown-message-rate

Syntax

unknown-message-rate *integer*

no unknown-message-rate

Context

[Tree] (config>router>pcep>pcc unknown-message-rate)

Full Context

configure router pcep pcc unknown-message-rate

Description

This command configures the maximum rate of unknown messages which can be received on a PCEP session.

When the rate of received unrecognized or unknown messages reaches the configured limit, the PCEP speaker closes the session to the peer.

The **no** form of the command returns the unknown message rate to the default value.

Default

unknown-message-rate 10

Parameters

integer

the rate of unknown messages, in messages per minute

Values 1 to 255

Platforms

7705 SAR Gen 2

31.19 unknown-ns-flood-evpn

unknown-ns-flood-evpn

Syntax

[**no**] **unknown-ns-flood-evpn**

Context

[Tree] (config>service>vpls>proxy-nd unknown-ns-flood-evpn)

Full Context

configure service vpls proxy-nd unknown-ns-flood-evpn

Description

This command controls whether unknown Neighbor Solicitation messages are flooded into the EVPN network. By default, the system floods NS (with source squelching) to SAPs/SDP-bindings including EVPN, if there is no active proxy-nd entry for the requested IPv6.

The **no** form of the command will only flood to local SAPs/SDP-bindings but not to EVPN destinations.

Default

unknown-ns-flood-evpn

Platforms

7705 SAR Gen 2

31.20 unknown-policer

unknown-policer

Syntax

unknown-policer *policer-id* [**fp-redirect-group**]

no unknown-policer

Context

[Tree] (config>qos>sap-ingress>fc unknown-policer)

Full Context

configure qos sap-ingress fc unknown-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7705 SAR Gen 2

31.21 unknown-queue

unknown-queue

Syntax

unknown-queue *queue-id* [**group** *queue-group-name*]

no unknown-queue

Context

[Tree] (config>qos>sap-ingress>fc unknown-queue)

Full Context

configure qos sap-ingress fc unknown-queue

Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

ip-address

Specifies an IP address.

Platforms

7705 SAR Gen 2

unnumbered

Syntax

unnumbered [{*ip-int-name* | *ip-address*}]

no unnumbered

Context

[Tree] (config>router>if unnumbered)

Full Context

configure router interface unnumbered

Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default

no unnumbered

Parameters

ip-int-name* | *ip-address

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

configure service vprn interface ipv6 icmp6 unreachables

configure service vprn interface icmp unreachables

configure service vprn network-interface icmp unreachables

configure service ies interface icmp unreachables

Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default

unreachables 100 10

Parameters

number

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

Platforms

7705 SAR Gen 2

configure router interface icmp unreachables

Description

This command enables and configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages that can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachables on the router interface.

Default

unreachables 100 10 — Maximum of 100 unreachable messages in 10 seconds.

Parameters

number

The maximum number of ICMP unreachable messages to send, expressed as a decimal integer. The *seconds* parameter must also be specified.

Values 10 to 2000

seconds

The time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

unreachables

Syntax

unreachables [*number seconds*]

no unreachables

Context

[Tree] (config>router>if>ipv6>icmp6 unreachables)

Full Context

configure router interface ipv6 icmp6 unreachables

Description

This command configures the rate for ICMPv6 unreachable messages. When enabled, ICMPv6 host and network unreachable messages are generated by this interface.

The **no** form of this command disables the generation of ICMPv6 host and network unreachable messages by this interface.

Default

unreachables 100 10 (when IPv6 is enabled on the interface)

Parameters

number

Determines the number destination unreachable ICMPv6 messages to issue in the time frame specified in *seconds* parameter.

Values 10 to 2000

seconds

Sets the time frame, in seconds, to limit the number of destination unreachable ICMPv6 messages issued per time frame.

Values 1 to 60

Platforms

7705 SAR Gen 2

31.24 untrusted

untrusted

Syntax

untrusted [**default-forwarding** *default-forwarding*]

no untrusted

Context

[Tree] (config>router>if untrusted)

Full Context

configure router interface untrusted

Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

Default

no untrusted

Parameters

default-forwarding

Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

Platforms

7705 SAR Gen 2

31.25 unzip

unzip

Syntax

unzip *source-file-url* [*dest-file-url*] **list**

unzip *source-file-url dest-file-url* [**create-destination**] [**force**]

Context

[Tree] (file unzip)

Full Context

file unzip

Description

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

Parameters

source-file-url, dest-file-url

Specifies the source or destination file URL.

Values

local-url	[*cflash-id*/]*file-path*
	200 chars max, including cflash-id
	directory length 99 chars max each

remote-url	{ftp | tftp}://[*login*:*pswd*@]
	remote-locn / [*file-path*]
	247 chars max, *file-path* 199 chars max
remote-locn	{*hostname* | *ipv4-address* | "["i*pv6-address*"]" }[:*port*]|
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1: | cf1-A: | cf2: | cf2-A: | cf3: | cf3-A:

create-destination

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

list

Lists the content of the ZIP file without performing the unzip operation.

force

Overwrites without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

Platforms

7705 SAR Gen 2

31.26 up

up

Syntax

up ip *seconds*

no up ip

up ipv6 *seconds*

no up ipv6

Context

[Tree] (config>service>vprn>nw-if>hold-time up)

[Tree] (config>service>vprn>if>hold-time up)

[Tree] (config>service>vpls>if>hold-time up)

Full Context

configure service ies interface hold-time up

configure service vprn network-interface hold-time up

configure service vprn interface hold-time up

configure service vpls interface hold-time up

Description

This command causes a delay in the deactivation of the associated IP interface by the specified number of seconds. The delay is invoked whenever the system attempts to bring the associated IP interface down.

The **no** form of this command removes the command from the active configuration and removes the delay in deactivating the associated IP interface. If the configuration is removed during a delay period, the currently running delay will continue until it expires.

Default

no up ip

Parameters

seconds

The time delay, in seconds, to make the interface operational.

Values 1 to 1200

Platforms

7705 SAR Gen 2

31.27 upa-lifetime

upa-lifetime

Syntax

upa-lifetime *upa-lifetime*

no upa-lifetime

Context

[Tree] (config>router>isis>upa upa-lifetime)

Full Context

configure router isis prefix-unreachable upa-lifetime

Description

This command configures the amount of time a UPA is advertised.

The **no** form of this command reverts to the default.

Default

180

Parameters

upa-lifetime

Specifies the amount of time, in seconds, the UPA is advertised.

Values 30 to 1800

Platforms

7705 SAR Gen 2

31.28 upa-metric

upa-metric

Syntax

upa-metric *upa-metric*

no upa-metric

Context

[Tree] (config>router>isis>upa upa-metric)

Full Context

configure router isis prefix-unreachable upa-metric

Description

This command configures a specific metric to an advertised UPA.

The **no** form of this command reverts to the default.

Default

4261412865

Parameters

upa-metric

Specifies the metric to an advertised UPA.

Values 4261412865 to 4294967294

Platforms

7705 SAR Gen 2

31.29 update

update

Syntax

update [**neighbor** *ip-address* | **group** *name*]

no update

Context

[Tree] (debug>router>bgp update)

Full Context

debug router bgp update

Description

This command decodes and logs all sent and received update messages in the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H

- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

7705 SAR Gen 2

Output

The following output is an example of debug router BGP update information.

Output Example

```
debug router bgp update
```

31.31 update-interval

update-interval

Syntax

update-interval *minutes* [**jitter** *seconds*]

no update-interval

Context

[Tree] (config>ipsec>rad-acct-plcy update-interval)

Full Context

configure ipsec radius-accounting-policy update-interval

Description

This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

Default

update-interval 10

Parameters

minutes

Specifies the interval in minutes.

Values 5 to 259200

seconds

Specifies the jitter as the number of seconds when the system sends each interim-update packet.

Values 0 to 3600

Platforms

7705 SAR Gen 2

31.32 update-key

update-key

Syntax

update-key card *cpm-slot* **serial-number** *cpm-serial-number* **confirmation-code** *code* **software-image** *file-url*

Context

[Tree] (admin>system>security>secure-boot update-key)

Full Context

admin system security secure-boot update-key

Description

This command updates secure boot keys.

Parameters

cpm-slot

Specifies the CPM slot.

Values A,B

cpm-serial-number

Specifies the CPM serial number, up to 256 characters.

code

Specifies the signed software confirmation code, up to 32 characters.

file-url

Specifies the URL for the software image.

Values [*local-url* | *remote-url*] (up to 180 characters)

where:

- *local-url* — [*cflash-id*/] [*file-path*]
  180 chars max, including *cflash-id*
  directory length 99 chars max each
- *remote-url* — [{ftp://| tftp://} *login*:*pswd*@*remote-locn*/][*file-path*]
  180 chars max
  directory length 99 chars max each
  where: *remote-locn* — [*hostname* | *ipv4-address* | *ipv6-address*]

  ipv4-address a.b.c.d

ipv6-address	x:x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface] x - [0..FFFF]H d - [0..255]D interface - 32 chars max, for link local addresses

31.33 update-timer

update-timer

Syntax

update-timer *seconds*

no update-timer

Context

[Tree] (config>router>rsvp>te-threshold-update update-timer)

Full Context

configure router rsvp te-threshold-update update-timer

Description

This command is to control timer-based IGP TE updates. Timer-based IGP updates can be enabled by specifying a non-zero time value. Default value of update-timer is 0.

The **no** form of this command should reset update-timer to the default value and disable timer-based IGP update.

Default

no update-timer

Parameters

seconds

Specifies the time in seconds.

Values 0 to 300

Platforms

7705 SAR Gen 2

31.34 updates

updates

Syntax

[**no**] **updates** [**neighbor** *ip-int-name* | *ip-address*]

Context

[Tree] (debug>router>rip updates)

Full Context

debug router rip updates

Description

This command enables debugging for RIP updates.

Parameters

ip-int-name* | *ip-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

updates

Syntax

[**no**] **updates** [**neighbor** *ip-int-name* | *ipv6-address*]

Context

[Tree] (debug>router>ripng updates)

Full Context

debug router ripng updates

Description

This command enables debugging for RIP updates.

Parameters

ip-int-name*| *ipv6-address

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

31.35 upstream-ip-filter

upstream-ip-filter

Syntax

upstream-ip-filter *filter-id*

no upstream-ip-filter

Context

[Tree] (config>router>nat>outside upstream-ip-filter)

[Tree] (config>service>vprn>nat>outside upstream-ip-filter)

Full Context

configure router nat outside upstream-ip-filter

configure service vprn nat outside upstream-ip-filter

Description

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

Default

no upstream-ip-filter

Parameters

filter-id

Specifies the identifier of an IP filter.

Platforms

7705 SAR Gen 2

31.36 url

url

Syntax

url *url*

no url

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note:
The URL must point to a DER encoded CRL.

Default

no url

Parameters

url

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms

7705 SAR Gen 2

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 url)

Full Context

configure system security pki ca-profile cmpv2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL is resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system tries to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system connects to the address in the management routing instance first, then the base routing instance.

Note:
If the service is VPRN, the system only allows HTTP ports 80 and 8080.

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id ***service-id***

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

service-name service-name

Identifies the service, up to 64 characters.

Platforms

7705 SAR Gen 2

31.37 url-entry

url-entry

Syntax

url-entry *entry-id* [**create**]

no url-entry *entry-id*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

Parameters

entry-id

Specifies a URL configured on this system.

Values 1 to 8

create

Creates an auto URL entry.

Platforms

7705 SAR Gen 2

configure service ies interface urpf-check

configure service vprn interface urpf-check

configure service vprn interface ipv6 urpf-check

configure service vprn network-interface urpf-check

configure service ies interface ipv6 urpf-check

Description

This command enables unicast RPF (uRPF) check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Default

no urpf-check

Platforms

7705 SAR Gen 2

urpf-check

Syntax

urpf-check

no urpf-check

Context

[Tree] (config>service>vprn>network>ingress urpf-check)

Full Context

configure service vprn network ingress urpf-check

Description

This command enables the unicast RPF (uRPF) check of network ingress traffic to include traffic associated with the VPRN if the incoming network interface is configured with the **urpf-selected-vprns** command

If the command is not configured, then traffic associated with this VPRN that arrives on a network interface with **urpf-selected-vprns** configured bypasses the uRPF checking options specified for that network interface.

Default

no urpf-check

Platforms

7705 SAR Gen 2

urpf-check

configure router interface urpf-check

configure router interface ipv6 urpf-check

Description

This command enables unicast RPF (uRPF) Check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Platforms

7705 SAR Gen 2

31.39 urpf-selected-vprns

urpf-selected-vprns

Syntax

[**no**] **urpf-selected-vprns**

Context

[Tree] (config>router>if urpf-selected-vprns)

Full Context

configure router interface urpf-selected-vprns

Description

This command enables uRPF checking of incoming traffic on the network interface for the following packets.

- Packets associated with the global routing table (base router) context.
- Packets associated with VPRNs that have enabled the uRPF check using the **config**>**service**>**vprn**>**network**> **ingress**>**urpf-check** command.

If the command is not configured, the default action is to perform uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** configuration options of the network interface.

Default

no urpf-selected-vprns

Platforms

7705 SAR Gen 2

31.40 use-arp

use-arp

[Tree] (config>service>vprn>if>dhcp use-arp)

Full Context

configure service ies interface dhcp use-arp

configure service vprn interface dhcp use-arp

Description

This command enables the use of ARP to determine the destination hardware address.

The **no** form of this command disables the use of ARP to determine the destination hardware address.

Platforms

7705 SAR Gen 2

31.41 use-bgp-routes

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>service>vprn>bgp>next-hop-res use-bgp-routes)

Full Context

configure service vprn bgp next-hop-resolution use-bgp-routes

Description

This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

Default

no use-bgp-routes

Platforms

7705 SAR Gen 2

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>router>bgp>next-hop-res use-bgp-routes)

Full Context

configure router bgp next-hop-resolution use-bgp-routes

Description

This command specifies whether to use BGP routes to recursively resolve the BGP next-hop of unlabeled IPv4 and unlabeled IPv6 routes. Up to four levels of recursion are supported.

The **no** form of this command reverts to the default behavior. By default, a BGP route is not resolvable by another BGP route.

Default

no use-bgp-routes

Platforms

7705 SAR Gen 2

use-bgp-routes

Syntax

use-bgp-routes

Context

[Tree] (config>router>bgp>next-hop-res>lbl-routes use-bgp-routes)

Full Context

configure router bgp next-hop-resolution labeled-routes use-bgp-routes

Description

Commands in this context configure labeled route options for next-hop resolution.

31.42 use-default-template

use-default-template

Syntax

[**no**] **use-default-template**

Context

[Tree] (config>service>vprn>aaa>rmt-srv>tacplus use-default-template)

[Tree] (config>system>security>tacplus use-default-template)

Full Context

configure service vprn aaa remote-servers tacplus use-default-template

configure system security tacplus use-default-template

Description

This command specifies whether the **user-template tacplus_default** is actively applied to the TACACS+ user. When enabled, some parameters of the **user-template tacplus_default** are actively applied to all users that authenticate via TACACS+. See the **user-template tacplus_default** command for more details.

When disabled, the parameters of the template are not applied to TACACS+ users, and TACACS+ users cannot connect to an SR OS router since the user access parameters are not available. In this case, TACACS+ can only be used for accounting.

Default

use-default-template

Platforms

7705 SAR Gen 2

use-default-template

Syntax

[**no**] **use-default-template**

Context

[Tree] (config>system>security>radius use-default-template)

[Tree] (config>service>vprn>aaa>rmt-srv>radius use-default-template)

Full Context

configure system security radius use-default-template

configure service vprn aaa remote-servers radius use-default-template

Description

This command specifies whether the RADIUS default user template is actively applied to the RADIUS user if no VSAs are returned with the auth-accept from the RADIUS server. When enabled, the radius_default user-template is actively applied if no VSAs are returned with the auth-accept from the RADIUS server and radius authorization is enabled.

The **no** form of this command disables the use of the RADIUS default template.

Default

no use-default-template

31.43 use-gi-address

use-gi-address

Syntax

use-gi-address [**scope** *scope*]

Context

[Tree] (config>router>dhcp>server use-gi-address)

[Tree] (config>service>vprn>dhcp>server use-gi-address)

Full Context

configure router dhcp local-dhcp-server use-gi-address

configure service vprn dhcp local-dhcp-server use-gi-address

Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

Parameters

scope

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

Platforms

7705 SAR Gen 2

31.44 use-leaked-routes

use-leaked-routes

Syntax

use-leaked-routes

Context

[Tree] (config>router>bgp>next-hop-res use-leaked-routes)

[Tree] (config>service>vprn>bgp>next-hop-res use-leaked-routes)

Full Context

configure router bgp next-hop-resolution use-leaked-routes

configure service vprn bgp next-hop-resolution use-leaked-routes

Description

Commands in this context configure the use of leaked static routes to resolve BGP next hops.

Platforms

7705 SAR Gen 2

31.45 use-link-address

use-link-address

Syntax

use-link-address [**scope** *scope*]

no use-link-address

Context

[Tree] (config>service>vprn>dhcp6>server use-link-address)

[Tree] (config>router>dhcp6>server use-link-address)

Full Context

configure service vprn dhcp6 local-dhcp-server use-link-address

configure router dhcp6 local-dhcp-server use-link-address

Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default

scope subnet

Parameters

scope

Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

Platforms

7705 SAR Gen 2

31.46 use-pool-from-client

use-pool-from-client

Syntax

use-pool-from-client delimiter *delimiter*

use-pool-from-client

no use-pool-from-client

Context

[Tree] (config>router>dhcp>server use-pool-from-client)

[Tree] (config>service>vprn>dhcp>server use-pool-from-client)

Full Context

configure router dhcp local-dhcp-server use-pool-from-client

configure service vprn dhcp local-dhcp-server use-pool-from-client

Description

This command enables the use of the pool indicated by DHCP client. When enabled, the IP address pool to be used by this server is the pool is indicated by the vendor-specific sub-option 13 of the DHCP option 82. When disabled or if there is no sub-option 13 in the DHCP message, the pool selection falls back to the **use-gi-address** configuration.

The **no** form of this command disables the use of the pool indicated by DHCP client.

Parameters

delimiter

A single ASCII character specifies the delimiter of separating primary and secondary pool names in Option82 VSO.

Platforms

7705 SAR Gen 2

31.47 use-virtual-mac

use-virtual-mac

Syntax

[**no**] **use-virtual-mac**

Context

[Tree] (config>service>vprn>router-advert>if use-virtual-mac)

Full Context

configure service vprn router-advertisement interface use-virtual-mac

Description

This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.

If the virtual router is not the master, no router advertisement messages are sent.

The **no** form of this command disables sending router advertisement messages.

Default

no use-virtual-mac

31.48 user

user

Syntax
[**no**] **user** *user-name*

Context
[Tree] (config>system>security user)

Full Context
configure system security user

Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

Parameters

user-name

Specifies the name of the user up to 32 characters.

Platforms

7705 SAR Gen 2

31.49 user-db

user-db

Syntax

user-db *local-user-db-name* [**create**]

no user-db

Context

[Tree] (config>router>dhcp>server user-db)

Full Context

configure router dhcp local-dhcp-server user-db

Description

This command configures a local user database for authentication.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the name of a user database, up to 32 characters.

create

Keyword used to create the user database. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

user-db

Syntax

user-db *local-user-db-name*

no user-db

Full Context

configure service vprn dhcp6 local-dhcp-server user-db

configure router dhcp6 local-dhcp-server user-db

Description

This command assigns a local user database for DHCP lease data lookup.

The **no** form of this command removes the configuration.

Default

no user-db

Parameters

local-user-db-name

Specifies the local user database name, up to 32 characters.

Platforms

7705 SAR Gen 2

31.50 user-ident

user-ident

Syntax

user-ident *user-ident*

no user-ident

Context

[Tree] (config>service>vprn>dhcp>server user-ident)

[Tree] (config>router>dhcp>server user-ident)

Full Context

configure service vprn dhcp local-dhcp-server user-ident

configure router dhcp local-dhcp-server user-ident

Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

Default

user-ident mac-circuit-id

Parameters

user-ident

Specifies the user identification method

Values **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.

circuit-id — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.

mac — Specifies to use the MAC address of the DHCPv4 client as the user identification method.

mac-circuit-id — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.

remote-id — Specifies to use the MAC address of the remote end as the user identification method.

Platforms

7705 SAR Gen 2

user-ident

Syntax

user-ident *user-ident*

no user-ident

Context

[Tree] (config>router>dhcp6>server user-ident)

[Tree] (config>service>vprn>dhcp6>server user-ident)

Full Context

configure router dhcp6 local-dhcp-server user-ident

configure service vprn dhcp6 local-dhcp-server user-ident

Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default

user-ident duid

Parameters

user-ident

Specifies the user identification method.

Values **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.

interface-id — Specifies the IPv6 interface-id option.

interface-id-link-local — Specifies the interface-id and link-local address.

Platforms

7705 SAR Gen 2

31.51 user-srlg-db

user-srlg-db

Syntax

user-srlg-db [**enable** | **disable**]

Context

[Tree] (config>router>mpls user-srlg-db)

Full Context

configure router mpls user-srlg-db

Description

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

Default

user-srlg-db disable

Platforms

7705 SAR Gen 2

31.52 user-template

user-template

Syntax

user-template {**tacplus_default** | **radius_default** | **ldap-default**}

Context

[Tree] (config>system>security user-template)

Full Context

configure system security user-template

Description

This command configures default security user template parameters.

Parameters

tacplus_default

Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the "profile" are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default

Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default

Specifies the default LDAP user template.

Platforms

7705 SAR Gen 2

31.53 usm-community

usm-community

Syntax

usm-community *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp usm-community)

Full Context

configure system security snmp usm-community

Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters

community-string

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**> **access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

31.54 util-stats-interval

util-stats-interval

Syntax

util-stats-interval *seconds*

Context

[Tree] (config>port>ethernet util-stats-interval)

Full Context

configure port ethernet util-stats-interval

Description

This command configures the interval used to calculate the utilization statistics.

Port utilization statistics are only available for physical Ethernet ports on a host system. These statistics are not available for the following:

- Ethernet ports on an Ethernet satellite
- PXC ports
- vsm-cca-xp ports

Parameters

seconds

Specifies the size of the interval, in seconds.

Values 30 to 600

Default 300

Platforms

7705 SAR Gen 2

32 v Commands

32.1 v4-routed-override-filter

v4-routed-override-filter

Syntax

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>egress v4-routed-override-filter)

Full Context

configure service ies interface vpls egress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to the VPLS endpoint, if configured.

Default

no v4-routed-override-filter

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

Platforms

7705 SAR Gen 2

v4-routed-override-filter

Syntax

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>ingress v4-routed-override-filter)

Full Context

configure service ies interface vpls ingress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to routed unicast ingress packets entering the VPLS or I-VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed. The IPv4 routed packets use any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface use the IPv4 ingress filter applied to the packets virtual port, when defined.

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

32.3 valid-lifetime

valid-lifetime

Syntax

valid-lifetime infinite

valid-lifetime [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no valid-lifetime

Context

[Tree] (config>service>vprn>dhcp6>local-dhcp-server>pool>prefix valid-lifetime)

[Tree] (config>router>dhcp6>server>pool>prefix valid-lifetime)

Full Context

configure service vprn dhcp6 local-dhcp-server pool prefix valid-lifetime

configure router dhcp6 local-dhcp-server pool prefix valid-lifetime

Description

This command configures the valid lifetime for the IPv6 prefix or address in the option.

The **no** form of this command reverts to the default.

Default

valid-lifetime days 1

Parameters

infinite

Sets the valid lifetime to infinite value.

valid-lifetime

Specifies the valid lifetime

Values	**days** *days*	0 to 49710
	hrs *hours*	0 to 23
	min *minutes*	0 to 59
	sec *seconds*	0 to 5

Platforms

7705 SAR Gen 2

valid-lifetime

Syntax

valid-lifetime {*seconds* | **infinite**}

no valid-lifetime

Context

[Tree] (config>service>vprn>router-advert>if>prefix valid-lifetime)

Full Context

configure service vprn router-advertisement interface prefix valid-lifetime

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

Values 0 to 429496729

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms

7705 SAR Gen 2

valid-lifetime

Syntax

valid-lifetime {*seconds* | **infinite**}

no valid-lifetime

Context

[Tree] (config>router>router-advert>if>prefix valid-lifetime)

Full Context

configure router router-advertisement interface prefix valid-lifetime

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms

7705 SAR Gen 2

32.4 validate

validate

Syntax

validate [*file-url*]

Context

[Tree] (admin>system>license validate)

Full Context

admin system license validate

Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.

- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

Values local-url, remote-url

Platforms

7705 SAR Gen 2

validate

Syntax

[**no**] **validate**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization validate)

Full Context

configure system security profile netconf base-op-authorization validate

Description

This command enables the NETCONF <validate> RPC.

The **no** form of this command disables the RPC.

Default

no validate

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

Platforms

7705 SAR Gen 2

validate

Syntax

validate software-image *file-url*

Context

[Tree] (admin>system>security>secure-boot validate)

Full Context

admin system security secure-boot validate

Description

This command validates the specified software image.

Parameters

file-url

Specifies the URL for the file.

Values [*local-url* | *remote-url*] (up to 180 characters)

where:

- *local-url* — [*cflash-id/*] [*file-path*]
  180 chars max, including *cflash-id*
  directory length 99 chars max each
- *remote-url* — [{ftp://| tftp://} *login*:*pswd*@*remote-locn/*][*file-path*]
  180 chars max
  directory length 99 chars max each
  where: *remote-locn* — [*hostname* | *ipv4-address* | *ipv6-address*]

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x - [0..FFFF]H
	d - [0..255]D
	interface - 32 chars max, for link local addresses
cflash-id	cf1:| cf1-A:| cf1-B:| cf2:| cf2-A:| cf2-B:| cf3:| cf3-A:| cf3-B:

Platforms

32.5 validate-next-hop

validate-next-hop

Syntax

[**no**] **validate-next-hop**

Context

[Tree] (config>service>vprn>static-route-entry>next-hop validate-next-hop)

Full Context

configure service vprn static-route-entry next-hop validate-next-hop

Description

This optional command tracks the state of the next hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next hop is not reachable and is removed from the ARP or Neighbor Cache, the next hop will no longer be considered valid and the associated static route state removed from the active route-table.

When the next hop is reachable again and present in the ARP/Neighbor Cache, the static route is considered valid and is subject to being placed into the active route-table.

Default

no validate-next-hop

Platforms

7705 SAR Gen 2

validate-next-hop

Syntax

[**no**] **validate-next-hop**

Context

[Tree] (config>router>static-route-entry>next-hop validate-next-hop)

Full Context

configure router static-route-entry next-hop validate-next-hop

Description

This optional command tracks the state of the next-hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next-hop is not reachable and is removed from the ARP or Neighbor Cache, the next-hop will no longer be considered valid and the associated static-route state removed from the active route-table.

When the next-hop is reachable again and present in the ARP/Neighbor Cache, the static route is considered valid and is subject to being placed into the active route-table.

Default

no validate-next-hop

32.6 vc-label

vc-label

Syntax

vc-label *egress-vc-label*

no vc-label [*egress-vc-label*]

Context

[Tree] (config>service>vprn>if>spoke-sdp>egress vc-label)

Full Context

configure service vprn interface spoke-sdp egress vc-label

Description

This command configures the egress VC label.

Parameters

vc-label

A VC egress value that indicates a specific connection.

Values 16 to 1048575

Platforms

7705 SAR Gen 2

vc-label

Syntax

vc-label *ingress-vc-label*

no vc-label [*ingress-vc-label*]

Context

[Tree] (config>service>vprn>if>spoke-sdp>ingress vc-label)

Full Context

configure service vprn interface spoke-sdp ingress vc-label

Description

This command configures the ingress VC label.

Parameters

vc-label

A VC ingress value that indicates a specific connection.

Values 2048 to 18431

Platforms

7705 SAR Gen 2

vc-label

Syntax

vc-label *egress-vc-label*

no vc-label [*egress-vc-label*]

Context

[Tree] (config>service>vpls>spoke-sdp>egress vc-label)

[Tree] (config>service>ies>if>spoke-sdp>egress vc-label)

Full Context

configure service vpls mesh-sdp egress vc-label

configure service vpls spoke-sdp egress vc-label

configure service ies interface spoke-sdp egress vc-label

Description

This command configures the static MPLS VC label used by this device to send packets to the far-end device in this service via this SDP.

Parameters

egress-vc-label

Specifies a VC egress value that indicates a specific connection.

Values 16 to 1048575

Platforms

7705 SAR Gen 2

vc-label

Syntax

vc-label *ingress-vc-label*

no vc-label [*ingress-vc-label*]

Context

[Tree] (config>service>vpls>mesh-sdp>ingress vc-label)

[Tree] (config>service>vpls>spoke-sdp>ingress vc-label)

[Tree] (config>service>ies>if>spoke-sdp>ingress vc-label)

Full Context

configure service vpls mesh-sdp ingress vc-label

configure service vpls spoke-sdp ingress vc-label

configure service ies interface spoke-sdp ingress vc-label

Description

This command configures the static MPLS VC label used by the far-end device to send packets to this device in this service via this SDP.

Parameters

ingress-vc-label

A VC ingress value that indicates a specific connection.

Values 2048 to 18431

Platforms

7705 SAR Gen 2

vc-label

Syntax

vc-label *egress-vc-label*

no vc-label [*egress-vc-label*]

Context

[Tree] (config>mirror>mirror-dest>spoke-sdp>egress vc-label)

[Tree] (config>mirror>mirror-dest>remote-src>spoke-sdp>egress vc-label)

Full Context

configure mirror mirror-dest spoke-sdp egress vc-label

configure mirror mirror-dest remote-source spoke-sdp egress vc-label

Description

This command configures the spoke SDP egress VC label.

The **no** form of this command removes the egress VC label value from the configuration.

Parameters

egress-vc-label

Specifies a VC egress value that indicates a specific connection.

Values 16 to 1048575

Platforms

7705 SAR Gen 2

vc-label

Syntax

vc-label *ingress-vc-label*

no vc-label [*ingress-vc-label*]

configure service vprn ip-mirror-interface spoke-sdp ingress vc-label

Description

This command configures the spoke SDP ingress VC label.

Parameters

vc-label

Specifies the VC ingress value that indicates a specific connection.

Values 32 to 18431

Platforms

7705 SAR Gen 2

32.7 vc-type

vc-type

Syntax

vc-type {**ether** | **vlan**}

Context

[Tree] (config>service>pw-template vc-type)

Full Context

configure service pw-template vc-type

Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

Platforms

7705 SAR Gen 2

32.8 ve-id

ve-id

Syntax

ve-id *value*

no ve-id

Context

[Tree] (config>service>epipe>bgp-vpws>ve-name ve-id)

[Tree] (config>service>epipe>bgp-vpws>remote-ve-name ve-id)

Full Context

configure service epipe bgp-vpws ve-name ve-id

configure service epipe bgp-vpws remote-ve-name ve-id

Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

Values 1 to 65535

Platforms

7705 SAR Gen 2

ve-id

Syntax

ve-id *ve-id-value*

no ve-id

Context

[Tree] (config>service>vpls>bgp-vpls>ve-name ve-id)

Full Context

configure service vpls bgp-vpls ve-name ve-id

Description

This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

Values 1 to 65535

Platforms

7705 SAR Gen 2

32.9 ve-name

ve-name

Syntax

[**no**] **ve-name** *name*

Context

[Tree] (config>service>epipe>bgp-vpws ve-name)

Full Context

configure service epipe bgp-vpws ve-name

Description

This command configures the name of the local VPWS instance in this service.

The **no** form of this command removes the ve-name.

Parameters

name

Specifies a site name up to 32 characters in length.

Platforms

7705 SAR Gen 2

ve-name

Syntax

ve-name *name*

no ve-name

Context

[Tree] (config>service>vpls>bgp-vpls ve-name)

Full Context

configure service vpls bgp-vpls ve-name

Description

This command creates or edits a ve-name. Just one ve-name can be created per BGP VPLS instance.

The **no** form of this command removes the configured ve-name from the bgp vpls node. It can be used only when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-name configured.

Default

no ve-name

Parameters

name

Specifies the A character string to identify the VPLS Edge instance up to 32 characters in length

Platforms

7705 SAR Gen 2

32.10 vendor-id

vendor-id

Syntax

vendor-id *vendor-id*

no vendor-id

Context

[Tree] (config>system>ned>profile vendor-id)

Full Context

configure system network-element-discovery profile vendor-id

Description

This command configures the vendor ID to be advertised.

The **no** form of this command reverts to the default value.

Default

vendor-id "Nokia"

Parameters

vendor-id

Specifies the vendor ID to be advertised with the profile, up to 255 characters.

Platforms

7705 SAR Gen 2

32.11 vendor-specific-option

vendor-specific-option

Syntax

Full Context

configure service vpls sap igmp-snooping version

configure service vpls spoke-sdp mld-snooping version

configure service vpls spoke-sdp igmp-snooping version

configure service vpls mesh-sdp mld-snooping version

configure service vpls mesh-sdp igmp-snooping version

configure service vpls sap mld-snooping version

Description

This command specifies the version of IGMP or MLD which is running on this SAP or SDP. This object can be used to configure a router capable of running either value. For IGMP or MLD to function correctly, all routers on a LAN must be configured to run the same version of IGMP or MLD on that LAN.

When the **send-query** command is configured, all type of queries generate ourselves are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Parameters

version

Specifies the IGMP or MLD version

Values 1, 2, 3

Platforms

7705 SAR Gen 2

version

Syntax

version *version*

no version

Context

[Tree] (config>service>vprn>igmp>if version)

Full Context

configure service vprn igmp interface version

Description

This command specifies the IGMP version. If routers run different versions of IGMP, they will negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version. For IGMP to function correctly, all routers on a LAN should be configured to run the same version of IGMP on that LAN.

For IGMPv3, a multicast router that is also a group member performs both parts of IGMPv3, receiving and responding to its own IGMP message transmissions as well as those of its neighbors.

Default

version 3

Parameters

version

Specifies the IGMP version number.

Values 1, 2, 3

Platforms

7705 SAR Gen 2

version

Syntax

version *version*

no version

Context

[Tree] (config>service>vprn>mld>if version)

candidate view

Description

This command displays the candidate configuration along with line numbers that can be used for editing the candidate configuration.

Parameters

line

Displays the candidate configuration starting at the point indicated by the following options (the display is not limited to the current CLI context/branch).

Values line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'

first	keyword - first line
edit-point	keyword - current edit point
last	keyword - last line that is not 'exit'

Platforms

7705 SAR Gen 2

view

Syntax

view [*checkpoint-id* | **rescue** | **latest-rb**]

Context

[Tree] (admin>rollback view)

Full Context

admin rollback view

Description

This command displays the checkpoint.

Parameters

latest-rb

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

checkpoint-id

Indicates rollback checkpoint file to be viewed. Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

Values 1 to 9

rescue

Displays the rescue configuration.

Platforms

7705 SAR Gen 2

view

Syntax

view {**bootup-cfg** | **active-cfg** | **candidate-cfg** | **latest-rb**| *checkpoint-id* | **rescue**}

Context

admin view

Description

The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the **admin** context.

Parameters

bootup-cfg

Specifies the bootup configuration.

active-cfg

Specifies current running configuration.

candidate-cfg

Specifies candidate configuration.

latest-rb

Specifies the latest configuration.

checkpoint-id

Specifies a specific checkpoint file configuration.

Values 1 to 9

rescue

Specifies a rescue checkpoint configuration.

Platforms

7705 SAR Gen 2

view

Syntax

view *view-name* **subtree** *oid-value*

no view *view-name* [**subtree** *oid-value*]

Context

[Tree] (config>system>security>snmp view)

Full Context

configure system security snmp view

Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

Parameters

view-name

Specifies a view name, up to 32 characters.

oid-value

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

32.15 virtual-link

virtual-link

Syntax

[**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context

[Tree] (config>service>vprn>ospf>area virtual-link)

[Tree] (config>service>vprn>ospf3>area virtual-link)

Full Context

configure service vprn ospf area virtual-link

configure service vprn ospf3 area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default

No virtual link is defined.

Parameters

router-id

The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area ***area-id***

The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

7705 SAR Gen 2

virtual-link

Syntax

[**no**] **virtual-link** *router-id* **transit-area** *area-id*

Context

[Tree] (config>router>ospf3>area virtual-link)

[Tree] (config>router>ospf>area virtual-link)

Full Context

configure router ospf3 area virtual-link

configure router ospf area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

By default, no virtual link is defined.

Default

no virtual-link

Parameters

router-id

Specifies the router ID of the virtual neighbor in IP address dotted-decimal notation.

area-id

Specifies the area-id that identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

7705 SAR Gen 2

32.16 virtual-neighbor

virtual-neighbor

Syntax

virtual-neighbor [*router-id*]

no virtual-neighbor

Context

[Tree] (debug>router>ospf virtual-neighbor)

[Tree] (debug>router>ospf3 virtual-neighbor)

Full Context

debug router ospf virtual-neighbor

debug router ospf3 virtual-neighbor

Description

This command enables debugging for an OSPF virtual neighbor.

Parameters

router-id

Specifies the router ID of the virtual neighbor.

Platforms

7705 SAR Gen 2

32.17 vlan

vlan

Syntax

vlan [*vlan-encap*]

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters

vlan-encap

Specifies the node cc VLAN IP.

Platforms

7705 SAR Gen 2

32.18 vlan-aware-bundle

vlan-aware-bundle

Syntax

vlan-aware-bundle *name* [**eth-tag** *value*]

no vlan-aware-bundle

Context

[Tree] (config>service>vpls>bgp-evpn vlan-aware-bundle)

Full Context

configure service vpls bgp-evpn vlan-aware-bundle

Description

This command configures a name that is used to group a bundle of VPLS services (Broadcast Domains) that are part of the same VLAN-aware bundle instance. This name is optional and allows the user to execute **show** commands that are relevant to all the Broadcast Domains in a VLAN-aware bundle service group.

The optional Ethernet Tag ID can be encoded in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service.

When the Ethernet Tag ID is set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes.

On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received Ethernet Tag ID field and processes only routes whose Ethernet Tag ID matches the local VLAN-aware bundle Ethernet Tag value.

The **no** form of this command removes the configuration.

Parameters

name

Specifies the VLAN-aware bundle name, up to 32 characters.

value

Specifies the Ethernet Tag ID.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

32.19 vlan-range

vlan-range

Syntax

[**no**] **vlan-range** [*vlan-range*]

Context

[Tree] (config>service>vpls>stp>mst-instance vlan-range)

Full Context

configure service vpls stp mst-instance vlan-range

Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

Parameters

vlan-range

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

Platforms

7705 SAR Gen 2

vlan-range

Syntax

vlan-range *from* [**to** *to*]

no vlan-range *from*

Context

[Tree] (config>connection-profile-vlan vlan-range)

Full Context

configure connection-profile-vlan vlan-range

Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters

from

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

to

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

Platforms

7705 SAR Gen 2

32.20 vlan-vc-etype

vlan-vc-etype

Syntax

vlan-vc-etype *ethernet-type*

no vlan-vc-etype [*ethernet-type*]

Context

[Tree] (config>service>sdp vlan-vc-etype)

Full Context

configure service sdp vlan-vc-etype

Description

This command configures the VLAN VC EtherType.

The **no** form of this command returns the value to the default.

Default

no vlan-vc-etype

Parameters

ethernet-type

Specifies a valid VLAN etype identifier.

Values 0x0600 to 0xffff

Platforms

7705 SAR Gen 2

32.21 vlan-vc-tag

vlan-vc-tag

Syntax

vlan-vc-tag *vlan-id*

no vlan-vc-tag [*vlan-id*]

Context

[Tree] (config>service>vpls>spoke-sdp vlan-vc-tag)

[Tree] (config>service>vpls>mesh-sdp vlan-vc-tag)

Full Context

configure service vpls spoke-sdp vlan-vc-tag

configure service vpls mesh-sdp vlan-vc-tag

Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default

no vlan-vc-tag

Parameters

vlan-id

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms

7705 SAR Gen 2

vlan-vc-tag

Syntax

vlan-vc-tag *tag*

no vlan-vc-tag *tag*

Context

[Tree] (config>service>epipe>spoke-sdp vlan-vc-tag)

Full Context

configure service epipe spoke-sdp vlan-vc-tag

Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default

no vlan-vc-tag

Parameters

tag

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms

7705 SAR Gen 2

vlan-vc-tag

Syntax

vlan-vc-tag *vlan-id*

no vlan-vc-tag

Context

7705 SAR Gen 2

32.22 vpls

vpls

Syntax

vpls *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**b-vpls** | **i-vpls**] [**etree**] [**name** *name*]

no vpls *service-id*

Context

[Tree] (config>service vpls)

Full Context

configure service vpls

Description

This command creates or edits a Virtual Private LAN Services (VPLS) instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

Parameters

service-id

Specifies unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

vpn vpn-id

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number

Values 1 to 2147483647

Default null (0)

create

Keyword used to create the service ID. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

m-vpls

Specifies a management VPLS

e-tree

Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

b-vpls | i-vpls

Creates a backbone-vpls or ISID-vpls

name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

Platforms

7705 SAR Gen 2

vpls

Syntax

vpls *service-name*

no vpls

Context

[Tree] (config>service>ies>if vpls)

Full Context

configure service ies interface vpls

Description

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters

service-name

The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

Platforms

32.23 vpls-group

vpls-group

Syntax

vpls-group *vpls-group-id* [**create**]

no vpls-group *vpls-group-id*

Context

[Tree] (config>service>vpls vpls-group)

Full Context

configure service vpls vpls-group

Description

This command defines a vpls-group index. Multiple vpls-group commands can be specified to allow the use of different VPLS and SAP templates for different ranges of service ids. A vpls-group can be deleted only in shutdown state. Multiple commands under different vpls-group ids can be issued and can be in progress at the same time.

Default

no vpls-group

Parameters

vpls-group-id

Specifies the ID associated with the VPLS group

Values 1 to 4094

Platforms

7705 SAR Gen 2

32.24 vpls-id

vpls-id

Syntax

vpls-id *vpls-id*

Context

[Tree] (config>service>vpls>bgp-ad vpls-id)

Full Context

configure service vpls bgp-ad vpls-id

Description

This command configures the VPLS ID component that is signaled in one of the extended community attributes (*ext-comm*).

Values and format (6 bytes, other 2 bytes of type-subtype is automatically generated)

Parameters

vpls-id

Specifies a globally unique VPLS ID for BGP auto-discovery in this VPLS service

Values vpls-id: <ip-addr:comm-val>| <as-number:ext-comm-val>
ip-addr: a.b.c.d
comm-val: [0 to 65535]
as-number: [1 to 65535]
ext-comm-val: [0 to 4294967295]

Platforms
7705 SAR Gen 2

32.25 vpls-sap-template

vpls-sap-template

Syntax
vpls-sap-template *name/id* **create**
[**no**] **vpls-sap-template** *name/id*

Context
[Tree] (config>service>template vpls-sap-template)

Full Context
configure service template vpls-sap-template

Description
This is the command used to create a SAP template to be used in a vpls-template. Only certain existing VPLS SAP attributes can be changed in the vpls-sap-template, not in the instantiated VPLS SAP

The following SAP attributes are set in the instantiated saps (no configuration allowed):

description: "Sap <sap-id> controlled by MVRP service <svc id>" – auto generated

shutdown: no shutdown

Parameters
name/id

Specifies the name in ASCII or the template ID

Values 1 to 2147483647

Platforms
7705 SAR Gen 2

32.26 vpls-template

vpls-template

Syntax

vpls-template *name/id* **create**

[**no**] **vpls-template** *name/id*

Context

[Tree] (config>service>template vpls-template)

Full Context

configure service template vpls-template

Description

This command is used to create a vpls-template to be used to auto-instantiate a range of VPLS services. Only certain existing VPLS attributes specified in the command reference section can be changed in the vpls-template, not in the instantiated VPLS. The following attributes are automatically set in the instantiated VPLSs (no template configuration necessary) and the operator cannot change these values.

vpn-id: none

description: "Service <svc id> auto-generated by control VPLS <svc-id>”

service-name: "Service <svc id>” (Auto-generated)

shutdown: no shutdown

Following existing attributes can be set by the user in the instantiated VPLSs:

[no] sap

All the other VPLS attributes are not supported.

Parameters

name/id

Specifies the name in ASCII or the template ID

Values name: ASCII string

Values ID: [1 to 2147483647]

Platforms

7705 SAR Gen 2

32.27 vpls-template-binding

vpls-template-binding

Syntax

vpls-template-binding *name/id*

no vpls-template-binding

Context

[Tree] (config>service>vpls>vpls-group vpls-template-binding)

Full Context

configure service vpls vpls-group vpls-template-binding

Description

This command configures the binding to a VPLS template to be used to instantiate pre-provisioned data VPLS using as input variables the service IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related VPLS instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group id is in no shutdown state. Any changes to the vpls-template-binding require the vpls-group to be in shutdown state.

Default

no vpls-template-binding

Parameters

name/id

Specifies the name or the ID of the VPLS template

Values 1 to 1024

Platforms

7705 SAR Gen 2

[Tree] (config>router>bgp vpn-apply-import)

Full Context

configure router bgp group vpn-apply-import

configure router bgp group neighbor vpn-apply-import

configure router bgp vpn-apply-import

Description

This command causes the base instance BGP import route policies to be applied to vpn-ipv4/6, mvpn-ipv4/6, l2-vpn, mdt-safi, mcast-vpn-ipv4, and evpn routes.

The **no** form of this command disables the application of the base instance BGP import route policies to vpn-ipv4/6, mvpn-ipv4/6, l2-vpn, mdt-safi, mcast-vpn-ipv4, and evpn routes.

Default

no vpn-apply-import

Platforms

7705 SAR Gen 2

32.30 vpn-domain

vpn-domain

Syntax

vpn-domain [*type* {**0005** | **0105** | **0205** | **8005**}] **id** *id*

no vpn-domain

Context

[Tree] (config>service>vprn>ospf vpn-domain)

Full Context

configure service vprn ospf vpn-domain

Description

This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vprn>ospf3** context.

This command is not supported in OSPF3.

Default

no vpn-domain

Parameters

id

Specifies the OSPF VPN domain in the "xxxx.xxxx.xxxx" format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

type

Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

Values 0005, 0105, 0205, 8005

7705 SAR Gen 2

32.31 vpn-family-policy

vpn-family-policy

Syntax

vpn-family-policy *policy-name*

no vpn-family-policy

Context

[Tree] (config>router>bgp>next-hop-resolution vpn-family-policy)

Full Context

configure router bgp next-hop-resolution vpn-family-policy

Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

  In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default

no vpn-family-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

Platforms

7705 SAR Gen 2

32.32 vpn-gre-source-ip

vpn-gre-source-ip

Syntax

vpn-gre-source-ip *ip-address*

no vpn-gre-source-ip

Context

[Tree] (config>service>system vpn-gre-source-ip)

Full Context

configure service system vpn-gre-source-ip

Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters

ip-address

Specifies the IPv4 address (a.b.c.d).

Platforms

7705 SAR Gen 2

32.33 vpn-ipv4

vpn-ipv4

Syntax

vpn-ipv4 send *send-limit* **receive** [**none**]

Full Context

configure router bgp group add-paths vpn-ipv4

configure router bgp add-paths vpn-ipv4

configure router bgp group neighbor add-paths vpn-ipv4

Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default

no vpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

Values 1 to 16, none, multipaths

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

Platforms

7705 SAR Gen 2

configure router bgp group add-paths vpn-ipv6

configure router bgp add-paths vpn-ipv6

configure router bgp group neighbor add-paths vpn-ipv6

Description

This command configures the add-paths capability for VPN-IPv6 routes. By default, add-paths is not enabled for VPN-IPv6 routes.

The maximum number of paths per VPN-IPv6 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv6 routes, causing sessions established using add-paths for VPN-IPv6 to go down and come back up without the add-paths capability.

Default

no vpn-ipv6

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv6 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all

of the used BGP multipaths for each VPN-IPv6 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

Values 1 to 16, none, multipaths

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv6 routes with its peers.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv6 routes with its peers.

vpn-tag

Syntax

vpn-tag *vpn-tag*

no vpn-tag

Context

[Tree] (config>service>vprn>ospf vpn-tag)

Full Context

configure service vprn ospf vpn-tag

Description

This command specifies the route tag for an OSPF VPN on a PE router. This field is set in the tag field of the OSPF external LSAs generated by the PE. This is mainly used to prevent routing loops. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance.

This command is not supported in OSPF3.

Default

vpn-tag 0

Platforms

7705 SAR Gen 2

32.36 vprn

vprn

Syntax

vprn *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]

no vprn *service-id*

Context

[Tree] (config>service vprn)

Full Context

configure service vprn

Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters

service-id

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service

of any type. The *service-id* must be the same number used for every 7705 SAR Gen 2 router on which this service is defined.

Values
service-id: 1 to 2147483648
svc-name: 64 characters maximum

customer-id

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name name

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

create

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

vprn

Syntax

Full Context

configure router mpls lsp vprn-auto-bind

configure router mpls lsp-template vprn-auto-bind

Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default

vprn-auto-bind include

Parameters

include

Allows an associated LSP to be used by auto-bin for vprn services

exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

Platforms

7705 SAR Gen 2

32.39 vprn-local

vprn-local

Syntax

vprn-local [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-local)

Full Context

configure router ttl-propagate vprn-local

Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default

vprn-local vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Platforms

7705 SAR Gen 2

32.40 vprn-network-exceptions

vprn-network-exceptions

Syntax

vprn-network-exceptions *number seconds*

no vprn-network-exceptions

Context

[Tree] (config>system>security vprn-network-exceptions)

Full Context

configure system security vprn-network-exceptions

Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters

number

Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds

Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

Platforms

7705 SAR Gen 2

32.41 vprn-transit

vprn-transit

Syntax

vprn-transit [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-transit)

Full Context

configure router ttl-propagate vprn-transit

Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]

- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

Default

vprn-transit vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Full Context

configure service vprn bgp-ipvpn mpls vrf-export

configure service vprn bgp-evpn mpls vrf-export

Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **configure router policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

Default

no vrf-export

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

configure service vprn bgp-ipvpn mpls vrf-import

configure service vprn bgp-evpn mpls vrf-import

Description

This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **configure router policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

Note:
Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

Default

no vrf-import

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

Full Context

configure service vprn bgp-ipvpn mpls vrf-target

configure service vprn bgp-evpn mpls vrf-target

Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default

no vrf-target

Parameters

ext-comm

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}	
	ip-addr:	a.b.c.d
	comm-val:	[0 to 65535]
	2byte-asnumber:	[0 to 65535]

ext-comm-val: [0 to 4294967295]

4byte-asnumber: [0 to 4294967295]

import *ext-community*

Specifies communities allowed to be received from remote PE neighbors.

export *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

[Tree] (config>service>ies>if vrrp)

Full Context

configure service ies interface ipv6 vrrp

configure service ies interface vrrp

Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

no vrrp *virtual-router-id*

Context

[Tree] (config>service>vprn>if vrrp)

Full Context

configure service vprn interface vrrp

Description

This command creates or edits a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. One, both, or none may be defined as owner. The nodal context of **vrrp** *virtual-router-id* is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shut down in order to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a new virtual router ID or one that can be modified on the IP interface.

Values 1 to 255

owner

Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. Once created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Identifies this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operational-up), or the **init** state (if the interface is operational-down). The **passive** keyword is not required when entering the *vrid* for editing purposes. Once a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with specified operation group.

Context

[Tree] (config>router>if vrrp)

[Tree] (config>router>if>ipv6 vrrp)

Full Context

configure router interface vrrp

configure router interface ipv6 vrrp

Description

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

Parameters

virtual-router-id

The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

32.46 vsi-export

vsi-export

Syntax

vsi-export *policy-name* [*policy-name*]

no vsi-export

Context

[Tree] (config>service>vpls>bgp vsi-export)

Full Context

configure service vpls bgp vsi-export

Description

This command specifies the name of the VSI export policies to be used for BGP EVPN, BGP auto discovery, BGP VPLS, BGP VPWS, and BGP multi-homing if these features are configured in this VPLS service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

Default

no vsi-export

Parameters

policy-name

Specifies up to five policy names, up to 32 characters.

Platforms

7705 SAR Gen 2

7705 SAR Gen 2

33.2 watermarks

watermarks

Syntax

watermarks high *percentage-high* **low** *percentage-low*

no watermarks

Context

[Tree] (config>router>nat>outside>pool watermarks)

[Tree] (config>service>vprn>nat>outside>pool watermarks)

Full Context

configure router nat outside pool watermarks

configure service vprn nat outside pool watermarks

Description

This command configures the watermarks for ports or port-block utilization in a NAT pool.

For CGN and L2-aware NAT, the port and port-block watermarks are used to monitor ports or port-block utilization in a NAT pool. High and low thresholds are configured in percentages of total available port-blocks or ports per protocol in a pool.

For LSN44 pools with flexible port allocation, the watermarks represent the port utilization per outside IP address if paired address pooling is enabled. If an arbitrary address pooling is enabled, then the watermarks represent the port utilization per pool.

For port-block based pools where flexible port allocation is disabled, the watermarks represent port-block occupancy per pool. These watermarks cover combined initial and extended port-blocks in a NAT pool. If the extended port blocks are not enabled in L2-aware NAT, then the L2-aware pool contains only the initial port-blocks.

For the system to generate those events, the NAT event ID is configured as follows:

- 2001 is enabled for L2-aware pools which do not use l2-aware port-block-extensions
- 2003 is enabled for port-blocks based LSN pools
- 2044 is enabled for L2-aware pools which use l2aware port-block-extension
- 2046 is enabled for port based LSN pools for flexible-port-allocation

Event IDs are enabled via log event control configuration.

Default

no watermarks

Parameters

high percentage-high

Specifies the high percentage.

Values 1 to 100

low percentage-low

Specifies the low percentage.

Values 0 to 99

33.3 weekday

weekday

Syntax

weekday {*weekday-number* [..*weekday-number*] | *day-name* [..*day-name*] | **all**}

no weekday

Context

[Tree] (config>system>cron>sched weekday)

Full Context

configure system cron schedule weekday

Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default

no weekday

Parameters

weekday-number

Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name

Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

all

Specifies all days of the week.

Platforms

7705 SAR Gen 2

33.4 weight

weight

Syntax

weight *weight*

no weight

Context

[Tree] (conf>router>segment-routing>sr-policies>policy>seg-list weight)

Full Context

configure router segment-routing sr-policies static-policy segment-list weight

Description

This command associates a weight value with a segment list of a statically-defined segment routing policy to achieve weighted ECMP behavior. Weight is an optional parameter.

When any segment-list in the active policy has a weight greater than 1, traffic matching the policy is load-balanced across the segment lists according to their relative weight values.

The **no** form of this command reverts to the default value.

Default

weight 1

Parameters

weight

Specifies the weight value.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

33.5 weight-down

weight-down

Syntax

[**no**] **weight-down** *lag-ports-down-weight*

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context

configure vrrp policy priority-event lag-port-down weight-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no weight-down

Parameters

lag-ports-down-weight

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64 (for 64-link capable LAGs)

1 to 32 (for other LAGs)

Full Context

configure service vpls bgp-evpn ip-route-link-bandwidth weighted-ecmp

configure service vprn bgp-evpn mpls evpn-link-bandwidth weighted-ecmp

Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP prefix route in the VPRN route table.

Flows to an IP prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

Default

no weighted-ecmp

Platforms

7705 SAR Gen 2

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>service>vprn weighted-ecmp)

Full Context

configure service vprn weighted-ecmp

Description

This command enables weighted load-balancing for IS-IS, OSPF, and static ECMP routes in the VPRN instance. Weighted ECMP can be performed when all next hops are configured with non-zero load-balancing weights. Weighted ECMP support for IS-IS, OSPF, and static ECMP routes applies to both IPv4 and IPv6.

The **no** form of this command restores regular ECMP spraying of packets to IS-IS, OSPF and static route destinations.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

Full Context

configure router ldp weighted-ecmp

Description

This command enables weighted ECMP on LDP using RSVP LSPs or SR-TE LSPs. LDP labeled packets are sprayed across the RSVP or SR-TE LSP ECMP in proportion to the configured **load-balancing-weight** of LSPs.

The **no** form of this command removes weighted ECMP.

Default

no weighted-ecmp

Platforms

7705 SAR Gen 2

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>router weighted-ecmp)

Full Context

configure router weighted-ecmp

Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

weighted-ecmp

Syntax

[**no**] **weighted-ecmp**

Context

[Tree] (config>service>sdp weighted-ecmp)

Full Context

configure service sdp weighted-ecmp

Description

This command enables weighted ECMP on an SDP. When weighted ECMP is enabled, packets from services using the SDP are sprayed across LSPs in the ECMP set to the SDP far end according to the outcome of the hash algorithm and the configured load-balancing weight of each LSP.

The **no** version of this command disables weighted ECMP for next-hop tunnel selection.

Default

no weighted-ecmp

Platforms

7705 SAR Gen 2

weighted-ecmp

Syntax

[**no**] **weighted-ecmp**

Context

[Tree] (config>router>bgp>next-hop-res weighted-ecmp)

Full Context

configure router bgp next-hop-resolution weighted-ecmp

Description

This command enables weighted ECMP for next-hop tunnel selection for 6PE. When weighted ECMP is enabled, the RSVP-TE tunnel used to forward 6PE packets to the ECMP next hop is chosen according to the outcome of the hash on the packet at the normalized load-balancing weight of the tunnel.

The **no** version of this command disables weighted ECMP for next-hop tunnel selection for 6PE.

Default

no weighted-ecmp

33.7 wide-metrics-only

wide-metrics-only

Syntax

[**no**] **wide-metrics-only**

Context

[Tree] (config>service>vprn>isis>level wide-metrics-only)

Full Context

configure service vprn isis level wide-metrics-only

Description

This command enables the exclusive use of wide metrics in the LSPs for the level number. Narrow metrics can have values between 1 and 63. IS-IS can generate two TLVs, one for the adjacency and one for the

IP prefix. In order to support traffic engineering, wider metrics are required. When wide metrics are used, a second pair of TLVs are added, again, one for the adjacency and one for the IP prefix.

By default, both sets of TLVs are generated. When wide-metrics-only is configured, IS-IS only generates the pair of TLVs with wide metrics for that level.

The **no** form of this command reverts to the default value.

Platforms

7705 SAR Gen 2

33.8 width

width

Syntax
width *width*

Context
[Tree] (environment>terminal width)

Full Context
environment terminal width

Description
This command determines display terminal width.

Default
width 80

Parameters
width
Sets the width of the display terminal.

Values 1 to 512

Platforms
7705 SAR Gen 2

width

Syntax
width *width*

Context
[Tree] (config>system>management-interface>cli>md-cli>environment>console width)

Full Context
configure system management-interface cli md-cli environment console width

Description

This command configures the set number of columns displayed on the console.

Default

width 80

Parameters

width

Specifies the number of columns displayed in the console window.

Values 80 to 512

Platforms

7705 SAR Gen 2

33.9 window-size

window-size

Syntax

window-size *seconds*

no window-size

Context

[Tree] (config>port>ethernet>crc-monitor window-size)

Full Context

configure port ethernet crc-monitor window-size

Description

This command specifies sliding window size over which the Ethernet frames are sampled to detect signal fail or signal degrade conditions. The command is used jointly with the sf-threshold and the sd-threshold to configure the sliding window size.

The **no** version of this command reverts to the default value of 10 seconds.

Default

no window-size

Parameters

seconds

The size of the sliding window in seconds over which the errors are measured.

Values 5 to 60

Platforms
7705 SAR Gen 2

33.10 wrap-around

wrap-around

Syntax
[**no**] **wrap-around**

Context
[Tree] (config>filter>log wrap-around)

Full Context
configure filter log wrap-around

Description
This command configures a memory filter log to log until full or to store the most recent log entries (circular buffer).

Specifying **wrap-around** configures the memory filter log to store the most recent filter log entries (circular buffer). When the log is full, the oldest filter log entries are overwritten with new entries.

The **no** form of the command configures the memory filter log to accept filter log entries until full. When the memory filter log is full, filter logging for the log filter ID ceases.

Default
wrap-around

33.11 wred-queue

wred-queue

Syntax
wred-queue [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]

no wred-queue

Context

[Tree] (config>qos>sap-egress>queue wred-queue)

Full Context

configure qos sap-egress queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

Default native

slope-usage

Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

Platforms

no wred-queue

Context

[Tree] (config>qos>qgrps>egr>qgrp>queue wred-queue)

Full Context

configure qos queue-group-templates egress queue-group queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the

pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

Default exceed-low

33.12 write

write

Syntax

write {*user-name* | *broadcast*} *message*

Context

[Tree] (write)

Full Context

write

Description

This command sends a console message to a specific user or to all users with active console sessions.

Parameters

user-name

Specifies the name of a user, up to 32 characters, with an active console session to which to send a console message.

Values any valid CLI username

broadcast

Sends the *message-string* to all users logged into the router.

message

Specifies the message string to send. Allowed values are any string, up to 256 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

Platforms

7705 SAR Gen 2

33.13 write-algorithm

write-algorithm

Syntax

write-algorithm {**hash** | **hash2** | **custom** | **cleartext**}

no write-algorithm

Context

[Tree] (config>system>security>management-interface>classic-cli write-algorithm)

Full Context

configure system security management-interface classic-cli write-algorithm

Description

This command specifies how encrypted configuration secrets are output from the system. For example, how encrypted secrets are displayed in the output of the info command, and how they are written to the saved configuration file.

The **no** form of this command reverts to the default value.

Default

write-algorithm hash2

Parameters

hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the read-algorithm should be **hash** as well.

hash2

Specifies hash2 which is module-specific.

custom

Specifies the custom encryption to management interface.

cleartext

Specifies that the phrase is displayed as cleartext everywhere.

xc

Syntax

xc [**detail**]

no xc

Context

[Tree] (debug>router>mpls>event xc)

Full Context

debug router mpls event xc

Description

This command debugs cross connect events.

The **no** form of the command disables the debugging.

Parameters

detail

Displays detailed information about cross connect events.

Platforms

7705 SAR Gen 2

34.2 xgig

xgig

Syntax

xgig {**lan** | **wan**}

Context

[Tree] (config>port>ethernet xgig)

Full Context

configure port ethernet xgig

Description

This command configures a 10 Gb/s interface to be in Local or Wide Area Network (LAN or WAN) mode. When configuring the port to be in WAN mode certain SONET/SDH parameters can be changed to reflect the SONET/SDH requirements for this port.

When the port is configured for LAN mode, all SONET/SDH parameters are pre-determined and not configurable.

Default

xgig lan

Parameters

lan

Sets the port to operate in LAN mode.

wan

Sets the port to operate in WAN mode.

Platforms

7705 SAR Gen 2

35 y Commands

35.1 yang-modules

yang-modules

Syntax

yang-modules

Context

[Tree] (config>system>management-interface yang-modules)

Full Context

configure system management-interface yang-modules

Description

Commands in this context configure YANG module parameters.

The **yang-modules** settings affect the data sent in a NETCONF <hello>, data populated in the RFC 6022 /netconf-state/schemas list, data returned in a <get-schema> request, and data populated in the RFC 8525 /yang-library. See the *7705 SAR Gen 2 System Management Guide*, sections "NETCONF Monitoring" and "YANG Library" for more information.

36 z Commands

36.1 zone

zone

Syntax

zone {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]

no zone

Context

[Tree] (config>system>time zone)

Full Context

configure system time zone

Description

This command sets the time zone and/or time zone offset for the device.

The SR OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default

zone UTC 00

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

non-std-zone-name

Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm]

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59

Default hours: 0 minutes: 0
