configure service epipe spoke-sdp shutdown

configure service cpipe shutdown

configure service cpipe sap shutdown

configure service epipe site shutdown

configure service epipe shutdown

configure service epipe sap shutdown

configure service cpipe spoke-sdp shutdown

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described as follows in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

Platforms

7705 SAR Gen 2

- configure service epipe spoke-sdp shutdown
- configure service epipe shutdown
- configure service epipe sap shutdown
- configure service epipe site shutdown

7705 SAR-Hx, 7705 SAR-Mx

- configure service cpipe sap shutdown
- configure service cpipe spoke-sdp shutdown
- configure service cpipe shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>epipe>bgp-vpws shutdown)

Full Context

configure service epipe bgp-vpws shutdown

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command administratively enables/disables the local BGP VPWS instance. On de-activation an MP-UNREACH-NLRI is sent for the local NLRI.

The **no** form of this command enables the BGP VPWS addressing and the related BGP advertisement. The associated BGP VPWS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane.

Default

shutdown

Platforms

7705 SAR Gen 2

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vpls>bgp-vpls shutdown)

Full Context

configure service vpls bgp-vpls shutdown

Description

This command administratively enables/disables the local BGP VPLS instance. On de-activation an MP-UNREACH-NLRI must be sent for the local NLRI.

The **no** form of this command enables the BGP VPLS addressing and the related BGP advertisement. The associated BGP VPLS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane. RT, RD usage: same as in the BGP AD solution, if the values are not configured here, the value of the VPLS-id from under the bgp-ad node is used. If VPLS-id value is not configured either the MH site cannot be activated – i.e. no shutdown returns an error. Same applies if a pseudowire template is not specified under the BGP node.

Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

Default

no shutdown

Platforms

7705 SAR Gen 2

shutdown

Context

[Tree] (file shutdown)

Full Context

file shutdown

Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [**active**] [**standby**] command to enable one or both CPM.

Use the **no shutdown** [*cflash-id*] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

Note:
The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

LED Status Indicators

Table 91: LED Status Indicators lists the possible states for the compact flash and their LED status indicators.

Table 91: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. **Note:** Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

State	Description
	down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

Default

no shutdown

Parameters

cflash-id

Specifies the compact flash slot ID to be shut down or enabled. If *cflash-id* is specified, the drive is shut down or enabled. If no *cflash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

Values cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

Default the current compact flash device

active

Specifies that all drives on the active CPM are shutdown or enabled.

standby

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command puts an entity into the administratively enabled state.

Default

no shutdown

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>system>snmp shutdown)

Full Context

configure system snmp shutdown

Description

This command administratively disables SNMP agent operations. System management can then only be performed using the command line interface (CLI). Shutting down SNMP does not remove or change configuration parameters other than the administrative state. This command does not prevent the agent from sending SNMP notifications to any configured SNMP trap destinations. SNMP trap destinations are configured under the **config>log>snmp-trap-group** context.

This command is automatically invoked in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof persist on** command is enabled.

The **no** form of the command administratively enables SNMP which is the default state.

Default

no shutdown

configure system ptp peer shutdown

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command administratively disables the PTP peer. Disabling a peer sends cancel unicast negotiation messages on any established unicast sessions. When disabled, all received packets from the peer are ignored.

If the **clock-type** is **ordinary slave** or **boundary**, and PTP is enabled, the last enabled peer cannot be disabled. This prevents the user from having PTP enabled without any peer configured and enabled.

The **no** form of this command administratively enables the PTP peer.

Default

no shutdown

Platforms

7705 SAR-Hx, 7705 SAR-Mx

shutdown

Syntax

[**no**] **shutdown**

Context

[Tree] (config>service>vprn>ipt shutdown)

[Tree] (config>service>ies>ipt shutdown)

Full Context

configure service vprn ip-transport shutdown

configure service ies ip-transport shutdown

Description

This command shuts down the IP transport service.

When the IP transport is **shutdown**, all TCP or UDP packets received from other remote hosts are dropped, and any serial data received from the serial port is dropped. Any TCP connections that are up are closed and no new TCP connection requests are accepted.

When the **no shutdown** command is configured for the IP transport service, it becomes operationally up, serial data from the serial port is encapsulated into TCP or UDP packets destined for remote hosts as determined by the IP transport service, and TCP or UDP packets can be received by the local host where raw serial data is sent out the serial port.

To make configuration changes to an IP transport service, users must configure **no shutdown** first.

Default

shutdown

28 s Commands – Part II

28.1 sid

sid

Syntax

sid label *value*

Context

[Tree] (config>router>isis>segm-rtng>adjacency-set sid)

[Tree] (config>router>ospf>segm-rtng>adjacency-set sid)

Full Context

configure router isis segment-routing adjacency-set sid

configure router ospf segment-routing adjacency-set sid

Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

Parameters

label *value*

Specifies the value of adjacency SID label.

Values 18432 to 524287 | 1048575 (FP4 only)

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

28.2 sid-map

sid-map

Syntax

sid-map node-sid {**index** *value* [**range** *value*]} **prefix** {{*ip-address*/*mask*} | {*ip-address*} {*netmask*}} [**set-flags** {**s**}] [**level** { **1** | **2** | **1/2**}] [**clear-n-flag**]

no sid-map node-sid index *value*

Context

[Tree] (config>router>isis>segm-rtng>mapping-server sid-map)

Full Context

configure router isis segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Parameters

index

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 4294967295

value

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

Values 0 to 65535

ip-address/mask

Specifies the IP address and mask.

Values *ip-address:* **a.b.c.d.** (host bits must be 0)

mask: **0 to 32**

ip-address netmask

Specifies the IP address netmask.

Values **a.b.c.d.** (network bits all 1 and host bits all 0)

set-flags

Specifies the flooding scope of the SID/Label binding TLV.

Default **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

level {1 | 2| 1/2}

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

Default 1/2

clear-n-flag

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

Platforms

7705 SAR Gen 2

sid-map

Syntax

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sid-map node-sid index *index-value* [**range** *range-value*] **prefix** *ip-addressImask* [*netmask*] **scope** {**area** *area-id* | **as**}

no sid-map node-sid index *index-value*

Context

[Tree] (config>router>ospf>segm-rtng>mapping-server sid-map)

Full Context

configure router ospf segment-routing mapping-server sid-map

Description

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

Note:
SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

Default

no prefix-sid-range

Parameters

index *index-value*

Specifies the index.

Values 0 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

range *range-value*

Specifies the range.

Values 1 to 65535

prefix *ip-address/mask*

Specifies the IP address in dotted decimal notation.

Values ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

netmask

Specifies the netmask.

Values netmask — a.b.c.d (network bits all 1 and host bits all 0)

area *area-id*

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

Values ip-address | 0 to 4294967295

Platforms

28.4 signal-mode

signal-mode

Syntax

signal-mode {**cas**}

no signal-mode

Context

[Tree] (config>port>tdm>e1 signal-mode)

Full Context

configure port tdm e1 signal-mode

Description

This command configures CAS at the port levels. When enabled, control signals (such as those for synchronizing and bounding frames) are carried in the same channels as voice and data signals. Individual channel groups within the E1 port inherit this state and cannot be changed.

If the signal mode for an E1 port is configured for CAS, any new channel groups default to CAS. The signal mode must be configured for CAS before a creating a Cpipe service that supports E1 with CAS.

The **no** form of this command disables all 64 kb/s channels within the port for CAS.

Default

signal-mode cas

Parameters

cas

Keyword to specify the channel associated signaling.

Platforms

7705 SAR-Hx, 7705 SAR-Mx

28.5 signaling

signaling

Syntax

signaling *signaling*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>epipe>spoke-sdp-fec signaling)

Full Context

configure service epipe spoke-sdp-fec signaling

Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAII has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAII has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAII and TAII of the spoke SDP, as previously described.

Default

signaling auto

Parameters

signaling

Configures this router as the active T-PE for signaling this MS-PW.

Values auto, master

Platforms

7705 SAR Gen 2

signaling

Syntax

signaling {**off** | **tldp** | **bgp**}

Context

[Tree] (config>service>sdp signaling)

Full Context

configure service sdp signaling

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

Note:
If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

Default

signaling tldp

Parameters

off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

significant-change

Syntax

significant-change *delta*

no significant-change

Context

[Tree] (config>log>acct-policy>cr significant-change)

Full Context

configure log accounting-policy custom-record significant-change

Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

Default

significant-change 0

Parameters

delta

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

Values 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

28.14 site-min-down-timer

site-min-down-timer

Syntax

site-min-down-timer *seconds*

no site-min-down-timer

Context

[Tree] (config>redundancy>bgp-multi-homing site-min-down-timer)

Full Context

configure redundancy bgp-multi-homing site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

Default

no site-min-down-timer

Parameters

seconds

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 1 to 100

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>vpls>site site-min-down-timer)

Full Context

configure service vpls site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the s**ite-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Values 0 to 100 seconds

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

site-min-down-timer

Syntax

site-min-down-timer *min-down-time*

no site-min-down-timer

Context

[Tree] (config>service>epipe>site site-min-down-timer)

Full Context

configure service epipe site site-min-down-timer

Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The preceding operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the s**ite-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to default value.

Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

Parameters

min-down-time

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

Platforms

7705 SAR Gen 2

28.18 slice-size

slice-size

Syntax

slice-size *slice-size*

no slice-size

Context

[Tree] (config>mirror>mirror-dest slice-size)

Full Context

configure mirror mirror-dest slice-size

Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

Parameters

slice-size

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

Values 128 to 9216

Platforms

7705 SAR Gen 2

configure system security management-access-filter mac-filter entry match snap-oui

Description

This command configures an IEEE 802.3 LLC SNAP Ethernet Frame OUI zero or non-zero value to be used as a MAC filter match criterion.

The **no** form of this command removes the criterion from the match criteria.

Default

no snap-oui

Parameters

zero

Specifies to match packets with the three-byte OUI field in the SNAP-ID set to zero.

non-zero

Specifies to match packets with the three-byte OUI field in the SNAP-ID not set to zero.

28.21 snap-pid

snap-pid

Syntax

snap-pid *snap-pid*

no snap-pid

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match snap-pid)

Full Context

configure qos sap-ingress mac-criteria entry match snap-pid

Description

Configures an IEEE 802.3 LLC SNAP Ethernet frame PID value to be used as a service ingress QoS policy match criterion.

This is a 2-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the 3-byte OUI field.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **snap-pid** match criteria is independent of the OUI field within the SNAP header. Two packets with different 3-byte OUI fields, but the same PID field, will both match the same policy entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

Default

no snap-pid

Parameters

snap-pid

The 2-byte snap-pid value to be used as a match criterion in hexadecimal.

Values 0x0000 to 0xFFFF

Platforms

7705 SAR Gen 2

28.23 snmp-trap-group

snmp-trap-group

Syntax

snmp-trap-group *log-id* | *log-name* [**name** *log-name*]

no snmp-trap-group *log-id* | *log-name*

Context

[Tree] (config>service>vprn>log snmp-trap-group)

Full Context

configure service vprn log snmp-trap-group

Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log-id, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

Parameters

log-id | *log-name*

Specifies the log ID or name (up to 32 characters).

Values *log-id*: 1 to 100

name *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

Platforms

7705 SAR Gen 2

28.24 snoop

snoop

Syntax

[**no**] **snoop**

Context

[Tree] (config>service>vpls>spoke-sdp>dhcp snoop)

[Tree] (config>service>vpls>mesh-sdp>dhcp snoop)

[Tree] (config>service>vpls>sap>dhcp snoop)

Full Context

configure service vpls spoke-sdp dhcp snoop

configure service vpls mesh-sdp dhcp snoop

configure service vpls sap dhcp snoop

Description

This command enables snooping of DHCP or DHCP6 messages on the SAP or SDP. Enabling DHCP or DHCP6 snooping on interfaces (SAPs and SDP bindings) is required where DHCP or DHCP6 messages important to lease state table population are received, or where Option 82 information is to be inserted. This includes interfaces that are in the path to receive messages from either DHCP or DHCP6 servers or from subscribers.

The **no** form of this command disables DHCP or DHCP6 snooping on the specified SAP or SDP binding.

Default

no snoop

28.25 sntp

sntp

Syntax

[**no**] **sntp**

Context

[Tree] (config>system>time sntp)

Full Context

configure system time sntp

Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

Default

sntp

Platforms

7705 SAR Gen 2

socket

Syntax

socket [**neighbor** *ip-address* | **group** *name*]

no socket

Context

[Tree] (debug>router>bgp socket)

Full Context

debug router bgp socket

Description

This command logs all TCP socket events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

Platforms

7705 SAR Gen 2

configure service vpls sap igmp-snooping static group source

configure service vpls mesh-sdp igmp-snooping static group source

Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

Parameters

ip-address

Specifies the IPv4 unicast address

src-ipv6-address

Specifies the IPv6 unicast address.

Platforms

7705 SAR Gen 2

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>service>vprn>if>sap>ip-tunnel source)

[Tree] (config>service>ies>if>sap>ip-tunnel source)

Full Context

configure service vprn interface sap ip-tunnel source

configure service ies interface sap ip-tunnel source

Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

Default

no source

Parameters

ip-address

Specifies an IPv4 address or an IPv6 address.

Values

ipv4-address	a.b.c.d	
ipv6-address		x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

source

Syntax

source *ip-address*

no source

Context

[Tree] (config>oam-pm>session>ip source)

Full Context

configure oam-pm session ip source

Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

Parameters

source

Indicates the launch point.

ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d

Context

[Tree] (config>oam-pm>session>eth source)

Full Context

configure oam-pm session ethernet source

Description

This command configures the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active; however, the frames sent and received and seen under the **show oam-pm statistics session** *session-name* command are zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name* should be used.

The **no** form of this command removes this session parameter.

Parameters

mep-id

Specifies the maintenance association endpoint identifier of the launch point.

Values 1 to 8191

md-index

Specifies the maintenance domain (MD) index value of the launch point. The **domain-name** *admin-name* parameter is preferred for specifying the domain information.

Values 1 to 4294967295

ma-index

Specifies the maintenance association (MA) index value of the launch point. The **association-name** *admin-name* parameter is preferred for specifying the association information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 4294967295

admin-name

Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

Platforms

7705 SAR Gen 2

[Tree] (config>aaa>radius-srv-plcy>servers source-address)

Full Context

configure aaa radius-server-policy servers source-address

Description

This command configures the source address of the RADIUS packet. The system IP address must be configured in order for the RADIUS client to work. See "Configuring a System Interface" in the *7705 SAR Gen 2 Router Configuration Guide*.

Note:
The system IP address must only be configured if the source-address is not specified. When the no source-address command is executed, the source address is determined at the moment the request is sent. This address is also used in the *nas-ip-address* attribute: over there it is set to the system IP address if no source-address was given.

The **no** form of this command reverts to the default value.

Parameters

ip-address

Specifies the source address of RADIUS packet.

Context

[Tree] (config>system>security source-address)

Full Context

configure system security source-address

Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the 7705 SAR Gen 2 or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

source-address

Syntax

source-address *ip-address*

source-address prefix-list *prefix-list-name*

no source-address

Context

[Tree] (config>router>policy-options>policy-statement>entry>from source-address)

Full Context

configure router policy-options policy-statement entry from source-address

Description

This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

Default

no source-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-address

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x:x
- x:x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

prefix-list-name

The prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

source-address

Syntax

source-address *ip-address*

no source-address

Context

[Tree] (config>router>ldp>lsp-bfd source-address)

Full Context

configure router ldp lsp-bfd source-address

Description

This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, an alternate routable IP address that is local to the source node should be used.

Default

no source-address

Parameters

ip-address

Specifies a routable IPv4 or IPv6 address that is local to the node.

Values *ipv4-address* — a.b.c.d

ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x — 0 to FFFF in hexadecimal

d — 0 to 255 in decimal

source-port

Syntax

source-port *port-id*

no source-port

Context

[Tree] (config>system>sync-if-timing>ref2 source-port)

[Tree] (config>system>sync-if-timing>ref1 source-port)

Full Context

configure system sync-if-timing ref2 source-port

configure system sync-if-timing ref1 source-port

Description

This command configures the source port for timing reference **ref1** or **ref2**. If the port is unavailable or the link is down, the reference sources are reevaluated according to the reference order configured in the **ref-order** command.

There are platform-based restrictions on the source port locations for **ref1** and **ref2**. See the *7705 SAR Gen 2 Basic System Configuration Guide* for more information.

The **no** form of this command removes the source port.

Default

no source-port

Parameters

port-id

Specifies the physical port to use as the source port.

Values *slot*/*mda*/*port*

Platforms

7705 SAR-Hx, 7705 SAR-Mx

source-udp-port

Syntax

source-udp-port *udp-port-number*

no source-udp-port

Context

[Tree] (config>oam-pm>session>ip source-udp-port)

Full Context

configure oam-pm session ip source-udp-port

Description

This command should only be used when the source UDP port for the session-sender twamp-test packet must be specified.

The **no** form of this command means the session-sender automatically assigns the source UDP port from the available dynamic (private) UDP range.

Parameters

udp-port-number

Specifies the UDP source port.

Values 64374 to 64383

Platforms

7705 SAR Gen 2

28.32 sp-reverse-route

sp-reverse-route

Syntax

sp-reverse-route [**ignore-default-route**]

no sp-reverse-route

Context

[Tree] (config>ipsec>tnl-temp sp-reverse-route)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure ipsec tunnel-template sp-reverse-route

Description

This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

Default

no sp-reverse-route

Parameters

ignore-default-route

Specifies to ignore any full range traffic selector in TSi.

Platforms

7705 SAR Gen 2

28.33 space

space

Syntax

[**no**] **space**

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>command-completion space)

Full Context

configure system management-interface cli md-cli environment command-completion space

Description

This command enables completion on the space character.

The **no** form of this command reverts to the default value.

Default

space

7705 SAR Gen 2

28.34 spe-address

spe-address

Syntax

spe-address *global-id:prefix*

no spe-address

Context

[Tree] (config>service>pw-routing spe-address)

Full Context

configure service pw-routing spe-address

Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 AII type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

Default

no spe-address

Parameters

global-id

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

Values <global-id:prefix>: <global-id>:{<prefix>| <ipaddress>}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

global-id	1 to 4294967295
prefix	1 to 4294967295
ipaddress	a.b.c.d

special-char

Syntax

special-char *value*

no special-char

Context

[Tree] (config>port>serial>rs232>socket>rx>eop special-char)

Full Context

configure port serial rs232 socket rx eop special-char

Description

This command configures a special character that, if received on the serial port, signals the end of a packet, triggering the previously received (and queued) characters to be packetized and sent over an IP transport IES or VPRN service.

There are other delimiting parameters within the EOP context. The first condition met signals the EOP.

The **no** form of this command disables checking for a special character.

Default

no special-char

Parameters

value

Specifies the special character, in decimal or hexadecimal form, that triggers the EOP.

Values 0 to 255
0x00 to 0xFF

speed

Syntax

speed {**10** | **100** | **1000** | **10000** | **25000** | **40000** | **50000** | **100000**}

Context

[Tree] (config>port>ethernet speed)

Full Context

configure port ethernet speed

Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

Default

dependent on port type

Parameters

10

Sets the link to 10 Mb/s speed.

100

Sets the link to 100 Mb/s speed.

1000

Sets the link to 1000 Mb/s speed.

10000

Sets the link to 10000 Mb/s speed.

Context

[Tree] (config>port>serial>rs232 speed)

Full Context

configure port serial rs232 speed

Description

This command configures the speed of the interface. The speed also determines the DS0 timeslots assigned to the channel group.

Default

speed 9600

Parameters

600

Keyword to set the link speed to 600 b/s.

1200

Keyword to set the link speed to 1200 b/s.

2400

Keyword to set the link speed to 2400 b/s.

4800

Keyword to set the link speed to 4800 b/s.

9600

Keyword to set the link speed to 9600 b/s.

19200

Keyword to set the link speed to 19200 b/s.

38400

Keyword to set the link speed to 38400 b/s.

57600

Keyword to set the link speed to 57600 b/s (supported on RS-232 raw sockets only).

115200

Keyword to set the link speed to 115200 b/s (supported on RS-232 raw sockets only).

28.38 spf-wait

spf-wait

Syntax

spf-wait *spf-wait* [**spf-initial-wait** *initial-wait*] [**spf-second-wait** *second-wait*]

no spf-wait

Context

[Tree] (config>service>vprn>isis>timers spf-wait)

Full Context

configure service vprn isis timers spf-wait

Description

This command configures the maximum interval, in milliseconds, between two consecutive SPF calculations. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs are controlled with this command.

Subsequent SPF runs (if required) occur at exponentially increasing intervals of the **spf-second-wait** interval. For example, if the **spf-second-wait** interval is 1000, the next SPF will run after 2000 milliseconds, and the next SPF after 4000 milliseconds, and so on, until it reaches the **spf-wait** value. The SPF interval remains at the **spf-wait** value until no more SPF runs are scheduled in that interval. After a full interval without any SPF runs, the SPF interval drops back to the **spf-initial-wait** value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

The **no** form of this command reverts to the default value.

Default

spf-wait 10000 spf-initial-wait 1000 spf-second-wait 1000

Parameters

spf-wait

Specifies the maximum interval, in milliseconds, between two consecutive SPF calculations.

Values 10 to 120000

initial-wait

Specifies the initial SPF calculation delay, in milliseconds, after a topology change.

Values 10 to 100000

second-wait

Specifies the hold time, in milliseconds, between the first and second SPF calculation.

Values 10 to 100000

[Tree] (config>service>vprn>bgp>group>neighbor split-horizon)

[Tree] (config>service>vprn>bgp>group split-horizon)

Full Context

configure service vprn bgp split-horizon

configure service vprn bgp group neighbor split-horizon

configure service vprn bgp group split-horizon

Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Caution:
Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

no split-horizon

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn rip group split-horizon

configure service vprn ripng group split-horizon

configure service vprn ripng split-horizon

configure service vprn rip group neighbor split-horizon

configure service vprn rip split-horizon

Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

Default

split-horizon enable

Parameters

enable

Enables split horizon and poison reverse.

disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level

Full Context

configure router bgp group neighbor split-horizon

configure router bgp group split-horizon

configure router bgp split-horizon

Description

This command enables the use of split-horizon. Split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

Default

no split-horizon

Full Context

configure router rip split-horizon

configure router ripng group split-horizon

configure router ripng split-horizon

configure router ripng group neighbor split-horizon

configure router rip group split-horizon

configure router rip group neighbor split-horizon

Description

This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default

enabled

Parameters

enable

Specifies enable split horizon and poison reverse.

disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

28.41 split-horizon-group

split-horizon-group

Syntax

split-horizon-group [*group-name*] [**residential-group**] [**create**]

Context

[Tree] (config>service>vpls split-horizon-group)

Full Context

configure service vpls split-horizon-group

Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

Default

A split horizon group is by default not created as a residential-group.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

Platforms

7705 SAR Gen 2

split-horizon-group

split-horizon-group *name*

no split-horizon-group

Context

[Tree] (config>service>vpls>bgp-evpn>mpls split-horizon-group)

Full Context

configure service vpls bgp-evpn mpls split-horizon-group

Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

Context

[Tree] (config>service>pw-template split-horizon-group)

Full Context

configure service pw-template split-horizon-group

Description

This command creates a new split horizon group (SGH).

Comparing a "residential" SGH and a "regular" SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

Parameters

group-name

Specifies the name of the split horizon group to which the SDP belongs.

residential-group

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported

© 2026 Nokia.

28.42 spoke-sdp

spoke-sdp

Syntax

spoke-sdp *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] **[**[**no-endpoint**]

spoke-sdp *sdp-id*[**:***vc-id*] [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] **[**[**endpoint**]

no spoke-sdp *sdp-id*[**:***vc-id*]

Context

[Tree] (config>service>vpls spoke-sdp)

Full Context

configure service vpls spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is treated like a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port where the traffic was received.

The SDP operational state determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

To associate an SDP with a VPLS service, the SDP must be predefined in the **configure service sdp** context . If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* exists, a binding is created between that *sdp-id* and the service.

SDPs must be explicitly associated and bound to a service; otherwise, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected. After the binding is removed, no packets are forwarded to the far-end router.

Default

No *sdp-id* is bound to a service.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

sdp-id

Specifies the SDP identifier.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier.

Values 1 to 4294967295

vc-type

Keyword that overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value that represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. Changing the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values **ether** – Keyword used to define the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined, the default is Ethernet for spoke-SDP bindings. Defining Ethernet is the same as executing **no vc-type**, and restores the default VC type for the spoke-SDP binding.

vlan – Keyword used to define the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined, the default is Ethernet for spoke-SDP bindings. The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and if a tag is present, strips one dotQ tag from traffic received on the pseudowire.

Note: The system expects a symmetrical configuration with its peer. Specifically, it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions may not function for asymmetrical configurations as they would for symmetrical configurations, resulting in unexpected behavior.

Default ether

group-name

Specifies the name of the split horizon group to which the SDP belongs

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

endpoint

Keyword that specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

no-endpoint

Keyword that removes the association of a spoke-SDP with an explicit endpoint name.

Platforms

7705 SAR Gen 2

spoke-sdp

Syntax

Context

[Tree] (config>service>vprn>if spoke-sdp)

[Tree] (config>service>ies>if spoke-sdp)

Full Context

configure service vprn interface spoke-sdp

configure service ies interface spoke-sdp

Description

This command binds a service to an existing service destination point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an IES service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down first before it can be deleted from the configuration.

configure service epipe spoke-sdp

Description

This command binds a service to an existing SDP. A spoke SDP is equivalent to a traditional bridge "port", where flooded traffic received on the spoke SDP is replicated on all other "ports" (including other spoke and mesh SDPs or SAPs), and not transmitted on the port on which it was received.

The SDP has an operational state that determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

To associate an SDP with an Epipe, VPLS, VPRN, or VPRN service, the SDP must be predefined in the **configure service sdp** context. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* exists, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated with and bound to a service; otherwise, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected. After it is removed, no packets are forwarded to the far-end router.

Parameters

sdp-id

Specifies the SDP identifier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 17407

vc-id

Specifies the virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs, however, it must be configured.

Values 1 to 4294967295

vc-type

Keyword that specifies the VC type, which overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value that represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the **dot1q** value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

Values ethernet

ether

Keyword used to specify the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. If the VC type is not defined, the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type**; it restores the default VC type for the spoke SDP binding.

vlan

Keyword used to specify the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined, the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer. Specifically, it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions may not function for asymmetrical configurations as they would for symmetrical configurations, resulting in unexpected behavior.

no-endpoint

Keyword used to remove the association of a spoke SDP with an explicit endpoint name.

endpoint-name

Specifies the name of the service endpoint.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

icb

Keyword used to specify the spoke SDP as an inter-chassis backup SDP binding.

Context

[Tree] (config>mirror>mirror-dest>remote-source spoke-sdp)

[Tree] (config>mirror>mirror-dest spoke-sdp)

Full Context

configure mirror mirror-dest remote-source spoke-sdp

configure mirror mirror-dest spoke-sdp

Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, r**emote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (mirror-dest>encap).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

Parameters

sdp-id:vc-id

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

Values 1 to 17407

no-endpoint

Removes the association of a SAP or a SDP with an explicit endpoint name.

name

Specifies the name of the endpoint associated with the SAP.

icb

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

Default Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

Description

This command binds a service to an existing service destination point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

Parameters

spoke-sdp-fec-id

An unsigned integer value identifying the spoke SDP.

Values 1 to 4294967295

fec-type

An unsigned integer value for the type of the FEC used by the MS-PW.

Values 129 to 130

aii-type

An unsigned integer value for the Attachment Individual Identifier (AII) type used to identify the MS-PW endpoints.

Values 1 to 2

endpoint-name

Specifies the name of the service endpoint.

no endpoint

Adds or removes a spoke SDP association.

icb

Configures the spoke SDP as an inter-chassis backup SDP binding.

Context

[Tree] (config>service>vprn>pim spt-switchover-threshold)

Full Context

configure service vprn pim spt-switchover-threshold

Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

Parameters

grp-ip-address

Specifies the multicast group address.

grp-ipv6-address

Specifies the multicast group address.

prefix-length

Specifies the address prefix length.

Values	grp-ipv6-address	: x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
	prefix-length	[1 to 128]

mask

Defines the mask of the multicast-ip-address.

Values 4 to 32

netmask

The subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

spt-switchover-threshold

Syntax

spt-switchover-threshold {*grp-ipv4-prefix*|*ipv4-prefix-length* | *grp-ipv4-prefix netmask* | *grp-ipv6-prefix*|*ipv6-prefix-length*} *spt-threshold*

no spt-switchover-threshold {*grp-ipv4-prefix*|*ipv4-prefix-length* | *grp-ipv4-prefix netmask* | *grp-ipv6-prefix*|*ipv6-prefix-length*}

Context

[Tree] (config>router>pim spt-switchover-threshold)

Full Context

configure router pim spt-switchover-threshold

Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

Parameters

grp-ipv4-prefix

Specifies the group IPv4 multicast address in dotted decimal notation.

Values a.b.c.d

ipv4-prefix-length

Specifies the length of the IPv4 prefix.

Values 4 to 32

netmask

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

Values a.b.c.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

grp-ipv6-prefix

Specifies the group IPv6 multicast address in hexadecimal notation.

Values xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

ipv6-prefix-length

Specifies the length of the IPv6 prefix.

Values 8 to 128

spt-threshold

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

Values 1 to 4294967294, infinity

28.47 sr-label-index

sr-label-index

Syntax

sr-label-index {*value* | *param-name*} [**prefer-igp**]

no sr-label-index

Context

[Tree] (config>router>policy-options>policy-statement>entry>action sr-label-index)

[Tree] (config>router>policy-options>policy-statement>default-action sr-label-index)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router policy-options policy-statement entry action sr-label-index

configure router policy-options policy-statement default-action sr-label-index

Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

Note:
Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

Default

no sr-label-index

Parameters

value

Specifies the BGP segment routing label index to associate with the matched route or routes.

Values 0 to 52487

param-name

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

prefer-igp

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

Full Context

configure router mpls-labels sr-labels

Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

Default

no sr-labels

Parameters

start-value

Specifies the start label value in the SRGB

Values 18432 to 524287 | 1048575

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

end-value

Specifies the end label value in the SRGB

Values 18432 to 524287 | 1048575

The label value is selectable within the dynamic label range which begins anywhere from 32 to 18432 (default).

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter sr-policy

Description

This command selects the tunnel type for the SR policy.

The **sr-policy** value instructs BGP to search for an SR policy with a non-null endpoint and color value that matches the BGP next hop and color extended community value of the EVPN route.

The **no** form of this command disables the SR policy setting for the auto-bind tunnel.

Default

no sr-policy

configure saa test type-multi-line lsp-ping sr-policy

Description

This command configures the SR policy target FEC.

Note:
The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

Parameters

color *color*

Specifies the color ID.

Values 0 to 4294967295

endpoint *ip-address*

Specifies the endpoint address.

Values
ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d

Description

This command enables support for SR-TE PCE-initiated LSPs.

The **no** form of this command removes SR-TE PCE-initiated LSP support. All PCE-initiated SR-TE LSPs are deleted.

Platforms

7705 SAR Gen 2

sr-te

Syntax

sr-te *value*

no sr-te

Context

[Tree] (config>router>mpls>tunnel-table-pref sr-te)

Full Context

configure router mpls tunnel-table-pref sr-te

Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

sr-te 8

Parameters

value

Specifies the tunnel table preference value for SR-TE LSP.

Values 1 to 255

Default 8

Platforms

7705 SAR Gen 2

sr-te

Syntax

[**no**] **sr-te**

Context

[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

Default

no sr-te

Full Context

configure system security snmp src-access-list

Description

This command configures a list of source IP addresses used to validate SNMPv1 and SNMPv2c requests after the list is associated with one or more SNMPv1 and SNMPv2c communities.

A source access list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the community, regardless of the VPRN/VRF interface (or "Base" interface) on which the request arrived. For example, if an SNMP request arrives on an interface in VPRN "100" but the request is referencing a community, the source IP address in the packet is validated against the source address list configured for the community. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the source IP address of the request message does not match the IP address of any of the **src-host** entries contained in the list, the request is discarded and logged as an SNMP authentication failure.

Caution:
Using source access list validation can impact the time it takes for an SR OS node to reply to an SNMP request. Nokia recommends keeping the lists short by including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named source access list. Users cannot remove a source access list that is referenced by one or more **community** instances.

Parameters

list-name

Specifies the name or key of the source access list. This parameter must begin with a letter (a-z or A-Z).

configure system security management-access-filter ipv6-filter entry src-ip

Description

This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IPv6 address match criterion.

Default

no src-ip

Parameters

ipv6-address/prefix-length

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values

ipv6-address	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D
prefix-length	1 to 128

ipv6-prefix-list-name

Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

no src-ip-address

Context

[Tree] (config>saa>test>type-multi-line>lsp-ping>sr-policy src-ip-address)

[Tree] (config>saa>test>type-multi-line>lsp-ping src-ip-address)

Full Context

configure saa test type-multi-line lsp-ping sr-policy src-ip-address

configure saa test type-multi-line lsp-ping src-ip-address

Description

This command configures the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. For example, when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next hop is set to an address other than the system interface address.

The **no** form of this command removes the configuration.

Parameters

ip-address

Specifies the source IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

28.65 src-mac

src-mac

Syntax

src-mac *ieee-address*

no src-mac

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv src-mac)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify src-mac

Description

This command specifies the source MAC address used for the ring-node connectivity verification of this ring node.

If all zeros are specified, the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

Default

no src-mac

Parameters

ieee-address

Enter the 48-bit IEEE MAC address to be used as a match criterion.

Values HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

ieee-address-mask

This 48-bit mask can be configured using the following formats:

Table 92: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHH	0x0FFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFF000000

Values 0x00000000000000 to 0xFFFFFFFFFFFF (hex)

Default 0xFFFFFFFFFFFF (hex) (exact match)

configure filter ip-exception entry match src-port

configure filter ipv6-filter entry match src-port

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq** 0" match criterion, may match non-initial fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

Default

no src-port

Parameters

lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

lt specifies that all port numbers less than *src-port-number* match.

gt specifies that all port numbers greater than *src-port-number* match.

eq specifies that *src-port-number* must be an exact match.

src-port-number

Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

Values 0 to 65535

port-list-name

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

src-port-number src-port-number

Specifies inclusive port range between two src-port-number values.

28.70 srlg

srlg

Syntax

[**no**] **srlg**

Context

[Tree] (config>router>mpls>lsp>secondary srlg)

Full Context

configure router mpls lsp secondary srlg

Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of srlgPrimaryCspfDisabled(25).

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code srlgPrimaryPathDown(26). After this first attempt, MPLS begins setting up the SRLG-enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code srlgPathWithSidHops(59).
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).
- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

28.73 srlg-frr

srlg-frr

Syntax

srlg-frr [**strict**]

no srlg-frr

Context

[Tree] (config>router>mpls srlg-frr)

Full Context

configure router mpls srlg-frr

Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

configure router mpls interface srlg-group

configure service ies interface if-attribute srlg-group

configure router interface if-attribute srlg-group

configure service vprn interface if-attribute srlg-group

Description

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

Platforms

7705 SAR Gen 2

srlg-group

Context

[Tree] (config>router>if-attribute srlg-group)

Full Context

configure router if-attribute srlg-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at an LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at an LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

Parameters

group-name

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

group-value

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

Values 0 to 4294967295

penalty-weight

Specifies the integer value of the penalty weight that is assigned to the SRLG group

ssap

Syntax

ssap *ssap-value* [*ssap-mask*]

no ssap

Context

[Tree] (config>qos>sap-ingress>mac-criteria>entry>match ssap)

Full Context

configure qos sap-ingress mac-criteria entry match ssap

Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

Default

no ssap

Parameters

ssap-value

The 8-bit ssap match criteria value in hex.

Values 0x00 to 0xFF (hex)

ssap-mask

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

28.76 ssh

ssh

Syntax

ssh *host* [**-l** *username*] [**-v** *ssh-version*] [{**router** *router-instance* | **service-name** *service-name*}] [**re-exchange-min** *minutes*] [**re-exchange-mbyte** *megabytes*] [**-i** *private-key-filename*] [**-p** *port*]

Context

[Tree] (ssh)

Full Context

ssh

Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate an SSH session, with a key reexchange, based on maximum megabytes or minutes, whichever occurs first. If the reexchange options are not set, the default behavior does not perform a key reexchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for the SSH session.

Parameters

host

Specifies the remote host for the SSH session.

Values

host: *user@hostname* - [up to 255 characters]	
user	up to 32 characters
hostname	[*dns-name* | *ipv4-address* | *ipv6-address*]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x - [0 to FFFF]H

d - [0 to 255]D

interface: up to 32 characters, mandatory for link local addresses

dns-name up to128 characters

username

Specifies the user name to use when opening the SSH session, up to 32 characters.

router-instance

Specifies the router name or service ID.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name "Base", "management", "vpls-management"

vprn-svc-id 1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

minutes

Specifies the time interval after which the SSH client will initiate the key reexchange.

Values 1 to 1440 minutes

megabytes

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key reexchange.

Values 1 to 64000 MB

private-key-filename

Specifies the name of the file containing the private key for public-key authentication on the SR OS SSH client, up to 255 characters. (The public key must be provided to the SSH server.) When using the *private-key-filename* option, if the file containing the private key is encrypted, the system asks for the password to decrypt the file.

port

Specifies the listening port for the SR OS SSH client to establish the SSH session with the SSH server.

Values 1 to 65535

28.79 ssh-reply

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>service>ies>if>vrrp ssh-reply)

Full Context

configure service ies interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Full Context

configure service vprn interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply

Platforms

7705 SAR Gen 2

ssh-reply

Syntax

[**no**] **ssh-reply**

Context

[Tree] (config>router>if>vrrp ssh-reply)

Full Context

configure router interface vrrp ssh-reply

Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

28.89 standby

standby

Syntax

[**no**] **standby**

Context

[Tree] (config>router>mpls>lsp>secondary standby)

Full Context

configure router mpls lsp secondary standby

Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

standby-signaling-slave

Syntax

[**no**] **standby-signaling-slave**

Context

[Tree] (config>service>epipe>endpoint standby-signaling-slave)

[Tree] (config>service>epipe>spoke-sdp standby-signaling-slave)

Full Context

configure service epipe endpoint standby-signaling-slave

configure service epipe spoke-sdp standby-signaling-slave

Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

Default

no standby-signaling-slave

configure router dhcp6 local-dhcp-server failover startup-wait-time

configure router dhcp local-dhcp-server failover startup-wait-time

configure router dhcp6 local-dhcp-server pool failover startup-wait-time

Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server** *server-name*>**pool**/**failover**>**abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

Default

startup-wait-time min 2

Parameters

minutes

Specifies the startup wait time, in minutes.

Values 1 to 59

seconds

Specifies the startup wait time, in seconds.

Values 1 to 59

hours

Specifies the startup wait time, in hours.

Values 1

28.99 stat-mode

stat-mode

Syntax

stat-mode *stat-mode*

no stat mode

Context

[Tree] (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

[Tree] (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)

Full Context

configure card fp ingress network queue-group policer-override policer stat-mode

configure card fp ingress access queue-group policer-override policer stat-mode

Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

See the *7705 SAR Gen 2 Router Configuration Guide* for details on the policer stat-mode parameters.

Platforms

7705 SAR Gen 2

stat-mode

[Tree] (config>service>epipe>sap>egress>policer-over>plcr stat-mode)

Full Context

configure service epipe sap ingress policer-override policer stat-mode

configure service epipe sap egress policer-override policer stat-mode

Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** to be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement

© 2026 Nokia.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card** *slot-num* **fp** *fp-number* command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The previous stat-mode setting active for the policer will continue to be used by the policer.

The **no** form of this command returns the policer's stat-mode setting to minimal.

Refer to the *7705 SAR Gen 2 Quality of Service Guide* for detailed information about the **policer stat-mode** command parameters.

Full Context

configure qos sap-ingress policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets

© 2026 Nokia.

(green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 95: Ingress Policer Stat Mode Summary .

Table 95: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Use subject to Terms available at: www.nokia.com/terms.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 96: Ingress Accounting Statistics Collected in minimal stat-mode .

For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 97: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 98: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 99: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 100: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 101: Ingress Accounting Statistics Collected in offered-total-cir stat-mode .

Table 101: Ingress Accounting Statistics Collected in offered-total-cir stat-mode

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 102: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

offered-profile-capped-cir

Counter resource allocation: 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 103: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the "offered undefined" statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 104: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

configure qos sap-egress policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dump resource-usage card fp command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in Table 105: Egress Policer Stat-mode Summary.

Table 105: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-	In/out exiting policer	Intended for when the policer has **profile-capped** configured

		Offered	Dropped/ Forwarded	
		of-profile) entering policer		
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is reclassified at egress to inplus and/ or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 106: Egress Accounting Statistics Collected in minimal stat-mode .

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 107: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 108: Egress Accounting Statistics Collected in offered-profile-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 109: Egress Accounting Statistics Collected in offered-total-cir stat-mode .

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

offered-limited-capped-cir is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 110: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using o**ffered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 111: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 112: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode .

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 113: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode .

Full Context

configure qos queue-group-templates ingress queue-group policer stat-mode

Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in Table 115: Stat Mode Descriptions.

Table 115: Stat Mode Descriptions

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of

© 2026 Nokia.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 116: Ingress Accounting Statistics Collected in minimal stat-mode .

	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 117: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode .

offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 118: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode .

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 120: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode .

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 121: Ingress Accounting Statistics collected in offered-total-cir stat-mode .

offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 122: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode .

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in Table 123: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode .

configure qos queue-group-templates egress queue-group policer stat-mode

Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in Table 125: Egress Policer Stat Mode Summary.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Table 125: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in- and out-of-profile.
offered-profile-cir	4	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In/out entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured. The information is limited compared to **offered-profile-capped-cir** with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer has **profile-capped** configured.
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with **enable-exceed-pir**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified to profile inplus and/ or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

Parameters

no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

minimal

Counter resource allocation: 1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in Table 126: Egress Accounting Statistics Collected in minimal stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 126: Egress Accounting Statistics Collected in minimal stat-mode

Dro. All	apd	AllPacketsDropped
	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

offered-profile-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-of profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 127: Egress Accounting Statistics Collected in offered-

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

	oof	OutOfProfileOctetsForwarded

offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 129: Egress Accounting Statistics Collected in offered-total-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 129: Egress Accounting Statistics Collected in offered-total-cir stat-mode

	oof	OutOfProfileOctetsForwarded

offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 130: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 131: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-exceed

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 132: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in Table 133: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode (the actual fields collected depends on the **record** configured in the applied accounting policy).

offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could

29 s Commands – Part III

29.1 state

state

Syntax

state *state*

no state

Context

[Tree] (config>router>policy-options>policy-statement>entry>from state)

Full Context

configure router policy-options policy-statement entry from state

Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

Default

no state

Parameters

state

Specifies the state.

Values srrp-master — This is used in non-CUPS BNG resiliency to identify routes associated with an active SRRP instance.

srrp-non-master — This is used in non-CUPS BNG resiliency to identify routes associated with a standby SRRP instance.

ipsec-master-with-peer — This is used in stateful multi-chassis IPsec (MC-IPsec) redundancy to identify routes associated with an active MC-IPsec node with a reachable peer.

ipsec-non-master — This is used in stateful MC-IPsec redundancy to identify routes associated with a standby MC-IPsec node.

ipsec-master-without-peer — This is used in stateful MC-IPsec redundancy to identify routes associated with an active MC-IPsec node without a reachable peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fsg-active — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the active BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-active-path-restoration — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on an active BNG-UP that is in a headless state. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

fsg-standby — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the standby BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

29.2 state-timer

state-timer

Syntax

state-timer *seconds* [**action** *action*]

no state-timer

Context

[Tree] (config>router>pcep>pcc state-timer)

Full Context

configure router pcep pcc state-timer

Description

This command configures the state timer for PCE-initiated LSPs. The state timer must be set to a value greater than the redelegation timer.

The **no** form of the command sets this value to the default.

Default

state-timer 180 action remove

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the number of seconds before the state timer expires.

Values 1 to 3600

action

Specifies the actions that are taken on undelegated LSPs upon the state timer expiration.

Values remove, none

Default remove

Platforms

7705 SAR Gen 2

Description

Commands in this context configure static group addresses. Static group addresses can be configured on a SAP or SDP. When present, either as a (*, g) or a (s,g) entry, multicast packets matching the configuration are forwarded even if no join message was registered for the specific group.

Platforms

7705 SAR Gen 2

static

Syntax

static *ip-address ieee-address*

no static *ip-address*

Context

[Tree] (config>service>vpls>proxy-arp static)

Full Context

configure service vpls proxy-arp static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either learned or CStatic (conditional static MAC) in order to become active.

Parameters

ip-address

Specifies the IPv4 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

Platforms

7705 SAR Gen 2

static

Syntax

static *ipv6-address ieee-address* {**host** | **router**}

no static *ipv6-address*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vpls>proxy-nd static)

Full Context

configure service vpls proxy-nd static

Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

Parameters

ipv6-address

Specifies the IPv6 address for the static entry.

ieee-address

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

host

Specifies that the entry is type "host”.

router

Specifies that the entry is type "router”.

configure router pim rp ipv6 static

Description

Commands in this context configure static Rendezvous Point (RP) addresses for a multicast group range.

Entries can be created or destroyed. If no IP addresses are configured in the **config>router>pim>rp>static>address** context, then the multicast group to RP mapping is derived from the RP-set messages received from the Bootstrap Router.

Platforms

7705 SAR Gen 2

static

Syntax

static *microseconds*

no static

Context

[Tree] (config>router>if>if-attribute>delay static)

Full Context

configure router interface if-attribute delay static

Description

This command configures the unidirectional link delay. By default there is no configured delay, the link delay metric TLV is pruned in the IGP.

The **no** form of this command removes the configured unidirectional link delay.

Default

no static

Parameters

microseconds

Specifies the unidirectional link delay in microseconds.

Values 1 to 16777214

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

static

Syntax

[**no**] **static**

Context

[Tree] (config>router>bgp>next-hop-res>use-leaked-routes static)

Full Context

configure router bgp next-hop-resolution use-leaked-routes static

Description

This command configures the router to resolve any non-leaked, unlabeled unicast IPv4 or IPv6 route in the base router BGP RIB by using a static route with direct next hops leaked from any VPRN instance. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP.

The **no** form of this command prevents the use of leaked static routes to resolve BGP routes of the base router.

Default

no static

Platforms

7705 SAR Gen 2

static

Syntax

[**no**] **static**

Context

[Tree] (config>service>vprn>bgp>next-hop-res>use-leaked-routes static)

Full Context

configure service vprn bgp next-hop-resolution use-leaked-routes static

Description

This command configures the router to resolve any non-leaked, unlabeled unicast IPv4 or IPv6 route in the VPRN BGP RIB by using a static route with direct next hops leaked from the GRT. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP.

The **no** form of this command prevents the use of leaked static routes to resolve BGP routes of the VPRN.

29.4 static-arp

static-arp

Syntax

static-arp *ieee-mac-address* **unnumbered**

static-arp *ip-address ieee-mac-address*

no static-arp [*ieee-mac-address*] **unnumbered**

no static-arp *ip-address* [*ieee-mac-address*]

Context

[Tree] (config>service>ies>if static-arp)

[Tree] (config>service>vprn>if static-arp)

Full Context

configure service ies interface static-arp

configure service vprn interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Platforms

7705 SAR Gen 2

static-arp

Syntax

static-arp *ip-address ieee-mac-address*

no static-arp *ip-address*

Context

[Tree] (config>service>vprn>nw-if static-arp)

Full Context

configure service vprn network-interface static-arp

Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP will appear in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface. If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

Parameters

ip-address

Specifies the IP address for the static ARP in IP address dotted decimal notation.

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

static-arp

Syntax

static-arp *ip-address ieee-address*

no static-arp *ip-address*

static-arp *ieee-address* **unnumbered**

no static-arp unnumbered

Context

[Tree] (config>router>if static-arp)

Full Context

configure router interface static-arp

Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

Parameters

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa*-*bb*-*cc*-*dd* -*ee*-*ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

unnumbered

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

Use subject to Terms available at: www.nokia.com/terms.

29.5 static-blackhole-first

static-blackhole-first

Syntax

[**no**] **static-blackhole-first**

Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel static-blackhole-first)

Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel static-blackhole-first

Description

This command configures the router to use a modified next-hop resolution sequence for each imported VPN-IP route. The router first checks for a static route in the Base routing table that matches the BGP next-hop address. If at least one such static route exists, and the route that is the longest match of the BGP next-hop address is a blackhole static route, the router resolves the VPN-IP route and programs it into the VPRN IP FIB table with a next-hop action that discards all matching packets. If there is no matching static route, or the longest matching static route is not a blackhole, the router resolves the VPN-IP route in the Base routing table as normal, that is, according to the configured VPRN auto-bind filter options.

The **no** form of this command configures the router to resolve VPN-IP routes in the Base routing table according to the configured VPRN auto-bind filter options.

Default

no static-blackhole-first

Platforms

7705 SAR Gen 2

29.6 static-cak

static-cak

Syntax

[**no**] **static-cak**

Context

[Tree] (config>macsec>connectivity-association static-cak)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure macsec connectivity-association static-cak

Description

This command allows the configuration of a Connectivity Association Key (CAK). The CAK is responsible for managing the MKA.

Platforms

7705 SAR Gen 2

29.7 static-entry

static-entry

Syntax

static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number* [{**valid** | **invalid**}]

no static-entry *ip-prefix/ip-prefix-length* **upto** *prefix-length2* **origin-as** *as-number*

Context

[Tree] (config>router>origin-validation static-entry)

Full Context

configure router origin-validation static-entry

Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validatio**n command configured.

Static entries can only be configured under the **config**>**router**>**origin-validation** context of the base router.

Parameters

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

Values 60 to 3600

prefix-length2

Specifies the maximum prefix length.

Values 1 to 128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

as-number

Specifies as-number.

Values 0 to 4294967295

valid

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

invalid

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

Platforms

7705 SAR Gen 2

29.8 static-label-range

static-label-range

Syntax

static-label-range *static-range*

no static-label-range

Context

[Tree] (config>router>mpls-labels static-label-range)

Full Context

configure router mpls-labels static-label-range

Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. This command also sets the lower bound of the dynamic label range which is contiguous to the static label range. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

Default

static-label-range 18400

Parameters

static-range

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

© 2026 Nokia.

29.9 static-lsp

static-lsp

Syntax

[**no**] **static-lsp** *lsp-name*

Context

[Tree] (config>router>mpls static-lsp)

Full Context

configure router mpls static-lsp

Description

This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp** *lsp-name* command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

Parameters

lsp-name

Specifies the name that identifies the LSP.

Values Up to 32 alphanumeric characters.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

29.10 static-lsp-fast-retry

static-lsp-fast-retry

Syntax

static-lsp-fast-retry *seconds*

no static-lsp-fast-retry

Context

[Tree] (config>router>mpls static-lsp-fast-retry)

Full Context

configure router mpls static-lsp-fast-retry

Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

Default

no static-lsp-fast-retry

Parameters

seconds

Specifies the value (in s), used as the fast retry timer for a static LSP.

Values 1 to 30

Platforms

7705 SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

29.11 static-mac

static-mac

Syntax

static-mac *ieee-mac-address* [**create**]

no static-mac *ieee-mac-address*

Context

[Tree] (config>service>vpls>spoke-sdp static-mac)

[Tree] (config>service>vpls>sap static-mac)

[Tree] (config>service>vpls>mesh-sdp static-mac)

Full Context

configure service vpls spoke-sdp static-mac

configure service vpls sap static-mac

configure service vpls mesh-sdp static-mac

Description

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the service destination point (SDP).

In a VPLS service, MAC addresses are associated with a SAP or with an SDP. MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

Note:
Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

Parameters

ieee-mac-address

Specifies the 48-bit MAC address for the static ARP in the form *aa*:*bb*:*cc*:*dd* :*ee*:*ff* or *aa-bb-cc-dd -ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

create

Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

static-mac

Syntax

static-mac

Context

[Tree] (config>service>vpls static-mac)

Full Context

configure service vpls static-mac

Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

Platforms

7705 SAR Gen 2

static-mac

29.14 static-route

static-route

Syntax

[**no**] **static-route** *route-name*

Context

[Tree] (config>service>pw-routing static-route)

Full Context

configure service pw-routing static-route

Description

This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

static-route 0:0:next_hop_ip_addresss

or

static-route 0:0.0.0.0:next_hop_ip_address

The **no** form of this command removes a previously configured static route.

Parameters

route-name

Specifies the static pseudowire route.

Values

route-name	<global-id>:<prefix>:<next-hop-ip_addr>
global-id	0 to 4294967295
prefix	a.b.c.d | 0 to 4294967295
next-hop-ip_addr	a.b.c.d

static-route

Syntax

[**no**] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

Context

[Tree] (bof static-route)

Full Context

bof static-route

Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

Default

no static-route

Parameters

ip-prefix/ip-prefix-length

Specifies the destination address of the static route in dotted decimal notation.

Values

ip-prefix/ip-prefix-length	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-le	0 to 32
	ipv6-prefix	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0to 255]D
	ipv6-prefix-le	0 to128
ip-address	ipv4-address	a.b.c.d
	ipv6-address	*x:x:x:x:x:x:x:x* (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x: [0 to FFFF]H

d: [0 to 255]D

mask

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

Values 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)

ip-address

Specifies the next hop IP address used to reach the destination.

Platforms

7705 SAR Gen 2

29.15 static-route-entry

static-route-entry

Syntax

static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

no static-route-entry *ip-prefix*/*prefix-length* [**mcast**]

Context

[Tree] (config>service>vprn static-route-entry)

Full Context

configure service vprn static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

The destination address of the static route.

Values	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mcast

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

Platforms

7705 SAR Gen 2

static-route-entry

Syntax

[**no**] **static-route-entry** *ip-prefixlprefix-length* [**mcast**]

Context

[Tree] (config>router static-route-entry)

Full Context

configure router static-route-entry

Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

Default

No static routes are defined.

Parameters

ip-prefix/prefix-length

Specifies the destination address of the static route.

Values	ipv4-prefix	a.b.c.d (host bits must be 0)	
	ipv4-prefix-length	0 to 32	
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:x:d.d.d.d	
		x	[0 to FFFF]H

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

ip-address

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	interface: 32 characters maximum, mandatory for link local addresses

mcast

Indicates that static route being configured is used for multicast table only.

Platforms

7705 SAR Gen 2

29.16 static-route-hold-down

static-route-hold-down

Syntax

no static-route-hold-down

Context

[Tree] (config>router static-route-hold-down)

Full Context

configure router static-route-hold-down

Description

This command enables the hold down time feature globally for static routes in the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

This command applies to all static routes in the VPRN and the base router instance in which this hold-down time is configured.

The **no** form of this command disables the hold down time feature globally for static routes in the system.

Default

no static-route-hold-down

Parameters

initial

Specifies the initial value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

multiplier

Specifies the multiplier value of the hold down time feature globally for static routes in the system.

Values 1 to 10

max-value

Specifies the maximum value of the hold down time, in seconds, globally for static routes in the system.

Values 1 to 65535

configure service ies interface static-tunnel-redundant-next-hop

configure service vprn interface static-tunnel-redundant-next-hop

Description

This command specifies redundant next-hop address on public or private IPsec interface (with public or private tunnel-sap) for static IPsec tunnel. The specified next-hop address will be used by standby node to shunt traffic to master in case of it receives them. Refer to the *7705 SAR Gen 2 Multiservice ISA and ESA Guide* for information about IPsec commands and descriptions.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

Parameters

ip-address

Specifies the static ISA tunnel redundant next-hop address.

Full Context

configure system security tls server-tls-profile status-verify

configure system security tls client-tls-profile status-verify

Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

Default

status-verify default-result revoked

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

good

Specifies that the certificate is considered acceptable.

revoked

Specifies that the certificate is considered revoked.

7705 SAR Gen 2

29.21 sticky-dest

sticky-dest

Syntax

sticky-dest *hold-time-up*

sticky-dest no-hold-time-up

no sticky-dest

Context

[Tree] (config>filter>ipv6-filter>entry sticky-dest)

[Tree] (config>filter>redirect-policy sticky-dest)

[Tree] (config>filter>ip-filter>entry sticky-dest)

Full Context

configure filter ipv6-filter entry sticky-dest

configure filter redirect-policy sticky-dest

configure filter ip-filter entry sticky-dest

Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

Default

no sticky-dest

Parameters

hold-time-up

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

Values 0 to 65535 seconds

Platforms

7705 SAR Gen 2

29.22 sticky-dr

sticky-dr

Syntax

sticky-dr [**priority** *dr-priority*]

no sticky-dr

Context

[Tree] (config>service>vprn>pim>if sticky-dr)

Full Context

configure service vprn pim interface sticky-dr

Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no sticky-dr

Parameters

priority *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

sticky-dr

Syntax

stp

Syntax

stp

Context

[Tree] (config>service>pw-template stp)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service pw-template stp

Description

Commands in this context configure the Spanning Tree Protocol (STP) parameters. The STP is simply the Spanning Tree Protocol (STP) with a few modifications to better suit the operational characteristics of VPLS services. The most evident change is to the root bridge election. Since the core network operating between service routers should not be blocked, the root path is calculated from the core perspective.

Platforms

7705 SAR Gen 2

29.26 streaming

streaming

Syntax

streaming

Context

[Tree] (config>system>snmp streaming)

Full Context

configure system snmp streaming

Description

This command enables the proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes. In higher latency networks, synchronizing router MIBs from network management via streaming takes less time than synchronizing via classic SNMP UDP requests. Streaming operates on TCP port 1491 and runs over IPv4 or IPv6.

Platforms

7705 SAR Gen 2

29.27 strict-adjacency-check

strict-adjacency-check

Syntax

[**no**] **strict-adjacency-check**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>isis strict-adjacency-check)

Full Context

configure service vprn isis strict-adjacency-check

Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

Default

no strict-adjacency-check

Platforms

7705 SAR Gen 2

strict-adjacency-check

29.28 strict-ero-nhop-direct-resolution

strict-ero-nhop-direct-resolution

Syntax

[**no**] **strict-ero-nhop-direct-resolution**

Context

[Tree] (config>router>mpls strict-ero-nhop-direct-resolution)

Full Context

configure router mpls strict-ero-nhop-direct-resolution

Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

Default

no strict-ero-nhop-direct-resolution

29.30 string

string

Syntax

string *string*

no string

Context

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident string)

Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification string

Description

This command specifies the string from the Nokia vendor-specific sub-option (VSO) in Option 82 to match when the LUDB is accessed using a DHCPv4 server.

Note:
This command is only used when **string** is configured as one of the **match-list** parameters.

The **no** form of this command removes the host identification string from the configuration.

Parameters

string

Specifies the VSO string of this host, up to 255 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7705 SAR Gen 2

Full Context

configure port ethernet dot1x macsec sub-port

Description

This command creates a MACsec instance on a physical port, targeting the specific subset of traffic defined by the **encap-match** command.

The **no** form of this command removes the MACsec instance.

Parameters

port-id

Specifies the sub-port id index.

Values 1 to 1023

create

Creates a new sub-port.

Platforms

7705 SAR Gen 2

29.33 subject

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

Context

[Tree] (config>service>vprn>log>filter>entry>match subject)

Full Context

configure service vprn log filter entry match subject

Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the subject match criterion.

Default

no subject

Parameters

eq | neq

This operator specifies the type of match. Valid operators are listed below.

Values

Table 135: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to

subject

A string used as the subject match criterion.

regexp

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

Platforms

7705 SAR Gen 2

subject

Syntax

subject {**eq** | **neq**} *subject* [*regexp*]

no subject

29.34 subnet

subnet

Syntax

subnet {*ip-address*/*mask* | *ip-address netmask*} [**create**]

no subnet {*ip-address*/*mask* | *ip-address netmask*}

Context

[Tree] (config>router>dhcp>server>pool subnet)

[Tree] (config>service>vprn>dhcp>server>pool subnet)

Full Context

configure router dhcp local-dhcp-server pool subnet

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn dhcp local-dhcp-server pool subnet

Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

Parameters

ip-prefix/mask

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

Values ip-prefix: a.b.c.d

mask: 8 to 32

netmask

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

Values a.b.c.d, any mask expressed as dotted quad

create

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

29.35 subnet-check

subnet-check

Syntax

[**no**] **subnet-check**

Context

[Tree] (config>service>vprn>igmp>if subnet-check)

Full Context

configure service vprn igmp interface subnet-check

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

The **no** form of this command disables local subnet checking for IGMP.

Platforms

7705 SAR Gen 2

subnet-check

Syntax

[**no**] **subnet-check**

Context

[Tree] (config>router>igmp>if subnet-check)

Full Context

configure router igmp interface subnet-check

Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

Default

subnet-check

Platforms

29.36 subnet-mask

subnet-mask

Syntax

subnet-mask *ip-address*

no subnet-mask

Context

[Tree] (config>router>dhcp>server>pool>subnet>options subnet-mask)

[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>options subnet-mask)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router dhcp local-dhcp-server pool subnet options subnet-mask

configure subscriber-mgmt local-user-db ipoe host options subnet-mask

Description

This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

The **no** form of this command removes the address from the configuration.

Parameters

ip-address

Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d

Platforms

7705 SAR Gen 2

29.37 subscriber-limit

subscriber-limit

Syntax

subscriber-limit *limit*

no subscriber-limit

Context

[Tree] (config>service>vprn>nat>outside>pool subscriber-limit)

Full Context

configure service vprn nat outside pool subscriber-limit

Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

The subscribers are counted per protocol (UDP, TCP and ICMP). For example, in LSN44 a source IPv4 address that uses ports on each of the three protocols (UDP, TCP and ICMP) on an outside IP address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

count as 3 subscribers on that outside IP address. The ‘no subscriber-limit’ removes the limit for the number of subscribers per outside IP address.

This command is not applicable to pools with:

- arbitrary address pooling enabled
- flexible port allocations (application configured under a pool)

Parameters

limit

Specifies the maximum number of subscribers per outside IP address.

Values 1 to 65535

Platforms

7705 SAR Gen 2

29.38 subscriber-mgmt

subscriber-mgmt

Syntax

subscriber-mgmt

Context

[Tree] (config subscriber-mgmt)

Full Context

configure subscriber-mgmt

Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

29.39 subscription

subscription

Syntax

subscription *percentage*

no subscription

Context

[Tree] (config>router>rsvp>interface subscription)

Full Context

configure router rsvp interface subscription

Description

This command configures the percentage of the link bandwidth that RSVP can use for reservation and sets a limit for the amount of over-subscription or under-subscription allowed on the interface.

When the **subscription** is set to zero, no new sessions are permitted on this interface. If the *percentage* is exceeded, the reservation is rejected and a log message is generated.

The **no** form of this command reverts the *percentage* to the default value.

Default

subscription 100

Parameters

percentage

Specifies the percentage of the interface's bandwidth that RSVP allows to be used for reservations.

Values 0 to 1000

Platforms

7705 SAR Gen 2

subscription

Syntax

subscription *subscription-id* **cancel**

subscription cancel-all

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn isis summary-address

Description

This command creates summary-addresses for the specified router or VPRN instance.

Parameters

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

Values		
	ip-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

netmask

The subnet mask in dotted decimal notation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

Values level-1, level-2, level-1/2

tag *tag*

Assigns a route tag to the summary address.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

summary-address

Syntax

summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [**tag** *tag*] [**algorithm** *algo-id*]

no summary-address {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

Context

[Tree] (config>router>isis summary-address)

Full Context

configure router isis summary-address

Description

This command creates a summary IPv4, IPv6, or SRv6 locator address.

When an IS-IS domain exists out of multiple areas, the user must redistribute IP addresses and SRv6 locators between areas for inter-area SRv6-based transport services.

Scaling may be impacted if all existing IPv4, IPv6, and SRv6 locators are redistributed between all existing areas. SRv6 locators and IP addresses can be summarized when they are redistributed from one area into another area. Summarization reduces the number of entries redistributed, which reduces the size of the Link State Database (LSDB) and increases network stability.

The **no** form of this command reverts to the default.

Default

no summary-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

ip-prefix/ip-prefix-length

Specifies the IP prefix and prefix length of the summary address.

Values

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	0 to 128

netmask

Specifies the subnet mask in dotted decimal notation.

Values 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

level

Specifies IS-IS level area attributes.

Values level-1, level-2, level-1/2

Default level-1/2

tag

Specifies the route tag to assign for the summary address.

Values 1 to 4294967295

algo-id

Specifies the algorithm topology applied for the summary address.

Values 0, 128 to 255

Default 0

match-route-tag *tag*

Specifies the route tag to match the Unreachable Prefix Announcements (UPAs). This selects a subset of summary member prefixes to monitor for reachability.

Values 1 to 4294967295

Default no match-route-tag

advertise-route-tag *tag*

Specifies the route tag to advertise in the UPA. The UPA tag can be used when there are multiple ASBR redistributing prefixes between two IGP areas.

29.44 summary-crit

summary-crit

Syntax

summary-crit dst-addr

summary-crit src-addr

no summary-crit

Context

[Tree] (config>filter>log>summary summary-crit)

Full Context

configure filter log summary summary-crit

Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

Default

summary-crit src-addr

Parameters

dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

Full Context

configure port ethernet dot1x supplicant-timeout

Description

This command configures the period during which the router waits for a client to respond to its EAPOL messages. When the supplicant-timeout expires, the 802.1x authentication session is considered to have failed.

The **no** form of this command returns the value to the default.

Default

supplicant-timeout 30

Parameters

seconds

Specifies the server timeout period in seconds.

Values 1 to 300

Platforms

7705 SAR Gen 2

29.47 suppress

suppress

Syntax

suppress *integer*

no suppress

Context

[Tree] (config>router>policy-options>damping suppress)

Full Context

configure router policy-options damping suppress

Description

This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is removed from the route table or inclusion in advertisements.

The **no** form of this command removes the suppress parameter from the damping profile.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no suppress

Parameters

integer

Specifies the suppress value expressed as a decimal integer.

Values 1 to 20000

Platforms

29.50 suppress-lsn-events

suppress-lsn-events

Syntax

[**no**] **suppress-lsn-events**

Context

[Tree] (config>isa>nat-group suppress-lsn-events)

Full Context

configure isa nat-group suppress-lsn-events

Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time: either the SR OS event logging facility or the RADIUS logging facility. SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility; for example, syslog, assuming that the events are enabled via the event-control command (**configure log event-control nat** *event* **generate**).

By explicitly disabling this command (**no suppress-lsn-events**), the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility, and the RADIUS logging facility.

Default

suppress-lsn-events

Platforms

7705 SAR Gen 2

29.51 suppress-lsn-sub-blks-free

suppress-lsn-sub-blks-free

Syntax

[**no**] **suppress-lsn-sub-blks-free**

Context

[Tree] (config>isa>nat-group suppress-lsn-sub-blks-free)

Full Context

configure isa nat-group suppress-lsn-sub-blks-free

Description

This command suppresses the tmnxNatLsnSubBlksFree summary notification and use the tmnxNatPlBlockAllocationLsn notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-blocks) will be stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN will be "LSN subscriber all blocks freed”. The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

Context

[Tree] (config>port>ethernet>dampening suppress-threshold)

Full Context

configure port ethernet dampening suppress-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the penalties thresholds at which the port state events to the upper layer are dampened (suppress threshold) and then permitted (reuse threshold).

Parameters

suppress-penalties

Specifies the threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again.

Values 1 to 20000

Default 2000

reuse-penalties

Specifies the threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.

Values 1 to 20000

Default 1000

configure system security management-access-filter mac-filter entry match svc-id

Description

This command specifies an existing svc-id to use as a match condition.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

service-id

Specifies a service-id to match.

Values *service-id*: 1 to 2147483647*svc-name*: 64 characters maximum

Platforms

7705 SAR Gen 2

29.55 swap

swap

Syntax

swap {*out-label* | **implicit-null-label**} **nexthop** *ip-address*

no swap

Context

[Tree] (config>router>mpls>if>label-map swap)

Full Context

configure router mpls interface label-map swap

Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

Parameters

implicit-null-label

Specifies the use of the implicit label value for the outgoing label of the swap operation.

out-label

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- label values 131,072 through 1,048,575 are reserved for future use

  Values 16 to 1048575

nexthop *ip-address*

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

29.56 sweep

sweep

Syntax

sweep start *dispersion-start* **end** *dispersion-end*

Context

[Tree] (config>port>dwdm>coherent sweep)

Full Context

configure port dwdm coherent sweep

Description

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

Parameters

dispersion-start

Specifies the lower range limit for the dispersion compensation.

Values -50000 to 50000

Default -25500

dispersion-end

Specifies the upper range limit for the dispersion compensation.

Values -50000 to 50000

29.57 switchover-exec

switchover-exec

Syntax

switchover-exec *file-url*

no switchover-exec

Context

[Tree] (config>system switchover-exec)

Full Context

configure system switchover-exec

Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

Default

no switch-over-exec

Parameters

file-url

Specifies the location and name of the CLI script file.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each

© 2026 Nokia.

29.61 synchronize

synchronize

Syntax

synchronize {**boot-env** | **config**}

Context

[Tree] (config>redundancy synchronize)

Full Context

configure redundancy synchronize

Description

This command enables the automatic synchronization of the standby CPM's images and/or config files from the active CPM. Either the **boot-env** or **config** parameter must be specified. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPMs have identical software images and configuration files. This includes the saved configuration, saved incremental configuration files in model-driven configuration mode, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

Default

synchronize config

Parameters

boot-env

Synchronizes all files required for the boot process (boot loader, BOF configuration, SR OS images, and all configuration files).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

config

Synchronizes the primary, secondary, and tertiary configuration files, SSH keys, the password history and the model-driven commit history.

Default config

Platforms

7705 SAR Gen 2

synchronize

Syntax

synchronize cert

synchronize {**boot-env** | **config**}

Context

[Tree] (admin>redundancy synchronize)

Full Context

admin redundancy synchronize

Description

This command performs a synchronization of the standby CPM's images and/or configuration files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

The **no** form of the command removes the parameter from the configuration.

Default

no synchronize

Parameters

cert

Synchronizes the imported certificate, key, and CRL files.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

boot-env

Synchronizes all files required for the boot process (boot loader, BOF, images, and configuration).

config

Synchronizes the primary, secondary, and tertiary configuration files.

Platforms

7705 SAR Gen 2

29.62 synchronous-execution

synchronous-execution

Syntax

synchronous-execution *seconds*

synchronous-execution never

Context

[Tree] (config>system>management-interface>ops>global-timeouts synchronous-execution)

Full Context

configure system management-interface operations global-timeouts synchronous-execution

Description

This command configures the period of time that operations launched as "'synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

Note:
This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

Caution:
This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

Default

synchronous-execution never

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

Values 1 to 604800

never

Keyword to specify that an execution timeout is not applied to synchronous operations.

Platforms

7705 SAR Gen 2

29.63 syslog

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>service>vprn>log syslog)

Full Context

configure service vprn log syslog

Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure**>**service**>**vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

Default

No syslog IDs are defined.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

syslog-id

Specifies the Syslog ID for the Syslog destination.

Values 1 to 30

name *syslog-name*

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

Platforms

7705 SAR Gen 2

syslog

Syntax

syslog *syslog-id* [**name** *syslog-name*]

no syslog *syslog-id*

Context

[Tree] (config>log syslog)

configure service vprn isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Default

no system-id

Parameters

isis-system-id

12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

system-id

Syntax

[**no**] **system-id**

Context

[Tree] (config>router>if>dhcp>option>vendor-specific-option system-id)

Full Context

configure router interface dhcp option vendor-specific-option system-id

Description

This command specifies whether the system-id is encoded in the Nokia vendor-specific sub-option of Option 82.

Default

no system-id

Platforms

7705 SAR Gen 2

system-id

Syntax

system-id *isis-system-id*

no system-id

Context

[Tree] (config>router>isis system-id)

Full Context

configure router isis system-id

Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference:

1. **config>router>isis>system-id**
2. **config>router>isis>router-id**
3. **config>router>router-id**
4. **config>router>interface>system> address**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, the IS-IS instance must be **shutdown** and then **no shutdown**. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

Parameters

isis-system-id

Specifies 12 hexadecimal characters in dotted-quad notation.

Values aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

Platforms

7705 SAR Gen 2

29.68 system-mac

system-mac

Syntax

system-mac *mac-address*

no system-mac

Context

[Tree] (config>system>ned>profile system-mac)

Full Context

configure system network-element-discovery profile system-mac

Description

This command configures the MAC address to be advertised.

The **no** form of this command removes any explicitly defined MAC address and chassis MAC address will be advertised.

Default

no system-mac

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mac-address

Specifies the MAC address to be associated with the profile in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

Platforms

7705 SAR Gen 2

29.69 system-password

system-password

Syntax

system-password admin-password

system-password dynsvc-password

Context

[Tree] (admin>system>security system-password)

Full Context

admin system security system-password

Description

This operational command changes a local system password.

Parameters

admin-password

Specifies to change the administrative password.

dynsvc-password

Specifies to change the dynamic services password.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

29.70 system-priority

system-priority

Syntax

system-priority *value*

no system-priority

Context

[Tree] (config>redundancy>multi-chassis>peer>mc-ep system-priority)

Full Context

configure redundancy multi-chassis peer mc-endpoint system-priority

Description

This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

Default

no system-priority

Parameters

value

Specifies the priority assigned to the local MC-EP peer.

Values 1 to 255

Platforms

7705 SAR Gen 2

29.71 system-profile

system-profile

Syntax

system-profile {**profile-a** | **profile-b**}

no system-profile

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (bof system-profile)

Full Context

bof system-profile

Description

This command configures the system profile in the BOF.

See "System profiles" in the *7705 SAR Gen 2 Basic System Configuration Guide* for more information.

The **no** form of this command removes the **system-profile** parameter from the BOF.

Parameters

profile-a

Specifies that the system profile is for generic deployment scenarios, IP forwarding and MPLS switching use-cases.

profile-b

Specifies that the system profile is primarily intended for applications requiring high packet manipulation and processing (for example, NAT and IPsec).

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30 t Commands – Part I

30.1 tab

tab

Syntax

[**no**] **tab**

Context

[Tree] (config>system>management-interface>cli>md-cli>environment>command-completion tab)

Full Context

configure system management-interface cli md-cli environment command-completion tab

Description

This command enables completion on the tab character.

The **no** form of this command reverts to the default value.

Default

tab

Platforms

7705 SAR Gen 2

30.2 table-size

table-size

Syntax

table-size *table-size*

Context

[Tree] (config>service>vpls>proxy-nd table-size)

[Tree] (config>service>vpls>proxy-arp table-size)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vpls proxy-nd table-size

configure service vpls proxy-arp table-size

Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

Default

table-size 250

Parameters

table-size

Specifies the table-size as number of entries for the service.

Values 1 to 16384

Platforms

7705 SAR Gen 2

30.3 tacplus

tacplus

Syntax

no tacplus

tacplus [**create**]

Context

[Tree] (config>service>vprn>aaa>rmt-srv tacplus)

Full Context

configure service vprn aaa remote-servers tacplus

Description

This command creates the context to configure TACACS+ authentication on the VPRN.

Configure multiple server addresses for each router for redundancy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the TACACS+ configuration.

Parameters

create

Keyword to create the TACACS+ configuration.

Platforms

7705 SAR Gen 2

tacplus

Syntax

[**no**] **tacplus**

Context

[Tree] (config>system>security tacplus)

Full Context

configure system security tacplus

Description

This command creates the context to configure TACACS+ authentication on the router.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

Platforms

7705 SAR Gen 2

30.4 tacplus-map-to-priv-lvl

tacplus-map-to-priv-lvl

Syntax

tacplus-map-to-priv-lvl [*admin-priv-lvl*]

no tacplus-map-to-priv-lvl

Context

[Tree] (config>system>security>password>enable-admin-control tacplus-map-to-priv-lvl)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure system security password enable-admin-control tacplus-map-to-priv-lvl

Description

When **tacplus-map-to-priv-lvl** is enabled, and tacplus authorization is enabled with the *use-priv-lvl* option, typing **enable-admin** starts an interactive authentication exchange from the node to the TACACS+ server. The start message (service=enable) contains the user-id and the requested *admin-priv-lvl*. Successful authentication results in the use of a new profile (as configured under **config>system>security>tacplus>priv-lvl-map**).

Platforms

7705 SAR Gen 2

30.5 tag

tag

Syntax

tag *tag*

no tag [*tag*]

Context

[Tree] (config>service>vprn>static-route-entry tag)

Full Context

configure service vprn static-route-entry tag

Description

This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols.

The tag specified at this level of the static route causes tag values configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the tag association.

Default

no tag

Parameters

tag

Specifies an integer value.

Values 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag-value*

no tag [*tag-value*]

Context

[Tree] (config>service>vprn>static-route-entry>next-hop tag)

[Tree] (config>service>vprn>static-route-entry>ipsec-tunnel tag)

[Tree] (config>service>vprn>static-route-entry>indirect tag)

Full Context

configure service vprn static-route-entry next-hop tag

configure service vprn static-route-entry ipsec-tunnel tag

configure service vprn static-route-entry indirect tag

Description

This command adds a 32-bit integer tag to the associated static route.

The tag value can be used in route policies to control distribution of the route into other protocols.

Default

no tag

Parameters

tag-value

Specifies an integer tag value.

Values 32 bit integer

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag*

no tag

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>isis>if tag)

Full Context

configure service vprn isis interface tag

Description

This command configures a route tag to the specified IP address of an interface.

Parameters

tag

Specifies the tag value.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag*

no tag [*tag*]

Context

[Tree] (config>router>static-route-entry tag)

[Tree] (config>router>static-route-entry>black-hole tag)

[Tree] (config>router>static-route-entry>indirect tag)

[Tree] (config>router>static-route-entry>next-hop tag)

Full Context

configure router static-route-entry tag

configure router static-route-entry black-hole tag

configure router static-route-entry indirect tag

configure router static-route-entry next-hop tag

Description

This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols.

The tag specified at this level of the static route causes tag values configured under the next-hop, black-hole and indirect contexts of the static route to be ignored.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command removes the tag association.

Default

no tag

Parameters

tag

Specifies an integer tag value.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag*

no tag

Context

[Tree] (config>router>isis>interface tag)

Full Context

configure router isis interface tag

Description

This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

Parameters

tag

Specifies a route tag.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tag

Syntax

tag {**no-tag** | *tag*}

no tag

Context

[Tree] (config>router>policy-options>policy-statement>entry>from tag)

Full Context

configure router policy-options policy-statement entry from tag

Description

This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

Default

no tag

Parameters

tag

Matches the configured tag value.

Values Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

no-tag

Specifies that no tag value is set.

Platforms

7705 SAR Gen 2

tag

Syntax

tag *tag*

no tag

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>policy-options>policy-statement>entry>action tag)

[Tree] (config>router>policy-options>policy-statement>default-action tag)

Full Context

configure router policy-options policy-statement entry action tag

configure router policy-options policy-statement default-action tag

Description

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

Default

no tag

Parameters

tag

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

Values Accepts decimal or hexadecimal formats:

IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295

RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@”.

30.6 taii-type2

taii-type2

Syntax

taii-type2 *global-id:prefix:ac-id*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no taii-type2

Context

[Tree] (config>service>epipe>spoke-sdp-fec taii-type2)

Full Context

configure service epipe spoke-sdp-fec taii-type2

Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 AII type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

Parameters

global-id

Specifies a global ID of this router T-PE. This value must correspond to one of the global_id values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

Values 1 to 4294967295

prefix

Speecifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

Values an IPv4-formatted address a.b.c.d or 1 to 4294967295

ac-id

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

Values 1 to 4294967295

Platforms

7705 SAR Gen 2

30.7 tail-end

tail-end

Syntax

[**no**] **tail-end**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>router>lsp-bfd tail-end)

Full Context

configure router lsp-bfd tail-end

Description

Commands in this context configure LSP BFD tail-end parameters.

The **no** form of this command removes the context.

Default

no tail-end

Platforms

7705 SAR Gen 2

30.8 target-name

target-name

Syntax

target-name {node-name | user-agent | custom-string *name***}**

no target-name

Context

[Tree] (config>system>grpc-tunnel>tunnel target-name)

Full Context

configure system grpc-tunnel tunnel target-name

Description

This command assigns a target name that the node will register with.

The **no** form of this command removes the target name.

Default

no target-name

Parameters

node-name

Keyword to register the tunnel with the node name configured using the **configure system name** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

user-agent

Keyword to register the tunnel with the user agent name string defined as *node-name:vendor:model:software-version*.

custom-string

Assigns an arbitrary string as the target name.

name

Specifies a string, up to 64 characters, that defines the target name.

Platforms

7705 SAR Gen 2

30.9 target-power

target-power

Syntax

target-power *power*

Context

[Tree] (config>port>dwdm>coherent target-power)

Full Context

configure port dwdm coherent target-power

Description

This command configures the target transmit optical power for the port.

Default

target-power 1.00

Parameters

power

Specifies the desired average output power in dBm.

Values -20.00 to 3.00

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.10 target-type

target-type

Syntax

target-type {grpc-server | ssh-server | custom-type *type***}**

no target-type

Context

[Tree] (config>system>grpc-tunnel>tunnel>handler target-type)

Full Context

configure system grpc-tunnel tunnel handler target-type

Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

Default

no target-type

Parameters

grpc-server

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI_GNOI”.

ssh-server

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH”.

custom-type

Keyword that assigns an arbitrary string as the target type.

type

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI_GNOI” or "SSH” can also be used.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.11 targeted-session

targeted-session

Syntax

targeted-session

Context

[Tree] (config>router>ldp targeted-session)

Full Context

configure router ldp targeted-session

Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

Platforms

7705 SAR Gen 2

30.12 task

task

Syntax

task [**detail**]

no task

Context

debug router pcep pcc task

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

debug router pcep pcc connection task

Description

This command enables debugging for PCC or connection task events.

The **no** form of this command disables debugging.

Parameters

detail

Keyword used to specify detailed information about PCC or connection task events.

Platforms

7705 SAR Gen 2

30.13 tcp

tcp

Syntax

tcp

Context

[Tree] (config>service>ies>ipt tcp)

[Tree] (config>service>vprn>ipt tcp)

Full Context

configure service ies ip-transport tcp

configure service vprn ip-transport tcp

Description

Commands in this context configure TCP parameters within the IP transport subservice.

Platforms

7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.14 tcp-ack

tcp-ack

Syntax

tcp-ack {**true** | **false**}

no tcp-ack

Context

[Tree] (config>filter>ip-filter>entry>match tcp-ack)

[Tree] (config>filter>ipv6-filter>entry>match tcp-ack)

Full Context

configure filter ip-filter entry match tcp-ack

configure filter ipv6-filter entry match tcp-ack

Description

This command configures an IP filter match criterion based on the Acknowledgment (ACK) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ack

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.15 tcp-cwr

tcp-cwr

Syntax

tcp-cwr {**true** | **false**}

no tcp-cwr

Context

[Tree] (config>filter>ip-filter>entry>match tcp-cwr)

[Tree] (config>filter>ipv6-filter>entry>match tcp-cwr)

Full Context

configure filter ip-filter entry match tcp-cwr

configure filter ipv6-filter entry match tcp-cwr

Description

This command configures an IP filter match criterion based on the Congestion Window Reduced (CWR) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-cwr

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.16 tcp-ece

tcp-ece

Syntax

tcp-ece {**true** | **false**}

no tcp-ece

Context

[Tree] (config>filter>ip-filter>entry>match tcp-ece)

[Tree] (config>filter>ipv6-filter>entry>match tcp-ece)

Full Context

configure filter ip-filter entry match tcp-ece

configure filter ipv6-filter entry match tcp-ece

Description

This command configures an IP filter match criterion based on the ECN-Echo (ECE) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-ece

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

© 2026 Nokia.

30.17 tcp-established

tcp-established

Syntax

tcp-established [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

no tcp-established

Context

[Tree] (config>service>nat>nat-policy>timeouts tcp-established)

Full Context

configure service nat nat-policy timeouts tcp-established

Description

This command configures the idle timeout applied to a TCP session in the established state.

Default

tcp-established hrs 2 min 4

Parameters

hours

Specifies the timeout hours field.

Values 1 to 24

minutes

Specifies the timeout minutes field.

Values 1 to 59

seconds

Specifies the timeout seconds field.

Values 1 to 59

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tcp-established

Syntax

[**no**] **tcp-established**

Context

Full Context

configure service nat cpm-nat-policy timeouts tcp-established

Description

This command configures the idle timeout applied to a TCP session in the established state.

The **no** form of this commands reverts to the default value.

Default

tcp-established hrs 2 min 4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

hours

Specifies the timeout, in hours.

Values 1 to 24

minutes

Specifies the timeout, in minutes.

Values 1 to 59

seconds

Specifies the timeout, in seconds.

Values 1 to 59

Platforms

7705 SAR Gen 2

30.18 tcp-fin

tcp-fin

Syntax

tcp-fin {**true** | **false**}

no tcp-fin

Context

[Tree] (config>filter>ip-filter>entry>match tcp-fin)

[Tree] (config>filter>ipv6-filter>entry>match tcp-fin)

Full Context

configure filter ip-filter entry match tcp-fin

configure filter ipv6-filter entry match tcp-fin

Description

This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

Default

no tcp-fin

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

Platforms

7705 SAR Gen 2

30.19 tcp-keepalive

tcp-keepalive

Syntax

tcp-keepalive

Context

[Tree] (config>system>grpc tcp-keepalive)

Full Context

configure system grpc tcp-keepalive

Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time** seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

tcp-mss

Syntax

tcp-mss *mss-value*

no tcp-mss

Context

[Tree] (config>service>ies>if>ipv6 tcp-mss)

[Tree] (config>service>ies>if tcp-mss)

Full Context

configure service ies interface ipv6 tcp-mss

configure service ies interface tcp-mss

Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value (tcp_mss = ip_mtu – 40).

Default

no tcp-mss

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

mss-value

The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

Note: 9158 = max-IP_MTU (9198)-40

Values 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

no tcp-mss

Context

[Tree] (config>service>vprn>bgp tcp-mss)

[Tree] (config>router>bgp tcp-mss)

Full Context

configure service vprn bgp tcp-mss

configure router bgp tcp-mss

Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

Default

no tcp-mss

Parameters

mss-value

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

Values 384 to 9746

Platforms

7705 SAR Gen 2

30.31 tdm

tdm

Syntax

tdm

Context

[Tree] (config>port tdm)

Full Context

configure port tdm

Description

Commands in this context configure E1 parameters for a port on a channelized 8-port T1/E1 ASAP Adapter card and TPIF parameters for ports 1/1/[5 to 8] on the Combination module m4-rs232-rj45+4-c3794-sfp MDA.

The TDM mechanism divides the bandwidth of a stream into separate channels or timeslots by assigning each stream a different timeslot in a set. TDM repeatedly transmits a fixed sequence of timeslots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

Full Context

configure router rsvp diffserv-te te-class

Description

This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in Table 137: Default Class Type.

Table 137: Default Class Type

Class Type (CT internal)	LSP Priority
0	7
0	6
0	5
0	4
0	3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Class Type (CT internal)	LSP Priority
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

Parameters

te-class *te-class-number*

Specifies the TE class number.

Values 0 to 7

class-type *ct-number*

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

Values 0 to 7

priority *priority*

Specifies the LSP priority.

Values 0 to 7

Full Context

configure router rsvp interface te-down-threshold

configure router rsvp te-down-threshold

Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

Parameters

threshold-level

Specifies the threshold level.

Values 0 to 100

Platforms

7705 SAR Gen 2

30.35 te-metric

te-metric

Syntax

te-metric *value*

no te-metric

Context

[Tree] (config>router>mpls>interface te-metric)

Full Context

configure router mpls interface te-metric

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

Parameters

value

Specifies the metric value.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

30.36 te-threshold-update

te-threshold-update

Syntax

30.38 tech-support

tech-support

Syntax

tech-support [*file-url*]

Context

[Tree] (admin tech-support)

Full Context

admin tech-support

Description

This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

Note:
This command should only be used with authorized direction of Nokia support.

Parameters

file-url

Specifies the file URL location to save the binary file.

Values		
	local-url | *remote-url*	
	local-url	[*cflash-id/*][*file-path*] 200 chars max, including cflash-id
		directory length 99 chars max each
	remote-url	[{ftp:// | tftp://}*login:pswd@remote-locn/*][*file-path*]
		199 chars max
	remote-locn	[*hostname* | *ipv4-address* | *ipv6-address*]
	ipv4-address	*a.b.c.d*

telnet

Description

This command opens a Telnet session to a remote host. In 7705 SAR Gen 2 networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

Parameters

ip-address

Specifies the IP address or the DNS name (if DNS name resolution is configured).

Values

ipv4-address	*a.b.c.d*	
ipv6-address	*x:x:x:x:x:x:x:x*[-interface]	*x*: [0 to FFFF]H
	x:x:x:x:x:x:d.d.d.d[-interface]	*d*: [0 to 255]D *ipv6-address* interface: up to 32 characters, mandatory for link local addresses
dns-name	up to 128 characters	

dns-name

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

port

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

Values 1 to 65535

Default 23

router-instance

Specifies the router name or service ID used to identify the router instance.

Values *router-instance*: *router-name* or *vprn-svc-id*

router-name	"Base", "management", vpls-management"
vprn-svc-id	1 to 2147483647

Default Base

service-name

Specifies the service name, up to 64 characters.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source *ip-address*

Specifies the source IP address to use as the source of the Telnet packets.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d

configure service ies interface ipv6 vrrp telnet-reply

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Proper login and CLI command authentication is still enforced.

When telnet-reply is not enabled, TCP port 23 Telnet packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the telnet-reply configuration.

The **telnet-reply** command is only available in non-owner VRRP nodal context. If the telnet-reply command is not executed, Telnet packets to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all Telnet packets destined to the non-owner virtual router instance IP addresses.

telnet-reply

Syntax

[**no**] **telnet-reply**

Context

[Tree] (config>router>if>ipv6>vrrp telnet-reply)

[Tree] (config>router>if>vrrp telnet-reply)

Full Context

configure router interface ipv6 vrrp telnet-reply

configure router interface vrrp telnet-reply

Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

[Tree] (config>service>template>vpls-template temp-flooding)

[Tree] (config>service>vpls temp-flooding)

Full Context

configure service template vpls-template temp-flooding

configure service vpls temp-flooding

Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

Default

no temp-flooding

Context

[Tree] (config>router>route-next-hop-policy template)

Full Context

configure router route-next-hop-policy template

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the begin command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the commit is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the abort command before the commit command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the commit command. Furthermore, the abort command, if entered, will have no effect on the prior deletion or creation of a template.

Once the commit command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

Parameters

name

Specifies the name of the template, up to 32 characters.

no tertiary-ip-address

Context

[Tree] (config>router>bgp>orr>location tertiary-ip-address)

Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close” to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

Default

no tertiary-ip-address

Parameters

ipv4-address

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

Values a.b.c.d

Platforms

test-duration

Syntax

test-duration *seconds*

no test-duration

Context

[Tree] (config>oam-pm>session>eth>slm test-duration)

[Tree] (config>oam-pm>session>ethernet>dmm test-duration)

Full Context

configure oam-pm session ethernet slm test-duration

configure oam-pm session ethernet dmm test-duration

Description

This command, which is optional, configures the length of time the test runs before stopping automatically. This command is only a valid option when a session is configured with a **session-type** of **on-demand**.

This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **oam-pm session start** command has been issued and they stop when the **oam-pm session stop** command is issued.

The **no** form of this command removes a previously configured test duration and allows the test to run until manually stopped.

Default

no test-duration

Parameters

seconds

Specifies the number of seconds the test runs from its start time.

Values 1 to 86400

Platforms

7705 SAR Gen 2

© 2026 Nokia.

30.57 test-fail-enable

test-fail-enable

Syntax

[**no**] **test-fail-enable**

Context

[Tree] (config>saa>test>trap-gen test-fail-enable)

Full Context

configure saa test trap-gen test-fail-enable

Description

This command enables the generation of a trap when a test fails. In the case of a ping test, the test is considered failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** parameter.

The **no** form of this command disables the trap generation.

Platforms

7705 SAR Gen 2

30.58 test-fail-threshold

test-fail-threshold

Syntax

test-fail-threshold *threshold*

no test-fail-threshold

Context

[Tree] (config>saa>test>trap-gen test-fail-threshold)

Full Context

configure saa test trap-gen test-fail-threshold

Description

This command configures the threshold for trap generation on test failure.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command has no effect when **test-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

Default

test-fail-threshold 1

Parameters

threshold

Specifies the number of consecutive test failures required to generate a trap.

Values 0 to 15

Platforms

7705 SAR Gen 2

30.59 test-oam

test-oam

Syntax

test-oam

Full Context

configure service epipe sap eth-cfm mep eth-test-enable test-pattern

configure service epipe spoke-sdp eth-cfm mep eth-test-enable test-pattern

Description

This command configures the test pattern for ETH-test frames.

The **no** form of this command removes the values from the configuration.

Default

test-pattern all-zeros

Parameters

all-zeros

Keyword used to specify the use of all zeros in the test pattern.

all-ones

Keyword used to specify the use of all ones in the test pattern.

crc-enable

Keyword used to generate a CRC checksum.

Platforms

7705 SAR Gen 2

configure service vprn bgp group third-party-nexthop

Description

Use this command to enable the router to send third-party next-hop to EBGP peers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGP peers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

Default

no third-party-nexthop

Platforms

7705 SAR Gen 2

30.65 throttle-rate

throttle-rate

Syntax

throttle-rate *events* [**interval** *seconds*]

no throttle-rate

Context

[Tree] (config>log throttle-rate)

Full Context

configure log throttle-rate

Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

Default

throttle-rate 2000 interval 1

Parameters

events

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

Values 1 to 20000

Default 2000

seconds

Specifies the number of seconds that an event throttling interval lasts.

no ti-lfa

Context

[Tree] (config>router>isis>lfa ti-lfa)

Full Context

configure router isis loopfree-alternates ti-lfa

Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

Default

no ti-lfa

Parameters

value

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

Values 0 to 3

Default 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sids-value

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

30.67 tier

tier

Syntax

tier {**1** | **2**}

Context

[Tree] (config>qos>policer-control-policy tier)

Full Context

configure qos policer-control-policy tier

Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

Platforms

7705 SAR Gen 2

tier

Syntax

[**no**] **tier** *tier*

Context

[Tree] (config>qos>scheduler-policy tier)

Full Context

configure qos scheduler-policy tier

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

Parameters

tier

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

Values 1 to 3

30.69 time-display

time-display

Syntax

time-display {**local** | **utc**}

Context

[Tree] (environment time-display)

Full Context

environment time-display

Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

Default

time-display local

Parameters

local

Indicates that local time should be used.

utc

Indicates that UTC time should be used.

Platforms

7705 SAR Gen 2

time-display

Syntax

time-display {**local** | **utc**}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

Full Context

configure system management-interface cli md-cli environment time-display

Description

This command configures whether the time is displayed in coordinated Universal Time (UTC) or local time (as configured in **config**>**system**>**time**).

Default

time-display local

Parameters

local

Specifies that the local time zone is used.

utc

Specifies that UTC is used.

Platforms

7705 SAR Gen 2

30.70 time-exceeded

time-exceeded

Syntax

time-exceeded [*number seconds*]

no time-exceeded

Context

[Tree] (config>service>ies>if>ipv6>icmp6 time-exceeded)

Full Context

configure service ies interface ipv6 icmp6 time-exceeded

Description

This command specifies whether time-exceeded ICMP messages should be sent. When enabled, ICMPv6 time-exceeded messages are generated by this interface.

When disabled, ICMPv6 time-exceeded messages are not sent.

The **no** form of this command reverts to the default.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

time-exceeded 100 10

Parameters

number

Specifies the number of time-exceeded ICMP messages are to be issued in the time frame specified by the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, that is used to limit the number of time-exceeded ICMP message to be issued.

Values 1 to 60

Platforms

7705 SAR Gen 2

time-exceeded

Syntax

time-exceeded [*number seconds*]

no time-exceeded

time-format

Syntax

time-format {**local** | **utc**}

Context

[Tree] (config>service>vprn>log>log-id time-format)

Full Context

configure service vprn log log-id time-format

Description

This command specifies whether the time should be displayed in local or Coordinated Universal Time (UTC) format.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

time-format

Syntax

time-format {**local** | **utc**}

Context

[Tree] (config>log>log-id time-format)

Full Context

configure log log-id time-format

Description

This command specifies whether the time should be output in local or Coordinated Universal Time (UTC) format in the following event log locations:

- in the syslog TIMESTAMP field
- in the timestamp of log events inside log files on local storage devices

The timestamp in the filename of event log files is not affected by this command.

The output of **show log log-id** and the output of YANG state under /state/log/log-id are not affected by this command. See the **environment time-display** command.

Default

time-format utc

Parameters

local

Specifies that timestamps are written in the system's local time.

utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

Use subject to Terms available at: www.nokia.com/terms.

no time-inaccuracy

Context

[Tree] (config>system>ptp time-inaccuracy)

Full Context

configure system ptp time-inaccuracy

Description

This command overrides the system-generated value for the PTP clock's time inaccuracy with a specified value. The clock's time inaccuracy value is added to the total time inaccuracy value in IEEE_C37_238 TLVs sent to downstream clocks in Announce messages. If there is no time inaccuracy override configured, the system uses 50 ns as the default for boundary clocks.

This command is applicable only for boundary clocks and only when the profile is configured as **c37dot238-2017**.

The **no** form of this command removes the time inaccuracy override value.

Parameters

0..10000000

Specifies the time inaccuracy of the PTP clock, in nanoseconds, to be added to the total time inaccuracy in the IEEE_C37_238 TLV.

Values 0 to 10000000

Platforms

7705 SAR-Hx, 7705 SAR-Mx

timeout

Syntax

timeout [*seconds*]

no timeout

Context

[Tree] (config>filter>redirect-policy>dest>ping-test timeout)

Full Context

configure filter redirect-policy destination ping-test timeout

Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

Default

timeout 1

Parameters

seconds

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

Values 1 to 60

Platforms

7705 SAR Gen 2

timeout

Syntax

timeout *seconds*

no timeout

Full Context

configure vrrp policy priority-event host-unreachable timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

Default

timeout 1

Parameters

seconds

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

Values 1 to 60

no timeout

Context

[Tree] (config>system>security>ldap timeout)

Full Context

configure system security ldap timeout

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The **timeout** value is the number of seconds that the SR OS will wait for a response from the current server that it is trying to establish a connection with. If the server does not reply within the configured **timeout** value, the SR OS will increment the retry counter by 1. The SR OS attempts to establish the connection to the current server up to the configured **retry** value before it moves to the next configured server.

The **no** form of this command reverts to the default value.

Default

timeout 3

Parameters

seconds

The length of time that the SR OS waits for a response from the server.

Values 1 to 90

Default 3

Platforms

configure service vprn rip group timers

configure service vprn rip group neighbor timers

configure service vprn ripng group timers

configure service vprn rip timers

configure service vprn ripng timers

Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

  Determines how often RIP updates are sent.

- **timeout timer**

  If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

  Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

Default

no timers

Parameters

update

The RIP update timer value in seconds.

Values 1 to 600

Default 30

timeout

The RIP timeout timer value in seconds.

Values 1 to 1200

Default 180

flush

The RIP flush timer value in seconds.

Values 1 to 1200

Default 120

timers [**neighbor** *ip-address* | **group** *name*]

no timers

Context

[Tree] (debug>router>bgp timers)

Full Context

debug router bgp timers

Description

This command logs all BGP timer events to the debug log.

The **no** form of this command disables debugging.

Parameters

neighbor *ip-address*

Debugs only events affecting the specified BGP neighbor.

Values ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

group *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

configure router ripng timers

configure router rip group timers

configure router rip timers

configure router ripng group neighbor timers

configure router rip group neighbor timers

configure router ripng group timers

Description

This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. After the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default

timers 30 180 120

Parameters

update

Specifies the RIP update timer value in seconds expressed as a decimal integer.

Values 1 to 600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout

Specifies the RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 to 1200

flush

Specifies the RIP flush timer value in seconds expressed as a decimal integer.

30.80 timing

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

Full Context

configure oam-pm session ip twamp-light loss timing

Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

Default

timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5

Parameters

frames

Defines the size of the small measurement window. Each delta-t is marked as available of unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value thank single probe per metric approaches.

Values 1 to 50

Default 1

deltas

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

Values 2 to 10

Default 10

threshold

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

Values 1 to 9

Default 5

Platforms

7705 SAR Gen 2

timing

Syntax

timing frames-per-delta-t *frames* **consec-delta-t** *deltas* **interval** *milliseconds* **chli-threshold** *threshold*

no timing

Context

[Tree] (config>oam-pm>session>eth>slm timing)

Full Context

configure oam-pm session ethernet slm timing

Description

This command configures availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and uses those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or user configured.

Parameters

frames

Specifies the of SLM frames that define the size of the Delta-T (small measurement window). Each Delta-T is marked as available or unavailable based on the **flr-threshold**. The size of the Delta-T measurement is the product of the number of frames and the interval.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 50

Default 10

deltas

Specifies the number of consecutive Delta-T small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the **consec-delta-t** parameter is in a new state.

Values 2 to 10

Default 10

milliseconds

Specifies the number of milliseconds between the transmission of the SLM frames.

Values 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000

Default 100

threshold

Specifies the number of consecutive high-loss intervals (CHLI) (unavailable Delta-T) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable Delta-T intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

[Tree] (config>service>vprn>log>syslog tls-client-profile)

Full Context

configure log syslog tls-client-profile

configure service vprn log syslog tls-client-profile

Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

tls-client-profile

Specifies the name of a TLS profile configured in the **config**>**system**>**security**>**tls** context, up to 32 characters.

Platforms

7705 SAR Gen 2

tls-client-profile

Syntax

tls-client-profile *profile-name*

no tls-client-profile

Context

[Tree] (config>router>pcep>pcc>peer tls-client-profile)

Full Context

configure router pcep pcc peer tls-client-profile

Description

This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

Default

no tls-client-profile

Parameters

profile-name

Specifies the TLS client profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

30.84 tls-profile

tls-profile

Syntax

tls-profile *tls-profile-name*

no tls-profile

Context

[Tree] (config>system>security>ldap>server tls-profile)

Full Context

configure system security ldap server tls-profile

Description

This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

Parameters

tls-profile-name

Specifies the TLD profile for encryption.

Platforms

7705 SAR Gen 2

30.85 tls-re-negotiate-timer

tls-re-negotiate-timer

Context

[Tree] (config>router>mpls>lsp to)

Full Context

configure router mpls lsp to

Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to node-id** may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

Default

no default

Parameters

ip-address

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values ipv4-address — a.b.c.d
ipv6-address — x:x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

node-id *a.b.c.d.* | *1...4294967295*
4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

Syntax
to *ip-address*

Context
[Tree] (config>router>mpls>static-lsp to)

Full Context
configure router mpls static-lsp to

Description
This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

Parameters
ip-address
Specifies the system IP address of the egress router.

Context

[Tree] (config>log>accounting-policy to)

Full Context

configure log accounting-policy to

Description

This command specifies the destination for the accounting records selected for the accounting policy.

Parameters

file-id

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

Context

[Tree] (config>router>policy-options>policy-statement>entry to)

Full Context

configure router policy-options policy-statement entry to

Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

to netconf [*size*]

to session

to snmp [*size*]

to syslog *syslog-id*

Context

[Tree] (config>log>log-id to)

Full Context

configure log log-id to

Description

This command specifies a destination for the log event data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

Parameters

cli

Specifies that log events are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools**>**perform**>**log**>**subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

console

Specifies that log events events are directed to the console port. If the console is not connected, all the entries are dropped.

file *log-file-id*

Specifies that log events are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config**>**log**>**file** *file-id* context. When the *file-id* location parameter is

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear**>**log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

Values 1 to 99, *name* (up to 64 characters max)

memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

Default 100

netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

session

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

size

Specifies the maximum size of the log data destination, in bytes.

Values 50 to 3000

snmp

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

syslog *syslog-id*

Specifies that log events are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config**>**log**>**syslog** *syslog-id* context.

Values 1 to 10

Full Context

configure service vprn interface tos-marking-state

configure service ies interface tos-marking-state

Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

Default

tos-marking-state trusted

Parameters

trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set.

untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

31.2 traceroute

traceroute

Syntax

Context

[Tree] (traceroute)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

traceroute

Description

This command determines the route to a destination address. DNS lookups for the responding hosts are enabled by default.

Parameters

candidate-path

Specifies a candidate path of the SRv6 policy to traceroute. The candidate path does not need to be the currently active candidate path.

dest-port-udp-fixed

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP seat port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

decode

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

detail

Specifies to display additional information about the resulting packet.

distinguisher

Specifies the distinguisher of the SRv6 policy candidate path to send the traceroute probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

Values 1 to 4294967295

dns-name

Specifies the DNS name, up to 63 characters, of the far-end device on which to send the traceroute request message.

endpoint *ipv6-address*

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

Values

ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-address

Specifies the far-end IP address on which to send the traceroute request message in dotted decimal notation.

Values

ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x:x	
	x:x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

max-ttl

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

Values 1 to 255

Default 30

milliseconds

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

Values 1 to 60000

Default 5000

min-ttl

Specifies the IP TTL in the initial traceroute packet to target a specific node or starting node along the path.

Values 1 to 255

Default 1

no-dns

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

original-datagram

Parse the returned original datagram including any IPv6 and SRH header information.

pad-size

Specifies the number of bytes added to the UDP or TCP payload.

Values 0 to 9786

Default 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-number

Specifies the transport protocol destination port number.

Values 1 to 65535

Default 33434

preference

Specifies the preference of the SRv6 policy candidate path to send the traceroute probe on.

Values 0 to 4294967295

Default 100

probes-per-hop

Specifies the number of probes per hop.

Values 1 to 10

Default 3

protocol-owner

Specifies the protocol owner of the SRv6 policy candidate path to traceroute.

Values bgp — Specifies a BGP SRv6 policy.

static — Specifies a locally configured static SRv6 policy.

protocol udp | tcp

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VPRN services only respond to UDP traceroutes.

Default udp

router-or-service

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

Values router-name: Base, management, vpls-management

vprn-svc-id: 1 to 2147483647

Default Base

router-instance

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

Values router-name: Base, management, vpls-management

vprn-svc-name: up to 64 characters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

service-name

Specifies the alias function that allows the service name to be used, converted, and stored as service ID.

source *ip-address*

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

type-of-service

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

Values 0 to 255

Default 0

srv6-policy

Keyword to specify that the traceroute probe is applied to an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

color-id

Specifies the SRv6 policy color ID.

Values 0 to 4294967295

segment-list

Specifies the SRv6 policy segment list to trace.

Values 1 to 32

Platforms

7705 SAR Gen 2

traceroute to 2002:abcd:1100:102:1::, 30 hops max, 60 byte packets
  1   1  2001:100:4:12::4  (2001:100:4:12::4)  1.23 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 2001:1:1:1::112, DA = 2002:abcd:1100:102:1::
  2   1  2001:100:3:4::3  (2001:100:3:4::3)  2.25 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 2001:1:1:1::112, DA = 2002:abcd:1100:101:1::
             Segment Routing Header SRv6, Segments Left 1
                 Segment_List[0] = 2002:abcd:1100:102:1::
  3   1  2001:100:1:3::1  (2001:100:1:3::1)  3.21 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 2001:1:1:1::112, DA = 2002:abcd:1100:101:1::
             Segment Routing Header SRv6, Segments Left 1
                 Segment_List[0] = 2002:abcd:1100:102:1::
  4   1  2001:1:1:1::102  (2001:1:1:1::102)  9.16 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 2001:1:1:1::112, DA = 2002:abcd:1100:102:1::
             Segment Routing Header SRv6, Segments Left 0
                 Segment_List[0] = 2002:abcd:1100:102:1::
```

The following output is an example of traceroute of an SRv6 policy.

Output Example

```
A:node-2# traceroute srv6-policy color 10 endpoint 6:6:6:6::86 probe-count 1

traceroute srv6-policy color 10 endpoint 6:6:6:6::86, 30 hops max, 60 byte packets (excluding
 SRH)
  1  fc00::a0a:203 (fc00::a0a:203)    2.76 ms
  2  fc00::a0a:505 (fc00::a0a:505)    5.11 ms
  3  6:6:6:6::86 (6:6:6:6::86)    6.18 ms
```

The following output is an example of traceroute of an SRv6 policy using the **decode original-datagram** option.

Output Example

```
A:node-2# traceroute srv6-policy color 10 endpoint 6:6:6:6::86 probe-count 1 detail decode
 original-datagram
traceroute srv6-policy color 10 endpoint 6:6:6:6::86, 30 hops max, 60 byte packets (excluding
 SRH)
  1   1  fc00::a0a:203  (fc00::a0a:203)  2.70 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 1:1:1:1::61, DA = 3:3:3:3:0:a::
             Segment Routing Header SRv6, Segments Left 2
                 Segment_List[0] = 6:6:6:6::86
                 Segment_List[1] = 5:5:5:5:0:a::
  2   1  fc00::a0a:505  (fc00::a0a:505)  4.88 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
                 SA = 1:1:1:1::61, DA = 5:5:5:5:0:a::
             Segment Routing Header SRv6, Segments Left 1
                 Segment_List[0] = 6:6:6:6::86
                 Segment_List[1] = 5:5:5:5:0:a::
  3   1  6:6:6:6::86  (6:6:6:6::86)  5.51 ms
         Original Datagram
             IPv6 Header, Hop Limit 1, DSCP be
```

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

```
                SA = 1:1:1:1::61, DA = 6:6:6:6::86
```

The following output is an example of traceroute for a candidate path of an SRv6 policy.

Output Example

```
A:node-2# traceroute srv6-policy color 20 endpoint fc00::a14:106 probe-count 1 detail
 candidate-path protocol-owner static distinguisher 126 preference 100
traceroute srv6-policy color 20 endpoint fc00::a14:106 candidate-path protocol-owner static
 preference 100 distinguisher 126, 30 hops max, 60 byte packets (excluding SRH)
  1   1  fc00::a0a:203  (fc00::a0a:203)  2.87 ms
  2   1  fc00::a0a:505  (fc00::a0a:505)  4.58 ms
  3   1  fc00::a14:106  (fc00::a14:106)  6.28 ms
```

31.3 traceroute-reply

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>ipv6>vrrp traceroute-reply)

Full Context

configure service ies interface ipv6 vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Default

no traceroute-reply

Platforms

7705 SAR Gen 2

traceroute-reply

Syntax

[**no**] **traceroute-reply**

Context

[Tree] (config>service>ies>if>vrrp traceroute-reply)

Full Context

configure service ies interface vrrp traceroute-reply

Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

Default

no traceroute-reply

31.4 tracking-support

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>service>vprn>pim>if tracking-support)

Full Context

configure service vprn pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to disable Join message suppression.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no tracking-support

Platforms

7705 SAR Gen 2

tracking-support

Syntax

[**no**] **tracking-support**

Context

[Tree] (config>router>pim>interface tracking-support)

Full Context

configure router pim interface tracking-support

Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to enable join message suppression. This capability allows for upstream routers to explicitly track join membership.

The **no** form of this command disables tracking support.

Default

no tracking-support

Platforms

7705 SAR Gen 2

31.5 traffic-engineering

traffic-engineering

Syntax

[**no**] **traffic-engineering**

Context

[Tree] (config>router>isis traffic-engineering)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure router isis traffic-engineering

Description

This command enables this IS-IS instance to advertise TE link attributes for RSVP-TE and SR-TE enabled interfaces.

Default

no traffic-engineering

Platforms

7705 SAR Gen 2

traffic-engineering

Syntax

[**no**] **traffic-engineering**

Context

[Tree] (config>router>ospf traffic-engineering)

Full Context

configure router ospf traffic-engineering

Description

This command enables the advertisement of the traffic engineering information for the router and its links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering of this router are limited to calculations based on link and nodal constraints.

The **no** form of this command disables the advertisement of the traffic engineering information.

Default

no traffic-engineering

Platforms

7705 SAR Gen 2

configure ipsec ipsec-transport-mode-profile dynamic-keying transform

configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform

configure service ies interface ipsec ipsec-tunnel dynamic-keying transform

configure ipsec tunnel-template transform

configure router interface ipsec ipsec-tunnel dynamic-keying transform

Description

This command associates the IPsec transform sets allowed for this the CHILD_SA. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

The **no** form of this command removes the transform ID from the configuration.

Default

no transform

Parameters

transform-id

Specifies a number to identify a tranform used for CHILD_SA negotiation. Up to four transform ID can be specified.

Values 1 to 2048

Platforms

7705 SAR Gen 2

transform

Syntax

transform *transform-id* [*transform-id*]

no transform

configure service vprn interface sap ipsec-tunnel dynamic-keying transform

Description

This command associates the IPsec transform sets allowed for this tunnel. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no transform

Parameters

transform-id

Specifies the value used for transforms for dynamic keying.

Values 1 to 2048

Platforms

7705 SAR Gen 2

31.9 transit

transit

Syntax

transit [**inherit** | **all** | **vc-only** | **none**]

Context

[Tree] (config>service>vprn>ttl-propagate transit)

Full Context

configure service vprn ttl-propagate transit

Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under config>router>ttl-propagate>vprn-transit.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

Default

transit inherit

Parameters

inherit

specifies the TTL propagation behavior is inherited from the global configuration under config>router>ttl-propagate>vprn-transit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

none

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

vc-only

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

all

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

Platforms

7705 SAR Gen 2

configure service vprn ospf area virtual-link transit-delay

configure service vprn ospf area interface transit-delay

configure service vprn ospf3 area interface transit-delay

configure service vprn ospf3 area virtual-link transit-delay

Description

This command configures the estimated time, in seconds, that it takes to transmit a LSA on the interface or virtual link or sham-link.

The **no** form of this command reverts to the default delay time.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

transit-delay 1

Parameters

seconds

The transit delay in seconds expressed as a decimal integer.

Values 0 to 3600

Platforms

7705 SAR Gen 2

transit-delay

Syntax

transit-delay *seconds*

no transit-delay

Context

[Tree] (config>router>ospf>area>virtual-link transit-delay)

[Tree] (config>router>ospf3>area>virtual-link transit-delay)

[Tree] (config>router>ospf>area>interface transit-delay)

[Tree] (config>router>ospf3>area>interface transit-delay)

Full Context

configure router ospf area virtual-link transit-delay

configure router ospf3 area virtual-link transit-delay

configure router ospf area interface transit-delay

configure router ospf3 area interface transit-delay

Description

This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.

The **no** form of this command reverts to the default delay time.

Default

transit-delay 1

Parameters

seconds

Specifies the transit delay in seconds expressed as a decimal integer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 1800

Platforms
7705 SAR Gen 2

31.11 transmission-profile

transmission-profile

Syntax
transmission-profile *name*
no transmission-profile

Context
[Tree] (config>system>security>pki>ca-profile>ocsp transmission-profile)

Full Context
configure system security pki ca-profile ocsp transmission-profile

Description
This command specifies the transmission-profile for OCSP. When specified, this configuration overrides the **service** *service-id* or **service** *service-name* configured in the **config>system>security>pki>ca-profile>ocsp** context.

The **no** form of the command removes the profile name from the configuration.

Default
no transmission-profile

Parameters
name
Specifies the file transmission profile name, up to 32 characters.

Platforms
7705 SAR Gen 2

transmission-profile

Syntax
transmission-profile *name*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

no transmission-profile

Context

[Tree] (config>system>security>pki>est-profile transmission-profile)

Full Context

configure system security pki est-profile transmission-profile

Description

This command specifies the transmission profile name created in the **config>system file-transmission-profile** context for the EST profile.

The **no** form of the command removes the name from the EST profile configuration.

Default

no transmission-profile

Parameters

name

Specifies the file transmission profile name, up to 32 characters.

Platforms

7705 SAR Gen 2

31.12 transmit-interval

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>bfd>bfd-template transmit-interval)

Full Context

configure router bfd bfd-template transmit-interval

Description

This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

transmit-interval 100

Parameters

transmit-interval

Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

Values 10 ms to 100,000 ms in 1 ms intervals

Default 10 ms for CPM3 or higher; 1 second for other hardware

Platforms

7705 SAR Gen 2

transmit-interval

Syntax

[**no**] **transmit-interval** *interval* [**multiplier** *multiplier*]

Context

[Tree] (config>port>ethernet>efm-oam transmit-interval)

Full Context

configure port ethernet efm-oam transmit-interval

Description

This command configures the transmit interval of OAM PDUs.

The **no** form of this command removes the configuration.

Default

transmit-interval 10 multiplier 5

Parameters

interval

Specifies the transmit interval, in 100 milliseconds.

Values 1 to 600

multiplier

Specifies the multiplier for transmit-interval to set local link down timer.

Values 2 to 5

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms

7705 SAR Gen 2

transmit-interval

Syntax

transmit-interval *transmit-interval*

no transmit-interval

Context

[Tree] (config>router>lsp-bfd>tail-end transmit-interval)

Full Context

configure router lsp-bfd tail-end transmit-interval

Description

This command configures the LSP BFD minimum transmit interval for the tail end of LSP BFD sessions.

The **no** form of this command reverts to the default value.

Default

transmit-interval 1000

Parameters

transmit-interval

Specifies the transmit interval, in milliseconds.

Values 100 to 1000

Default 1000

Platforms

7705 SAR Gen 2

31.13 transmit-period

transmit-period

Syntax

transmit-period *seconds*

no transmit-period

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>port>ethernet>dot1x transmit-period)

Full Context

configure port ethernet dot1x transmit-period

Description

This command configures the period after which the router sends a new EAPOL request message.

The **no** form of this command returns the value to the default.

Default

transmit-period 30

Parameters

seconds

Specifies the server transmit period in seconds.

Values 1 to 3600

Platforms

7705 SAR Gen 2

31.14 transport

transport

Syntax

transport *transport-protocol*

no transport

Context

[Tree] (config>system>snmp transport)

Full Context

configure system snmp transport

Description

This command configures the transport protocol used by the SNMP agent.

The **no** form of this command removes the transport protocol.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no transport

Parameters

transport-protocol

Specifies the transport protocol.

Values **udp** — Keyword to specify UDP only.
tcp — Keyword to specify TCP only.
both — Keyword to specify TCP and UDP.

Default udp

Platforms

7705 SAR Gen 2

31.15 transport-address

transport-address

Syntax

transport-address {**interface** | **system**}
no transport-address

Context

[Tree] (config>router>ldp>if-params>ipv6 transport-address)
[Tree] (config>router>ldp>if-params>if>ipv4 transport-address)
[Tree] (config>router>ldp>if-params>ipv4 transport-address)
[Tree] (config>router>ldp>if-params>if>ipv6 transport-address)

Full Context

configure router ldp interface-parameters ipv6 transport-address
configure router ldp interface-parameters interface ipv4 transport-address
configure router ldp interface-parameters ipv4 transport-address
configure router ldp interface-parameters interface ipv6 transport-address

Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

Default

system

Parameters

interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

system

Specifies the system IP address is used to set up the LDP session between neighbors.

Platforms

7705 SAR Gen 2

31.16 transport-encryption

transport-encryption

Syntax

transport-encryption

Context

[Tree] (config>redundancy>multi-chassis>peer>sync transport-encryption)

© 2026 Nokia.

Full Context

configure redundancy multi-chassis peer sync transport-encryption

Description

Commands in this context configure MCS applications that need to encrypt synchronized states for transportation .

Platforms

7705 SAR Gen 2

31.17 transport-tunnel

transport-tunnel

Syntax

transport-tunnel

Context

[Tree] (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel

Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

trap-target

Syntax

trap-target name address *ip-address* [**port port**] [**snmpv1** | **snmpv2c** | **snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level** {**no-auth-no-privacy** | **auth-no-privacy** | **privacy**}] [**replay**]

no trap-target *name*

Context

[Tree] (config>service>vprn>log>snmp-trap-group trap-target)

Full Context

configure service vprn log snmp-trap-group trap-target

Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Default

No SNMP trap targets are defined.

Parameters

name

specifies the name of the trap target up to 28 characters in length

address *ip-address*

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values		
	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x:x[-interface]
		x:x:x:x:x:x:d.d.d.d[-interface]
		x: [0 to FFFF]H
		d: [0 to 255]D
		interface: 32 characters maximum, mandatory for link local addresses

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Values 1 to 65535

Default 162

snmpv1 | *snmpv2c* | *snmpv3*

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

Values snmpv1, snmpv2c, snmpv3

Default snmpv3

notify-community community | *security-name*

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

security-name

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Values no-auth-no-privacy, auth-no-privacy, privacy

Default no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

replay

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

Context

[Tree] (config>log>snmp-trap-group trap-target)

Full Context

configure log snmp-trap-group trap-target

Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

Note:
If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

Parameters

name

Specifies the name of the trap target, up to 28 characters.

ip-address

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

Values

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

port

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

Default 162

Values 1 **to** 65535

snmpv1 | *snmpv2c* | *snmpv3*

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c,** then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

Default snmpv3

Values snmpv1, snmpv2c, snmpv3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

community | *security-name*

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

community-name

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

security-name

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

security-level {no-auth-no-privacy | auth-no-privacy | privacy}

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

Default **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

Values no-auth-no-privacy, auth-no-privacy, privacy

replay

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

Note:
Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-

Full Context

configure port ethernet efm-oam trigger-fault

Description

This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an operationally up state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without waiting for protocol timeouts, assuming the peer supports the necessary action when it receives the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

Default

no trigger-fault

Parameters

dying-gasp

Keyword to set the dying gasp flag.

critical-event

Keyword to set the critical event flag.

Platforms

7705 SAR Gen 2

31.24 triggered-policy

triggered-policy

Syntax

[**no**] **triggered-policy**

Context

[Tree] (config>router triggered-policy)

Full Context

configure router triggered-policy

Description

This command triggers route policy re-evaluation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

no triggered-policy

31.30 ts-location

ts-location

Syntax

ts-location *file-url*

no ts-location

Context

[Tree] (config>system>security>tech-support ts-location)

Full Context

configure system security tech-support ts-location

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the ts-location is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

Default

no ts-location

Parameters

file-url

Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, cf1:\) is blocked for local compact flash destinations. A sub-directory (for example, cf2:\tech-support) must be used if local cf is the location.

Values

local-url | *remote-url*	
local-url	[*cflash-id*/][*file-path*] 200 chars max, including cflash-id
	directory length 99 chars max each
remote-url	[ftp://*login:pswd@remote-locn*/][*file-path*]
	247 chars max
	directory length 99 chars max each

31.33 ttl-expired

ttl-expired

Syntax

ttl-expired *number seconds*

no ttl-expired [*number seconds*]

Context

[Tree] (config>service>ies>if>icmp ttl-expired)

Full Context

configure service ies interface icmp ttl-expired

Description

This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

Default

ttl-expired 100 10

Parameters

number

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

Values 1 to 60

Platforms

7705 SAR Gen 2

[Tree] (config>router>ldp>tcp-session-params>peer-transport ttl-security)

Full Context

configure system login-control ssh ttl-security

configure router bgp group ttl-security

configure system login-control telnet ttl-security

configure router bgp group neighbor ttl-security

configure router ldp tcp-session-parameters peer-transport ttl-security

Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

Parameters

min-ttl-value

Specifies the minimum TTL value for an incoming BGP packet.

Values 1 to 255

Platforms

7705 SAR Gen 2

31.36 tunnel

tunnel

Syntax

Full Context

debug ipsec tunnel

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables debugging for specified IPsec tunnel.

Note:
Up to 16 IPsec tunnels are allowed, to enable debugging, at a time.

Parameters

ipsec-tunnel-name

Specifies the name of ipsec-tunnel, up to 32 characters.

detail

Displays detailed debug information.

no-dpd-debug

Stops logging IKEv1 and IKEv2 DPD events for less noise during debug.

display-keys

Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

Platforms

7705 SAR Gen 2

tunnel

Syntax

tunnel *name* **[create]**

no tunnel *name*

Context

[Tree] (config>system>grpc-tunnel tunnel)

Full Context

configure system grpc-tunnel tunnel

Description

Commands in this context configure gRPC tunnel parameters for the specified tunnel. There can be multiple tunnels to one or more destinations.

The **no** form of this command removes the specified gRPC tunnel.

Parameters

name

Specifies the tunnel name, up to 32 characters.

create

Keyword used to create a tunnel.

Default

tunnel-dot1q

Platforms

7705 SAR Gen 2

31.38 tunnel-down-damp-time

tunnel-down-damp-time

Syntax

tunnel-down-damp-time *seconds*

no tunnel-down-damp-time

Context

[Tree] (config>router>ldp tunnel-down-damp-time)

Full Context

configure router ldp tunnel-down-damp-time

Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

seconds

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

Platforms

7705 SAR Gen 2

31.39 tunnel-elmi

tunnel-elmi

Syntax

[**no**] **tunnel-elmi**

Context

[Tree] (config>service>vpls tunnel-elmi)

Full Context

configure service vpls tunnel-elmi

Description

This command enables the tunneling of E-LMI packets in a VPLS service. The following must also be true for this command to function:

- the **configure port ethernet elmi mode uni-n** command is not configured
- the E-LMI packets map to that VPLS service

The **no** form of this command disables tunneling of the E-LMI packets for a VPLS service.

Default

no tunnel-elmi

Description

This command enables debugging for OSPF tunnel endpoints.

Parameters

tunnel-spf

Specifies the tunnel SPF IP address.

tunnel-leak

Specifies the tunnel leak IP address.

ip-address

Specifies the IP address.

Platforms

7705 SAR Gen 2

31.41 tunnel-far-end

tunnel-far-end

Syntax

tunnel-far-end *ip-address* | *ipv6-address*

no tunnel-far-end [*ip-address* | *ipv6-address*]

Context

[Tree] (config>service>sdp tunnel-far-end)

Full Context

configure service sdp tunnel-far-end

Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

Default

no tunnel-far-end

Parameters

ip-address | *ipv6-address*

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

Platforms

7705 SAR Gen 2

31.42 tunnel-group

tunnel-group

Syntax

no tunnel-group *tunnel-group-id*

Context

[Tree] (config>isa tunnel-group)

Full Context

configure isa tunnel-group

Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type.

The **no** form of this command deletes the specified tunnel group from the configuration

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

tunnel-group-id

Identifies the tunnel group.

Values 1 to 16

isa-scale-mode

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group. When it is not explicitly specified, **isa-scale-mode** has a default value, but that value is different on different platforms.

Values tunnel-limit-2k, tunnel-limit-32k, tunnel-limit-64k, tunnel-limit-8, tunnel-limit-32

create

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

tunnel-group

31.43 tunnel-interface

tunnel-interface

Syntax

[**no**] **tunnel-interface** {**rsvp-p2mp** *lsp-name* | **ldp-p2mp** *p2mp-id* **sender** *sender-address* [**root-node**]}

Context

[Tree] (config>router tunnel-interface)

Full Context

configure router tunnel-interface

Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Parameters

rsvp-p2mp *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

ldp-p2mp *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

Values 1 to 4294967296 (on leaf node)
1 to 8192 (on root node)

sender *sender-address*

Specifies the sender IP address: a.b.c.d.

Platforms

7705 SAR Gen 2

© 2026 Nokia.

31.45 tunnel-mtu

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>isis>segment-routing tunnel-mtu)

Full Context

configure router isis segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

*SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr-overhead)*4}*

Where:

Cfg_SR_MTU is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

IGP_Tunnel_MTU is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

frr-overhead is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

Values 512 to 9786

Platforms

7705 SAR Gen 2

tunnel-mtu

Syntax

tunnel-mtu *bytes*

no tunnel-mtu

Context

[Tree] (config>router>ospf>segm-rtng tunnel-mtu)

configure router ospf segment-routing tunnel-mtu

Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The MTU of the SR tunnel in bytes is then determined as follows:

SR_Tunnel_MTU = MIN {Cfg_SR_MTU, IGP_Tunnel_MTU- (1+frr—overhead)X4}

Where:

- *Cfg_SR_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the tunnel-mtu command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP_Tunnel_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

Default

no tunnel-mtu

Parameters

bytes

Specifies the size of the MTU in bytes.

Values 512 to 9786

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>isis>igp-shortcut tunnel-next-hop)

Full Context

configure router isis igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

Platforms

7705 SAR Gen 2

tunnel-next-hop

Syntax

tunnel-next-hop

Context

[Tree] (config>router>ospf3>igp-shortcut tunnel-next-hop)

[Tree] (config>router>ospf>igp-shortcut tunnel-next-hop)

Full Context

configure router ospf3 igp-shortcut tunnel-next-hop

configure router ospf igp-shortcut tunnel-next-hop

Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution**=**match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

Note:
An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

configure router ldp tunnel-table-pref

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

Default

tunnel-table-pref 9

Parameters

preference

Specifies the preference value.

Values 1 to 255

Default 9

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

Full Context

configure router isis segment-routing tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

tunnel-table-pref 11

Parameters

preference

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

Values 1 to 255

Platforms

7705 SAR Gen 2

tunnel-table-pref

Syntax

tunnel-table-pref *preference*

no tunnel-table-pref

Context

[Tree] (config>router>ospf>segm-rtng tunnel-table-pref)

Full Context

configure router ospf segment-routing tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note:
The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Default

tunnel-table-pref 10

Parameters

preference

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

Full Context

configure router ldp targeted-session auto-rx ipv4 tunneling

configure router ldp targeted-session auto-tx ipv4 tunneling

Description

This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

The **no** form of this command disables the local system from sending FEC/label bindings.

Default

no tunneling

Parameters

mac-address

Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

remote-mepid *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the source MEP for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

Values 1 to 8191

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

priority

Specifies the priority.

Values 0 to 7

Default 7

send-count

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

Values 1 to 1000

Default 1

data-size

Specifies the size of the data portion of the Data TLV. If 0 is specified, no Data TLV is added to the packet.

Values 0 to 1500

Default 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. After the expiration of the message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

Values 1 to 10

Default 5

interval

Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

Values 0.1 to 0.9, 1 to 10

Default 5

configure port ethernet lldp dest-mac tx-mgmt-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies which management address to transmit. The operator can choose to send the system IPv4 address, the system IPv6 address, the out-of-band IPv4 address, the out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol in order to send the management address.

The **no** form of the command resets value to the default.

Default

no tx-mgmt-address

Parameters

system

Specifies to use the system IP address. The system address will only be transmitted once it has been configured if this parameter is specified.

system-ipv6

Specifies to use the system IPv6 address. The system address will only be transmitted once it has been configured if this parameter is specified.

oob

Specifies to use the out-of-band IPv4 address for active CPM.

oob-ipv6

Specifies to use the out-of-band IPv6 address for active CPM.

Platforms

7705 SAR Gen 2

tx-tlvs

Syntax

tx-tlvs [**port-desc**] [**sys-name**] [**sys-desc**] [**sys-cap**]

no tx-tlvs

Context

[Tree] (config>port>ethernet>lldp>dstmac tx-tlvs)

Full Context

configure port ethernet lldp dest-mac tx-tlvs

Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

Default

no tx-tlvs

Parameters

port-desc

Indicates that the LLDP agent should transmit port description TLVs.

sys-name

Indicates that the LLDP agent should transmit system name TLVs.

sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

31.68 tx-while-sync-uncertain

tx-while-sync-uncertain

Syntax

[**no**] **tx-while-sync-uncertain**

Context

[Tree] (config>system>ptp tx-while-sync-uncertain)

Full Context

configure system ptp tx-while-sync-uncertain

Description

This command configures the local PTP clock to transmit Announce messages to downstream clocks, indicating it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the SyncUncertain state is true.

The **no** form of this command prevents the local PTP clock from sending Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the **no** form of this command is used while the SyncUncertain state for the clock is true, unicast negotiation grant requests are not granted and current grants are cancelled.

Default

tx-while-sync-uncertain

Platforms

7705 SAR-Hx, 7705 SAR-Mx

31.69 type

type

Syntax

type *reflector-type*

Context

[Tree] (config>service>vprn>twamp-light>refl type)

[Tree] (config>router>twamp-light>reflector type)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Full Context

configure service vprn twamp-light reflector type

configure router twamp-light reflector type

Description

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of session senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A session sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

Default

type twamp-light

Parameters

reflector-type

Specifies the type of processing behavior for the reflector.

Values stamp, twamp-light

Platforms

7705 SAR Gen 2

type

Syntax

[**no**] **type** {**internal** | **external**}

Context

[Tree] (config>service>vprn>bgp>group>neighbor type)

[Tree] (config>service>vprn>bgp>group type)

Full Context

configure service vprn bgp group neighbor type

configure service vprn bgp group type

Description

This command designates the BGP peer as type internal or external.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The type of **internal** indicates the peer is an IBGP peer while the type of external indicates that the peer is an EBGP peer.

By default, the OS derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

Default

no type

Parameters

internal

Configures the peer as internal.

external

Configures the peer as external.

no type

Type of neighbor is derived on the local AS specified.

Platforms

7705 SAR Gen 2

type

Syntax

type [**hub** | **spoke** | **subscriber-split-horizon**]

no type

Context

[Tree] (config>service>vprn type)

Full Context

configure service vprn type

Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

Default

no type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

Platforms

7705 SAR Gen 2

type

Syntax

[**no**] **type**

Context

[Tree] (config>saa>test type)

Full Context

configure saa test type

Description

This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

Full Context

file type

Description

This command displays the contents of a text file.

Parameters

file-url

Specifies the file contents to display.

Values

local-url	[*cflash-id/*][*file-path*] up to 200 characters, including cflash-id directory length up to 99 each
remote-url	[{ftp | tftp | sftp | http | https}:///*login*:*pswd*@*remote-locn*/][*file-path*]
	up to 247 characters
	directory length up to 99 characters each
remote-locn	[hostname | ipv4-address | [ipv6-address]]
ipv4-address	*a.b.c.d*
ipv6-address	*x:x:x:x:x:x:x:x*[*-interface*]
	x:x:x:x:x:x:d.d.d.d[*-interface*]

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - up to 32 characters, for link local addresses 255
cflash-id	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

profile

Specifies the TLS client profile configured under **config**>**system**>**security**>**tls**> **client-tls-profile** to use.

proxy-url

Specifies the URL of an HTTP proxy. For example, http://proxy.mydomain.com:8000. This URL must be an HTTP URL and not an HTTPS URL.

no-redirect

Keyword to automatically refuse any HTTP redirects without prompting the user.

router-instance

Specifies the router name or the VPRN service ID.

Values

router-instance:	*router-name* | *vprn-svc-id*
router-name:	"Base" | "management" | "vpls-management"
vprn-svc-id:	1 to 2147483647

[Tree] (config>router>policy-options>policy-statement>default-action type)

Full Context

configure router policy-options policy-statement entry action type

configure router policy-options policy-statement default-action type

Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

type 2

Parameters

type

Specifies the type metric.

Values Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

param-name

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

Full Context

configure service nat cpm-nat-policy timeouts udp-dns

Description

This command configures the timeout applied to a UDP session with destination port 53.

The **no** form of this commands reverts to the default value.

Default

udp-dns sec 15

Parameters

hours

Specifies the timeout, in hours.

Values 1 to 24

minutes

Specifies the timeout, in minutes.

Values 1 to 59

seconds

Specifies the timeout, in seconds.

Values 1 to 59

32.5 unavailability-event

unavailability-event

Syntax

unavailability-event {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

no unavailability-event {**forward** | **backward** | **aggregate**}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss-events unavailability-event)

Full Context

configure oam-pm session ip twamp-light loss-events unavailability-event

Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

Default

no unavailability-event forward

no unavailability-event backward

no unavailability-event aggregate

Parameters

forward

Specifies the threshold is applied to the forward direction count.

backward

Specifies the threshold is applied to the backward direction count.

aggregate

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

raise-threshold

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

Values 1 to 864000

clear-threshold

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

Values 0 to 863999

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A value of zero means that the unavailability counter must be 0.

Platforms

7705 SAR Gen 2

unavailability-event

Syntax

configure router ospf3 unicast-import-disable

Description

This command allows one IGP to import its routes into RPF RTM while another IGP imports routes only into the unicast RTM. Import policies can redistribute routes from an IGP protocol into the RPF RTM (the multicast routing table). By default, the IGP routes are not imported into RPF RTM as such an import policy must be explicitly configured.

Default

no unicast-import-disable

Platforms

7705 SAR Gen 2

32.15 unicast-rt-test

unicast-rt-test

Syntax

[**no**] **unicast-rt-test**

Context

[Tree] (config>filter>redirect-policy>dest unicast-rt-test)

Full Context

configure filter redirect-policy destination unicast-rt-test

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures a unicast route test for this destination. A destination is eligible for redirect if a valid unicast route to that destination exists in the routing instance specified by **config>filter>redirect-policy>router**. The unicast route test is mutually exclusive with other redirect-policy test types.

The test cannot be configured if **no router** is configured for this redirect policy.

The **no** form of the command disables the test.

Default

no unicast-rt-test

32.17 unknown-mac-route

unknown-mac-route

Syntax

[**no**] **unknown-mac-route**

Context

[Tree] (config>service>vpls>bgp-evpn unknown-mac-route)

Full Context

configure service vpls bgp-evpn unknown-mac-route

Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7705 SAR Gen 2 can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

Default

no unknown-mac-route

Platforms

7705 SAR Gen 2

32.18 unknown-message-rate

unknown-message-rate

Syntax

unknown-message-rate *integer*

no unknown-message-rate

32.20 unknown-policer

unknown-policer

Syntax

unknown-policer *policer-id* [**fp-redirect-group**]

no unknown-policer

Context

[Tree] (config>qos>sap-ingress>fc unknown-policer)

Full Context

configure qos sap-ingress fc unknown-policer

Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown** *queue-id* or **unknown** *queue-id* **group** *ingress-queue-group* commands) or an ingress policer (**unknown-policer** *policer-id*). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

Parameters

policer-id

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

Values 1 to 63

fp-redirect-group

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

Platforms

7705 SAR Gen 2

32.21 unknown-queue

unknown-queue

Syntax

unknown-queue *queue-id* [**group** *queue-group-name*]

no unknown-queue

Context

[Tree] (config>qos>sap-ingress>fc unknown-queue)

Full Context

configure qos sap-ingress fc unknown-queue

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

Parameters

queue-id

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

Values Any valid multipoint *queue-id* in the policy including 2 through 32.

Default 11

group *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified queue-id within the queue-group-name. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

7705 SAR Gen 2

32.22 unlock

unlock

Syntax

unlock [**card** *cpm-slot*]

Context

[Tree] (admin>system>security>os-security>anti-theft unlock)

Full Context

admin system security os-security anti-theft unlock

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command disables anti-theft locking to allow router configuration. When prompted, the user must enter their OS security password, which is configured using the **admin system security os-security set-password** command. For each incorrect password attempt, the initial unsuccessful authentication wait period is doubled. This wait period is common for all users. Entering the correct password resets the wait period to the initial value for all users.

Parameters

cpm-slot

Specifies the CPM slot on which to disable the anti-theft locking.

Platforms

7705 SAR Gen 2

32.23 unnumbered

unnumbered

Syntax

unnumbered {*ip-int-name* | *ip-address*}

no unnumbered

Context

[Tree] (config>service>ies>if unnumbered)

Full Context

configure service ies interface unnumbered

Description

This command configures the interface as an unnumbered interface. Unnumbered IP interfaces are supported on a SONET/SDH access port with the PPP, ATM, Frame Relay, cisco-HDLC encapsulation. It is not supported on access ports that do not carry IP traffic, but are used for native TDM circuit emulation.

Parameters

ip-int-name

Specifies the name of an IP interface. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes.

ip-address

Specifies an IP address.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unnumbered

Syntax

unnumbered [*ip-int-name* | *ip-address*]

no unnumbered

Context

[Tree] (config>router>if unnumbered)

Full Context

configure router interface unnumbered

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

Default

no unnumbered

Parameters

ip-int-name | *ip-address*

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

configure service vprn interface icmp unreachables

configure service vprn network-interface icmp unreachables

configure service ies interface icmp unreachables

Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachables on the router interface. The rate at which ICMP unreachables is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachables messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

Default

unreachables 100 10

Parameters

number

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

Values 10 to 2000

seconds

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

Values 1 to 60

32.26 untrusted

untrusted

Syntax

untrusted [**default-forwarding** *default-forwarding*]

no untrusted

Context

[Tree] (config>router>if untrusted)

Full Context

configure router interface untrusted

Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no untrusted

Parameters

default-forwarding

Specifies the default forwarding behavior of labeled packets received on this interface.

Values forward, drop

Default forward

unzip

Syntax

unzip *source-file-url* [*dest-file-url*] **list** [**router** *router-instance*]

unzip *source-file-url dest-file-url* [**create-destination**] [**force**] [**router** *router-instance*]

Context

[Tree] (file unzip)

Full Context

file unzip

Description

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

Parameters

source-file-url, dest-file-url

Specifies the source or destination file URL.

Values

local-url	[*cflash-id*/]*file-path*
	200 chars max, including cflash-id
	directory length 99 chars max each

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote-url	{ftp | tftp | sftp}://[*login*:*pswd*@]
	remote-locn / [*file-path*]
	247 chars max, *file-path* 199 chars max
remote-locn	{*hostname* | *ipv4-address* | "["i*pv6-address*"]" }[:*port*]|
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D
	interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1: | cf1-A: | cf2: | cf2-A: | cf3: | cf3-A:

create-destination

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

list

Keyword that lists the content of the ZIP file without performing the unzip operation.

force

Keyword that overwrites, without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

router-instance

Specifies the router name or the VPRN service ID.

Values

router-instance:	*router-name* | *vprn-svc-id*
router-name:	"Base" | "management" | "vpls-management"
vprn-svc-id:	1 to 2147483647

32.32 update-fault-tolerance

update-fault-tolerance

Syntax

[**no**] **update-fault-tolerance**

Context

[Tree] (config>service>vprn>bgp>error-handling update-fault-tolerance)

[Tree] (config>service>vprn>bgp>group>neighbor>error-handling update-fault-tolerance)

[Tree] (config>service>vprn>bgp>group>error-handling update-fault-tolerance)

Full Context

configure service vprn bgp error-handling update-fault-tolerance

configure service vprn bgp group neighbor error-handling update-fault-tolerance

configure service vprn bgp group error-handling update-fault-tolerance

Description

This command enables **treat-as-withdraw** and other similarly non-disruptive approaches for handling a wide range of UPDATE message errors, as long as there are no length errors that prevent all of the NLRI fields from being correctly identified and parsed.

Default

no update-fault-tolerance

Platforms

7705 SAR Gen 2

update-fault-tolerance

32.33 update-interval

update-interval

Syntax

update-interval *minutes* [**jitter** *seconds*]

no update-interval

Context

[Tree] (config>ipsec>rad-acct-plcy update-interval)

Full Context

configure ipsec radius-accounting-policy update-interval

Description

This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

Default

update-interval 10

Parameters

minutes

Specifies the interval in minutes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 5 to 259200

seconds

Specifies the jitter as the number of seconds when the system sends each interim-update packet.

Values 0 to 3600

Platforms

7705 SAR Gen 2

32.35 update-timer

update-timer

Syntax

update-timer *seconds*

no update-timer

Context

[Tree] (config>router>rsvp>te-threshold-update update-timer)

Full Context

configure router rsvp te-threshold-update update-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command is to control timer-based IGP TE updates. Timer-based IGP updates can be enabled by specifying a non-zero time value. Default value of update-timer is 0.

The **no** form of this command should reset update-timer to the default value and disable timer-based IGP update.

Default

no update-timer

Parameters

seconds

Specifies the time in seconds.

Values 0 to 300

Platforms

7705 SAR Gen 2

32.36 updates

updates

Syntax

[**no**] **updates** [**neighbor** *ip-int-name* | *ip-address*]

Context

[Tree] (debug>router>rip updates)

Full Context

debug router rip updates

Description

This command enables debugging for RIP updates.

Parameters

ip-int-name **|** *ip-address*

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

updates

Syntax

[**no**] **updates** [**neighbor** *ip-int-name* | *ipv6-address*]

Context

[Tree] (debug>router>ripng updates)

Full Context

debug router ripng updates

Description

This command enables debugging for RIP updates.

Parameters

*ip-int-name***|** *ipv6-address*

Debugs the RIP updates sent on the neighbor IP address or interface.

Platforms

7705 SAR Gen 2

32.37 upstream-ip-filter

upstream-ip-filter

Syntax

upstream-ip-filter *filter-id*

no upstream-ip-filter

Context

[Tree] (config>service>vprn>nat>outside upstream-ip-filter)

[Tree] (config>router>nat>outside upstream-ip-filter)

Full Context

configure service vprn nat outside upstream-ip-filter

configure router nat outside upstream-ip-filter

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

Default

no upstream-ip-filter

Parameters

filter-id

Specifies the identifier of an IP filter.

Platforms

7705 SAR Gen 2

32.38 url

url

Syntax

url *url*

no url

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

Note:
The URL must point to a DER encoded CRL.

Default

no url

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

url

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

Platforms

7705 SAR Gen 2

url

Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

Context

[Tree] (config>system>security>pki>ca-profile>cmpv2 url)

Full Context

configure system security pki ca-profile cmpv2 url

Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL is resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system tries to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system connects to the address in the management routing instance first, then the base routing instance.

Note:
If the service is VPRN, the system only allows HTTP ports 80 and 8080.

Parameters

url-string

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

service-id *service-id*

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

Values service-id: 1 to 2147483647 base-router: 0

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

service-name *service-name*

Identifies the service, up to 64 characters.

Platforms

7705 SAR Gen 2

32.39 url-entry

url-entry

Syntax

url-entry *entry-id* [**create**]

no url-entry *entry-id*

Context

[Tree] (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

Parameters

entry-id

Specifies a URL configured on this system.

Values 1 to 8

create

Creates an auto URL entry.

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configure service vprn network-interface urpf-check

configure service vprn interface ipv6 urpf-check

configure service vprn interface urpf-check

configure service ies interface ipv6 urpf-check

configure service ies interface urpf-check

Description

This command enables unicast RPF (uRPF) check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

Default

no urpf-check

Platforms

7705 SAR Gen 2

urpf-check

Syntax

urpf-check

no urpf-check

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>network>ingress urpf-check)

Full Context

configure service vprn network ingress urpf-check

Description

This command enables the unicast RPF (uRPF) check of network ingress traffic to include traffic associated with the VPRN if the incoming network interface is configured with the **urpf-selected-vprns** command

If the command is not configured, then traffic associated with this VPRN that arrives on a network interface with **urpf-selected-vprns** configured bypasses the uRPF checking options specified for that network interface.

Default

no urpf-check

Platforms

7705 SAR Gen 2

urpf-check

Syntax

[**no**] **urpf-check**

Context

[Tree] (config>router>if urpf-check)

[Tree] (config>router>if>ipv6 urpf-check)

32.41 urpf-selected-vprns

urpf-selected-vprns

Syntax

[**no**] **urpf-selected-vprns**

Context

[Tree] (config>router>if urpf-selected-vprns)

Full Context

configure router interface urpf-selected-vprns

Description

This command enables uRPF checking of incoming traffic on the network interface for the following packets.

- Packets associated with the global routing table (base router) context.
- Packets associated with VPRNs that have enabled the uRPF check using the **config**>**service**>**vprn**>**network**> **ingress**>**urpf-check** command.

If the command is not configured, the default action is to perform uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** configuration options of the network interface.

Default

no urpf-selected-vprns

Platforms

7705 SAR Gen 2

32.42 use-arp

use-arp

Syntax

[**no**] **use-arp**

Context

[Tree] (config>service>vprn>if>dhcp use-arp)

Full Context

configure service ies interface dhcp use-arp

configure service vprn interface dhcp use-arp

Description

This command enables the use of ARP to determine the destination hardware address.

The **no** form of this command disables the use of ARP to determine the destination hardware address.

Platforms

7705 SAR Gen 2

32.43 use-bgp-routes

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>service>vprn>bgp>next-hop-res use-bgp-routes)

Full Context

configure service vprn bgp next-hop-resolution use-bgp-routes

Description

This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

Default

no use-bgp-routes

Platforms

7705 SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

use-bgp-routes

Syntax

[**no**] **use-bgp-routes**

Context

[Tree] (config>router>bgp>next-hop-res use-bgp-routes)

Full Context

configure router bgp next-hop-resolution use-bgp-routes

Description

This command specifies whether to use BGP routes to recursively resolve the BGP next-hop of unlabeled IPv4 and unlabeled IPv6 routes. Up to four levels of recursion are supported.

The **no** form of this command reverts to the default behavior. By default, a BGP route is not resolvable by another BGP route.

Default

no use-bgp-routes

Platforms

7705 SAR Gen 2

use-bgp-routes

32.45 use-gi-address

use-gi-address

Syntax

use-gi-address [**scope** *scope*]

Context

[Tree] (config>router>dhcp>server use-gi-address)

[Tree] (config>service>vprn>dhcp>server use-gi-address)

Full Context

configure router dhcp local-dhcp-server use-gi-address

configure service vprn dhcp local-dhcp-server use-gi-address

Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

Parameters

scope

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

Values **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

pool — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

[Tree] (config>router>dhcp6>server use-link-address)

Full Context

configure service vprn dhcp6 local-dhcp-server use-link-address

configure router dhcp6 local-dhcp-server use-link-address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

Default

scope subnet

Parameters

scope

Specifies the scope of the IP address selection.

Values **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

pool — Specifies that all prefixes in the selected pool are eligible for assignment.

Platforms

7705 SAR Gen 2

configure service vprn dhcp local-dhcp-server use-pool-from-client

configure router dhcp local-dhcp-server use-pool-from-client

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command enables the use of the pool indicated by DHCP client. When enabled, the IP address pool to be used by this server is the pool is indicated by the vendor-specific sub-option 13 of the DHCP option 82. When disabled or if there is no sub-option 13 in the DHCP message, the pool selection falls back to the **use-gi-address** configuration.

The **no** form of this command disables the use of the pool indicated by DHCP client.

Parameters

delimiter

A single ASCII character specifies the delimiter of separating primary and secondary pool names in Option82 VSO.

32.49 use-virtual-mac

use-virtual-mac

Syntax

[**no**] **use-virtual-mac**

Context

[Tree] (config>service>vprn>router-advert>if use-virtual-mac)

Full Context

configure service vprn router-advertisement interface use-virtual-mac

Description

This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.

If the virtual router is not the master, no router advertisement messages are sent.

The **no** form of this command disables sending router advertisement messages.

Default

no use-virtual-mac

Platforms

7705 SAR Gen 2

32.50 use-well-known-ports

use-well-known-ports

Syntax

[**no**] **use-well-known-ports**

Context

[Tree] (config>router>nat>outside>pool use-well-known-ports)

[Tree] (config>service>vprn>nat>outside>pool use-well-known-ports)

Full Context

configure router nat outside pool use-well-known-ports

configure service vprn nat outside pool use-well-known-ports

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the dynamic allocation of well-known ports for interface-based NAT and can only be configured when the pool application is set to **use-interface-ip**.

Ports within the well-known range (0-1023) can still be allocated statically using static port forwarding.

The **no** form of this command does not dynamically allocate well-known ports for either transit traffic or traffic initiated from the control plane.

Default

no use-well-known-ports

Platforms

7705 SAR Gen 2

32.51 user

user

Syntax

[**no**] **user** *user-name*

Context

[Tree] (config>system>security user)

Full Context

configure system security user

Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

user-name

Specifies the name of the user up to 32 characters.

Platforms

7705 SAR Gen 2

32.52 user-db

user-db

Syntax

user-db *local-user-db-name* [**create**]

no user-db

Context

[Tree] (config>router>dhcp>server user-db)

Full Context

configure router dhcp local-dhcp-server user-db

Description

This command configures a local user database for authentication.

The **no** form of this command reverts to the default.

Parameters

local-user-db-name

Specifies the name of a user database, up to 32 characters.

create

Keyword used to create the user database. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Platforms

7705 SAR Gen 2

configure router dhcp local-dhcp-server user-ident

configure service vprn dhcp local-dhcp-server user-ident

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

Default

user-ident mac-circuit-id

Parameters

user-ident

Specifies the user identification method

Values **client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.

circuit-id — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.

mac — Specifies to use the MAC address of the DHCPv4 client as the user identification method.

mac-circuit-id — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.

remote-id — Specifies to use the MAC address of the remote end as the user identification method.

Platforms

7705 SAR Gen 2

user-ident

Syntax

user-ident *user-ident*

no user-ident

Context

[Tree] (config>service>vprn>dhcp6>server user-ident)

Full Context

configure service vprn dhcp6 local-dhcp-server user-ident

configure router dhcp6 local-dhcp-server user-ident

Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA_NA or PD).

The **no** form of the reverts to the default.

Default

user-ident duid

Parameters

user-ident

Specifies the user identification method.

Values **duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.

interface-id — Specifies the IPv6 interface-id option.

interface-id-link-local — Specifies the interface-id and link-local address.

Platforms

7705 SAR Gen 2

32.54 user-srlg-db

user-srlg-db

Syntax

user-srlg-db [**enable** | **disable**]

Context

[Tree] (config>router>mpls user-srlg-db)

Full Context

configure router mpls user-srlg-db

Description

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

Default

user-srlg-db disable

32.55 user-template

user-template

Syntax

user-template {**tacplus_default** | **radius_default** | **ldap-default**}

Context

[Tree] (config>system>security user-template)

Full Context

configure system security user-template

Description

This command configures default security user template parameters.

Parameters

tacplus_default

Specifies the default TACACS+ user template. All parameters of the tacplus_default template except the "profile" are actively applied to all TACACS+ users if tacplus **use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a priv-lvl for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

radius_default

Specifies the default RADIUS user template. The radius_default template is actively applied to a RADIUS user if radius authorization is enabled, radius **use-default-template** is enabled, and no VSAs are returned with the auth-accept from the RADIUS server.

ldap_default

Specifies the default LDAP user template.

32.56 usm-community

usm-community

Syntax

usm-community *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

no usm-community *community-string* [**hash** | **hash2** | **custom**]

Context

[Tree] (config>system>security>snmp usm-community)

Full Context

configure system security snmp usm-community

Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

Parameters

community-string

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, $, spaces), the entire string must be enclosed within double quotes.

group

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config**>**system**>**security**>**snmp**> **access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

list-name

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

32.57 util-stats-interval

util-stats-interval

Syntax

util-stats-interval *seconds*

Context

[Tree] (config>port>ethernet util-stats-interval)

Full Context

configure port ethernet util-stats-interval

Description

This command configures the interval used to calculate the utilization statistics.

Port utilization statistics are only available for physical Ethernet ports on a host system. These statistics are not available for the following:

- Ethernet ports on an Ethernet satellite
- PXC ports
- vsm-cca-xp ports

Parameters

seconds

Specifies the size of the interval, in seconds.

Values 30 to 600

Default 300

33 v Commands

33.1 v4-routed-override-filter

v4-routed-override-filter

Syntax

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>egress v4-routed-override-filter)

Full Context

configure service ies interface vpls egress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to the VPLS endpoint, if configured.

Default

no v4-routed-override-filter

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

v4-routed-override-filter

Syntax

v4-routed-override-filter *ip-filter-id*

no v4-routed-override-filter

Context

[Tree] (config>service>ies>if>vpls>ingress v4-routed-override-filter)

Full Context

configure service ies interface vpls ingress v4-routed-override-filter

Description

This command configures an IPv4 filter ID that is applied to routed unicast ingress packets entering the VPLS or I-VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed. The IPv4 routed packets use any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface use the IPv4 ingress filter applied to the packets virtual port, when defined.

Parameters

ip-filter-id

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

valid-lifetime

Syntax

valid-lifetime {*seconds* | **infinite**}

no valid-lifetime

Context

[Tree] (config>service>vprn>router-advert>if>prefix valid-lifetime)

Full Context

configure service vprn router-advertisement interface prefix valid-lifetime

Description

This command specifies the length of time in seconds that the prefix is valid for the purpose of on-link determination. A value of all one bits (0xffffffff) represents infinity.

The address generated from an invalidated prefix should not appear as the destination or source address of a packet.

Default

valid-lifetime 2592000

Parameters

seconds

Specifies the remaining length of time in seconds that this prefix will continue to be valid.

Values 0 to 429496729

infinite

Specifies that the prefix will always be valid. A value of 4,294,967,295 represents infinity.

Platforms

7705 SAR Gen 2

33.4 validate

validate

Syntax

validate [*file-url*]

Context

[Tree] (admin>system>license validate)

Full Context

admin system license validate

Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

Note:
If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

Parameters

file-url

Specifies the file URL location to read the license file.

Values local-url, remote-url

Platforms

7705 SAR Gen 2

validate

Syntax

[**no**] **validate**

Context

[Tree] (configure>system>security>profile>netconf>base-op-authorization validate)

Full Context

configure system security profile netconf base-op-authorization validate

Description

This command enables the NETCONF <validate> RPC.

The **no** form of this command disables the RPC.

Default

no validate

Note:
The operation is enabled by default in the built-in system-generated administrative profile.

configure router static-route-entry next-hop validate-next-hop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This optional command tracks the state of the next-hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next-hop is not reachable and is removed from the ARP or Neighbor Cache, the next-hop will no longer be considered valid and the associated static-route state removed from the active route-table.

When the next-hop is reachable again and present in the ARP/Neighbor Cache, the static route is considered valid and is subject to being placed into the active route-table.

Default

no validate-next-hop

33.7 vc-type

vc-type

Syntax

vc-type {**ether** | **vlan**}

Context

[Tree] (config>service>pw-template vc-type)

Full Context

configure service pw-template vc-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

Parameters

ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

Note:
The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

33.8 ve-id

ve-id

Syntax

ve-id *value*

no ve-id

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>epipe>bgp-vpws>ve-name ve-id)

[Tree] (config>service>epipe>bgp-vpws>remote-ve-name ve-id)

Full Context

configure service epipe bgp-vpws ve-name ve-id

configure service epipe bgp-vpws remote-ve-name ve-id

Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

Values 1 to 65535

Platforms

7705 SAR Gen 2

ve-id

Syntax

ve-id *ve-id-value*

no ve-id

Context

[Tree] (config>service>vpls>bgp-vpls>ve-name ve-id)

Full Context

configure service vpls bgp-vpls ve-name ve-id

Description

This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

Default

no ve-id

Parameters

value

Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

Values 1 to 65535

Platforms

7705 SAR Gen 2

configure service vpls spoke-sdp mld-snooping version

configure service vpls spoke-sdp igmp-snooping version

configure service vpls sap mld-snooping version

configure service vpls mesh-sdp igmp-snooping version

configure service vpls mesh-sdp mld-snooping version

configure service vpls sap igmp-snooping version

Description

This command specifies the version of IGMP or MLD which is running on this SAP or SDP. This object can be used to configure a router capable of running either value. For IGMP or MLD to function correctly, all routers on a LAN must be configured to run the same version of IGMP or MLD on that LAN.

When the **send-query** command is configured, all type of queries generate ourselves are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

Parameters

version

Specifies the IGMP or MLD version

view *view-name* **subtree** *oid-value*

no view *view-name* [**subtree** *oid-value*]

Context

[Tree] (config>system>security>snmp view)

Full Context

configure system security snmp view

Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP),* each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of vacmViewTreeFamilyType in the entry whose value of vacmViewTreeFamilySubtree has the most sub-identifiers.

The **no view** *view-name* command removes a view and all subtrees.

The **no view** *view-name* **subtree** *oid-value* removes a sub-tree from the view name.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

view-name

Specifies a view name, up to 32 characters.

oid-value

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements**.**

configure service vprn ospf3 area virtual-link

Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

Default

No virtual link is defined.

Parameters

router-id

The router ID of the virtual neighbor in IP address dotted decimal notation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

transit-area *area-id*

The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

Platforms

7705 SAR Gen 2

33.16 virtual-neighbor

virtual-neighbor

Syntax

virtual-neighbor [*router-id*]

no virtual-neighbor

Context

[Tree] (debug>router>ospf3 virtual-neighbor)

[Tree] (debug>router>ospf virtual-neighbor)

Full Context

debug router ospf3 virtual-neighbor

debug router ospf virtual-neighbor

Description

This command enables debugging for an OSPF virtual neighbor.

Parameters

router-id

Specifies the router ID of the virtual neighbor.

Platforms

7705 SAR Gen 2

33.17 vlan

vlan

Syntax

vlan [*vlan-encap*]

Context

[Tree] (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

Parameters

vlan-encap

Specifies the node cc VLAN IP.

Platforms

7705 SAR Gen 2

33.18 vlan-aware-bundle

vlan-aware-bundle

Syntax

vlan-aware-bundle *name* [**eth-tag** *value*]

no vlan-aware-bundle

Context

[Tree] (config>service>vpls>bgp-evpn vlan-aware-bundle)

Full Context

configure service vpls bgp-evpn vlan-aware-bundle

Description

This command configures a name that is used to group a bundle of VPLS services (Broadcast Domains) that are part of the same VLAN-aware bundle instance. This name is optional and allows the user to execute **show** commands that are relevant to all the Broadcast Domains in a VLAN-aware bundle service group.

The optional Ethernet Tag ID can be encoded in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service.

When the Ethernet Tag ID is set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes.

On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received Ethernet Tag ID field and processes only routes whose Ethernet Tag ID matches the local VLAN-aware bundle Ethernet Tag value.

The **no** form of this command removes the configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Parameters

name

Specifies the VLAN-aware bundle name, up to 32 characters.

value

Specifies the Ethernet Tag ID.

Values 1 to 16777215

Platforms

7705 SAR Gen 2

33.19 vlan-range

vlan-range

Syntax

[**no**] **vlan-range** [*vlan-range*]

Context

[Tree] (config>service>vpls>stp>mst-instance vlan-range)

Full Context

configure service vpls stp mst-instance vlan-range

Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

Parameters

vlan-range

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

Values 1 to 4094 to 1 to 4094

© 2026 Nokia.

7705 SAR Gen 2

vlan-range

Syntax

vlan-range *from* [**to** *to*]

no vlan-range *from*

Context

[Tree] (config>connection-profile-vlan vlan-range)

Full Context

configure connection-profile-vlan vlan-range

Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range** *vid* **to** *vid* must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.
- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

Parameters

from

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

Values 1 to 4094

to

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

Values 1 to 4094

33.20 vlan-translation

vlan-translation

Syntax

vlan-translation {*vlan-id* | **copy-outer**}

no vlan-translation

Context

[Tree] (config>service>vpls>sap>ingress vlan-translation)

[Tree] (config>service>epipe>sap>ingress vlan-translation)

Full Context

configure service vpls sap ingress vlan-translation

configure service epipe sap ingress vlan-translation

Description

This command configures ingress VLAN translation. If this command is enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the **copy-outer** keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- dot1q SAPs
- QinQ saps with **qinq-vlan-translation** enabled
- connection profile VLAN SAPs if the **copy-outer** option is configured

The **no** form of this command disables VLAN translation.

Default

no vlan-translation

Parameters

vlan-id

Specifies the VLAN id.

Values 0 to 4094

copy-outer

Keyword to specify to use the outer VLAN ID.

[Tree] (config>service>vpls>spoke-sdp vlan-vc-tag)

Full Context

configure service vpls mesh-sdp vlan-vc-tag

configure service vpls spoke-sdp vlan-vc-tag

Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

Default

no vlan-vc-tag

Parameters

vlan-id

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

Values 0 to 4094

Platforms

7705 SAR Gen 2

vlan-vc-tag

Syntax

33.23 vpls

vpls

Syntax

vpls *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**m-vpls**] [**name** *name*]

no vpls *service-id*

Context

[Tree] (config>service vpls)

Full Context

configure service vpls

Description

This command creates or edits a VPLS instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not already exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together, acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. To create a service, enter the **customer** keyword and specify a preexisting *customer-id* to associate the service with a customer. After a service is associated with a customer, the association cannot be edited. The service must be deleted and recreated with a new customer association.

After a service is created, using the **customer** *customer-id* to navigate to the service configuration context is optional. Attempting to edit a service using an incorrect *customer-id* results in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

Parameters

service-id

Specifies a unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

Values *service-id*: 1 to 2147483647

svc-name: 64 characters maximum

customer-id

Specifies the customer ID number to be associated with the service. This parameter is required during service creation, and is optional for service editing or deleting.

Values 1 to 2147483647

vpn-id

Specifies the VPN ID number that allows you to identify VPNs by a VPN identification number

Values 1 to 2147483647

Default null (0)

create

Keyword used to create the service ID. The **create** keyword requirement can be enabled or disabled in the **environment create** context.

m-vpls

Keyword that specifies a management VPLS.

name

Specifies an optional service name identifier, up to 64 characters, for a specific service. This service name can be used in configuration references and **show** commands throughout the system. The service provider or administrator can use the defined service name to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, SR OS assigns a string version of the *service-id* as the name.

vpls

Syntax

vpls *service-name*

no vpls

Context

[Tree] (config>service>ies>if vpls)

Full Context

configure service ies interface vpls

Description

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

Parameters

service-name

The service-name parameter is required when using the IP interface vpls command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

Full Context

configure service vprn ospf vpn-domain

Description

This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vprn>ospf3** context.

This command is not supported in OSPF3.

Default

no vpn-domain

Parameters

id

Specifies the OSPF VPN domain in the "xxxx.xxxx.xxxx" format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

type

Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

Values 0005, 0105, 0205, 8005

Full Context

configure router bgp next-hop-resolution vpn-family-policy

Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

  In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

Default

no vpn-family-policy

Parameters

policy-name

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, ?, space), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

Context

[Tree] (config>service>system vpn-gre-source-ip)

Full Context

configure service system vpn-gre-source-ip

Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config**>**service**>**vprn**>**spoke-sdp**) with a tunnel of encapsulation GRE.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config**>**service**>**sdp**>**local-end** context and all L2oGRE SDPs under the **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config**>**service**>**sdp**>**local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config**>**service**>**system**>**gre-eth-bridged**>**tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.
- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

Parameters

ip-address

Specifies the IPv4 address (a.b.c.d).

Platforms

7705 SAR Gen 2

Full Context

configure router bgp group neighbor add-paths vpn-ipv4

configure router bgp add-paths vpn-ipv4

configure router bgp group add-paths vpn-ipv4

Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

Default

no vpn-ipv4

Parameters

send-limit

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Values 1 to 16, none, multipaths

receive

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

none

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

33.37 vprn

vprn

Syntax

vprn *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]

no vprn *service-id*

Context

[Tree] (config>service vprn)

Full Context

configure service vprn

Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

Parameters

service-id

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7705 SAR Gen 2 router on which this service is defined.

Values

service-id: 1 to 2147483648

svc-name: 64 characters maximum

customer-id

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

Values 1 to 2147483647

name *name*

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

create

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

Full Context

configure router mpls lsp vprn-auto-bind

configure router mpls lsp-template vprn-auto-bind

Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

Default

vprn-auto-bind include

Parameters

include

Allows an associated LSP to be used by auto-bin for vprn services

exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

33.40 vprn-local

vprn-local

Syntax

vprn-local [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-local)

Full Context

configure router ttl-propagate vprn-local

Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

Default

vprn-local vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

7705 SAR Gen 2

33.41 vprn-network-exceptions

vprn-network-exceptions

Syntax

vprn-network-exceptions *number seconds*

no vprn-network-exceptions

Context

[Tree] (config>system>security vprn-network-exceptions)

Full Context

configure system security vprn-network-exceptions

Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **no** form of this command disables the rate limiting of the reply to these packets.

Parameters

number

Specifies the number limit of MPLS exception messages.

Values 10 to 10,000

seconds

Specifies the rate limit of MPLS exception messages, in seconds.

Values 1 to 60

Platforms

7705 SAR Gen 2

33.42 vprn-transit

vprn-transit

Syntax

vprn-transit [{**none** | **all** | **vc-only**}]

Context

[Tree] (config>router>ttl-propagate vprn-transit)

Full Context

configure router ttl-propagate vprn-transit

Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

Default

vprn-transit vc-only

Parameters

none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

Full Context

configure service vprn bgp-ipvpn mpls vrf-export

configure service vprn bgp-evpn mpls vrf-export

Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **configure router policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

Default

no vrf-export

Parameters

plcy-or-long-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

plcy-or-expr

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

Full Context

configure service vprn bgp-evpn mpls vrf-target

configure service vprn bgp-ipvpn mpls vrf-target

Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

Default

no vrf-target

Parameters

ext-comm

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

Values

<ext-community>	: target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}	
	ip-addr:	a.b.c.d
	comm-val:	[0 to 65535]
	2byte-asnumber:	[0 to 65535]

© 2026 Nokia.

Full Context

configure service ies interface ipv6 vrrp

configure service ies interface vrrp

Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a virtual router ID or an ID that can be modified on the IP interface.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

no vrrp *virtual-router-id*

Context

[Tree] (config>service>vprn>if vrrp)

Full Context

configure service vprn interface vrrp

Description

This command creates or edits a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. One, both, or none may be defined as owner. The nodal context of **vrrp** *virtual-router-id* is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shut down in order to remove the virtual router instance.

Parameters

virtual-router-id

Specifies a new virtual router ID or one that can be modified on the IP interface.

Values 1 to 255

owner

Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. Once created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Identifies this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operational-up), or the **init** state (if the interface is operational-down). The **passive** keyword is not required when entering the *vrid* for editing purposes. Once a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

Context

[Tree] (config>router>if vrrp)

[Tree] (config>router>if>ipv6 vrrp)

Full Context

configure router interface vrrp

configure router interface ipv6 vrrp

Description

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrid* is internally associated with the IP interface. This allows the *vrid* to be used on multiple IP interfaces while representing different virtual router instances.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrid* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrid* become master. Passive *VRIDs* can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrid* from the IP interface. This terminates VRRP participation and deletes all references to the *vrid* in conjunction with the IP interface. The *vrid* does not need to be shut down to remove the virtual router instance.

Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

Parameters

virtual-router-id

The virtual router ID for the IP interface expressed as a decimal integer.

Values 1 to 255

owner

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

passive

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrid* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

group-name

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

33.47 vsi-export

vsi-export

Syntax

vsi-export *policy-name* [*policy-name*]

no vsi-export

Context

[Tree] (config>service>vpls>bgp vsi-export)

Full Context

configure service vpls bgp vsi-export

Description

This command specifies the name of the VSI export policies to be used for BGP EVPN, BGP auto discovery, BGP VPLS, BGP VPWS, and BGP multi-homing if these features are configured in this VPLS service.

If multiple policy names are configured, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The policy name list is handled by the SNMP agent as a single entity.

The **no** form of this command removes the policy from the configuration.

Default

no vsi-export

Parameters

policy-name

Specifies up to five policy names, up to 32 characters.

Platforms

34.1 wait

wait

Syntax

wait *seconds*

Context

[Tree] (bof wait)

Full Context

bof wait

Description

This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console.

When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF).

Only one **wait** command can be defined in the BOF.

Default

wait 3

Parameters

seconds

Specifies the time to pause at the start of the boot process, in seconds.

Values 1 to10

Platforms

7705 SAR Gen 2

© 2026 Nokia.

Full Context

configure router mpls lsp primary bfd wait-for-up-timer

configure router mpls lsp bfd wait-for-up-timer

configure router mpls lsp secondary bfd wait-for-up-timer

Description

This command configures the time to wait, in seconds, for a BFD to come up. This timer is applicable to RSVP-TE LSPs.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

Default

no wait-for-up-timer

Parameters

seconds

Specifies the BFD wait for up timer in seconds.

Values 0 to 60

Default 4

Platforms

7705 SAR Gen 2

© 2026 Nokia.

34.3 wait-to-restore

wait-to-restore

Syntax

wait-to-restore *minutes*

no wait-to-restore

Context

[Tree] (config>system>sync-if-timing wait-to-restore)

Full Context

configure system sync-if-timing wait-to-restore

Description

This command configures the time for the Wait to Restore timer. A previously failed input reference must be valid for the specified time before it is used for the central clock input reference.

The **no** form of this command disables the timer.

Default

no wait-to-restore

Parameters

minutes

Specifies a value for the wait to restore timeout, in minutes.

Values 1 to 12

Platforms

7705 SAR-Hx, 7705 SAR-Mx

34.4 watermarks

watermarks

Syntax

watermarks high *percentage-high* **low** *percentage-low*

no watermarks

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context

[Tree] (config>service>vprn>nat>outside>pool watermarks)

[Tree] (config>router>nat>outside>pool watermarks)

Full Context

configure service vprn nat outside pool watermarks

configure router nat outside pool watermarks

Description

This command configures the watermarks for ports or port-block utilization in a NAT pool.

For CGN and L2-aware NAT, the port and port-block watermarks are used to monitor ports or port-block utilization in a NAT pool. High and low thresholds are configured in percentages of total available port-blocks or ports per protocol in a pool.

For LSN44 pools with flexible port allocation, the watermarks represent the port utilization per outside IP address if paired address pooling is enabled. If an arbitrary address pooling is enabled, then the watermarks represent the port utilization per pool.

For port-block based pools where flexible port allocation is disabled, the watermarks represent port-block occupancy per pool. These watermarks cover combined initial and extended port-blocks in a NAT pool. If the extended port blocks are not enabled in L2-aware NAT, then the L2-aware pool contains only the initial port-blocks.

For the system to generate those events, the NAT event ID is configured as follows:

- 2001 is enabled for L2-aware pools which do not use l2-aware port-block-extensions
- 2003 is enabled for port-blocks based LSN pools
- 2044 is enabled for L2-aware pools which use l2aware port-block-extension
- 2046 is enabled for port based LSN pools for flexible-port-allocation

Event IDs are enabled via log event control configuration.

Default

no watermarks

Parameters

high percentage-high

Specifies the high percentage.

weekday

Syntax

weekday {*weekday-number* [..*weekday-number*] | *day-name* [..*day-name*] | **all**}

no weekday

Context

[Tree] (config>system>cron>sched weekday)

Full Context

configure system cron schedule weekday

Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

Default

no weekday

Parameters

weekday-number

Specifies a weekday number.

Values 1 to 7 (maximum 7 weekday-numbers)

day-name

Specifies a day by name.

Values sunday, monday, tuesday, wednesday, thursday, friday, saturday (maximum 7 weekday names)

Use subject to Terms available at: www.nokia.com/terms.

34.7 weight-down

weight-down

Syntax

[**no**] **weight-down** *lag-ports-down-weight*

Context

[Tree] (config>vrrp>policy>priority-event>lag-port-down weight-down)

Full Context

configure vrrp policy priority-event lag-port-down weight-down

Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

Default

no weight-down

Parameters

lag-ports-down-weight

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

Values 1 to 64 (for 64-link capable LAGs)

1 to 32 (for other LAGs)

Full Context

configure service vprn bgp-evpn mpls evpn-link-bandwidth weighted-ecmp

configure service vpls bgp-evpn ip-route-link-bandwidth weighted-ecmp

Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP prefix route in the VPRN route table.

Flows to an IP prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

Default

no weighted-ecmp

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>service>vprn weighted-ecmp)

Full Context

configure service vprn weighted-ecmp

Description

This command enables weighted load-balancing for IS-IS, OSPF, and static ECMP routes in the VPRN instance. Weighted ECMP can be performed when all next hops are configured with non-zero load-balancing weights. Weighted ECMP support for IS-IS, OSPF, and static ECMP routes applies to both IPv4 and IPv6.

The **no** form of this command restores regular ECMP spraying of packets to IS-IS, OSPF and static route destinations.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

weighted-ecmp

Syntax

weighted-ecmp [**strict**]

no weighted-ecmp

Context

[Tree] (config>router weighted-ecmp)

Full Context

configure router weighted-ecmp

Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

Default

no weighted-ecmp

Parameters

strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

34.13 wred-queue

wred-queue

Syntax

wred-queue [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]

no wred-queue

Context

[Tree] (config>qos>sap-egress>queue wred-queue)

Full Context

configure qos sap-egress queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default native

slope-usage

Specifies congestion control to be used.

Values **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

Default exceed-low

Platforms

7705 SAR Gen 2

configure qos queue-group-templates egress queue-group queue wred-queue

Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

  This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

  This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the wred-queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card** [*slot-num*] **fp** [*fp-number*] output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

Default

no wred-queue

Parameters

slope-policy-name

Specifies an existing slope policy that is used to override the default WRED slope policy.

mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

Values **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

pool-per-queue - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

Default native

slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

Values **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

exceed-low - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

37.1 zone

zone

Syntax

zone {*std-zone-name* | *non-std-zone-name*} [*hh* [*:mm*]]

no zone

Context

[Tree] (config>system>time zone)

Full Context

configure system time zone

Description

This command sets the time zone and/or time zone offset for the device.

The SR OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

Default

zone UTC 00

Parameters

std-zone-name

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

Values A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

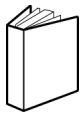
non-std-zone-name

Specifies the non-standard time zone name. The name can be up to 5 characters.

hh [:mm]

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

Values hours: -11 to 12 minutes: 0 to 59



Default hours: 0 minutes: 0
