Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address in LSP ping and BFD control packets
Context	**configure** router *named-item-64* ldp lsp-bfd *reference* source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Introduced	25.3.R2
Platforms	SAR Gen 2

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for LDP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* ldp max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command sets the maximum number of ECMP routes that LDP may use to resolve the next hop for a FEC as permitted by the RTM or TTM. The system-wide maximum number of ECMP routes is set by the **configure router ecmp** command; therefore, the operational maximum number used by LDP is set to the lesser of the values configured by this command and the **configure router ecmp** command.
Range	1 to 128
Default	32
Introduced	25.3.R2
Platforms	SAR Gen 2

prefer-protocol-stitching *boolean*

Synopsis	Stitch LDP ILM to SR NHLFE even if LDP NHLFE exists
Context	**configure** router *named-item-64* ldp prefer-protocol-stitching *boolean*
Tree	prefer-protocol-stitching
Description	When configured to **true**, an LDP ILM stitches to an SR NHLFE, even if an LDP NHLFE exists. When configured to **false**, the stitching preference of an LDP ILM is to an LDP NHLFE.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

prefer-tunnel-in-tunnel *boolean*

Synopsis	Preference tunnel-in-tunnel over a simple LDP tunnel
Context	**configure** router *named-item-64* ldp prefer-tunnel-in-tunnel *boolean*
Tree	prefer-tunnel-in-tunnel
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

session-parameters

Synopsis	Enter the **session-parameters** context
Context	**configure** router *named-item-64* ldp session-parameters
Tree	session-parameters
Introduced	25.3.R2
Platforms	SAR Gen 2

peer [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **peer** list instance
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Introduced	25.3.R2
Platforms	SAR Gen 2

[ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the LDP peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

adv-adj-addr-only *boolean*

Synopsis	Distribute only the local addresses used to establish the Hello adjacencies with a peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* adv-adj-addr-only *boolean*
Tree	adv-adj-addr-only
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

adv-local-lsr-id *boolean*

Synopsis	Advertise local LSR ID over a specified LDP session
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* adv-local-lsr-id *boolean*
Tree	adv-local-lsr-id
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

community *policy-string*

Synopsis	Community string associated with a session to a specified peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* community *policy-string*
Tree	community
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

dod-label-distribution *boolean*

Synopsis	Use LDP Downstream-on-Demand (DoD) label distribution procedures
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* dod-label-distribution *boolean*
Tree	dod-label-distribution
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

export-addresses *reference*

Synopsis	Export policies to determine which local addresses should be distributed to this peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* export-addresses *reference*

bfd-liveness *boolean*

Synopsis	Enable BFD tracking of T-LDP peer session
Context	**configure** router *named-item-64* ldp targeted-session peer-template *named-item* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the router uses BFD to track the selected T-LDP session. By enabling BFD for a selected targeted session, the state of that session is tied to the state of the underneath BFD session between the two nodes. The command options used for the BFD are configured under the IP interface. When configured to **false**, the router does not use the central BFD session to track the T-LDP session operational state. On the 7705 SAR Gen 2, BFD is supported only for IPv4 T-LDP sessions.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	Authentication key between LDP peers
Context	**configure** router *named-item-64* ldp tcp-session-parameters authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the authentication key used to establish a session between LDP peers. Authentication uses the MD-5 message-based digest. The peer address used in authentication must be the TCP session transport address. If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR ID value, the user must add each transport address to the authentication key configuration as a separate peer. As a result, when the TCP connection is bootstrapped by a specific Hello adjacency, the authentication can operate over that TCP connection by using its specific transport address. The per-peer authentication configuration takes precedence over global authentication configuration, and authentication keychain configuration takes precedence over authentication key configuration. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 422
Introduced	25.3.R2
Platforms	SAR Gen 2

Context	**configure** router *named-item-64* ldp tunnel-down-damp-time *number*
Tree	tunnel-down-damp-time
Range	0 to 20
Units	seconds
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

tunnel-table-pref *number*

Synopsis	Tunnel table preference value for address FECs
Context	**configure** router *named-item-64* ldp tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the tunnel table preference for an LDP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

tunnel-table-pref *number*

Synopsis	Tunnel table preference
Context	**configure** router *named-item-64* mpls forwarding-policies forwarding-policy *named-item-64* tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference value of an MPLS forwarding policy. It is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	255
Introduced	25.3.R2
Platforms	SAR Gen 2

reserved-label-block *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* mpls interface *reference*
Tree	interface
Description	Commands in this context configure the attributes for MPLS protocol support on an IP interface. MPLS commands are not executed on an IP interface where MPLS is not enabled. An MPLS interface must be explicitly enabled (admin-state enabled). The MPLS interface must be admin-state disabled to delete the interface definition. A corresponding RSVP interface must also be configured. The MPLS interface cannot be deleted without also deleting the RSVP interface.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**interface-name**] *reference*

Introduced	25.3.R2
Platforms	SAR Gen 2

admin-group *reference*

Synopsis	Administrative groups supported by the interface
Context	**configure** router *named-item-64* mpls interface *reference* admin-group *reference*
Tree	admin-group
Description	This command specifies the administrative groups that the interface supports. This information is advertised as part of OSPF and IS-IS to help CSPF compute constrained LSPs that must include or exclude certain administrative groups. An MPLS interface is assumed to belong to all the administrative groups unless this command is issued under the interface configuration. With this command configured, the interface is assumed to belong to only the groups specifically configured in this command. Only the administrative groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.
Reference	**configure** routing-options if-attribute admin-group *named-item*

Introduced	25.3.R2
Platforms	SAR Gen 2

lsp [lsp-name] *named-item-64*

Synopsis	Enter the **lsp** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64*
Tree	lsp
Description	Commands in this context create or configure an LSP that is either signaled dynamically by the router, or is a statically provisioned MPLS-TP LSP. Use the **to** command to specify the egress router. At least one **primary** or **secondary** path (for signaled LSPs or at least one working path for MPL-TP LSPs) must be specified when the LSP is created. All other statements under the LSP hierarchy are optional.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**lsp-name**] *named-item-64*

Synopsis	Labeled Switch path name
Context	**configure** router *named-item-64* mpls lsp *named-item-64*
Tree	lsp
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

adaptive *boolean*

Synopsis	Enable make-before-break functionality
Context	**configure** router *named-item-64* mpls lsp *named-item-64* adaptive *boolean*
Tree	adaptive
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-tag [name] *reference*

Synopsis	Add a list entry for **admin-tag**
Context	**configure** router *named-item-64* mpls lsp *named-item-64* admin-tag *reference*
Tree	admin-tag
Max. instances	4
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *reference*

Synopsis	Name of the admin tags
Context	**configure** router *named-item-64* mpls lsp *named-item-64* admin-tag *reference*
Tree	admin-tag
Reference	**configure** routing-options admin-tags admin-tag *string*
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

adspec *boolean*

Synopsis	Include ADSPEC object in RSVP messages
Context	**configure** router *named-item-64* mpls lsp *named-item-64* adspec *boolean*
Tree	adspec

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd
Tree	bfd
Description	Commands in this context configure BFD on LSPs. These commands apply to BFD on RSVP LSPs.
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness *boolean*

Synopsis	Enable BFD on the LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the system enables LSP BFD on the LSP. LSP BFD must also be configured under the **configure router** context. The named BFD template provides the configuration settings for the BFD session, which must be configured and associated with the service using the BFD template. When configured to **false**, the system disables LSP BFD on the LSP. This command applies to BFD on RSVP LSPs.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-template *reference*

Synopsis	BFD template to be used by LSP BFD sessions
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-template *reference*
Tree	bfd-template
Reference	**configure** bfd bfd-template *named-item*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

failure-action *keyword*

Synopsis	Action when LSP BFD fails
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd failure-action *keyword*
Tree	failure-action
Description	This command specifies the action when LSP BFD fails on a LSP. Regardless of the failure action specified, when the BFD session goes down on the LSP, the system generates an SNMP trap.
Options	none, down, failover, failover-or-down
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

lsp-ping-interval *(number | keyword)*

Synopsis	Interval for periodic LSP ping for BFD bootstrapping
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd lsp-ping-interval *(number | keyword)*
Tree	lsp-ping-interval
Range	60 to 300
Units	seconds
Options	none
Default	60
Introduced	25.3.R2
Platforms	SAR Gen 2

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. For RSVP-TE LSPs, the timer controls the following:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

Range	1 to 60
Units	seconds
Default	4
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp-shortcut *boolean*

Synopsis	Include LSP for BGP routes
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bgp-shortcut *boolean*
Tree	bgp-shortcut
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp-transport-tunnel *boolean*

Synopsis	Include LSP as transport LSP for labeled BGP routes
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bgp-transport-tunnel *boolean*
Tree	bgp-transport-tunnel
Introduced	25.3.R2
Platforms	SAR Gen 2

binding-sid *number*

Synopsis	Binding SID for the LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* binding-sid *number*
Tree	binding-sid
Description	This command binds a label to the LSP. The label value must belong to the reserved label block that is configured with the **configure router mpls lsp-bsid-block** command.
Range	32 to 1048575
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

class-type *number*

Synopsis	Class type for an LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* class-type *number*
Tree	class-type
Range	0 to 7
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

entropy-label *keyword*

Synopsis	Entropy label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* entropy-label *keyword*
Tree	entropy-label
Options	false, true
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude-admin-group *reference*

Synopsis	Name of admin group excluded when LSP is set up
Context	**configure** router *named-item-64* mpls lsp *named-item-64* exclude-admin-group *reference*
Tree	exclude-admin-group
Reference	**configure** routing-options if-attribute admin-group *named-item*
Max. instances	32
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude-node *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Exclude Routers object to be included in the bypass path message
Context	**configure** router *named-item-64* mpls lsp *named-item-64* exclude-node *(ipv4-address-no-zone | ipv6-address-no-zone)*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	exclude-node
Introduced	25.3.R2
Platforms	SAR Gen 2

fallback-path-computation-method *keyword*

Synopsis	Fallback path computation method
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fallback-path-computation-method *keyword*
Tree	fallback-path-computation-method
Description	This command specifies the fallback path computation method used if all configured PCEs are down or are signaling overload and the redelegation timer has expired. This method is used regardless of whether the LSP is PCE-controlled and PCE-computed, or only PCE-computed.
Options	none, local-cspf
Introduced	25.3.R2
Platforms	SAR Gen 2

fast-reroute

Synopsis	Enable the **fast-reroute** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fast-reroute
Tree	fast-reroute
Introduced	25.3.R2
Platforms	SAR Gen 2

frr-method *keyword*

Synopsis	Fast Reroute method
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fast-reroute frr-method *keyword*
Tree	frr-method
Options	one-to-one, facility
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hop-limit *number*

Synopsis	Total number of hops a detour or backup LSP can take
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fast-reroute hop-limit *number*
Tree	hop-limit
Range	0 to 255
Default	16
Introduced	25.3.R2
Platforms	SAR Gen 2

node-protect *boolean*

Synopsis	Enable node and link protection for the specified LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fast-reroute node-protect *boolean*
Tree	node-protect
Introduced	25.3.R2
Platforms	SAR Gen 2

propagate-admin-group *boolean*

Synopsis	Enable admin group constraints on a FRR backup LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* fast-reroute propagate-admin-group *boolean*
Tree	propagate-admin-group
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

from *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:

allow-sr-over-srte *boolean*

Synopsis	Use as eligible SRv4 or SRv6 IGP shortcut
Context	**configure** router *named-item-64* mpls lsp *named-item-64* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router performs the local SPF and the SR-TE LSP is used as an eligible IGP SR-MPLS shortcut for SR-MPLS SRv4 or SRv6 only if the SR-TE is explicitly allowed using this command when the top SID in the SR-TE LSP is an adjacency SID.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

lfa-type *keyword*

Synopsis	LSP usage in LFA SPF
Context	**configure** router *named-item-64* mpls lsp *named-item-64* igp-shortcut lfa-type *keyword*
Tree	lfa-type
Options	lfa-protect, lfa-only
Notes	The following elements are part of a choice: **lfa-type** or **relative-metric**.
Introduced	25.3.R2
Platforms	SAR Gen 2

relative-metric *number*

Synopsis	Shortest IGP cost between the endpoints of the LSP plus the configured offset
Context	**configure** router *named-item-64* mpls lsp *named-item-64* igp-shortcut relative-metric *number*
Tree	relative-metric
Range	-10 to 10
Notes	The following elements are part of a choice: **lfa-type** or **relative-metric**.
Introduced	25.3.R2
Platforms	SAR Gen 2

Introduced	25.3.R2
Platforms	SAR Gen 2

load-balancing-weight *number*

Synopsis	Load balancing weight for an MPLS LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* load-balancing-weight *number*
Tree	load-balancing-weight
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

local-sr-protection *keyword*

Synopsis	Local SR protection preference for LSP path computation
Context	**configure** router *named-item-64* mpls lsp *named-item-64* local-sr-protection *keyword*
Tree	local-sr-protection
Options	none, preferred, mandatory
Default	preferred
Introduced	25.3.R2
Platforms	SAR Gen 2

main-ct-retry-limit *number*

Synopsis	Maximum number of retries before reverting to backup CT
Context	**configure** router *named-item-64* mpls lsp *named-item-64* main-ct-retry-limit *number*
Tree	main-ct-retry-limit
Range	1 to 10000
Introduced	25.3.R2
Platforms	SAR Gen 2

max-sr-labels

Synopsis	Enter the **max-sr-labels** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* max-sr-labels

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	max-sr-labels
Introduced	25.3.R2
Platforms	SAR Gen 2

additional-frr-labels *number*

Synopsis	Value for the maximum additional overhead labels
Context	**configure** router *named-item-64* mpls lsp *named-item-64* max-sr-labels additional-frr-labels *number*
Tree	additional-frr-labels
Range	0 to 4
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

label-stack-size *number*

Synopsis	Maximum label stack size
Context	**configure** router *named-item-64* mpls lsp *named-item-64* max-sr-labels label-stack-size *number*
Tree	label-stack-size
Description	This command configures the maximum label stack size of the primary path of the SR-TE LSP.
Range	1 to 11
Introduced	25.3.R2
Platforms	SAR Gen 2

metric *number*

Synopsis	LSP metric that forces to a constant value
Context	**configure** router *named-item-64* mpls lsp *named-item-64* metric *number*
Tree	metric
Range	0 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

metric-type *keyword*

Synopsis	Metric type used for LSP path computation
Context	**configure** router *named-item-64* mpls lsp *named-item-64* metric-type *keyword*
Tree	metric-type
Options	igp, te, delay
Default	igp
Introduced	25.3.R2
Platforms	SAR Gen 2

override-tunnel-elc *boolean*

Synopsis	Override any received entropy label capability
Context	**configure** router *named-item-64* mpls lsp *named-item-64* override-tunnel-elc *boolean*
Tree	override-tunnel-elc
Description	When configured to **true**, this command allows the system to override any received entropy label capability advertisement. When configured to **false**, this command disables the override.
Default	false
Introduced	25.10.R1
Platforms	SAR Gen 2

path-computation-method *keyword*

Synopsis	Path computation method
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-computation-method *keyword*
Tree	path-computation-method
Description	This command configures the path computation method of an RSVP-TE or SR-TE LSP. If this command is not configured to one of the supported options, the default path computation method is used depending on the type of LSP; the hop-to-label translation is used for the SR-TE LSP template and the IGP-based path is used for the RSVP-TE-LSP. See "SR-TE LSP path computation using hop-to-label translation" in the *7705 SAR Gen 2 Segment Routing and PCE User Guide* for more information.
Options	local-cspf, pce

Introduced	25.3.R2
Platforms	SAR Gen 2

path-profile [profile-id] *number*

Synopsis	Enter the **path-profile** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-profile *number*
Tree	path-profile
Description	Commands in this context configure the attributes of the PCE path profile.
Max. instances	5
Introduced	25.3.R2
Platforms	SAR Gen 2

[**profile-id**] *number*

Synopsis	Profile ID for the specified LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-profile *number*
Tree	path-profile
Range	1 to 4294967295
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

path-group *number*

Synopsis	Path-group ID for the specified LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-profile *number* path-group *number*
Tree	path-group
Max. range	0 to 4294967295
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pce-associations

Synopsis	Enter the **pce-associations** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-associations
Tree	pce-associations
Description	Commands in this context configure the LSP binding with one or more PCEP associations.
Introduced	25.3.R2
Platforms	SAR Gen 2

diversity [diversity-name] *reference*

Synopsis	Add a list entry for **diversity**
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-associations diversity *reference*
Tree	diversity
Description	Commands in this context bind the LSP to a named diversity association. The diversity association must exist under the PCC.
Max. instances	5
Introduced	25.3.R2
Platforms	SAR Gen 2

[**diversity-name**] *reference*

Synopsis	Name of the PCE association configured under the PCC
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-associations diversity *reference*
Tree	diversity
Reference	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item*
Notes	This element is part of a list key.

policy [policy-name] *reference*

Synopsis	Add a list entry for **policy**
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-associations policy *reference*
Tree	policy
Description	Commands in this context bind the LSP to a named policy association. The policy association name must exist under the PCC.
Max. instances	5
Introduced	25.3.R2
Platforms	SAR Gen 2

[**policy-name**] *reference*

Synopsis	Name of the PCE association configured under the PCC
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-associations policy *reference*
Tree	policy
Reference	**configure** router *named-item-64* pcep pcc pce-associations policy *named-item*
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

pce-control *boolean*

Synopsis	Enable PCE controlled LSP mode of operation
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-control *boolean*
Tree	pce-control
Description	When configured to **true**, this command enables a PCE-controlled mode of operation for the LSP. In this mode, the router delegates full control of the LSP to the PCE (PCE controlled). The PCE acts in stateful-active mode for this LSP and is able to reroute the path following a failure or to re-optimize the path and update the router without a request from the router. When configured to **false**, the PCE-controlled mode of operation for the LSP has no effect.
Default	false

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up

secondary [path-name] *reference*

Synopsis	Enter the **secondary** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference*
Tree	secondary
Description	Commands in this context configure an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required when the **configure router mpls lsp primary** command is specified. After the switchover from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the retry-timer interval. The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively disables the path. The first successfully established non-standby secondary path is made the active path for the LSP. For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal, and the first available path is used.

bfd

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd
Tree	bfd
Description	Commands in this context configure BFD on LSPs. These commands apply to BFD on RSVP LSPs.
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness *boolean*

Synopsis	Enable BFD on the LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the system enables LSP BFD on the LSP. LSP BFD must also be configured under the **configure router** context. The named BFD template provides the configuration settings for the BFD session, which must be configured and associated with the service using the BFD template. When configured to **false**, the system disables LSP BFD on the LSP.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

mbb-prefer-current-hops *boolean*

Synopsis	Select preference to use the current hops for (MBB

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context **configure** router *named-item-64* mpls mbb-prefer-current-hops *boolean*

Tree mbb-prefer-current-hops

Description When configured to **true**, the router instructs CSPF to select an MBB path of a RSVP-TE LSP which has the most overlapping links with the current path.

When MPLS performs an MBB for the primary or secondary path of a P2P LSP, or the S2L path of a P2MP LSP, and this command is enabled in the MPLS context, CSPF selects a path, among equal-cost candidate paths, with the most overlapping links with the current path. Normally, CSPF selects the path randomly.

The procedures for the MBB CSPF path selection apply to LSP without the **least-fill** command enabled. If the least-fill rule results in a different path, the LSP path is moved. Users can still favor stability over the least-fill condition by applying a larger value to the **least-fill-min-thd** command, under the MPLS context, such that a path is only moved when the difference of the least-available bandwidth becomes significant enough between the most used links in the equal-cost paths. If that difference is not significant enough, CSPF selects the path with the most overlapping links instead of selecting a path randomly.

The procedures when this command is enabled apply to the following MBB types:

- RSVP P2P LSP:
- global revertive MBB
- autobandwidth MBB
- configuration change MBB
- soft preemption MBB
- TE graceful shutdown MBB
- delayed retry MBB (for SRLG secondary LSP path)
- path change MBB
- timer resignal MBB
- manual resignal MBB
- S2L path of a RSVP P2MP LSP:
- global revertive MBB
- soft preemption MBB
- TE graceful shutdown MBB

During the FRR global revertive MBB, CSPF selects a random link from those available between the PLR node and the Merge Point node, including the failed link if it has restored in the meantime. These links cannot be checked for overlap with the current path.

The TE graceful shutdown MBB still avoids the link or node that is in maintenance and the soft preemption MBB still avoids the link that is overbooked.

For an inter-area LSP, this feature applies to the subset of the path from the ingress LER to the exit ABR.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The procedures of this feature are not applied to a zero-bandwidth CSPF LSP, including an autobandwidth CSPF LSP while its operational bandwidth is zero, and to a non-CSPF LSP.

resignal-on-igp-event *boolean*

Synopsis	Reoptimize RSVP LSP paths upon IGP events
Context	**configure** router *named-item-64* mpls resignal-on-igp-event *boolean*
Tree	resignal-on-igp-event
Description	When configured to **true**, the system enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported: • link down • link up • IGP or TE metric change • SRLG change • admin group change The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

resignal-on-igp-overload *boolean*

Synopsis Resignal all RSVP-TE LSPs upon IGP overload

Context **configure** router *named-item-64* mpls resignal-on-igp-overload *boolean*

Tree resignal-on-igp-overload

Description When configured to **true**, the receipt of the IS-IS overload bit in the TE-DB triggers the immediate resignaling of all RSVP-TE LSPs. MPLS forces the expiry of the resignal timer and the TE-DB computes a new CSPF for each RSVP-TE LSP active path. The re-optimization causes the immediate transition of RSVP-TE LSP paths away from the IS-IS node in overload using the MBB operation.

This command cannot be configured to **true** when the **retry-on-igp-overloa**d command is configured to **true**.

When configured to **false**, the default behavior is maintained where MBB re-optimization occurs only when a timer-based resignal is performed or a manual resignal is executed.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

resignal-on-igp-event *boolean*

Synopsis Reoptimize SR-TE LSPs upon IGP link events

Context **configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-event *boolean*

Tree resignal-on-igp-event

Description When configured to **true**, the system enables the ad hoc reoptimization of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in the operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

resignal-on-igp-overload *boolean*

Synopsis	Enable resignaling of SR-TE LSPs upon IGP overload
Context	**configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-overload *boolean*
Tree	resignal-on-igp-overload
Description	When configured to **true**, the system enables ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router. When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up. The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the **configure router mpls sr-te-resignal resignal-timer** command to configure the resignal timer for the SR-TE application. When configured to **false**, MPLS does not act immediately on an IS-IS overload bit from a remote router. MPLS acts on it at the next timer-based or manual re-optimization of the SR-TE LSPs.
Default	false

Introduced	25.3.R2
Platforms	SAR Gen 2

strict-ero-nhop-direct-resolution *boolean*

Synopsis	Resolves RSVP-TE LSP ERO to local and host routes only
Context	**configure** router *named-item-64* mpls strict-ero-nhop-direct-resolution *boolean*
Tree	strict-ero-nhop-direct-resolution
Description	When configured to **true**, the router enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table. This command applies to an ERO when all of the following conditions are met: • the ERO next hop is an IPv4 address • the ERO object is a strict hop • the IPv4 address matches the primary subnet of a local numbered interface If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2). When configured to **false**, the router disables the strict ERO next-hop direct resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

tunnel-table-pref

Synopsis	Enter the **tunnel-table-pref** context
Context	**configure** router *named-item-64* mpls tunnel-table-pref
Tree	tunnel-table-pref
Description	Commands in this context configure the tunnel table preference for RSVP-TE LSP and SR-TE LSP tunnel types.
Introduced	25.3.R2
Platforms	SAR Gen 2

rsvp-te *number*

Synopsis	RSVP-TE tunnel table preference
Context	**configure** router *named-item-64* mpls tunnel-table-pref rsvp-te *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	rsvp-te
Description	This command configures the tunnel table preference for RSVP-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. Nokia recommends that tunnel types have unique preference values. In a situation where two or more tunnel types are set to the same preference value, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	7
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-te *number*

Synopsis	SR-TE tunnel table preference
Context	**configure** router *named-item-64* mpls tunnel-table-pref sr-te *number*
Tree	sr-te
Description	This command configures the tunnel table preference for SR-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	8
Introduced	25.3.R2
Platforms	SAR Gen 2

user-srlg-db *boolean*

Context	**configure** router *named-item-64* mpls-labels
Tree	mpls-labels
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp-labels-hold-timer *number*

Synopsis	BGP labels hold timer for the ingress router
Context	**configure** router *named-item-64* mpls-labels bgp-labels-hold-timer *number*
Tree	bgp-labels-hold-timer
Description	This command configures the time to delay before the label-forwarding entries programmed by BGP are removed from the datapath. A non-zero delay is useful in the following situations: • label-unicast route is readvertised by an ABR/ASBR operating in label-per-next-hop mode to choose a new primary path • IP VPN route is readvertised by an ABR/ASBR operating in label-per-next-hop mode to choose a new primary path • IP VPN best-external route is readvertised by a VPRN to choose a new backup path • IP VPN route is readvertised by a VPRN in label-per-next-hop mode to choose a new primary path In the preceding situations, configure the hold timer to be large enough to account for the propagation delay of the route withdrawal to all ingress routers.
Range	0 to 255
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

Synopsis	Use an IPv4 interface for NAT
Context	**configure** router *named-item-64* nat outside pool *named-item* applications use-interface-ip *boolean*
Tree	use-interface-ip
Description	When configured to **true**, the router uses the IPv4 address of a NAT enabled local interface as the public IP address, within the same outside (public) routing context. Only one such NAT'd interface can be defined per outside routing context.
Default	false
Introduced	25.7.R1
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* nat outside pool *named-item* description *description*
Tree	description
String length	1 to 80

Introduced	25.3.R2
Platforms	SAR Gen 2

icmp-echo-reply *boolean*

Synopsis	Allow NAT pool IP addresses to respond to ICMP PINGs
Context	**configure** router *named-item-64* nat outside pool *named-item* icmp-echo-reply *boolean*
Tree	icmp-echo-reply
Description	This command allows IP addresses in the NAT pool to respond to ICMP Echo requests (PINGs). The configuration can be toggled while the pool is in use. In L2-aware NAT when port-block-extensions is disabled, the reply from an outside IP address is generated only when this IP address has at least one host (binding) behind it. In L2-aware NAT when port-block-extensions is enabled, the reply from an outside IP address is generated regardless if a binding is present.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In LSN, the reply from an outside IP address is generated regardless if a binding is present.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

large-scale

Synopsis	Enter the **large-scale** context

cpm-reserved-ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of ports per protocol reserved for CPM traffic
Context	**configure** router *named-item-64* nat outside pool *named-item* large-scale use-interface-ip cpm-reserved-ports *number*
Tree	cpm-reserved-ports
Description	This command configures the router to reserve ports specifically for local (CPM) traffic. On the public IPv4 address of a NAT interface, the ports are shared between CPM traffic and transit traffic passing through the node. This reservation ensures that NAT traffic destined for the local node (CPM traffic) is guaranteed a minimum number of available ports, even if the public IPv4 port pool becomes exhausted.
Range	0 to 65535
Default	10
Introduced	25.7.R1
Platforms	SAR Gen 2

use-well-known-ports *boolean*

Synopsis	Enable dynamic allocation of well-known ports
Context	**configure** router *named-item-64* nat outside pool *named-item* large-scale use-interface-ip use-well-known-ports *boolean*
Tree	use-well-known-ports
Description	When configured to **true**, the router configures the dynamic allocation of well-known ports for interface-based NAT. When configured to **false**, well-known ports are not dynamically allocated for either transit traffic or traffic initiated from the control plane. This command can only be configured when the **configure service vprn nat outside pool application use-interface-ip** is set to **true**. Ports within the well-known range (0-1023) can still be allocated statically using static port forwarding.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

Tree	port-forwarding
Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-block-reservation *boolean*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Reserve dynamic block for subscriber
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding dynamic-block-reservation *boolean*
Tree	dynamic-block-reservation
Description	When configured to **true**, the system reserves dynamic port block when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being used and mappings are created. Dynamic port block reservation due to the port forward creation but without any dynamic mapping, is not logged. The reserved port block is released only when the last mapping in the block expires and there are no port forwards associated with the subscriber. The de-allocation log (syslog or RADIUS) is generated when the dynamic port block is completely released. Dynamic port block reservations can be enabled only if the configured maximum number of subscribers per outside IP addresses are less than or equal to the maximum number of configured port blocks per outside IP address. When configured to **false**, dynamic port blocks are not reserved when the first port forward for the subscriber is created.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

range-end *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	End of the wildcard range for port forwards

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding range-end *number*
Tree	range-end
Description	This command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-start** command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool. If unconfigured, the **range-end** implicit value is set to 1023, that represents the end of the well-known port range that is always enabled. Port forwards are supported only in pools in NAPT mode. Pools in 1:1 mode do not support port-forwards.
Range	0 | 1023 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

port-reservation

Synopsis	Enter the **port-reservation** context
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation
Tree	port-reservation
Introduced	25.3.R2
Platforms	SAR Gen 2

port-blocks *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Port block size for NAT subscribers
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation port-blocks *number*
Tree	port-blocks
Description	In CGN, this command specifies the number of port-blocks per outside IP address in the NAT pool. The available ports per outside IP address (the end port minus the upper bound value of the static port-forwarding range) are divided into the number of port blocks specified in this command. This implicitly determines the size of each port block.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For L2-aware NAT, this command can be configured only if the port block extensions (extended port blocks) are disabled. You must disable the **l2-aware port-block-extension** hierarchy in the NAT pool.

Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Size of the port block for NAT subscribers
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation ports *number*
Tree	ports
Description	For carrier-grade NAT (CGN), this command specifies the size of port blocks for NAT subscribers in the NAT pool. For Layer 2 aware NAT, this command specifies the size of the initial port block of a subscriber in the pool. Additional port blocks (extended port blocks) for the Layer 2 aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port blocks. For deterministic pools, the port range begins with zero. However, for non-deterministic pools, the port range begins with one.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.

rpki-session [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **rpki-session** list instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* origin-validation rpki-session *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	rpki-session
Description	This command configures a session with an RPKI local cache server by using the RPKI to Router (RPKI-RTR) protocol. Using these sessions, the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-RTR protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-RTR session using the base routing table (in-band) or the management router (out-of-band). Use the **configure router management** command to configure a session using the management port.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IPv4 or IPv6 address for the RPKI local cache server
Context	**configure** router *named-item-64* origin-validation rpki-session *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	rpki-session
Description	This command specifies an IPv4 address or an IPv6 address for the RPKI local cache server. If the IPv6 address is link-local, the interface name must be appended to the IPv6 address after a hyphen (-).
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

static-entry [ip-prefix] *(ipv4-prefix | ipv6-prefix)* upto *number* origin-as *number*

Synopsis	Enter the **static-entry** list instance
Context	**configure** router *named-item-64* origin-validation static-entry *(ipv4-prefix | ipv6-prefix)* upto *number* origin-as *number*
Tree	static-entry
Description	Commands in this context configure a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored, along with dynamic VRP entries (learned from local cache servers using the RPKI-RTR protocol), in the origin validation database of the router. This database is used for determining the origin validation state of IPv4 and IPv6 BGP routes received over sessions with origin validation enabled. Static entries can be configured only in the **configure router origin-validation** context of the base router.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

interface [interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name*
Tree	interface
Description	Commands in this context configure the attributes of the OSPF area interface. Unless they are explicitly configured, interfaces are not activated by default in any interior gateway protocol such as OSPF.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**interface-name**] *interface-name*

Synopsis	Router interface name
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name*
Tree	interface
Description	This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area it is moved to this area.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness
Tree	bfd-liveness
Introduced	25.3.R2
Platforms	SAR Gen 2

remain-down-on-failure *boolean*

Synopsis	Force adjacency down on failure until session returns
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness remain-down-on-failure *boolean*
Tree	remain-down-on-failure
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1
Platforms	SAR Gen 2

dead-interval *number*

Synopsis	OSPF wait time for Hellos before neighbor declared down

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis Interface type

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* interface-type *keyword*

Tree interface-type

Description This command specifies the interface type.

broadcast - Broadcast network

To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

non-broadcast - Non-broadcast network

point-to-point - Point-to-point link

Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

p2mp-nbma - Point-to-multipoint on a link without broadcast or multicast support

No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

secondary - Multiple secondary adjacencies allowed

A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

Options broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma

Introduced 25.3.R2

Platforms SAR Gen 2

node-sid

Synopsis Enable the **node-sid** context

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid

Tree node-sid

Description Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary.

This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 25.3.R2

Platforms SAR Gen 2

clear-n-flag *boolean*

Synopsis Clear the N-flag in an OSPF prefix

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*

Tree clear-n-flag

Description When configured to **true**, this command allows the user to clear the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system.

When configured to **false**, the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared.

When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

Default false

Introduced 25.3.R2

Tree	trace-path
Range	0 to 31
Options	none
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

compatible-rfc1583 *boolean*

Synopsis	OSPF summary and external route calculations
Context	**configure** router *named-item-64* ospf *number* compatible-rfc1583 *boolean*
Tree	compatible-rfc1583
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

database-export

Synopsis	Enable the **database-export** context
Context	**configure** router *named-item-64* ospf *number* database-export
Tree	database-export
Description	Commands in this context enable the population of the extended TE Database (TE-DB) with the link-state information from a specific IGP instance. This information includes the IGP, TE, and SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp-ls-identifier

Synopsis	Enable the **bgp-ls-identifier** context
Context	**configure** router *named-item-64* ospf *number* database-export bgp-ls-identifier
Tree	bgp-ls-identifier

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context correlate, along with the Autonomous System Number (ASN), the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain.
Introduced	25.3.R2
Platforms	SAR Gen 2

value *number*

Synopsis	BGP-LS ID sent in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain. **Note:** If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.
Max. range	0 to 4294967295
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

igp-identifier *number*

Synopsis	IGP instance in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of an instance ID specified for OSPF is local subnet significant (RFC 6549). An IGP identifier value can be configured to be unique within a specified IGP domain when the router sends the IGP link state information using BGP-LS.
Max. range	0 to 18446744073709551615
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* ospf *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

entropy-label

Synopsis	Enter the **entropy-label** context
Context	**configure** router *named-item-64* ospf *number* entropy-label
Tree	entropy-label
Introduced	25.3.R2
Platforms	SAR Gen 2

override-tunnel-elc *boolean*

Synopsis	Enable override of received ELC advertisements
Context	**configure** router *named-item-64* ospf *number* entropy-label override-tunnel-elc *boolean*
Tree	override-tunnel-elc
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

export-limit

Synopsis	Enable the **export-limit** context
Context	**configure** router *named-item-64* ospf *number* export-limit
Tree	export-limit
Introduced	25.3.R2
Platforms	SAR Gen 2

log-percent *number*

Synopsis	Export limit before warning and SNMP notification sent
Context	**configure** router *named-item-64* ospf *number* export-limit log-percent *number*
Tree	log-percent
Range	1 to 100
Introduced	25.3.R2
Platforms	SAR Gen 2

number *number*

Synopsis	Maximum routes or prefixes exported from route table
Context	**configure** router *named-item-64* ospf *number* export-limit number *number*
Tree	number
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* ospf *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

Routing policies are created in the **configure router policy-options** context.

Reference	**configure** policy-options policy-statement *named-item-64*

Platforms	SAR Gen 2

advertise-admin-group *keyword*

Synopsis	Administrative group TLV to advertise
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms advertise-admin-group *keyword*
Tree	advertise-admin-group
Description	This command configures the type of Administrative Group TLV the router advertises as an IGP link attribute. This command is configured for this IGP instance.
Options	prefer-ag, eag-only, ag-eag
Default	prefer-ag
Introduced	25.3.R2
Platforms	SAR Gen 2

flex-algo [flex-algo-id] *number*

Synopsis	Enter the **flex-algo** list instance
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number*
Tree	flex-algo
Description	Commands in this context configure the attributes of the OSPFv2 flexible algorithm. The maximum unique flexible algorithms can be configured on a router across all configured OSPFv2 instances. In each OSPF flexible algorithm configuration context, the OSPFv2 instance participation can be either enabled or disabled, and it configures the advertising of a locally-configured flexible algorithm definition. When flexible algorithm is enabled in an OSPF instance, it is enabled for all areas within the OSPF instance.
Max. instances	7
Introduced	25.3.R2
Platforms	SAR Gen 2

[**flex-algo-id**] *number*

Platforms	SAR Gen 2

advertise *reference*

Synopsis	Flexible Algorithm Definition advertisement
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* advertise *reference*
Tree	advertise
Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context

micro-loop-avoidance

Synopsis	Enable the **micro-loop-avoidance** context
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* micro-loop-avoidance
Tree	micro-loop-avoidance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured, the system enables micro-loop avoidance for an SR-OSPF flexible algorithm, and consequently, inherits the FIB delay timer from the SR-OSPF **configure router ospf segment-routing** context. When this command is configured, FIB updates are delayed before the system programs new primary next hops to avoid micro-loops. When configured, the feature applies to the following contexts: • OSPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop-avoidance is disabled (by removing this command from the configuration), the system forces any running FIB delay to expire immediately and programs the new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.
Introduced	25.3.R2
Platforms	SAR Gen 2

participate *boolean*

Synopsis	Allow participation in the Flexible Algorithm
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* participate *boolean*
Tree	participate
Description	When configured to **true**, the router advertises the capability to participate in a flexible algorithm within the IS-IS Router Capability TLV. A router only advertises participation when the winning FAD can be supported, which includes segment routing support. When configured to **false**, flexible algorithm participation is not enabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* ospf *number* graceful-restart
Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.

Introduced 25.3.R2

Platforms SAR Gen 2

helper-mode *boolean*

Synopsis Enable graceful restart helper for OSPF

Context **configure** router *named-item-64* ospf *number* graceful-restart helper-mode *boolean*

Tree helper-mode

Description When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval.

When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

helper-resync-timeout *number*

Synopsis Maximum resynchronization period

Context **configure** router *named-item-64* ospf *number* graceful-restart helper-resync-timeout *number*

Tree helper-resync-timeout

Description This command configures the maximum resynchronization period. If the resynchronization takes longer than the configured value, the graceful restart process stops, and the OSPF neighbor session falls back to the ExStart state for normal adjacency establishment.

Range 120 to 900

Units seconds

Default 120

Introduced 26.3.R1

Platforms SAR Gen 2

© 2026 Nokia.

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.
Introduced	25.3.R2
Platforms	SAR Gen 2

augment-route-table *boolean*

Synopsis	Attach remote LFA information to RTM entries
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate augment-route-table *boolean*
Tree	augment-route-table
Description	When configured to **true**, this command enables IS-IS to attach remote LFA-specific information to RTM entries for use by protocols such as LDP. When configured to **false**, rLFA-specific information is not added to RTM entries.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude

prefix-policy *reference*

Synopsis	Policy to exclude prefixes from LFA SPF calculation
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate exclude prefix-policy *reference*
Tree	prefix-policy
Description	This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation. An excluded prefix is not included in LFA calculation regardless of its priority. The prefix tag is, however, used in the main SPF.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context configure a multihomed prefix LFA for both RTM routes (IP FRR) and SR-OSPF tunnels. SR-OSPF tunnels enable multihomed prefix extension in both algorithm 0 and flexible-algorithm numbers. This feature makes use of the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes. This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes. The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to all. The user must enable the ip-fast-reroute leaf to have these backup paths programmed into the FIB in datapath. The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as

ti-lfa

Synopsis	Enable the **ti-lfa** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa
Tree	ti-lfa
Description	Commands in this context enable the use of the Topology Independent Loop-Free Alternate (TI-LFA) algorithm used in the LFA Shortest Path First (SPF) calculation for this OSPF instance.
Introduced	25.3.R2
Platforms	SAR Gen 2

max-sr-frr-labels *number*

Synopsis	Maximum number of labels the TI-LFA backup path can use
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa max-sr-frr-labels *number*
Tree	max-sr-frr-labels

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.
Range	0 to 3
Default	2
Introduced	25.3.R2
Platforms	SAR Gen 2

neighbor-path-expand *boolean*

Synopsis	Expand the neighbor path
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa neighbor-path-expand *boolean*
Tree	neighbor-path-expand
Description	When configured to **true**, the router uses the TI-LFA backup path computation algorithm for the protection of an IPv4 SR-OSPF node SID of a neighbor and of an adjacency SID over a link to that neighbor to avoid traffic loops when the neighbor node fails. The SR-OSPF TI-LFA expanded neighbor backup path expands the path from the Q node to the destination node, which is the neighbor node in this case, by first visiting the penultimate node and then riding an unprotected adjacency SID over a link to the destination node. When applied to the backup path of a neighbor IPv4 SR-OSPF node SID or of an adjacency SID over a link to this neighbor, it forces the traffic to drop at the penultimate node and does not loop in case of neighbor node failure.
Default	false
Introduced	26.7.R1
Platforms	SAR Gen 2

multi-instance *boolean*

Synopsis	Enable OSPF Multi Instance Extensions
Context	**configure** router *named-item-64* ospf *number* multi-instance *boolean*
Tree	multi-instance
Description	When configured to **true**, the Base router supports RFC 6549, OSPFv2 Multi-Instance Extensions. This support is enabled per instance and allows flexibility when migrating a particular instance from classic OSPFv2 to a multi-instance OSPFv2.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

multicast-import *boolean*

Synopsis	Submit routes into the multicast Route Table Manager
Context	**configure** router *named-item-64* ospf *number* multicast-import *boolean*
Tree	multicast-import
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

multicast-import-policy *reference*

Synopsis	Import policy to submit IGP routes to the multicast RTM
Context	**configure** router *named-item-64* ospf *number* multicast-import-policy *reference*
Tree	multicast-import-policy
Description	This command specifies the policy used by OSPF to submit routes to the multicast RTM. This command applies only when the **configure router ospf multicast-import** command is enabled. By default, enabling **multicast-import** causes OSPF to submit all IGP routes to the multicast RTM. Configuring this command allows the user to specify prefixes in the policy prefix list to control OSPF route submission.
Reference	**configure** policy-options policy-statement *named-item-64*

adj-sid-hold *(number | keyword)*

Synopsis Adjacency SID hold time

Context **configure** router *named-item-64* ospf *number* segment-routing adj-sid-hold *(number | keyword)*

Tree adj-sid-hold

Description This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

Tree	maximum-sid-depth
Introduced	25.3.R2
Platforms	SAR Gen 2

override-bmi *number*

Synopsis	Value to override the announced node MSD-BMI value
Context	**configure** router *named-item-64* ospf *number* segment-routing maximum-sid-depth override-bmi *number*
Tree	override-bmi
Description	This command overrides the announced MSD node Base MPLS Imposition (BMI) value. The MSD-BMI value announced by a router can be used by recipients to understand the number of MPLS labels that can be imposed inclusive of all service, transport, or special labels. When unconfigured, the router announces the maximum supported BMI of the node assuming the most simple services and Layer 2 encapsulation.
Range	0 to 13
Introduced	25.3.R2
Platforms	SAR Gen 2

override-erld *number*

Synopsis	Value to override the announced node MSD-ERLD value
Context	**configure** router *named-item-64* ospf *number* segment-routing maximum-sid-depth override-erld *number*
Tree	override-erld
Description	This command configures the override Entropy Readable Label Depth (ERLD) Maximum Sid Depth (MSD) value. Information about the capability of each intermediate LSR of reading the maximum label stack depth is used by ingress LSRs to perform EL-based load balancing. When unconfigured, the router announces the node maximum supported ERLD assuming the most simple Layer 2 encapsulation.
Range	0 to 15
Introduced	25.3.R2
Platforms	SAR Gen 2

Context	**configure** router *named-item-64* ospf *number* segment-routing micro-loop-avoidance
Tree	micro-loop-avoidance
Description	Commands in this context configure micro-loop avoidance for SR-OSPF.
Introduced	25.3.R2
Platforms	SAR Gen 2

fib-delay *number*

Synopsis	FIB delay
Context	**configure** router *named-item-64* ospf *number* segment-routing micro-loop-avoidance fib-delay *number*
Tree	fib-delay
Description	This command configures the FIB delay before programming new primary next hops. Configure the FIB delay timer to a value that corresponds to the worst-case IGP convergence in a network domain. The default FIB delay timer value corresponds to a network with a nominal convergence time. When configured, the feature applies to the following contexts: • SPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop avoidance is disabled, the system forces any running FIB delay to expire immediately and the system programs new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.
Range	1 to 300
Units	deciseconds
Default	15
Introduced	25.3.R2
Platforms	SAR Gen 2

tunnel-table-pref *number*

Synopsis Preference of SR tunnels created by the IGP instance

Context **configure** router *named-item-64* ospf *number* segment-routing tunnel-table-pref *number*

Tree tunnel-table-pref

Description This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *named-item-64* ospf *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within the OSPF-TE TLV attribute or when the Application-Specific Link Attribute (ASLA) is enabled within SR-TE ASLA. When the router is configured under the **configure router ospf traffic-engineering-options sr-te application-specific-link-attributes** command to generate SR-TE ASLA attributes, link delay is advertised as a legacy RFC 3630 TLV when RSVP-TE is enabled and as an ASLA RFC 8920 TLV for SR-TE when MPLS is enabled for an interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SR OS accepts and handles both legacy RSVP-TE TLVs and ASLAs for the RSVP application. However, SR OS only advertises RFC 3630 legacy RSVP-TE TLVs (as recommended by RFC 8920) to avoid compatibility issues.

When configured to **false**, the router disables link delay advertisement.

Default	false
Introduced	25.3.R2

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	25.3.R2
Platforms	SAR Gen 2

load-balancing-weight *number*

node-sid

Synopsis	Enable the **node-sid** context
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid
Tree	node-sid
Description	Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address. In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary. This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 25.3.R2

Platforms SAR Gen 2

clear-n-flag *boolean*

Synopsis Clear the N-flag in an OSPF3 prefix

Context **configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*

Tree clear-n-flag

Description When configured to **true**, this command allows the user to clear the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system.

When configured to **false**, the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared.

When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

Default false

Introduced	25.3.R2
Platforms	SAR Gen 2

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* ospf3 *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* ospf3 *number* graceful-restart

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-mode *boolean*

Synopsis	Enable graceful restart helper for OSPF
Context	**configure** router *named-item-64* ospf3 *number* graceful-restart helper-mode *boolean*
Tree	helper-mode
Description	When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval. When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-lsa-checking *boolean*

Synopsis	Perform strict LSA checking during graceful restart
Context	**configure** router *named-item-64* ospf3 *number* graceful-restart strict-lsa-checking *boolean*
Tree	strict-lsa-checking
Default	true

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** router *named-item-64* ospf3 *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude

Synopsis	Enter the **exclude** context
Context	**configure** router *named-item-64* ospf3 *number* loopfree-alternate exclude
Tree	exclude
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix-policy *reference*

Synopsis	Policy to exclude prefixes from LFA SPF calculation
Context	**configure** router *named-item-64* ospf3 *number* loopfree-alternate exclude prefix-policy *reference*
Tree	prefix-policy
Description	This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation. An excluded prefix is not included in LFA calculation regardless of its priority. The prefix tag is, however, used in the main SPF.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* ospf3 *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency. When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection. • IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV. • The adjacency SID hold timer starts. • The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges. • If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value. • If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.

- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

Range	1 to 1800

tunnel-table-pref *number*

Synopsis Preference of SR tunnels created by the IGP instance

Context **configure** router *named-item-64* ospf3 *number* segment-routing tunnel-table-pref *number*

Tree tunnel-table-pref

Description This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

lsa-second-wait *number*

Synopsis	Hold time between the first and second LSA generation
Context	**configure** router *named-item-64* ospf3 *number* timers lsa-generate lsa-second-wait *number*
Tree	lsa-second-wait
Range	10 to 600000
Units	milliseconds
Default	5000
Introduced	25.3.R2
Platforms	SAR Gen 2

max-lsa-wait *number*

Synopsis	Max time between two LSAs being generated
Context	**configure** router *named-item-64* ospf3 *number* timers lsa-generate max-lsa-wait *number*
Tree	max-lsa-wait
Range	10 to 600000
Units	milliseconds
Default	5000
Introduced	25.3.R2
Platforms	SAR Gen 2

redistribute-delay *number*

Synopsis	Hold down timer for external routes into OSPF
Context	**configure** router *named-item-64* ospf3 *number* timers redistribute-delay *number*
Tree	redistribute-delay
Range	0 to 1000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-wait

Synopsis	Enter the **spf-wait** context
Context	**configure** router *named-item-64* ospf3 *number* timers spf-wait
Tree	spf-wait
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-initial-wait *number*

Synopsis	Initial SPF calculation delay after a topology change
Context	**configure** router *named-item-64* ospf3 *number* timers spf-wait spf-initial-wait *number*
Tree	spf-initial-wait
Range	10 to 100000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-max-wait *number*

Synopsis	Max interval between two consecutive SPF calculations
Context	**configure** router *named-item-64* ospf3 *number* timers spf-wait spf-max-wait *number*
Tree	spf-max-wait
Range	10 to 120000
Units	milliseconds
Default	10000
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-second-wait *number*

Synopsis	Hold time between the first and second SPF calculation
Context	**configure** router *named-item-64* ospf3 *number* timers spf-wait spf-second-wait *number*
Tree	spf-second-wait

Range	10 to 100000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

unicast-import *boolean*

Synopsis	Submit routes into the unicast Route Table Manager
Context	**configure** router *named-item-64* ospf3 *number* unicast-import *boolean*
Tree	unicast-import
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

pcep

Synopsis	Enter the **pcep** context
Context	**configure** router *named-item-64* pcep
Tree	pcep
Description	Commands in this context configure the PCEP command options.
Introduced	25.3.R2
Platforms	SAR Gen 2

pcc

Synopsis	Enable the **pcc** context
Context	**configure** router *named-item-64* pcep pcc
Tree	pcc
Description	Commands in this context configure the PCC command options.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

admin-state *keyword*

Synopsis	Administrative state of the PCEP session element
Context	**configure** router *named-item-64* pcep pcc admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

capability-advertisement

Synopsis	Enter the **capability-advertisement** context
Context	**configure** router *named-item-64* pcep pcc capability-advertisement
Tree	capability-advertisement
Description	Commands in this context configure the advertisement of PCEP PCC capabilities in the Open message.
Introduced	26.3.R2
Platforms	SAR Gen 2

multi-path *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable advertising multipath capability in Open message
Context	**configure** router *named-item-64* pcep pcc capability-advertisement multi-path *boolean*
Tree	multi-path
Description	When configured to **true**, the router advertises the multipath capability in the Open message, which allows PCEP speakers to signal their ability to support and handle multiple paths or segment lists for an SR policy. This is needed for proper negotiation and operation of SR policies in relation to load sharing. When configured to **false**, the router disables the advertisement of the multipath capability in the Open message.
Default	false
Introduced	26.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

sr-policy *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable advertising SR-policy capability in Open message
Context	**configure** router *named-item-64* pcep pcc capability-advertisement sr-policy *boolean*
Tree	sr-policy
Description	When configured to **true**, the router advertises the SR-policy capability in the Open message, which allows the PCCs to signal their support for SR policies during PCEP session establishment. When configured to **false**, the router disables the advertisement of the SR policy in the Open message.
Default	false
Introduced	26.3.R2
Platforms	SAR Gen 2

dead-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Configure dead timer
Context	**configure** router *named-item-64* pcep pcc dead-timer *number*
Tree	dead-timer
Range	1 to 255
Units	seconds
Default	120
Introduced	25.3.R2
Platforms	SAR Gen 2

keepalive *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Configure keepalive
Context	**configure** router *named-item-64* pcep pcc keepalive *number*
Tree	keepalive
Range	1 to 255
Units	seconds
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

local-address *ipv4-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local IPv4 address of the PCEP speaker
Context	**configure** router *named-item-64* pcep pcc local-address *ipv4-unicast-address*
Tree	local-address
Description	This command configures the local IPv4 address of the PCEP speaker.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

local-address-ipv6 *ipv6-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local IPv6 address of the PCEP speaker

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* pcep pcc local-address-ipv6 *ipv6-unicast-address*
Tree	local-address-ipv6
Description	This command configures the local IPv6 address of the PCEP speaker.
Introduced	25.3.R2
Platforms	SAR Gen 2

max-srte-pce-init-lsps *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Configure max sr te pce init LSP
Context	**configure** router *named-item-64* pcep pcc max-srte-pce-init-lsps *number*
Tree	max-srte-pce-init-lsps
Range	0 to 8191
Default	8191
Introduced	25.3.R2
Platforms	SAR Gen 2

pce-associations

Synopsis	Enter the **pce-associations** context
Context	**configure** router *named-item-64* pcep pcc pce-associations
Tree	pce-associations
Description	Commands in this context configure PCE association groups.
Introduced	25.3.R2
Platforms	SAR Gen 2

diversity [assoc-name] *named-item*

Synopsis	Enter the **diversity** list instance
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item*
Tree	diversity
Description	Commands in this context create a named diversity association from which the parameters for the specified diversity association are configured.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

[**assoc-name**] *named-item*

Synopsis	Name of the association group
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item*
Tree	diversity
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

association-id *number*

Synopsis	Association ID for the diversity association group
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* association-id *number*
Tree	association-id
Description	This command configures the diversity association ID. The user must specify an association ID.
Range	0 to 65535
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

association-source *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address of the diversity association
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* association-source *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	association-source
Introduced	25.3.R2
Platforms	SAR Gen 2

disjointness-reference *boolean*

Synopsis	Configure P-flag in the disjointness configuration TLV
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* disjointness-reference *boolean*
Tree	disjointness-reference
Description	When configured to **true**, the router sets the P-flag in the disjointness configuration TLV. When the P-flag is set, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID. When configured to **false**, the router does not set the P-flag in the disjointness configuration TLV.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

disjointness-type *keyword*

Synopsis	Disjointness type for the association group
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* disjointness-type *keyword*
Tree	disjointness-type
Options	strict, loose
Default	loose
Introduced	25.3.R2
Platforms	SAR Gen 2

diversity-type *keyword*

Synopsis	Diversity type for the association group
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* diversity-type *keyword*
Tree	diversity-type
Description	This command configures the diversity type for the association group.
Options	none, link, node, srlg-link, srlg-node
Default	none

Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the PIM interface
Context	**configure** router *named-item-64* pim interface *interface-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

assert-period *number*

Synopsis	Time for periodic refreshes of PIM Assert messages on an interface
Context	**configure** router *named-item-64* pim interface *interface-name* assert-period *number*
Tree	assert-period
Range	1 to 300
Default	60
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

Synopsis	Enter the **bfd-liveness** context
Context	**configure** router *named-item-64* pim interface *interface-name* bfd-liveness
Tree	bfd-liveness
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *boolean*

Synopsis	Use Bidirectional Forwarding Detection for IPv4 on PIM interface
Context	**configure** router *named-item-64* pim interface *interface-name* bfd-liveness ipv4 *boolean*
Tree	ipv4

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Use Bidirectional Forwarding Detection for IPv6 on PIM interface
Context	**configure** router *named-item-64* pim interface *interface-name* bfd-liveness ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bsm-check-rtr-alert *boolean*

Synopsis	Check router alert option in bootstrap messages received
Context	**configure** router *named-item-64* pim interface *interface-name* bsm-check-rtr-alert *boolean*
Tree	bsm-check-rtr-alert
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

hello-interval *number*

Synopsis	Frequency at which PIM Hello messages are sent over this interface
Context	**configure** router *named-item-64* pim interface *interface-name* hello-interval *number*
Tree	hello-interval
Range	0 to 255
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

hello-multiplier *number*

Synopsis	Multiplier to determine the hold time for PIM neighbor
Context	**configure** router *named-item-64* pim interface *interface-name* hello-multiplier *number*
Tree	hello-multiplier
Range	20 to 100
Default	35
Introduced	25.3.R2
Platforms	SAR Gen 2

improved-assert *boolean*

Synopsis	Allow improved assert processing on interface
Context	**configure** router *named-item-64* pim interface *interface-name* improved-assert *boolean*
Tree	improved-assert
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

instant-prune-echo *boolean*

Synopsis	Allow PIM to send an instant prune echo when router starts the prune pending timer for PIM interface
Context	**configure** router *named-item-64* pim interface *interface-name* instant-prune-echo *boolean*
Tree	instant-prune-echo
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* pim interface *interface-name* ipv4
Tree	ipv4

Tree	operation
Options	add, subtract, set
Introduced	25.3.R2
Platforms	SAR Gen 2

priority-delta *number*

Synopsis	Delta priority with operation when operational group is active
Context	**configure** router *named-item-64* pim interface *interface-name* ipv6 monitor-oper-group priority-delta *number*
Tree	priority-delta
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

multicast *boolean*

Synopsis	Enable PIM interface operation
Context	**configure** router *named-item-64* pim interface *interface-name* ipv6 multicast *boolean*
Tree	multicast
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-groups *number*

Synopsis	Maximum number of groups for the interface
Context	**configure** router *named-item-64* pim interface *interface-name* max-groups *number*
Tree	max-groups
Range	0 | 1 to 16000
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

multicast-senders *keyword*

Synopsis	Subnet matching for the incoming data packets
Context	**configure** router *named-item-64* pim interface *interface-name* multicast-senders *keyword*
Tree	multicast-senders
Options	auto, always, never
Default	auto
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	DR election priority for this interface
Context	**configure** router *named-item-64* pim interface *interface-name* priority *number*
Tree	priority
Description	This command sets the priority value to elect the DR. The DR election priority is a 32-bit unsigned number and the numerically larger priority is always preferred.
Range	1 to 4294967295
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sticky-dr

Synopsis	Enable the **sticky-dr** context
Context	**configure** router *named-item-64* pim interface *interface-name* sticky-dr
Tree	sticky-dr
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	DR election priority for this interface
Context	**configure** router *named-item-64* pim interface *interface-name* sticky-dr priority *number*
Tree	priority
Range	1 to 4294967295
Default	1024
Introduced	25.3.R2
Platforms	SAR Gen 2

three-way-hello *boolean*

Synopsis	Allow three-way hello compatibility mode
Context	**configure** router *named-item-64* pim interface *interface-name* three-way-hello *boolean*
Tree	three-way-hello
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

tracking-support *boolean*

Synopsis	Allow upstream routers to explicitly track join membership
Context	**configure** router *named-item-64* pim interface *interface-name* tracking-support *boolean*
Tree	tracking-support
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* pim ipv4
Tree	ipv4
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of PIM operation for IPv4
Context	**configure** router *named-item-64* pim ipv4 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

rpf-table *keyword*

Synopsis	Route tables for RPF lookup
Context	**configure** router *named-item-64* pim ipv4 rpf-table *keyword*
Tree	rpf-table
Options	rtable-m, rtable-u, both
Default	rtable-u
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address

Synopsis	Enter the **source-address** context
Context	**configure** router *named-item-64* pim ipv4 source-address
Tree	source-address
Description	Commands in this context configure the source IP address for PIM messages.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

register-message *ipv4-unicast-address*

Synopsis	Source IPv4 address for PIM register messages
Context	**configure** router *named-item-64* pim ipv4 source-address register-message *ipv4-unicast-address*
Tree	register-message
Description	This command configures the source IPv4 address for register messages in this PIM instance. The IP address can be set to any unicast address, regardless of whether it resides on the node. Ensure that the specified IP address is configured on the router as a loopback or interface IP address. When unconfigured, the source IP address for register messages is selected by choosing the smallest IP address from available interfaces on the node.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

ssm-assert-compatible-mode *boolean*

Synopsis	Enable SSM assert compatible mode
Context	**configure** router *named-item-64* pim ipv4 ssm-assert-compatible-mode *boolean*
Tree	ssm-assert-compatible-mode
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ssm-default-range *boolean*

Synopsis	SSM default range
Context	**configure** router *named-item-64* pim ipv4 ssm-default-range *boolean*
Tree	ssm-default-range
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** router *named-item-64* pim ipv6
Tree	ipv6
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of PIM operation for IPv6
Context	**configure** router *named-item-64* pim ipv6 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

rpf-table *keyword*

Synopsis	Route tables for RPF lookup
Context	**configure** router *named-item-64* pim ipv6 rpf-table *keyword*
Tree	rpf-table
Options	rtable-m, rtable-u, both
Default	rtable-u
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address

Synopsis	Enter the **source-address** context
Context	**configure** router *named-item-64* pim ipv6 source-address
Tree	source-address
Description	Commands in this context configure the source IP address for PIM messages.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

register-message *ipv6-unicast-address*

Synopsis	Source IPv6 address for PIM register messages
Context	**configure** router *named-item-64* pim ipv6 source-address register-message *ipv6-unicast-address*
Tree	register-message
Description	This command configures the source IPv6 address for register messages in this PIM instance. The IP address can be set to any unicast address, regardless of whether it resides on the node. Ensure that the specified IP address is configured on the router as a loopback or interface IP address. When unconfigured, the source IP address for register messages is selected by choosing the smallest IP address from available interfaces on the node.
Introduced	25.3.R2
Platforms	SAR Gen 2

ssm-default-range *boolean*

Synopsis	SSM default range
Context	**configure** router *named-item-64* pim ipv6 ssm-default-range *boolean*
Tree	ssm-default-range
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

mdt-spt *boolean*

Synopsis	Use SPT switchover for default MDT
Context	**configure** router *named-item-64* pim mdt-spt *boolean*
Tree	mdt-spt
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

non-dr-attract-traffic *boolean*

Synopsis	Attract traffic when the router is not the designated one
Context	**configure** router *named-item-64* pim non-dr-attract-traffic *boolean*
Tree	non-dr-attract-traffic
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

pim-ssm-scaling *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable PIM-SSM scaling
Context	**configure** router *named-item-64* pim pim-ssm-scaling *boolean*
Tree	pim-ssm-scaling
Description	When configured to **true**, this command enables an increase of PIM SSM (S,G) scaling to a maximum of 256000 per system. The total maximum multicast capacity is, however, constrained by the lowest-performance FP. When the maximum link capacity from the fabric to the lowest-performance FP is reached, the link to that FP is overloaded, resulting in packet loss for all FPs. This capacity constraint is independent of whether the lowest-performance FP has a receiver on it or not. If the multicast management chassis per-plane total capacity is configured to an explicit value larger than that supported by the lowest-performance FP, then IMPM believes that there is more plane capacity available than there actually is and the result is (S,G) packet loss instead of blackholing. By setting the multicast management chassis per-plane total capacity to **dynamic**, the system automatically sets the switch fabric multicast plane capacity to the minimum value supported by the fabric and all line cards in the system. When PIM SSM scaling is enabled, the following multicast features are disabled: • DM • MoFRR • JP policy • InBand features (BIER and MLDP) • Extranet • ASM When configured to **false**, there is no increase of PIM SSM (S,G) scaling.

Context	**configure** router *named-item-64* radius server *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

insert-message-authenticator *boolean*

Synopsis	Insert Message-Authenticator in Access-Request
Context	**configure** router *named-item-64* radius server *named-item* insert-message-authenticator *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	insert-message-authenticator
Description	When configured to **true**, the router inserts a Message-Authenticator attribute as the first attribute in Access-Request messages.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

pending-requests-limit *number*

Synopsis	Limit of the number for pending RADIUS requests
Context	**configure** router *named-item-64* radius server *named-item* pending-requests-limit *number*
Tree	pending-requests-limit
Range	1 to 4096
Default	4096
Introduced	25.3.R2
Platforms	SAR Gen 2

require-message-authenticator *boolean*

Synopsis	Require Message-Authenticator in Access-Request reply
Context	**configure** router *named-item-64* radius server *named-item* require-message-authenticator *boolean*
Tree	require-message-authenticator
Description	When configured to **true**, the router silently drops responses to Access-Requests without a Message-Authenticator attribute.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

secret *encrypted-leaf*

Synopsis	Secret key associated with this RADIUS server
Context	**configure** router *named-item-64* radius server *named-item* secret *encrypted-leaf*
Tree	secret

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the secret key associated with this RADIUS server in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 166
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

rip

Synopsis	Enable the **rip** context
Context	**configure** router *named-item-64* rip
Tree	rip
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the RIP instance
Context	**configure** router *named-item-64* rip admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors
Context	**configure** router *named-item-64* rip authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.

When unconfigured, this command removes the authentication password from the configuration and disables authentication.

This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.

String length 1 to 102

Introduced 25.3.R2

Platforms SAR Gen 2

authentication-type *keyword*

Synopsis Authentication type used between RIP neighbors

Context **configure** router *named-item-64* rip authentication-type *keyword*

Tree authentication-type

Description This command sets the type of authentication to be used between RIP neighbors.

The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.

When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.

Options none, password, md5, md20

Default none

Introduced 25.3.R2

Platforms SAR Gen 2

bfd-liveness *boolean*

Synopsis Enable BFD to control the state of protocol adjacency

Context **configure** router *named-item-64* rip bfd-liveness *boolean*

Tree bfd-liveness

Description When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency.

When configured to **false**, this command removes BFD from the associated protocol adjacency.

Default false

Introduced 25.3.R2

Platforms	SAR Gen 2

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this command removes BFD from the associated protocol adjacency.

Introduced 25.3.R2

Platforms SAR Gen 2

check-zero *boolean*

Synopsis Enable checking of mandatory zero fields

Context **configure** router *named-item-64* rip group *named-item* neighbor *interface-name* check-zero *boolean*

Tree check-zero

Description When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages.

When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

Introduced 25.3.R2

Platforms SAR Gen 2

export-policy *reference*

Synopsis Policies used to rule which routes are exported to RIP

Context **configure** router *named-item-64* rip group *named-item* neighbor *interface-name* export-policy *reference*

Tree export-policy

Description This command specifies the export route policies used to determine which routes are exported to RIP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

import-policy *reference*

Synopsis	Policies to decide routes accepted from RIP neighbors
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* import-policy *reference*
Tree	import-policy
Description	This command configures import route policies to determine which routes are accepted from RIP neighbors. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

message-size *number*

Synopsis	Maximum number of routes per RIP update message
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* message-size *number*
Tree	message-size
Range	25 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

metric-in *number*

Synopsis	Metric added to routes received from a RIP neighbor
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* metric-in *number*
Tree	metric-in
Range	1 to 16
Introduced	25.3.R2
Platforms	SAR Gen 2

metric-out *number*

Synopsis	Metric added to routes exported into RIP
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* metric-out *number*
Tree	metric-out
Range	1 to 16
Introduced	25.3.R2
Platforms	SAR Gen 2

preference *number*

Synopsis	Route preference
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* preference *number*
Tree	preference
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

receive *keyword*

Synopsis	Accepted version on received packets
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* receive *keyword*
Tree	receive

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	version-1, version-2, both, none
Introduced	25.3.R2
Platforms	SAR Gen 2

send *keyword*

Synopsis	RIP version and method used to send RIP updates
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* send *keyword*
Tree	send
Options	none, version-1, broadcast, multicast, unicast
Introduced	25.3.R2
Platforms	SAR Gen 2

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	25.3.R2
Platforms	SAR Gen 2

timers

Synopsis	Enable the **timers** context
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* timers
Tree	timers
Introduced	25.3.R2

Platforms	SAR Gen 2

flush *number*

Synopsis	RIP flush timer
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* timers flush *number*
Tree	flush
Description	This command specifies the time a route is maintained in the RIP database after it has been declared invalid. When the timer expires, the route is flushed from the RIP database completely.
Range	1 to 1200
Units	seconds
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	RIP timeout timer
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* timers timeout *number*
Tree	timeout
Description	This command specifies the RIP timeout timer. If a route is not updated by the time the timer expires, the route is declared invalid, but the route is maintained in the RIP database.
Range	1 to 1200
Units	seconds
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

update *number*

Synopsis	Timer that controls the frequency of updates

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* ripng group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

authentication-over-bypass *boolean*

Synopsis	Enable MD5 authentication over bypass LSP of PLR and MP
Context	**configure** router *named-item-64* rsvp authentication-over-bypass *boolean*
Tree	authentication-over-bypass
Description	When configured to **true**, this command configures the MD5 authentication over the bypass LSP of all Point of Local Repairs (PLRs) and Merge Points (MPs) on the router. Only enable this command when the TE interfaces in the RSVP-TE network use the same MD5 authentication parameters. When a Point of Local Repair (PLR) activates a bypass LSP towards a Merge Point (MP), by default, the INTEGRITY object corresponding to the bypass LSP interface is not added to a transmitted RSVP message except for packets of routed RSVP messages (Resv, Srefresh, and ACK), and only when the packet is intended for a bypass LSP endpoint (PLR or MP) that is a directly connected neighbor. When this command is enabled, the INTEGRITY object of the interface corresponding to the bypass LSP is added to a transmitted RSVP message regardless of whether the bypass LSP endpoint (PLR or MP) is a directly connected RSVP neighbor. The INTEGRITY object is included with the following RSVP messages: Path, PathTear, Path Err, Resv, ResvTear, ResvErr, Srefresh, and ACK. In all cases, an RSVP message received from a PLR or a MP (sender address in the SenderTemplate oe FilterSpec is different from an Extended Tunnel Id in a Session Object), and which includes the INTEGRITY object is authenticated against the bypass LSP interface. An RSVP message received from a PLR or MP without the INTEGRITY object is also accepted. When configured to **false**, the router disables MD5 authentication over bypass LSP of the PLRs and MPs.
Default	false

authentication-key *encrypted-leaf*

Synopsis	Authentication or hash key string
Context	**configure** router *named-item-64* rsvp interface *reference* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key for use between RSVP neighbors to authenticate RSVP messages. Authentication uses the MD5 message-based digest. When enabled on an RSVP interface, authentication of RSVP messages operates in both directions of the interface. A router maintains a security association using one authentication key for each interface to an RSVP neighbor. An RSVP neighbor transmits an authenticating digest of the RSVP message that is computed using the shared authentication key and a keyed-hash algorithm. The message digest is included in an INTEGRITY object, which also contains a flags field, a key identifier field, and a sequence number field. An RSVP neighbor uses the key together with the authentication algorithm to process received RSVP messages. The RSVP MD5 authentication complies to the procedures for RSVP message generation in RFC 2747, *RSVP Cryptographic Authentication*. The MD5 implementation does not support the authentication challenge procedures in RFC 2747. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.

Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the maintenance policy
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* admin-state *keyword*
Tree	admin-state
Description	This command sets the administrative state of the maintenance policy. A maintenance policy must be administratively disabled to change any of the parameters. When a maintenance template is administratively disabled, all applicable candidate paths are removed from the data path.
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable seamless BFD for segment lists of candidate path
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables seamless BFD on every segment list of an SR policy candidate path to which the maintenance policy is applied. The BFD template configures the parameters for the BFD session. When configured to **false**, seamless BFD is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bfd-template *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	BFD template to be used by seamless BFD
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* bfd-template *reference*
Tree	bfd-template
Description	This command references a named BFD template to be used by seamless BFD. A BFD template must exist on the system before being referenced from a maintenance policy. The template specifies parameters that are used by the BFD session, such as the minimum transmit and receive control packet timer intervals.
Reference	**configure** bfd bfd-template *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-down-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Hold down timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* hold-down-timer *number*
Tree	hold-down-timer
Description	This command configures the hold down timer for the maintenance policy. The purpose of the timer is to prevent bouncing of the SR policy path state if S-BFD sessions associated with the segment lists flap, causing the threshold to be repeatedly crossed in a short period of time. The timer is started when the number of up S-BFD sessions drops below the threshold. The SR policy path is not considered to be up again until the hold down timer has expired and the number of up S-BFD sessions reaches or exceeds the threshold and the internal hold timer is not running. If the revert timer is also configured, the revert timer is not started until after the number of up S-BFD sessions equals or exceeds the threshold and the hold down timer for the primary candidate path has expired.
Range	0 to 5000

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	deciseconds
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Protection mode for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* mode *keyword*
Tree	mode
Description	This command specifies the data path programming and protection mechanism for SR policy candidate paths to which the maintenance policy is applied.
Options	none, ecmp-protected, linear
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range	32 to 1048575
Introduced	25.3.R2
Platforms	SAR Gen 2

revert-timer *number*

Synopsis	Revert timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* revert-timer *number*
Tree	revert-timer
Description	This command configures the revert timer for SR Policy candidate paths. The revert timer is started when the primary path recovers (the number of S-BFD sessions that are up equals or exceeds the threshold value and the hold down timer has expired). When the timer expires, the system reverts to the primary path.
Range	0 to 4320
Units	minutes
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Minimum number of up S-BFD sessions for up path status
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* threshold *number*
Tree	threshold
Description	This command configures the minimum number of S-BFD sessions that must be up for the SR policy candidate path to be considered up. If the number of up sessions is below this threshold value, the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.
Range	1 to 32

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Unique value for a policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* distinguisher *number*
Tree	distinguisher
Description	This command configures a distinguisher value to associate with a statically defined SR policy. This is a mandatory command for non-local SR policies. Every non-local SR policy must have a unique distinguisher value. When a non-local static SR policy is imported into BGP and originated as a BGP route, the configured distinguisher value is copied into the NLRI of the route.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Destination of the source-routed path
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	endpoint
Description	This command associates an IPv4 or IPv6 endpoint address with a statically defined SR policy. This association is mandatory when enabling an SR policy.
Introduced	25.3.R2
Platforms	SAR Gen 2

head-end *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Head-end address for this static policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* head-end *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)*
Tree	head-end
Description	This command associates a head-end location with a statically defined SR policy. The head end identifies the target router to install the policy. This is a mandatory command for enabling the SR policy.
Options	local
Introduced	25.3.R2
Platforms	SAR Gen 2

maintenance-policy *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Policy name
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* maintenance-policy *reference*
Tree	maintenance-policy
Reference	**configure** router *named-item-64* segment-routing maintenance-policy *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

pce-report *boolean*

Synopsis	Enable reporting of SR policy candidate path via PCEP
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* pce-report *boolean*
Tree	pce-report

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router reports the SR policy candidate path to a PCE through PCEP.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

preference *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Preference value of this static policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* preference *number*
Tree	preference
Description	This command configures a preference value to associate with a statically defined SR policy. When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process, which considers both static local policies and BGP-signaled policies, the policy with the highest preference value is preferred over all policies with a lower preference value.
Max. range	0 to 4294967295
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

segment-list [seg-list-index] *number*

Synopsis	Enter the **segment-list** list instance
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number*
Tree	segment-list
Description	Commands in this context configure a segment list for the statically defined segment routing policy.
Max. instances	32

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

[**seg-list-index**] *number*

Synopsis	Index for identifying a specific segment list
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number*
Tree	segment-list
Range	1 to 32
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of segment list for static policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

segment [segment-index] *number*

Synopsis	Enter the **segment** list instance
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number*
Tree	segment
Description	Commands in this context configure a segment inside a segment-list of a statically-defined segment routing policy candidate path. A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.

Max. instances	24
Introduced	25.3.R2
Platforms	SAR Gen 2

[**segment-index**] *number*

Synopsis	Index for identifying a segment in a segment list
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number*
Tree	segment
Description	This command configures the index for identifying a segment in a segment list. Each segment list can have up to 11 segments for SR-MPLS policies, and 24 segments for an SRv6 segment list which only includes micro-segments. For an SRv6 segment list that mixes regular and micro-segments, up to 7 regular segments can be configured.
Range	1 to 24
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

mpls-label *number*

Synopsis	Value for the MPLS label
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number* mpls-label *number*
Tree	mpls-label
Range	0 to 1048575
Introduced	25.3.R2
Platforms	SAR Gen 2

weight *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Weight of the segment list
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* weight *number*
Tree	weight
Description	This command associates an optional weight value with a segment list of a statically defined segment routing policy to achieve weighted ECMP behavior. When any segment list in the active policy has a weight greater than 1, traffic matching the policy is load-balanced across the segment lists according to their relative weight values.
Max. range	0 to 4294967295
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

sfm-overload

Synopsis	Enable the **sfm-overload** context
Context	**configure** router *named-item-64* sfm-overload
Tree	sfm-overload
Introduced	25.3.R2
Platforms	SAR Gen 2

holdoff-time *number*

hold-down

Synopsis	Enable the **hold-down** context
Context	**configure** router *named-item-64* static-routes hold-down

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	hold-down
Description	Commands in this context enable the hold-down time feature globally for static routes in the system. The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap. The commands in this context apply to all static routes in the VPRN and the base router instance in which this hold-down time is configured in.
Introduced	25.3.R2
Platforms	SAR Gen 2

initial *number*

Synopsis	Value for the initial hold-down time
Context	**configure** router *named-item-64* static-routes hold-down initial *number*
Tree	initial
Description	This command specifies the initial value of the hold-down time globally for static routes in the system. When a static route is ready to become active, it remains inactive for the hold-down time before activating the static-route. If, during this hold-down period, the static route becomes inactive again because of factors such as interface failure, the hold-down timer is reset, effectively postponing the activation of the route until the next opportunity.
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

max-value *number*

Synopsis	Maximum value of the hold-down time
Context	**configure** router *named-item-64* static-routes hold-down max-value *number*
Tree	max-value
Description	This command specifies the maximum value of the hold-down time globally for static routes in the system.
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multiplier *number*

Synopsis	Multiplier of the previous hold-down time
Context	**configure** router *named-item-64* static-routes hold-down multiplier *number*
Tree	multiplier
Description	This command specifies the multiplier value by which the previous hold-down time is multiplied to calculate the new one. This value applies globally for static routes in the system.
Range	1 to 10
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

route [ip-prefix] *(ipv4-prefix | ipv6-prefix)* route-type *keyword*

Synopsis	Enter the **route** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword*
Tree	route
Description	Commands in this context create a static route entry. A prefix and netmask must be specified. After the static route context for the specified prefix and netmask has been created, additional options associated with the static route or routes may be specified through the inclusion of additional static route commands.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	IP prefix and prefix length for the static routes
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword*

indirect [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **indirect** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	indirect
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Next-hop IP address used to reach the destination
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	indirect
Description	This command specifies the next-hop IP address used to reach the destination. The specified IP address can be either on the network side or the access side and is typically at least one hop away from the node.
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the static route operation
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	25.3.R2
Platforms	SAR Gen 2

community *community*

Synopsis	Community ID associated with the static route
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* community *community*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	community
Description	This command associates one BGP community (standard, extended, or large) with a next hop of the static route. This community can be matched in route policies and automatically added to BGP routes that are created from the static route. If at least one community is specified at the prefix level of the static route entry, this command is ignored.
String length	1 to 72
Introduced	25.3.R2
Platforms	SAR Gen 2

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.
Max. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

[**address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

preference *number*

Synopsis	Priority of static route over different route sources

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* ipsec-tunnel *named-item* preference *number*
Tree	preference
Description	This command specifies the route preference to be assigned to the associated static route. The lower the preference value the more preferred the route is considered.
Range	1 to 255
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

tag *number*

Synopsis	Static route tag
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* ipsec-tunnel *named-item* tag *number*
Tree	tag
Description	This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols. If a tag is specified at the prefix level of the static route entry, this command is ignored.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

leak-destination

Synopsis	Enter the **leak-destination** context
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* leak-destination
Tree	leak-destination
Description	Commands in this context configure a list of VPRNs that receive a leaked copy of the static route. When a VPRN service is added to this list, the static route is leaked into that VPRN if the following conditions are met: • all the configured next hops of the static route are direct next hops • the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a packet received by a VPRN matches a "VPN Leak" route leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

Introduced 25.3.R2

Platforms SAR Gen 2

router-instance [service-name] *reference*

community *community*

Synopsis	Community ID associated with the static route
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* community *community*
Tree	community
Description	This command associates one BGP community (standard, extended, or large) with a next hop of the static route. This community can be matched in route policies and automatically added to BGP routes that are created from the static route. If at least one community is specified at the prefix level of the static route entry, this command is ignored.
String length	1 to 72
Introduced	25.3.R2
Platforms	SAR Gen 2

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

sr-mpls-local *keyword*

Synopsis	TTL propagation for local CPM generated IP packets
Context	**configure** router *named-item-64* ttl-propagate sr-mpls-local *keyword*
Tree	sr-mpls-local
Description	This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command enables or disables propagation of the TTL or hop-limit field value of CPM originated IP packet to all labels in the segment routing transport label stack. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.

Options
none – Do not propagate TTL or hop-limit field value
all – Propagate TTL or hop-limit field value

Default all

Introduced 25.3.R2

Platforms SAR Gen 2

sr-mpls-transit *keyword*

Synopsis TTL propagation for in-transit user IP packets

Context **configure** router *named-item-64* ttl-propagate sr-mpls-transit *keyword*

Tree sr-mpls-transit

Description This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy.

This command enables or disables propagation of the TTL or hop-limit field value for transit IP packets to all labels in the segment routing transport label stack. Transit IP packets are packets of base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.

Options
none – Do not propagate TTL or hop-limit field value
all – Propagate TTL or hop-limit field value

Default all

Introduced 25.3.R2

Platforms SAR Gen 2

type *keyword*

Synopsis	Processing behavior type for the reflector
Context	**configure** router *named-item-64* twamp-light reflector type *keyword*
Tree	type
Description	This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light** the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet. In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, set the value to **stamp**. When the reflector is operating in **stamp** mode, the primary parsing is based on STAMP, checking and processing known TLVs, or determining if the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros padding pattern when the pad size is non zero.
Options	stamp – Reflector finds and processes supported STAMP TLVs twamp-light – Reflector does not check received PDU
Default	twamp-light
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **exclude** context
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude
Tree	exclude
Description	Commands in this context define administrative groups that are used to exclude links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The exclude rule that is part of the FAD specifies that links with the named administrative groups set are to be excluded from the topology graph.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude admin-group *reference*
Tree	admin-group
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude admin-group *reference*
Tree	admin-group
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

flags-tlv *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertise the FAD Flags TLV
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* flags-tlv *boolean*
Tree	flags-tlv
Description	When configured to **true**, the router advertises the FAD Flags TLV within the FAD. The M-flag within the TLV is set to 1, specifying the use of a Flex-Algorithm specific prefix metric. A router receiving the TLV modifies the constrained SPF (cSPF) based on the M-flag status. When configured to **false**, the FAD Flags TLV is not included with the FAD advertisement.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

include-all

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **include-all** context
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all
Tree	include-all
Description	Commands in this context define administrative groups that are used to include links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The include-all rule that is part of the FAD specifies that all named administrative groups must be present in a link to be included in the topology graph.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all admin-group *reference*
Tree	admin-group
Introduced	25.3.R2
Platforms	SAR Gen 2

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all admin-group *reference*
Tree	admin-group
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

include-any

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **include-any** context
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-any
Tree	include-any
Description	Commands in this context define administrative groups that are used to include links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The include-all rule that is part of the FAD specifies that any link with the named administrative groups is included in the topology graph.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-any admin-group *reference*
Tree	admin-group
Introduced	25.3.R2
Platforms	SAR Gen 2

metric-type *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FAD metric type
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* metric-type *keyword*
Tree	metric-type
Options	igp, delay, te-metric
Default	igp
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FAD priority
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* priority *number*
Tree	priority
Description	This command configures the priority of the FAD. The priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.
Range	0 to 255
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

if-attribute

Synopsis	Enter the **if-attribute** context
Context	**configure** routing-options if-attribute
Tree	if-attribute

4.26.1 saa command descriptions

saa

Synopsis	Enter the **saa** context
Context	**configure** saa
Tree	saa
Description	Commands in this context configure the Service Assurance Agent (SAA) tests.
Introduced	25.3.R2
Platforms	SAR Gen 2

owner [owner-name] *named-item* test *named-item*

Synopsis	Enter the **owner** list instance
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Introduced	25.3.R2
Platforms	SAR Gen 2

[**owner-name**] *named-item*

Synopsis	Optional owner name of the SAA operation
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Description	This command configures the owner associated with the SAA operation.
String length	1 to 32
MD-CLI default	TiMOS CLI
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test *named-item*

Synopsis	SAA test name
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

accounting-policy *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Accounting policy associated with the SAA test
Context	**configure** saa owner *named-item* test *named-item* accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the SAA test
Context	**configure** saa owner *named-item* test *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

continuous *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Execute the SAA tests as continuous
Context	**configure** saa owner *named-item* test *named-item* continuous *boolean*
Tree	continuous
Description	When configured to **true**, the SAA test execution is continuous, that is, it cannot be started or stopped with the **oam saa test start** or **stop** commands. The SAA test types supported by this command include the following: • **cpe-ping** • **dns** • **eth-cfm-loopback** • **eth-cfm-two-way-delay** • **eth-cfm-two-way-slm** • **icmp-ping** (not applicable to **rapid** type) • **lsp-ping** • **mac-ping** • **sdp-ping** • **vccv-ping** • **vprn-ping**
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** saa owner *named-item* test *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

jitter-event [direction] *keyword* threshold-type *keyword*

Synopsis	Enter the **jitter-event** list instance
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event
Description	Commands in this context configure the jitter event thresholds used to evaluate the jitter event value at the termination of an SAA test probe. The system generates SAA threshold events as required.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**direction**] *keyword*

Synopsis	Direction for OAM ping responses for OAM ping test run
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event
Options	inbound, outbound, round-trip
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold-type *keyword*

Synopsis	Threshold type
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event
Options	rising, falling
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Threshold jitter value
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword* threshold *number*
Tree	threshold
Description	This command specifies the threshold jitter value. The system generates an SAA threshold event when the jitter value of the test run crosses the threshold value.
Range	0 to 2147483647
Units	microseconds
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

latency-event [direction] *keyword* threshold-type *keyword*

Synopsis	Enter the **latency-event** list instance
Context	**configure** saa owner *named-item* test *named-item* latency-event *keyword* threshold-type *keyword*
Tree	latency-event
Description	Commands in this context configure the latency event thresholds used to evaluate the latency event value at the termination of an SAA test probe. The system generates SAA threshold events as required.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**direction**] *keyword*

Synopsis	Direction for OAM ping responses for OAM ping test run
Context	**configure** saa owner *named-item* test *named-item* latency-event *keyword* threshold-type *keyword*
Tree	latency-event
Options	inbound, outbound, round-trip
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

threshold-type *keyword*

Synopsis	Threshold type
Context	**configure** saa owner *named-item* test *named-item* latency-event *keyword* threshold-type *keyword*
Tree	latency-event
Options	rising, falling
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Threshold latency value
Context	**configure** saa owner *named-item* test *named-item* latency-event *keyword* threshold-type *keyword* threshold *number*
Tree	threshold
Description	This command specifies the threshold latency value. The system generates an SAA threshold event when the latency value of the test run crosses the threshold value.
Range	0 to 2147483647
Units	microseconds
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

loss-event [direction] *keyword* threshold-type *keyword*

Synopsis	Enter the **loss-event** list instance
Context	**configure** saa owner *named-item* test *named-item* loss-event *keyword* threshold-type *keyword*
Tree	loss-event
Description	Commands in this context configure the loss event thresholds used to evaluate the loss event value at the termination of an SAA test probe. The system generates SAA threshold events as required.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

[**direction**] *keyword*

Synopsis	Direction for OAM ping responses for OAM ping test run
Context	**configure** saa owner *named-item* test *named-item* loss-event *keyword* threshold-type *keyword*
Tree	loss-event
Options	inbound, outbound, round-trip
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold-type *keyword*

Synopsis	Threshold type
Context	**configure** saa owner *named-item* test *named-item* loss-event *keyword* threshold-type *keyword*
Tree	loss-event
Options	rising, falling
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Threshold loss event value
Context	**configure** saa owner *named-item* test *named-item* loss-event *keyword* threshold-type *keyword* threshold *number*
Tree	threshold
Description	This command specifies the threshold loss value. The system generates an SAA threshold event when the loss value of the test run crosses the threshold value.
Range	0 to 2147483647
Units	packets
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-history *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	History probe behavior
Context	**configure** saa owner *named-item* test *named-item* probe-history *keyword*
Tree	probe-history
Options	keep, drop, auto
Default	auto
Introduced	25.3.R2
Platforms	SAR Gen 2

type

Synopsis	Enter the **type** context
Context	**configure** saa owner *named-item* test *named-item* type
Tree	type
Introduced	25.3.R2
Platforms	SAR Gen 2

eth-cfm-loopback

Synopsis	Enable the **eth-cfm-loopback** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback
Tree	eth-cfm-loopback
Description	Commands in this context configure an Ethernet CFM loopback test in SAA.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	25.10.R1
Platforms	SAR Gen 2

count *number*

Synopsis	Number of packets to send

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback count *number*
Tree	count
Range	1 to 100
Units	packets
Default	1
Introduced	25.10.R1
Platforms	SAR Gen 2

destination *(mac-unicast-address-no-zero | number)*

Synopsis	Destination MAC address or remote MEP ID of the peer
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback destination *(mac-unicast-address-no-zero | number)*
Tree	destination
Description	This command specifies the Layer 2 unicast MAC address of the destination MEP or, alternatively, the remote MEP ID. When the remote MEP ID option is used instead of the MAC address, the domain and association information of the source MEP for the test is used to check for a locally stored unicast MAC address for the peer. The local MEP must be administratively enabled.
Range	1 to 8191
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

interval *number*

Synopsis	Interval between packets sent
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	5
Introduced	25.10.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ma-admin-name *(named-item-64 | admin-name)*

Synopsis	Source Ethernet Maintenance Association (MA) name
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback ma-admin-name *(named-item-64 | admin-name)*
Tree	ma-admin-name
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

md-admin-name *(named-item-64 | admin-name)*

Synopsis	Source Ethernet Maintenance Domain (MD) name
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback md-admin-name *(named-item-64 | admin-name)*
Tree	md-admin-name
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

mep *number*

Synopsis	Source Ethernet MEP ID
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback mep *number*
Tree	mep
Range	1 to 8191
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback qos
Tree	qos
Introduced	25.10.R1
Platforms	SAR Gen 2

fc *keyword*

Synopsis	FC for the sent echo request packets
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback qos fc *keyword*
Tree	fc
Options	be – Best Effort l2 – Low 2 (best effort) af – Assured Forwarding (assured) l1 – Low 1 (assured) h2 – High 2 (high priority) ef – Expedited Forwarding (high priority) h1 – High 1 (high priority) nc – Network Control (high priority)
Default	nc
Introduced	25.10.R1
Platforms	SAR Gen 2

profile *keyword*

Synopsis	QoS profile for the sent echo request packets
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback qos profile *keyword*
Tree	profile
Options	in – In profile out – Out of profile
Default	in
Introduced	25.10.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

size *number*

Synopsis	Size of the value field in the sent frames
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback size *number*
Tree	size
Range	0 to 1500
Units	bytes
Default	0
Introduced	25.10.R1
Platforms	SAR Gen 2

timeout *number*

Synopsis	Maximum time to wait for a reply packet
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback timeout *number*
Tree	timeout
Description	This command configures the maximum time the router waits for a reply packet after sending the last probe for the test. When the timeout expires, the test is marked complete and no more packets are processed.
Range	1 to 10
Units	seconds
Default	5
Introduced	25.10.R1
Platforms	SAR Gen 2

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation
Tree	trap-generation
Introduced	25.10.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	25.10.R1
Platforms	SAR Gen 2

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.10.R1
Platforms	SAR Gen 2

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	25.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	25.10.R1
Platforms	SAR Gen 2

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.10.R1
Platforms	SAR Gen 2

icmp-ping

Synopsis	Enable the **icmp-ping** context
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping
Tree	icmp-ping
Description	Commands in this context configure an ICMP ping test.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	25.3.R2
Platforms	SAR Gen 2

bypass-routing *boolean*

Synopsis	Bypass routing table for directly connected interfaces
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping bypass-routing *boolean*
Tree	bypass-routing
Default	false
Notes	The following elements are part of a choice: **bypass-routing**, **interface**, or **next-hop-address**.
Introduced	25.3.R2
Platforms	SAR Gen 2

count *number*

Synopsis	ICMP Echo Request packets to send in a sample window
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping count *number*
Tree	count
Range	1 to 100000
Units	packets
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

destination-address *(ipv4-address-no-zone | ipv6-address-no-zone | string-not-all-spaces)*

Synopsis	Destination IP address or DNS name to send ping request
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping destination-address *(ipv4-address-no-zone | ipv6-address-no-zone | string-not-all-spaces)*
Tree	destination-address
String length	1 to 128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

do-not-fragment *boolean*

Synopsis	Do not fragment echo request packets (valid for IPv4)
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping do-not-fragment *boolean*
Tree	do-not-fragment
Description	This command sets the Do Not Fragment (DF) bit in the IPv4 header. This prevents packet fragmentation along the path when there is an MTU mismatch.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

interface *interface-name*

Synopsis	Interface name
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping interface *interface-name*
Tree	interface
String length	1 to 32
Notes	The following elements are part of a choice: **bypass-routing**, **interface**, or **next-hop-address**.
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *(number | decimal-number)*

Synopsis	Minimum time to expire before message request is sent
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping interval *(number | decimal-number)*
Tree	interval
Range	1 to 10000

© 2026 Nokia.

Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Next-hop IP address to reach destination
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping next-hop-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	next-hop-address
Notes	The following elements are part of a choice: **bypass-routing**, **interface**, or **next-hop-address**.
Introduced	25.3.R2
Platforms	SAR Gen 2

pattern *(keyword | number)*

Synopsis	Pattern to fill the data portion in a ping packet
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping pattern *(keyword | number)*
Tree	pattern
Range	0 to 65535
Options	sequential
Default	sequential
Introduced	25.3.R2
Platforms	SAR Gen 2

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping qos
Tree	qos
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc *keyword*

Synopsis	Forwarding class
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping qos fc *keyword*
Tree	fc
Options	be – Best Effort l2 – Low 2 (best effort) af – Assured Forwarding (assured) l1 – Low 1 (assured) h2 – High 2 (high priority) ef – Expedited Forwarding (high priority) h1 – High 1 (high priority) nc – Network Control (high priority)
Default	nc
Introduced	25.3.R2
Platforms	SAR Gen 2

tos *number*

Synopsis	Type of service
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping qos tos *number*
Tree	tos
Range	0 to 255
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

router-instance *string*

Synopsis	Router name or VPRN service name
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping router-instance *string*
Tree	router-instance
Default	Base
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

size *number*

Synopsis	Packet padding size
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping size *number*
Tree	size
Description	This command configures the number of bytes in the combined ICMP Header (8 bytes) and ICMP Payload (variable size) of the ICMP Echo Request packets.
Range	0 to 16384
Units	bytes
Default	56
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures the source IP address to be loaded into the IP header of the ICMP Echo Request packet. If unconfigured, the router uses a system-selected local address.
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	Time router waits for a reply after sending last probe
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping timeout *number*
Tree	timeout
Range	1 to 10
Units	seconds
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation
Tree	trap-generation
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2

Platforms	SAR Gen 2

ttl *number*

Synopsis	Time to live in the IP header
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping ttl *number*
Tree	ttl
Range	1 to 128
Default	64
Introduced	25.3.R2
Platforms	SAR Gen 2

lsp-ping

Synopsis	Enable the **lsp-ping** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping
Tree	lsp-ping
Description	Commands in this context configure the command options to perform in-band LSP connectivity tests. LSP ping uses the protocol and data structures defined in RFC 8029, *Detecting Multiprotocol Label Switched (MPLS) Data-Plane Failures*.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

Synopsis	Minimum time before the next lsp-ping request is sent
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	25.3.R2

© 2026 Nokia.

path *named-item-64*

Synopsis	Name of the MPLS path to be tested
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type sr-te path *named-item-64*
Tree	path
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

path-destination

Synopsis	Enter the **path-destination** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type sr-te path-destination
Tree	path-destination
Introduced	25.3.R2
Platforms	SAR Gen 2

interface *interface-name*

Synopsis	Egress router interface used with the path destination
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type sr-te path-destination interface *interface-name*
Tree	interface
String length	1 to 32

© 2026 Nokia.

Notes	The following elements are part of a choice: **interface** or **next-hop**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the path destination
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type sr-te path-destination ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	ip-address
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Egress IP next hop address used with path destination
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type sr-te path-destination next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	next-hop
Notes	The following elements are part of a choice: **interface** or **next-hop**.
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	Time router waits for a reply to an echo request
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping timeout *number*
Tree	timeout
Range	1 to 10
Units	seconds
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation
Tree	trap-generation
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

ttl *number*

Synopsis	TTL value for the echo request MPLS label
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping ttl *number*
Tree	ttl
Range	1 to 255
Default	255
Introduced	25.3.R2
Platforms	SAR Gen 2

sdp-ping

Synopsis	Enable the **sdp-ping** context
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping
Tree	sdp-ping
Description	Commands in this context configure tests on SDPs for unidirectional or round-trip connectivity, as well as for performing SDP MTU path tests.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	25.3.R2
Platforms	SAR Gen 2

count *number*

Synopsis	Number of SDP echo request packets to send
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping count *number*
Tree	count
Description	This command specifies the number of echo request packets to send. Each request must either time out or receive a reply before the next message request is sent. The **interval** value must expire before the next message request is sent.
Range	1 to 100
Units	packets
Default	1
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

interval *number*

Synopsis	Interval between SDP echo request packets sent
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

originating-sdp-identifier *number*

Synopsis	SDP ID used to send packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping originating-sdp-identifier *number*
Tree	originating-sdp-identifier
Description	This command specifies the SDP ID that is used by SDP ping. The far-end address of the specified SDP ID is the expected responder ID within each reply received. The SDP ID defines the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If this ID is invalid, administratively down, or otherwise unavailable, the SDP echo request message is not sent, and an error message is displayed. After the interval timer expires, the SDP ping attempts to send the next request, if required.
Range	1 to 32767
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos
Tree	qos
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

fc *keyword*

Synopsis	FC for the transmitted SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos fc *keyword*
Tree	fc
Options	be – Best Effort l2 – Low 2 (best effort) af – Assured Forwarding (assured) l1 – Low 1 (assured) h2 – High 2 (high priority) ef – Expedited Forwarding (high priority) h1 – High 1 (high priority) nc – Network Control (high priority)
Default	be
Introduced	25.3.R2
Platforms	SAR Gen 2

profile *keyword*

Synopsis	QoS profile for transmitted SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos profile *keyword*
Tree	profile
Options	in – In profile out – Out of profile
Default	out
Introduced	25.3.R2
Platforms	SAR Gen 2

responder-sdp-identifier *number*

Synopsis	SDP ID used by the far-end to reply to the request
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping responder-sdp-identifier *number*
Tree	responder-sdp-identifier
Description	This command configures the return SDP ID to be used by the far-end router for the message reply for round-trip SDP connectivity testing.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this ID does not exist on the far-end router, or terminates on a different router from the originating router, or another issue prevents the far-end router from using this ID, the SDP echo reply is sent using generic IP or GRE OAM encapsulation. The received FC (as mapped on the ingress network interface for the far end) defines the FC encapsulation for the reply message.

Range	1 to 32767
Introduced	25.3.R2
Platforms	SAR Gen 2

size *number*

Synopsis	Size of the SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping size *number*
Tree	size
Description	This command configures the size of the SDP echo request packets, which includes the SDP header and payload. The size does not include the SDP encapsulation, VC label (if applied), or any DLC headers or trailers.
Range	72 to 9786
Units	bytes
Default	72
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	Maximum time to wait for SDP echo reply packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping timeout *number*
Tree	timeout
Description	This command configures the time the router waits for a message reply after sending the last probe for a specific test. When the timeout expires, the test is marked complete and no more packets are processed.
Range	1 to 10
Units	seconds
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation
Tree	trap-generation
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	25.3.R2

4.27.1 service command descriptions

service

Synopsis	Enter the **service** context
Context	**configure** service
Tree	service
Introduced	25.3.R2
Platforms	SAR Gen 2

cpipe [service-name] *service-name*

Synopsis	Enter the **cpipe** list instance
Context	**configure** service cpipe *service-name*
Tree	cpipe
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service cpipe *service-name*
Tree	cpipe
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association. When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error. This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The service ID must be the same number used for every platform on which this service is defined.
String length	1 to 64

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the service
Context	**configure** service cpipe *service-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

customer *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Service customer ID
Context	**configure** service cpipe *service-name* customer *reference*
Tree	customer
Reference	**configure** service customer *customer-name*
Notes	This element is mandatory.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

description *description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* description *description*
Tree	description
String length	1 to 80

© 2026 Nokia.

String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

endpoint [name] *named-item*

Synopsis	Enter the **endpoint** list instance
Context	**configure** service cpipe *service-name* endpoint *named-item*
Tree	endpoint
Max. instances	2
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**name**] *named-item*

Synopsis	Service endpoint name
Context	**configure** service cpipe *service-name* endpoint *named-item*
Tree	endpoint
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

active-multipath *boolean*

Synopsis	Active multi-path protection status
Context	**configure** service cpipe *service-name* endpoint *named-item* active-multipath *boolean*
Tree	active-multipath
Default	false
Introduced	26.7.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.

active-multipath-timeout *number*

Synopsis	Active Multipath timeout
Context	**configure** service cpipe *service-name* endpoint *named-item* active-multipath-timeout *number*
Tree	active-multipath-timeout
Range	1 to 60
Units	seconds
Introduced	26.7.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

description *description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* endpoint *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

hold-time-active *number*

Synopsis	Time before entering standby when MC-LAG SAP goes down
Context	**configure** service cpipe *service-name* endpoint *named-item* hold-time-active *number*
Tree	hold-time-active
Range	1 to 60
Units	deciseconds
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

revert-time *(number | keyword)*

Synopsis	Time to wait before reverting to primary spoke SDP
Context	**configure** service cpipe *service-name* endpoint *named-item* revert-time *(number | keyword)*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	revert-time
Range	1 to 600
Units	seconds
Options	never, immediate
Default	immediate
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

standby-signaling *keyword*

Synopsis	Status of whether PW standby bit is sent to T-LDP peer
Context	**configure** service cpipe *service-name* endpoint *named-item* standby-signaling *keyword*
Tree	standby-signaling
Description	This command configures whether the pseudowire standby bit (value 0x00000020) is sent to the T-LDP peer for each spoke-SDP of the endpoint that is selected as a standby. This command is mutually exclusive with the **vc-switching** command.
Options	master, slave
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

network-latency-measurement *boolean*

Synopsis	Enable/disable network latency measurement
Context	**configure** service cpipe *service-name* network-latency-measurement *boolean*
Tree	network-latency-measurement
Default	false
Introduced	26.7.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

sap [sap-id] *sap*

Synopsis	Enter the **sap** list instance
Context	**configure** service cpipe *service-name* sap *sap*
Tree	sap

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**sap-id**] *sap*

Synopsis	SAP ID
Context	**configure** service cpipe *service-name* sap *sap*
Tree	sap
String length	1 to 45
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

accounting-policy *reference*

Synopsis	Accounting policy
Context	**configure** service cpipe *service-name* sap *sap* accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the SAP
Context	**configure** service cpipe *service-name* sap *sap* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

cem

Synopsis	Enter the **cem** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service cpipe *service-name* sap *sap* cem
Tree	cem
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

asym-delay-control

Synopsis	Enable the **asym-delay-control** context
Context	**configure** service cpipe *service-name* sap *sap* cem asym-delay-control
Tree	asym-delay-control
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

min-repeat *number*

Synopsis	Interval at which the ADC function will repeat after the service is up
Context	**configure** service cpipe *service-name* sap *sap* cem asym-delay-control min-repeat *number*
Tree	min-repeat
Range	0 to 1440
Units	minutes
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

samples *number*

Synopsis	Sample size in thousands
Context	**configure** service cpipe *service-name* sap *sap* cem asym-delay-control samples *number*
Tree	samples
Range	1 | 2 | 4 | 8 | 16 | 32
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

threshold-repeat *number*

Synopsis	Threshold to determine if an octet correction is made after an ADC repeat or on-demand ADC analysis in 125 microseconds increments
Context	**configure** service cpipe *service-name* sap *sap* cem asym-delay-control threshold-repeat *number*
Tree	threshold-repeat
Range	125 to 4000
Units	microseconds
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

packet

Synopsis	Enter the **packet** context
Context	**configure** service cpipe *service-name* sap *sap* cem packet
Tree	packet
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

jitter-buffer *number*

Synopsis	Jitter buffer size
Context	**configure** service cpipe *service-name* sap *sap* cem packet jitter-buffer *number*
Tree	jitter-buffer
Range	1 to 250
Units	milliseconds
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

payload-size *number*

Synopsis	Size of payload packets transmitted to PSN by CEM SAP
Context	**configure** service cpipe *service-name* sap *sap* cem packet payload-size *number*
Tree	payload-size
Range	2 to 1514

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	bytes
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

report-alarm

Synopsis	Enter the **report-alarm** context
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm
Tree	report-alarm
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

buffer-overrun *boolean*

Synopsis	Report alarm for buffer overrun
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm buffer-overrun *boolean*
Tree	buffer-overrun
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

buffer-underrun *boolean*

Synopsis	Report alarm for buffer underrun
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm buffer-underrun *boolean*
Tree	buffer-underrun
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

malformed-packets *boolean*

Synopsis	Report alarm for malformed packets
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm malformed-packets *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	malformed-packets
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

packet-loss *boolean*

Synopsis	Report remote peer is currently in packet loss status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm packet-loss *boolean*
Tree	packet-loss
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

remote-fault *boolean*

Synopsis	Report remote TDM interface is currently not in service
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-fault *boolean*
Tree	remote-fault
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

remote-packet-loss *boolean*

Synopsis	Report remote peer is currently in packet loss status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-packet-loss *boolean*
Tree	remote-packet-loss
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote-rdi *boolean*

Synopsis	Report remote TDM interface is currently in RDI status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-rdi *boolean*
Tree	remote-rdi
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

stray-packets *boolean*

Synopsis	Report alarm for stray packets
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm stray-packets *boolean*
Tree	stray-packets
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

collect-stats *boolean*

Synopsis	Collect accounting statistics
Context	**configure** service cpipe *service-name* sap *sap* collect-stats *boolean*
Tree	collect-stats
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

description *long-description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* sap *sap* description *long-description*
Tree	description
String length	1 to 160
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	26.3.R1

Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

service-mtu *number*

Synopsis	MTU size
Context	**configure** service cpipe *service-name* service-mtu *number*
Tree	service-mtu
Range	1 to 9194
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

spoke-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis	Enter the **spoke-sdp** list instance
Context	**configure** service cpipe *service-name* spoke-sdp *sdp-bind-id*
Tree	spoke-sdp
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**sdp-bind-id**] *sdp-bind-id*

Synopsis	SDP binding ID
Context	**configure** service cpipe *service-name* spoke-sdp *sdp-bind-id*
Tree	spoke-sdp
String length	3 to 16
String format	'sdp-bind-id' must be sdp-id:vc-id (sdp 1..32767, vc 1..4294967295)
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the SDP binding to the service
Context	**configure** service cpipe *service-name* spoke-sdp *sdp-bind-id* admin-state *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	enable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

bandwidth *(number | keyword)*

Synopsis	Bandwidth that is reserved for this SDP binding
Context	**configure** service cpipe *service-name* spoke-sdp *sdp-bind-id* bandwidth *(number | keyword)*
Tree	bandwidth
Range	0 to 100000000
Units	kilobps
Options	max
Default	0
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

control-word *boolean*

Synopsis	Use control word as part of packet encapsulation
Context	**configure** service cpipe *service-name* spoke-sdp *sdp-bind-id* control-word *boolean*
Tree	control-word
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service customer *customer-name* multi-service-site *named-item* egress scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context will not change. If the scheduler name does not exist in this or another

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context does not change.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character

Introduced	25.3.R2
Platforms	SAR Gen 2

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service epipe *service-name*
Tree	epipe
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association. When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error. This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The service ID must be the same number used for every platform on which this service is defined.
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2

bgp-evpn

Synopsis	Enable the **bgp-evpn** context
Context	**configure** service epipe *service-name* bgp-evpn
Tree	bgp-evpn
Description	Commands in this context configure the BGP-EVPN options.
Introduced	25.3.R2
Platforms	SAR Gen 2

evi *number*

Synopsis	EVPN ID
Context	**configure** service epipe *service-name* bgp-evpn evi *number*
Tree	evi
Description	This command configures an EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers. The following options are supported: If this EVPN identifier is not specified, the value is zero and no route distinguisher or route target is automatically derived from it.If the specified EVPN identifier is lower than 65535 and no other route distinguisher or route target is configured in the service, the following applies:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the route distinguisher is derived from <system_ip>:evi
- the route target is derived from <autonomous-system>:evi

If the specified EVPN identifier is higher than 65535 and no other route distinguisher or route target is configured in the service, the following applies.

- The route distinguisher cannot be automatically derived. An error is generated if enabling EVPN is attempted without a route distinguisher. A manual or an **auto-rd** route distinguisher must be configured.
- The route target can only be automatically derived if the **evi-three-byte-auto-rt** command is configured. If configured, the route target is automatically derived in accordance with the rules described in RFC8365.

Range	1 to 16777215
Introduced	25.3.R2

eth-tag *number*

Synopsis	Ethernet tag of the attachment circuit
Context	**configure** service epipe *service-name* bgp-evpn local-attachment-circuit *named-item* eth-tag *number*
Tree	eth-tag
Description	This command configures the Ethernet tag value of the attachment circuit. When configured in the local attachment circuit context, the tag value is used in the advertised AD per-EVI route sent for the attachment circuit. When configured in the remote attachment circuit context, the value is compared with the Ethernet tag value of the imported D per-EVI routes for the service. When there is a match, the system creates an EVPN destination for the Epipe.
Range	1 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

mpls [bgp-instance] *number*

Synopsis	Enter the **mpls** list instance
Context	**configure** service epipe *service-name* bgp-evpn mpls *number*

ecmp *number*

Synopsis	Maximum ECMP routes information
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel ecmp *number*
Tree	ecmp
Range	1 to 32
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-strict-tunnel-tagging *boolean*

Synopsis	Enable/disable enforcement of strict tunnel tagging
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services.
Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

resolution *keyword*

Synopsis	Resolution method for tunnel selection
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution *keyword*
Tree	resolution
Options	none, filter, any
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

resolution-filter

Synopsis	Enter the **resolution-filter** context
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter
Tree	resolution-filter
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp *boolean*

Synopsis	Use BGP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter bgp *boolean*
Tree	bgp
Description	When configured to **true**, BGP searches the BGP LSP for the address of the BGP next hop. When configured to **false**, BGP tunneling is not used and inter-area or inter-as prefixes are not resolved.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, BGP searches for an LDP LSP with a FEC prefix corresponding to the address of the BGP next hop. When configured to **false**, LDP tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop. When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, IS-IS tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-ospf *boolean*

Synopsis Use OSPF SR tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf *boolean*

Tree sr-ospf

Description When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-ospf3 *boolean*

Synopsis Use OSPFv3 SR tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf3 *boolean*

Tree sr-ospf3

Description When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP-EVPN service routes.

This command configures BGP to search for an SR policy with:

- a non-null endpoint that matches the next hop of the service route, and
- a color value that matches the highest numbered color for the extended community attached to the service route

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-te *boolean*

Synopsis Use SR-TE tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-te *boolean*

Tree sr-te

Description When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop.

In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, SR-TE tunneling is not used for next-hop resolution.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

weighted-ecmp *boolean*

Synopsis	Allow weighted load balancing
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this router enables weighted ECMP for packets using tunnels that a VPLS or Epipe automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP. When configured to **false**, this command disables weighted ECMP for next-hop tunnel selection.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

control-word *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable support for control word
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* control-word *boolean*
Tree	control-word
Description	When configured to **true**, the router enables the transmission and reception of the control word for all EVPN-MPLS destinations at the same time.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	25.3.R2
Platforms	SAR Gen 2

domain-id *domain-id*

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* domain-id *domain-id*
Tree	domain-id
Description	This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances). Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred). In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N: Seg Len=1 / 65000:1:128 If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows: Seg Len=2 / 65000:2:70 / 65000:1:128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The command is also supported in Epipe services with two instances. As in the case of multi-instance VPRN services, the configured domain ID in an Epipe instance is prepended to the AD per EVI route redistributed to the other instance.

String format 'domain-id' must be global-field:local-field (uint32:uint16 range)

Introduced 25.3.R2

Platforms SAR Gen 2

dynamic-egress-label-limit *boolean*

Synopsis Enables dynamic egress label limit

Context **configure** service epipe *service-name* bgp-evpn mpls *number* dynamic-egress-label-limit *boolean*

Tree dynamic-egress-label-limit

Description When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

entropy-label *boolean*

Synopsis Enable use of entropy-labels

Context **configure** service epipe *service-name* bgp-evpn mpls *number* entropy-label *boolean*

evi-three-byte-auto-rt *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Auto-derive the BGP EVPN route target
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* evi-three-byte-auto-rt *boolean*
Tree	evi-three-byte-auto-rt
Description	When configured to **true**, the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID). Where: • Global Administrator – is the configured 2-octet AS number; if the configured ASN exceeds the 2 byte limit, the low order 16-bit value is taken • A=0 (for auto-derivation) • Type=4 (EVI-based route-target) • D-ID= [1..2] – encodes the BGP instance, which allows the auto-derivation of different route-targets in multi-instance services; the value is inherited from the corresponding BGP instance • Service ID=3-octet EVI When configured to **false**, route target derivation is not allowed.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

eth-tag *number*

Synopsis	Ethernet tag of the attachment circuit
Context	**configure** service epipe *service-name* bgp-evpn remote-attachment-circuit *named-item* eth-tag *number*
Tree	eth-tag
Description	This command configures the Ethernet tag value of the attachment circuit. When configured in the local attachment circuit context, the tag value is used in the advertised AD per-EVI route sent for the attachment circuit. When configured in the remote attachment circuit context, the value is compared with the Ethernet tag value of the imported D per-EVI routes for the service. When there is a match, the system creates an EVPN destination for the Epipe.
Range	1 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

sap [sap-id] *sap*

Synopsis	Enter the **sap** list instance
Context	**configure** service epipe *service-name* sap *sap*
Tree	sap
Description	Commands in this context configure a SAP within a service. A SAP is a combination of port and encapsulation parameters which identifies the SAP on the interface and within the device. Each SAP must be unique. All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP does not exist on that object. A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port.
Max. instances	255

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service epipe *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

parent

Synopsis	Enter the **parent** context

client-meg-level *number*

Synopsis	Client MEG level for AIS message generation
Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais client-meg-level *number*
Tree	client-meg-level
Description	This command configures the client Maintenance Entity Group (MEG) level to use for AIS message generation. One restriction is that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level is used for facility MEPs.
Range	1 to 7
Max. instances	7
Introduced	25.3.R2
Platforms	SAR Gen 2

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on operationally down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

llf

Synopsis	Enter the **llf** context
Context	**configure** service epipe *service-name* sap *sap* ethernet llf
Tree	llf
Description	Commands in this context enable Link Loss Forwarding (LLF) on an Ethernet port. This feature provides an end-to-end OAM fault notification for Ethernet VLL service. It brings down the Ethernet port (Ethernet LLF) or sends a SONET/SDH Path AIS (ATM LLF) toward the attached CE when there is a local fault on the pseudowire or service, or a remote fault on the SAP or pseudowire, signaled with label withdrawal or T-LDP status bits. It ceases when the fault disappears. The Ethernet port must be configured for null encapsulation. This feature is also supported in Epipes with BGP-EVPN enabled. In this case, after removal of the EVPN destination, the port transitions to an operationally down state, however the AD per-EVI route for the SAP is still advertised (the SAP remains operationally up). The port transitions to the operationally up state when the EVPN destination is created.

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service epipe *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.

service-mtu *number*

Synopsis	MTU size
Context	**configure** service epipe *service-name* service-mtu *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree service-mtu

Description This command configures the Maximum Transmission Unit (MTU) value (payload) for the service. The system uses the value to validate the operational state of the SAP and SDP binding within the service. The value overrides the default MTU for the service type.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) are used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

In the **configure service epipe spoke-sdp** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE.

Range 1 to 9782

Introduced 25.3.R2

Platforms SAR Gen 2

spoke-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis Enter the **spoke-sdp** list instance

Context **configure** service epipe *service-name* spoke-sdp *sdp-bind-id*

Tree spoke-sdp

Description Commands in this context bind a service to an existing SDP. A spoke SDP is treated like a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state that determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **configure service sdp** context to associate an SDP with an Epipe, VPLS, VPRN, or VPRN service. SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

adv-service-mtu *number*

Synopsis	Service MTU used in signaling
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP, instead of the service MTU. However, the configuration does not affect the locally enforced value, which is still based on the service MTU. This MTU value cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command (**configure service sdp** context). When unconfigured, an adjusted service MTU is used (**service-mtu** command).
Range	0 to 9782
Introduced	25.3.R2
Platforms	SAR Gen 2

bandwidth *(number | keyword)*

Synopsis	Bandwidth that is reserved for this SDP binding
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* bandwidth *(number | keyword)*

ais

Synopsis	Enable the **ais** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais
Tree	ais
Description	Commands in this context enable the reception of AIS messages.
Introduced	25.3.R2
Platforms	SAR Gen 2

client-meg-level *number*

Synopsis	Client MEG level for AIS message generation
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais client-meg-level *number*
Tree	client-meg-level
Description	This command configures the client Maintenance Entity Group (MEG) level to use for AIS message generation. One restriction is that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level is used for facility MEPs.
Range	1 to 7
Max. instances	7
Introduced	25.3.R2
Platforms	SAR Gen 2

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on operationally down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false

force-vc-forwarding *keyword*

Synopsis	VLAN tag processing action
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* force-vc-forwarding *keyword*
Tree	force-vc-forwarding
Description	This command configures the VLAN tag processing used on the service. The **vlan** option configures the router to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations. The **qinq-c-tag-c-tag** option configures the router to pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs. The **qinq-s-tag-c-tag** option configures the router to push two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.
Options	vlan – Push VLAN ID and 802.1p bits of service-delimiting qtag qinq-c-tag-c-tag – Push two tags identical to inner service-delimiting tag qinq-s-tag-c-tag – Push two tags based on QinQ service-delimiting values
Introduced	25.3.R2
Platforms	SAR Gen 2

ies [service-name] *service-name*

Synopsis	Enter the **ies** list instance
Context	**configure** service ies *service-name*
Tree	ies
Description	Commands in this context specify an Internet Ethernet Service (IES) service instance. Multiple IES services are created to separate customer-owned IP interfaces. More than one IES service may be created for a single customer ID. More than one IP interface may be created within a single IES service ID. All IP interfaces created within an IES service ID belong to the same customer.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service ies *service-name*
Tree	ies
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association. When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error. This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The service ID must be the same number used for every platform on which this service is defined.
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.

Platforms	SAR Gen 2

dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Redundant next-hop address for the dynamic IPsec tunnel
Context	**configure** service ies *service-name* interface *interface-name* dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	dynamic-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for dynamic IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	The next-hop address is resolved in the routing table of a corresponding service.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the IPsec tunnel
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **bfd** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd
Tree	bfd
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-designate *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Designate IPsec tunnel to carry BFD traffic
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-designate *boolean*
Tree	bfd-designate
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **bfd-liveness** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-liveness
Tree	bfd-liveness
Description	Commands in this context configure a BFD session to provide a heart-beat mechanism for a specified IPsec tunnel. There can be only one BFD session assigned to any given IPsec tunnel, but there can be multiple IPsec tunnels using the same BFD session. BFD controls the state of the association tunnel. If the BFD session goes down, the system brings down the associated non-designated IPsec tunnel.
Introduced	25.3.R2
Platforms	SAR Gen 2

dest-ip *ipv4-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Destination address used for the BFD session
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-liveness dest-ip *ipv4-unicast-address*
Tree	dest-ip
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

interface *interface-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Name of the interface used by the BFD session
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-liveness interface *interface-name*
Tree	interface
String length	1 to 32
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

service-name *service-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative service name
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-liveness service-name *service-name*
Tree	service-name
Description	This command configures the name of the service where BFD traffic is forwarded to.
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

clear-df-bit *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	Reset the DF bit to 0 in all payload IP packets
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* clear-df-bit *boolean*
Tree	clear-df-bit
Description	When configured to **true**, the DF bit is set to 0 in all payload IP packets associated with the IPsec tunnel, before any potential fragmentation occurs.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

copy-traffic-class-upon-decapsulation *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable traffic class copy upon decapsulation
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* copy-traffic-class-upon-decapsulation *boolean*
Tree	copy-traffic-class-upon-decapsulation
Description	When configured to **true**, the system copies the traffic class from the outer tunnel IP packet header to the payload IP packet header in the decapsulating direction (public to private).
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

encapsulated-ip-mtu *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum size of the encapsulated tunnel packet
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* encapsulated-ip-mtu *number*
Tree	encapsulated-ip-mtu
Description	This command specifies the maximum size of the encapsulated tunnel packet to the IPsec tunnel, the IP tunnel, or the dynamic tunnels terminated on the IPsec Gateway. If the encapsulated IPv4 or IPv6 tunnel packet exceeds this value, the system fragments the packet.
Range	512 to 9000
Units	bytes
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp-generation

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **icmp-generation** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp-generation
Tree	icmp-generation
Description	Commands in this context configure settings for ICMPv4 message generation.
Introduced	25.3.R2
Platforms	SAR Gen 2

frag-required

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	Enter the **frag-required** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp-generation frag-required
Tree	frag-required
Description	Commands in this context configure the attributes for sending generated ICMP Destination Unreachable "fragmentation needed and DF set" messages (type 3, code 4) back to the source, if the received size of the IPv4 packet on the private side exceeds the private MTU size.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative state of sending ICMP messages
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp-generation frag-required admin-state *keyword*
Tree	admin-state
Description	This command configures the administrative state of sending ICMP Destination Unreachable "fragmentation needed, DF set" messages (type 3, code 4) messages to the source if the received size of the IPv4 packet on the private side exceeds the private MTU size.
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Interval for sending ICMP messages
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp-generation frag-required interval *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	interval
Description	This command configures the interval for sending ICMP Destination Unreachable "fragmentation needed, DF set" messages (type 3, code 4).
Range	1 to 60
Units	seconds
Default	10
Introduced	25.3.R2
Platforms	SAR Gen 2

message-count *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of ICMP messages that can be sent
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp-generation frag-required message-count *number*
Tree	message-count
Description	This command configures the maximum number of ICMP Destination Unreachable "fragmentation needed, DF set" messages (type 3, code 4) that can be sent during the configured interval.
Range	10 to 1000
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp6-generation

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **icmp6-generation** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp6-generation
Tree	icmp6-generation
Description	Commands in this context configure settings for ICMPv6 message generation.

© 2026 Nokia.

Introduced	25.3.R2
Platforms	SAR Gen 2

packet-too-big

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **packet-too-big** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp6-generation packet-too-big
Tree	packet-too-big
Description	Commands in this context configure the parameters to send ICMPv6 PTB (Packet Too Big) messages on the private side. The system sends PTB messages if a received IPv6 packet on the private side is greater than 1280 bytes and it exceeds the private MTU of the tunnel. The private MTU for the tunnel is configured via the **configure router interface ipsec ipsec-tunnel ip-mtu** command for the interface.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative state of Packet Too Big message sends
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp6-generation packet-too-big admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

ipsec-transform *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Transform entry used by manual SAs
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange manual keys *number* direction *keyword* ipsec-transform *reference*
Tree	ipsec-transform
Reference	**configure** ipsec ipsec-transform *number*
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

spi *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	SPI of inbound and outbound packets
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange manual keys *number* direction *keyword* spi *number*
Tree	spi
Description	This command specifies the Security Parameter Index (SPI) used to look up the instruction to verify and decrypt the incoming IPsec packets when the direction is inbound. When the direction is outbound, the SPI is used in the encoding of the outgoing packets. The remote node can use the SPI to look up the instruction to verify and decrypt the packet.
Range	256 to 16383
Notes	This element is mandatory.

remote-gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Remote IPsec tunnel endpoint address
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* remote-gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	remote-gateway-address
Introduced	25.3.R2
Platforms	SAR Gen 2

replay-window *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Anti-replay window size
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* replay-window *number*
Tree	replay-window
Description	This command specifies the size of an IPsec anti-replay window. If unconfigured, IPsec anti-replay is disabled.
Range	32 | 64 | 128 | 256 | 512
Units	packets
Introduced	25.3.R2
Platforms	SAR Gen 2

security-policy

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **security-policy** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	security-policy
Description	Commands in this context specify a security policy used by the tunnel.
Introduced	25.3.R2
Platforms	SAR Gen 2

id *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Security policy ID for use by the tunnel
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy id *number*
Tree	id
Max. range	0 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.

Introduced	25.3.R2
Platforms	SAR Gen 2

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
String format	'ipv4-address' must use only digits and dots (no %zone)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)

Introduced 25.3.R2

Platforms SAR Gen 2

lease-populate

Platforms	SAR Gen 2

none

Synopsis	Do not include the circuit ID
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

sap-id

Synopsis	Use the SAP ID
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2

Description	This command configures the IP address which will be used as the DHCP server address in the context of the SAP. Typically, the configured address should be in the context of the subnet represented by the service.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

lease-time

Synopsis	Enter the **lease-time** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp proxy-server lease-time
Tree	lease-time
Introduced	25.3.R2
Platforms	SAR Gen 2

radius-override *boolean*

Synopsis	Use lease time information provided by RADIUS server
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp proxy-server lease-time radius-override *boolean*
Tree	radius-override
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

value *number*

Synopsis	DHCP lease time
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp proxy-server lease-time value *number*
Tree	value
Range	300 to 315446399
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

relay-plain-bootp *boolean*

Synopsis	Enable relaying of plain BOOTP packets
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp relay-plain-bootp *boolean*
Tree	relay-plain-bootp
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

relay-proxy

Synopsis	Enable the **relay-proxy** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp relay-proxy
Tree	relay-proxy
Introduced	25.3.R2
Platforms	SAR Gen 2

release-update-src-ip *boolean*

Synopsis	Update the source IP address of a DHCP RELEASE message
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp relay-proxy release-update-src-ip *boolean*
Tree	release-update-src-ip
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

siaddr-override *ipv4-unicast-address*

Synopsis	DHCP server IP address for address hiding function
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp relay-proxy siaddr-override *ipv4-unicast-address*
Tree	siaddr-override
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Max. instances	8
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	25.3.R2
Platforms	SAR Gen 2

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp trusted *boolean*
Tree	trusted

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

use-arp *boolean*

Synopsis	Use ARP to determine the destination hardware address
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp use-arp *boolean*
Tree	use-arp
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp

Synopsis	Enter the **icmp** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 icmp
Tree	icmp
Introduced	25.3.R2

nat

Synopsis	Enable the **nat** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 nat
Tree	nat
Description	Commands in this context enable NAT and configure CPM NAT policies for the IPv4 interface. These commands must be used in conjunction with NAT pools where the pool application is configured with the **configure router nat outside pool applications use-interface-ip** command.
Introduced	25.7.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cpm-nat-policy *reference*

Synopsis	CPM NAT policy association with public IPv4 interface
Context	**configure** service ies *service-name* interface *interface-name* ipv4 nat cpm-nat-policy *reference*
Tree	cpm-nat-policy
Description	This command associates a CPM NAT policy to the interface. The NAT policy applies to traffic that either originates from, or is destined to, the local node itself (CPM traffic). Specifically, it is used when the traffic is routed through a public NAT IPv4 interface in the outside routing context. A CPM NAT policy should be used when the local node communicates with public networks over NAT, and the source or destination is a local interface within the outside routing context. This can include the public IPv4 interface or any other interface assigned to that routing context.
Reference	**configure** service nat cpm-nat-policy *external-named-item*
Introduced	25.7.R1
Platforms	SAR Gen 2

cpm-spf-nat-policy *reference*

Synopsis	CPM NAT policy for static port forwards
Context	**configure** service ies *service-name* interface *interface-name* ipv4 nat cpm-spf-nat-policy *reference*
Tree	cpm-spf-nat-policy
Description	This command associates a CPM NAT policy to the interface for static port forwards. The configurations for traffic using static port forwards to a local IP address in the outside routing context are separate from those used for other CPM traffic going through NAT. This command allows the router to apply different NAT behavior for port-forwarded traffic than for general traffic originating from the local node.
Reference	**configure** service nat cpm-nat-policy *external-named-item*
Introduced	25.7.R1
Platforms	SAR Gen 2

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery
Tree	neighbor-discovery

route-tag *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Tag value used with the host route from an ARP/ND entry
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery host-route populate *keyword* route-tag *number*
Tree	route-tag
Description	This command specifies the route tag that is added in the route table for ARP or ND host routes. This tag can be matched on BGP VRF export and BGP peer export policies.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

learn-unsolicited *boolean*

Synopsis	Learn new entries from any received NA message
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both. When configured to **false**, the router follows standard behavior for learning neighbor entries. • If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored. • If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.
Default	false

Units	percent
Default	90
Introduced	25.3.R2
Platforms	SAR Gen 2

local-proxy-arp *boolean*

Synopsis	Enable local proxy ARP on interface
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery local-proxy-arp *boolean*
Tree	local-proxy-arp
Description	When configured to **true**, the router enables local proxy ARP on the interface. When configured to **false**, the router does not respond to ARP requests for addresses on the same subnet.
Introduced	25.3.R2
Platforms	SAR Gen 2

populate *boolean*

Synopsis	Allow static and dynamic hosts to be populated in system ARP cache
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery populate *boolean*
Tree	populate
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

proactive-refresh *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery proactive-refresh *boolean*
Tree	proactive-refresh
Description	When configured to **true**, the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries). When configured to **false**, the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

proxy-arp-policy *reference*

Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number*
Tree	vrrp
Range	1 to 255
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

authentication-key *encrypted-leaf*

Synopsis	Password for simple text authentication
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command optionally assigns a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages. If this command is re-executed with a different password key defined, the new key immediately replaces the old key. This command may be executed at any time. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 94
Introduced	25.3.R2
Platforms	SAR Gen 2

backup *ipv4-unicast-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* backup *ipv4-unicast-address*
Tree	backup
Description	This command associates virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails. See "Owner and non-owner VRRP" in the *7705 SAR Gen 2 Router Configuration Guide* for more information about owner and non-owner virtual router instances.

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	25.3.R2
Platforms	SAR Gen 2

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer. When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

Range 1 to 2559

Units deciseconds

Default 10

Introduced 25.3.R2

Platforms SAR Gen 2

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis VRRP instance to follow a specified operational group

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* monitor-oper-group *reference*

Tree monitor-oper-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* oper-group *reference*
Tree	oper-group
Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

ssh-reply *boolean*

Synopsis	Allow the non-owner master to reply to SSH requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ssh-reply *boolean*
Tree	ssh-reply

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address). When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6
Tree	ipv6
Description	This command enables the context to configure IPv6 parameters for the interface.
Introduced	25.3.R2
Platforms	SAR Gen 2

address [ipv6-address] *ipv6-address*

Synopsis	Enter the **address** list instance
Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Description	This command assigns an IPv6 address/subnet to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. **Caution:** Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD). When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address* eui-64 *boolean*
Tree	eui-64
Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix-length *number*

Synopsis	IPv6 address prefix length
Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.

Tree	exclude
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ta *boolean*

Synopsis	Create route based on IA_TA prefix option in relay-reply message
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay lease-populate route-populate ta *boolean*
Tree	ta
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

option

Synopsis	Enter the **option** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option
Tree	option
Introduced	25.3.R2
Platforms	SAR Gen 2

interface-id

Synopsis	Enter the **interface-id** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option interface-id
Tree	interface-id
Introduced	25.3.R2
Platforms	SAR Gen 2

ascii-tuple

Synopsis	Use ASCII-encoded concatenated tuple

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option interface-id ascii-tuple
Tree	ascii-tuple
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

if-index

Synopsis	Use interface index in the DHCPv6 relay packet
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option interface-id if-index
Tree	if-index
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

sap-id

Synopsis	Use SAP ID in interface ID option in relay packet
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option interface-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

string *string-not-all-spaces*

Synopsis	String for interface ID option in DHCPv6 relay packet
Context	**configure** service ies *service-name* interface *interface-name* ipv6 dhcp6 relay option interface-id string *string-not-all-spaces*
Tree	string
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.

host-route

Synopsis	Enter the **host-route** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery host-route
Tree	host-route
Introduced	25.3.R2
Platforms	SAR Gen 2

populate [route-type] *keyword*

Synopsis	Enter the **populate** list instance
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery host-route populate *keyword*
Tree	populate
Introduced	25.3.R2
Platforms	SAR Gen 2

[**route-type**] *keyword*

Synopsis	Type of ARP or ND entries that generate host routes
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery host-route populate *keyword*
Tree	populate
Options	static – Host routes created from EVPN ARP or ND entries dynamic – Host routes created from dynamic ARP or ND entries evpn – Host routes created from EVPN entries evpn-local-es – Host routes created from EVPN local ES entries
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

route-tag *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	Tag value used with the host route from an ARP/ND entry
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery host-route populate *keyword* route-tag *number*
Tree	route-tag
Description	This command specifies the route tag that is added in the route table for ARP or ND host routes. This tag can be matched on BGP VRF export and BGP peer export policies.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited
Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	25.3.R2
Platforms	SAR Gen 2

limit

Synopsis	Enter the **limit** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit
Tree	limit
Introduced	25.3.R2
Platforms	SAR Gen 2

log-only *boolean*

Synopsis	Generate log entries when limit is reached

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned. When configured to **false**, the router does not send the warning message.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

max-entries *number*

Synopsis	Maximum number of entries learned on an IP interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit max-entries *number*
Tree	max-entries
Description	This command configures the maximum number of entries that can be learned on an IP interface. When unconfigured, no maximum limit is imposed.
Range	0 to 102400
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Threshold percentage that triggers a warning message
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit threshold *number*
Tree	threshold
Range	1 to 100
Units	percent
Default	90
Introduced	25.3.R2
Platforms	SAR Gen 2

local-proxy-nd *boolean*

Synopsis	Enable local proxy neighbor discovery on the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery local-proxy-nd *boolean*
Tree	local-proxy-nd
Description	When configured to **true**, the router enables local proxy neighbor discovery on the interface and replies to neighbor solicitation requests when both the hosts are on the same subnet. In this case, ICMP redirects are disabled. When configured to **false**, the router disables local proxy neighbor discovery on the interface and does not reply to neighbor solicitation requests if both the hosts are on the same subnet.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

proactive-refresh *keyword*

Synopsis	Proactive refresh of neighbor entries
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery proactive-refresh *keyword*
Tree	proactive-refresh
Description	This command enables a proactive refresh of the neighbor entries. After the stale timer expires, the router sends an NUD message to the host (regardless of the existence of traffic to the IP address on the IOM), so the entry can be refreshed or removed.
Options	global, link-local, both
Introduced	25.3.R2
Platforms	SAR Gen 2

proxy-nd-policy *reference*

Synopsis	Proxy Neighbor Discovery policy name for the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery proxy-nd-policy *reference*
Tree	proxy-nd-policy

Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number*
Tree	vrrp
Range	1 to 255
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

backup *ipv6-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* backup *ipv6-address*
Tree	backup

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command associates router IPv6 virtual router IP addresses with those of the parental IP interface.

This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance.

Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7705 SAR Gen 2 Router Configuration Guide* for more information about owner and non-owner virtual router instances.

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	25.3.R2
Platforms	SAR Gen 2

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 25.3.R2

Platforms SAR Gen 2

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	VRRP instance to follow a specified operational group
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* oper-group *reference*
Tree	oper-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).

When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

Introduced 25.3.R2

Platforms SAR Gen 2

preempt *boolean*

Synopsis Allow the VRRP to override an existing non-owner master

Context **configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* preempt *boolean*

Tree preempt

Description When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router.

When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

priority *number*

Synopsis Base priority for the VRRP

Context **configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* priority *number*

Tree priority

Description This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process.

The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.

Range 1 to 255

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Introduced	25.3.R2
Platforms	SAR Gen 2

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.

local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local IP address of this tunnel
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	local-ip-address
Description	This command specifies the local IP address to use for the IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The address must belong to one of the IP subnets associated with the public SAP interface of the tunnel group. The source IP address, the remote IP address, and the backup remote IP address of a tunnel must all belong to the same address family (IPv4 or IPv6). When this command specifies an IPv6 address, it must be a global unicast address.
Introduced	25.3.R2
Platforms	SAR Gen 2

pmtu-discovery-aging *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time to age out the learned path MTU
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* pmtu-discovery-aging *number*
Tree	pmtu-discovery-aging
Description	This command configures the temporary public MTU expiration time. The temporary public MTU is used for MTU propagation.
Range	900 to 3600
Units	seconds
Default	900
Introduced	25.3.R2
Platforms	SAR Gen 2

private-tcp-mss-adjust *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TCP Maximum Segment Size (MSS) on the private side
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* private-tcp-mss-adjust *number*
Tree	private-tcp-mss-adjust
Description	This command specifies the TCP MSS to adjust for tunnels on the private side. The value is used to adjust the TCP MSS option in the TCP SYN packet.
Range	512 to 9000
Units	bytes
Introduced	25.3.R2
Platforms	SAR Gen 2

propagate-pmtu-v4 *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable propagation of the path MTU to IPv4 hosts
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* propagate-pmtu-v4 *boolean*
Tree	propagate-pmtu-v4
Introduced	25.3.R2
Platforms	SAR Gen 2

propagate-pmtu-v6 *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable propagation of path MTU to IPv6 hosts
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* propagate-pmtu-v6 *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	propagate-pmtu-v6
Introduced	25.3.R2
Platforms	SAR Gen 2

public-tcp-mss-adjust *(number | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TCP Maximum Segment Size (MSS) on the public side
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Description	This command specifies the TCP MSS for TCP traffic sent from the public network to the private network. The value is used to adjust the TCP MSS option in the TCP SYN packet.
Range	512 to 9000
Units	bytes
Options	auto
Introduced	25.3.R2
Platforms	SAR Gen 2

reassembly *(number | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum reassembly wait time
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* reassembly *(number | keyword)*
Tree	reassembly
Description	This command configures the maximum time to wait to receive all fragments of a particular IPsec or GRE packet for reassembly.
Range	1 to 5000
Units	milliseconds
Options	use-tunnel-group-setting, none

cert

Synopsis	Enter the **cert** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert
Tree	cert
Introduced	25.3.R2
Platforms	SAR Gen 2

cert-profile *reference*

Synopsis	Certificate profile name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert cert-profile *reference*
Tree	cert-profile
Reference	**configure** ipsec cert-profile *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

status-verify

Synopsis	Enter the **status-verify** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify
Tree	status-verify
Description	Commands in this context configure certificate revocation status verification.
Introduced	25.3.R2
Platforms	SAR Gen 2

default-result *keyword*

Synopsis	Default result of Certificate Status Verification (CSV)
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify default-result *keyword*
Tree	default-result
Description	This command specifies the default result when both the primary and secondary methods fail to provide an answer.
Options	revoked, good
Default	revoked
Introduced	25.3.R2
Platforms	SAR Gen 2

primary *keyword*

Synopsis	Primary method of CSV to verify the revocation status
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify primary *keyword*
Tree	primary
Options	crl, ocsp
Default	crl
Introduced	25.3.R2
Platforms	SAR Gen 2

secondary *keyword*

Synopsis	Secondary method of CSV to verify the revocation status
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify secondary *keyword*

Platforms	SAR Gen 2

trust-anchor-profile *reference*

Synopsis	Trust anchor profile name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert trust-anchor-profile *reference*
Tree	trust-anchor-profile
Reference	**configure** ipsec trust-anchor-profile *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

client-db

Synopsis	Enable the **client-db** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db
Tree	client-db
Description	Commands in this context configure the IPsec client database. The client database is used to authenticate the IKEv2 dynamic LAN-to-LAN tunnel.
Introduced	25.3.R2
Platforms	SAR Gen 2

fallback *boolean*

Synopsis	Fall back to the default authentication policy
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db fallback *boolean*
Tree	fallback
Description	When configured to **true**, this command specifies whether the IPsec gateway can fall back to the default authentication policy when the IPsec tunnel authentication request fails to match any clients in the IPsec database.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false** and the client database lookup fails to return a matched result, the system fails the tunnel setup.

Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

name *reference*

Synopsis	Client database name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db name *reference*
Tree	name
Reference	**configure** ipsec client-db *named-item*
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

default-secure-service

Synopsis	Enable the **default-secure-service** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* default-secure-service

static-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Address for the static ISA tunnel redundant next-hop
Context	**configure** service ies *service-name* interface *interface-name* static-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	static-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for a static IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work. The next-hop address is resolved in the routing table of the corresponding service.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).

Synopsis	Enter the **routed-override-filter** context
Context	**configure** service ies *service-name* interface *interface-name* vpls *named-item-64* ingress routed-override-filter
Tree	routed-override-filter
Introduced	25.3.R2
Platforms	SAR Gen 2

ip *reference*

Synopsis	IPv4 filter policy name
Context	**configure** service ies *service-name* interface *interface-name* vpls *named-item-64* ingress routed-override-filter ip *reference*
Tree	ip
Description	This command specifies an IP filter that is applied to routed unicast ingress packets entering the VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IP filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IP routed packets use the existing ingress IP filter configured on the VPLS endpoint.
Reference	**configure** filter ip-filter *filter-name*
Introduced	25.3.R2
Platforms	SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

ipv6 *reference*

Synopsis	IPv6 filter policy name
Context	**configure** service ies *service-name* interface *interface-name* vpls *named-item-64* ingress routed-override-filter ipv6 *reference*
Tree	ipv6
Description	This command specifies an IPv6 filter that is applied to routed unicast ingress packets entering the VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IP filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IP routed packets use the existing ingress IP filter configured on the VPLS endpoint.
Reference	**configure** filter ipv6-filter *filter-name*
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-transport [ipt-id] *port*

Synopsis	Enter the **ip-transport** list instance
Context	**configure** service ies *service-name* ip-transport *port*
Tree	ip-transport
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**ipt-id**] *port*

Synopsis	IP Transport identifier.
Context	**configure** service ies *service-name* ip-transport *port*
Tree	ip-transport
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the IP transport.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* ip-transport *port* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

description *description*

Synopsis	Description for the IP transport.
Context	**configure** service ies *service-name* ip-transport *port* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

dscp-name *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	dscp name
Context	**configure** service ies *service-name* ip-transport *port* dscp-name *keyword*
Tree	dscp-name
Options	be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63
Default	ef

dynamic-ports *number*

Synopsis	Maximum number of dynamic ports per subscriber
Context	**configure** service nat cpm-nat-policy *external-named-item* port-limits dynamic-ports *number*
Tree	dynamic-ports
Description	This command limits the number of ports per protocol on an outside IP address for a subscriber regardless of the pool pairing mode. This command applies to LSN44 pools with flexible port allocation.
Range	1 to 65536
Default	65536
Introduced	25.7.R1
Platforms	SAR Gen 2

forwarding *number*

Synopsis	Maximum number of port forwarding entries
Context	**configure** service nat cpm-nat-policy *external-named-item* port-limits forwarding *number*
Tree	forwarding
Range	1 to 65535
Introduced	25.7.R1
Platforms	SAR Gen 2

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat cpm-nat-policy *external-named-item* port-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	25.7.R1
Platforms	SAR Gen 2

high *number*

Synopsis	High watermark percentage

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat cpm-nat-policy *external-named-item* port-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.7.R1
Platforms	SAR Gen 2

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat cpm-nat-policy *external-named-item* port-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.7.R1
Platforms	SAR Gen 2

session-limits

Synopsis	Enter the **session-limits** context
Context	**configure** service nat cpm-nat-policy *external-named-item* session-limits
Tree	session-limits
Description	Commands in this context configure session-limit attributes for the policy.
Introduced	25.7.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max *number*

Synopsis	Maximum number of sessions per subscriber
Context	**configure** service nat cpm-nat-policy *external-named-item* session-limits max *number*
Tree	max
Range	1 to 65535
Default	100
Introduced	25.7.R1
Platforms	SAR Gen 2

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat cpm-nat-policy *external-named-item* session-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	25.7.R1
Platforms	SAR Gen 2

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat cpm-nat-policy *external-named-item* session-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.7.R1
Platforms	SAR Gen 2

Range	60 to 86400
Units	seconds
Default	240
Introduced	25.7.R1
Platforms	SAR Gen 2

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat cpm-nat-policy *external-named-item* timeouts udp
Tree	udp
Description	Commands in this context configure the User Datagram Protocol (UDP) mapping timeout attributes.
Introduced	25.7.R1
Platforms	SAR Gen 2

dns *number*

Synopsis	Timeout applied to UDP session with destination port 53
Context	**configure** service nat cpm-nat-policy *external-named-item* timeouts udp dns *number*
Tree	dns
Range	15 to 86400
Units	seconds
Default	15
Introduced	25.7.R1
Platforms	SAR Gen 2

initial *number*

Synopsis	UDP mapping timeout applied to new sessions
Context	**configure** service nat cpm-nat-policy *external-named-item* timeouts udp initial *number*
Tree	initial
Range	10 to 300
Units	seconds
Default	15

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.7.R1
Platforms	SAR Gen 2

normal *number*

Synopsis	UDP mapping timeout
Context	**configure** service nat cpm-nat-policy *external-named-item* timeouts udp normal *number*
Tree	normal
Range	60 to 86400
Units	seconds
Default	300
Introduced	25.7.R1
Platforms	SAR Gen 2

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat cpm-nat-policy *external-named-item* udp
Tree	udp
Introduced	25.7.R1
Platforms	SAR Gen 2

inbound-refresh *boolean*

Synopsis	Extend UDP session timeout on inbound traffic
Context	**configure** service nat cpm-nat-policy *external-named-item* udp inbound-refresh *boolean*
Tree	inbound-refresh
Description	When configured to **true**, the router extends the UDP session timeout on inbound traffic. When configured to **false**, the router does not extend the UDP session timeout.
Default	false
Introduced	25.7.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

nat-policy [name] *external-named-item*

Synopsis	Enter the **nat-policy** list instance
Context	**configure** service nat nat-policy *external-named-item*
Tree	nat-policy
Max. instances	4096
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *external-named-item*

Synopsis	NAT policy name
Context	**configure** service nat nat-policy *external-named-item*
Tree	nat-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

alg

Synopsis	Enter the **alg** context
Context	**configure** service nat nat-policy *external-named-item* alg
Tree	alg
Description	Commands in this context configure the Application Layer Gateway (ALG) attributes of the policy.
Introduced	25.3.R2
Platforms	SAR Gen 2

ftp *boolean*

Synopsis	Use FTP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg ftp *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ftp
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

pptp *boolean*

Synopsis	Use PPTP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg pptp *boolean*
Tree	pptp
Description	When configured to **true**, the policy uses Point-to-Point Tunneling Protocol (PPTP) ALG. PPTP sessions can only be initiated from NAT inside. GRE traffic is allowed through NAT only if the corresponding mapping exists. There can be seven calls (GRE tunnels) per control session. When configured to **false**, PPTP ALG is not used.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rtsp *boolean*

Synopsis	Use RTSP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg rtsp *boolean*
Tree	rtsp
Description	When configured to **true**, Real-Time Streaming Protocol (RTSP) ALG is used for the policy.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sip *boolean*

Synopsis	Use SIP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg sip *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sip
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

block-limit *number*

Synopsis	Maximum number of port blocks per subscriber
Context	**configure** service nat nat-policy *external-named-item* block-limit *number*
Tree	block-limit
Range	1 to 40
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** service nat nat-policy *external-named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

filtering *keyword*

Synopsis	Filtering method for inbound traffic for the policy
Context	**configure** service nat nat-policy *external-named-item* filtering *keyword*
Tree	filtering
Options	endpoint-independent, address-and-port-dependent
Default	endpoint-independent
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pool

Synopsis	Enter the **pool** context
Context	**configure** service nat nat-policy *external-named-item* pool
Tree	pool
Notes	The following elements are part of a choice: **dnat-only**, **l2-outside**, or **pool**.
Introduced	25.3.R2
Platforms	SAR Gen 2

name *named-item*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	NAT pool name
Context	**configure** service nat nat-policy *external-named-item* pool name *named-item*
Tree	name
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

router-instance *string*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Router or VPRN service name
Context	**configure** service nat nat-policy *external-named-item* pool router-instance *string*
Tree	router-instance
Introduced	25.3.R2
Platforms	SAR Gen 2

port-limits

Synopsis	Enter the **port-limits** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat nat-policy *external-named-item* port-limits
Tree	port-limits
Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-ports *number*

Synopsis	Maximum number of dynamic ports per subscriber
Context	**configure** service nat nat-policy *external-named-item* port-limits dynamic-ports *number*
Tree	dynamic-ports
Description	This command limits the number of ports per protocol on an outside IP address for a subscriber regardless of the pool pairing mode. This command applies to LSN44 pools with flexible port allocation.
Range	1 to 65536
Default	65536
Introduced	25.7.R1
Platforms	SAR Gen 2

forwarding *number*

Synopsis	Maximum number of port forwarding entries
Context	**configure** service nat nat-policy *external-named-item* port-limits forwarding *number*
Tree	forwarding
Range	1 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

session-limits

Synopsis	Enter the **session-limits** context
Context	**configure** service nat nat-policy *external-named-item* session-limits
Tree	session-limits
Description	Commands in this context configure session-limit attributes for the policy.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

max *number*

Synopsis	Maximum number of sessions per subscriber
Context	**configure** service nat nat-policy *external-named-item* session-limits max *number*
Tree	max
Range	1 to 65535
Default	65535
Introduced	25.3.R2
Platforms	SAR Gen 2

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	25.3.R2
Platforms	SAR Gen 2

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat nat-policy *external-named-item* tcp
Tree	tcp
Description	Commands in this context configure the Transmission Control Protocol (TCP) attributes of the policy.
Introduced	25.3.R2
Platforms	SAR Gen 2

mss-adjust *number*

Synopsis	TCP MSS adjustment value
Context	**configure** service nat nat-policy *external-named-item* tcp mss-adjust *number*
Tree	mss-adjust
Description	This command configures the value to use to adjust the TCP Maximum Segment Size (MSS) option, if not already present or the present value is higher.
Range	160 to 10240
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeouts

Synopsis	Enter the **timeouts** context
Context	**configure** service nat nat-policy *external-named-item* timeouts
Tree	timeouts
Description	Commands in this context configure the attributes of session idle timeouts for the policy.
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp-query *number*

Synopsis	Timeout applied to an ICMP Query session
Context	**configure** service nat nat-policy *external-named-item* timeouts icmp-query *number*
Tree	icmp-query
Range	60 to 240
Units	seconds
Default	60
Introduced	25.3.R2
Platforms	SAR Gen 2

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp
Tree	tcp
Description	Commands in this context configure TCP timeout attributes.
Introduced	25.3.R2
Platforms	SAR Gen 2

established *number*

Synopsis	Idle timeout for TCP session in established state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp established *number*
Tree	established
Range	60 to 86400

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Default	7440
Introduced	25.3.R2
Platforms	SAR Gen 2

syn *number*

Synopsis	TCP session timeout when synchronizing initial sequence
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp syn *number*
Tree	syn
Range	6 to 86400
Units	seconds
Default	15
Introduced	25.3.R2
Platforms	SAR Gen 2

time-wait *number*

Synopsis	Timeout applied to a TCP session in the time-wait state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp time-wait *number*
Tree	time-wait
Range	0 to 240
Units	seconds
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

transitory *number*

Synopsis	Idle timeout for TCP session in transitory state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp transitory *number*
Tree	transitory
Range	60 to 86400
Units	seconds

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	240
Introduced	25.3.R2
Platforms	SAR Gen 2

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat nat-policy *external-named-item* timeouts udp
Tree	udp
Description	Commands in this context configure the User Datagram Protocol (UDP) mapping timeout attributes.
Introduced	25.3.R2
Platforms	SAR Gen 2

dns *number*

Synopsis	Timeout applied to UDP session with destination port 53
Context	**configure** service nat nat-policy *external-named-item* timeouts udp dns *number*
Tree	dns
Range	15 to 86400
Units	seconds
Default	15
Introduced	25.3.R2
Platforms	SAR Gen 2

initial *number*

Synopsis	UDP mapping timeout applied to new sessions
Context	**configure** service nat nat-policy *external-named-item* timeouts udp initial *number*
Tree	initial
Range	10 to 300
Units	seconds
Default	15
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

normal *number*

Synopsis	UDP mapping timeout
Context	**configure** service nat nat-policy *external-named-item* timeouts udp normal *number*
Tree	normal
Range	60 to 86400
Units	seconds
Default	300
Introduced	25.3.R2
Platforms	SAR Gen 2

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat nat-policy *external-named-item* udp
Tree	udp
Introduced	25.3.R2
Platforms	SAR Gen 2

inbound-refresh *boolean*

Synopsis	Extend UDP session timeout on inbound traffic
Context	**configure** service nat nat-policy *external-named-item* udp inbound-refresh *boolean*
Tree	inbound-refresh
Description	When configured to **true**, the router extends the UDP session timeout on inbound traffic. When configured to **false**, the router does not extend the UDP session timeout.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

oper-group [name] *named-item*

Synopsis	Enter the **oper-group** list instance
Context	**configure** service oper-group *named-item*
Tree	oper-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Max. instances	32768
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *named-item*

Synopsis	Operational group name
Context	**configure** service oper-group *named-item*
Tree	oper-group
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** service oper-group *named-item* bfd-liveness
Tree	bfd-liveness
Introduced	25.3.R2
Platforms	SAR Gen 2

dest-ip *ipv4-unicast-address*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Destination address for BFD
Context	**configure** service oper-group *named-item* bfd-liveness dest-ip *ipv4-unicast-address*
Tree	dest-ip
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is mandatory.

© 2026 Nokia.

Introduced	25.3.R2
Platforms	SAR Gen 2

auto-learn-mac-protect *boolean*

Synopsis	Enable automatic update of MAC protect list
Context	**configure** service pw-template *pw-template-name* fdb auto-learn-mac-protect *boolean*
Tree	auto-learn-mac-protect
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-learn-mac-protect-exclude-list *named-item*

Synopsis	Name of the MAC protect exclusion list
Context	**configure** service pw-template *pw-template-name* fdb auto-learn-mac-protect-exclude-list *named-item*
Tree	auto-learn-mac-protect-exclude-list
Description	This command configures the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

discard-unknown-source *boolean*

Synopsis	Discard frames with unknown source
Context	**configure** service pw-template *pw-template-name* fdb discard-unknown-source *boolean*
Tree	discard-unknown-source
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

aging *boolean*

Synopsis	Enable aging of MAC addresses
Context	**configure** service pw-template *pw-template-name* fdb mac-learning aging *boolean*
Tree	aging
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

learning *boolean*

Synopsis	Enable learning of new MAC addresses
Context	**configure** service pw-template *pw-template-name* fdb mac-learning learning *boolean*
Tree	learning
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

mac-pinning *boolean*

Synopsis	Enable MAC address pinning on this spoke SDP
Context	**configure** service pw-template *pw-template-name* fdb mac-pinning *boolean*
Tree	mac-pinning
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service pw-template *pw-template-name* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this PW template.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared.

When the configured limit is reached and the **configure service pw-template fdb discard-unknown-source** command is set to **true** for this PW template, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown.

However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached.

When unconfigured, the PW template uses the global MAC learning limitations.

Range 1 to 511999

Introduced 25.3.R2

Platforms SAR Gen 2

protected-src-mac-violation-action *keyword*

Synopsis Action taken after a relearn request for protected MAC

Context **configure** service pw-template *pw-template-name* fdb protected-src-mac-violation-action *keyword*

Tree protected-src-mac-violation-action

Description This command configures how the system handles relearn requests for protected MAC addresses.

Options sdp-bind-oper-down, alarm-only, discard

Introduced 25.3.R2

Platforms SAR Gen 2

force-vc-forwarding *keyword*

Synopsis VLAN tag processing action

Context **configure** service pw-template *pw-template-name* force-vc-forwarding *keyword*

Tree force-vc-forwarding

Description This command configures the VLAN tag processing used on the service.

The **vlan** option configures the router to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations.

The **qinq-c-tag-c-tag** option configures the router to pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **qinq-s-tag-c-tag** option configures the router to push two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.

Options
vlan – Push VLAN ID and 802.1p bits of service-delimiting qtag
qinq-c-tag-c-tag – Push two tags identical to inner service-delimiting tag
qinq-s-tag-c-tag – Push two tags based on QinQ service-delimiting values

Introduced 25.3.R2

Platforms SAR Gen 2

hash-label

Synopsis Enable the **hash-label** context

Context **configure** service pw-template *pw-template-name* hash-label

Tree hash-label

Description Commands in this context configure the use of hash labels for egress datapaths.

For information about hash-label handling, see the "Hash labels" section of the *7705 SAR Gen 2 MPLS Guide*.

Notes The following elements are part of a choice: **entropy-label** or **hash-label**.

Introduced 25.3.R2

Platforms SAR Gen 2

signal-capability

Synopsis Signal hash label capability to the remote PE

Context **configure** service pw-template *pw-template-name* hash-label signal-capability

Tree signal-capability

Description When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes.

The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration. The node must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F-bit in the flow label interface option sub-TLV of the pseudowire ID FEC element.

signaling *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Signaling protocol used to obtain pseudowire labels
Context	**configure** service sdp *number* signaling *keyword*
Tree	signaling
Description	This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if the SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if the SDP does not already have pseudowires signaled over it. Also, BGP signaling is not supported with mixed mode LSP SDPs. **Note**: If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by using the **admin-state** command to administratively disable and then enable the SDP.
Options	off, tldp, bgp

attribute-propagation *boolean*

Synopsis	Enable propagation of BGP path attributes
Context	**configure** service system bgp evpn ad-per-evi-routes attribute-propagation *boolean*
Tree	attribute-propagation
Description	When configured to **true**, the router propagates the attributes in multi-instance Epipe services.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router disables the propagation of the attributes, including D-PATH, even if the **domain-id** is configured in the service.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

bgp-path-selection *boolean*

Synopsis Enable BGP path selection

Context **configure** service system bgp evpn ad-per-evi-routes bgp-path-selection *boolean*

Tree bgp-path-selection

Description When configured to **true**, the router compares the received EVPN VPWS AD per-EVI routes based on the BGP path attributes.

The **attribute-propagation** command must be configured to **true**.

When configured to **false**, the router does not compare the routes.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

d-path-ignore *boolean*

Synopsis Ignore D-PATH for BGP path selection

Context **configure** service system bgp evpn ad-per-evi-routes d-path-ignore *boolean*

Tree d-path-ignore

Description When configured to **true**, the router ignores the Domain PATH attribute (D-PATH) when BGP computes the best path selection for received routes.

When configured to **false**, the router considers the D-PATH length and value as a tiebreaker in determining the best-path selection. In accordance with *draft-sr-bess-evpn-dpath*, the router compares the D-PATH attribute received in AD per-EVI routes with the same key (same or different RD) as follows:

- Routes with the shortest D-PATH are preferred; therefore, routes not tied for the shortest D-PATH are removed. Routes without D-PATH are considered zero-length D-PATH.
- Routes with the numerically lowest left-most Domain-ID are preferred; therefore, routes not tied for the numerically lowest left-most Domain-ID are removed from consideration.

Default false

Introduced 25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

attribute-uniform-propagation *boolean*

Synopsis	Enable attribute uniform propagation
Context	**configure** service system bgp evpn ip-prefix-routes interface-ful attribute-uniform-propagation *boolean*
Tree	attribute-uniform-propagation
Description	When configured to **true**, the system enables the uniform propagation of BGP attributes for EVPN-IFF routes. When configured to **false**, the system re-originates the BGP path attributes when propagating EVPN-IFF routes into other inter-subnet forwarding families.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp-path-selection *boolean*

Synopsis	Enable BGP path selection

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service system bgp evpn ip-prefix-routes interface-ful bgp-path-selection *boolean*
Tree	bgp-path-selection
Description	When configured to **true**, the system enables BGP path selection for EVPN-IFF routes. The EVPN-IFF routes are ordered and selected in a similar manner as IP-VPN or EVPN-IFL routes, that is, based on the regular BGP path selection process. When configured to **false**, the system orders EVPN-IFF routes based on their {R-VPLS Ifindex, RD, Ethernet Tag}. For example, if two EVPN-IFF routes with different Route Distinguishers (RDs) are received for the same prefix on the same R-VPLS, the route with the lowest RD is selected.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Synopsis	Multicast leave group synchronization delay
Context	**configure** service system bgp evpn multicast-leave-sync-propagation *number*
Tree	multicast-leave-sync-propagation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the additional amount of time that the system waits before removing a multicast state that was synchronized in an Ethernet Segment via Multicast Join or Leave Synch routes. This value represents a delta corresponding to the time it takes for a BGP advertisement to propagate to ES peers. The node triggering the route computes the maximum response time as the product of the locally configured values, Last Member Query Count and Last Member Query Interval, and adds the delta value to the maximum response time. The query count value is configured in the **configure services vrpn igmp robust-count** command. The query interval value is taken from the **configure service vpls sap igmp-snooping query-last-member-interval** or the **configure service vpls spoke-sdp igmp-snooping query-last-member-interval** configuration, depending on the Ethernet Segment. Increasing the maximum response time by this value can help minimize the churn of removing and recreating the state on the node. This value should be configured consistently in all ES peers.
Range	0 to 300
Units	seconds
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service vpls *service-name*
Tree	vpls
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association. When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error. This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The service ID must be the same number used for every platform on which this service is defined.
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2

Platforms	SAR Gen 2

interface-type *keyword*

Synopsis	LDRA interface type
Context	**configure** service vpls *service-name* bgp-evpn dhcp6 ldra interface-type *keyword*
Tree	interface-type
Description	This command configures this end point as a client-facing or network-facing interface. BGP EVPN service tunnels must be configured as a network-facing interface.
Options	client-facing, network-facing
Notes	This element is mandatory.
Introduced	26.7.R1
Platforms	SAR Gen 2

evi *number*

Synopsis	EVPN ID
Context	**configure** service vpls *service-name* bgp-evpn evi *number*
Tree	evi

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures a 2-byte EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers. If not specified, the EVPN ID value is zero and no route distinguisher or route targets are auto-derived from it. If the EVI ID value is specified and no other **route-distinguisher** or **route-target** is configured in the service, the following rules apply: • the route distinguisher is derived from <system_ip>:evi • the route target is derived from <autonomous-system>:evi If VSI import and export policies are configured, the route target must be configured in the policies and those values take precedence over the auto-derived route targets. If **bgp-ad vpls-id** and **bgp-evpn evi** are both configured on the same service, the VPLS ID auto-derived route target or route distinguisher takes precedence over the values auto-derived from the EVI. Use the **show service id bgp** command to display the operational route target for a service.
Range	1 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-mtu-mismatch *boolean*

Synopsis	Ignore MTU mismatch
Context	**configure** service vpls *service-name* bgp-evpn ignore-mtu-mismatch *boolean*
Tree	ignore-mtu-mismatch
Description	When configured to **true**, the system ignores the received Layer 2 MTU in the L2 Attributes extended community of the IMET route for a peer. When configured to **false**, the system compares the local service MTU against the received Layer 2 MTU and if there is a mismatch, keeps the EVPN destination to the peer with operational state down.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

incl-mcast-orig-ip *ipv4-unicast-address*

Synopsis	Originating IP address
Context	**configure** service vpls *service-name* bgp-evpn incl-mcast-orig-ip *ipv4-unicast-address*
Tree	incl-mcast-orig-ip
String format	'ipv4-address' must use only digits and dots (no %zone)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)

Introduced 25.3.R2

Platforms SAR Gen 2

mac-duplication

Synopsis Enter the **mac-duplication** context

Context **configure** service vpls *service-name* bgp-evpn mac-duplication

Tree mac-duplication

Description Commands in this context configure the BGP EVPN MAC duplication command options.

Introduced 25.3.R2

Platforms SAR Gen 2

blackhole *boolean*

Synopsis Use duplicated MAC as a black-hole MAC

Context **configure** service vpls *service-name* bgp-evpn mac-duplication blackhole *boolean*

Tree blackhole

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

detect

Synopsis Enter the **detect** context

Context **configure** service vpls *service-name* bgp-evpn mac-duplication detect

Tree detect

Description Commands in this context monitor the number of moves of a MAC address for a period of time (window).

Introduced 25.3.R2

Platforms SAR Gen 2

num-moves *number*

Synopsis BGP EVPN MAC duplication detection number of moves

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect num-moves *number*
Tree	num-moves
Range	3 to 10
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

trusted-mac-move-factor *number*

Synopsis	Trusted MAC move factor
Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect trusted-mac-move-factor *number*
Tree	trusted-mac-move-factor
Description	This command configures the factor by which the number of moves is multiplied when detecting a MAC duplication event for trusted MACs. For example, if the number of moves is 5 and the trusted MAC move factor is 3, 5 moves, within the window, is enough to declare a non-trusted MAC as duplicate. However, 15 moves are needed to declare a trusted MAC as duplicate. By default the factor for a trusted MAC is the same as for a non-trusted MAC. This provides a backwards compatible solution upon upgrade of the node.
Range	1 to 10
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

window *number*

Synopsis	BGP EVPN MAC duplication detection window
Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect window *number*
Tree	window
Range	1 to 15
Units	minutes
Default	3
Introduced	25.3.R2

Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

[**bgp-instance**] *number*

Synopsis	BGP instance
Context	**configure** service vpls *service-name* bgp-evpn mpls *number*
Tree	mpls
Range	1 to 2
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of BGP EVPN MPLS
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-bind-tunnel

Synopsis	Enter the **auto-bind-tunnel** context
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel
Tree	auto-bind-tunnel
Description	Commands in this context configure automatic binding of a VPRN service using tunnels to MP-BGP peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-flex-algo-fallback *boolean*

Synopsis	Enable flexible algorithm fallback

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel allow-flex-algo-fallback *boolean*
Tree	allow-flex-algo-fallback
Description	When configured to **true**, a BGP router with a Flex-Algorithm action configured (via the **configure policy-options policy-statement entry action flex-algo** command) can resolve to a tunnel with algorithm 0 if no target Flex-Algorithm tunnel is available**.** When configured to **false**, the BGP router can resolve only to the intended Flex-Algorithm tunnel, which may cause traffic loss if no corresponding Flex-Algorithm tunnel is available.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ecmp *number*

Synopsis	Maximum ECMP routes information
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel ecmp *number*
Tree	ecmp
Range	1 to 32
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-strict-tunnel-tagging *boolean*

Synopsis	Enable/disable enforcement of strict tunnel tagging
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services.
Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

resolution *keyword*

Synopsis	Resolution method for tunnel selection
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution *keyword*
Tree	resolution
Options	none, filter, any
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

resolution-filter

Synopsis	Enter the **resolution-filter** context
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter
Tree	resolution-filter
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp *boolean*

Synopsis	Use BGP tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter bgp *boolean*
Tree	bgp

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, BGP searches the BGP LSP for the address of the BGP next hop. When configured to **false**, BGP tunneling is not used and inter-area or inter-as prefixes are not resolved.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, BGP searches for an LDP LSP with a FEC prefix corresponding to the address of the BGP next hop. When configured to **false**, LDP tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-isis *boolean*

Synopsis Use IS-IS SR tunneling for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-isis *boolean*

Tree sr-isis

Description When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop.

When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, IS-IS tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-ospf *boolean*

Synopsis Use OSPF SR tunneling for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf *boolean*

Tree sr-ospf

Description When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms SAR Gen 2

sr-ospf3 *boolean*

Synopsis Use OSPFv3 SR tunneling for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf3 *boolean*

Tree sr-ospf3

Description When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP-EVPN service routes.

This command configures BGP to search for an SR policy with:

- a non-null endpoint that matches the next hop of the service route, and
- a color value that matches the highest numbered color for the extended community attached to the service route

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-te *boolean*

Synopsis	Use SR-TE tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-te *boolean*
Tree	sr-te
Description	When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, SR-TE tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

weighted-ecmp *boolean*

Synopsis	Allow weighted load balancing
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this router enables weighted ECMP for packets using tunnels that a VPLS or Epipe automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP. When configured to **false**, this command disables weighted ECMP for next-hop tunnel selection.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

control-word *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable control word support
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* control-word *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	control-word
Description	When configured to **true**, the router enables the transmission and reception of the control word for all EVPN-MPLS destinations at the same time.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-egress-label-limit *boolean*

Synopsis	Enables dynamic egress label limit
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* dynamic-egress-label-limit *boolean*
Tree	dynamic-egress-label-limit
Description	When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table. For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed. For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

entropy-label *boolean*

Synopsis Allow use of entropy labels for spoke SDPs

Context **configure** service vpls *service-name* bgp-evpn mpls *number* entropy-label *boolean*

Tree entropy-label

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

evi-three-byte-auto-rt *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Auto-derive the BGP EVPN route target

Context **configure** service vpls *service-name* bgp-evpn mpls *number* evi-three-byte-auto-rt *boolean*

Tree evi-three-byte-auto-rt

Description When configured to **true**, the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID).

Where:

- Global Administrator – is the configured 2-octet AS number; if the configured ASN exceeds the 2 byte limit, the low order 16-bit value is taken
- A=0 (for auto-derivation)
- Type=4 (EVI-based route-target)
- D-ID= [1..2] – encodes the BGP instance, which allows the auto-derivation of different route-targets in multi-instance services; the value is inherited from the corresponding BGP instance
- Service ID=3-octet EVI

When configured to **false**, route target derivation is not allowed.

Default false

Tree	split-horizon-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the value of split-horizon group for all BGP-EVPN segment routing v6 instances.
Reference	**configure** service vpls *service-name* split-horizon-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

per-pe-etree-leaf

Synopsis	Enable the **per-pe-etree-leaf** context
Context	**configure** service vpls *service-name* bgp-evpn per-pe-etree-leaf
Tree	per-pe-etree-leaf
Description	Commands in this context configure the PE as an E-Tree leaf PE for the service. When this command is configured, the PE operates as a leaf PE for the service. As a result, EVPN BUM bindings are not created toward remote PEs that are also configured as E-Tree leaf PEs. In addition, received EVPN MAC/IP Advertisement routes with the leaf flag set are not installed in the service FDB unless they convey an ESI that matches a local ESI on an operationally up SAP, or the **configure service vpls bgp-evpn per-pe-etree-leaf blackhole-non-local-leaf-macs** command is enabled.
Introduced	26.7.R1
Platforms	SAR Gen 2

blackhole-non-local-leaf-macs *boolean*

Synopsis	Blackhole non-local leaf MAC addresses
Context	**configure** service vpls *service-name* bgp-evpn per-pe-etree-leaf blackhole-non-local-leaf-macs *boolean*
Tree	blackhole-non-local-leaf-macs
Description	When configured to **true**, EVPN MAC addresses learned from EVPN MAC and IP advertisement routes marked with the leaf flag and originating from remote PEs are installed in the FDB as blackhole MACs. EVPN MACs learned from non-zero ESI MAC and IP routes that are marked as leaf and associated with a local ES SAP are installed normally. When configured to **false**, the router installs EVPN MACs learned from non-zero ESI MAC and IP routes marked as a leaf and associated with a local ES SAP, while all other leaf-flagged EVPN MACs received from remote PEs are not installed in the FDB.
Default	false
Introduced	26.7.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

routes

Synopsis	Enter the **routes** context
Context	**configure** service vpls *service-name* bgp-evpn routes
Tree	routes
Introduced	25.3.R2
Platforms	SAR Gen 2

incl-mcast

advertise-ingress-replication *boolean*

Synopsis	BGP EVPN IMET-IR route advertisement
Context	**configure** service vpls *service-name* bgp-evpn routes incl-mcast advertise-ingress-replication *boolean*
Tree	advertise-ingress-replication
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-l2-attributes *boolean*

Synopsis	Advertise Layer 2 attributes
Context	**configure** service vpls *service-name* bgp-evpn routes incl-mcast advertise-l2-attributes *boolean*
Tree	advertise-l2-attributes
Description	When configured to **true**, the router advertises the Layer 2 Attributes Extended Community including: • the service MTU in the Layer 2 MTU field

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the F bit, which is set to 1 if the **hash-label** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the F bit is set to 0
- the C bit, which is set to 1 if the **control-word** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the C bit is set to 0

The router compares the received Layer 2 MTU from a peer with the local service MTU. If there is a mismatch, the operation state of the EVPN destination is set to down, except if the **configure service vpls bgp-evpn ignore-mtu-mistmatch** command is set to **true**.

A mismatch between the received C bit and the local **control-word** setting (in the **configure service vpls bgp-evpn mpls** context) results in the operational state of the EVPN destination being set to down.

A mismatch between the received F bit and the local F bit (via the hash label configuration) results in the operational state of the EVPN destination being set to down.

When configured to **false**, the Layer 2 Attributes Extended Community is not advertised with the Inclusive Multicast Ethernet Tag route for the service.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

domain-id *domain-id*

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service vpls *service-name* bgp-evpn routes ip-prefix domain-id *domain-id*
Tree	domain-id
Description	This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances). Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred). In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N: Seg Len=1 / 65000:1:128 If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows: Seg Len=2 / 65000:2:70 / 65000:1:128 That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.
String format	'domain-id' must be global-field:local-field (uint32:uint16 range)
Introduced	25.3.R2
Platforms	SAR Gen 2

include-direct-interface-host *boolean*

Synopsis	Advertise the interface host address in EVPN

vlan-aware-bundle-eth-tag *number*

Synopsis	Ethernet tag associated with VPLS service
Context	**configure** service vpls *service-name* bgp-evpn routes vlan-aware-bundle-eth-tag *number*
Tree	vlan-aware-bundle-eth-tag
Description	This command configures the Ethernet Tag ID in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service. When set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes. On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* endpoint *named-item* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this endpoint. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. Packets with unknown source MAC addresses are still forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the endpoint uses the global MAC learning limitations.
Range	1 to 511999
Introduced	25.3.R2
Platforms	SAR Gen 2

protected-src-mac-violation-action *keyword*

Synopsis	Action taken after a relearn request for protected MAC
Context	**configure** service vpls *service-name* endpoint *named-item* fdb protected-src-mac-violation-action *keyword*
Tree	protected-src-mac-violation-action
Description	This command configures how the system handles relearn requests for protected MAC addresses.
Options	sdp-bind-oper-down, alarm-only, discard
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-standby-signaling *boolean*

Synopsis	Ignore standby-bit received from TLDP peers when performing internal tasks
Context	**configure** service vpls *service-name* endpoint *named-item* ignore-standby-signaling *boolean*
Tree	ignore-standby-signaling

© 2026 Nokia.

Platforms	SAR Gen 2

aging *boolean*

Synopsis	Enable aging of MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning aging *boolean*
Tree	aging
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

learning *boolean*

Synopsis	Enable learning of new MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning learning *boolean*
Tree	learning
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

local-age-time *number*

Synopsis	Aging time for locally learned MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning local-age-time *number*
Tree	local-age-time
Description	This command configures the aging time for locally learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or a Service Destination Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs. In each VPLS service instance, there are independent aging timers for locally learned MAC and remotely learned MAC entries in the FDB. As in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time).
Range	60 to 86400
Default	300
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

remote-age-time *number*

Synopsis	Aging time for remotely learned MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning remote-age-time *number*
Tree	remote-age-time
Description	This command configures the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or a Service Destination Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs. In each VPLS service instance, there are independent aging timers for locally learned MAC and remotely learned MAC entries in the FDB. As in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). To reduce the amount of signaling required between switches, configure this time larger than the **local-age-time** command.
Range	60 to 86400
Default	900
Introduced	25.3.R2
Platforms	SAR Gen 2

mac-move

Synopsis	Enter the **mac-move** context
Context	**configure** service vpls *service-name* fdb mac-move
Tree	mac-move
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of MAC move
Context	**configure** service vpls *service-name* fdb mac-move admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable

Introduced	25.3.R2
Platforms	SAR Gen 2

mesh-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis	Enter the **mesh-sdp** list instance
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id*
Tree	mesh-sdp
Description	Commands in this context bind a VPLS service to an existing SDP. Mesh SDPs bound to a service are logically treated like a single bridge "port" for flooded traffic where flooded traffic received on any mesh SDP on the service is replicated to other "ports" (spoke SDPs and SAPs) and not transmitted on any mesh SDPs. **Note**: This command creates a binding between a service and an SDP. The SDP has an operational state that determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down. The SDP must already be defined in the **configure service sdp** context to associate the SDP with an Epipe or VPLS service. SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end router devices can participate in the service.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

[**sdp-bind-id**] *sdp-bind-id*

Synopsis	SDP binding ID
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id*
Tree	mesh-sdp
String length	3 to 16
String format	'sdp-bind-id' must be sdp-id:vc-id (sdp 1..32767, vc 1..4294967295)
Notes	This element is part of a list key.
Introduced	25.3.R2

Introduced	25.3.R2
Platforms	SAR Gen 2

adv-service-mtu *number*

Synopsis	Advertise service MTU value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP. The router uses the value for signaling and for validation with the received MTU instead of the service MTU. However, the value does not affect the locally enforced value, which is still based on the service MTU. This command cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command.
Range	0 to 9782
Introduced	25.3.R2
Platforms	SAR Gen 2

Description	This command configures the client Maintenance Entity Group (MEG) level to use for AIS message generation. One restriction is that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level is used for facility MEPs.
Range	1 to 7
Max. instances	7
Introduced	25.3.R2
Platforms	SAR Gen 2

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on operationally down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

direction *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Direction the MEP faces

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* direction *keyword*
Tree	direction
Description	This command configures the direction in which the MEP faces on the bridge port.
Options	down – Send ETH-CFM messages toward the MAC relay entity up – Send ETH-CFM messages away from the MAC relay entity
Default	down
Introduced	25.3.R2
Platforms	SAR Gen 2

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	25.3.R2
Platforms	SAR Gen 2

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	25.3.R2
Platforms	SAR Gen 2

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern pattern *keyword*
Tree	pattern
Description	This command specifies the test pattern of the Ethernet Test (ETH-TST) frames. This does not have to be configured the same on the sender and the receiver.
Options	all-zeros, all-ones
Default	all-zeros
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fault-propagation *keyword*

Synopsis	Fault propagation for the MEP
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* fault-propagation *keyword*
Tree	fault-propagation
Options	use-if-status-tlv – Use the interface TLV suspend-ccm – Suspend continuity check messages
Introduced	25.3.R2
Platforms	SAR Gen 2

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	25.3.R2
Platforms	SAR Gen 2

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MEP
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* mac-address *mac-unicast-address-no-zero*
Tree	mac-address
Description	This command specifies the MAC address of the MEP. When unconfigured, the MAC address of the port (if the MEP is on a SAP) or the MAC address of a bridge (if the MEP is on a spoke) is used.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

one-way-delay-threshold *number*

Synopsis	Threshold time limit for the one-way delay test
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* one-way-delay-threshold *number*
Tree	one-way-delay-threshold
Range	0 to 600
Units	seconds
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

fdb

Synopsis	Enter the **fdb** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb
Tree	fdb
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-learn-mac-protect *boolean*

Synopsis	Enable automatic population of the MAC protect list
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb auto-learn-mac-protect *boolean*
Tree	auto-learn-mac-protect
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-learn-mac-protect-exclude-list *reference*

Synopsis	Referenced MAC protect exclusion list name
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb auto-learn-mac-protect-exclude-list *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	auto-learn-mac-protect-exclude-list
Description	This command references the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
Reference	**configure** service mac-list *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

mac-pinning *boolean*

Synopsis	MAC address pinning in active status
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb mac-pinning *boolean*
Tree	mac-pinning
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

protected-src-mac-violation-action *keyword*

Synopsis	Action taken after a relearn request for protected MAC
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb protected-src-mac-violation-action *keyword*
Tree	protected-src-mac-violation-action
Description	This command configures how the system handles relearn requests for protected MAC addresses.
Options	sdp-bind-oper-down, alarm-only, discard
Introduced	25.3.R2
Platforms	SAR Gen 2

force-vc-forwarding *keyword*

Synopsis	VLAN tag processing action
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* force-vc-forwarding *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	force-vc-forwarding
Description	This command configures the VLAN tag processing used on the service. The **vlan** option configures the router to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations. The **qinq-c-tag-c-tag** option configures the router to pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs. The **qinq-s-tag-c-tag** option configures the router to push two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.
Options	vlan – Push VLAN ID and 802.1p bits of service-delimiting qtag qinq-c-tag-c-tag – Push two tags identical to inner service-delimiting tag qinq-s-tag-c-tag – Push two tags based on QinQ service-delimiting values
Introduced	25.3.R2
Platforms	SAR Gen 2

hash-label

Synopsis	Enable the **hash-label** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* hash-label
Tree	hash-label
Description	Commands in this context configure the use of hash labels for egress datapaths. For information about hash-label handling, see the "Hash label" section of the *7705 SAR Gen 2 MPLS Guide*.
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	25.3.R2
Platforms	SAR Gen 2

signal-capability

Synopsis	Signal hash label capability to the remote PE
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* hash-label signal-capability
Tree	signal-capability
Description	When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration.

Introduced 25.3.R2

Platforms SAR Gen 2

igmp-snooping

Synopsis Enter the **igmp-snooping** context

Context **configure** service vpls *service-name* mesh-sdp *sdp-bind-id* igmp-snooping

restrict-non-configured-ip-address

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **restrict-non-configured-ip-address** context
Context	**configure** service vpls *service-name* proxy-arp restrict-non-configured-ip-address
Tree	restrict-non-configured-ip-address
Description	Commands in this context configure whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP requests or neighbor solicitations (NS) coming from a unauthorized sender IP are not replied (unless the **sponge-mac** command option is configured).
Introduced	25.3.R2
Platforms	SAR Gen 2

sponge-mac *mac-unicast-address-no-zero*

Synopsis	Sponge MAC used to reply to unauthorized requests
Context	**configure** service vpls *service-name* proxy-arp restrict-non-configured-ip-address sponge-mac *mac-unicast-address-no-zero*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sponge-mac
Description	This command configures the system to ignore ARP requests or neighbor solicitations from an unauthorized IP address. These requests are not learned in the proxy ARP or ND table (when the **restrict-non-configured-ip-address** command is configured), and the system replies with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and there is no reply. The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node. This command supersedes the operation of the **restrict-non-configured-ip-address** command for replies to ARP requests or neighbor solicitation: • If only **restrict-non-configured-ip-address** is configured, all ARP or ND packets from unauthorized IPs are dropped. • If **restrict-non-configured-ip-address sponge-mac** is configured, ARP or ND packets from unauthorized IPs are dropped except for ARP requests or neighbor solicitation messages, to which the system replies with the configured sponge MAC address.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)

Synopsis	Advertisement type of static or dynamic entries in EVPN
Context	**configure** service vpls *service-name* proxy-nd evpn advertise-neighbor-type *keyword*
Tree	advertise-neighbor-type
Description	This command enables the advertisement of static or dynamic entries that are learned as host, router, or host and router (only one option is possible in a specified service). It also determines the R flag (host or router) when sending Neighbor Advertisement (NA) messages for existing EVPN entries in the proxy-ND table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **router-host** command option is only possible when the ARP/ND extended community is advertised along with the MAC/IP routes. It determines that both host and router (dynamic and static) entries are advertised in MAC/IP routes, with an indication whether the entry is host or router in the R flag. These EVPN entries are installed as host or router entries depending on the R flag of the route, and NA messages for them are sent with the proper host or router indication.

Options	router, host, router-host

restrict-non-configured-ip-address

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **restrict-non-configured-ip-address** context
Context	**configure** service vpls *service-name* proxy-nd restrict-non-configured-ip-address
Tree	restrict-non-configured-ip-address
Description	Commands in this context configure whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

requests or neighbor solicitations (NS) coming from a unauthorized sender IP are not replied (unless the **sponge-mac** command option is configured).

Introduced 25.3.R2

Platforms SAR Gen 2

sponge-mac *mac-unicast-address-no-zero*

Synopsis Sponge MAC used to reply to unauthorized requests

Context **configure** service vpls *service-name* proxy-nd restrict-non-configured-ip-address sponge-mac *mac-unicast-address-no-zero*

Tree sponge-mac

Description This command configures the system to ignore ARP requests or neighbor solicitations from an unauthorized IP address. These requests are not learned in the proxy ARP or ND table (when the **restrict-non-configured-ip-address** command is configured), and the system replies with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and there is no reply.

The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node.

This command supersedes the operation of the **restrict-non-configured-ip-address** command for replies to ARP requests or neighbor solicitation:

- If only **restrict-non-configured-ip-address** is configured, all ARP or ND packets from unauthorized IPs are dropped.
- If **restrict-non-configured-ip-address sponge-mac** is configured, ARP or ND packets from unauthorized IPs are dropped except for ARP requests or neighbor solicitation messages, to which the system replies with the configured sponge MAC address.

String format 'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)

Introduced 25.3.R2

bgp-vpls-mh-veid *number*

Synopsis	BGP-VPLS multi-homing VE-ID
Context	**configure** service vpls *service-name* sap *sap* bgp-vpls-mh-veid *number*
Tree	bgp-vpls-mh-veid
Description	This command specifies a VE ID that is configured on SAPs that are part of an EVPN single-active Ethernet Segment. The configuration of this command allows the advertisement of L2VPN routes that indicate the state of multi-homed SAPs to the remote BGP-VPLS PEs, which can trigger a MAC flush operation on the service to avoid traffic from being blackholed when a failure occurs in the active PE. When unconfigured from the SAP, L2VPN routes are withdrawn, which causes MAC flush processing on the remote BGP-VPLS.
Range	1 to 65535

interface-type *keyword*

Synopsis	LDRA interface type
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra interface-type *keyword*
Tree	interface-type
Description	This command specifies the LDRA interface type. **client-facing** - configure the SAP as an untrusted client-facing interface. Only DHCPv6 client messages are accepted and encapsulated in a Relay-Forward message. It is mandatory to configure an interface ID for client-facing SAPs. Relay-Forward, Relay-Reply, and DHCPv6 server messages are silently dropped when received on a client-facing SAP. **network-facing** - configure the SAP as a network-facing interface. Only Relay-Reply messages are accepted: the server message is extracted from the Relay-Reply message and forwarded in the VPLS. All other DHCPv6 message types are silently dropped when received on a network-facing SAP.

Synopsis	Use an ASCII-encoded concatenated tuple
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options interface-id ascii-tuple
Tree	ascii-tuple
Description	This command specifies the use of the ASCII-encoded concatenated tuple, which consists of the system name, service ID, and SAP ID separated by "|".
Notes	The following elements are part of a mandatory choice: **ascii-tuple** or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

vlan-ascii-tuple

Synopsis	Use an enhanced ASCII-encoded concatenated tuple

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options interface-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	This command specifies the use of the ASCII-encoded concatenated tuple enhanced with VLAN ID and dot1p bits, consisting of the system name, service ID, SAP ID, dot1p inner VLAN, and inner VLAN ID separated by "|".
Notes	The following elements are part of a mandatory choice: **ascii-tuple** or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id
Tree	remote-id
Description	Commands in this context configure the Relay-Agent remote ID contents inserted by the LDRA.
Introduced	25.3.R2
Platforms	SAR Gen 2

mac

Synopsis	Use the DHCPv6 client source MAC address
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id mac
Tree	mac
Description	This command sets the enterprise number field of the Relay Agent remote ID to 6527 and configures the DHCPv6 client source MAC address as six hexadecimal numbers.
Notes	The following elements are part of a choice: **mac** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

string *string*

Synopsis	User-defined ASCII string
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id string *string*
Tree	string

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command sets the enterprise number field of the Relay-Agent remote ID to 6527 and configures the ASCII-encoded string.
String length	1 to 32
Notes	The following elements are part of a choice: **mac** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

dist-cpu-protection *reference*

Synopsis	Distributed CPU protection policy for SAP
Context	**configure** service vpls *service-name* sap *sap* dist-cpu-protection *reference*
Tree	dist-cpu-protection
Reference	**configure** system security dist-cpu-protection policy *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

egress

Synopsis	Enter the **egress** context
Context	**configure** service vpls *service-name* sap *sap* egress
Tree	egress
Introduced	25.3.R2
Platforms	SAR Gen 2

agg-rate

Synopsis	Enter the **agg-rate** context
Context	**configure** service vpls *service-name* sap *sap* egress agg-rate
Tree	agg-rate
Notes	The following elements are part of a choice: **agg-rate** or **percent-agg-rate**.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service vpls *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

client-meg-level *number*

Synopsis	Client MEG level for AIS message generation
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais client-meg-level *number*
Tree	client-meg-level
Description	This command configures the client Maintenance Entity Group (MEG) level to use for AIS message generation. One restriction is that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level is used for facility MEPs.
Range	1 to 7
Max. instances	7
Introduced	25.3.R2
Platforms	SAR Gen 2

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on operationally down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

Synopsis	Transmission interval for AIS messages

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interval *number*
Tree	interval
Range	1 | 60
Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def – Generate AIS frame for any defect in CCM state machine mac-rem-err-xcon – Generate AIS frame for def-mac-status defect or higher
Default	all-def
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	Priority of the AIS messages generated by the node
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais priority *number*
Tree	priority

Synopsis	Enable automatic update of MAC protect list
Context	**configure** service vpls *service-name* sap *sap* fdb auto-learn-mac-protect *boolean*
Tree	auto-learn-mac-protect
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-learn-mac-protect-exclude-list *reference*

Synopsis	Referenced MAC protect exclusion list
Context	**configure** service vpls *service-name* sap *sap* fdb auto-learn-mac-protect-exclude-list *reference*
Tree	auto-learn-mac-protect-exclude-list

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command references the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
Reference	**configure** service mac-list *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

discard-unknown-source *boolean*

Synopsis	Discard packets with unknown destination MAC addresses
Context	**configure** service vpls *service-name* sap *sap* fdb discard-unknown-source *boolean*
Tree	discard-unknown-source
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

discard-unprotected-dest-mac *boolean*

Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* sap *sap* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this SAP. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. When the configured limit is reached and the **configure service pw-template fdb discard-unknown-source** command is set to **true** for this SAP, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the SAP uses the global MAC learning limitations.
Range	1 to 511999
Introduced	25.3.R2
Platforms	SAR Gen 2

protected-src-mac-violation-action *keyword*

Synopsis	Action taken after a relearn request for protected MAC
Context	**configure** service vpls *service-name* sap *sap* fdb protected-src-mac-violation-action *keyword*
Tree	protected-src-mac-violation-action
Description	This command configures how the system handles relearn requests for protected MAC addresses.
Options	sap-oper-down, alarm-only, discard
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

i-vpls-mac-flush

Synopsis	Enter the **i-vpls-mac-flush** context
Context	**configure** service vpls *service-name* sap *sap* i-vpls-mac-flush

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** service vpls *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Introduced	25.3.R2
Platforms	SAR Gen 2

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service vpls *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

parent

service-mtu *number*

Synopsis	MTU size
Context	**configure** service vpls *service-name* service-mtu *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree service-mtu

Description This command configures the Maximum Transmission Unit (MTU) value (payload) for the service. The system uses the value to validate the operational state of the SAP and SDP binding within the service. The value overrides the default MTU for the service type.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) are used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

In the **configure service epipe spoke-sdp** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE.

Range 1 to 9782

Introduced 25.3.R2

Platforms SAR Gen 2

split-horizon-group [shg-name] *named-item*

Synopsis Enter the **split-horizon-group** list instance

auto-learn-mac-protect-exclude-list *reference*

Synopsis	Referenced MAC protect exclusion list name
Context	**configure** service vpls *service-name* split-horizon-group *named-item* fdb saps auto-learn-mac-protect-exclude-list *reference*
Tree	auto-learn-mac-protect-exclude-list
Description	This command references the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
Reference	**configure** service mac-list *named-item*
Introduced	25.3.R2

Description	This command configures how the system handles relearn requests for protected MAC addresses.
Options	sap-oper-down, alarm-only, discard
Introduced	25.3.R2
Platforms	SAR Gen 2

spoke-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis	Enter the **spoke-sdp** list instance
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id*
Tree	spoke-sdp
Description	Commands in this context bind a service to an existing service destination point (SDP). A spoke SDP is treated like a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other ports (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received. The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down. The SDP must already be defined in the **configure service sdp** context to associate an SDP with a VPLS service. SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service

adv-service-mtu *number*

Synopsis	Advertise service MTU value
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP. The router uses the value for signaling and for validation with the received MTU instead of the service MTU. However, the value does not affect the locally enforced value, which is still based on the service MTU. This command cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command.
Range	0 to 9782
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms	SAR Gen 2

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on operationally down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

Synopsis	Transmission interval for AIS messages
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interval *number*
Tree	interval
Range	1 | 60
Units	seconds

Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

learning *boolean*

Synopsis	Enable learning of new MAC addresses
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb mac-learning learning *boolean*
Tree	learning
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

mac-pinning *boolean*

Synopsis	MAC address pinning in active status
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb mac-pinning *boolean*
Tree	mac-pinning
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this spoke SDP. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. When the configured limit is reached and the **configure service spoke-sdp fdb discard-unknown-source** command is set to **true** for this spoke SDP, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached.

When unconfigured, the spoke SDP uses the global MAC learning limitations.

Range 1 to 511999

Introduced 25.3.R2

Platforms SAR Gen 2

protected-src-mac-violation-action *keyword*

Synopsis Action taken after a relearn request for protected MAC

Context **configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb protected-src-mac-violation-action *keyword*

Tree protected-src-mac-violation-action

Description This command configures how the system handles relearn requests for protected MAC addresses.

Options sdp-bind-oper-down, alarm-only, discard

Introduced 25.3.R2

Platforms SAR Gen 2

force-vc-forwarding *keyword*

Synopsis VLAN tag processing action

Context **configure** service vpls *service-name* spoke-sdp *sdp-bind-id* force-vc-forwarding *keyword*

Tree force-vc-forwarding

Description This command configures the VLAN tag processing used on the service.

The **vlan** option configures the router to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations.

The **qinq-c-tag-c-tag** option configures the router to pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs.

The **qinq-s-tag-c-tag** option configures the router to push two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.

Options vlan – Push VLAN ID and 802.1p bits of service-delimiting qtag
qinq-c-tag-c-tag – Push two tags identical to inner service-delimiting tag

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

qinq-s-tag-c-tag – Push two tags based on QinQ service-delimiting values

Introduced 25.3.R2

Platforms SAR Gen 2

hash-label

Synopsis Enable the **hash-label** context

Context **configure** service vpls *service-name* spoke-sdp *sdp-bind-id* hash-label

Tree hash-label

Description Commands in this context configure the use of hash labels for egress datapaths.

For information about hash-label handling, see the "Hash label" section of the *7705 SAR Gen 2 MPLS Guide*.

Notes The following elements are part of a choice: **entropy-label** or **hash-label**.

Introduced 25.3.R2

Platforms SAR Gen 2

signal-capability

Synopsis Signal hash label capability to the remote PE

Context **configure** service vpls *service-name* spoke-sdp *sdp-bind-id* hash-label signal-capability

Tree signal-capability

Description When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes.

The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration.

Introduced 25.3.R2

Platforms SAR Gen 2

[**group-address**] *ipv4-multicast-address*

Synopsis	Group address of static IGMP multicast channel
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* igmp-snooping static group *ipv4-multicast-address*
Tree	group
Description	This command configures an address that receives data on an interface. The IP address must be unique for each static group.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id) 'ipv4-multicast-address' must be in 224.0.0.0-239.255.255.255 range with valid dotted-quad form
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

source [source-address] *ipv4-unicast-address*

Synopsis	Add a list entry for **source**
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* igmp-snooping static group *ipv4-multicast-address* source *ipv4-unicast-address*
Tree	source
Notes	The following elements are part of a mandatory choice: **source** or **starg**.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**source-address**] *ipv4-unicast-address*

Synopsis	Source IP address of multicast channel sending data
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* igmp-snooping static group *ipv4-multicast-address* source *ipv4-unicast-address*
Tree	source
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.

vprn [service-name] *service-name*

Synopsis	Enter the **vprn** list instance
Context	**configure** service vprn *service-name*
Tree	vprn
Description	Commands in this context create or edit a VPRN service instance.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service vprn *service-name*
Tree	vprn
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association. When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error. This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	any other service of any type. The service ID must be the same number used for every platform on which this service is defined.
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms	SAR Gen 2

request-format

Synopsis	Enter the **request-format** context
Context	**configure** service vprn *service-name* aaa remote-servers tacplus authorization request-format
Tree	request-format
Description	Commands in this context configure access operations that are sent to the TACACS+ server during authorization.
Introduced	25.3.R2
Platforms	SAR Gen 2

access-operation-cmd *keyword*

Synopsis	Access operations sent in authorization requests
Context	**configure** service vprn *service-name* aaa remote-servers tacplus authorization request-format access-operation-cmd *keyword*
Tree	access-operation-cmd
Description	This command sends an operation argument in authorization requests. In model-driven interfaces, this command configures the system to send the operation in the cmd argument, and the path in the cmd-args argument, in TACACS+ authorization requests. This command does not apply to authorization requests in classic interfaces.
Options	delete
Max. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

use-priv-lvl *boolean*

Synopsis	Allow privilege level mapping
Context	**configure** service vprn *service-name* aaa remote-servers tacplus authorization use-priv-lvl *boolean*
Tree	use-priv-lvl
Description	When configured to **true**, this command automatically performs a single authorization request to the TACACS+ server for cmd* (all commands) immediately after login, and then uses the local profile associated (via the **priv-lvl-map**) with the priv-lvl returned by

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the TACACS+ server for all subsequent authorization (except **enable-admin**). After the initial authorization for cmd*, no further authorization requests are sent to the TACACS+ server (except **enable-admin**).

When configured to **false**, each command is sent to the TACACS+ server for authorization (this is true regardless of whether the **tacplus use-default-template** setting is enabled).

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-unknown-mandatory-vsas *boolean*

Synopsis	Ignore unknown mandatory VSAs and fail authentication
Context	**configure** service vprn *service-name* aaa remote-servers tacplus ignore-unknown-mandatory-vsas *boolean*
Tree	ignore-unknown-mandatory-vsas
Description	When configured to **true**, the system ignores unknown mandatory VSAs and authentication succeeds. When configured to **false**, the system ignores unknown mandatory VSAs received in a reply from the TACACS+ server. Authentication fails and the user is disconnected because the system cannot process a mandatory VSA that is unknown.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

interactive-authentication *boolean*

Synopsis	Allows TACACS+ interactive authentication
Context	**configure** service vprn *service-name* aaa remote-servers tacplus interactive-authentication *boolean*
Tree	interactive-authentication
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Address of the indirect next hop
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	indirect
Description	This command programs aggregate routes into the forwarding table with an indirect next hop. If a packet matches the aggregate route but not a contributing route, it is forwarded toward the indirect next hop rather than being discarded.
Notes	The following elements are part of a choice: **blackhole** or **indirect**.
Introduced	25.3.R2
Platforms	SAR Gen 2

local-preference *number*

Synopsis	Local preference used when aggregate route is exported
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* local-preference *number*
Tree	local-preference
Description	This command configures the local preference value to use when the aggregate route is exported rather than using any of the local preference values assigned for any of the contributing routes.
Range	0 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

policy *reference*

Synopsis	Policy name for the aggregated route

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* policy *reference*
Tree	policy
Description	This command associates an aggregate route with a policy reference. The aggregated route is activated only when there is at least one eligible active route in the sub-trees below it that is accepted by the policy evaluation. There is no evaluation into any sub-tree that starts with another active aggregate route. Eligible routes exclude host routes and LDP shortcut routes. If an aggregate route has no policy, or the reference is to an empty policy, this configuration is treated as equivalent to a policy with one rule that accepts all routes.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.3.R2
Platforms	SAR Gen 2

summary-only *boolean*

Synopsis	Advertise the aggregate route only
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* summary-only *boolean*
Tree	summary-only
Description	When configured to **true**, the router suppresses the advertisement of more specific component routes for the aggregate. When configured to **false**, the router advertises both the aggregate route and its contributing routes.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

tunnel-group *number*

Synopsis	Tunnel group from which to associate the MC IPSec state
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* tunnel-group *number*
Tree	tunnel-group
Description	This command adds the MC-IPsec state of the specific tunnel-group to the aggregate route.
Range	1 to 64
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

allow-export-bgp-vpn *boolean*

Synopsis	Include BGP-VPN routes for export
Context	**configure** service vprn *service-name* allow-export-bgp-vpn *boolean*
Tree	allow-export-bgp-vpn
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

autonomous-system *number*

Synopsis	AS number advertised to peers for this router
Context	**configure** service vprn *service-name* autonomous-system *number*
Tree	autonomous-system
Description	This command configures the autonomous system (AS) number for the router. This value must be set before BGP can be activated. If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp

Synopsis	Enable the **bgp** context
Context	**configure** service vprn *service-name* bgp
Tree	bgp
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the BGP instance
Context	**configure** service vprn *service-name* bgp admin-state *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-inactive *boolean*

Synopsis	Advertise inactive BGP routes to peers
Context	**configure** service vprn *service-name* bgp advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows any inactive BGP route to be advertised, even though it is not the used route. When configured to **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-ipv6-next-hops

Synopsis	Enter the **advertise-ipv6-next-hops** context
Context	**configure** service vprn *service-name* bgp advertise-ipv6-next-hops
Tree	advertise-ipv6-next-hops
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *boolean*

Synopsis	Enable IPv4 routes to be advertised
Context	**configure** service vprn *service-name* bgp advertise-ipv6-next-hops ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to 0
Context	**configure** service vprn *service-name* bgp aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Description	When configured to **true**, the router ID in the BGP AGGREGATOR path attribute is set to 0 when BGP aggregates routes. This prevents different routers within an AS from creating aggregate routes for the same prefix with different path attributes. When configured to **false**, the AS number and router ID are added to the AGGREGATOR path attribute.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

asn-4-byte *boolean*

Synopsis	Advertise support for 4-byte ASNs
Context	**configure** service vprn *service-name* bgp asn-4-byte *boolean*
Tree	asn-4-byte
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

attribute-set

Synopsis	Enter the **attribute-set** context
Context	**configure** service vprn *service-name* bgp attribute-set
Tree	attribute-set
Description	Commands in this context configure the handling of attribute set (ATTR_SET) attributes in BGP routes received from PE-CE peers of the VPRN. ATTR_SET is an optional transitive BGP path attribute standardized by RFC 6368 that is added to BGP L3 VPN routes to provide logical separation between the BGP domain of a customer and the BGP domain of a service provider.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remove *boolean*

Synopsis	Remove ATTR_SET in received BGP routes from PE-CE peers
Context	**configure** service vprn *service-name* bgp attribute-set remove *boolean*
Tree	remove
Description	When configured to **true**, BGP ignores and silently discards ATTR_SETs in BGP routes received from PE-CE peers of the VPRN. The discarded ATTR_SETs do not affect BGP best path selection in the VPRN, and they do not appear in the VPN-IP routes that result from the VRF export of the BGP routes. Nokia recommends configuring this command to **true** in most deployments. When configured to **false**, BGP ignores ATTR_SETs in BGP routes received from PE-CE peers of the VPRN, but does not discard them. This allows the ATTR_SETs to propagate between CE devices connected to the VPRN and to other PE devices when the BGP routes are exported as VPN-IP routes. **Note:** If the configuration of this command is changed, ROUTE_REFRESH messages are sent to all PE-CE peers of the VPRN.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	BGP authentication key for all peers
Context	**configure** service vprn *service-name* bgp authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key used to protect all sessions. The stored format of the authentication key is based on the **configure system security hash-control management-interface md-cli hash-algorithm** setting. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 422
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** service vprn *service-name* bgp authentication-keychain *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

backup-path

Synopsis	Enter the **backup-path** context
Context	**configure** service vprn *service-name* bgp backup-path
Tree	backup-path
Description	Commands in this context enable the use of a backup path for specified BGP-learned prefixes belonging to the base router. Multiple paths must be received for a prefix in order to take advantage of this feature. When a prefix has a backup path and its primary paths fail, the affected traffic is rapidly diverted to the backup path without waiting for control plane re-convergence to occur. When many prefixes share the same primary paths and in some cases, the same backup path, the time to divert failover traffic to the backup path is independent of the number of prefixes. By default, IPv4 and IPv6 prefixes do not have a backup path installed in the IOM.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp backup-path ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Enable support for unlabeled unicast IPv6 routes
Context	**configure** service vprn *service-name* bgp backup-path ipv6 *boolean*
Tree	ipv6

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv4 *boolean*

Synopsis	Enable support for labeled-unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp backup-path label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv6 *boolean*

Synopsis	Enable support for labeled unicast IPv6 routes
Context	**configure** service vprn *service-name* bgp backup-path label-ipv6 *boolean*
Tree	label-ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

best-path-selection

Synopsis	Enter the **best-path-selection** context
Context	**configure** service vprn *service-name* bgp best-path-selection
Tree	best-path-selection
Introduced	25.3.R2
Platforms	SAR Gen 2

always-compare-med

Synopsis	Enter the **always-compare-med** context
Context	**configure** service vprn *service-name* bgp best-path-selection always-compare-med
Tree	always-compare-med

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context determine how the BGP decision process is affected by the MED path attribute.
Introduced	25.3.R2
Platforms	SAR Gen 2

med-value *keyword*

Synopsis	Action for a missing MED attribute
Context	**configure** service vprn *service-name* bgp best-path-selection always-compare-med med-value *keyword*
Tree	med-value
Options	off, missing-med-zero, missing-med-infinity, on
Default	off
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-as *boolean*

Synopsis	Compare MED only for routes from same neighbor AS
Context	**configure** service vprn *service-name* bgp best-path-selection always-compare-med strict-as *boolean*
Tree	strict-as
Description	When configured to **true**, the route selection process can compare the MED path attribute between routes only if they come from the same neighbor AS. When configured to **false**, the route selection process can compare the MED path attribute between routes even if they come from different neighbor ASs.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

as-path-ignore

Synopsis	Enter the **as-path-ignore** context
Context	**configure** service vprn *service-name* bgp best-path-selection as-path-ignore
Tree	as-path-ignore

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context determine whether the AS path length is considered in the selection process for routes of the specified address families.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *boolean*

Synopsis	Ignore AS path length for unlabeled unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp best-path-selection as-path-ignore ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Ignore AS path length for unlabeled unicast IPv6 routes
Context	**configure** service vprn *service-name* bgp best-path-selection as-path-ignore ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv4 *boolean*

Synopsis	Ignore AS path length for labeled-unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp best-path-selection as-path-ignore label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv6 *boolean*

Synopsis	Ignore AS path length for labeled unicast IPv6 routes
Context	**configure** service vprn *service-name* bgp best-path-selection as-path-ignore label-ipv6 *boolean*
Tree	label-ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

compare-origin-validation-state *boolean*

Synopsis	Allow comparison of origin validation states
Context	**configure** service vprn *service-name* bgp best-path-selection compare-origin-validation-state *boolean*
Tree	compare-origin-validation-state
Description	When configured to **true**, the RPKI origin validation state is compared between BGP routes, where a Valid state is preferred over a Not-Found state, and a Not-Found state is preferred over an Invalid state. When configured to **false**, the RPKI origin validate state comparison is not performed as part of the BGP route selection process.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

deterministic-med *boolean*

Synopsis	Group paths based on AS before MED attribute comparison
Context	**configure** service vprn *service-name* bgp best-path-selection deterministic-med *boolean*
Tree	deterministic-med
Description	When configured to **true**, BGP groups paths from the same AS that are equal up to the MED attribute comparison and then compares the best path from each group to select the overall best path. This process ensures that the best-path selection process is deterministic in all cases. When configured to **false**, paths are not grouped and the overall best-path selection can depend on the order of route arrival.
Default	false

Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

ebgp-ibgp-equal

Synopsis	Enter the **ebgp-ibgp-equal** context
Context	**configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal
Tree	ebgp-ibgp-equal
Description	Commands in this context allow BGP to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled) for the specified address families. The result is a form of EIBGP load-balancing in a multipath scenario. This behavior can be applied selectively to certain address families. By default, the BGP decision process prefers an EBGP learned route over an IBGP learned route.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *boolean*

Synopsis	Consider EBGP and IBGP IPv4 routes equal
Context	**configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Consider EBGP and IBGP IPv6 routes equal
Context	**configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

label-ipv4 *boolean*

Synopsis	Consider EBGP and IBGP label-IPv4 routes equal
Context	**configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv6 *boolean*

Synopsis	Consider EBGP and IBGP label-IPv6 routes equal
Context	**configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal label-ipv6 *boolean*
Tree	label-ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-nh-metric *boolean*

Synopsis	Ignore next-hop distance in best path selection
Context	**configure** service vprn *service-name* bgp best-path-selection ignore-nh-metric *boolean*
Tree	ignore-nh-metric
Description	When configured to **true**, BGP ignores the resolved distance to the BGP next hop in its route selection process. When configured to **false**, BGP factors the distance to the next hop into its decision process when it compares two BGP routes with the same NLRI learned from base router BGP peers (in the **router** context) or IP prefix learned from VPRN BGP peers (in the **vprn** context).
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ignore-router-id

Synopsis	Enable the **ignore-router-id** context
Context	**configure** service vprn *service-name* bgp best-path-selection ignore-router-id
Tree	ignore-router-id
Description	Commands in this context determine whether the BGP selection process ignores the BGP identifier (router ID) comparison of two EBGP paths from different EBGP peers when determining the best path for the specified address families. By default, BGP selects the path with the lower router ID when it compares two paths from EBGP peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

origin-invalid-unusable *boolean*

Synopsis	Ignore routes with invalid origin validation state
Context	**configure** service vprn *service-name* bgp best-path-selection origin-invalid-unusable *boolean*
Tree	origin-invalid-unusable
Description	When configured to **true**, routes that have an RPKI origin validation state of Invalid are considered unusable by the best-path selection algorithm. These routes cannot be used for forwarding and cannot be advertised to BGP peers. When configured to **false**, routes with an RPKI origin validation state of Invalid are compared to other usable routes for the same prefix, according to the BGP decision process.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** service vprn *service-name* bgp bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, BFD is enabled on all BGP sessions, subject to the association of those BGP sessions with IP interfaces that have BFD configurations. When configured to **false**, BFD is not enabled globally for all BGP sessions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-strict-mode

Synopsis	Enter the **bfd-strict-mode** context
Context	**configure** service vprn *service-name* bgp bfd-strict-mode
Tree	bfd-strict-mode
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise

Synopsis	Enable the **advertise** context
Context	**configure** service vprn *service-name* bgp bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** service vprn *service-name* bgp bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range	1 to 65535
Units	seconds
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop-reachability *boolean*

Synopsis	Consider next hop unreachable if BFD session is down
Context	**configure** service vprn *service-name* bgp bfd-strict-mode next-hop-reachability *boolean*
Tree	next-hop-reachability
Description	When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met: • The BFD session to the peer is in a down state. • There is a valid interface BFD configuration that applies to the peer. • There is a valid BFD liveness configuration that applies to the peer. The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address. Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer. The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent. Configuring this command to **true** only affects routes belonging to the following address families: • IPv4 • IPv6 • IPv4 VPN • IPv6 VPN • labeled unicast IPv4 • labeled unicast IPv6 • EVPN • IPv4 multicast • IPv6 multicast • IPv4 VPN multicast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

client-reflect *boolean*

Synopsis	Allow client reflection of routes by route reflector
Context	**configure** service vprn *service-name* bgp client-reflect *boolean*
Tree	client-reflect
Description	When configured to **true**, routes received from neighbors considered to be RR clients are reflected to other peers as expected. When configured to **false**, routes received from neighbors considered to be RR clients are not reflected to other clients.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

cluster

Synopsis	Enter the **cluster** context
Context	**configure** service vprn *service-name* bgp cluster
Tree	cluster
Introduced	25.3.R2
Platforms	SAR Gen 2

cluster-id *ipv4-address*

Synopsis	Route reflector cluster ID
Context	**configure** service vprn *service-name* bgp cluster cluster-id *ipv4-address*
Tree	cluster-id
Description	The command specifies the cluster ID to associate with the routing instance, effectively making all IBGP peers of the routing instance RR clients.

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** service vprn *service-name* bgp damp-peer-oscillations
Tree	damp-peer-oscillations
Description	Commands in this context support the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the router does not perform peer oscillation damping and immediately transitions out of the idle state after every reset.

Introduced 25.3.R2

Platforms SAR Gen 2

error-interval *number*

Synopsis Time after a reset that the session must be error-free

Context **configure** service vprn *service-name* bgp damp-peer-oscillations error-interval *number*

Tree error-interval

Description This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.

Range 0 to 2048

Default 30

Introduced 25.3.R2

Platforms SAR Gen 2

idle-hold-time

Synopsis Enter the **idle-hold-time** context

Context **configure** service vprn *service-name* bgp damp-peer-oscillations idle-hold-time

Tree idle-hold-time

Description Commands in this context configure how long a BGP peer session remains in the idle state after some type of error causes the session to reset.

In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur in a short time period after each session reset cause longer and longer hold times in the idle state.

Introduced 25.3.R2

Platforms SAR Gen 2

initial-wait *number*

Synopsis Time session remains in idle state after stabilization

Context **configure** service vprn *service-name* bgp damp-peer-oscillations idle-hold-time initial-wait *number*

Tree initial-wait

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 2048
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

max-wait *number*

Synopsis	Maximum session idle time after repeated instability
Context	**configure** service vprn *service-name* bgp damp-peer-oscillations idle-hold-time max-wait *number*
Tree	max-wait
Range	1 to 2048
Default	60
Introduced	25.3.R2
Platforms	SAR Gen 2

second-wait *number*

Synopsis	Time that doubles after each session failure
Context	**configure** service vprn *service-name* bgp damp-peer-oscillations idle-hold-time second-wait *number*
Tree	second-wait
Description	This command defines the hold time that doubles after each repeated session failure that occurs in a short span of time.
Range	1 to 2048
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

damping *boolean*

Synopsis	Use BGP route damping to reduce route flap
Context	**configure** service vprn *service-name* bgp damping *boolean*
Tree	damping

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables route damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes. Route damping is controlled by profiles set in route policies. If no profile is specified in the route policy, the default damping profile is used with the following parameters: • Half-life: 15 minutes • Max-suppress: 60 minutes • Suppress-threshold: 3000 • Reuse-threshold: 750 When configured to **false**, BGP route damping for learned routes is disabled.
Default	false
Introduced	25.3.R2

Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** service vprn *service-name* bgp enforce-first-as *boolean*
Tree	enforce-first-as
Description	When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**). This command does not flap an established session because it applies only to routes received after the command is issued. When configured to **false**, received routes are not checked for compliance with the rule.

Platforms	SAR Gen 2

legacy-mode *boolean*

Synopsis	Enable legacy-mode of BGP error handling
Context	**configure** service vprn *service-name* bgp error-handling legacy-mode *boolean*
Tree	legacy-mode
Description	When configured to **true**, the BGP instance handles the BGP update error messages based on the configured **update-fault-tolerance** commands. If these commands are not explicitly configured, BGP error handling follows the legacy procedures described in RFC 4271, which can result in disruptive session resets. When configured to **false**, the BGP instance ignores the configured **update-fault-tolerance** commands and applies the new error handling procedures described in RFC 7606 on all sessions.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** service vprn *service-name* bgp error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When configured to **false**, most errors trigger a session reset.

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** service vprn *service-name* bgp graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** service vprn *service-name* bgp graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.

Range	0 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** service vprn *service-name* bgp graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.
Default	false
Introduced	25.3.R2

Platforms SAR Gen 2

advertise-inactive *boolean*

Synopsis Advertise an inactive BGP route to peers

Context **configure** service vprn *service-name* bgp group *named-item-64* advertise-inactive *boolean*

Tree advertise-inactive

Description When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicapt IPv4 and IPv6 routes depends on several factors.

- If the active route for the IP prefix is a BGP route, that route is advertised.
- If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertise unless the active non-BGP route is matched and accepted by an export policy applied to the session
- If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicity configured to **false**.

When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.

Introduced 25.3.R2

Platforms SAR Gen 2

advertise-ipv6-next-hops

Synopsis Enable the **advertise-ipv6-next-hops** context

Context **configure** service vprn *service-name* bgp group *named-item-64* advertise-ipv6-next-hops

Platforms	SAR Gen 2

advertise

Synopsis	Enable the **advertise** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range	1 to 65535
Units	seconds
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop-reachability *boolean*

Synopsis	Consider next hop unreachable if BFD session is down
Context	**configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode next-hop-reachability *boolean*
Tree	next-hop-reachability
Description	When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met: • The BFD session to the peer is in a down state. • There is a valid interface BFD configuration that applies to the peer. • There is a valid BFD liveness configuration that applies to the peer. The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address. Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer. The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent. Configuring this command to **true** only affects routes belonging to the following address families: • IPv4 • IPv6 • IPv4 VPN • IPv6 VPN • labeled unicast IPv4 • labeled unicast IPv6 • EVPN • IPv4 multicast • IPv6 multicast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 25.3.R2

Platforms SAR Gen 2

capability-negotiation *boolean*

Synopsis Enable capability negotiation

Context **configure** service vprn *service-name* bgp group *named-item-64* capability-negotiation *boolean*

Tree capability-negotiation

Description When configured to **true**, this command enables the exchange of capabilities.

When configured to **false** and the peering is flapped, new capabilities are not negotiated and strictly IPv4 exchanges are supported with the peer.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

client-reflect *boolean*

Synopsis Allow cluster RR to advertise routes to its clients

Context **configure** service vprn *service-name* bgp group *named-item-64* client-reflect *boolean*

Tree client-reflect

Description When unconfigured, this command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **true**.

When the command inherits a value of **true**, client reflection of routes is enabled.

When configured to **false**, this command disables client reflection of routes.

Introduced 25.3.R2

cluster-id *ipv4-address*

Synopsis	Route reflector cluster ID
Context	**configure** service vprn *service-name* bgp group *named-item-64* cluster cluster-id *ipv4-address*
Tree	cluster-id
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

connect-retry *number*

Synopsis	BGP connect retry timer value
Context	**configure** service vprn *service-name* bgp group *named-item-64* connect-retry *number*
Tree	connect-retry
Range	1 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* damp-peer-oscillations
Tree	damp-peer-oscillations
Description	Commands in this context specify how long a BGP peer session remains in the idle state after an error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short time after each session reset cause longer and longer hold times in the idle state. When unconfigured, command settings are inherited from the global-level configuration.
Introduced	25.3.R2
Platforms	SAR Gen 2

error-interval *number*

Synopsis	Time after a reset that the session must be error-free
Context	**configure** service vprn *service-name* bgp group *named-item-64* damp-peer-oscillations error-interval *number*
Tree	error-interval
Description	This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.
Range	0 to 2048
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

idle-hold-time

Synopsis	Enter the **idle-hold-time** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* damp-peer-oscillations idle-hold-time
Tree	idle-hold-time
Introduced	25.3.R2
Platforms	SAR Gen 2

initial-wait *number*

Synopsis	Time session remains in idle state after stabilization
Context	**configure** service vprn *service-name* bgp group *named-item-64* damp-peer-oscillations idle-hold-time initial-wait *number*
Tree	initial-wait
Range	0 to 2048
Default	0
Introduced	25.3.R2

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference*
Tree	interface
Description	Commands in this context configure an unnumbered VPRN access IP interface for dynamic neighbors. If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses. The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions. When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**interface-name**] *reference*

Synopsis	Name of the dynamic neighbor interface
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference*

allowed-peer-as *string*

Synopsis	Allowed peer AS value or range of acceptable values

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference* allowed-peer-as *string*
Tree	allowed-peer-as
Description	This command specifies a singular allowed peer AS value or a range of acceptable values in the format *n1*..*n*2. All values greater than or equal to *n1* and less than or equal to *n2*are acceptable. For example, if the acceptable peer AS numbers are 65001 to 65005 (range) and 62100 (singular value), configure this command to use a value of [65001..65005 62100].
String format	'allowed-peer-as' must be 4-byte decimal AS number or AS..AS range
Max. instances	32
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

max-sessions *number*

Synopsis	Maximum number of dynamic sessions allowed
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference* max-sessions *number*
Tree	max-sessions
Description	This command specifies the maximum number of dynamic sessions that are allowed to be set up on the interface as a result of accepting sessions from link-local addresses or initiating sessions by receiving IPv6 router advertisements.
Range	1 to 255
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

match

Synopsis	Enter the **match** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor match
Tree	match

dynamic-neighbor-limit *number*

Synopsis	Maximum dynamic BGP sessions to accept from remote peer
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor-limit *number*
Tree	dynamic-neighbor-limit
Description	This command configures the maximum number of dynamic BGP sessions that are accepted from remote peers associated with a specific peer group. If accepting a new dynamic session causes the group limit to be exceeded, the new session attempt is rejected and a Notification message is sent back to the remote peer. When unconfigured, the setting is inherited from the BGP global-level configuration.
Range	1 to 8192
Introduced	25.3.R2
Platforms	SAR Gen 2

ebgp-default-reject-policy

Synopsis	Enable the **ebgp-default-reject-policy** context

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** service vprn *service-name* bgp group *named-item-64* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** service vprn *service-name* bgp group *named-item-64* graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** service vprn *service-name* bgp group *named-item-64* graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.
Default	false
Introduced	25.3.R2

Context	**configure** service vprn *service-name* bgp group *named-item-64* hold-time minimum-hold-time *number*
Tree	minimum-hold-time
Description	This command specifies the minimum hold time that is accepted for the session. If a peer proposes a hold time lower than this value, the session attempt is rejected. When unconfigured, the command value is inherited from the BGP global-level setting.
Range	0 | 3 to 65536
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

seconds *number*

Synopsis	Maximum time BGP waits between successive messages

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp group *named-item-64* hold-time seconds *number*
Tree	seconds
Description	This command configures the maximum time BGP waits between successive messages (either keepalive or update) from its peer before closing the connection. Although the implementation allows setting the keepalive timer at the BGP group level times separately, the configured keepalive timer is overridden by this value under the following circumstances. • If the specified hold time is less than the configured keepalive time, the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed. • If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. The connection with the peer is up permanently and no keepalive packets are sent to the peer. When unconfigured, the command setting is inherited from the BGP global-level configuration.
Range	0 | 3 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

import

initial-send-delay-zero *boolean*

Synopsis	Send BGP updates as soon as the session comes up
Context	**configure** service vprn *service-name* bgp group *named-item-64* initial-send-delay-zero *boolean*
Tree	initial-send-delay-zero
Description	When configured to **true**, BGP updates are sent as soon as the session comes up. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BGP waits to send UPDATE messages for the minimum route advertisement time after a session is established.
Introduced	25.3.R2
Platforms	SAR Gen 2

keepalive *number*

Synopsis	Time after which the BGP KEEPALIVE message is sent
Context	**configure** service vprn *service-name* bgp group *named-item-64* keepalive *number*
Tree	keepalive
Description	This command configures the BGP keepalive timer value. A keepalive message is sent every time this timer expires. This value is generally one-third of the hold time interval configured in the **hold-time seconds** context. Although the implementation allows this keepalive value and the hold time interval to be independently set, under the following circumstances, the configured keepalive value is overridden by the hold time interval value: • If the specified keepalive value is greater than the configured hold time, the specified keepalive value is ignored and the timer value is set to one third of the current hold time value. • If the specified hold time interval is less than the configured keepalive value, the keepalive value is reset to one third of the specified hold time interval. • If the hold time interval is set to zero, the configured keepalive value is ignored. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

path-mtu-discovery *boolean*

Synopsis	Enable Path MTU Discovery
Context	**configure** service vprn *service-name* bgp group *named-item-64* path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections. When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated. When configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms SAR Gen 2

peer-ip-tracking *boolean*

Synopsis Enable BGP peer tracking

Context **configure** service vprn *service-name* bgp group *named-item-64* peer-ip-tracking *boolean*

Tree peer-ip-tracking

Description When configured to **true**, this command enables BGP peer tracking.

Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, peer tracking is disabled.

Introduced 25.3.R2

Platforms SAR Gen 2

preference *number*

Synopsis Route preference for routes learned from all peers

Context **configure** service vprn *service-name* bgp group *named-item-64* preference *number*

prefix-limit [family] *keyword*

Synopsis Enter the **prefix-limit** list instance

Context **configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword*

Tree prefix-limit

Description Commands in this context limit the number of BGP routes per address family received from a BGP peer and define the actions when crossing the configured maximum.

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**family**] *keyword*

Synopsis	Address family to which the limit applies
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword*
Tree	prefix-limit
Options	ipv4, ipv6, mcast-ipv4, flow-ipv4, flow-ipv6, mcast-ipv6, label-ipv4
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-excess *number*

Synopsis	Percentage of maximum routes to install in route table
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword* hold-excess *number*
Tree	hold-excess
Description	This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-import** command is configured to **true**, only routes not rejected by import policies count toward the limit. A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This command is mutually exclusive with the **idle-timeou**t and **log-only** commands.
Range	1 to 100
Introduced	25.3.R2
Platforms	SAR Gen 2

idle-timeout *number*

Synopsis	Time BGP peering remains idle before reconnecting
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword* idle-timeout *number*
Tree	idle-timeout
Description	This command configures the time in minutes before a BGP peer is automatically re-established after reaching the prefix limit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the BGP peer stays down until the operator performs a reset. This command and **log-only** cannot be configured simultaneously.

Range	1 to 1024
Introduced	25.3.R2
Platforms	SAR Gen 2

log-only *boolean*

Synopsis	Send warning message at threshold instead of take-down
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword* log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router disables the BGP session from being taken down upon reaching the prefix limit. Instead, only a warning message is sent when the limit is reached. A warning message is also sent when the configured threshold percentage of the limit is reached. This command and **idle-timeout** cannot be configured simultaneously. When configured to **false**, the router generates a log event and takes the BGP session down upon reaching the prefix limit.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum *number*

Synopsis	Maximum number of routes to be learned from a peer
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword* maximum *number*
Tree	maximum
Description	This command configures the maximum number of BGP routes of the specified address family that can be received from a peer before administrative action is taken. When **log-only** is unconfigured, the BGP session is taken down whenever the limit of any family is exceeded even if the limits of the other family has not been exceeded.
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

post-import *boolean*

Synopsis	Apply limit only to routes accepted by import policies
Context	**configure** service vprn *service-name* bgp group *named-item-64* prefix-limit *keyword* post-import *boolean*
Tree	post-import
Description	When configured to **true**, the system limits the number of routes that are accepted by import policies. Routes rejected by import policies are not counted against the configured limit. When configured to **false**, the system limits the number of routes to all routes received from the peer.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Generate and advertise an IPv6 default route (::/0)
Context	**configure** service vprn *service-name* bgp group *named-item-64* send-default ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** service vprn *service-name* bgp group *named-item-64* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	25.3.R2
Platforms	SAR Gen 2

static-group *boolean*

Synopsis	Use group for static peers
Context	**configure** service vprn *service-name* bgp group *named-item-64* static-group *boolean*
Tree	static-group
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** service vprn *service-name* bgp group *named-item-64* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows: TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router. TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.
Range	384 to 9746
Options	ip-stack
Introduced	25.3.R2
Platforms	SAR Gen 2

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** service vprn *service-name* bgp group *named-item-64* third-party-nexthop *boolean*
Tree	third-party-nexthop
Description	When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route. When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.
Introduced	25.3.R2
Platforms	SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

ttl-security *number*

Synopsis	Minimum TTL value for an incoming BGP packet
Context	**configure** service vprn *service-name* bgp group *named-item-64* ttl-security *number*
Tree	ttl-security
Description	This command configures the minimum TTL value that BGP accepst from an incoming packet. A packet with a TTL value less than the minimum configured TTL value is discarded.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

type *keyword*

Synopsis	BGP peer type
Context	**configure** service vprn *service-name* bgp group *named-item-64* type *keyword*
Tree	type
Options	internal, external
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-time

Synopsis	Enter the **hold-time** context
Context	**configure** service vprn *service-name* bgp hold-time
Tree	hold-time
Introduced	25.3.R2
Platforms	SAR Gen 2

minimum-hold-time *number*

Synopsis	Minimum hold time between successive messages
Context	**configure** service vprn *service-name* bgp hold-time minimum-hold-time *number*
Tree	minimum-hold-time
Description	This command specifies the minimum hold time that is accepted for the session. If a peer proposes a hold time lower than this value, the session attempt is rejected.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 | 3 to 65535
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

seconds *number*

Synopsis	Maximum time BGP waits between successive messages
Context	**configure** service vprn *service-name* bgp hold-time seconds *number*
Tree	seconds
Description	This command configures the maximum time BGP waits between successive messages (either keepalive or update) from its peer before closing the connection. Although the implementation allows setting the keepalive timer at the BGP global level times separately, the configured keepalive timer is overridden by this value under the following circumstances. • If the specified hold time is less than the configured keepalive time, the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed. • If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. The connection with the peer is up permanently and no keepalive packets are sent to the peer.
Range	0 | 3 to 65535
Default	90
Introduced	25.3.R2
Platforms	SAR Gen 2

ibgp-multipath *boolean*

Synopsis	Enable IBGP multipath load balancing
Context	**configure** service vprn *service-name* bgp ibgp-multipath *boolean*
Tree	ibgp-multipath
Description	When configured to **true**, this command enables IBGP multipath load balancing when adding BGP routes to the route table if the route resolving the BGP next hop offers multiple next hops. When configured to **false**, this command disables IBGP multipath load balancing.
Default	false
Introduced	25.3.R2

family [family-type] *keyword*

Synopsis	Enter the **family** list instance
Context	**configure** service vprn *service-name* bgp multipath family *keyword*
Tree	family
Description	Commands in this context set ECMP multipath parameters that apply only to the specified label unicast address family. When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The distribution of traffic over the multiple paths may or may not be equal. The distribution is based on weights derived from the Link Bandwidth Extended Community. For more information about the criteria a non-best route must meet to qualify as a multipath, see “BGP route installation in the route table” in the *7705 SAR Gen 2 Unicast Routing Protocols User Guide*.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**family-type**] *keyword*

Synopsis	Address family type for the multipath selection
Context	**configure** service vprn *service-name* bgp multipath family *keyword*
Tree	family
Options	ipv4, ipv6, label-ipv4, label-ipv6
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

ebgp *number*

Synopsis	Maximum multipaths when best path is EBGP learned route
Context	**configure** service vprn *service-name* bgp multipath family *keyword* ebgp *number*
Tree	ebgp
Description	This command configures the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route. The limit configured using this command overrides the limit configured in the **max-paths** command. If the best path is an EBGP learned route, and this command is set to 1, multipaths are disabled.
Range	1 to 64

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

ibgp *number*

Synopsis	Maximum multipaths when best path is IBGP learned route
Context	**configure** service vprn *service-name* bgp multipath family *keyword* ibgp *number*
Tree	ibgp
Description	This command configures the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route. The limit configured using this command overrides the limit configured in the **max-paths** command. If the best path is an IBGP learned route and this command is set to 1, multipaths are disabled.
Range	1 to 64
Introduced	25.3.R2
Platforms	SAR Gen 2

max-paths *number*

Synopsis	Maximum number of multipaths per prefix or NLRI
Context	**configure** service vprn *service-name* bgp multipath family *keyword* max-paths *number*
Tree	max-paths
Description	This command configures the maximum number of multipaths per prefix or NLRI for the IP family option specified using the **family** command. Consider the following when configuring this command: • If the best path is an EBGP-learned route and the **ebgp** command is configured, the limit configured in the **ebgp** command overrides the limit configured in this command. • If the best path is an IBGP-learned route and the **ibgp** command is configured, the limit configured in the **ibgp** command overrides the limit configured in this command. • If the best path is an EBGP-learned route and the **ebgp** command is not configured, and this command is configured to 1, multipaths are disabled. • If the best path is an IBGP-learned route and the **ibgp** command is not configured, and this command is configured to 1, multipaths are disabled.
Range	1 to 64
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-address**] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	IP address of the BGP peer router
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	neighbor
String format	'ipv4-address-with-zone' must be a.b.c.d with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the BGP neighbor
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-inactive *boolean*

Synopsis	Advertise an inactive BGP route to peers
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicast IPv4 and IPv6 routes depends on several factors. • If the active route for the IP prefix is a BGP route, that route is advertised. • If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.

Introduced 25.3.R2

Platforms SAR Gen 2

advertise-ipv6-next-hops

Synopsis Enable the **advertise-ipv6-next-hops** context

Context **configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops

as-override *boolean*

Synopsis	Replace the peer ASN with the local ASN in AS Path
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* as-override *boolean*
Tree	as-override
Description	When configured to **true**, the advertising router's local AS replaces all occurrences of the peer AS in the AS_PATH attribute. This command should be used with caution, as it breaks BGP's loop detection mechanism. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). This command cannot be explicitly configured to **false**. When the command inherits a value of **false**, no AS override is performed.
Introduced	25.3.R2
Platforms	SAR Gen 2

asn-4-byte *boolean*

Synopsis	Advertise the use of 4-byte ASNs
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* asn-4-byte *boolean*

advertise

Synopsis	Enable the **advertise** context
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.
Range	1 to 65535
Units	seconds
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 25.3.R2

Platforms SAR Gen 2
